171. A letter of credit is a precise document whereby the importer's bank extends credit to the importer and assumes responsibility in paying the exporter. Aside from the letter of credit document, other documents used in legitimate Trade include shipping and insurance documents, and commercial invoices. The documentary credit arrangement offers an internationally recognised and used method of attaining a commercially acceptable undertaking by providing for payment to be made against presentation of documentation representing the goods, making possible the transfer of title to those goods.

172. Documentary credits (LCs, etc) are seen as a declining method of doing business, although small and medium enterprises often rely upon documentary credit basis for trade finance. Trade finance has been shifting away from this sometimes cumbersome and often expensive method of conducting business to that conducted on an open account basis.

Vulnerabilities

- Even in this simple form the true value of goods transferred between countries can be masked through misrepresentation of price, quantity and quality. Letters of Credit may be generated to create a veneer.
- The documentation generated in the process leaves a paper trail which money launderer may rely upon to disguise illegal proceeds.

Open Account Facilities

173. Open account transactions can be described as 'buy now, pay later' and are more like regular payments for a continuing flow of goods rather than specific transactions. The pursuit of 'supply chain efficiencies' among larger businesses has encouraged their preference for open account trading, even as small and medium enterprises still rely upon documentary credit basis to conduct business of international trade. Ultimately these results suggest that trade finance should be flexible and that financiers will benefit by adapting product and service offerings to the needs of customers in different segments.[16]

Vulnerabilities

- Open account facilities have caused a disconnect between the movement of the underlying trade and the money used to finance it.

[16] http://www.east.com.au/media/2009-09-16.pdf

- Payments against these facilities may or may not be undertaken through an international funds transfer instruction (IFTI) or SWIFT.

174. A range of Open Account Facilities are set out below.

Factoring

175. Factoring, also known as invoice discounting, receivables factoring or debtor financing, is where a third party company assumes a debt or invoice from another company. This involves either the sale at a discount of accounts receivable or other debt assets on a daily, weekly or monthly basis in exchange for immediate cash. It can also involve the charging of interest on the debt. The debt assets are sold by the exporter at a discount to a factoring house, which thereby assumes part of risks of the account receivable. Factoring in international trade is the discounting of a short-term receivable (up to 180 days). The exporter transfers title to its short-term foreign accounts receivable to a factoring house for cash at a discount from the face value. It allows an exporter to ship on open account as the factor assumes the financial liability of the importer to pay and handles collections on the receivables. The factoring house usually works with consumer goods.

176. Factoring therefore relieves the first party of a debt for less than the total amount providing them with working capital to continue trading, while the buyer, or factor, chases up the debt for the full amount and profits when it is paid. The factor is required to pay additional fees, typically a small percentage, once the debt has been settled. The factor may also offer a discount to the indebted party. Essentially factoring transfers the ownership of accounts to another party that then chases up the debt. In the absence of private sector players, Governments can facilitate the establishment of a state-owned factor; or a joint venture set-up with several banks and trading enterprises. The peak international body is Factors Chain International (FCI) which is a body that International Factors deal with[17].

177. Factoring is divided into import factoring and export factoring. Details of each are set out below.

Export factoring

178. In export factoring, the Factor deals directly with the seller of the goods. In this case the debt is a 'recourse' debt, and if the seller goes under, or the purchaser does not pay, the local Factor assumes the risk. In Export factoring the local Factor, deals with a counterparty Factor, who will check out the creditworthiness of the purchaser.

179. In this case the seller will provide documentation to show that the goods have been shipped prior to payment. Payment is usually made on an 80/20 split, 80% is paid to the seller at the time of the invoice/goods shipment. This amount is loaned to the seller by the Factor and interest charged until the purchaser pays. When the purchaser pays the 100% of the invoice

[17] http://www.fci.nl/about-factoring/how-does-it-work

the Factor pays the seller the other 20% of the invoice. There is usually a small activity fee (around 1% of the invoice that is also charged, so it is typically a 80/1/19 split!)

Import Factoring

180. Import factoring is a reverse of the scenario set out for export factoring, but differs slightly. The local Factor will insure the risk on a usually 80% basis, and will therefore carry a 20% risk. This is called a 'non-recourse debt'. The local Factor will check out the bona fide credit history etc. of the purchaser of the goods. Credit lines etc are usually established.

181. The foreign factor will examine the bills of lading shipping documents etc and confirm with the Local Factor. International factoring (as opposed to domestic factoring) have more to do with the counterpart abroad and with insuring risk.

Vulnerabilities

- Often the factor may be left with losses after the so-called traders disappear, after having indulged in TBML, by moving illicit funds through ‘sham trade’.

Forfaiting

182. Forfaiting is the purchase of an exporter's receivables (the amount importers owe the exporter) at a discount by paying cash. The purchaser of the receivables, or forfaiter, must now be paid by the importer to settle the debt. As the receivables are usually guaranteed by the importer's bank, the forfaiter frees the exporter from the risk of non-payment by the importer. The receivables have then become a form of debt instrument that can be sold on the secondary market as bills of exchange or promissory notes. Forfaiting is a method of trade financing that allows the exporter to sell its medium-term receivables (180 days to 7 years) to the forfaiter at a discount, in exchange for cash. With this method, the forfaiter assumes all the risks, enabling the exporter to extend open account terms and incorporate the discount into the selling price. Forfaiters usually work with capital goods, and large projects.

Vulnerabilities

- These instruments (exporter's receivables) are capable of being sold on the secondary market as ‘bills of exchange’ or ‘promissory notes’, provides a money launderer with an enhanced mechanism to move value.
- If the launderer, through collaboration inflates the value of receivables more value can be moved.

Pre-Shipment Finance

183. This is financing for the period prior to the shipment of goods, to support pre-export activities like wages and other costs. It is especially needed when inputs for production must be imported. It also provides additional working capital for the exporter. Pre-shipment financing is especially important to smaller enterprises because the international sales cycle

is usually longer than the domestic sales cycle. Pre-shipment financing can take the form of short-term loans, overdrafts and cash credits.

Vulnerabilities

- Pre-shipping finance especially its application to 'inputs for production that must be imported' provides the money launderer with an ability to engage a third party in another jurisdiction thus moving value to all venues in which the criminal syndicate are operating and thus widen the scope for TBML.
- Short-term loans, overdrafts and cash credits may allow launderers to make business claims on the relevant revenue agencies in those countries thus supplementing their reasons for the value they hold.

Post-Shipment Finance

184. This is financing for the period following shipment. The ability to be competitive often depends on the trader's credit term offered to buyers. Post-shipment financing ensures adequate liquidity until the purchaser receives the products and the exporter receives payment. Post-shipment financing is usually short-term.

Vulnerabilities

- Although this method of financing is short term by nature, cash is usually supplied at time of sale, hence such pretence would not raise suspicion unless intelligence arouse such suspicion.

Buyer's Credit

185. A financial arrangement whereby a financial institution in the exporting jurisdiction extends a loan directly or indirectly to a foreign buyer to finance the purchase of goods and services from the exporting jurisdiction. This arrangement enables the buyer to make payments due to the supplier under the contract.

Vulnerabilities

- Financing of the importer by an institution in the exporter's jurisdiction widen the scope for TBML, since to exercise due diligence in a foreign jurisdiction may be more difficult.
- The money launderers seek this credit to help minimise risk of confiscation.
- If a financial institution has a stake in the trade, law enforcement has to account for that stake in any ensuing action unless the law enforcement action can demonstrate that the financial institution in complicit.

Supplier's Credit

186. A financing arrangement under which an exporter extends credit to the buyer in the importing jurisdiction to finance the buyer's purchases.

Vulnerabilities

- The utilisation of *Supplier's Credit* arrangements provide a mechanism to move significant amounts of value in most forms irrespective of whether or not the trade is legitimate, inflated or phantom.
- This financing arrangement need not involve a financial institution, although to reinforce the veneer, engaging the third party may be undertaken in ML schemes.
- If the buyer and seller are in collusion, this mechanism is a channel for TBML.

Structured Commodity Finance

187. Structured commodity finance (SCF) focuses on three main commodity groups: metals & mining, energy, and soft commodities (agricultural crops). It is a financing technique utilised by commodity producers and trading companies conducting business in the emerging markets. SCF provides liquidity management and risk mitigation for the production, purchase and sale of commodities and materials. This is done by isolating assets, which have relatively predictable cash flow attached to them so as to estimate their present value. The corporate borrowers use such assets to mitigate risk and secure credit from a lender. A corporate therefore borrows against a commodity's expected worth.

188. If all processes go to plan, then the lender is reimbursed through the sale of the assets. If not then the lender has recourse to some or all of the assets. Lenders charge interest on any funds disbursed as well as fees for arranging the transaction. SCF funding techniques include those techniques previously mentioned, namely, pre-export finance, countertrade, barter, and inventory finance. These solutions can be applied across part or all of the commodity trade value chain: from producer to distributor to processor, and the physical traders who buy and deliver commodities.

189. As a financing technique based on performance risk, it is particularly well-suited for emerging markets considered as higher risk environments.[18]

USEFUL TIPS FOR TBML INVESTIGATORS

190. Whilst it is suggested that trade financing and especially open account facilities can provide a reasonable veneer for the activities of the money launderer, it is still costly to set up and maintain. It is important to emphasise that if the veneer protecting the criminal mischief is cracked the trail is relatively easy to follow. In conducting Trade business, legitimate companies also require mechanisms to track their activity and example of this include:

Export Credit Insurance

191. In addition to financing issues, traders are also subject to risks, which can be either commercial or political. Commercial risk arises from factors like the non-acceptance of goods by buyer, the failure of buyer to pay debt, and the failure of foreign banks to honour

[18] http://www.tradefinancemagazine.com/boutUs/tub/WhatIsTradeFinance.html

documentary credits. Political risk arises from factors like war, riots and civil commotion, blockage of foreign exchange transfers and currency devaluation. Export credit insurance involves insuring exporters against such risks. Export Credit Insurance is not likely to be something of interest to either the professional or novice money launderer as it adds additional costs seen as unnecessary and therefore should be something actively examined by the TBML investigator.

Trade Services Utility

192. In response to the development of open account trading, the organisation SWIFT launched the TSU (trade services utility), a collaborative centralised data matching utility, which allows banks to build products around its core functionality to improve the speed and flow of open account trade. This is helping banks re-intermediate themselves into these trade flows.

193. This development may in fact be of assistance to TBML investigators as it can help identify 'red flags' discussed in this paper. There are a number of other mechanisms capable of collecting data including revenue departments, customs departments, accountancy data, general financial data, market data, topography data and social media data. The issue to date when it comes to investigating and prosecuting TBML is that this data is still stored in a dispersed way.

194. TBML investigator will need to devise ways in which to gather this data, have it integrated and then analysed against the concept of time and distance and normality. It is only then will enough criminal activity will be identified and actioned to cause a change in general attitude which is all that can be expected.

195. The project team believes that two critical elements that might be used to crack the veneer created by the ML syndicates is for investigators to consider the concepts of time and distance in ML schemes. Investigators need to commence building a time line of all known events surrounding the activities of the syndicates being investigated. Information and intelligence gathering is paramount to this endeavour and interaction with the financial institution is essential. These institutions have a vested interest in ensuring the trade in which they are engaged is legitimate. These discussions may be hampered by domestic privacy restrictions so legislative change may be necessary before significant headway can be made.

196. Distance is the other key concept. Inconsistencies in documentation, excessive complication and unrealistic time frames all contradict that path of least resistance and should therefore raise suspicion.

Partnership with Private Sector

197. An outreach programme can help create awareness about the TBML vulnerabilities to which private business are exposed. Not only the private sector can install preventative measures but in turn disseminate useful information for the ML investigators. U.S. Immigration and Customs Enforcement (ICE) have introduced many new initiatives aimed

at analysing and combating the movement of illicit funds by bulk cash smuggling, TBML, courier hubs, money services businesses (MSBs), charities, and alternative remittance systems. These initiatives include:

- Operation Cornerstone, (founded in 2003 – a private industry partnership and aggressive outreach program) (http://www.ice.gov/cornerstone/).
- Operation Cornerstone detects and closes down weaknesses within U.S. financial, trade and transportation sectors that can be exploited by criminal networks. Law enforcement entities share criminal typologies and methods with businesses and industries that manage the very systems that terrorists and criminal organizations seek to exploit. This sharing of information allows the financial and trade community to take precautions to protect itself from exploitation. In return, ICE receives information to more thoroughly investigate these complex and sophisticated criminal schemes.

Inter-sectoral & cross border transaction data analysis

198. Cross referencing of trade data with that of trade finance is useful to discover trade anomalies which can in turn lead to TBML investigations. It is important that such anomalies are investigated in the light of information obtained from international trading partners. In 2004, the US ICE established a number of Trade Transparency Units (http://www.ice.gov/trade-transparency/) to combat TBML and other import–export crimes. These TTUs rely on data analysis of international trade patterns to identify potential TBML activities. The TTUs in the United States use the 'Data Analysis and Research for Trade Transparency Systems' (DARTTS), which allows investigators to view totals for merchandise imports and then sort on any number of variables, such as jurisdiction of origin, importer name, manufacturer name, and total value (US DHS 2010: 3). Through this, DARTTS identifies trade and financial transactions that are 'statistically anomalous based on known facts and user queries', rather than being used to 'predict future behaviour' or to 'profile' traders (US DHS 2010: 3) The data that DARTTS uses is collected from US Customs, the US Bureau of Census (where historical trade data is held), FinCEN and foreign government bodies, and consists of information gathered from those required to complete import–export forms (US DHS 2010). From this collection of data, three types of analysis are conducted by DARTTS:

- *International Trade Discrepancy Analysis* — US and foreign import/export data are compared to identify anomalies and discrepancies that warrant further investigation for potential fraud or other illegal activity.
- *Unit Price Analysis* — trade pricing data are analysed to identify over- or under-valuation of goods, which may be an indicator of TBML or other import–export crimes.
- *Financial Data Analysis* — financial reporting data (the import/ export of currency, deposits of currency in financial institutions, reports of suspicious financial activities and the identities of parties to these transactions) are analysed to identify patterns of activity that may indicate illegal ML schemes (US DHS 2010: 110).

199. When conducting this analysis, the TTU in the United States relies heavily upon information gathered from other countries.

CHAPTER IV - CASE STUDIES

200. Case studies best illustrate the complex and simple forms of TBML. The cases studies set out below, while being based upon the experience of various jurisdictions, present the facts in simplified manner, through narration and diagram, highlighting the modus operandi and red flags.

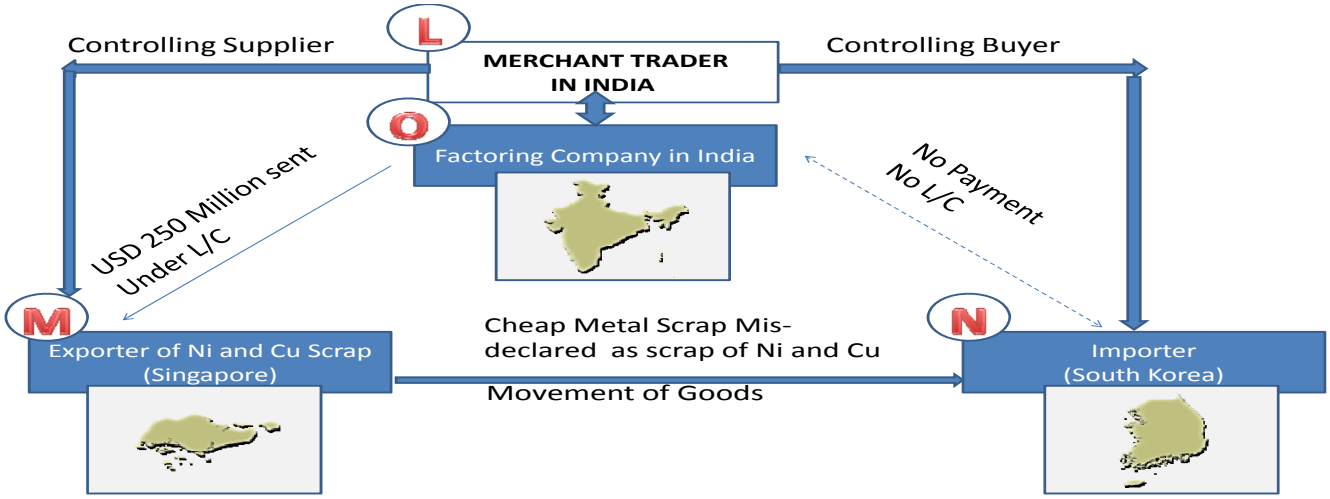
201. The FATF Paper 2006 on the TBML focused on trade based techniques used in TBML. The techniques which have been mentioned are over/under invoicing of goods, multiple invoicing of goods, over/under shipments of goods and false description of goods. Besides identifying these elements of trade that facilitate TBML, the seven case studies presented in this Chapter also bring-out the mechanisms of trade finance used in TBML.

202. The cases studies have been presented in four parts. The first part comprises the modus operandi in several simple steps. The second part demonstrates the essence of modus operandi though a diagram. The third part relates to giving comments on the case study so as to highlight the essential features. Finally, a list of red flags which can be inferred from the case study is included.

CASE STUDY 1 (Information provided by India)

- Company L located in India entered into a trade arrangement called merchanting trade with Company M located in Singapore and Company N located in South Korea.
- Trade arrangement required that Company L act as an intermediary between Company M and Company N.
- Trade finance arrangements required Company L to make payments to Company M and receive payments from Company N.
- Goods involved in the transaction i.e. “Nickel & Copper Scrap” were to be directly shipped from Company M to Company N.
- To secure payment for Company M, Company L got Letters of Credit (L/C) issued in favour of Company M (import leg).
- Company L entered into an agreement with Company O in India to get such Letters of Credit issued by Company O in favour of Company M for a charge of commission by Company O (for the import leg of the transaction).
- Company O secured receipt of payments for the export leg of the transaction (payment from company N) by obtaining bonds and guarantees furnished by Company L.
- On the advice of Company L, Company O opened L/Cs in favour of Company M as & when Company M directly shipped scrap consignments to Company N.
- Company M on shipment of the goods to Company N, got such Letters of Credit discounted with the bank.

- For the initial shipments, Company N accepted the goods and made payments to Company L. For payments made through Letters of Credit by Company O to Company M, Company L compensated Company O through payments received from Company N.
- After the successful completion of the initial rounds of transactions, Company N defaulted on payments to Company L even though the Letters of Credit opened by Company O at the behest of Company L in favour of Company M had already been discounted by Company M.
- The trade finance arrangement for the import leg of the transaction was completed between Company M & Company O by way of payment to beneficiary (Company M) but for the export leg of the transaction, due to non-acceptance of goods by Company N, no payment was received from Company N to Company O through Company L.
- On investigations it was found that Company L was in league with Company M & Company N. Company O was left with heavy losses.
- Predicate offences of cheating and criminal conspiracy were involved and merchanting trade and its finance arrangements were used to launder the criminal proceeds.



Commentary:

203. This case study reveals the misuse of trade and trade finance to generate proceeds of crime and to launder funds. Unlike conventional methods of laundering the money in which generally, the proceeds of crime is structured into the financial system, in this case proceeds of crime were generated through mis-declaration of the goods, forgery of trade documents and the introduction of a third party in a jurisdiction other than the two trading countries. The techniques deployed to indulge in TBML were mis-declaration of goods and related party transactions which were not independent corporate structures.

204. In this case study, Letters of Credit (trade finance) were arranged only for the import leg of the transaction and not for the export leg. Thus trade finance mechanisms became

vulnerable to laundering the criminal proceeds. The lack of proper due diligence by the factoring company in assessing and acknowledging the risks and the lack of duty of care by banks in undertaking the proper scrutiny of the documents facilitated the commission of crime and TBML.

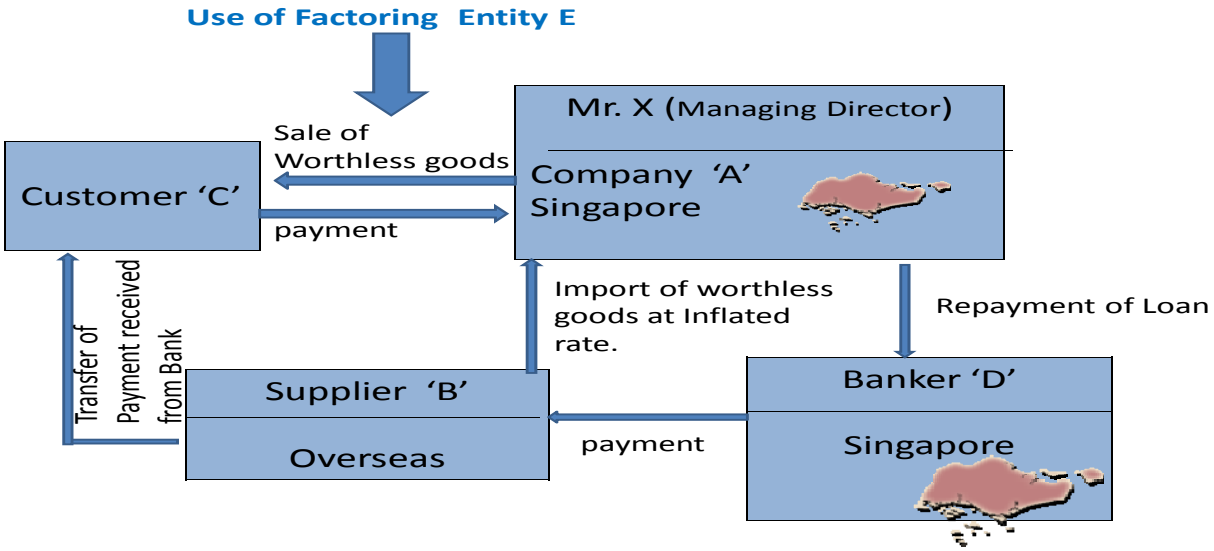
Red Flags

1. Mis-declaration of the goods - both of quality and type.
2. The third party located in a third jurisdiction acted as an intermediary, even though goods were in fact capable of being supplied from one jurisdiction to another jurisdiction directly.
3. Both supplier and buyer of the goods are related to the intermediary or the buyer and /or the seller all belong to the same group of companies.
4. Risk exposure of the factoring company was not commensurate with expected norms.
5. Intermingling of different types of trade finance arrangements for different segments of trade transactions.

CASE STUDY 2 (Information provided by Singapore)

- Mr X was the managing director of a Company A listed on a stock exchange outside Singapore. Company A indulged in trade of integrated circuit chips.
- In 2001, Company A began experiencing cash flow problems due to an industry downturn.
- Mr. X tied up with Supplier B located abroad and Customer C to collude in a fraudulent scheme.
- Overseas Supplier B supplied worthless goods to Company A and raised grossly inflated invoices.
- Company A submitted trade credit applications to Banker D for disbursing invoiced value to Supplier B.
- Supplier B then transferred the funds corresponding to the inflated value to Customer C.
- Company A then “sold” these worthless goods to Customer C again at inflated value.
- In order to realise the invoiced value of the goods “sold” to its accomplice Customer C before the expiry of the credit period, Company A discounted the invoices raised to Customer C with Factoring Entity E.
- The payment received by Company A was then used to repay the trade credit which it had obtained from its Banker D.
- The Customer C paid the factoring company when the credit term was due.
- Through this scheme, Company A and its accomplice suppliers and customers defrauded various banks and a factoring company into disbursing funds.
- Mr X was charged with cheating offences for his role in defrauding bankers and the factoring company.

- Mr. X had also exploited the international trade system to channelize the disbursements from Singapore back to Company A after a series of cross border sham purchases / sales involving the same worthless goods.



Commentary:

205. In this case study, international trade was mis-used to fraudulently obtain funds from banks and from a factoring company and launder proceeds through trade channels. By resorting to cross-border transactions, it became easy to deceive the banks and the factoring company as it is generally difficult to verify the genuineness of the other end of the international trade transactions pipeline. Further, by using accomplice suppliers and accomplice customers, the entire movement of mis-declared goods was fully controlled by the main person Mr. X and thereby it escaped detection for six years. The trade finance channels of the bank, trade credit, open accounting and factoring were all used to circulate the funds.

Red Flags

1. Mis-declaration of value (over-valuation) of goods.
2. Series of cross border transactions in the same goods between related companies.
3. Use of factoring companies to finance trade transactions between related companies.
4. Despite an industry-wide recession, the ability of a company to generate large funds from trade.
5. Direct payment through open accounting from banks to overseas suppliers on trade credit application of the domestic trader.

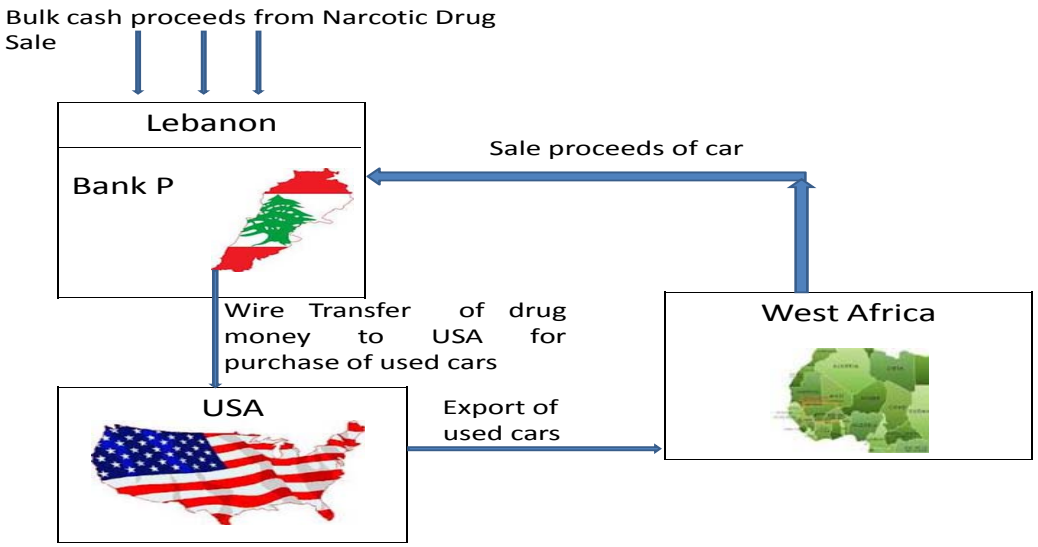
CASE STUDY 3 (Information provided by USA)

206. Authorities in US had information that Bank P in Lebanon had been extensively used by an international drug trafficking syndicate controlled by individual Q for moving the proceeds of narcotics sales through TBML across the globe.

- The syndicate smuggled narcotics from South America to Europe and to the Middle East through West Africa.
- The kingpin Q of the syndicate organised shipments of 100 Tonnes of Cocaine from South America and laundered the proceeds of up to US $ 200 Million per month, obtained from the sale of cocaine in Europe and Middle East.
- Proceeds of drug trafficking were moved and laundered through-
    1. bulk cash smuggling (cash couriers) ;
    2. use of exchange houses including one owned by Q.
    3. use of accounts of family members of "Q" in several branches of Bank P ;
- Bulk cash deposits were made by Q and his associates into exchange houses which in turn deposited the money into several accounts maintained in Bank P.
- In fact Q owned and controlled one of the exchange houses located in the same building as a branch of Bank P. Certain employees of Bank P were in league with Q.
- Two distinct TBML schemes were used by the syndicate to move and launder illicit funds through trade.

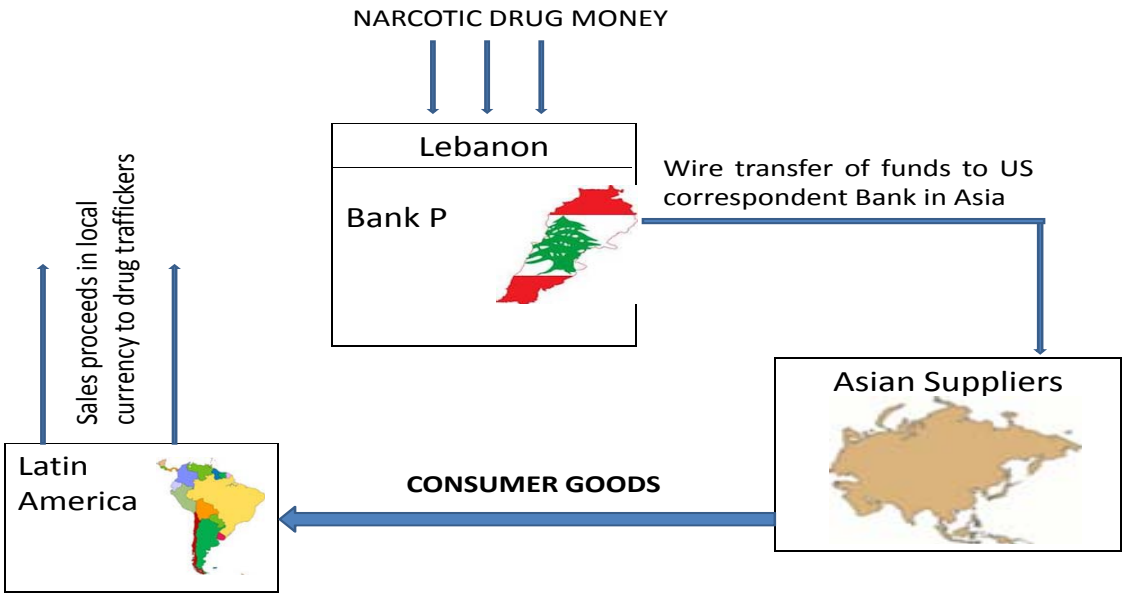
SCHEME A

- In the first scheme, wire transfers from Bank P were sent to banks in U.S. for the purchase of used cars in the U.S.
- The car dealerships were operated by individuals who had been separately identified in drug-related investigations.
- The recipients of these funds purchased vehicles in the United States, which were then shipped to countries in West Africa and elsewhere.
- The proceeds generated from sale of used cars were ultimately repatriated back to Lebanon.
- The money generated from illicit drug trade was thus fully integrated into the financial system through TBML scheme involving trade in used cars.



SCHEME B

- In the second scheme, Individual R, who owned a wide network of companies which were dealing in consumer goods in Asia and in other regions provided consumer goods for TBML.
- Although based in Asia, individual R had centralized his banking operations in Lebanon, particularly through the use of over 30 accounts at Bank P.
- Individual R received funds in his accounts from the kingpin Q and R also exchanged funds with the Latin American members of the drug syndicate.
- In the TBML scheme used by them, the proceeds generated in local currency from the sale of imported consumer goods were deposited in individuals' accounts in the local banks.
- This completed the Latin America-based Black Market Peso Exchange ML cycle, and allowed for the repatriation of proceeds for the Latin American drug producers.



Commentary:

207. The proceeds of narcotics drug money were first placed into the financial system of a jurisdiction where the AML regime was not adequately strong. The syndicate targeted jurisdictions where the AML regime may not have been as strong as Europe. The criminal syndicate was able to influence individuals on the operations of its bank as well as those of the exchange houses. The proceeds of drugs was layered and moved through the use of international trade. Round tripping of the money and its laundering occurred through abuse of trade and trade finance (open accounting system). Interestingly, both the TBML schemes were being operated concurrently and funds were moving between the two schemes, by use of the Money Exchange House established by Q.

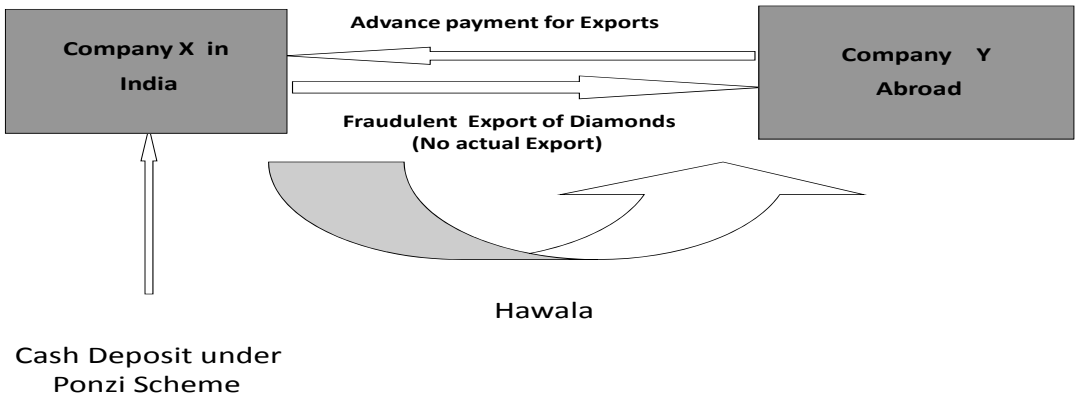
Red flags

1. Trade in commodities like used cars and consumer goods for which valuation can be manipulated.
2. Payment for imports received from banks located in a third jurisdiction, whereas goods are traded between two other countries.
3. Cash deposits made in bulk in certain bank accounts from high risk customers like exchange houses.
4. Cross border wire transfers from sensitive jurisdictions without adequate explanation of the considerations involved for such transfers.

CASE STUDY 4 (Information provided by India)

208. Company X located in India received advance remittance from Company Y located in foreign jurisdiction for a promise to export consignments of diamonds.

- Company X filed falsely declared and forged documents with the bank to show the overvalued exports of diamond without having made any shipment.
- To give a colour of authenticity, Company X also fabricated purchase invoices to show local purchases of diamonds, whereas no purchases of diamonds had actually ever taken place.
- Company X received export payments through trade finance arrangements via an open accounting system from Company Y.
- Company X had received substantial cash deposits in India from the public on the promise of high returns via a fraudulent Ponzi Scheme.
- Company X transferred large amounts of public deposits to company Y through hawala (Alternative Remittance System).
- Company X indulged in round tripping by receiving back as export earnings the financial value which it had transferred abroad as hawala.
- Predicate offences of cheating, criminal conspiracy and forgery of documents occurred.



Commentary:

209. In this case, the proceeds of crime were generated through the fraud perpetrated on general public under a Ponzi scheme which was then laundered through fraudulent and bogus exports. Such proceeds of crime were transferred abroad through alternative remittance system. Money was received back from abroad through banking channels as export

remittance. Round tripping of money and its laundering occurred through TBML. Company X had a network of associate companies established in many jurisdictions abroad. In this case, on the trade side, overvaluation of export goods and under shipment (no shipment) of goods was done. Proceeds of Crime were moved abroad by using alternative remittance system (hawala) and then round tripping occurred through open accounting system.

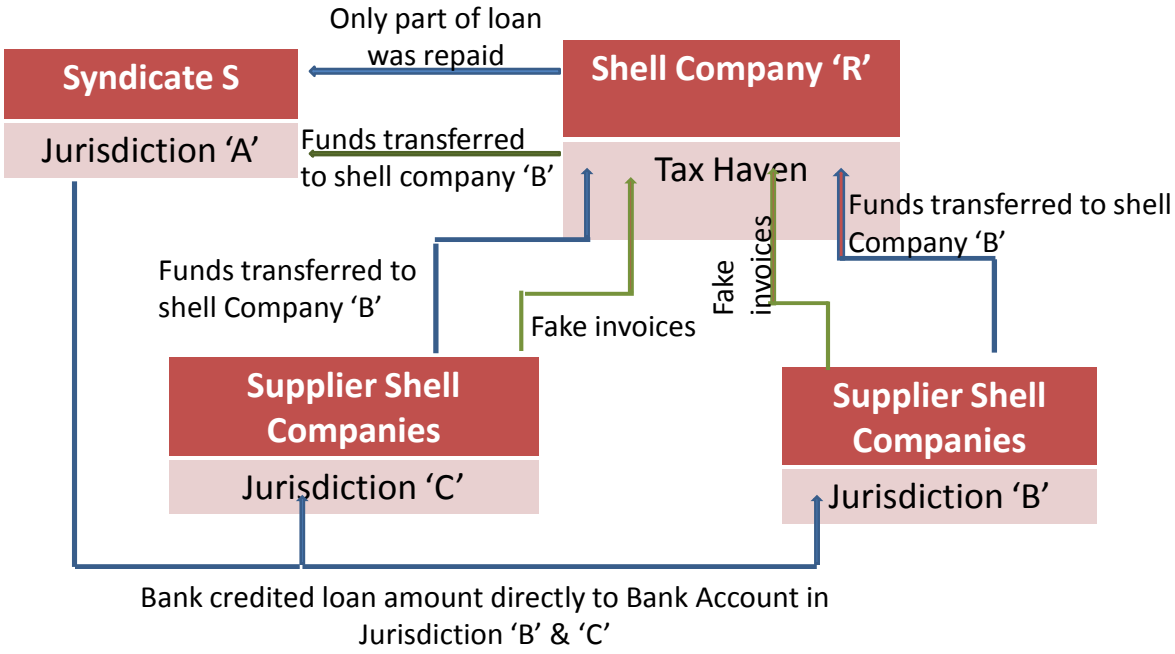
Red flags

1. Export of goods without any corresponding purchase of raw materials or finished goods.
2. Sudden increase in volume of exports by a new exporter.
3. Advance inward remittance against exports without justifiable reasons.
4. Export documents which are not duly authenticated by export regulating agency were accepted by the bank.

CASE STUDY 5 (Information provided by Macao, China)

210. Criminal Syndicate S had a regional base in Jurisdiction A.

- Syndicate S registered a Shell Company R in a tax haven jurisdiction.
- Syndicate S set up a number of "supplier" shell companies in Jurisdiction B and Jurisdiction C.
- Syndicate S opened accounts in more than 10 banks in Jurisdiction A and applied for high value loans.
- Shell Company R claimed that the company dealt with cross-border trading activities, and thus purchased goods from Supplier Companies in Jurisdiction B and in Jurisdiction C.
- Shell Company R obtained trade credit from the banks in Jurisdiction A on the strength of invoices for the purchases made from Jurisdictions B & C.
- The banks in Jurisdiction A directly credited loan amounts at the behest of Company R into the bank accounts of the "supplier" shell companies in Jurisdiction B and in Jurisdiction C.
- On receipt of funds the "supplier" shell companies immediately transferred the funds through a circuitous route to Shell Company R and to other accounts controlled by Syndicate S.
- Shell Company R used the funds for part repayment of loans.
- The fake transaction cycle engendered outstanding non-performing loans for banks in Jurisdiction A.



211. **Commentary**: In this case study, it is observed that cross border trade was mis-used by a criminal syndicate to move value between shell companies located in different jurisdictions. There was use of a Tax Haven jurisdiction to take advantage of relaxed AML regime and to avoid detection. The veneer of international trade was created to conceal collusion among related companies located in different jurisdictions. The trade finance mechanism of raising bank loans (trade credit) against fake invoices could occur due to limitations to verify the credibility of overseas suppliers. Wire transfers made to such related suppliers resulted in losses to banks. Thus a Criminal Syndicate could indulge in TBML in the absence of cross-verification of trade data and financial data.

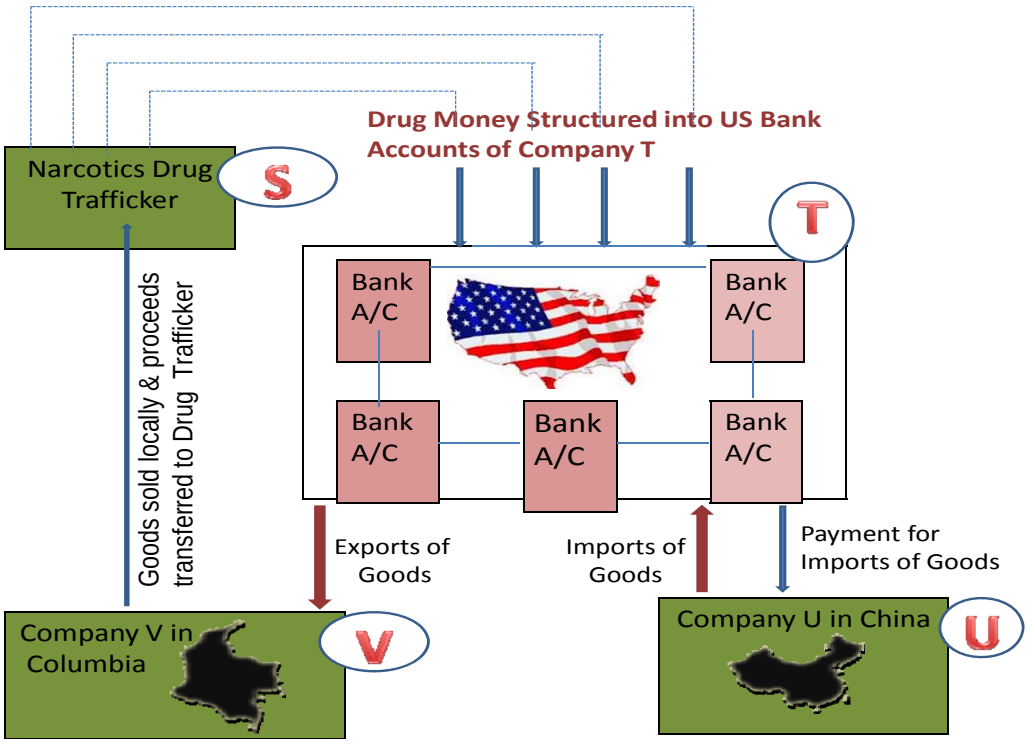
Red Flags

1. Use of corporate structure of shell companies located across the jurisdictions.
2. Registration of a trading company in a tax haven even though its business relates to another jurisdiction.
3. Mismatch between trade documents like bill of lading, import bill, invoices and trade finance documents (trade credit applications).
4. Direct payments by banks to overseas suppliers who are related parties without adequate verification of the authenticity of such suppliers and without verifying trade transactions.

CASE STUDY 6 (Information provided by USA)

212. Toy Company T of Los Angeles, USA was receiving cash generated from trafficking of narcotics by Columbian drug cartel S.

- Company T received such cash by two methods - in some cases, people affiliated with drug traffickers simply dropped cash at the company offices in downtown Los Angeles; the second method involved cash deposits made directly into Company's bank account, sometimes by individuals located as far away as New York.
- During the four-year period, the investigation tracked more than $ 8 million in cash deposits into the accounts of the Company T, and not a single transaction was for more than $ 10,000.
- The bank accounts of Company T, were used to pay for import of toys into USA.
- The toys, viz. stuffed animals, including teddy bears and Topo Gigio dolls, were imported from Company U in China.
- The toys imported into US from China were again exported from the U.S. to Company V in Colombia.
- The Colombian pesos generated by the sales of toys by Company V were then used to reimburse the Colombian drug trafficker.
- TTU Colombia was deployed to investigate shipments of toys.
- The TBML investigation brought out structuring transactions to avoid reporting requirements, bulk cash smuggling and intimidation of witnesses. In addition, the toy Company T was charged with conspiracy to launder money.
- Five persons, including two owners of the Company T and a Columbia-based businessman were convicted and fined.



Commentary:

213. Cash obtained from the trafficking of narcotics was first structured into financial system through smurfing. Money was then used to import toys, thereby converting the proceeds of narcotics trafficking into goods. The imported toys were then re-exported to move that value to the desired jurisdiction, in lieu of the value of narcotic drugs. Thus international trade was used for layering and integrating the crime money and to disguise its illicit origin.

Red Flags

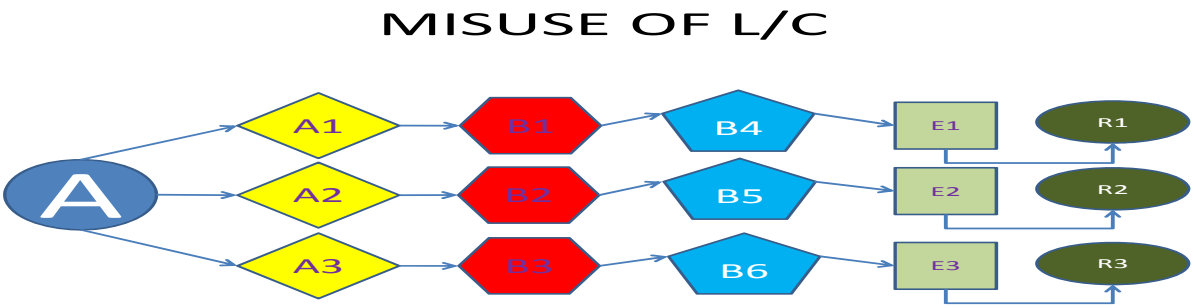
1. Payment for import is made through multiple accounts.
2. Credits into such accounts were made mostly through structured cash deposits, i.e. through smurfing.
3. Re-export of goods to sensitive jurisdictions.
4. Inadequate consideration received for re-exported goods.

CASE STUDY 7 (Information provided by India)

214. This is a complex case which involves multiple techniques of ML by misuse of trade as well as trade finance mechanisms. The kingpin of this ML racket, called "A" in this case study, was laundering funds for Narcotic Drug cartels in Asia and South America using various techniques including cash couriers, money service bureaus, alternate remittance system (hawala) as well as through formal mechanisms of trade finance.

A. MISUSE OF LETTERS OF CREDIT (DOCUMENTARY CREDIT)

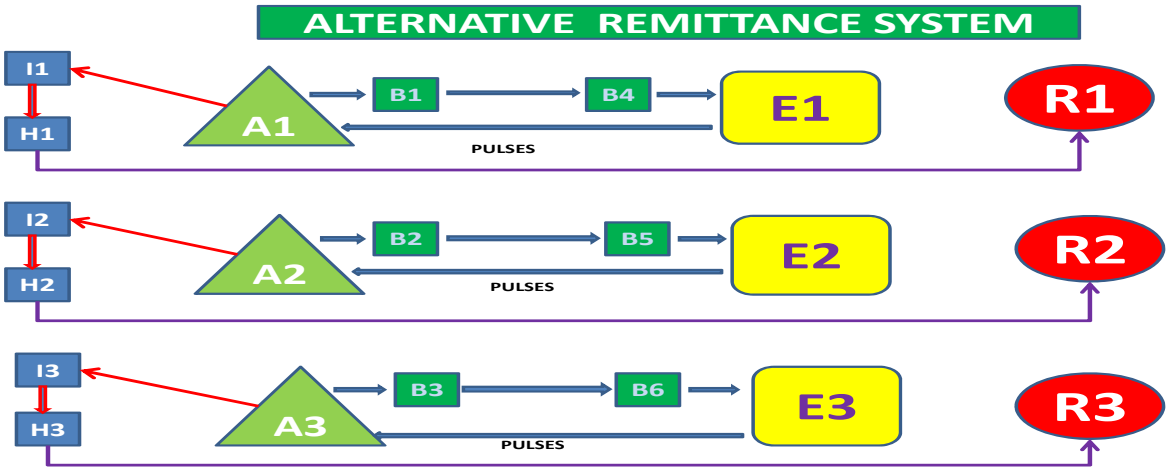
- An Indian national "A" was based in Dubai and had established a number of companies there, say A1, A2, A3.
- He also had a network which spread across many countries in Europe, Asia, Africa and USA.
- In Dubai, he got Letters of Credit (L/Cs) opened by various companies A1, A2 & A3, which were controlled by him, for Importers I1, I2 & I3 in Dubai.
- Exporters E1, E2 & E3 in India, as well as in other parts of the world, were the beneficiary parties for these L/Cs.
- For opening of L/Cs, "A" used his networking with Issuing Banks (B1, B2 & B3), who tied up with the Advising Banks (B4, B5 & B6). Advising Banks were responsible for transmission of funds into accounts of Exporters E1, E2 & E3.
- L/Cs were opened for amounts substantially higher than the real value of the actual consignments being traded.
- "A" arranged for trade documents to be prepared so as to make such documents acceptable to the Issuing Banks B1, B2 & B3 and Beneficiary/Advising Banks B4, B5 & B6.
- "A" in turn remitted the inflated value of exports to Exporters E1, E2 & E3 in India, as per the terms of L/Cs, after adding the drug money lying with him. Funds remitted to India were as per the terms of the L/C.
- After receiving the higher remittances, the Exporters E1, E2 & E3 retained the actual price of the goods exported and transferred the additional amount to the family members (R1, R2 & R3) of "A" in India and to his associates in other parts of the world.
- In a slight variation of this technique of misuse of L/Cs, "A" facilitated opening of L/Cs for importers (I1, I2 & I3), for commission. The L/Cs were opened at inflated values. He collected fair value of imports from the importers but remitted the inflated L/C amount of higher value to the Exporters E1, E2 & E3. The additional funds thus transferred were collected from Exporters, by associates of "A"
- Thus, by misuse of Letters of Credit, funds were moved across countries, in the guise of trade finance, after intermingling of drug money of criminal origin.



B. USE OF ALTERNATIVE REMITTANCE SYSTEM

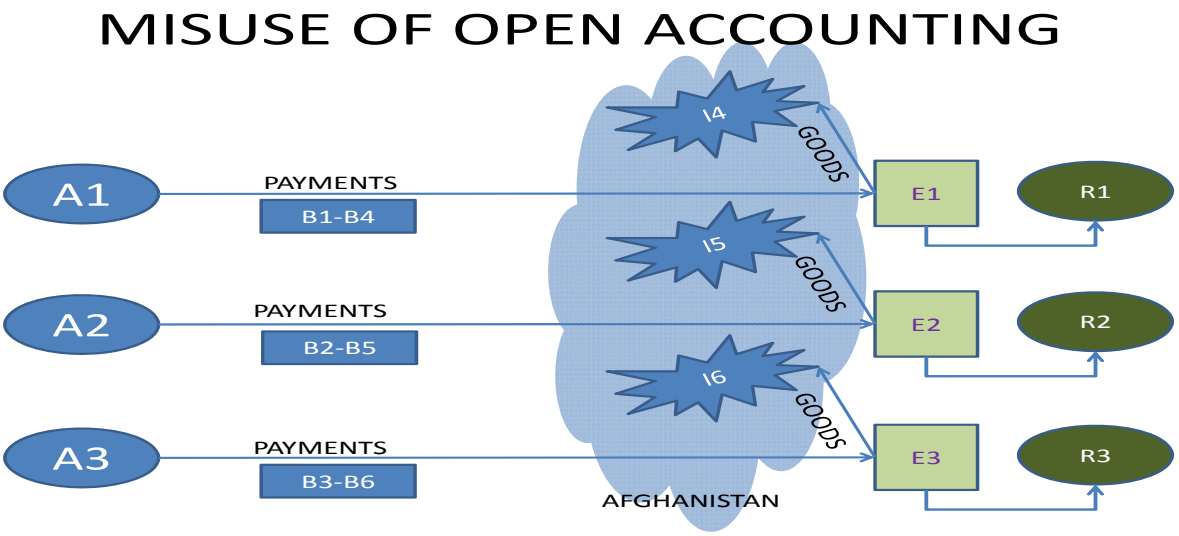
- "A" also utilised the services of alternative remitters (hawala operators) to move funds offshore.
- The legal framework in Dubai allows hawala to operate after registration with the UAE Central Bank.
- One way of use of Alternate Remitters by "A" was by funding those individuals who were visiting Dubai and were in need of funds in local currency, which he provided.
- The flush of money arising from the narcotics trade was enough to cater to large demands of individuals as well as of companies.
- On return to their home jurisdiction, these individuals made compensatory payments to the assigned agents of "A" located in their home jurisdiction, in currency of their home jurisdiction, thereby completing the clandestine movement of funds from Dubai to the home jurisdiction of these individuals.
- In another technique of use of Alternate Remitters, "A" facilitated trade in prohibited / restricted goods by falsifying trade documents by using his network of associates in India. Fake documents were prepared to fraudulently export pulses from India, when such exports were banned.
- To circumvent the restriction, the goods were mis-described in trade documents, which also enabled mis-declaration of value and thereby also enabled movement of excess funds to the exporting jurisdiction.
- He used alternative remitters (Hawala operators) H1, H2 & H3 to settle differential payments arising out of such trade in prohibited / restricted goods.
- Through the companies A1, A2 & A3 controlled by him, "A" first imported pulses into Dubai and made payments of contractual price to Exporters E1, E2 & E3, through banking channels / through L/C.
- Through his companies A1, A2 & A3, he resold the imported pulses at higher prices to the real importers I1, I2 & I3, who were in fact the genuine buyers of pulses in Dubai and elsewhere.

- Since A had pre-dated the contracts to allow for export of pulses from India after ban, he earned huge profits on resale in foreign market facing shortage of pulses.
- Profits earned on resale of pulses were also remitted to his agents R1, R2 & R3 through Alternate Remitters (Hawala operators) H1, H2 & H3.



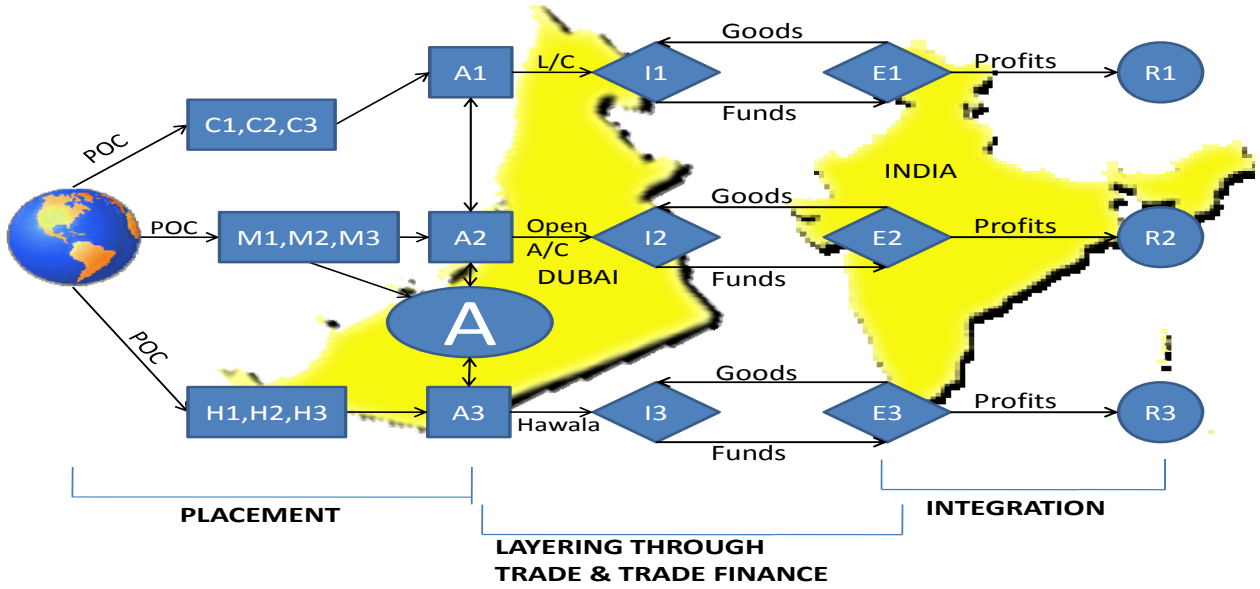
C. USE OF OPEN ACCOUNT

- "A" organised exports of artificial jewellery from India to various importers (I4, I5 & I6) in Afghanistan.
- Companies A1, A2 & A3 established in Dubai by "A" were declared as 'Notifying Parties' in trade documents for exports from India to Afghanistan.
- Payment was sent by A1, A2 & A3 through banks B1, B2 & B3 in Dubai to the accounts of Indian exporters E1, E2 & E3 in banks B4, B5 & B6 in India.
- The Indian exporters having received payments through open accounting paid the commission in cash for such exports to the agents of "A" in India, viz. R1, R2 & R3.
- Thus, in exchange for drugs originating from Afghanistan, "A" arranged for delivery of goods in that jurisdiction, by indulging in countertrade through trade manipulation.
- "A" used his companies A1, A2 & A3, by declaring them as 'Notifying Parties' in the trade documents to facilitate misuse of the trade finance mechanism of open account trading.



215. As stated at the outset, "A" was operating a very complex scheme of TBML, which can be summed up as follows:

- "A" indulged in laundering of proceeds from Narcotics trafficking and was based in Dubai. He opened a number of associate companies (A1, A2 & A3) to place money into the financial system by using the services of Cash Couriers (C1, C2,& C3) or Money Service Bureaus (M1, M2 & M3) or Alternative Remitters or Hawala Agents (H1, H2 & H3).
- To remit part of the proceeds of crime to his home in India, he tied up with Indian exporters (E1, E2 & E3).
- The Indian exporters (E1, E2 & E3) overvalued the exports to earn export incentives. The individual "A" used letters of credit, open accounting as well as alternative remittance system for movement of money between importers (I1, I2 & I3) and the Indian exporters E1, E2 & E3.
- The actual importers / users situated in the same jurisdiction as "A", collected the goods exported from India and paid to "A", the actual cost (true value) of the goods so imported.
- "A" in turn remitted the inflated proceeds of exports either against the L/Cs opened in the names of Importers (I1, I2 & I3) OR through open account OR through alternative remittance system to Indian Exporters (E1, E2 & E3).
- After receiving the higher remittances, the Exporters (E1, E2 & E3) retained the actual costs and conveyed the additional amounts to the associates (R1, R2 & R3) of "A" in India or elsewhere.
- The Exporters (E1, E2 & E3) gained from excess export incentives on overvalued exports and from being able to export banned goods and to inaccessible destination. The importers gained by acquiring goods which were not available through normal trade channel.
- "A" succeeded to launder criminal proceeds through trade finance.



Commentary:

216. In this complex case study, the funds originated from narcotic drug sales and fraudulent export incentives. The proceeds of crime were laundered by mis-declaration of description of goods and forgery of documents.

217. In the first illustration, the misuse of Letter of Credit mechanism of trade finance to disguise the movement of criminal funds in conjunction with overvaluation of goods, where both exporter as well as importers were in league, has been depicted.

218. In the second illustration, use of alternative remittance system (Hawala) has been explained, wherein funds were moved in connection with trade in prohibited / restricted goods. Using the international trade system, the criminal organisation was able to transfer illegal funds by using trade transactions to justify payment through the financial system.

219. In the third illustration, criminals have mis-used the open account trade finance system to launder the crime money. Movements of funds were disguised by using the third party remittance system. Mis-declaration of goods, over-valuation of goods and barter of goods were deployed, coupled with misuse of trade finance mechanisms of L/Cs and open account trading. Extensive use of Alternate Remitters was also resorted to move funds illegally across countries, at will.

Red Flags

1. Trade in banned/prohibited/restricted goods.
2. Overvaluation of export goods.

3. Exports to sensitive destinations of a new commodity by a regular exporter of some other commodity.
4. Introduction of notifying parties in trade documents without adequate explanation.
5. Export Remittances received from third parties.
6. Settlement of accounts for trade between two countries through a third jurisdiction.
7. Movement of abnormally large sums of money in various accounts of the individuals and companies which are not related to the nature of their business.

ALTERNATIVE REMITTANCE SYSTEMs:

220. Some of the case studies have referred to Alternate Remittance System. Therefore a brief write-up on Alternative Remittance System by Bangladesh in the box placed below explain the basic features of such a system whereby accounts are settled across the nations through compensatory payments made in local currency of trading partners for differentials arising between true value of goods involved in trade and formal means of trade finance.

ALTERNATIVE REMITTANCE SYSTEM

Alternative Remittance System i.e. "Hundi" or "Hawala" is a way to transfer funds through informal channels. Hundi means "trust" and hawala means "transfer related to money". These are also often referred to as "underground banking system" or "parallel banking system" or "informal money transfer system". Alternative remittance systems are financial services, traditionally operating outside the conventional financial sector, where value or funds are moved from one geographic location to another. (FATF Best Practice Paper 2006: Combating the abuse of Alternative Remittance System http://www.fatf-afi.org/media/fatf/documents/recommendations.)

Under-invoicing / over invoicing of goods and services are used in TBML to move funds across the borders not only to disguise its illicit origin but also to evade taxes and duties as well as get undue export incentives. To settle such over or under payments in international trade transactions, Hundi or Hawala mechanisms are used.

Hawala Operators (Hawaldars) or Hundi Dealers operate their business under a global network which helps them to do their business worldwide. Generally Hawala Operators or Hundi Dealers have other formal businesses, like exchange houses, travel agencies, import/export or shipping companies, grocery stores, gold and jewellery shops, textile or apparel shops and many other business establishments. Often these operators arrange fund transfers for a large number of migrant workers and immigrants, who send back their savings to the home jurisdiction. The popularity of their business lies in 3 C's viz. certainty, convenience and cheap. The transactions ensure that remittance reaches the beneficiary at an assigned address in definite time period, for a charge which is less than the transfer charges of formal system. Moreover the accounts among the Alternative Remittance System operators are settled by making compensatory payments in local currency to persons in the home jurisdiction who have been assigned by the partner hawala operator located abroad.

Since such hawala transactions remain largely unreported, there is no reliable data available on the magnitude of hawala / hundi / other alternative remittance systems. The significance of this trade finance mechanism as means to fill up the gap arising out of difference in actual trade value being exchanged and the amount transferred through formal mechanisms call-for larger awareness and focused training on the subject of Alternative Remittance System.

CONCLUSIONS

221. The first case study relating to 'merchanting trade' reveals how a third party located in a third jurisdiction ostensibly to facilitate trade between two other countries introduces TBML vulnerability in such trade transactions. The financing of different segments of trade through diverse mechanisms of trade finance can introduce risks in the trade transactions which are difficult to assess by financial institutions.

222. The second case study brings-out how the 'carousel trade' with the circulation of the same goods across the countries, call for close scrutiny of such transactions, for TBML. The mechanisms of financing trade through factoring and through disbursement of trade credit to overseas suppliers are fraught with risks for financial institutions unless due diligence is exercised about the overseas trading partner.

223. The third case study reveals how proceeds of crime can move to a jurisdiction where the AML regime may have weaknesses. It also shows the vulnerability arising from trade finance mechanisms in a system wherein the integrity of financial institutions has been undermined by weak application of fit and proper controls. The operations of 'exchange houses' owned and controlled by criminals coupled with 'compromised' working of a bank make trade finance mechanisms means for indulging in TBML.

224. The fourth case study demonstrates how proceeds of crime generated out of a 'ponzi scheme' were moved abroad though a variant of alternative remittance system viz. hawala. The TBML allowed for integration of proceeds as legal remittance.

225. The fifth case study reveals how the creation of veneer of international trade can help conceal the identity of true beneficiary from the financial institutions. The use of a corporate structure of shell companies located in sensitive jurisdictions of a tax haven can hoodwink the institutions of trade finance.

226. The sixth case study demonstrates yet another variant of alternative remittance system viz. Black Market Peso Exchange. The use of international trade acts as a lubricant to facilitate the cycle of laundering of narcotic drugs funds.

227. The seventh case study shows multiple forms of international trade and various mechanisms of trade finance which give inherent flexibility to criminals to adopt those forms and types which suit the demands of a situation. Such adaptability of these forms makes the detection and prevention of TBML a very challenging task.

228. The FATF Paper 2006 highlighted four basic techniques of TBML. These basic techniques relate to abuse of trade transactions and combine with techniques which abuse trade finance mechanisms for TBML to occur. Four of the trade finance techniques which can be inferred from the analysis in this Paper are following:

    a) **Cash Inflow Based Payment:** Cash is structured into formal financial system through smurfing and other processes so as to make payments for international trade transactions. Trade finance payments are funded out of cash receipts of the financial institutions.

Normally cash will be received in one jurisdiction and payment through trade finance mechanisms will be made in the jurisdiction of trading partner. Thus the veneer of international trade is used to obliterate the signs of illicit origin of the payments.

b) **Third Party Payment:** A third party is introduced preferably in a third jurisdiction, in the payment channel between two trading partners. Such third party may be a notifying party between consignor and consignee. It can also be a facilitator who acts as an intermediary for trade transaction as well as for trade finance mechanism. In still other situations such third party may either be a factoring or forfaiting entity. The technique involves making the process of due diligence to be conducted by domestic financial institutions more difficult to succeed.

c) **Segmental Modes of Payment:** Instead of opting to finance single trade transaction as a whole, the trade transaction is split into parts so that each part is financed through different modes of trade finance. The segmental modes of trade finance are used to fund the trade transaction. This technique is normally used wherein a third party is brought in between the exporter and the importer. For imports of goods, letters of credit mechanisms may be used and on the re-export of such goods to other jurisdictions wire transfers may be opted. The technique introduces different levels of risks for different segments of trade so that financial institutions are unable to make correct risk assessment of the trade finance payments.

d) **Alternative Remittance Payment:** Trade transactions which are vulnerable to TBML involve transfer of goods of which the true value does not correspond to the amount of payment transferred through formal mechanisms of trade finance. To finance such gap the alternative remittance mechanisms are utilized. The technique involves 'squaring-off' the 'differential gaps' by making compensatory payments in local currency to domestic persons assigned by the trading partner located abroad.

229. The techniques of trade finance abuse succeed only when they work in conjunction with the techniques of abuse of trade transaction. The segregation of sectors of finance and of trade prevents investigators from having an integrated approach. Isolated sectoral outlooks fail to raise 'alerts' about the TBML.

CHAPTER V - CONCLUSIONS

CHALLENGES

Growing Concerns

230. This study on TBML, done six years after the landmark FATF Study of 2006, has reaffirmed the conclusion of the earlier study that TBML is an important channel for criminal organizations and terrorist financiers to move money or value to disguise its illicit origin and to integrate it into the formal economy. The rapid growth in the global economy has made international trade an increasingly attractive avenue to move funds through goods and services. There are instances brought out in this Paper where the veil of international trade was deliberately created so as to launder the proceeds of crime. A number of publications on TBML during the intervening period of six years, as reviewed in Chapter-I, reflect the growing concern about its potential as a form of ML.

231. While various jurisdictions may have different levels of preparedness for identifying and investigating TBML, the general recognition of its existence and of its future potential underscore its significance. In fact, international trade remains a viable option for movement of value even in those jurisdictions that do not have a well-developed financial or banking sector. Thus, TBML is a concern for the international community even though it may presently impinge upon various jurisdictions without the same impact.

Complex Phenomenon

232. TBML is a complex phenomenon since its constituent elements cut across not only sectoral boundaries but also national borders. The dynamic environment of international trade imparts inherent flexibility for TBML to take multiple forms. To discern TBML from among the legitimate activities of international trade has become a daunting task. The features of the dynamic environment that also distinguish TBML from other forms of ML were identified in Chapter I. Such features include occurrence of TBML through intermingling of the trade sector with the trade finance sector in cross-border transactions. The foreign exchange market and the long supply chain make international trade more vulnerable to TBML.

233. To assist in recognizing the multiple forms of TBML, Chapter II of this Paper has enumerated specific characteristics of TBML. These attributes of TBML have been categorized into those relating to trade finance and to trade. For further simplification trade characteristics have been classified into four groups, namely: jurisdictions; goods; corporate structures; and, predicate offences. This methodology has allowed the Project Team to identify some ‘Red Flags’ which relate to specific characteristic of TBML.

Statistics and Data

234. Very few cases of trade base ML were reported. Thus statistics on detection of TBML and on TBML related STRs were also very limited. One of the major obstacles in devising future strategy to tackle TBML has been the lack of reliable statistics relating to it. Most jurisdictions do not distinguish TBML from other forms of ML. Hence they have reported that they do not maintain separate statistics for TBML. Moreover, the data on trade which

is largely collected by the Customs Department in most of the jurisdictions are oriented to serve purposes other than those of TBML. While the trade data is collected, maintained and analysed by the Customs they neither have a legal mandate to undertake TBML investigations nor do they have training and competence to utilize such data to combat TBML. Merely 25% of the jurisdictions have reported that TBML investigations were initiated on the basis of trade data.

235. As already pointed out in this Paper any strategy that focuses only on the trade sector leaving-out the corresponding elements of the trade finance sector would be inadequate to tackle TBML. Having a warehouse of trade finance data within financial institutions without correlating such data to that of the trade sector will not allow effective targeting of TBML. The Project Team holds that an isolated sectoral approach has not worked. An integrated holistic strategy to fight TBML is needed.

Sharing of Information

236. It is evident from the feedback from most of the jurisdictions that sharing of the information obtained domestically and internationally, has impediments. These impediments relate to inadequate and delayed response, restrictions on the use of the information furnished and insistence on confidentiality or secrecy clause which hamstring its evidential value. More than 50% of the jurisdictions reported having initiated TBML investigations on referrals from other agencies. Again, more than 50% of the jurisdictions reported seeking information from foreign jurisdictions. Laying platforms for effective and prompt sharing of information domestically and internationally can go a long way to combat TBML.

Trade Finance Vulnerabilities

237. Investigators in many jurisdictions face major challenges comprehending trade finance products and the implications of the use of trade finance in TBML. Chapter-III of this Paper attempts to be a ready reckoner for investigators to assist them to better understand trade finance products. This should assist investigators to begin to incorporate trade finance analysis in their investigations.

238. The trade finance products set out in Chapter III reveal a menu of choices that are available to genuine traders to facilitate trade. While the various trade finance products reduce trade transaction costs, their accessibility have also made them vulnerable to abuse.

239. Information relating to the trade finance products remain concentrated within the financial sector. Often the financial institutions are not aware of the significance of the information held by them to TBML investigators. A TBML investigator would need to obtain crucial data from financial institutions and correlate that with the information available in the trade sector so as to sieve ‘TBML-laced’ transactions from the predominantly genuine trade flows, the ‘noise’.

240. Chapter II of this Paper finds that jurisdictions were unanimous in highlighting a need for training to be provided to regulators regarding TBML vulnerabilities and risks associated with trade finance activities.

TBML Techniques of Trade Finance

241. The selection of Case Studies in Chapter IV has the intention of expounding the 'modus operandi' involved in TBML not only to throw light on the abuses in the trade sector but also to bring home the contributory anomalies of the trade finance sector. Several of these Case Studies reflect the confidence of the criminal syndicates in the impregnability of the veneer of the international trade they have created to move illicit funds and indulge-in TBML. The syndicates have not merely taken advantage of existing trade structures but have gone on to create new and additional structures for TBML.

242. A number of 'Red Flags' have been enumerated from each of the 7 Case Studies. The 'Red Flags' relate to trade as well as to trade finance. These red flags also corroborate the patterns identified for TBML in Chapter-II.

243. On the basis of the analysis of patterns, modus operandi and red flags, four techniques of TBML relating to trade finance have been formulated. The four techniques are: cash inflow payments; third party payments: segmental modes of payment; and, alternative remittance payments. These four techniques are those which have been more commonly used by criminal syndicates to support the practice of abusing the trade sector.

THE WAY FORWARD

244. Any strategy to prevent and combat TBML needs to be based on dismantling TBML structures, while allowing genuine trade to occur unfettered. A holistic approach, with emphasis on inter-agency coordination and international cooperation, needs to be universally adopted by the policy-makers. A comprehensive strategy which takes into account sectoral peculiarities, agency specialization and jurisdictional frameworks can only address the challenges in tackling TBML. Some of the steps that can form part of the way forward are discussed ad seriatim.

Standardization of Data and Statistics

245. Presently, statistics relating to TBML are not distinguished from those of other forms of ML. Data needed to combat TBML remain dispersed over various domestic sectors. Practices to compile and collate the statistics and data relevant to TBML vary among jurisdictions. There is a need to have common formatting of how TBML statistics are to be recorded and maintained so that trends are more easily identifiable.

246. If centralization of data and statistics is not presently possible then access of competent authorities to such statistics and data should be ensured. Cross-referencing data relating to trade and trade finance can be the starting point for adopting a risk based approach. Such an approach will not only lead to prioritization of limited resources but will also facilitate genuine trade without compromising the necessary governance over TBML. A risk based approach will help capture crucial trade data along with providing an ability to keep track of its corresponding payments data. To ensure efficient real time delivery of analysis the adopting of an electronic platform may be essential.

247. Monitoring foreign exchange may be an option for some jurisdiction in identifying anomalies to detect TBML. one of the finding of the project team is there exists an acute need to correlate trade data with the foreign exchange data of a jurisdiction so as to detect TBML and in particular identify cases wherein value is moved across countries in the form of goods without corresponding outgo of foreign exchange as its payment.

248. As an example, the development of a foreign exchange monitoring system by South Korea endeavours to cross-reference trade related data based on an electronic platform. By working out trends and past performances the system conducts some risk analysis to select risk-prone foreign exchange transactions for more specific scrutiny. There is a capacity to systematically target TBML.

249. Capturing data on trade and trade finance in standard format across the jurisdictions will ease cross-referencing for discovering trade anomalies leading to detection of TBML. Correlating such findings with systematic compilation of foreign exchange data can foster efficient strategies to prevent and combat TBML.

Domestic Task Forces

250. Multiple agencies are associated either directly or indirectly in fighting TBML. One way-forward to combine the respective competencies of relevant authorities for combating TBML is to form domestic task-forces. Task-forces focused on TBML investigations will need to have the ability to utilize the expertise of each agency without comprising its functional skills. It is suggested that to be successful the task-force must set its modes of communication and interaction. The operating platform should be electronic which allows for virtual exchange and management of large quantities of information. If a manual operating platform is adopted then task-force members must ensure regular interaction. The coordination achieved through a TBML task-force should go some way in providing effective support in intelligence, investigation and prosecution work relating to TBML.

251. Customs agencies hold trade data in most of the jurisdictions surveyed. Traditionally such data is used to detect and investigate Customs offences relating to smuggling and duty evasion. The regulators in the trade finance sector issue alerts on the basis of the data available within the sector for the use of financial institutions.

252. Law enforcement agencies responsible for investigating ML use the same tools to investigate TBML without any specialized training to undertake such investigations. These agencies work in isolation without the necessary inputs from Customs and Regulators. FIUs in most jurisdictions analyse and disseminate suspicious transaction reports on the information furnished by the financial sector without corresponding inflow from trade sector and foreign exchange control agencies (in those jurisdictions with such controls). Tax authorities exclusively focus on investigation relating to tax evasion. Transfer pricing audits conducted by such authorities do not identify implications for TBML.

253. The competent authorities tasked with tackling TBML are more often than not focused on work mandated by the legislation as it relates to them. They may have even achieved professional specialization and competence in such mandated work. However, the strategy

to prevent and combat TBML requires expertise created through the combination of all such authorities. It is recognized however that any necessary amendment in the given legal framework may not be easy and in some cases may impact on the respective professional efficiency that exists.

International Cooperation

254. International cooperation to combat TBML is difficult to achieve. The formal and informal means of international cooperation used include treaties and agreements. The Mutual Legal Assistance Treaty (MLAT) and the Customs Mutual Assistance Agreement (CMAA) are bilateral arrangements for exchange of information and are often deployed for combating TBML. However, exchanges made through formal channels often result in delayed responses, inadequate information and limited or no further feedback.

255. Informal channels include interaction with the representatives of foreign jurisdictions assigned for the purpose in the domestic jurisdiction. Informal channels which exist as part of bilateral diplomatic arrangements can also be used to tackle TBML.

256. The Project Team believes that there is an urgent need to strengthen the existing bilateral arrangements and to build multilateral mechanisms for international cooperation. The bilateral arrangements must ensure prompt exchange of information with regular follow-ups which should result in more efficient delivery. The multilateral mechanisms may entail equal commitment of all trading jurisdictions for coordination in matters relating to TBML. Technological innovations for effective communication across jurisdictions can provide permanency to multilateral arrangements. In this regard an initiative by the World Customs Organisation (WCO) to develop the concept of Globally Networked Customs (GNC) for exchange of information may turn-out to have significant strategic value.

TBML Focused Training

257. TBML focused training is an absolute necessity for the anti-TBML strategy to succeed. Customs, ML investigating LEA, FIU, Tax Authorities and Regulators have all identified a pressing need for more focused training so that their personnel can have an adequate knowledge base to detect, prevent and combat TBML. Many of the jurisdictions have reported limitations with regard to resources which they can spare to provide training capable of mitigating TBML activities. This study reiterates the findings of the FATF Best Practices Paper 2008 to incorporate a TBML focus in the existing AML training programmes.

258. The sharper focus on TBML in existing training programs can be brought about by incorporating specific topics which relate to TBML. The case studies, the red flags and typology papers on TBML may be disseminated during such programs. As trade essentially involves multiple jurisdictions, there is a need for Law Enforcement Officers to understand the legal and procedural aspects of other jurisdictions. Training should be aimed at making use of trade data analysis as well as cross referencing trade data with trade finance data and understanding any useful tools developed to identify trade anomalies which may lead to investigation and prosecution of TBML cases. Inter-linkages of tax frauds and customs violations with TBML also need to be explained.

259. The significance of domestic coordination and of international cooperation to tackle TBML must be conveyed during training programs. Further, as a large number of private players are involved in international trade they need to be apprised of concealed TBML threats in any outreach programs that are conducted. Thus, capacity building among all competent authorities and private industry is an important component of any successful strategy to prevent and combat TBML.

Further Research

260. The ongoing fight against TBML through the comprehensive strategy discussed in this Chapter should spur further research so as to meet emergent challenges. The possible areas of such research may be briefly delineated as follows:

a) Services: Treatment with regard to TBML vulnerabilities in trade of services shall require specialized tools. Services more than goods, give wide scope for manipulation in pricing, quantification and delivery time-schedule. It may therefore be imperative to undertake further research to develop case-studies and identify red-flags.

b) Terrorist Financing: Moving of funds through trade to fund illicit activity of terrorism in an important issue confronting the global security. Further research to look into aspects of such illicit fund movement through trade is called for.

c) Financing the proliferation of WMD: Building on work undertaken by the FATF, there is a need to further consider vulnerabilities of trade finance to the financing of the proliferation of WMD.

d) Risk Based Approaches: Adoption of risk based approaches in the strategy to combat TBML is essential not only to maximise resources but to target TBML without inhibiting genuine trade flows. Research should be undertaken to work-out models which could be practically adopted by various jurisdictions.

e) Tax evasion: The work done by international bodies such as OECD, Global Financial Integrity, have brought into focus trade-mispricing and transfer pricing as well as their correlation with poverty. With continued enhanced focus on tax evasion, or use of tax havens and on evasion of customs duty, it is essential to do research to explore their inter-linkages with TBML.

261. A comprehensive strategy to meet the growing concern about TBML has been recommended in this Chapter. Challenges in formulating such a strategy have been identified. Ways forward for addressing some of these challenges have been suggested. International trade needs to be kept free of TBML so that the full benefit from effective and efficient global trade can be realised by the community of nations.

ANNEX A - TBML RED FLAGS FROM CURRENT & EXISTING STUDIES

262. The Red Flags which have been mentioned in the existing studies have been categorized as per the scheme adopted in Chapter II of this Paper. Annex A sets out red flags gleaned from existing studies, as well as those identified in the current study. In many cases there is a correlation between previous studies and the present study.

263. The Red Flags set out in this section of Annex A are derived from studies by the FATF, US (FINCEN & ICE), Australia (AIC) the Wolfsberg Group and studies by BRANNIGAN (2010) and Brown (2009).

Red Flags relating to Trade Finance:

- The transaction involves receipt of cash (or other payments like wire transfers, checks, bank drafts or postal money orders) from unrelated third party entities or an intermediary (either an individual or an entity) apparently unrelated to the seller or purchaser of goods. This may be done to obscure the true origin of the funds (e.g. Wires where no apparent business relationship appears to exist between the originator and the beneficiary) ;

- The transaction involves the use of repeatedly amended or frequently extended letters of credit without reasonable justification or for reasons like changes of the beneficiary or location of payment ;

- A customer's inability to produce appropriate documentation (e.g. invoice or any other document) to support a requested financial transaction or bank finds double invoicing or a Customer fails to provide adequate information about the originator, beneficiary, and purpose of the wire transfer;

- The method of payment appears inconsistent with the risk characteristics of the transaction; (For example, the use of an advance payment for a shipment from a new supplier in a high-risk country or Frequent transactions involving rounding or whole dollar amounts).

- Phantom shipping – no goods are shipped and all documentation is completely falsified to move funds in the guise of trade

- Negotiable instruments (such as traveller's checks, cashier's checks and money orders) in round denominations under $3,000 used to fund domestic accounts or, alternatively, smuggled from a jurisdiction for placement into accounts at foreign financial institutions. The negotiable instruments may be sequentially numbered or purchased at multiple locations and may frequently lack payee information or contain visible broker markings or symbols. These negotiable instruments may also be used to pay for goods and services.

- International wire transfers received as payment for goods into bank accounts or processed through correspondent or intermediary accounts in a particular country, especially where the ordering party (importer of goods) of the wire does not live in the country from which the wire originated. (e.g. Wires originating from jurisdictions which have been highlighted in relation to black market peso exchange activities),

- Sudden onset and equally sudden cessation of payments – typically wire transfers – within a short duration. This could be an indication that the account is temporarily being used to launder illicit proceeds.

- A foreign based importing entity with accounts in exporting country receiving payments from locations outside the areas of their customer base.

- Unusual deposits occurring in combination with one or more of the following indicators:

    - Multiple deposits occurring in various locations when the account owner resides elsewhere, for example, deposits made in various cities when the account owner resides in a different city.
    - Multiple bank accounts held by a customer individually or along with closely related family members. These accounts may be held at one or more financial institutions. Such accounts may be used to facilitate the placement and layering of illicit funds.
    - Checking accounts receiving cash deposits in amounts under $1,000 as frequently as several times per month. These deposits may be followed by ATM withdrawals in foreign countries. This method, sometimes referred to as micro-structuring, is used by “smurfs” to deposit cash which may then be used to purchase goods.

- Foreign visitors opening multiple bank accounts at one or more financial institutions. Individuals may travel to a foreign jurisdiction with instructions to establish multiple bank accounts as a straw party. Upon return to their home country the straw account owner signs all of the blank checks and relinquishes control of the checkbooks and ATM cards tied to the accounts to the beneficial owner who now has control of the accounts. The following are examples of activity common to these accounts:

    - Cash deposits received using over-the-counter deposit slips since the checkbooks containing the pre-printed deposit slips as well as ATM cards are located out of that country;
    - Deposits which are frequently made in multiple cities / jurisdictions;
    - Withdrawals made via foreign ATM transactions; or
    - Withdrawals via check transactions that exhibit a difference between the handwriting for the signature and the payee portions of the check.

- Unusual activity in established bank accounts for non-resident aliens, such as structured cash and monetary instrument deposits; checks written from the domestic account to foreign businesses with no apparent relationship to the account holder; and international wire transfers to entities that do not appear to have any relationship with the originator.

- Sequentially numbered checks drawn on domestic bank accounts negotiated through foreign money services businesses.

264. It is important to remember that no one activity by itself is a clear indication of trade-based ML. Due to some similarities with legitimate financial activities, financial institutions should evaluate indicators of potential trade-based ML in combination with other red flags and expected transaction activity for its customer before making determinations of suspiciousness. Additional investigation and analysis may be necessary to determine if the activity is suspicious, based on information available to the financial institution.

Red Flags relating to Jurisdictions:

- The commodity is shipped to (or from) a jurisdiction designated as "high risk" for ML activities;
- The commodity is transhipped through one or more jurisdictions for no apparent economic reason;
- Customers conducting business in high-risk jurisdictions. Although not specifically identified by the authority handling AML work or FATF ; FTZs may be added to the list of high-risk jurisdictions given that there is an argument that FTZs exacerbate the risk
- Customers shipping items through high-risk jurisdictions, including transit through non-cooperative countries
- Unusual shipping routes or trans-shipment points
- Funds transferred into a country's domestic accounts that are subsequently transferred out of the account in the same or nearly the same amounts. Origination and destination locations are frequently high risk jurisdictions.

Red Flags relating to Goods:

- Significant discrepancies between the descriptions of the goods on the transport document (i.e., bill of lading), the invoice, or other documents (i.e., certificate of origin, packing list, etc.).
- Significant discrepancies appear between the description of the goods on the bill of lading (or invoice) and the actual goods shipped;
- Significant discrepancies appear between the value of the commodity reported on the invoice and the commodity's fair market value;
- The size of the shipment appears inconsistent with the scale of the exporter or importer's regular business activities;
- The type of commodity being shipped is designated as "high risk" for ML activities; [e.g. high-value, low-volume goods (e.g. consumer electronics, diamonds), which have high turnover rates and which present valuation difficulties].
- Shipment locations or description of goods that are inconsistent with the letter of credit

- Documentation showing a higher or lower value or cost of merchandise than that which was declared to Customs or paid by the importer (i.e. commodity over-valuation or under-valuation)
- Customers involved in potentially high-risk activities, including those subject to export/import restrictions such as equipment for military or police organisations of foreign governments, weapons, ammunition, chemical mixtures, classified defence articles, sensitive technical data, nuclear materials, precious gems, or certain natural resources such as metals, ore and crude oil
- Obvious misrepresentation of quantity or type of goods imported or exported
- A shipment that does not make economic sense (e.g. the use of a forty-foot container to transport a small amount of relatively low value merchandise)
- The type of commodity being traded appears inconsistent with the exporter or importer's usual business activities (e.g. a steel company that starts dealing in paper products, or an information technology company that suddenly starts dealing in bulk pharmaceuticals)
- Carousel transactions: the repeated importation and exportation of the same high-value commodity
- Packaging inconsistent with commodity or shipping method

Red Flags relating to Corporate Structures used:

- A transaction involves the use of front (or shell) companies.
- Companies or Money Exchange Bureaus located in third countries used as intermediaries for transfer of goods or money.
- A transaction structure that appears unnecessarily complex through introduction of corporate entities so that it obscures the true nature of the transaction.
- Companies operating out of foreign countries, especially when it is difficult or impossible to determine ownership or controlling persons of the company, or when the business purpose is not fully apparent.

RED FLAGS CONFIRMED IN THE APG TBML PAPER

265. The present paper has categorized the Red Flags received from various jurisdictions in response to the questionnaire into following five broad categories.

TRADE FINANCE

266. Based on the responses received from jurisdictions, red flags relating to financial & banking products may be categorized as follows:

a) Use of **letters of credit** to move money between those countries, where such trade would not normally occur and / or is **not consistent with the customer's usual business activity**. A Letter of credit is generally resorted to so as to accord more legitimacy to the transaction in order to conceal the real facts.

b) The **method of payment** requested by the client appears **inconsistent with the risk characteristics of the transaction**. For example receipt of an advance payment for a shipment from a new seller in a high-risk jurisdiction.

c) The transaction involves the receipt of cash (or by other payment methods) **from third party entities** that have no apparent connection with the transaction or which involve front or shell companies or wire instructions / payment from parties which were not identified in the original letter of credit or other documentation. The transactions that involve payments for goods through cheques, bank drafts, or money orders not drawn on the account of the entity that purchased the items also need further verification.

d) The transaction involves the use of repeatedly **amended or frequently extended letters of credit** without reasonable justification or that includes changes in regard to the beneficiary or location of payment without any apparent reason.

e) **Unusual deposits** i.e. use of cash or negotiable instruments (such as traveller's cheques, cashier's cheques and money orders) in **round denominations** (to keep below reporting threshold limit) to fund bank accounts and to pay for goods and services. The negotiable instruments may be sequentially numbered or purchased at multiple locations and may frequently lack payee information. Further, cash payments for high-value orders are also indication of TBML activity.

f) Inward remittances in **multiple accounts** and payments made from multiple accounts for trade transaction of same business entity are indicators for TBML. In this regard the study of foreign exchange remittances may help detect the offence.

g) In the case of **merchanting trade**, the trade finance mechanism should be in place for both export leg as well as import leg of transaction. If the Trade Finance mechanism, for example, Letters of Credit, have been provided for only the import leg of the transaction and not for export leg, it also indicates the possibility of TBML.

JURISDICTIONS (ORIGIN OR DESTINATION OF GOODS)

a) The commodity is shipped to or from a jurisdiction designated as '**high risk'** for ML activities or sensitive / non co-operative jurisdictions.

b) The commodity is **transhipped** through one or more such high risk / sensitive jurisdictions for no apparent economic reason.

c) Presence of **Free Trade Zones / Special Economic Zones** also affects the sensitiveness of a jurisdiction as far as TBML is concerned. FTZs are also emerging as being especially vulnerable to TBML. FATF (2010: 4) defines FTZs as 'designated areas within countries that offer a free trade environment with a minimum level of regulation'. In the said report, FATF noted that most zone authorities operate separate company formation services from those that exist in the rest of the jurisdiction and market the ease of setting up a legal entity in an FTZ to attract business. Many zone authorities request little or no ownership information of the companies interested in setting up in the zone. As a result, it is simpler for legal entities to set up the firms/companies in FTZs and hide the name(s) of the true beneficial owners. This lack of transparency has allowed companies located in FTZs to create layers of transactions that are difficult (if not impossible) for law enforcement agencies to follow (FATF 2010). It also reported that 'goods introduced in a FTZ' are generally not subject to the usual customs controls, with goods undergoing 'various economic operations, such as transhipment, assembly, manufacturing, processing, warehousing'. FinCEN has identified TBML red flags that are specific to FTZs. In its 2010 report, FinCEN (2010: 4) signalled that a number of red flags seen in conjunction with shipments of high dollar merchandise (such as electronics, auto parts and precious metals and gems) to duty free trade zones could be an indication of a trade-based ML activity.

   These include:

   i. third-party payments for goods or services made by an intermediary (either an individual or an entity) apparently unrelated to the seller or purchaser of goods. This may be done to obscure the true origin of the funds;
   ii. amended letters of credit without reasonable justification;
   iii. a customer's inability to produce appropriate documentation (ie invoices) to support a requested transaction; and
   iv. significant discrepancies between the descriptions of the goods on the transport document (ie bill of lading), the invoice, or other documents (ie certificate of origin, packing list etc) (FinCEN 2010).

d) **Circuitous route of shipment** and/or **circuitous route of financial transaction** or **Order for the goods** is placed by firms or individuals from foreign countries other than the jurisdiction of the stated end-user.

e) Transaction involves **shipment of goods inconsistent with normal geographic trade patterns** of the jurisdiction i.e. trade in goods other than goods which are normally exported/ imported by a jurisdiction or which does not make any economic sense e.g.

Semi-conductor manufacturing equipment being shipped to a jurisdiction that has no electronics industry.

NATURE OF GOODS

a) Where significant discrepancies appear between the **description, quality and quantity** of the goods on the documents such as bills of lading, invoices etc and the actual goods shipped. The misrepresentation may also be in relation to or type / grade of goods. For example, a relatively inexpensive good is supplied but it is invoiced as being more expensive, of different quality or even as an entirely different item so the documentation does not accurately record what is actually supplied. This technique is particularly useful in TBML. Cheap cloth items / waste thereof are declared as premium quality garments to launder the criminal money.

b) Significant discrepancies appear between the **value** of the commodity reported on the invoice and the commodity's fair market value. This is done either in conjunction with mis-declaration of the description / quality / grade of goods or without it. This is also often associated with mis-declaration of the jurisdiction of origin.

c) **Consignment size or type of commodity** being shipped appears **inconsistent with the scale or capacity of the exporter or importer's having regard to their regular business activities** or the shipment does not make economic sense i.e. there is no reasonable explanation for the client's financial investment into the shipment.

COPRPORATE STRUCTURES

a) The transaction involves the use of **front or shell companies**. Both shell and front companies can be used to facilitate TBML but in different ways. A shell company has no real operating activity and is used to hide ML activity and the identities of individuals involved so as to obscure the money trail. If activity is traced to the company it is literally an empty shell. As FATF (2010: 20) explained TBML and other ML schemes rely on the ability of the perpetrator of the crime to distance themselves from the illicit proceeds. Shell companies enable illicit actors to create a network of legal entities around the world. By contrast, a front company has real business whose legitimate operations are used as a cover for ML and other criminal activity. In many ways, front companies present a much more significant TBML threat than shell companies. The characteristics of offshore companies, for example, convenient formation, free operation, tax exemption and financial secrecy, all provide rather good veneer to disguise ML

b) Numerous **sole proprietorship businesses/private limited companies** set up by seemingly unrelated people (proxies) are found to be controlled by the same group of people. For the setting up of such businesses false addresses are registered.

c) Trade transaction reveals links between representatives of companies exchanging goods i.e. same owners or management. TBML requires collusion between traders at both ends of the import/export chain. **Related party transactions** (ie transactions between entities

that are part of the same corporate or business group) can possibly make TBML easier and more difficult to detect. Related party transactions, including transfer pricing, rely on mutual agreements between the parties, rather than free market forces. As the FATF (2006: 5) pointed out, over- or under-invoicing of goods and services requires collusion between the exporter and importer. Although there is a higher risk of related party transactions being used for fraud and for TBML, dealings between related parties are not necessarily illegal. d) Transfer pricing is a related party transaction that is commonly used by transnational corporation as part of their financial and tax planning strategy. Multinational organisations use transfer pricing to shift taxable income from jurisdictions with relatively high tax rates to jurisdictions with relatively low tax rates to minimise income tax. Similar strategies are also employed in relation to import duties and value added tax. FATF (2006: 3) made it clear though that in the case of transfer pricing, the reference to over- and under-invoicing relates to the legitimate allocation of income between related parties, rather than customs fraud.

PREDICATE OFFENCES OF TBML

267. 15% of the jurisdictions have reported that **tax evasion** is the predominant predicate offence in TBML cases whereas 10% of the jurisdictions have reported c**ustoms offences** as the main predicate offence. Other responses indicate that predicate offenses are often related to commercial fraud, IPR, Narcotics, human trafficking, terrorist financing, embezzlement, corruption, organized crime (racketeering), dealing in banned goods, conducting illegal business, speculation etc. One Reporting jurisdiction indicated that ML is considered to be an autonomous offence and there is no need to prove the existence or nature of the predicate offence in order to prosecute hence as a consequence, there is no systemic link between ML cases and other crimes.

ANNEX B - SUMMARY OF RESPONSES TO THE APG TBML QUESTIONNAIRE

268. 19 jurisdictions responded to the questionnaire: Anguilla, Australia, Belgium, Belize, Bhutan, Cambodia, Canada, Fiji, Hong Kong,China, India, Japan, Macao, Malaysia, Myanmar, Nepal, OCO, Pakistan, Singapore, Vietnam and USA. Oceania Customs Organisation also responded to the questionnaire.

SUMMARY OF RESPONSES

SECTION A. COORDINATING AGENCIES

	Yes	No
1A. Reason for very few cases of TBML reported up to 2011:		
i. It is not an issue;	**4**	**1**
ii. It is a policy/law, issue that results in no detection; or	**8**	
iii. Other Issues (Training, awareness / other)that results in no detection;	**9**	
No Report / Not Applicable etc: (**1)**		
2A. Did the FATF 2006 & 2008 papers describe all types of TBML?	**11**	**4**
No Report / Not Applicable etc: (**5)**		
3A. Whether any Government department records information on goods imported and exported into your jurisdiction?	**19**	**-**
No Report / Not Applicable etc: (**1)**		
4A. Does this agency, if Customs, has dedicated financial investigators with experience in trade related offences and or ML investigations?	**5**	**10**
Does this agency, if other than Customs, has dedicated financial investigators with experience in trade related offences and or ML investigations?		**5**
No Report / Not Applicable etc: (**2)**		
6A. Does your jurisdiction use any database to identify the value of goods, ie under/overpricing?	**12**	**5**
No Report / Not Applicable etc: (**3)**		
7A. If your jurisdiction has identified cases of TBML?	**9**	**8**
No Report / Not Applicable etc: (**3)**		
8A. Has your jurisdiction undertaken any of the following: **a.** A typologies study on TBML , or Abuse of the Trade Finance sector in the jurisdiction?	**2**	**14**
b. A risk assessment of TBML or Abuse of Trade Finance sector in the jurisdiction?	**2**	**14**
c. A risk assessment on Transfer Pricing.	**2**	**14**
d. A risk assessment of the use of Alternative Remittance Sectors in trade finance.	**2**	**14**
No Report / Not Applicable etc: (**4)**		

SECTION B. CUSTOMS AGENCIES

	Yes	No
1B. Does Customs conduct investigations into TBML or Transfer pricing?	**8**	**11**
If so, does the Customs agency also conduct the ML aspect of this investigation?	**4**	**4**
No Report / Not Applicable etc: (**1**)		

2B. Statistics on the number of TBML investigations in the past 5 years.

Details	**2007**	**2008**	**2009**	**2010**	**2011**
Nos of TBML investigations initiated / identified / referred	-	-	5	8	219
Amount involved in such offences	-	-	-	-	Not available
Result of investigations	-	-	-	-	-
Value of assets attached / frozen	-	-	-	$90 million#	Not available
Value of assets confiscated	-	-	-	-	-

Not Available/ Not Maintained separately / Nil: (**17**)

 # US reported TBML investigations completed in 2010 resulted in approx US$90 million in seizures.

	Yes	No
3B. Is Customs part of any joint financial investigation/ML task force that conducts investigations into these offences?	**9**	**9**
Not Available/ Not Maintained separately: (**2**)		
4B. Has Customs received training on TBML?	**8**	**10**
Does Customs provide training to other agencies on TBML issues?	**2**	**10**
No Report / Not Applicable etc**:** **(2)**		
	Yes	**No**
5B. Whether any impediments encountered when conducting investigations? Eg impediments regarding the release of FIU data to the agency or agency unable to share trade information etc.	**6**	**6**
No Report / Not Applicable etc: (**8**)		
	Yes	**No**
6B. Whether information is collected on type of goods, value of goods, importer, exporter, owner, receiver, shipping company etc?	**17**	
No Report / Not Applicable etc: (**3**)		
7B. Do you conduct analysis of trade information that could be used to identify, investigate or prosecute TBML?	**10**	**9**
No Report / Not Applicable etc: (**1**)		
8B. Has your jurisdiction identified patterns of goods that are involved in TBML?	**5**	**13**
No Report / Not Applicable etc: (**2**)		
9B. Are goods in TBML usually trans-shipped?	**1**	**5**
And is there any pattern of jurisdiction of origin (ie where are the goods usually shipped from, or are there some jurisdictions more prevalent than others as a point of origin)?	**2**	**2**
No Report / Not Applicable etc: (**14**)		

10B. How are the investigations into TBML usually initiated? ie information from intelligence, law enforcement, FIU data, STRs, trade data etc.

On the basis of inter-agency intelligence	**8**
On the basis of intra-agency intelligence	**8**

information from intelligence	information from law enforcement,	information from FIU data	information from STRs,	information from trade data	information from other sources
6	**9**	**7**	**6**	**5**	**3**
No Report / Not Applicable etc: (**9)**					

	Yes	**No**
11B. During your investigations do you seek information from your international counterparts?	**11**	**3**
During your investigations do you seek information from your WCO?	**10**	**3**
No Report / Not Applicable etc: (**6)**		
12B. During your investigations do you seek information from Domestic LEAs?	**10**	**3**
No Report / Not Applicable etc: (**7)**		
13B. During your investigations do you seek information from international LEAs ?	**8**	**4**
During your investigations do you seek information from FIUs?	**8**	**3**
No Report / Not Applicable etc: (**8)**		
14B. Is there any impediments to the receipt or dissemination of this information?	**8**	**5**
Is there any legal requirements for the dissemination of information related to trade (ie MoU)?	**4**	**4**
No Report / Not Applicable etc: (**7)**		
15B. Does your agency maintain an intelligence database on import and export of goods?	**15**	**4**
Do you cross reference this information with other government databases, i.e. companies registry, tax records, criminal records etc.?	**6**	**7**
No Report / Not Applicable etc: (**1)**		
16B. Whether any indicators and red flags of TBML identified?	**7**	**5**
No Report / Not Applicable etc: (**8)**		
17B. Have you shared any TBML related intelligence with your foreign counterparts?	**6**	**10**
If so are you aware of the results of that dissemination, i.e. aid in investigation, result in prosecution etc.	**3**	
No Report / Not Applicable etc: (**4)**		
18B. Are there any challenges and obstacles for your agency to identify or investigate TBML?	**8**	**3**
No Report / Not Applicable etc: (**9)**		

SECTION C. LAW ENFORCEMENT AGENCY MANDATED TO INVESTIGATE ML (MAY INCLUDE CUSTOMS / INVESTIGATIVE FIUS)

1C. Statistics on the number of TBML investigations in the past 5 years

Details	**2007**	**2008**	**2009**	**2010**	**2011**
No. of TBML investigations initiated / identified / referred from other agencies	1	18	27	20	**223**
Amount involved	USD 2.17 Million	USD 6.16 Million	USD 420.59 Million	USD 46.88 Million	USD 81.52Million

Result of investigations	-	-	Prosecution pending	Prosecution pending	Prosecution pending
Value of assets attached / frozen (US $)	USD 2.17 Million	USD 6.16 Million	USD 44.98 Million	USD 91.04 Million #	Under investigation
Value of assets confiscated	-	-	-	-	-
No Report / Not Applicable etc/ Nil : (**15)**					
#: *In addition to above as per report of USA: 208 investigations. TBML investigations completed during 2010 resulted in approximately $90 million dollars in seizures.*					

	Yes	**No**
2C. Does the law enforcement agency conduct investigations into TBML or Transfer pricing?	11	4
If so does the law enforcement agency also conduct the ML aspect of this investigation?	**11**	**3**
No Report / Not Applicable etc: (**5)**		
3C. Is the law enforcement agency part of a joint financial investigation/ML task force that conducts investigations into these offences?	**9**	**6**
No Report / Not Applicable etc: (**5)**		
4C. Has the law enforcement agency received training on TBML?	**7**	**10**
Does it provide training to other agencies on TBML issues?	**3**	**9**
No Report / Not Applicable etc: (**3)**		
5C. Are there any impediments encountered when conducting investigations?	**6**	**9**
No Report / Not Applicable etc: (**5)**		
6C. How are TBML investigations initiated? i.e. referrals from other agencies etc.? 1. From Internal intelligence: (**7)** **2.** Referrals from other agencies: (**11)**		
No Report / Not Applicable etc: (**7)**		
7C. Of the TBML matters investigated what is the average size, in dollar terms, of the offence?	USD 557.3 Million in 19 cases.	
No Report / Not Applicable etc: (**15)**		
8C. What are the predicate offences that have in the past been associated with TBML? **1.** Narcotics **2.** Domestic Crime / Organised Crime **3.** Corruption **4.** Customs Violations **5.** Tax Evasion **6.** Manufacturing, stockpiling, transporting and/or trading in banned goods **7.** Conducting business illegally **8.** Speculation **9.** Commercial fraud **10.** IPR **11.** Human Trafficking & Terrorist Financing **12.** Embezzlement **13.** Fraud		
No Report / Not Applicable etc: (**12)**		
9C. What types of goods are involved in TBML matters? **1.** Metal scrap.		

2. Textile materials. **3.** Zero duty goods like Diamonds. (**2)** **4.** Precious metals. **5.** Luxury watches **6.** Good where the taxes are high or which are heavily controlled **7.** Electronic goods **8.** Illicit tobacco products **9.** Counterfeit Products **10.** Bulk Commodities.
No Report / Not Applicable etc: (**14)**
10C. What types of corporate structures are used by criminal syndicates in TBML investigations? **1.** Companies: (**6**) **2.** Offshore Companies: (**5**) **3.** Others: joint-venture companies registered in developing countries **(1)** **4.** Criminals don't use Corporate Structure. **(1)**

	Yes	**No**
Where such offshore companies are registered? Is there any pattern to jurisdictions that they are registered?	**3**	
No Report / Not Applicable etc: **(16)**		
Yes **No**		
11C & 12C. Whether you receive information from the Customs agency?	**12**	**1**
Are there any restrictions on the use of this information?	**7**	**5**
No Report / Not Applicable etc: (**7)**		
14C. Does your agency have specialist financial investigators who conduct the TBML investigations?	**9**	**7**
No Report / Not Applicable etc: (**4)**		

	Value in USD
15C. What was the value of any assets forfeited as a result of the investigation?	USD 72.66 Million
No Report / Not Applicable etc: **(17)**	
16C. What red flags or indicators of the TBML activity have you identified?	
No Report / Not Applicable etc: **(12)**	

	Yes	**No**
17C. Have investigations of Alternative Remitters identified instances of TBML?	**3**	**7**
Have investigations of Alternative Remitters identified instances of abuse of trade finance?	**2**	**7**
No Report / Not Applicable etc: (**10)**		

SECTION D. FIU

1D. Statistics on the number of TBML STRs in the past 5 years

Details	**2007**	**2008**	**2009**	**2010**	**2011**
Nos of TBML STRs received	15	49	186	690	1054
Nos of TBML STRs disseminated	7	28	130	474	699
Value of STRs received (USD)	$756	$15462	$164614	$486256	$7315
No Report / Not Applicable etc: (**15)**					

	Yes	**No**
2D. Is the FIU part of a joint financial investigation/ML task force that conducts	**3**	**15**

investigations into these offences?		
No Report / Not Applicable etc: **(2)**		
3D. Has the FIU received training on TBML?	**7**	**11**
Does it provide training to other agencies on TBML issues?	**7**	**11**
No Report / Not Applicable etc: **(2)**		
4D. Are there any impediments encountered when conducting intelligence gathering? For example, impediments regarding the release of FIU information, unable to receive law enforcement information, lack of access to databases etc.	**5**	**11**
No Report / Not Applicable etc: **(4)**		
5D. Can Customs agencies receive financial information from the FIU?	**18**	**-**
No Report / Not Applicable etc: **(2)**		
6D. Have requests been made for sharing financial intelligence (FIU to FIU, FIU to LEA etc)?	**14**	**4**
No Report / Not Applicable etc: **(2)**		

SECTION E. TAX AUTHORITIES

	Yes	**No**
1E. Do you have any estimates of the size of (detected and undetected) TBML and transfer pricing in your jurisdiction?	**2**	**9**
If yes, what is the size? USD 19 Million (1 Jurisdiction)		
No Report / Not Applicable etc: **(9)**		
2E. Does the Tax Authority conduct investigations/audits into TBML or Transfer Pricing?	**3**	**10**
No Report / Not Applicable etc: **(7)**		

3E. Statistics on the number of TBML/transfer pricing detections in the past 5 years

Details	**2007**	**2008**	**2009**	**2010**	**2011**
No of TBML/transfer pricing investigations initiated / identified		1	1	3	63
Amount involved in such offences (USD)		USD 234.6	USD 111.8	USD 49.3	USD 240.9
Result of investigations		*Not prosecuted*	Not prosecuted	Not prosecuted	Not prosecuted
Assets attached / frozen/confiscated					

Nil /No Report / Statistics not maintained for TBML cases /Not Applicable etc: (**18)**		
	Yes	**No**
4E. Is the Tax Authority part of a joint financial investigations/ML/Task Force that combats TBML?	**5**	**6**
If so, is there a lead agency?	**2**	**3**
No Report / Not Applicable etc: (**9)**		
5E. Has the Tax Authority received training on TBML?	**4**	**9**
Does it provide training to other agencies on TBML issues?	**1**	**10**
No Report / Not Applicable etc: (**6)**		
7E. Does the Tax Authority receive FIU data for the purpose of investigation of administrative issues?	**6**	**5**
No Report / Not Applicable etc: (**9)**		

SECTION F. AML REGULATOR

	Yes	**No**
1F. Has the regulator or supervisor provided guidance to reporting entities regarding TBML vulnerabilities and red flags?	**11**	**5**
No Report / Not Applicable etc: (**4)**		
2F. Does the regulator or supervisor provide training to reporting entities and their own staff on TBML?	**8**	**8**
Does the regulator have experts in the area of Trade Finance?	**5**	**7**
No Report / Not Applicable etc: (**4)**		
3F. Does AML supervision include trade finance aspects of compliance?	**10**	**6**
No Report / Not Applicable etc: (**4)**		
4F. Does your jurisdiction have foreign currency controls?	**11**	**4**
No Report / Not Applicable etc: (**5)**		
5F. Do foreign currency controls have a role in identifying abuse of trade finance or TBML?	**5**	**4**
No Report / Not Applicable etc: (**11)**		
6F. Have investigations of Alternative Remitters identified instances of TBML or abuse of trade finance?	**3**	**9**
No Report / Not Applicable etc: (**8)**		

PROJECT TEAM

CO-LEADERS

FATF

FATF REPORT

Virtual Currencies
Key Definitions and Potential AML/CFT Risks

June 2014

FINANCIAL ACTION TASK FORCE

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit the website:

NPPS Guidance	Guidance for a Risk-Based Approach to Prepaid Cards, Mobile Payments and Internet-Based Payment Services

VIRTUAL CURRENCIES - KEY DEFINITIONS AND POTENTIAL AML/CFT RISKS[1]

INTRODUCTION

As decentralised, math-based virtual currencies—particularly Bitcoin[2]—have garnered increasing attention, two popular narratives have emerged: (1) virtual currencies are the wave of the future for payment systems; and (2) virtual currencies provide a powerful new tool for criminals, terrorist financiers and other sanctions evaders to move and store illicit funds, out of the reach of law enforcement and other authorities.[3] Against this backdrop, this paper builds on the 2013 New Payment Products and Services (NPPS) Guidance (FATF, 2013) by suggesting a conceptual framework for understanding and addressing the anti-money laundering / countering the financing of terrorism (AML/CFT) risks associated with one kind of internet-based payment system: virtual currencies. Specifically, the paper proposes a common definitional vocabulary that clarifies what virtual currency is and classifies the various types of virtual currency, based on their different business models and methods of operation,[4] and identifies the participants in typical virtual currency systems. It also applies risk factors set forth in Section IV (A) of the 2013 NPPS Guidance to specific types of virtual currencies to identify potential risks; describes some recent investigations and enforcement efforts involving virtual currency; and presents a sample of jurisdictions' current regulatory approaches to virtual currency.

While the 2013 NPPS Guidance broadly addressed internet-based payment services, it did not define "digital currency," "virtual currency," or "electronic money." Nor did it focus on virtual currencies, as distinct from internet-based payment systems that facilitate transactions denominated in real money (fiat or national currency) (e.g., Pay-Pal, Alipay, or Google Checkout). It also did not address decentralised convertible virtual currencies, such as Bitcoin. The 2013 Guidance also notes that, "[g]iven the developing nature of alternate online currencies, the FATF may consider further work in this area in the future" (2013 NPPS Guidance, p. 11, para. 29). A short-term typologies project on this basis was initiated with the following objectives:

- develop a risk-matrix for virtual currencies (or perhaps, more broadly, for both virtual currencies and e-money);
- promote fuller understanding of the parties involved in convertible virtual currency systems and the way virtual currency can be used to operate payment systems; and
- stimulate a discussion on implementing risk-based AML/CFT regulations in this area.

This typologies project may lead to policy work by the FATF, e.g. the issuance of supplemental guidance for applying a risk-based approach to virtual currencies that would incorporate the proposed vocabulary and risk-matrix developed by the typologies project and explain how specific FATF Recommendations apply in the context of virtual currency.

KEY DEFINITIONS:

A common set of terms reflecting how virtual currencies operate is a crucial first step to enable government officials, law enforcement, and private sector entities to analyse the potential AML/CFT

risks of virtual currency as a new payment method. As regulators and law enforcement officials around the world begin to grapple with the challenges presented by virtual currencies, it has become apparent that we lack a common vocabulary that accurately reflects the different forms virtual currency may take. The following set of terms is intended to aid discussion between FATF members. It is important to note that this vocabulary may change as virtual currency evolves and as regulators and law enforcement/government officials continue to consider the challenges virtual currencies present. Nevertheless, the proposed vocabulary aims to provide a common language for developing conceptual tools to help us better understand how virtual currencies operate and the risks and potential benefits they offer.

VIRTUAL CURRENCY

Virtual currency is a digital representation[5] of value that can be digitally traded and functions as (1) a medium of exchange; and/or (2) a unit of account; and/or (3) a store of value, but does not have legal tender status (i.e., when tendered to a creditor, is a valid and legal offer of payment)[6] in any jurisdiction.[7] It is not issued nor guaranteed by any jurisdiction, and fulfils the above functions only by agreement within the community of users of the virtual currency. Virtual currency is distinguished from **fiat currency** (a.k.a. **"real currency," "real money,"** or **"national currency"**), which is the coin and paper money of a country that is designated as its legal tender; circulates; and is customarily used and accepted as a medium of exchange in the issuing country. It is distinct from e**-money**, which is a digital representation of fiat currency used to electronically transfer value denominated in fiat currency. E-money is a digital transfer mechanism for fiat currency—i.e., it electronically transfers value that has legal tender status.

Digital currency can mean a digital representation of either virtual currency (non-fiat) or e-money (fiat) and thus is often used interchangeably with the term "virtual currency". In this paper to avoid confusion, only the terms "virtual currency" or "e-money" are used.

CONVERTIBLE VERSUS NON-CONVERTIBLE VIRTUAL CURRENCY

This paper proposes dividing virtual currency into two basic types: convertible and non-convertible virtual currency.[8] Although the paper uses "non-convertible" and "closed", and "convertible" and "open" as synonyms, it should be emphasised that the notion of "convertible currency" does not in any way imply an ex officio convertibility (e.g. in the case of gold standard), but rather a de facto convertibility (e.g. because a market exists). Thus, a virtual currency is "convertible" only as long as some private participants make offers and others accept them, since the "convertibility" is not guaranteed at all by law.

Convertible (or open) virtual currency has an equivalent value in real currency and can be exchanged back-and-forth for real currency.[9] Examples include: Bitcoin; e-Gold (defunct); Liberty Reserve (defunct); Second Life Linden Dollars; and WebMoney.[10]

Non-convertible (or closed) virtual currency is intended to be specific to a particular virtual domain or world, such as a Massively Multiplayer Online Role-Playing Game (MMORPG) or Amazon.com, and under the rules governing its use, cannot be exchanged for fiat currency. Examples include**:** Project Entropia Dollars; Q Coins; and World of Warcraft Gold.

It should be noted that even where, under the terms set by the administrator, a non-convertible currency is officially transferrable only within a specific virtual environment and is not convertible, it is possible that an unofficial, secondary black market may arise that provides an opportunity to exchange the "non-convertible" virtual currency for fiat currency or another virtual currency. Generally, the administrator will apply sanctions (including termination of membership and/or forfeiture of remaining virtual currency) to those seeking to create or use a secondary market, contrary to the rules of the currency.[11] Development of a robust secondary black market in a particular "non-convertible" virtual currency may, as a practical matter, effectively transform it into a convertible virtual currency. A non-convertible characterisation is thus not necessarily static.

CENTRALISED VERSUS NON-CENTRALISED VIRTUAL CURRENCIES

All non-convertible virtual currencies are centralised: by definition, they are issued by a central authority that establishes rules making them non-convertible. In contrast, convertible virtual currencies may be either of two sub-types: centralised or decentralised.

Centralised Virtual Currencies have a single administrating authority (**administrator)**—i.e., a third party[12] that controls the system. An administrator issues the currency; establishes the rules for its use; maintains a central payment ledger; and has authority to redeem the currency (withdraw it from circulation). The exchange rate for a convertible virtual currency may be either **floating**—i.e., determined by market supply and demand for the virtual currency--or **pegged**—i.e., fixed by the administrator at a set value measured in fiat currency or another real-world store of value, such as gold or a basket of currencies. Currently, the vast majority of virtual currency payments transactions involve centralised virtual currencies. Examples: E-gold (defunct); Liberty Reserve dollars/euros (defunct); Second Life "Linden dollars"; PerfectMoney; WebMoney "WM units"; and World of Warcraft gold.

Decentralised Virtual Currencies (a.k.a. crypto-currencies) are distributed[13], open-source, math-based peer-to-peer virtual currencies that have no central administrating authority, and no central monitoring or oversight. Examples: Bitcoin; LiteCoin; and Ripple.[14]

Cryptocurrency refers to a math-based, decentralised convertible virtual currency that is protected by cryptography.—i.e., it incorporates principles of cryptography to implement a distributed, decentralised, secure information economy. Cryptocurrency relies on public and private keys to transfer value from one person (individual or entity) to another, and must be cryptographically signed each time it is transferred. The safety, integrity and balance of cryptocurrency ledgers is ensured by a network of mutually distrustful parties (in Bitcoin, referred to as miners) who protect the network in exchange for the opportunity to obtain a randomly distributed fee (in Bitcoin, a small number of newly created bitcoins, called the "block reward" and in some cases, also transaction fees paid by users as a incentive for miners to include their transactions in the next block). Hundreds of cryptocurrency specifications have been defined, mostly derived from Bitcoin, which uses a proof-of-work system to validate transactions and maintain the block chain. While Bitcoin provided the first fully implemented cryptocurrency protocol, there is growing interest in developing alternative, potentially more efficient proof methods, such as systems based on proof-of-stake.

Bitcoin, launched in 2009, was the first decentralised convertible virtual currency, and the first cryptocurrency. Bitcoins are units of account composed of unique strings of numbers and letters

that constitute units of the currency and have value only because individual users are willing to pay for them. Bitcoins are digitally traded between users with a high degree of anonymity and can be exchanged (purchased or cashed out) into US dollars, Euros, and other fiat or virtual currencies. Anyone can download the free, open-source software from a website to send, receive, and store bitcoins and monitor Bitcoin transactions. Users can also obtain Bitcoin addresses, which function like accounts, at a Bitcoin exchanger or online wallet service. Transactions (fund flows) are publicly available in a shared transaction register and identified by the Bitcoin address, a string of letters and numbers that is not systematically linked to an individual.. Therefore, Bitcoin is said to be "pseudo-anonymous". Bitcoin is capped at 21 million bitcoins (but each unit could be divided in smaller parts), projected to be reached by 2140.[15] As of April 2, 2014, there were over 12-and-a-half million bitcoins, with total value of slightly more than USD 5.5 billion, based on the average exchange rate on that date.

Altcoin refers to math-based decentralised convertible virtual currency other than bitcoins, the original such currency. Current examples include Ripple; PeerCoin, Lite-coin; zerocoin; anoncoin and dogecoin. One popular exchanger, Cryptsy, would reportedly exchange over 100 different virtual currencies (as of 2 April 2014). (Popper, N., 2013)

Anonymiser (anonymising tool) refers to tools and services, such as darknets and mixers, designed to obscure the source of a Bitcoin transaction and facilitate anonymity. (Examples: Tor (darknet); Dark Wallet (darknet); Bitcoin Laundry (mixer)).

Mixer (laundry service, tumbler) is a type of anonymiser that obscures the chain of transactions on the blockchain by linking all transactions in the same bitcoin address and sending them together in a way that makes them look as if they were sent from another address. A mixer or tumbler sends transactions through a complex, semi-random series of dummy transactions that makes it extremely difficult to link specific virtual coins (addresses) with a particular transaction. Mixer services operate by receiving instructions from a user to send funds to a particular bitcoin address. The mixing service then "comingles" this transaction with other user transactions, such that it becomes unclear to whom the user intended the funds to be directed. (Examples: Bitmixer.io; SharedCoin; Blockchain.info; Bitcoin Laundry; Bitlaunder; Easycoin).

Tor (originally, The Onion Router) is an underground distributed network of computers on the Internet that conceals the true IP addresses, and therefore the identities of the network's users, by routing communications/transactions through multiple computers around the world and wrapping them in numerous layers of encryption. Tor makes it very difficult to physically locate computers hosting or accessing websites on the network. This difficulty can be exacerbated by use of additional tumblers or anonymisers on the Tor network. Tor is one of several underground distributed computer networks, often referred to as darknets, cypherspace, the Deep web, or anonymous networks, which individuals use to access content in a manner designed to obscure their identity and associated Internet activity.

Dark Wallet is a browser-based extension wallet, currently available on Chrome (and potentially on Firefox), that seeks to ensure the anonymity of Bitcoin transactions by incorporating the following features: auto-anonymiser (mixer); decentralised trading; uncensorable crowd funding platforms; stock platforms and information black markets; and decentralised market places similar to Silk Road.

Cold Storage refers to an offline Bitcoin wallet—i.e., a Bitcoin wallet that is not connected to the Internet. Cold storage is intended to help protect the stored virtual currency against hacking and theft.

Hot Storage refers to an online bitcoin wallet. Because it is connected to the Internet, hot storage is more vulnerable to hacking/theft than cold storage.

Local Exchange Trading System (LETS) is a locally organised economic organisation that allows members to exchange goods and services with others in the group. LETS use a locally created currency to denominate units of value that can be traded or bartered in exchange for goods or services. Theoretically, bitcoins could be adopted as the local currency used within a LETS. (Examples: Ithica Dollars; Mazacoin).

VIRTUAL CURRENCY SYSTEM PARTICIPANTS

An **exchanger (also sometimes called a virtual currency exchange)** is a person or entity engaged as a business in the exchange of virtual currency for real currency, funds, or other forms of virtual currency and also precious metals, and vice versa, for a fee (commission). Exchangers generally accept a wide range of payments, including cash, wires, credit cards, and other virtual currencies, and can be administrator-affiliated, non-affiliated, or a third party provider. Exchangers can act as a bourse or as an exchange desk. Individuals typically use exchangers to deposit and withdraw money from virtual currency accounts.

An **administrator** is a person or entity engaged as a business in **issuing** (putting into circulation) a centralised virtual currency, establishing the rules for its use; maintaining a central payment ledger; and who has the authority to **redeem** (withdraw from circulation) the virtual currency.

A **user** is a person/entity who obtains virtual currency and uses it to purchase real or virtual goods or services or send transfers in a personal capacity to another person (for personal use), or who holds the virtual currency as a (personal) investment. Users can obtain virtual currency in several ways. For example, they can (1) purchase virtual currency, using real money (from an exchanger or, for certain centralised virtual currencies, directly from the administrator/issuer); (2) engage in specific activities that earn virtual currency payments (e.g., respond to a promotion, complete an online survey, provide a real or virtual good or service); (3) with some decentralised virtual currencies (e.g., Bitcoin), self-generate units of the currency by "mining" them (see definition of miner, below),and receive them as gifts, rewards, or as part of a free initial distribution.

A **miner** is an individual or entity that participates in a decentralised virtual currency network by running special software to solve complex algorithms in a distributed proof-of-work or other distributed proof system used to validate transactions in the virtual currency system. Miners may be users, if they self-generate a convertible virtual currency solely for their own purposes, e.g., to hold for investment or to use to pay an existing obligation or to purchase goods and services. Miners may also participate in a virtual currency system as exchangers, creating the virtual currency as a business in order to sell it for fiat currency or other virtual currency.

Virtual currency wallet is a means (software application or other mechanism/medium) for holding, storing and transferring bitcoins or other virtual currency.

A wallet provider is an entity that provides a virtual currency wallet (i.e., a means (software application or other mechanism/medium) for holding, storing and transferring bitcoins or other virtual currency). A wallet holds the user's private keys, which allow the user to spend virtual currency allocated to the virtual currency address in the block chain. A wallet provider facilitates participation in a virtual currency system by allowing users, exchangers, and merchants to more easily conduct the virtual currency transactions. The wallet provider maintains the customer's virtual currency balance and generally also provides storage and transaction security. For example, beyond providing bitcoin addresses, the wallet may offer encryption; multiple key (multi-key) signature protection, backup/cold storage; and mixers. All Bitcoin wallets can interoperate with each other. Wallets can be stored both online ("hot storage") or offline ("cold storage"). (Examples: Coinbase; Multibit; Bitcoin Wallet).

In addition, various **other entities** may participate in a virtual currency system and may be affiliated with or independent of exchangers and/or administrators. These include web **administration service providers (a.k.a. web administrators**); **third party payments senders** facilitating merchant acceptance; **software developers**; and **application providers** (some of the "other entities" listed in this paragraph may already fall into one of the categories above.). Applications and software development can be for legitimate purposes—e.g., to increase ease of merchant acceptance and customer payments or to respond to legitimate privacy concerns—or for illicit purposes—e.g., a mixer developer/operator can target illicit users with products designed to avoid regulatory and law enforcement scrutiny.

It must be emphasised that this list of participants is not exhaustive. Moreover, given the rapid development of virtual currency technologies and business models, additional participants could arise within virtual currency systems and pose potential AML/CFT risks.

Taxonomy of Virtual Currencies

	Centralised	**Decentralised**
Convertible	Administrator, exchangers, users; third-party ledger; can be exchanged for fiat currency. Example: WebMoney	Exchangers, users (no administrator); no Trusted Third-Party ledger; can be exchanged for fiat currency. Example: Bitcoin
Non-convertible	Administrator, exchangers, users; third-party ledger; cannot be exchanged for fiat currency. Example: World of Warcraft Gold	Does not exist

LEGITIMATE USES

Like other new payment methods, virtual currency has legitimate uses, with prominent venture capital firms investing in virtual currency start-ups. Virtual currency has the potential to improve

payment efficiency and reduce transaction costs for payments and fund transfers. For example, Bitcoin functions as a global currency that can avoid exchange fees, is currently processed with lower fees/charges than traditional credit and debit cards, and may potentially provide benefit to existing online payment systems, like Paypal.[16] Virtual currency may also facilitate micro-payments, allowing businesses to monetise very low-cost goods or services sold on the Internet, such as one-time game or music downloads. At present, as a practical matter, such items cannot be sold at an appropriately low per/unit cost because of the higher transaction costs associated with e.g., traditional credit and debit. Virtual currency may also facilitate international remittances and support financial inclusion in other ways, as new virtual currency-based products and services are developed that may potentially serve the under- and un-banked. Virtual currency - notably, Bitcoin- may also be held for investment. These potential benefits need to be carefully analysed, including whether claimed cost advantages will remain if virtual currency becomes subject to regulatory requirements similar to those that apply to other payments methods, and/or if exchange fees for cashing out into fiat currency are factored in, and whether volatility, consumer protection and other factors[17] limit their potential for financial inclusion.

POTENTIAL RISKS

Convertible virtual currencies that can be exchanged for real money or other virtual currencies are potentially vulnerable to money laundering and terrorist financing abuse for many of the reasons identified in the 2013 NPPS Guidance. First, they may allow greater anonymity than traditional non-cash payment methods. Virtual currency systems can be traded on the Internet, are generally characterised by non-face-to-face customer relationships, and may permit anonymous funding (cash funding or third-party funding through virtual exchangers that do not properly identify the funding source). They may also permit anonymous transfers, if sender and recipient are not adequately identified.

Decentralised systems are particularly vulnerable to anonymity risks. For example, by design, Bitcoin addresses, which function as accounts, have no names or other customer identification attached, and the system has no central server or service provider. The Bitcoin protocol does not require or provide identification and verification of participants or generate historical records of transactions that are necessarily associated with real world identity. There is no central oversight body, and no AML software currently available to monitor and identify suspicious transaction patterns. Law enforcement cannot target one central location or entity (administrator) for investigative or asset seizure purposes (although authorities can target individual exchangers for client information that the exchanger may collect). It thus offers a level of potential anonymity impossible with traditional credit and debit cards or older online payment systems, such as PayPal.

Virtual currency's global reach likewise increases its potential AML/CFT risks. Virtual currency systems can be accessed via the Internet (including via mobile phones) and can be used to make cross-border payments and funds transfers. In addition, virtual currencies commonly rely on complex infrastructures that involve several entities, often spread across several countries, to transfer funds or execute payments. This segmentation of services means that responsibility for AML/CFT compliance and supervision/enforcement may be unclear. Moreover, customer and transaction records may be held by different entities, often in different jurisdictions, making it more

difficult for law enforcement and regulators to access them. This problem is exacerbated by the rapidly evolving nature of decentralised virtual currency technology and business models, including the changing number and types/roles of participants providing services in virtual currency payments systems. And importantly, components of a virtual currency system may be located in jurisdictions that do not have adequate AML/CFT controls. Centralised virtual currency systems could be complicit in money laundering and could deliberately seek out jurisdictions with weak AML/CFT regimes. Decentralised convertible virtual currencies allowing anonymous person-to-person transactions may seem to exist in a digital universe entirely outside the reach of any particular country.

LAW ENFORCEMENT ACTIONS INVOLVING VIRTUAL CURRENCY

Law enforcement is already seeing cases that involve the abuse of virtual currency for money laundering purposes. Examples include:

LIBERTY RESERVE

In what is to date the largest online money-laundering case in history, in May 2013, the US Department of Justice charged Liberty Reserve, a Costa Rica-based money transmitter, and seven of its principals and employees with operating an unregistered money transmitter business and money laundering for facilitating the movement of more than 6 billion USD in illicit proceeds. In a coordinated action, the Department of the Treasury identified Liberty Reserve as a financial institution of primary money laundering concern under Section 311 of the USA PATRIOT Act, effectively cutting it off from the US financial system.

Established in 2006, Liberty Reserve was designed to avoid regulatory and law enforcement scrutiny and help criminals distribute, store, and launder the proceeds of credit card fraud, identity theft, investment fraud, computer hacking, narcotics trafficking, and child pornography by enabling them to conduct anonymous and untraceable financial transactions. Operating on an enormous scale, it had more than a million users worldwide, including more than 200 000 in the United States, and handled approximately 55 million transactions, almost all of which were illegal. It had its own virtual currency, Liberty Dollars (LR), but at each end, transfers were denominated and stored in fiat currency (US dollars).

To use LR currency, a user opened an account through the Liberty Reserve website. While Liberty Reserve ostensibly required basic identifying information, it did not validate identities. Users routinely established accounts under false names, including blatantly criminal names ("Russia Hackers," "Hacker Account," "Joe Bogus") and blatantly false addresses ("123 Fake Main Street, Completely Made Up City, New York"). To add a further layer of anonymity, Liberty Reserve required users to make deposits and withdrawals through recommended third-party exchangers—generally, unlicensed money transmitting businesses operating in Russia, and in several countries without significant governmental money laundering oversight or regulation at that time, such as Malaysia, Nigeria, and Vietnam. By avoiding direct deposits and withdrawals from users, Liberty Reserve evaded collecting information about them through banking transactions or other activity that would create a central paper trail. Once an account was established, a user could conduct transactions with other Liberty Reserve users by transferring LR from his or her account to other

users, including front company "merchants" that accepted LR as payment. For an extra "privacy fee" (75 US cents per transaction), users could hide their Liberty Reserve account numbers when transferring funds, making the transfers completely untraceable. After learning it was being investigated by US law enforcement, Liberty Reserve pretended to shut down in Costa Rica but continued to operate through a set of shell companies, moving millions through their accounts in Australia, Cyprus, China, Hong Kong, Morocco, Russia, Spain and elsewhere.[18]

SILK ROAD

In September 2013, the US Department of Justice unsealed a criminal complaint charging the alleged owner and operator of Silk Road, a hidden website designed to enable its users to buy and sell illegal drugs, weapons, stolen identity information and other unlawful goods and services anonymously and beyond the reach of law enforcement, with narcotics trafficking, computer hacking, and money laundering conspiracies. The Justice Department also seized the website and approximately 173 991 bitcoins, worth more than USD 33.6 million at the time of the seizure, from seized computer hardware. The individual was arrested in San Francisco in October and indicted in February 2014; the investigation is ongoing.

Launched in January 2011, Silk Road operated as a global black-market cyber bazaar that brokered anonymous criminal transactions and was used by several thousand drug dealers and other unlawful vendors to distribute unlawful goods and services to over a hundred thousand buyers, a third of whom are believed to have been in the United States. It allegedly generated total sales revenue of approximately USD 1.2 billion (more than 9.5 million bitcoins) and approximately USD 80 million (more than 600 000 bitcoins) in commissions for Silk Road. Hundreds of millions of dollars were laundered from these illegal transactions (based on bitcoin value as of dates of seizure). Commissions ranged from 8 to 15 percent of total sales price.

Silk Road achieved anonymity by operating on the hidden Tor network and accepting only bitcoins for payment. Using bitcoins as the exclusive currency on Silk Road allowed purchasers and sellers to further conceal their identity, since senders and recipients of peer-to-peer (P2P) bitcoin transactions are identified only by the anonymous bitcoin address/account. Moreover, users can obtain an unlimited number of bitcoin addresses and use a different one for each transaction, further obscuring the trail of illicit proceeds. Users can also employ additional "anonymisers," beyond the tumbler service built into Silk Road transactions (see discussion below).

Silk Road's payment system functioned as an internal Bitcoin bank, where every Silk Road user had to hold an account in order to conduct transactions on the site. Every Silk Road user had at least one Silk Road Bitcoin address (and potentially thousands) associated with the user's Silk Road account, stored on wallets maintained on servers controlled by Silk Road. To make a purchase, a user obtained bitcoins (typically through a Bitcoin exchanger) and sent them to a Bitcoin address associated with his or her Silk Road account to fund the account. When a purchase was made, Silk Road transferred the user's bitcoins to an escrow account it maintained, pending completion of the transaction, and then transferred the user's / buyer's bitcoins from the escrow account to the vendor's Silk Road Bitcoin address. As a further step, Silk Road employed a "tumbler" for every purchase, which, as the site explained, "sen[t] all payments through a complex, semi-random series

of dummy transactions ... --making it nearly impossible to link your payment with any [bit]coins leaving the site."[19]

WESTERN EXPRESS INTERNATIONAL

An eight-year investigation of a multinational, Internet-based cybercrime group, the Western Express Cybercrime Group, resulted in convictions or guilty pleas of 16 of its members for their role in a global identity theft/cyberfraud scheme. Members of the cybercrime group interacted and communicated primarily through Internet "carding" web sites devoted to trafficking in stolen credit card and personal identifying information and used false identities, anonymous instant messenger accounts, anonymous email accounts, and anonymous virtual currency accounts to conceal the existence and purpose of the criminal enterprise; avoid detection by law enforcement and regulatory agencies; and maintain their anonymity.

The criminal enterprise was composed of vendors, buyers, cybercrime services providers, and money movers located in numerous countries, ranging from Ukraine and throughout Eastern Europe to the United States. The vendors sold nearly 100 000 stolen credit card numbers and other personal identification information through the Internet, taking payment mostly in e-Gold and WebMoney. The buyers used the stolen identities to forge credit cards and purchase expensive merchandise, which they fenced (including via reshipping schemes), committing additional crimes, such as larceny, criminal possession of stolen property, and fraud, and generating about USD 5 million in credit card fraud proceeds. The cybercrime services providers promoted, facilitated, and aided in the purchase, sale and fraudulent use of stolen credit card numbers and other personal identifying information by providing computer services to the vendors and the buyers. The money mover laundered the cybercrime group's illicit proceeds in a variety of high-tech ways, moving more than USD 35 million through various accounts.

The hub of the entire operation was Western Express International, Inc., a New York corporation based in Manhattan that operated as a virtual currency exchanger and unregistered money transmitter to coordinate and facilitate the Internet payment methods used by the criminal enterprise, and to launder the group's proceeds. One of the largest virtual currency exchangers in the United States, Western Express International exchanged a total of USD 15 million in WebMoney and USD 20 million in e-Gold for the cybercrime group and used banks and traditional money transmitters to move large sums of money. It also provided information and assistance through its websites (including Dengiforum.com and Paycard2000.com) on ways to move money anonymously and to insulate oneself from reporting requirements.

Western Express International and its owner/operator, a Ukrainian national, plead guilty in February 2013 in New York State to money laundering, fraud, and conspiracy offenses. (In February 2006, Western Express was also indicted for running an illegal check cashing/wire transfer service.) Three other defendants were convicted after trial in June 2013; several more plead guilty in August 2009. Two indicted defendants remain fugitives. The investigation was conducted jointly by the US Secret Service and the Manhattan (New York County) District Attorney's Office and was successfully prosecuted by the Manhattan District Attorney's Office.

NOTES

[1] The first draft of this paper was prepared jointly by Australia, Canada, Russia, the United Kingdom and the United States for the FATF meetings in February 2014. After that all delegations were invited to provide comments on the draft with a view to adopting a final paper at the next meeting. Comments were received from 10 delegations, and these have been taken into account in preparing this revision.

[2] "Bitcoin" (capitalised) refers to both the open source software used to create the virtual currency and the peer-to-peer (P2P) network formed as a result; "bitcoin" (lowercase) refers to the individual units of the virtual currency.

[3] It should also be noted that some observers, including former US Federal Reserve Chairman Alan Greenspan, Nout Wellink, a former President of the Dutch Central Bank, and Nobel Laureate economist Robert Shiller, maintain that virtual currency is a passing fad or bubble, akin to Tulipmania in 17th Century Netherlands.

[4] Virtual currency is a complex subject that implicates not only AML/CFT issues, but also other regulatory matters, including consumer protection, prudential safety, tax and soundness regulation, and network IT security standards. The proposed vocabulary is thus relevant across a number of complementary regulatory jurisdictions. Adoption of consistent terms and a common conceptual understanding of virtual currency by all relevant government entities is important to avoid duplicating efforts and/or working at unintended cross purposes, and facilitates the capacity of governmental authorities to leverage their various perspectives and areas of expertise in order to most effectively identify and address relating to virtual currencies.

[5] **Digital representation** is a representation of something in the form of digital data—i.e., computerised data that is represented using discrete (discontinuous) values to embody information, as contrasted with continuous, or analog signals that behave in a continuous manner or represent information using a continuous function. A physical object, such as a flash drive or a bitcoin, may contain a digital representation of virtual currency, but ultimately, the currency only functions as such if it is linked digitally, via the Internet, to the virtual currency system,

[6] Legal tender status does not necessarily require an entity or individual to accept payment in a particular type of legal tender. For example, in many jurisdictions, a private business, person, or organisation is free to develop internal policies on whether or not to accept the jurisdiction's physical currency or coins (cash) as payment for goods and/or services.

[7] This definition differs from that offered in 2012 by the European Central Bank (ECB), which defined virtual currency "as a type of unregulated, digital money, which is issued and usually controlled by its developers, and used and accepted among the members of a specific virtual community" ECB, *Virtual Currency Schemes* (October 2012), p. 6. The ECB recognised on p.13 of its report that its "definition may need to be adapted in future if fundamental characteristics change." Its definition now appears too limited, since math-based, decentralised virtual currencies like Bitcoin are not issued and controlled by a central developer, and some jurisdictions (e.g., the United States, Sweden, and Thailand) now regulate virtual currencies.

[8] This categorisation differs from the ECB's three-part classification, which divides virtual currencies into three types: "Type 1 . . . refer[s] to closed virtual currency schemes . . . used in an online game. Type 2 . . . [refers to] schemes [that] have a unidirectional flow (usually an inflow), i.e. there is a conversion rate for purchasing the virtual currency, which can … be used to buy virtual goods and services . . . (and exceptionally also … real goods and services) . . . Type 3 [refers to] schemes . . .[with] bidirectional flows, i.e. the virtual currency . . . acts like any . . . convertible [real] currency, with . . . [buy and sell] exchange rates . . . [and] can . . . be used to buy [both] virtual . . . [and] real goods and services." ECB *Virtual Currency Schemes*, p. 6. This discussion paper adopts a simpler, bifurcated classification because at present, only (fully) convertible virtual currencies that can be used to move value into and out of the formal financial sector present significant AML/CFT risks. This is because money laundering requires: Conversion or transfer (of illicit funds); concealment or disguise of the source/origin (of illicit funds); or acquisition/possession/use (of illicit funds).

[9] Some convertible virtual currencies can be exchanged directly through the issuing administrator (directly exchanged); others must be exchanged through a virtual currency exchanger (third-party exchanged).

[10] For example, WebMoney is a virtual currency because "valuables" (assets) are transferred and stored in the form of a non-fiat currency, The units of measurement of the valuables' property rights stored by the guarantor are WebMoney Title Units (WM) of the corresponding type. http://wmtransfer.com/eng/about/

[11] For example, despite such deterrence measures, several exchanges allow blackmarket conversion of World of Warcraft Gold.

[12] A third-party is an individual or entity that is involved in a transaction but is not one of the principals and is not affiliated with the other two participants in the transaction—i.e., a third party functions as a neutral entity between the principals (e.g., sender and receiver, buyer and seller) in a business or financial transaction. The third party's involvement varies with the type of business or financial transaction. For example, an online payment portal, such as PayPal, acts as a third party in a retail transaction. A seller offers a good or service; a buyer uses a credit or debit card entered through the PayPal payment service; and the trusted third party completes the financial transfer. Similarly, in a real estate transaction, a third-party escrow company acts as a neutral agent between the buyer and seller, collecting the documents from the seller and money from the buyer that the two principals need to exchange to complete the transaction.

[13] Distributed is a term of art that refers to an essential feature of decentralised math-based virtual currencies: transactions are validated by a *distributed* proof-of-work system. Each transaction is *distributed* among a network of participants who run the algorithm to validate the transaction.

[14] Apart from the initial creation and issuance of ripple coins (RXP), Ripple operates as a decentralised virtual currency. Ripple's founders created all 100 billion ripple coins and retained 20 billion of them, with the remainder to be distributed by a separate entity, Ripple Labs. However, all transactions are verified by a decentralised computer network, using Ripple's open source protocol, and recorded in a shared ledger that is a constantly updated database of Ripple accounts and transactions.

[15] In 2140, the block award will cease to be available and miners will be rewarded only by transaction fees.

[16] For example, PayPal is actively looking at accepting and clearing bitcoins on the PayPal platform, and JP Morgan Chase has filed a US patent application for an online electronic payments system using a math-based virtual currency protocol that would enable users to make anonymous payments without providing an account number or name, with the virtual currency to be stored on JPMC computers and verified through a shared log, much like the 'block chain' in the bitcoin system.

[17] For instance, it remains to be seen whether virtual currency systems can provide a pathway to other financial services, like credit and insurance.

[18] The Liberty Reserve investigation and takedown involved law enforcement action in 18 countries and jurisdictions, including Costa Rica; the Netherlands; Spain; Morocco; Sweden; Switzerland; Cyprus; Australia; China; Hong Kong, China; Norway; Latvia; Luxembourg; the United Kingdom; Russia; Canada; and the United States to restrain criminal proceeds, forfeit domain names, and seize servers.

[19] The Silk Road investigation involved multiple US law enforcement agencies, led the Federal Bureau of Investigation's (FBI')s New York Special Operations and Cyber Division, and the Drug Enforcement Administration's (DEA's) New York Organized Crime Drug Enforcement Strike Force (comprised of agents and officers of DEA, the Internal Revenue Service (IRS), the New York City Police Department, US Immigration and Customs Enforcement's (ICE) Homeland Security Investigations (HSI), the New York State Police, the Bureau of Alcohol, Tobacco, Firearms and Explosives, the US Secret Service, the US Marshals Service, Office of Foreign Assets Control (OFAC), and NY Department of Taxation), with assistance and support of the ICE-HIS Chicago field office, the Department of Justice's Computer Crime and Intellectual Property and Asset Forfeiture and Money Laundering Sections, the United States Attorney's Office for the Southern District of New York, and foreign law enforcement partners, particularly the Reykjavik Metropolitan Police of the Republic of Iceland and the French Republic's Central Office for the Fight Against Crime Linked to Information Technology and Communication.

FATF REPORT

THE ROLE OF *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS IN MONEY LAUNDERING AND TERRORIST FINANCING

October 2013

FINANCIAL ACTION TASK FORCE

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit the website:

EXECUTIVE SUMMARY

Twelve years after September 11th and the adoption of Special Recommendation VI on Alternative Remittance Systems, two often competing and conflicting views on *hawala* still stand. Many countries and communities, as well as the development community, view them as essential providers of financial services to the unbanked in countries with limited financial access. In significant numbers of jurisdictions and sometimes in the same jurisdiction, law enforcement views them as one of the leading channels for terrorist financing and money laundering.

Against this background, this typology seeks to demystify *hawala* and similar service providers. It seeks to provide a facts-based review of the extent of their vulnerability, as of today, to money laundering and terrorist financing. To this end, the typology project team sought input from members of the FATF and FATF-style regional bodies. The team received feed-back from 33 countries to a survey it had developed.

The term *hawala* is used in a number of jurisdictions and is associated with a money transfer mechanism that operated extensively in South Asia many centuries ago, and which still exists there, as well in the Middle East, and in Africa. In others countries, it has several different connotations in particular illegal money transmitter and in others, the term *hawala* is neither used nor understood, however, the service of remitting money may be covered by the country's legislative framework.

Hawala in fact is not a universal term. Still, there appears to be a universal recognition of the existence of *hawala* or *hawala*-like providers across jurisdictions, in so far as they present unique characteristics, focused on their settlement mechanisms. Recognizing this, this typology uses a broader term than *hawala* and instead focuses on "*hawala* and other similar service providers" or HOSSPs.

HOSSPs, for the purpose of the typology, are defined as money transmitters, particularly with ties to specific geographic regions or ethnic communities, which arrange for transfer and receipt of funds or equivalent value and settle through trade, cash, and net settlement over a long period of time. Some HOSSPs have ties to particular geographic regions and are described using a variety of specific terms, including *hawala*, *hundi*, and *underground banking*. While they often use banking channels to settle between receiving and pay-out agents, what makes them distinct from other money transmitters is their use of non-bank settlement methods, including settlement via trade and cash, as well as prolonged settlement time. There is also a general agreement as to what they are not: global money transfer networks (including agents) operated by large multinational money transmitters and money transfers carried out through new payment methods including mobile money remittance services. This description is based on *services* provided by them and *not their legal status*.

HOSSPs are used in some jurisdictions by legitimate customers for reasons of geography, culture, and lack of banking access. They are also used by individuals and entities seeking to evade currency controls, tax obligations, and sanctions. HOSSPs generally are cash-in and cash out businesses that primarily send personal remittances of low value. They generally operate in areas with a high percentage of expatriate workers and are visible to members of that community. They often run businesses other than money transfer, particularly currency exchange.

This typology reviews three major types of HOSSPs: pure traditional (legitimate) ones; hybrid traditional (often unwitting) ones; and criminal (complicit) ones. Distinct ML/FT risks apply to each. Pure traditional HOSSPs tend to be popular because of familial, regional or tribal affiliation and inadequate access to regulated financial services for senders/recipients in origin/receiver countries. Hybrid traditional HOSSPs also serve legitimate customers, but at the same time are used, wittingly or not, for illegitimate purposes to transfer funds cross-border. Criminal HOSSPs, on the other hand, are set up or expanded to service criminals.

Surveyed countries gave a number of reasons for the continued existence of HOSSPs, including their competitive pricing, faster money transmission, cultural preference, lack of banking access, low confidence in the banking system, as well as deliberate transfer or concealment of criminal proceeds and evasion of currency controls, sanctions, and taxes. At the same time, the typology highlights that many of the assumptions on HOSSPs are outdated. For instance, they, in some jurisdictions, offer services well beyond money transmission. More universally, they often have detailed records; are not necessarily based upon trust; often are highly visible to the community they serve; and are not always high risk. Further, they ultimately often settle through banks, meaning that banks that have been provided with high risk indicators by their authorities are positioned to identify suspicious activities and notify their authorities accordingly.

The typology explains the different settlement mechanisms used by HOSSPs, including simple reverse transactions, triangular settlement, settlement through value, and the use of cash couriers. It provides country-specific examples, as well outlines their communication techniques that in some cases permit the instant availability of funds. It finds that most countries cannot provide estimates on the scale of unregulated HOSSPs or their relative threat.

As always the case when criminals own or control financial intermediaries, criminal HOSSPs deserve particular attention. Although a limited number of case studies were provided to the project team, there are several reasons why HOSSPs continue to pose a money laundering and terrorist financing vulnerability. These include a lack of supervisory will or resources; settlement across multiple jurisdictions through value or cash outside of the banking system in some cases; the use of businesses that are not regulated financial institutions; the use of net settlement and the commingling of licit and illicit proceeds. While the settlement through value or trade that masks the individual fund transfers is a source of vulnerability, the most significant reason for concern is lack of supervisory resources and commitment to effective regulation.

Out of the cases gathered for this typology, a picture emerges of common elements used by *criminal* HOSSPs, including control by a professional third party money launderer called a controller or money broker, depending upon the jurisdiction. Based upon existing case studies, it appears that HOSSPs can also be abused or used for import and export fraud, to launder drug proceeds, and to evade sanctions.

Similarly, the typology's case studies provide examples of terrorists still using HOSSPs to move funds twelve years after 9/11. They are used for reasons of familiarity, culture, extensive international reach, speed of transfers, and often lax supervision or lack of political will. The latter factors make it more likely that these institutions may lack robust AML/CFT controls, making them attractive to criminals and terrorist financiers.

A slight majority of surveyed countries bar HOSSPs from operating legally. Those that allow them to operate legally, provided they license/register with the relevant authorities and comply with relevant AML/CFT and other laws, largely believe that legalization of HOSSPs helped expand remittances through legal channels. However, in most jurisdictions that allow HOSSPs to operate legally, relatively few HOSSPs have actually registered or become licensed, with a few notable exceptions.

Effective supervision of HOSSPs is one of the primary challenges facing regulators and their governments. Most countries do not appear to have separate examiner teams for HOSSPs. While most have criminal, civil, and, to a lesser extent, administrative sanctions available for violations of AML/CFT obligations, many countries do not appear to have used these sanctions. Few countries require that money transmitters, including legal HOSSPs, should only partner with money transmitters in pay-out countries that are legally licensed or registered. The absence of requirements on foreign counterparties may be a critical vulnerability posed by money transmitters, including HOSSPs and further consideration of the application of Recommendation 13 in the context of money transmitters offering cross-border may be beneficial. Similarly, the absence of more than a handful of case studies involving international cooperation suggests that further discussion is warranted on how law enforcement or other competent authorities can better obtain the tools and expertise needed to tackle HOSSPs involved in money laundering or terrorist financing.

In the first decade after 9/11, the globe has been largely ineffective in supervising HOSSPs. The international community can address the resulting vulnerability by bringing the HOSSPs under a risk-based AML/CFT regulatory and supervisory framework that is effectively implemented. FATF could take these findings into account when it considers the policy implications of this report.

Note: The findings highlighted in this report should also be useful to other streams of work at the FATF, within national governments and for other stakeholders, for example in relation to the implementation of the FATF Standards.

CHAPTER 1: SCOPE OF THE PROJECT

The scope of the project is a discussion of typology and role of *hawala* and other similar service providers (HOSSPs) in money laundering and terrorist financing. HOSSPs are a subset of money or value transfer services (MVTS).

MVTS are defined by Financial Action Task Force (FATF) as financial services that involve the acceptance of cash, checks, other monetary instruments or other stores of value and the payment of a corresponding sum in cash or other form to a beneficiary by means of a communication, message, transfer, or through a clearing network to which the MVTS provider belongs. Transactions performed by such services can involve one or more intermediaries and a final payment to a third party, and may include any new payment methods.

One key lesson from the survey questionnaire prepared by the typology project team and distributed to members of FATF and FSRBs and discussed at the typology workshop held in Dakar, Senegal in 2012[1] is that there is no common definition to the term *hawala*, which is interpreted in varied ways, having different meanings across jurisdictions. Some HOSSPs have ties to particular geographic regions and are described using a variety of specific terms, including *hawala*, *hundi*, and *underground banking*.

The term *hawala* is traditionally associated with a money transfer mechanism that operated extensively in South Asia many centuries ago and had strong links along traditional trade routes in Middle East and parts of East Africa. It operated as a closed system within corridors linked by family, tribe or ethnicity. In recent times, the term *hawala* has often been used as a "proxy" to describe a wider range of financial service providers, beyond these traditional and geographically tied systems.

In other countries, the term *hawala* is actually not used at all. However, there is a general recognition of the existence of *hawala* or *hawala-like* providers in many jurisdictions and of the type of methods they use and services they provide. There is also a general agreement as to what they are not: global money transfer networks (including agents) operated by large multinational money transmitters and money transfers carried out through new payment methods including mobile money remittance services.

Based on experience across countries, HOSSPs provide both legitimate and illegitimate services. They are money transfer service providers that are legal in certain countries if registered or licensed and illegal in others. In other countries, HOSSPs are referred only within the context of underground or criminal money transfer services.

For the purpose of this typology, HOSSPs are defined as money transmitters, particularly with ties to specific geographic regions or ethnic communities, which arrange for transfer and receipt of funds or equivalent value and settle through trade, cash, and net settlement over a long period of time.

[1] The 11-member project team prepared a 47 question questionnaire, which was circulated to the FATF membership and to the FSRBS in September 2012. The APG sent an abbreviated version of the questionnaire to its members. Received questionnaire results were discussed at a typology workshop in Dakar, Senegal in November 2012.

While HOSSPs often use banking channels to settle between them, what makes them distinct from other money transmitters is their use of other settlement methods, including trade, cash, and long-term net settlement. Against this background, it is important to highlight that the definition of "*hawala* and other similar service providers" is based on the services provided by them and is irrespective of their legal status.

As described below, why HOSSPs exist and their services are utilized reflects a rather diverse set of reasons, often linked to country-specific circumstances. These include reasons of history, geography, culture, lack of banking access, currency controls, tax evasion and sanctions circumvention which create a demand and a market, or lead to the emergence of the provision of services described in this report.

This Chapter will explain the attributes of *hawala* and other similar service providers, how HOSSPs operate, what services are provided by them, who uses their services and what technology is used to transmit customer and transaction related information. It includes a discussion on the different formats of *hawala* and other similar service providers operations and the scale and nature of the "*hawala* and other similar" markets around the world.

1.1 ATTRIBUTES OF *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

H*awala* and other similar service providers share many attributes with other money transmitters. Like many other money transmitters, HOSSPs generally:

a. Are cash-in and cash-out businesses that primarily send personal remittances of low value. This does not preclude them from sending high value business transfers.

b. Operate in areas with high percentages of expatriate workers (in particular in originating countries), often in competition with other money transmitters.

c. Offer legitimate financial services to migrants sending remittances; however, they can also be used (or abused) for illegitimate purposes to move illegal/illicit money across the borders.

d. Operate within a community, are visible and accessible to their customers, are able to know their customers and maintain accurate records sufficient to ensure they complete transactions whilst preserving their profit

e. Run other businesses in addition to money transfer.

f. Belong to networks of similar operators in other countries.

g. Communicate only limited information on the customer and beneficiary as far as individual transactions are concerned. This communication is limited to what is needed to complete the transaction. This information generally includes the beneficiary name, contact number and may also include a transaction reference number (code number/words to identify recipients), in order to ensure that the delivery is made to the right person in an efficient manner.

HOSSPs tend to use specific and distinct settlement tools: They settle through trade, cash courier or net settlement, often without any direct wire transfer between the originator and beneficiary.

However, they may also send wire transfers aggregating funds received through individual remitters through the international banking system. In addition, they sometimes reconcile/settle through third party payments, which may lead to long settlement durations.

1.2 TYPES OF *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS CATEGORIZED BY LEGITIMATE AND ILLICIT USE

For the purposes of this typology, there are three major types of *hawala* and other similar service providers that operate across the globe as categorized by legitimate and illicit use – to which distinct ML/FT risks apply:

- **Pure traditional** (legitimate) *hawala* and other similar service providers;
- **Hybrid traditional** (sometimes unwitting) *hawala* and other similar service providers and
- **Criminal** (complicit) *hawala* and other similar service providers

PURE TRADITIONAL *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

In South Asia and Middle East, the word *hawala* is commonly used to refer to "Pure Traditional *Hawala*", a centuries-old money transmission system which was often used for trade-finance. These systems have operated for centuries in an unregulated environment and are still present in some countries for trade-finance and personal remittances, sometimes under a regulatory umbrella, but more typically not. Pure Traditional *Hawala* and other similar service providers are also extensively used to send low-value remittances on behalf of individuals, for example, migrant workers – extending outside their historical geographical area as populations migrate and trade routes develop. For instance, *hawala* are a common provider for remittances to migrant workers in the United Arab Emirates, where a significant portion of the working class population is composed of expatriates. Pure Traditional *Hawala* and other similar service providers tend to be popular among migrants because of familial, regional or tribal affiliation and inadequate access to regulated financial services for senders/recipients in origin/ receiver countries. These service providers may primarily function to provide legitimate and efficient remittance/trade finance services to customers sending low value transactions. If sufficiently regulated and supervised, these providers, due to the low value of their average transactions, may present a low or lower money laundering and terrorist financing vulnerability. Minimal supervision in certain jurisdictions, however, may amplify the risk for misuse.

HYBRID TRADITIONAL *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

Hybrid Traditional *Hawala* and other similar service providers or designated non-financial institutions or designated non-financial businesses and professions (DNFBPs) in the provision of legitimate services but at the same time they may also be used, wittingly or are also used, wittingly or not, for illegitimate purposes such as transmission of illicit money across the borders. These networks are not primarily set up to move illicit money but may be involved in illegal activities such as movement of money generated from tax evasion, to evade currency controls and to avoid sanctions, etc. These service providers utilize similar methods as traditional HOSSPs and are not a

part of a criminal network. They develop where there is an un-serviced demand for remittances; they may interact with other HOSSPs to complete transactions.

CRIMINAL *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

In some countries, there is concern that HOSSPs systems are increasingly being set up or expanded to service criminals. Providers who set up such systems are described in this report as "Criminal HOSSPs". Such systems are driven by illegitimate money flows and are often controlled by criminals or criminal groups. They therefore represent a high criminal money laundering and terrorist financing risk. A third party professional money launderer often runs the financial network. These criminal networks also enable other offences including tax fraud, currency offences and corruption. Criminal *Hawala* and other similar service providers are often a part of well-developed criminal networks that have been developed specifically to enable illegitimate activities. Initially these channels may be developed as networks to satisfy local/personal remittance needs by Traditional or Hybrid *Hawala* and other similar service providers. As the network grows into a strong transfer corridor, it becomes attractive to criminals and evolves into a criminal transfer corridor. These criminal networks are characterized by high value transactions between legal and natural persons that do not necessarily share the same cultural or geographic background. They are often used to send payments to countries with developed and regulated banking systems.

1.3 COMMON CHARACTERISTICS OF *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

This sub-section describes the common characteristics of "*Hawala* and Other Similar Service Providers" based on survey[2] results, previous FATF work on alternate remittance services, literature review and country presentations at *hawala* typology workshop. The descriptions are also influenced by the lack of a common definition or understanding of what HOSSPs are. All the characteristics may not always be present in all the countries of operations. In other words, only some of these characteristics may be present in some countries.

Generally *hawala* and other similar service providers include:

a. Illegal or unlicensed/unregistered money transmitters. More than half of the respondents confirmed that HOSSPs are generally either unregulated or illegal in their country. In most of the countries, *hawala* and other similar service providers have not traditionally been subject to any regulatory oversight. However, recent efforts have resulted in the shifting of *hawala* and other similar service providers into the regulated financial sector in several countries. In 50% of the countries that responded to the question, *hawala* and other similar service providers are now regulated. In some countries, the process of regulation is in its very early stage.

[2] Only FATF member countries responded to this question. Out of 25 FATF member countries that responded, 22 countries provided an answer to this question and three countries could not because "*hawala* and other similar service providers" do not exist in their country. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

b. Alternative remittance providers that transfers funds outside of banks or other regulated financial institutions. All except one of the surveyed countries that responded to the question agreed to this, and this characteristic is the only one that is common in most of the surveyed countries.

c. Money transmitters that use net settlement with payout agents actually transferring no funds. In net settlement, there are no funds transferred for each and every transaction that takes place between *hawala* and other similar service providers. For these individual transactions, *hawaladar* (a money transmitter that provides *hawala* services) and similar service providers use their local cash pool to pay the beneficiary. After a set period of time (example after a month) only the net amount owed between the two *hawaladars* and other similar service providers is settled. About 80% of the surveyed countries concur that net settlement without transfer of funds is the most common settlement process used in their country by *hawala* and other similar service providers.

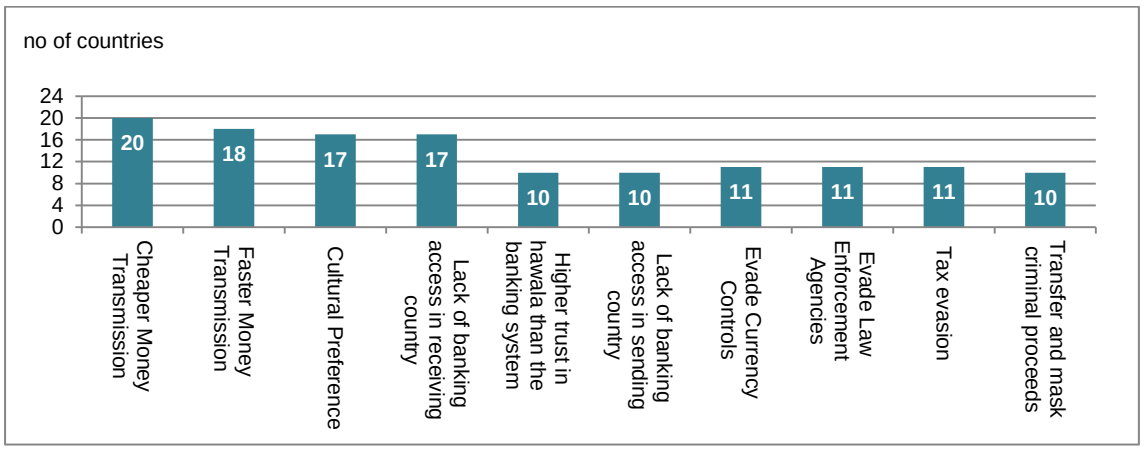
d. Money transmitters that settle through equivalent value instead of monetary instruments. Settlement through value may take place through trade transactions, such as merchandise or other commodities. At times, *hawaladar* and other similar service providers that owe debt to corresponding providers settle accounts by fulfilling commercial obligations of such corresponding providers such as paying a debt or invoice of same value that they owe. This approach is used in 68%of the countries that responded to the question.

e. Money transmitters that often only serve specific diaspora communities. About 32% of the countries believed that *hawala* and other similar systems serviced only specific communities. Traditionally, *hawala* and other similar channels were described as groups or networks that were based on familial, regional, or tribal affiliation. In recent times, *hawala* and other similar service providers have started servicing wider networks, but this is still an emerging trend.

1.4 REASONS *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS EXIST

This section highlights the main reasons for existence of *hawala* and other similar service providers in various countries. The survey sought information on what needs *hawala* and other similar service providers fulfil in the surveyed countries. Figure 1.1 below highlights the main reasons put forward and their frequency. As it can be observed, there are significant differences in the responses received, highlighting a noticeable disparity across countries, reflecting themselves the different characteristics of *hawala* and other similar service providers. Some characteristics are more prevalent in some countries than others. The responses indicated that some of the answers are not based on specific real-life examples, but more on perceptions of the roles and characteristics of HOSSPs.

Figure 1.1 **Reasons for Existence of *Hawala* and Other Similar Service Providers – Survey Result**



Source: F*ATF project questionnaire.*

Note: Only FATF member countries responded to this question. Out of 25 FATF member countries that responded 22 countries provided an answer to this question and 3 countries could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

The most common reasons cited were:

a. **Cheaper Money Transmission:** *hawala* and other similar service providers usually charge 25-50% of the equivalent bank charge depending on destination of transfer, according to the responses of some countries. Depending upon the jurisdiction, customers generally obtain better exchange rates from HOSSPs than from the banks because they operate with very low overheads.

b. **Faster Money Transmission:** *hawala* and other similar service providers may have a vast network of counterparties located in specific countries. Money transmission can be completed in few hours or at the most in one or two days. In the same locations, banks can often take a few days or even longer in certain jurisdictions, to send an international wire transfer and money transmission networks may be unable or limited in their ability to compete. One of the reasons for quick transmission of funds under HOSSPs is that operators do not transfer cash for every client transaction, often resort to net settlement as do many other types of MVTS.

c. **Cultural Preference:** HOSSPs have existed for a long time in some areas of Central Asia, South Asia and Middle East, even long before the modern banking started operating. So it can be a cultural tradition for the people in these areas to transfer money through traditional *hawala* and other similar service providers. In many developed countries, such channels are primarily used by migrants because of ease of rapport building and access between *hawaladars* and other similar service providers and their customers, who share similar customs, lifestyle and language.

d. **Lack of Banking Access in Remittance Receiving and Sending Country:** Many remittance receiving countries have underdeveloped financial systems. In such

countries, *hawala* and other similar service providers have the ability to deliver money to distant locations where regulated channels do not exist. Countries like Nepal, Pakistan or some countries in North Africa and the Middle East are good examples of such situation. HOSSPs are also often the only channel through which funds can be transmitted in certain conflict regions like in parts of Somalia and parts of Afghanistan[3]. These remittance transfers are the safest, easiest and cheapest way to transfer funds in these countries.

In addition, on the remittance sending country side, where banking access is more developed, *hawala* and other similar service providers are often used by illegal foreign migrants residing in developed countries. Their illegal immigration status precludes these clients to access banks and other regulated financial services providers – leaving only limited cost-effective alternatives like unregulated service providers to send remittances to their families. It is worth emphasizing though that legal resident and migrants also extensively use these service providers for the other reasons stated in this section.

e. **Higher Confidence in *Hawala* and other similar service providers than in the banking system:** This is true in countries where there is a cultural lack of confidence towards banks – in particular in countries where customers have in the past lost their deposits when bank failures occurred. The limited understanding or familiarity with traditional financial services due to lack of financial literacy may be another reason explaining this lack of confidence towards regulated financial institutions. Finally, language barriers are likely to be a significant hurdle for immigrant populations.

f. **Evade Currency controls and international sanctions:** Responses to the survey highlight how, in some specific circumstances, *hawala* and other similar service providers seem to have been used to circumvent restrictions applying to international transactions – for instance exchange controls or international sanctions. These responses and examples show how *hawala* and other similar channels are used to bypass currency controls or international sanctions that increase money laundering and terrorist financing risks.

g. **Evade Taxes:** Responses note *hawala* and other similar service providers are used to evade taxes - as the tax authority have access to records kept in banks, but usually do not have the same tools for HOSSPs and other similar service providers – or do not even try to trace transactions in such circumstances. The use by commercial businesses of unregulated networks (instead of official financial service providers) may signal the underlying intention of concealing the funds being transferred for tax evasion purposes or to avoid sanctions.

h. **Transfer or Conceal Criminal Proceeds:** Responses note that criminals are perceived to prefer to use HOSSPs to transfer funds because commitment to CDD procedures performed by some *hawaladars* are not believed to be as rigorous and

[3] A 2005 World Bank study estimated that 80 to 90 per cent of Afghanistan's economic activity at that time was facilitated by *hawala*.

deep as those of banks and other regulated financial institutions, and are less likely to be accessible to the authorities. Therefore where holders of illicit funds have access to HOSSPs and the operators are willing to serve them, it is thought easier to transfer criminal money through these channels. In addition, tracing the money flow by the competent authorities may be made more challenging because, even when records are kept they can be falsified (ranging from counterfeit or hijacked customer identities to complete sets of entirely fictitious business records), making them, less easily followed by law enforcement.

This summary highlights that *hawala* and other similar service providers offer services for legitimate purposes, but can also be abused – or set up for criminal purposes. The level of regulation of HOSSPs at both ends of a remittance (and their actual implementation of AML/CFT requirements) has a link to their level of risk.

1.5 OUTDATED ASSUMPTIONS

Some surveyed countries also noted that some of widely repeated characteristics of pure traditional *hawala* do not necessarily match the reality in all the countries, particularly in Western Europe and North America. These were referred to as "***Hawala* Myths**".

a. **An ancient and static system:** Even pure traditional *hawala* is actually an ever evolving one. Country experiences suggest that entities within licit network adapt their structure and methods to ensure remittance corridors are serviced efficiently. Each end of a remittance reflects the rules, regulations and context that they operate in. In many countries, an operation described as *hawala* looks and acts the same as a MSB in another country.

b. **Remittance system only, it also offers other financial services:** In its heartland, "pure traditional *hawala*" are not pure remittance systems. Apart from sending remittances, they also usually offer other financial services such as currency exchange, and in some jurisdictions, short term lending, trade guarantees, and safe keeping of funds. In some countries, they may operate as pawn shops, travel agencies and mobile phone shops.

c. **Paperless system:** Many *hawala* investigations have revealed that *hawaladars* and similar service providers actually keep detailed records. They maintain manual accounts, ledgers, computerized records or a combination of these. The businesses of some *hawaladars* are based on small margins of profit, and recording and tracking deposits, payments and transfers is important to their good reputation and efficiency; alternatively HOSSPs that service the criminal market need to keep detailed records in order to keep track of transactions completed through complex settlement methods such as third party payments and trade transactions.

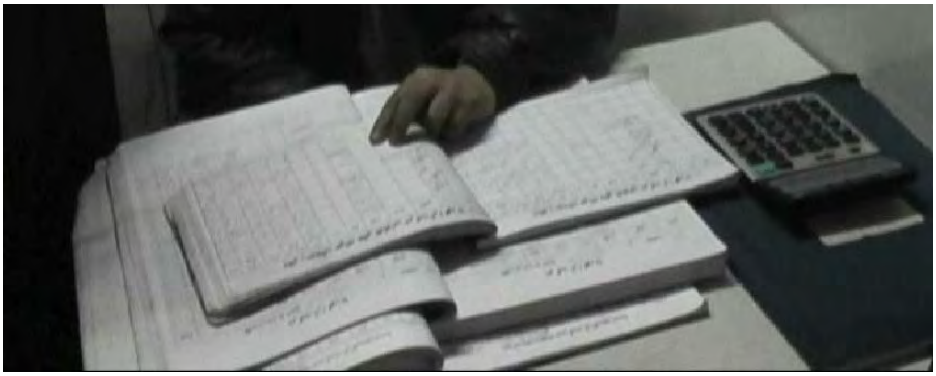


Image 1. **Hawala ledgers from Hawala Bazaar in Kabul, Afghanistan**

d. **Always Cheaper:** "*hawala* and other similar service providers'" transactions may be cheap but only within defined and specific corridors. Their competiveness is highest where customers need to send money to areas where traditional banking systems and large money transmitter's chains find it difficult, expensive or a high risk to operate. When such conditions are not met, the cost of sending funds through *hawala* and other similar service providers may actually not be that competitive.

e. **Trust based system of money transmission:** *hawala* are often defined as a trust-based system of money transmission. Rather than trust, *hawaladars* and other similar service providers actually rely on reputation for effective delivery. The customer chooses a *hawaladar* or other similar service provider because of their reputation for performance and this reputation is quickly lost when performance slips. *Hawaladar* and other similar service providers are also often relatively respected individuals within their community and success of their business is performance based.

f. **Underground:** In many countries, *hawaladars* and other similar service providers are actually highly visible within the community they serve and may even advertise their services openly (even when they are not a regulated or licensed or registered business).

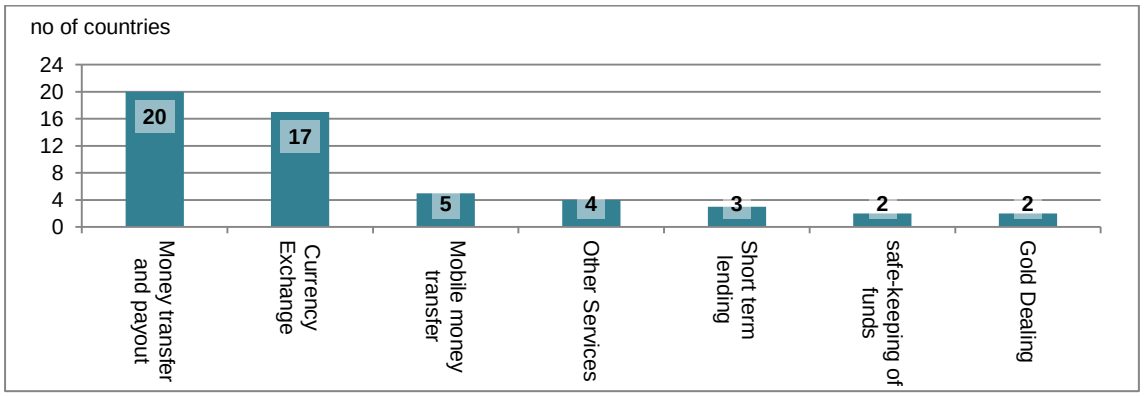
g. **High Risk always:** Depending on the type of *hawala* or other similar service provider and on the kind of services provided, the risk profile may actually differ significantly. The risk profile of the *hawala* and other similar services providers is dependent on its customer's risk profile, among others. *Hawala* transactions can be a lower risk if, for example, the service is provided by a regulated entity or entails low value transactions on behalf of low risk individuals.

1.6 SERVICES PROVIDED BY *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

The survey results as shown in Figure 1.2 summarize the feed-back on the types of services predominantly provided by *hawala* and other similar service providers. The two most common financial services provided are: 1) money transfer and pay-out and 2) currency exchange. Besides these services, *hawala* and other similar service providers may offer other services such as safe-

keeping of funds for the clients, short-term lending, mobile money transfers etc. although these are not as common.

Figure 1.2 **Financial Services provided by *Hawala* and Other Similar Service Providers**

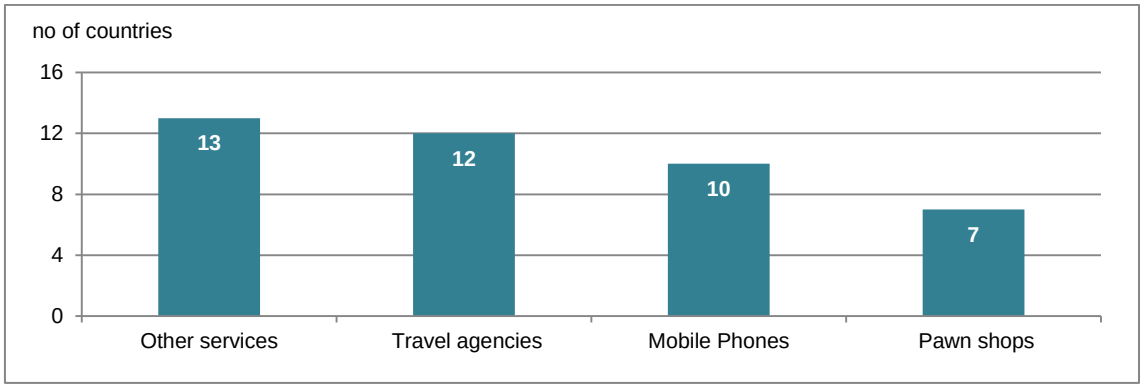


Source: FATF project questionnaire.

Note: Only FATF member countries responded to this question. Out of 25 FATF member countries that responded 21 countries provided an answer to this question, 1 country did not respond to this question and 3 countries could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

Apart from financial services, in many of the surveyed countries, *hawala* and other similar service providers also operate other business (see Figure 1.3). Typical side-line retail business includes travel agencies, pawn shops, selling mobile phones, SIM cards and mobile top-up cards. Many of them also operate as travel agents. In some cases they also operate as community specific grocers. Grocery stores are a typical venue for *hawaladars* and other similar services providers to conduct their remittance business. Many of them also provide import –export business – which creates an enabling environment for value settlement – in particular over-under invoicing when remitting funds to other geographic locations. Some *hawala* and other similar service providers also operate out of neighbourhood businesses, such as nail salons, beauty salons, flower shops etc. Such businesses not only generate more business for the service providers, but also provide a veil without being easily identified by regulators and law enforcement agencies. By running an additional business such as a travel or ticket agency or freight forwarding, criminal HOSSPs can derive an additional benefit that provides them with a ready supply of customer identity documents, which can be 'hijacked' and used to generate false customer records which are used to mask the receipt of criminally derived cash.

Figure 1.3 **Businesses Operated by *Hawala* and Other Similar Service Providers**



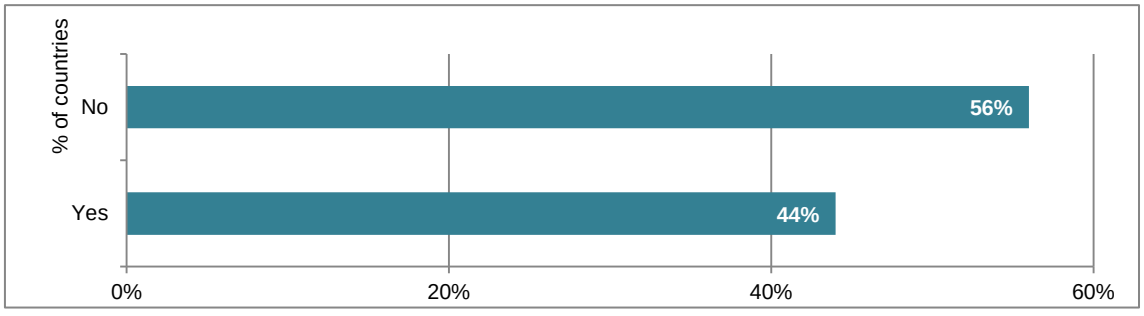
Source: FATF project questionnaire.

Note: Only FATF member countries responded to this question. Out of 25 FATF member countries that responded, only 16 countries provided an answer to this question, 6 countries did not respond to this question and 3 countries could not provide an answer to this question because "*hawala* and Other Similar Service Providers" do not exist in their country. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

1.7 PROVIDING SERVICES TO UNBANKED

In a large minority of countries, HOSSPs are believed to provide services to the unbanked. Twenty five[4] surveyed countries answered the question whether HOSSPs provide legitimate financial service to the unbanked and under-banked in their country. Of those surveyed, 44% of the countries answered positively as shown in Figure 1.4. In the majority of the surveyed countries where HOSSPs are legal, they are considered to play an important role in providing financial services to the unbanked population, facilitate migrant remittances that support development, with the majority of the transactions being for overseas legitimate family support.

Figure 1.4 **Do HOSSPs Provide Legitimate Financial Service to the Unbanked?**



Source: FATF project questionnaire.

[4] Both FATF and APG member countries responded to this question. Out of 25 FATF member countries that responded 19 countries provided an answer to this question, 3 countries did not respond to this question and 3 countries could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country. Out of 8 APG member countries that responded 6 countries provided an answer to this question, 1 country did not respond to this question and 1 country could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country.

1.8 SETTLEMENT MECHANISMS USED BY *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

As noted above, settlement in the context of *hawala* and other similar service providers generally takes place through net settlement, with recourse to value settlement. The use of net settlement by HOSSPs is not unique, but a technique also often used by banks and other money transmitters. The use of value to settle is unique. Some however also use actual transfer of funds for the settlement purpose. Most of the regulated *hawala* and other similar service providers use regulated channels, such as the banking system, to settle if their respective ledger does not balance after certain time period.

In this context, the most frequent methods of settlement used by *hawala* and other similar service providers include:

a. Simple "reverse *hawala*": a remittance or payment going in the opposite direction. For example, an individual customer wants to send money from US to India. The service provider in the US will ask his counterpart in India to make a payment to the beneficiary in India. For this transaction, there is no transfer of funds between the two service providers, and the service provider in India will use his local cash pool to make the payments. To settle the accounts, sometime in the future the US service provider will make a payment to a beneficiary in US on behalf of a customer of the service provider in India. Over a period of time, the overall net amount of transactions may balance. When this does not occur, notably if the aggregate remittance flows are highly asymmetrical among countries, net settlement then takes place – often through wire transfers through the banking system.

b. "Triangular" settlement with networks of service providers. *Hawaladars* and other similar service providers may operate within a network that is spread across many jurisdictions. They use cross-provider balances on each other and correspondents to settle their respective accounts. In the above example, the service providers in the US and India both operate within the same broader network. After the initial transaction, the US service provider owes the Indian one. At the same time, the service provider in India has a customer who wants to send money to Somalia. If the service provider in India doesn't have any counterpart in Somalia, he would seek assistance from his counterpart in the US to identify a counterpart service provider in Somalia who owes debt to the US one. Once the Somalia service provider pays the beneficiary on behalf of the Indian one, all accounts are settled.

c. Value settlement through trade transactions, including through over or under invoicing. This type of arrangement is a common practice in Afghanistan, Iran, Pakistan and Somalia. In this case, operators use a surplus of cash or banked money to fund trade payments at the request of a business which in turn pays the individual recipients in the remittance destination region. International controllers or money brokers involved in criminal HOSSPs often settle by conducting completely separate trade transactions with criminally derived cash in their control.

d. Settlement through cash transport – notably cash couriers, including cross border.

Box 1.1 **Country Examples of Settlement procedures given by survey respondents**

Belgium: In some cases money remitters (HOSSPs) used the banking system to transfer bulk funds received from different clients to the bank account of hawaladars in Dubai. From there on, the money is send to the beneficiaries' in East-African countries using settlement through value or mobile payment systems. In other cases, money was directly transferred from Belgium to Pakistan using settlement through value, licensed money remitters and the regular banking system.

Sweden: Money is generally not moved physically or electronically at the time of the individual (usually rather small) payment order. Each month or at agreed point in time there is a settlement or clearance of transactions between the Swedish agent and the foreign agent. The difference is sent from the Swedish agent to the foreign (local) agent in one big lump sum through a Swedish bank to the bank account of the agent overseas. Settlement may also take place with merchandise or other commodities. In recent years it has also become more frequent that individuals (with or without their own business) make their own bank accounts available to international payment transfers.

Chinese Taipei: "Underground Money shops" (the Chinese term for HOSSPs) settle transactions either by direct remittances, cross-border transportation of precious metals, cash or mingling remittance transfer with trade accounts. In some recent cases, settlements were done through Western Union Remittance System and China Union Pay Cards as well.

Italy: Evidence from STRs in Italy suggest that HOSSPs may collect remittances from their customers (usually belonging to their own diaspora communities) and perform bulk transfers to the country of origin by making use of official channels, either by depositing the funds on his/her own bank account and making a wire transfer to his/her correspondent in the beneficiary country or by placing an order at a licensed money remittance transmitter. The use of prepaid cards in the remittance collection phase is also being observed.

Germany: Illegal HOSSPs often use relatives in foreign countries for the pay-out. Sometimes they travel to the foreign country themselves regularly to pay out the money. Another way is they use registered service providers, but act in their own name instead of the name of the customer. In some rare cases, authorized agents conduct money remittance business on their own behalf in an illegal way by using the software given by the principal remittance service provider.

Source: Country investigations, FATF project questionnaire.

1.9 TECHNOLOGIES AND COMMUNICATION TOOLS USED BY *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

The techniques and tools used by *hawaladars* and other similar service providers require effective communication mechanisms, as they cannot rely on the IT communication services of international funds transfers' providers.

Effective communication is also one key competitive advantage of these services providers, as clients value the immediate availability of funds. Telephone, fax and e-mails to communicate transmission messages to other services providers across the borders are therefore essential. Recently, authorities have been observing the use of advanced internet technologies by *hawala* and

other similar agents and suspect they are exclusively using protected online services to conduct their activities and maintain their accounts, leaving no manual accounts. Some of these authorities suspect that these services and websites are being hosted from servers located in Dubai[5]. The same authorities also consider that such agents also operate through banks located in Dubai for net settlement of their transactions, leaving no trail after being processed through these banks.[6]

1.10 SCALE OF UNREGULATED *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

The scale of unregulated *hawalas* is unknown and is impossible to generalize. Most countries have difficulties reaching credible estimates of the size of unregulated *hawala* and other similar service providers. Variations are understood to be significant from one country to the other, as are the structure of the *hawala* and other similar services markets. In some countries, traditional *hawala* and other similar services providers are believed to be more prominent while in others, illegal/criminal operators reportedly represent the highest market share. The situation is further complicated as in many countries regulated money transfer agents are reportedly used to conduct illegal *hawala* and other similar services transactions separately and covertly in addition to their regulated activities. Such market structures make it even more difficult to estimate the amount of illegal HOSSPs in a country.

Out of the 21[7] countries that responded to the question on the size of illegal *hawala* and other similar service providers in their jurisdiction, only 8 countries attempted to provide some information on the scale of unregulated *hawala* and other similar services operations in their country. The remaining 13 countries acknowledged the existence of unregulated *hawala* and other similar service providers but could not provide any estimate. The estimated number of unregulated *hawala* and other similar services provided by countries ranged from 25 to several hundred. Countries pointed out that these estimates most likely underestimate the real number of unregulated operators. Some countries provided a rough estimate of the market share of unregulated *hawala* and other similar service providers in total remittance market, ranging from 10% to 50%. These estimates are largely based on investigations, are anecdotal, and may not be representative.

Against such difficulties to reach even reasonable estimates, regulating, supervising and monitoring unregulated *hawala* and other similar service providers proves very challenging.

Several reasons can be identified to explain the challenge in providing reasonable estimates, including: (1) Very small number of ML/TF investigations involving *hawala* and other similar service providers; (2) Very limited number of operations by public authorities to detect unregulated *hawala* and other similar service providers; (3) Strong variations and diversity in the structure of

5 Netherlands Authorities.

6 *Ibid.*

7 Only FATF member countries responded to this question. Out of 25 FATF member countries that responded 21 countries provided an answer to this question, one country did not respond to this question and 3 countries could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

the *hawala* and other similar service providers markets; and (4) The absence in most countries of coordinated policy and operational coordination to identify unregulated *hawala* and other similar service providers.

1.11 LACK OF SUPERVISION EXACERBATES MONEY LAUNDERING AND TERRORIST FINANCING VULNERABILITY

One of the key findings of this survey is that how best to regulate and supervise *hawala* and other similar service providers remains one of the key challenges authorities face in many countries today and that a lack of supervisory resources for MVTS is a global problem. As with other sectors, the less regulated and supervised the *hawala* and other similar service providers market is, the greater the money laundering and terrorist financing vulnerability. Completely unregulated operators are particularly vulnerable to Money Laundering/Terrorist Financing risks because they permit funds to be sent with little or no CDD requirements, allowing a money launderer or terrorist financier to freely send funds with limited risk of being identified. The information collected from the questionnaire shows that with no requirement to comply with core AML/CFT obligations, most of the unregulated *hawala* and other similar service providers maintain records in a format that are not easily accessible to law enforcement authorities. Similarly, the findings highlight how limited supervisory capacity for the MVTS sector in most countries only exacerbates this problem. FATF could take these findings into account when it considers the policy implications of this report.

On the other hand, unregulated *hawala* and similar services provide legitimate and efficient remittance services to lower risk customers who pose lower ML/TF risk. Their services are particularly relevant where access to the regulated financial sector is difficult or prohibitively expensive.

The multi-dimensional nature of unregulated *hawala* and other similar service providers makes regulating the sector a complex issue, all the more so given the significant resources constraints facing supervisors of the MVTS sector. Understanding the dynamics of unregulated *hawala* and other similar service providers in the framework of broader financial system is important before designing a monitoring/regulatory/supervisory regime for the sector. One of the concerns expressed by the development community is whether over-regulating *hawala* and other similar service providers could result in such providers becoming completely underground and as a result, more vulnerable to ML/TF risks. Hard evidence, however, is difficult to come by to document this concern. As countries are imposing stricter AML obligations such as CDD in the regulated financial sector - including remittance and money transfer businesses, it is possible that unregulated sector might become more attractive for money laundering activities. Therefore it becomes of paramount importance for countries to balance these two facets of the sector in order to most effectively mitigate ML/TF risks.

While much attention has been paid to *hawala* and other similar service providers over the last ten years, the complexity, diversity, varying drivers and variety of the *hawala* and other similar service providers, particularly in countries where the regulated financial sector is far from having reached maturity, continues to make the set up and enforcement of effective regulatory and supervisory frameworks a challenge in many countries.

CHAPTER 2: MONEY LAUNDERING AND TERRORIST FINANCING RISKS ASSOCIATED WITH HAWALA AND OTHER SIMILAR SERVICE PROVIDERS

2.1 VULNERABILITY TO MONEY LAUNDERING AND TERRORIST FINANCING

As is always the case when criminals own or control financial intermediaries, criminal HOSSPs deserve particular attention. Although a limited number of case studies were provided to the project team, there are several reasons why HOSSPs continue to pose a money laundering and terrorist financing vulnerability. These include a lack of supervisory will or resources; settlement across multiple jurisdictions through value or cash outside of the banking system in some instances; the use of businesses whose primary focus may not be regulated as financial institutions; the use of net settlement or cover payments, not serial payments, to settle through the banking system that makes it difficult to track individual transfers; the commingling of criminal and illicit proceeds; and the masking of illicit proceed transfer that appears to be trade. None of these factors are unique to HOSSPs. The most significant reasons for concern are two-fold and jurisdiction-specific: lack of supervisory resources and settlement through value or cash that makes HOSSPs transactions particularly difficult for law enforcement to follow the money.

High threat HOSSPs networks often rely on the fact that the full size of the network is not visible in any individual country and that national registers of registered or licensed money transmitters are either not accessible or are difficult to find.

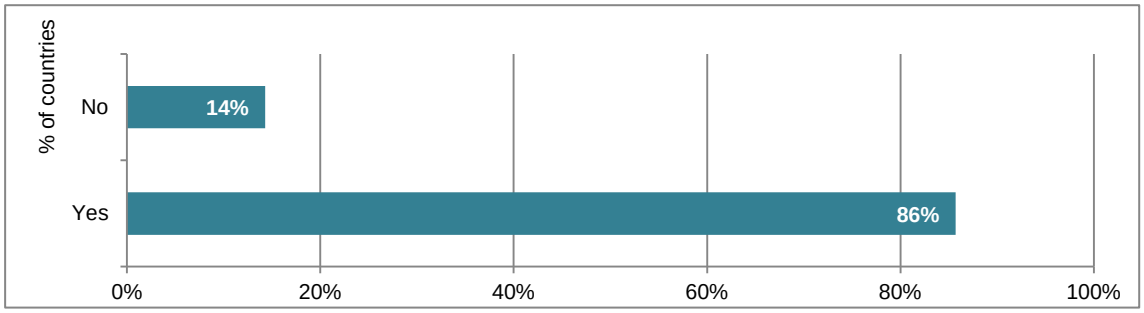
Most countries view HOSSPs as highly vulnerable to money laundering. Despite a limited number of cases provided to the project team, twenty eight[8] surveyed countries answered the question whether HOSSPs are regarded as high risk for criminal money laundering in their country. Of those, 86% of the surveyed countries stated that HOSSPs are vulnerable to ML risks as shown in Figure 2.1. All 4 countries that said no to the question clearly stated that HOSSPs are not commonly used in their countries because of the existence of highly efficient and convenient banking and remittance services.

Among the countries that answered positively to the question, very few responding countries clearly mentioned that there have been convictions of illegal HOSSPs for money laundering crimes. Some countries explicitly stated that they do not have the data to support the contention that HOSSPs are highly vulnerable, but base this conclusion on financial intelligence investigations/reports. A few countries raised concerns that increased customer due diligence and compliance processes in place at other types of financial institutions may make unregulated HOSSPs more attractive for money laundering. For these countries, HOSSPs are seen as vulnerable because they avoid attention from authorities including law enforcement authorities,

8 Both FATF and APG member countries responded to this question. Out of 25 FATF member countries that responded 21 countries provided an answer to this question, 1 country did not respond to this question and 3 countries could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country. Out of 8 APG member countries that responded 7 countries provided an answer to this question and 1 country could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country.

evade restrictions on foreign exchange controls and leave a minimal paper trail for law enforcement agencies to follow in comparison to banks or other money transmitters.

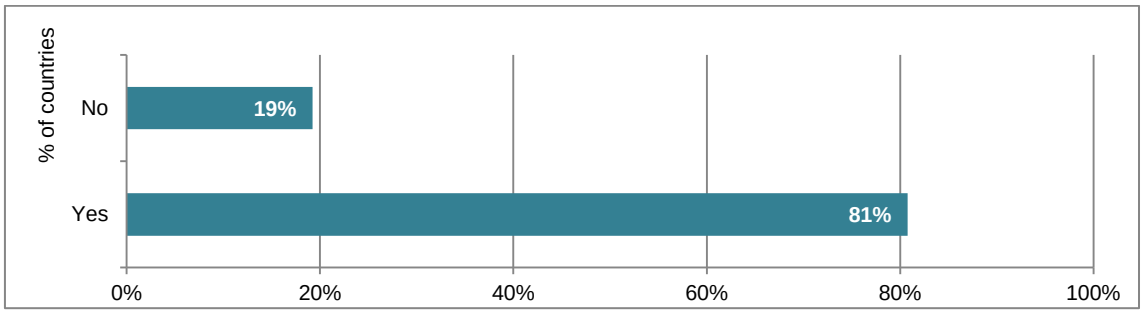
Figure 2.1 **Are HOSSPs vulnerable to money laundering risk?**



Source: FATF project questionnaire.

Most countries also view HOSSPs as highly vulnerable to terrorist financing. Twenty six[9] surveyed countries answered the question whether HOSSPs are regarded as high risk for terrorist financing (TF) in their country. 81% of the surveyed countries agreed that HOSSPs are vulnerable to TF risks as shown in Figure 2.2. All 5 countries that said no to the question clearly stated that HOSSPs are not commonly used in their countries because of the existence of highly efficient and convenient banking and remittance services.

Figure 2.2 **Are HOSSPs vulnerable to terrorist financing risk?**



Source: FATF project questionnaire.

Among the countries that answered positively to the question, only a few countries like India mentioned that there have been quite a few cases where the funds from abroad by the terrorist organizations were received in the country through HOSSPs. Many countries consider HOSSPs as high vulnerability for TF but have very few domestic cases to support the statement.

9 Both FATF and APG member countries responded to this question. Out of 25 FATF member countries that responded 21 countries provided an answer to this question, 1 country did not respond to this question and 3 countries could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country. Out of 8 APG member countries that responded 5 countries provided an answer to this question, 2 countries did not respond to this question and 1 country could not provide an answer to this question because "*hawala* and other similar service providers" do not exist in their country.

2.2 CRIMINAL HOSSPS

A distinct form of criminal remittance network has been reported as operating internationally and servicing the needs of criminal organizations. These criminal HOSSPs appear to exist predominately to serve the criminal needs. In Europe and Australia, they are focussed on the collection of cash and transfer of value across borders, whilst in India or Pakistan they may be focussed on capital flight, exchange control violations or tax fraud.

2.3 WHAT MAKES CRIMINAL HOSSPS DISTINCT

Criminal HOSSPs primarily exist to facilitate the movement and/or laundering of criminal proceeds generated by drug trafficking, smuggling and fraud. Their existence is primarily driven by the demand from criminal customers to dispose of cash on their behalf and pay the equivalent value to the criminal group on demand elsewhere in the world. To achieve this criminal HOSSP networks use cash pools and reciprocal settlements by servicing remittances for other HOSSP groups. Individual criminal HOSSPs groups co-operate to form unregulated networks with surplus cash or individual electronic remittances are shared to complete the remittances demanded by different markets.

2.4 CRIMINAL HOSSPS METHODOLOGY FOR CRIMINAL PROCEEDS TRANSFERS

Law enforcement case studies indicate that criminal HOSSPs generally involve at least four individuals for the placement stage of criminal proceeds. These are:

- **Controller or Money Broker** – a trusted individual normally who arranges for the collection of street money (e.g., drug proceeds) and arranges for the delivery of an equivalent value to its ultimate destination (e.g., to businesses controlled by a drug cartel).
- **Collector** – instructed by the Controller to collect money from criminals and dispose it upon the controller's instructions.
- **Co-ordinator** – an intermediary who manages parts of the money laundering process for one or more Controller.
- **Transmitter** – receives and dispatches the money to the control of the Controller.

Role of the Controller: The Controller (also called a money broker in some jurisdictions) is the key to success of the system. The criminal customer tells the controller who will hand over the money and where the value is to be paid. Acting as a third party money launderer, the Controller serves multiple criminal organizations in multiple countries. The Controllers back office needs to keep records of the money he collects, controls and disburses. The Controller will normally be responsible for the money from the time it is collected until the value is successfully delivered as instructed. He may bear the cost of funds that are lost or are not effectively transferred.

Role of the Collector: The Collector is the Controller's trusted representative operating on instructions sent to him by the Controller, or his back office, by text message, email, and

Blackberry messenger or by other means. He faces the highest risk of arrest, because he has to meet the criminals to collect the cash. The Collector contacts the criminals and arranges to collect the cash at a discrete place or in circumstances where such activity, even if overt, does not attract attention. Over time the criminal and Collector may contact each other directly to arrange the pick-ups, but the collector will be told how much money he is responsible for and will dispose it on the instructions of the controller. The Controller will receive instructions from the criminal group directly or by such means which ensures the information is accurately received and understood.

2.5. COMPLETING THE CRIMINAL PROCEEDS TRANSFERS

Once the cash is counted, and any shortages accounted for, the Controller completes the criminal transaction by arranging for the equivalent value to be made available to the criminal group in the chosen destination, either by an electronic payment from a business controlled by an associate or through another handover of cash. Where the transaction is completed with a cash handover, the Controller arranges for this to be done by a Collector working for him or through another controller who co-operates with him. A token may also be used for this handover from a Collector to a criminal customer, but the process will start with a Collector nominating a bank note to be used, and conclude with the bank note being passed to the Collector.

2.5.1 AUTHENTICATING THE HANDOVER – USE OF A TOKEN

A regular feature of criminal cash handovers is the use of the unique serial number on a banknote to act as a means of identification and a rudimentary receipt for the handover. A Collector starts the process by identifying banknotes in his possession to be used as "tokens" in future transactions. He gives his Controller the serial number, and the controller then passes this on to the criminal customers holding the cash to be laundered. The criminal group ensures that the courier delivering the cash to the meeting knows what banknote will be presented to him. The collector shows the banknote and usually passes it over when he has received the cash. The criminal cash courier then takes the token away with him to show his bosses he has passed the money to the right person.

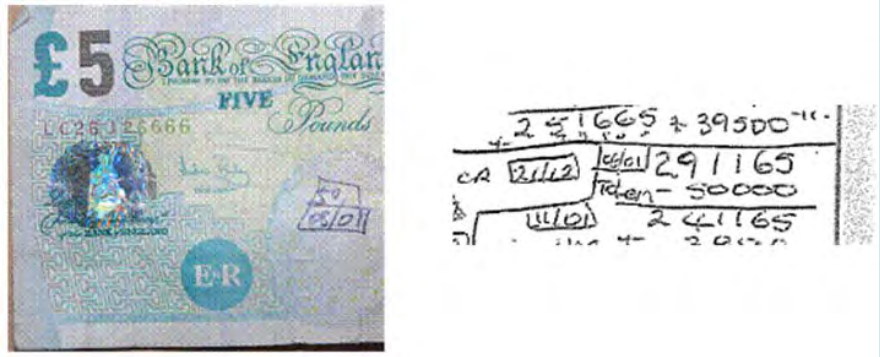
Token seized from criminal courier marked with the amount collected and recorded in her drugs ledger



Step by step explanation – Use of tokens by criminal HOSSPs in UK

1. The first text message above is from a Controller to a Collector requesting the Collector sends a token number for use in a handover of criminal cash.
2. In the second text, the Collector sends the serial number of a Bank of England GBP 5 note to the Controller for use as a token; the Controller would then forward this token number, with the Collector's mobile telephone number, to the criminal customer.
3. In the third text, the Collector sends the criminal customer's courier the details of where to meet to conduct the handover – a UK postcode and address (probably for entering into a satellite navigation device).
4. In the fourth text, the Controller asks the Collector if the handover has taken place – the words '50pin' refer to the collection of GBP 50 000.
5. In the fifth text, the Collector confirms that the handover will take place later that evening from a criminal courier she has met before.
6. In the sixth text, the Controller asks for confirmation when the handover has taken place as his customers need the money elsewhere and he needs to make the equivalent value available to them as soon as possible.
7. The banknote shown has the same serial number as the token number in the second text and is annotated with the amount collected and the date (50 08/01 – note dates on text messages). In this case the Collector has retained the token, possibly because the criminal courier and collector already knew each other (see above).The extract from the ledger (completed by the collector) shows the Collector's record of the transaction.

Source: United Kingdom.

Box 2.2 **Use of Tokens in the Netherlands**

Another example of use of tokens can be seen in the following extract from a Dutch investigation. While the case example below is a real one, note the mobile phone numbers are fictitious. The real numbers have been replaced with randomly generated phone numbers.

Information that is sent through payment chain for conducting illegal transfer

- HOSSPs broker sends a SMS-message:
- 236430126 (mobile phone number)
- 163665 (amount to be transferred USD 163 665)
- X4569 (Token, identification number)
- The HOSSPs broker calls the mobile phone and delivers the money.

Example of a token. Part of a banknote is used as identification for a transfer.

2.5.2 CRIMINAL HOSSPS CONTROLLER TRANSFER METHODS

The Controller takes responsibility for the cash once the Collector has made the handover. The Controller may charge a fee based on the percentage of the money and/or manipulate the exchange rate used to make a profit. The cash value becomes his as he uses value held in separate cash pools to complete the criminal transaction. Controllers have used the following identified methods to dispose of the cash:

a. Using local complicit money service businesses to bank and transmit the money to third parties or into accounts run by the Controller;

b. Passing the cash to other "customers" of the Controller to complete separate inward remittances which can be legitimate but are most profitable when they complete a different criminal transfer;

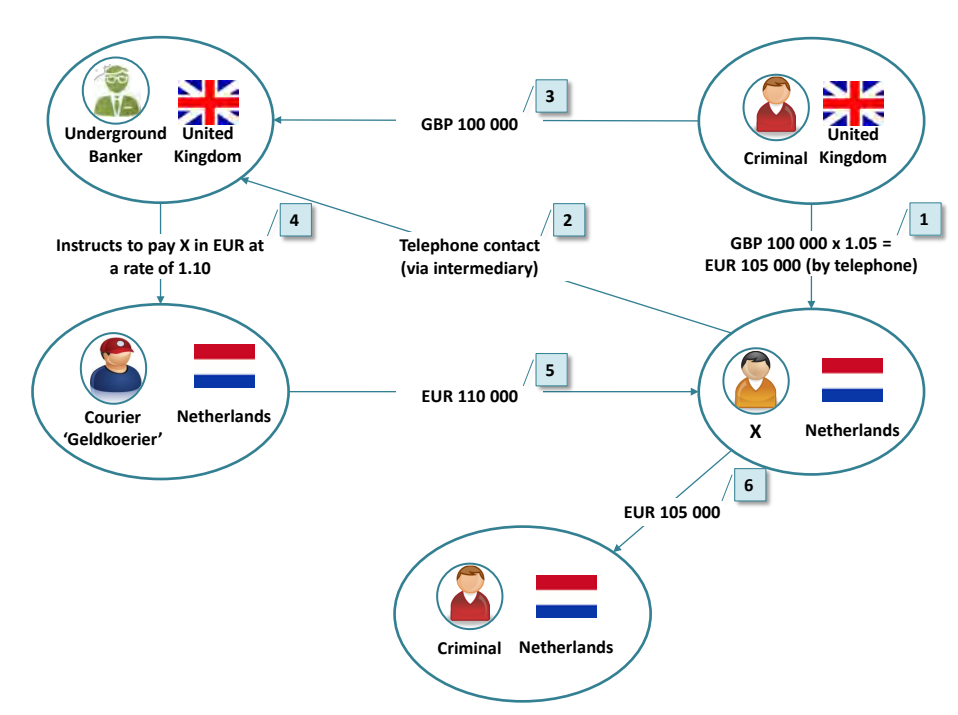
c. Paying the cash into bank accounts on behalf of the Controller to complete separate inward remittances (cuckoo smurfing); and

d. The physical movement of the cash (cash smuggling) by courier or in freight for sale or disposal at a safer location.

None of these techniques are necessarily unique to Criminal HOSSPs.

Box 2.3 **Illegal Currency Trade**

The following example from the Netherlands shows how the Criminal HOSSPs network profit from criminal proceeds transfer.



The picture above shows the working of the underground banking currency traders. The procedure of illegal currency trade is as follows (boxed numbers in above figure correspond to

transaction).

1. Underground broker/criminal HOSSPs broker X resides in the Netherlands and makes a phone call to a criminal or an intermediary in UK who has GBP 100 000 and wants to pay Euros to a criminal contact in the Netherlands. X buys the GBP 100 000 and offers an exchange rate of 1.05. This rate is lower than the official exchange rate. Either the criminal accepts or negotiates the rate with the underground broker.
2. X makes a phone call to a criminal HOSSPs broker in UK. In this phone call X offers GBP 100 000 at an exchange rate of 1.1 to EUR. This rate is higher than the official exchange rate. The broker in UK agrees to pay higher exchange rate probably because he can probably sell pounds later for better exchange rate.
3. The GBP 100 000 is physically transferred in UK from the criminal in UK to the underground broker in UK.
4. The underground broker in UK calls a contact in Netherlands (in picture 'Geldkoerier Nederland') and directs him to pay EUR 110 000 (GBP 100 000 x 1.1) to X.
5. The contact *Geldkoerier Nederland* in Netherlands brings EUR 110 000 physically to X.
6. X pays EUR 105 000 to a criminal in Netherlands. X makes a profit of EUR 5 000 on this specific criminal currency trade and there is no physical money transfer across the border. Such transactions can be easily undertaken without paper trail.

Source: Netherlands.

2.6 MONEY LAUNDERING VULNERABILITY OF HOSSPS

2.6.1 USE OF THIRD PARTY PAYMENTS TO TRANSFER CRIMINAL PROCEEDS

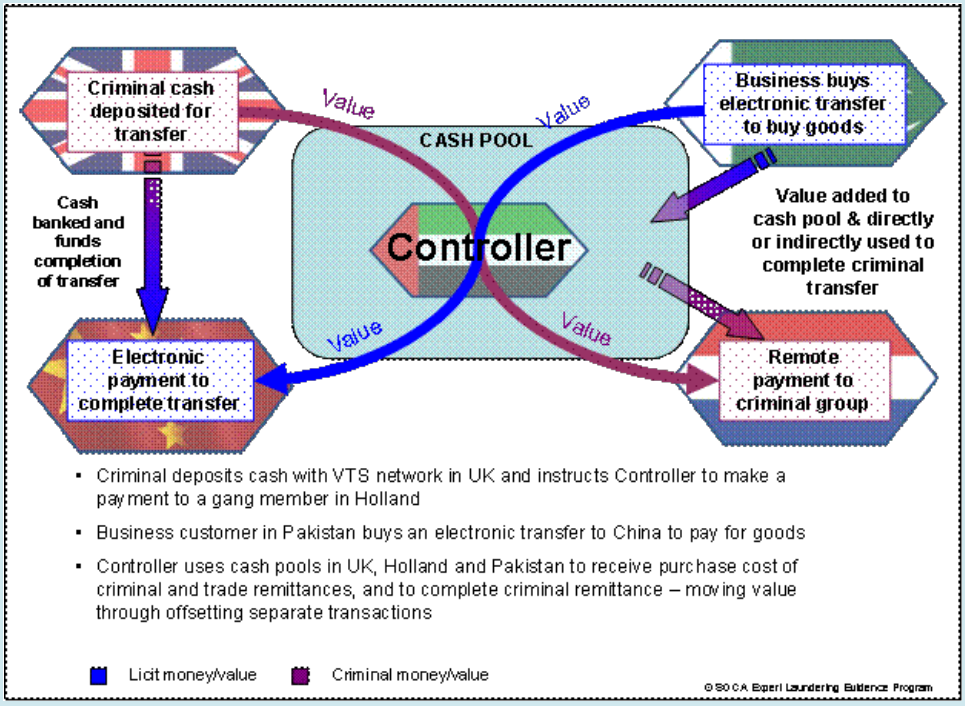
A common technique used by criminal HOSSPs is to use third party payments to transmit funds as well as to commit export and import fraud. Controllers build up large cash pools in countries where they service drug traffickers and other cash based criminals. To move the value of this cash, they directly or indirectly offer remittance services to other markets which have a demand for electronic remittances. They can do this by undercutting bank costs and exchange rates and use their cash pool to complete licit remittances, but they are also uniquely placed to service other criminal remittance corridors serving customers undertaking tax fraud, import fraud, export fraud or breaching exchange controls.

The Controller sends limited information to their transmitter, just enough information to complete a bank electronic transfer request. This will typically comprises of the beneficiary account Name, account number, SWIFT code and amount. In a country where the banks or regulators are vigilant the transmitter has often been observed creating false invoices to provide a false provenance for the transfer made.

This process is known as third party payment or invoice settlement, and has commonly been used by criminal HOSSPs, because it is an efficient way of moving excess values from a cash pool and HOSSPs get paid to do so.

Box 2.4 **The Use of Trade to Transfer Criminal Proceeds**

The example below is a typical third party payment settlement.



Controllers have a lucrative second market in servicing businesses and individuals who want to move value to breach local rules or to facilitate fraud. This may occur in countries where the amount of outward remittances in foreign currency is restricted or where exchange control or restricted access to foreign currency creates delay or high exchange costs. However access to a Controllers cash pools can also facilitate fraud.

Source: United Kingdom.

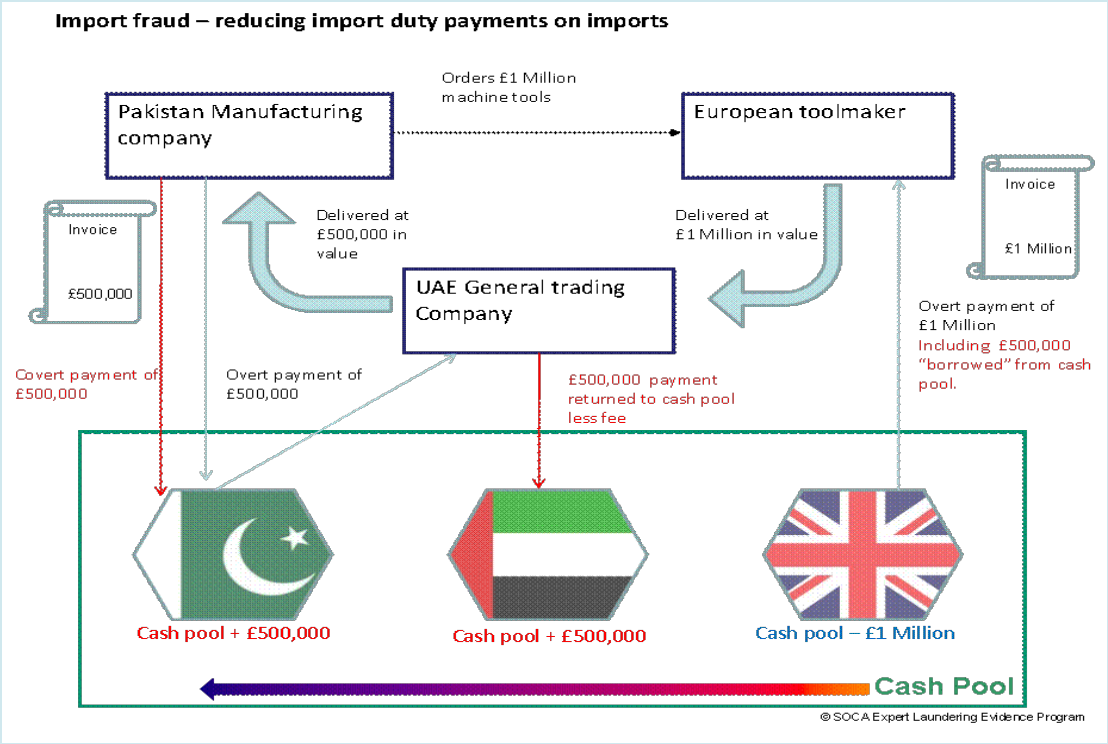
Box 2.5 **Import Fraud through third party payment**

In this example a Controller makes a third party payment to facilitate an import fraud. The example provided involves the United Arab Emirates and Pakistan:

- A Pakistan manufacturing company seeks to buy a new machine costing GBP 1 000 000.
- It identifies a European supplier and places a provisional order.
- To avoid import tax it uses a UAE general trading company as an intermediary. The UAE Company invoices them for the same equipment at GBP 500 000 in value, and an overt payment is made through an MSB associated to the cash pool. This provides all the documents required to validate the import of the machinery at a reduced value.
- At the same time the Pakistani manufacturer arranges for the full GBP 1 000 000 payment to be made through the cash pool in the UK. The goods are delivered to the UAE intermediary for onwards shipment to China.
- The UAE Company has a surplus of GBP 500 000 which it returns to or leaves in the cash pool

in UAE. The Pakistani manufacturing company also has a debt to the cash pool of GBP 500 000 (the balance of the true value of the imported goods) which it settles with a covert payment to the cash pool.

- The net result is that the UK cash pool is reduced by GBP 1 000 000 whilst the Pakistan & UAE cash pool increase by GBP 500 000 each.



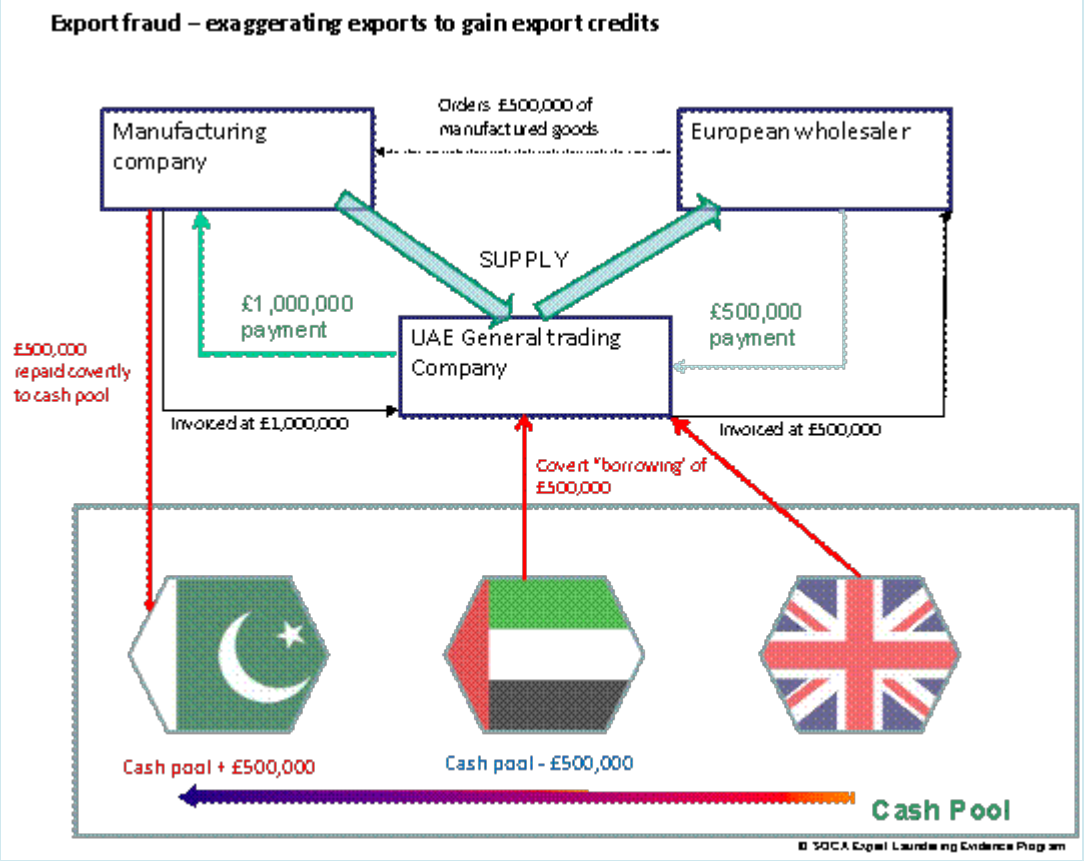
Source: United Kingdom.

Box 2.6 **Export fraud through third party payment**

- Case studies indicate that HOSSPs are used to facilitate export fraud. Export fraud can work in many ways, but the principal is the same – to overvalue export goods to benefit from export credits or tax rebates. This example uses Pakistan, where exporters can benefit from export rebates, GST rebates (equivalent of UK VAT), as well as beneficial access to credit.
- A European wholesaler orders GBP 500 000 of manufactured goods from a Pakistani manufacturing company.
- The Pakistani company arranges to supply the goods through a UAE company. This company invoices the buyer at a true value of GBP 500 000, receives payment and supplies the goods.
- At the same the Pakistani manufacturer raises an invoice for the same goods to the UAE Company but for a false value of GBP 1 000 000. The UAE Company "borrows" GBP 500 000 from the cash pool, combines this with the licit payment from the buyer and pays the full value of the false GBP 1 000 000 invoice.
- The Pakistani company returns GBP 500 000 to the cash pool in Pakistan to settle the amount borrowed in UAE plus any fees. The Pakistani company benefits from increased tax

rebates and access to credit.

- The net effect of the fraud is to move GBP 500 000 in value from the UAE to Pakistani cash pool.



Source: United Kingdom.

2.6.2 USE OF TRADE BY CRIMINAL HOSSPS TO LAUNDER DRUG PROCEEDS

Ample evidence underscores the use of criminal HOSSPs to launder drug proceeds. The use of trade by criminal money brokers has been identified by law enforcement as a common technique to facilitate the movement of drug proceeds generated in one jurisdiction to drug cartels outside of the jurisdiction. The net settlement technique called the "black market peso exchange" system is a common criminal HOSSPs method used in the United States and elsewhere by drug cartels.

Developed in the 1990s, Colombian and Mexican drug cartels export drugs to the United States, where they are sold for US dollars. The drug cartel enters into a contract with a peso broker (the controller), who uses a US-based agent to buy the US dollars from the drug sales. Once the US dollars are received, the peso broker deposits the equivalent in pesos into the drug cartels' account in Colombia or Mexico. To obtain the pesos, the peso broker buys the pesos from Colombian or Mexican-based exporters, who need to purchase goods in dollars in the United States or abroad. The broker then arranges for the importers to obtain the dollars in the United States to purchase goods for export to the importers' home country.

Box 2.7 **Criminal HOSSPs Use of Trade to Launder Drug Proceeds**

Case 1: Toy Company Used to Launder Proceeds

A Los Angeles-based toy company named Angel Toy Company manufactured plush toys like teddy bears. In March 2011, all three defendants pleaded guilty to conspiracy to structure currency transactions. In court documents, all three defendants admitted that, from 2000 through July 2010, there was an agreement that cash deposits into ATC's bank accounts had to be under USD 10 000 in order to avoid financial reporting requirements, specifically the filing of a Currency Transaction Report. The owners of Angel Toys received cash deposits, which were drug proceeds, into their banks accounts. The money was returned to drug traffickers when actual goods – in the case of the company, stuffed animals such as Teddy bears – are exported to the foreign countries and sold to generate local "clean" money.

The investigation revealed two primary ways in which ATC received and structured cash: in some cases, people affiliated with drug traffickers simply dropped cash at ATC's offices in downtown Los Angeles; the second method involved cash deposits made directly into an ATC bank account, sometimes by individuals located as far away as New York. During one four-year period, the investigation tracked more than USD 8 million in cash deposit into ATC accounts, and not a single transaction was for more than USD 10 000, according to court documents. The owners of Angel Toys were sentenced to more than three years in prison.

Source: United States.

Case 2: Use of Underground Money Shops and Local Banks to Launder Drug Proceeds

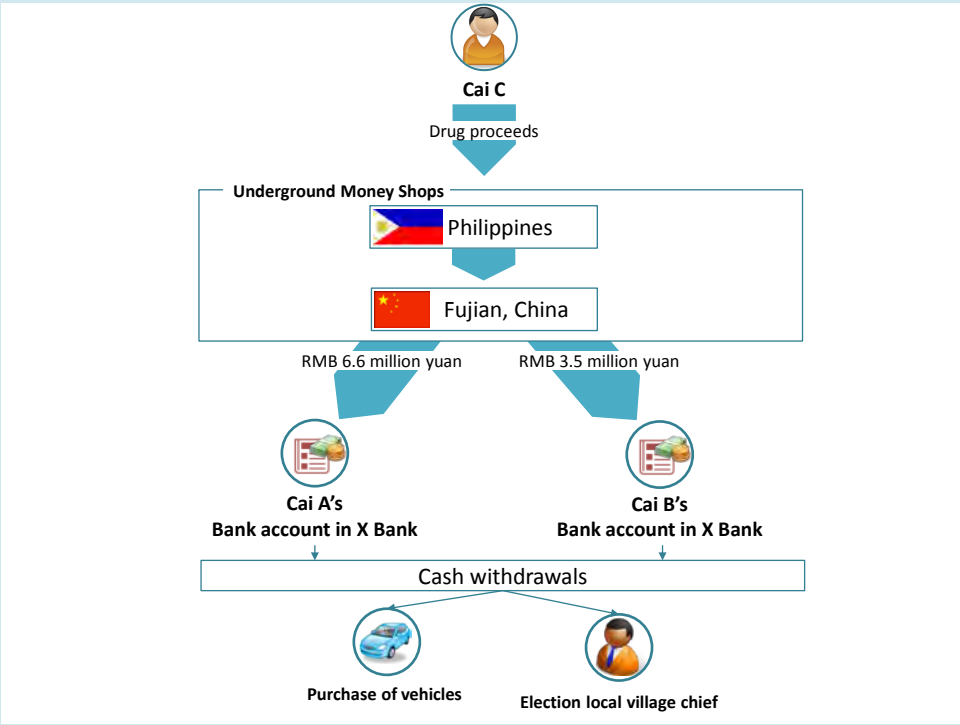
On May 9, 2005, fifteen defendants involved in '5.12' transnational drug trafficking case, which was jointly investigated by the Chinese and Malaysian police, were convicted of drug manufacturing and trafficking and money laundering by the Intermediate People's Court of Quanzhou, Fujian. Found guilty of money laundering, Cai A was sentenced to three years' imprisonment and a fine of RMB 330 000 yuan, and Cai B was sentenced to two and a half years' imprisonment and a fine of RMB 175 000 yuan.

From August 2002 to April 2004, the drug dealer Cai C had transferred the drug proceeds from underground money shops in Philippines to their counterparts in China. Abetted by Cai C, his relatives Cai A and Cai B respectively opened accounts with their own names in the local banks and deposited the illicit money in these accounts. The total amount of illicit money deposited in Cai B's accounts was about RMB 3.5 million yuan while that deposited in Cai A's account was about RMB 6.6 million yuan. Afterwards, most of the illicit money had been used for the purchase of vehicles and the election of local village chief.

The main process of money laundering activities in this case can be divided into the following steps:

1. Cai Ci transferred drug proceeds from underground money shops in Philippines to their counterparts in Quanzhou, Jinjiang and Shishi in China;
2. Underground money shops in Quanzhou, Jinjiang and Shishi deposited these funds in Cai A and Cai B's bank accounts;
3. Cai A and Cai B withdrew cash to purchase vehicles and so forth ordered by Cai Ci.

The flow of funds is depicted as follows:



Source: China.

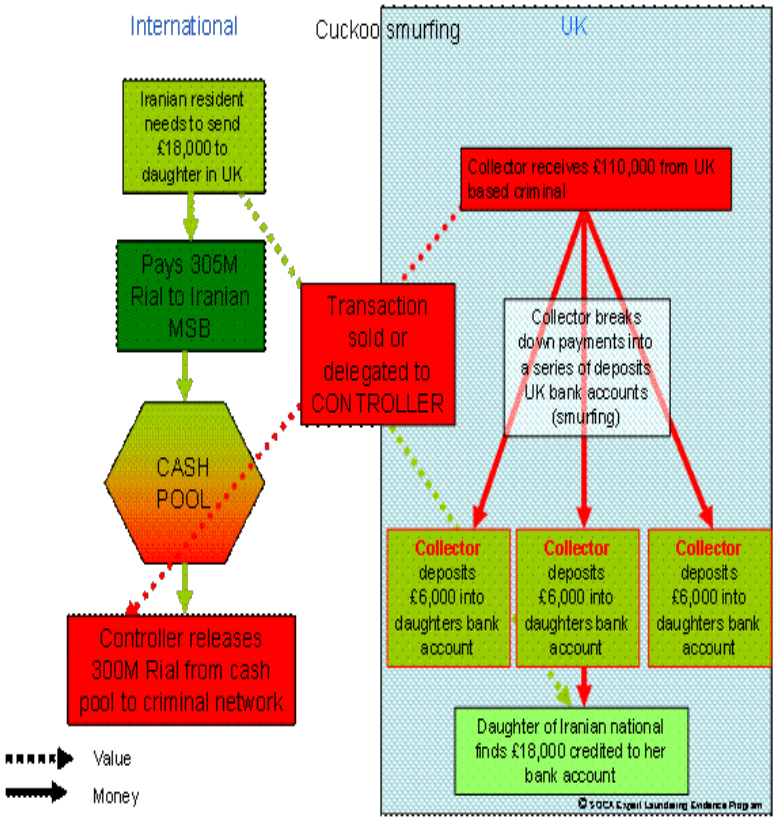
2.6.3 USE OF CRIMINAL HOSSPS TO EVADE SANCTIONS

Criminal HOSSPs are used to evade sanctions and to allow the transfer of funds into and out of sanctioned jurisdictions because these entities offer an alternative to banks and other regulated financial institutions that will no longer process transactions on behalf of sanctioned entities. Criminal HOSSPs are used instead because they can mask the identity of the ultimate originator from the banks or money transmitters that wire the funds on behalf of the HOSSPs. As illustrated below, one common technique is cuckoo smurfing. It occurs where the destination account is in the same country as surplus of criminal cash.

In the example in Figure 2.3, the Controller has a relationship with a *saraf* or money exchanger in Iran. A customer approaches the *saraf* to make a transfer of GBP 18 000 to the bank account of their daughter in UK. The Controller has a surplus of cash from a collection made from a Criminal group in UK and instructs their Collector to use part of this cash to make a series of small deposits into account number given by the family in Iran. The Iranian sender and recipient have no control over how the remittance is completed. The Collector chooses to "smurf" or structure the deposits to limit the likelihood of his role be identified by the receiving bank.

For the Controller this technique has the advantage of avoiding the costs and risk of running any overt business and also the bank charges are met by the person receiving the inward remittances. This technique has been the subject of large scale prosecutions in UK and Australia, with individual groups of Collectors responsible for cuckoo smurfing deposits into business and personal bank accounts in excess of GBP 100 million.

Figure 2.3 **Cuckoo Smurfing by Criminal HOSSPs**



Source: United Kingdom.

Box 2.8 **Sanctions Evasion by Criminal HOSSPs**

Iran Sanctions Evasion by Criminal HOSSPs: Immigration and Customs Enforcement (ICE) Homeland Security Investigations (HSI) agents arrest Manhattan management consultant on charges of criminally violating the Iran Trade Embargo. ICE agents, acting as part of a New York-based Task Force, arrested Mahmoud Reza Banki on January 7, 2009. The investigation was conducted jointly by ICE and the U.S. Treasury's Office of Foreign Assets Control. According to the indictment, BANKI provided money transmitting services to residents of Iran by operating a *hawala* in which BANKI received wire transfers in a personal bank account he maintained at Bank of America in Manhattan totalling about USD 4.7 million from companies and individuals located in the following countries: Saudi Arabia, Kuwait, Latvia, Slovenia, Russia, Sweden, the Philippines, the United States, and other countries.

Generally, BANKI did not know the wire originators personally. He received the funds with the understanding that an equivalent amount of Iranian currency would, in turn, be disbursed to intended recipients residing in Iran. Banki informed an Iran-based co-conspirator, when funds had been received and the co-conspirator then disbursed the funds in Iran, less any fees. Banki, according to the indictment, used specific funds transferred into his Bank of America account to make joint investments in the United States with the Iran-based co-conspirator. Among other things, Banki used the funds to purchase a USD 2.4 million Manhattan condominium; to invest in securities for his own benefit and that of the co-conspirator; and to make payments on his credit card accounts, including about USD 55 000 in one month alone in the summer of 2007.

Banki was charged with violating the International Emergency Economic Powers Act (IEEPA), together with Executive Orders and U.S. Department of Treasury regulations; conducting an unlicensed money transmitting business; and conspiracy to commit those crimes. Banki was found guilty on June 4, 2010, of one count of conspiracy to violate IEEPA and to operate unlicensed money transmitting business; one substantive count of violating IEEPA; one substantive count of operating an unlicensed money transmitting business; and two counts of making false statements to a Federal agency. In response to a special verdict form, the jury found that BANKI was an aider and abettor with respect to the substantive IEEPA and unlicensed money transmitting counts. BANKI was also ordered to forfeit USD 3 314 047, which represents the sum of money involved in the offenses and the proceeds derived there from. In October 2011, the United States Court of Appeals reversed the lower court's decision that al-Banki had acted as unregistered money transmitter on technical grounds, but did not challenge the facts of the case.

Source: United States.

2.7 TERRORIST FINANCING AND HOSSPS

More than a decade after the promulgation of Special Recommendation VI, terrorists continue to use HOSSPs to transmit funds. Terrorist exploitation of money transmitters is a function of geography, culture and financial access. In many countries of greatest concern, HOSSPs traditionally were a legitimate and accepted type of remitters and the primary vehicle for fund transfers, both legitimate and illicit. Limited banking access and high degrees of corruption and tax evasion in some of these jurisdictions continues to lead legitimate customers and criminals alike to use networks of unregistered HOSSPs.

There are several reasons why HOSSPs continue to pose a terrorist financing vulnerability, including: a lack of supervisory will or resources; settlement across multiple jurisdictions through value or cash outside of the banking system in some cases; the use of businesses that are not regulated financial institutions; the use of net settlement and the commingling of licit and illicit proceeds. While the settlement through value or trade that masks the individual fund transfers is a source of vulnerability, the most significant reason for concern is lack of supervisory resources and commitment to effective regulation. Inadequate efforts of outreach to the unregulated sector to pull them into the regulated sphere in some countries plus limited or no enforcement actions against unregistered entities also minimizes the incentives for unregulated entities to subject themselves to regulation and supervision, making them more vulnerable to terrorist abuse.

Box 2.9 **Terrorist Abuse of HOSSPs – United States Cases**

Case Example 1: Terrorist Abuse of HOSSPs - Hamza Case

In April 2008, Money remitter sentenced to over 9 years for money laundering conspiracy and concealing terrorist financing Saifullah Anjum Ranjha, a Pakistani national residing in Washington, D.C. and Maryland, was sentenced to 110 months in prison for conspiring to launder money and for concealing terrorist financing in addition to being ordered to forfeit USD 2 208 000 worth of assets. This was an Immigration and Customs Enforcement (ICE)-led

investigation. According to his guilty plea, Ranjha operated a money remitter business in the District of Columbia known as Hamza, Inc. A cooperating witness, acting at the direction of law enforcement, held himself out to Ranjha and his associates to be involved in large scale international drug trafficking, international smuggling of counterfeit cigarettes and weapons. He also represented that he was providing assistance and financing to members of al Qaeda and its affiliated organizations and their operatives. From October 2003 to September 19, 2007, the cooperating witness gave Ranjha and his associates a total of USD 2 208 000 in government funds in order to transfer the monies abroad through a hawala. The cooperating witness represented that the monies were the proceeds of, and related to, his purported illegal activities and Ranjha laundered these funds believing they were to be used to support those activities. Ranjha was the primary point of contact for the cooperating witness and received the bulk of the monies from the cooperating witness, for a total of 21 hawala transactions in amounts ranging from USD 13 000 to USD 300 000. Most of the monies were turned over to Ranjha in locations in Maryland. On a few occasions the cooperating witness met Ranjha and other co-conspirators at Hamza, Inc. to provide monies for a particular hawala transfers. Ranjha arranged with his associates for the equivalent amount of monies, minus commissions, to be delivered to the cooperating witness, his third party designee, or a designated bank account in Canada, England, Spain, Pakistan, Japan and Australia. Ranjha kept a commission of approximately five per cent of the amount of currency sought to be transferred on each occasion. Other conspirators involved in a particular transaction retained an additional commission of between three to five per cent of the transaction amount. All the funds transferred abroad were picked up by cooperating individuals and returned to the Government.

Case Example 2: Terrorist Abuse of HOSSPs - Times Square Bomber case

On August 18, 2011, Mohammad Younis pled guilty in Manhattan federal court to operating an unlicensed money transfer business between the United States and Pakistan. One of the money transfers was used to fund the May 1, 2010, attempted car bombing in New York City's Times Square by Faisal Shahzad who is serving a life sentence in federal prison.

From January to May 2010, Younis provided money transmitting services to individuals in the New York City area by assisting in the operation of a hawala. On April 10, 2010, Younis engaged in two separate hawala transactions with customers who travelled from Connecticut and New Jersey to meet with him in Long Island. In each of the transactions, Younis provided thousands of dollars in cash to the individuals at the direction of a co-conspirator in Pakistan, but without knowledge of how the customers were planning to use the funds. At no time did Younis have the license to operate a money transmitting business from either state or federal authorities.

One of the individuals to whom Younis provided money was Shahzad, who, on June 21, 2010, pled guilty to a ten-count indictment charging him with crimes relating to his attempt to detonate a car bomb in Times Square on May 1, 2010. During the course of his plea allocution, Shahzad acknowledged receiving a cash payment in April 2010 in the United States to fund his preparations for the May 1, 2010, attempted bombing. According to Shahzad, the April cash payment was arranged in Pakistan by associates of the Tehrik-e-Taliban, the militant extremist group based in Pakistan that trained him to make and use explosive devices.

On September 15, 2010, Younis was arrested by the FBI and other agents of the New York Joint Terrorism Task Force.

Younis 45, of Long Island, New York, pled guilty to one count of conducting an unlicensed

money transmitting business.

Case Example 3: Terrorist Abuse of HOSSPs - Carnival Ice Cream Case

Abad and his nephew Aref Elfgeeh ran a money-transfer operation at Abad's Carnival French Ice Cream (or "Carnival") shop in Brooklyn, New York. Abad was arrested in January 2003; an arrest warrant was issued for Aref, who was arrested in December of that year. Carnival French Ice Cream maintained an account at J.P. Morgan Chase Bank ("Chase"), as well as account statements from 12 "feeder" accounts at Chase and other banks. Bank statements showed large totals of money deposited into the Carnival account in small amounts as transfers from 12 feeder accounts, and large sums of money wired out of the Carnival account to accounts in 25 other countries, including Yemen where one of the recipients was a known member of Al Qaeda that used the Abads business to transmit funds to him. In a one-month period during the fall of 2000, more than USD 245 000 was deposited into the Carnival account and more than USD 268 000 was wired out. Between 1996 and 2003, the total amount deposited into the Carnival account was USD 22 190 642.21, and the total amount withdrawn was USD 21 995 556.54. Abad was charged with operating an unlicensed money transmission business.

The money arrived in the feeder accounts by various means, including check deposits, cash deposits, and wire transfers. Then, money went from the feeder accounts to the Carnival account in generally one of two ways. Most often there were checks written from one of the 12 feeder accounts, payable to the order of Carnival French Ice Cream account and then it was deposited into the Carnival French Ice Cream account. On some occasions the feeder accounts would wire money over to the Carnival French Ice Cream account. There were hundreds of checks from the feeder accounts made out to the Carnival account. One of the feeder accounts was a Chase bank account opened in the name of Prospect Deli that was opened by Aref and listed the home address and telephone number of Abad. The Prospect Deli was a business a few blocks away from the Carnival French Ice Cream shop; the Prospect Deli was in operation only from 1996 to 1998, but activity in the Prospect Deli bank account continued until 2002. For example, bank records showed that in 2001 approximately $850,000 was deposited into the Prospect Deli account and about USD 823 000 was transferred out to the Carnival account. Aref was sentenced principally to 51 months' imprisonment, followed by a three-year term of supervised release, and was ordered to pay a USD 500 000 fine and to forfeit USD 22 435 467. Abad was sentence principally to 188 months' imprisonment to be followed by a three-year term of supervised release, and was ordered to pay a USD 1 250 000 fine and to forfeit USD 22 435 467.

Source: United States.

Box 2.10 **Terrorist Abuse of HOSSPs – Indian Cases**

Case Example 1: Terrorist Abuse of HOSSPs

In a case of hawala money transfer to terrorists of the proscribed terrorist organization "X" in India, two hawala operators along with two receivers of hawala money for the terrorists were apprehended in the year 2011 and an amount of approximately INR 2 000 000 (USD 32 000) was recovered from them. They revealed that the hawala money was provided by the organization leaders based in country "Y" and routed through another country "Z" where another over ground worker of the terrorist organization is based. The modus operandi is that the terrorist leader in country "Y" collects terror funds in that country and sends it to another terrorist agent in country "Z" who contacts hawala operators who operate freely in that country. Apparently hawala is not illegal in country "Z". The hawala operator in country "Z" then gives a number on a currency note to the agent along with the telephone number of the person who would deliver the money in India. The agent then informs the same to the terrorist leader at "Y". The terrorist leader at "Y" then contacts the over-ground worker of the proscribed terrorist organisation at Delhi and gives the telephone number of the hawala agent and the number of the currency note. This over-ground worker then contacts the hawala operator at the given number and then collects the money at the decided location after giving the number of the currency note. The over-ground worker does not get to know the identity of the hawala operator as he delivers the money wearing a scooter helmet.

Note: The terrorist agent does not have to pay any commission at the receiving end.

Case Example 2: Terrorist Abuse of HOSSPs

In another case of Terrorist financing, a sum of INR 10 000 000 (USD 160 000) was intercepted in a State A in India which was meant to be delivered to a terrorist gang X. Investigation revealed that a number of earlier consignments had earlier been delivered to the terrorist gang earlier. It was revealed that development funds of a particular area in that State was defalcated and then sent to location P in that State. From location P, it was sent to location Q in another State B with the help of hundi operators operating between State A and State B. The hundi operators are told that the money belongs to a very influential person at state A. The hundi operators do not object conducting the transaction hearing the name of this influential person and deliver the money at state B to the person authorized by the agent of the terrorist gang. The money is delivered after deducting a commission of 1 per cent from the total money which is transferred. At State B, the hawala money is then changed from INR to Dollars in an unregulated exchange market and then transferred to another country E where arms and ammunition are purchased by the terrorist gang leaders based there. These arms and ammunition are then transferred across the borders and then delivered to the terrorist gang operating in State A for carrying our terrorist activities. In this case a total of 15 accused were arrested and charge sheeted and the trial is being held. The arrested members include terrorists, contractors, agents and government servants.

Source: India.

CHAPTER 3: REGULATORY AND SUPERVISORY RESPONSES TO MITIGATE ML/TF RISKS

The findings highlighted in this chapter should also be useful to other streams of work at the FATF, within national governments and for other stakeholders, for example in relation to the implementation of the FATF Standards.

3.1 A REGULATORY/SUPERVISORY RESPONSE INFLUENCED BY THE LEGAL STATUS OF *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS (HOSSPS)

This section focuses on the legal status of HOSSPs in the surveyed countries. The findings of the survey confirm that countries have taken different approaches to the regulation of *hawala* and other similar service providers, with a slight majority of countries treating *hawalas* and other similar service providers as illegal.

Among the 33[10] surveyed countries, 18 countries treat *hawala* and other similar service providers as illegal while 15 countries consider them legal if registered or licensed. Interestingly, most developed countries allow licensing or registration of HOSSPs, while developing countries do not. Within the developed countries respondents, only six out of 17 countries define *hawala* and other similar service providers as "illegal" and the remaining eleven have legalised *hawala* and other similar activity if service providers are either registered or licensed. On the other hand, 12 out of 16 developing countries respondents define *hawala* and other similar activity as "illegal" and only 4 countries allow them to operate legally if licensed or registered (See Table 3.1.). One of the reasons put forward by developing countries to consider *hawala* and other similar service providers as "illegal" is their capacity constraints.

Table 3.1 **Legal Status of *Hawala* and Other Similar Service Providers**

	Status of *hawala* and other similar service providers		
	Illegal	**Legal**	**Total**
Number of Countries	**18**	**15**	**33**
of which Developed Country	6	11	17
of which Developing Country	12	4	16

Source: FATF project questionnaire.

At the same time, caution needs to be exercised when analysing the survey results. As explained in Chapter 1, countries have varying definitions of what *hawala* means. In the 18 countries where

10 25 FATF and eight APG member countries provided answer to the question on legal status of *hawala* and other similar service providers in their country. Please note that three FATF member countries responded to this question where *hawala* and other similar service providers do not exist as a money transmission channel but *hawala* and other similar service providers is either legal or illegal under an existing law.

hawala and other similar service providers are illegal, two rather different approaches can be identified:

- Countries that do not allow *hawala* or other similar service providers to operate because *hawala* in these countries is synonymous to "illegal" operations. However, providers of the same kind of services can legally operate if licensed or registered but under a different name such as money service providers, or payment institution, or money remitters and therefore not included in the definition used in this report
- Countries where only traditional financial institutions – such as banks -are allowed to provide money remittance services. In such countries, *hawala* and other similar service providers are simply supposed to be non-existent.

3.2 IMPACT OF THE LEGALISATION OF *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS ON THE FORMALISATION OF THE REMITTANCE MARKET?

To gauge the impact of the legalisation of *hawala* and other similar service providers, the surveyed countries were asked whether legalizing *hawala* and other similar service providers has helped in formalizing the remittance market successfully in their country. 80%[11] of the surveyed countries where *hawala* and other similar service providers are legal answered positively to this question, confirming that licensing or registration requirements have led to an expansion of the regulated remittance market (Figure 3.1). However, this seems contradicted by the numbers of registered/licensed *hawala* and other similar service providers provided in the questionnaire responses by the countries where *hawala* is legalised. The number of domestic principal licensed/registered *hawala* and other similar service providers in seven[12] countries reporting numbers ranged from four to 26. In one country, the number of businesses registering as unregulated value transfer services (informal value transfer services or IVTS), a broader category than HOSSPs, was over 1 000. This country uses the term IVTS to refer to any system, mechanism, or network of people that receives money for the purposes of making the funds or an equivalent value payable to a third party in another geographic location, whether or not in the same form.

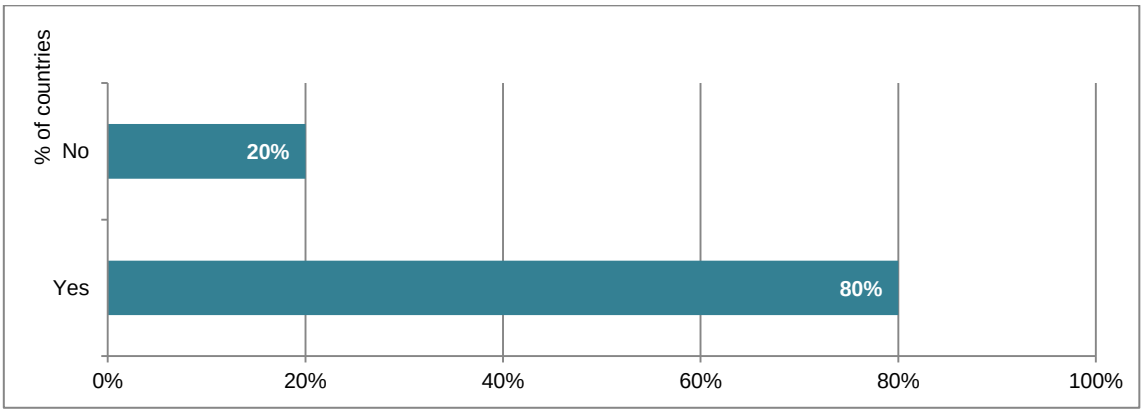
In general, the numbers of regulated HOSSPs are still very few—making it very likely that unregulated *hawala* and other similar service providers are in effect continuing their business in these countries. In most of the countries where *hawala* and other similar service providers have been legalised, they operate as licensed Money Service Operators (MSOs) and are required to

11 15 surveyed countries have legalised *hawala* and other similar service providers. Out of 15, 10 countries responded to the question. 4 countries where HOSSPs are legal did not respond to the question and one country could not respond because *hawala* does not exist as a money transmission channel in that country though *hawala* and other similar service providers is legal under an existing law.

12 Out of the 15 surveyed countries that legalised *hawala* and other similar service providers, eleven countries have provided information about licensed or registered domestic *hawala* and other similar service providers. But only seven countries could provide exact number of licensed/registered *hawala* and other similar service providers operating in their country.

conduct customer due diligence (CDD), keep records and implement other AML/CFT obligations set out in law - which contributes to mitigating ML/TF risks.

Figure 3.1 **Did Legalisation of Hawala and Other Similar Service Providers Help Formalise the Remittance Market?**



Source: FATF project questionnaire.

3.3 LESSONS LEARNED REGARDING THE LICENSING /REGISTRATION REQUIREMENTS FOR REGULATED *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

Building on the survey results, this section presents the licensing/registration requirements for regulated *hawala* and other similar service providers and their agents/branches.

3.3.1 SURVEY RESULTS: LICENSING/REGISTRATION REQUIREMENTS FOR REGULATED *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

Under a registration regime, the service provider has to identify its business to the authorities and provide certain information (as may be requested by the authorities). Authorities usually attach few or no conditions to the ability of the service provider to provide its services under the registration regime, making the market entry easier. Although there are varying practices of registration requirements, registration regime tend not to require AML/CFT compliance systems prior to registration unlike licensing system, and the initial application fee for registration is also lower than that for obtaining a license. A licensing regime provides more front-end screening by authorities and requirements to meet certain criteria. Regulatory authority grants the licensee the permission to engage in certain activities subject to specified terms and conditions. Such terms and conditions may define purpose, time-period, territory, compliance requirements, and operational instructions among others.

The survey results as shown in Table 3.2 illustrate that registration and licensing regimes are almost equally used in countries where *hawala* and other similar service providers have been legalised. The licensing approach is slightly more common with a total of seven countries adopting it compared to five countries which adopted a registration regime. Two countries— Republic of Guinea, and Sweden—have dual system depending on the size and type of service providers. For example in Sweden, a legal or natural person who is involved in commercial money remittance is

obliged to be either licensed (as a payment institution) or registered (as a registered payment service provider). The turnover of business is one among other factors that determines whether registration is sufficient or not. Similarly in the UK, a dual system is in place by which the service provider needs to obtain a license from the Financial Conduct Authority as an authorized payment institution or a payment service provider, but at the same time, also needs to register with the Customs and Tax authority for AML/CFT purpose.

Table 3.2 **Licensing/Registration Requirement for *Hawala* and Other Similar Service providers**

	Licensing	Registration	Dual
Developed Country	6	3	2
Developing Country	1	2	1
Total	7	5	3

Source: FATF project questionnaire.

3.3.2 SURVEY RESULTS: LICENSING/REGISTRATION REQUIREMENTS FOR AGENTS OR BRANCHES OF *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

In the majority of the countries where *hawala* and other similar service providers are legal, they usually can operate through branches or agents, which allow them to reach out to remote areas and expand their business. Survey results illustrate that in the case of agents, registration is by far the preferred approach, while in the case of branches, registration, licensing, as well as dual systems are used.

In the case of branches, one of the reasons why licensing or dual systems are used more often than in case of agents is that these are service providers which usually deliver only financial services (Table 3.3). By contrast, agents tend to provide remittance or other financial services as ancillary services to other businesses, such as operating supermarket, gas station, grocery stores, etc.

Table 2.3 **Licensing/Registration Requirements for Agents/Branches of Hawala and Other Similar Service Providers**

	Branches	Agents
Only Licensing	2	1
Only Registration	5	7
Dual System	1	0

Source: FATF project questionnaire.

3.3.3 REGULATING MARKET ENTRY FOR *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS: LICENSE OR REGISTRATION REQUIREMENT? [13]

Several factors determine the choice between a licensing regime and a registration regime—which in themselves have different impact on the ease/control of market access and the resources required for regulatory/supervisory oversight. This choice is also likely to have a bearing on the incentives for businesses between staying informal or entering the regulated economy.

Registration regimes require fewer conditions to be fulfilled at the time of entry thus making it easier to enter the market. Licensing regimes are most often more involved processes with more demanding conditions. They also usually require front-end screening of the applicants by the authorities. As a result, registration processes are expected to be faster and less resource consuming, while more supervisory capacities are expected to be necessary for licensing regimes. All things being equal, the less stringent up-stream conditions under registration regimes are expected to call for more on-going supervision and surveillance—particularly if the market is composed of a large number of smaller players.

Another important factor is how the registration/licensing regimes comparatively affect the incentives for expanding remittances through regulated channels. Survey results do not point to any clear cut benefit from one system compared to the other. It is however expected that the lower the barriers at entry and application fees, the easier it would be for market participants (notably the smaller ones) to enter the regulated market.

Both registration and licensing regimes create a framework for supervisors to exercise control over who can act as a principal service provider or an agent and to ensure compliance with AML/CFT obligations. Licensing requirements are expected to be more comprehensive and rigorous; they are also more expensive, which increases compliance costs for both the authorities and the service providers – irrespective of ML/TF risks.

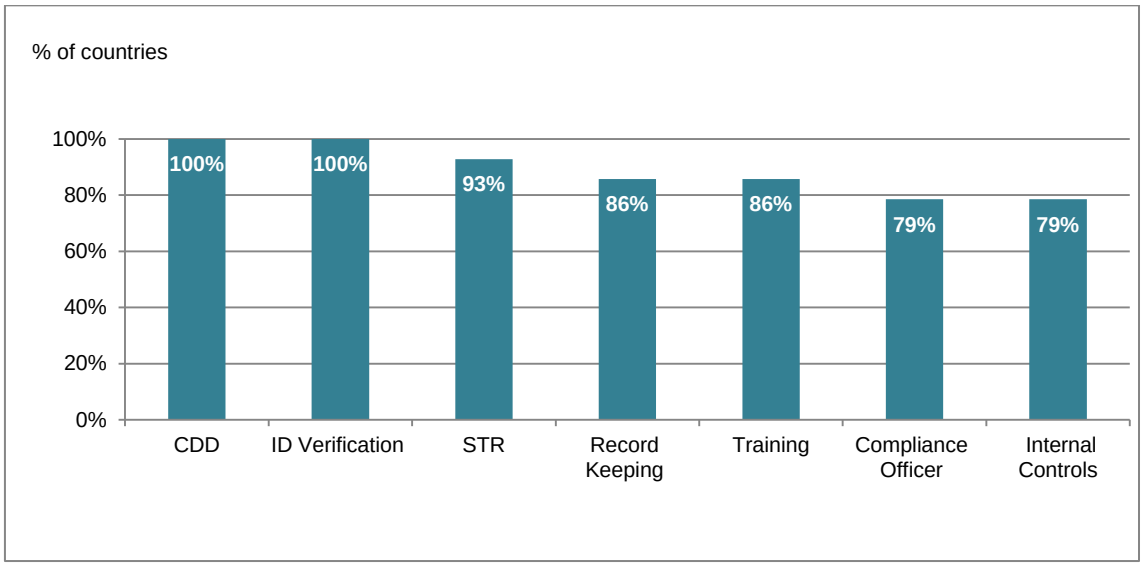
3.4 AML/CFT OBLIGATIONS OF REGULATED *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

Where legal, money service businesses and *hawala* and other similar service providers are usually treated the same way and subject to the same regulations as far as AML/CFT obligations are concerned. Out of 15 countries where *hawala* and other similar service providers are legal, 14 countries provided data on AML/CFT obligations of regulated *hawala* and other similar service providers in their countries. Survey results as shown in Figure 3.2 indicates that 75-100% of these countries impose Customer Due Diligence (CDD), Identify (ID) verification, Suspicious Transaction Reporting (STR), Recordkeeping, Training, Compliance Officers, and Internal Controls Requirements. In particular, all these countries require compliance with CDD requirements. All except one country require STR reporting. All except two countries require training of staff on AML/CFT regulations and record keeping for a minimum of five years. Only three of these countries

[13] Discussion in this sub-section relies on information provided in the World Bank report "Making Remittances Work: Balancing Financial Integrity and Inclusion" (soon to be published). Authors: E. Todoroki, W.Noor, K.Celik and A. Kulathunga.

do not require the appointment of a compliance officer and development and implementation of an internal control program.

Figure 3.2 **AML/CFT Obligations of *Hawala* and Other Similar Service Providers (percentage of countries)**



Source: FATF project questionnaire.

3.5 SUPERVISION AND ENFORCEMENT RELATED TO *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

Effective supervision of HOSSPs is one of the primary challenges facing regulators. This section discusses the survey results on the supervision of *hawala* and other similar service providers, sanctions applicable to regulated *hawala* and other similar service providers for failure to implement AML/CFT obligations and requirement on foreign counterparties with respect to money transfers.

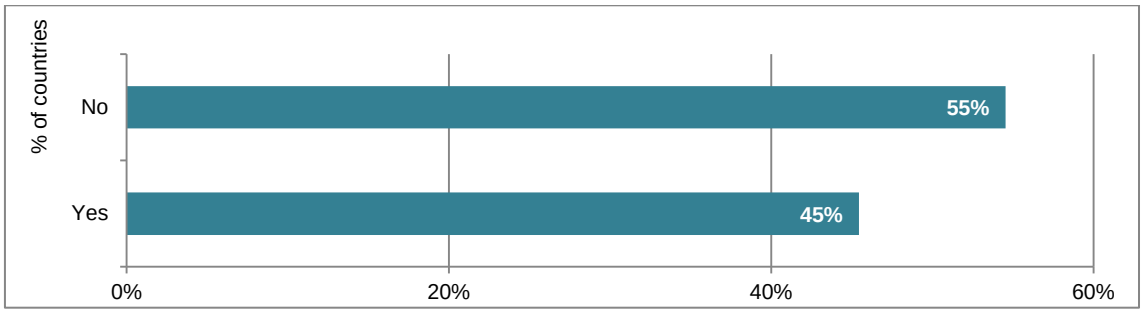
3.5.1 SUPERVISION OF REGULATED HAWALA AND OTHER SIMILAR SERVICE PROVIDERS

Five countries responded that they have a separate examination approach and teams for regulated *hawala* and other similar service providers while six[14] countries did not have such a separate approach, as shown in Figure 3.3. It is not clear whether the separate examination team is only for *hawala* and other similar service providers or it is for general remittance companies, money service providers, or payment institutions, among others.

In the case of Australia, within the FIU, there is a centralised team that focuses on remittance service providers.

[14] Only 11 out of 15 surveyed countries where *hawala* and other similar service providers are legal provided the information.

Figure 3.3 **Separate Team to Examine Regulated *Hawala* and Other Similar Service Providers (percentage of countries)**



Source: FATF project questionnaire.

3.5.2 SURVEY RESULTS: REGULATORY AND SUPERVISORY AUTHORITIES

In developing countries, the Central Bank is most of the time the supervisory authority for HOSSPs, while there is more diversity in the case of developed countries. Except for one country, the same agency is responsible both for regulation and supervision of the legal *hawala* and other similar service providers. Though the sample size is small, there are essentially four different institutional arrangements for the regulation and supervision of legal HOSSPs:

1. Central Bank
2. Financial Supervisory Authority (FSA)
3. Financial Intelligence Unit (FIU)
4. Others like Excise and Customs department, Department of Internal Affairs

Having the central Bank as the regulator and supervisor is the most common model in developing countries, as the Central Bank is the default supervisor for the whole financial market in addition to being one of the most established state agencies in these countries.[15]

The most common regulator and supervisor in developed countries is the Financial Supervisory Authority. In the case of Germany, Norway and Sweden, this authority is the sole regulator and supervisor for the legal HOSSPs. In the UK, the FCA (Financial Conduct Authority) regulates and supervises in cooperation with another authority, "H M Revenue and Customs".

In several countries, the FIU has been designated as the AML/CFT regulator and supervisor of legal *hawala* and other similar service providers – for instance Canada and United States. In the U.S., the FIU has delegated examination of HOSSPs to their tax authority. In Australia, all the AML/CFT supervision including those of *hawala* and other similar service providers is undertaken by the Australian Transaction Reports and Analysis Centre (AUSTRAC), Australian FIU.

All these various arrangements are outlined in Table 3.4.

15 See Todoroki, Noor, Celik, Kulathunga (2013).

Table 3.4 **AML/CFT Regulatory and Supervisory Authorities in Surveyed Countries**

Countries	Regulatory Authority	Supervisory Authority
Australia	AUSTRAC (Australia's AML/CTF regulator and FIU)	AUSTRAC (Australia's AML/CTF regulator and FIU)
Germany	BaFin (Financial Services Authority)	BaFin (Financial Services Authority)
Republic of Guinea	Central Bank	Central Bank

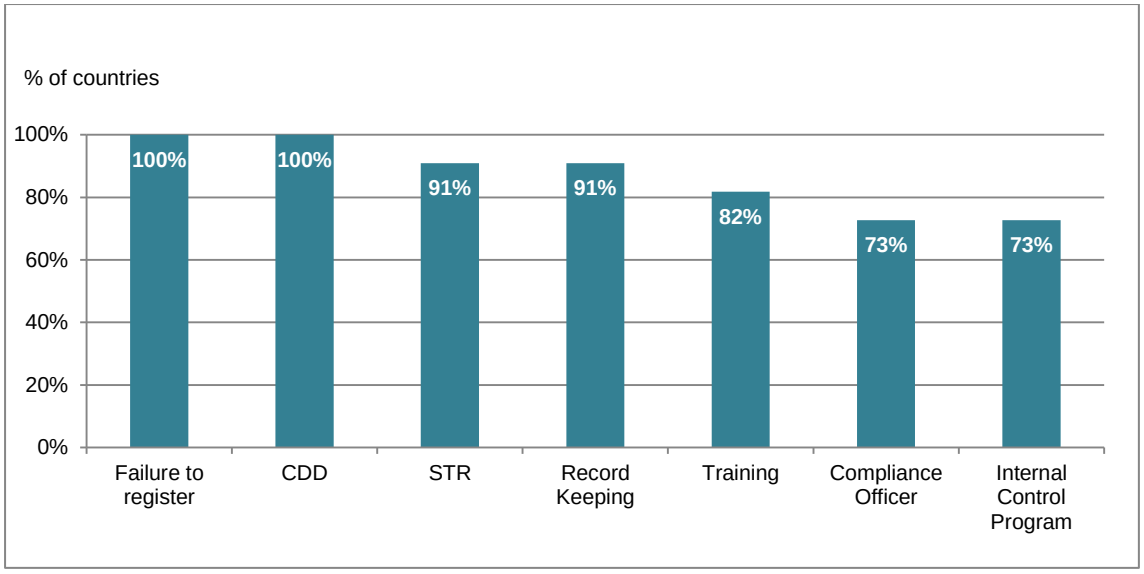
3.5.3 SANCTIONS APPLICABLE TO REGULATED *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS FOR FAILURE TO IMPLEMENT AML/CFT REQUIREMENTS

Survey results (Figure 3.4) highlight the range of compliance issues that can lead to sanctions applied to regulated *hawala* and other similar service providers (failure to register/become licensed; failure to comply with AML/CFT obligations such as CDD, STR, record keeping, training, compliance officer and internal control program) and the percentage of surveyed countries having such sanctions available.

Figure 3.4 **Sanctions for Failure to Implement AML/CFT Obligations (percentage of countries)**



Source: FATF project questionnaire.

Note: *Hawala* and other similar service providers are legal in 15 countries. Out of 12 FATF member countries where Hawala and other similar service providers are legal, 11 countries provided the data. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

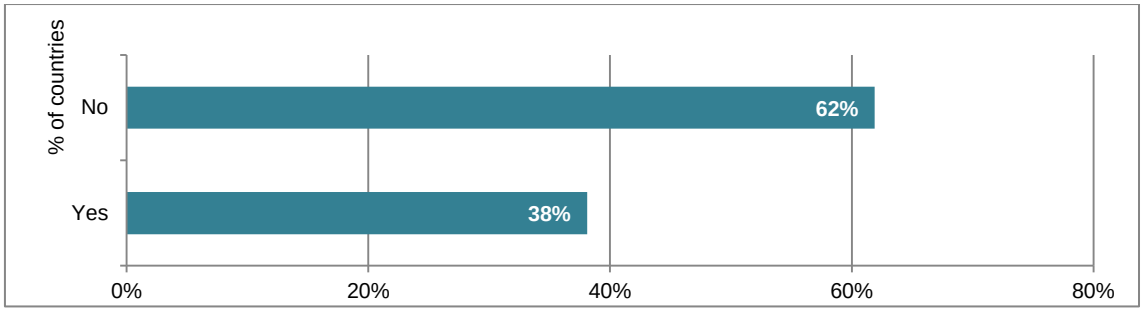
As *hawala* and other similar service providers are treated the same as any other remittance companies for the purpose of AML/CFT obligations, sanctions applicable to *hawala* and other similar service providers for failure to implement AML/CFT requirements are general provisions that apply to all MVTS whether they are called remittance companies, money service providers, or payment institutions. The questionnaire did not specifically ask whether sanctions are the same for all the financial institutions including MVTS or not, but some countries impose the same range and scale of sanctions for all the financial institutions while others have different scale and range of sanctions depending on types of financial institutions (for example, there are differences between banks and MVTS).

Though sanctions are applicable for failure to implement AML/CFT requirements in most of the countries, survey data pointed out that actual enforcement cases where sanctions were imposed against *hawala* and other similar service providers have been very few in most of the countries in the last five years.

3.5.4 REQUIREMENTS ON FOREIGN COUNTERPARTIES

Twenty one surveyed countries answered the question whether money transmitters in their countries can only deal with registered/licensed money transmitters in the ultimate recipient country and only eight out of these twenty one impose such a requirement (Figure 3.5).

Figure 3.5 **Requirement to Deal only with Regulated Money Transmitter in Ultimate Recipient Country (percentage of countries)**

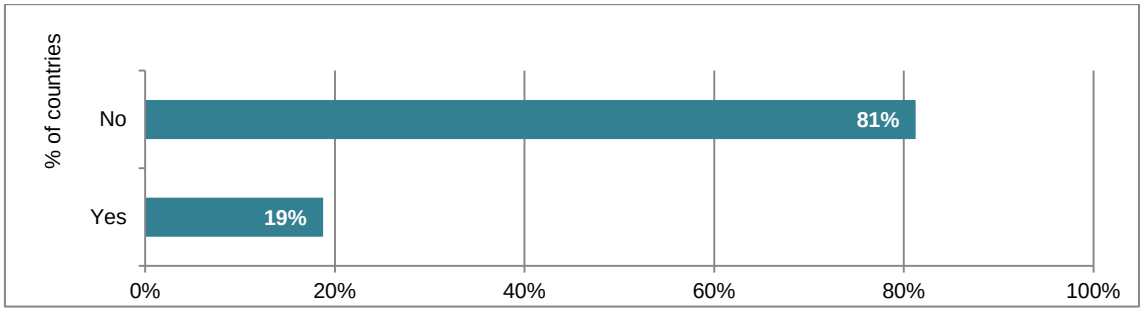


Source: FATF project questionnaire.

Note: Out of 25 FATF member countries, 21 responded to this question. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

Only three out of the 16[16] countries that responded to the question whether "it is a requirement in their country that funds should be sent directly to the pay-out countries by the originating money transmitter." answered positively (Figure 3.6).

Figure 3.6 **Requirement to Send Funds Directly to Pay-Out Country by Originating Money Transmitter (percentage of countries)**



Source: FATF project questionnaire.

This would suggest that further discussion of Recommendation 13 in the context of money transmitters would be useful, in particular whether countries should interpret R13 to require that money transmitters, including *hawala* and other similar service providers, should only deal with licensed or registered foreign counterparties.

3.6 SUPERVISION AND ENFORCEMENT RELATED TO UNREGULATED *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

This section discusses the survey results of the oversight of and enforcement against unregulated *hawala* and other similar service providers, sanctions against unauthorized money transmitters, as

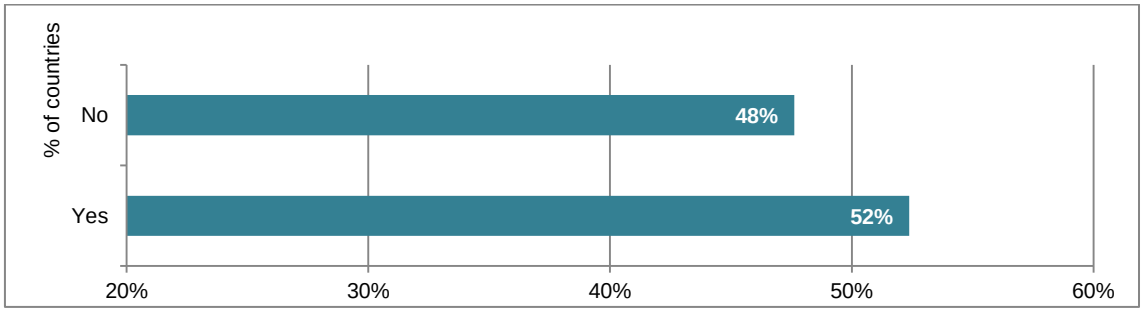
16 Only FATF member countries responded to this question. Out of 25 FATF member countries that responded, 16 countries provided an answer to this question. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

well as various strategies used by countries to identify unregulated *hawala* and other similar service providers and steps taken to shift unregulated players to regulated channels.

3.6.1 IDENTIFICATION OF UNREGULATED *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

A majority of surveyed countries have set up specific mechanisms to identify HOSSPs. Out of the 21[17] countries that provided answers to whether they have set up any mechanism to identify illegal *hawala* and other similar service providers in their country, a small majority provided a positive answer (eleven out of 21), see Figure 3.7. Many countries have not yet devised effective mechanisms to identify, monitor and take action as needed against illegal *hawala* and other similar service providers – either in terms of promoting their integration in the AML/CFT regime or cracking down on illegal operations. Given the vulnerabilities of unsupervised financial services providers, this lack of identification and lack of enforcement actions means that HOSSPs may remain a significant vulnerability.

Figure 3.7 **Taskforce to Identify Illegal Hawala and Other Similar Service Providers (percentage of countries)**



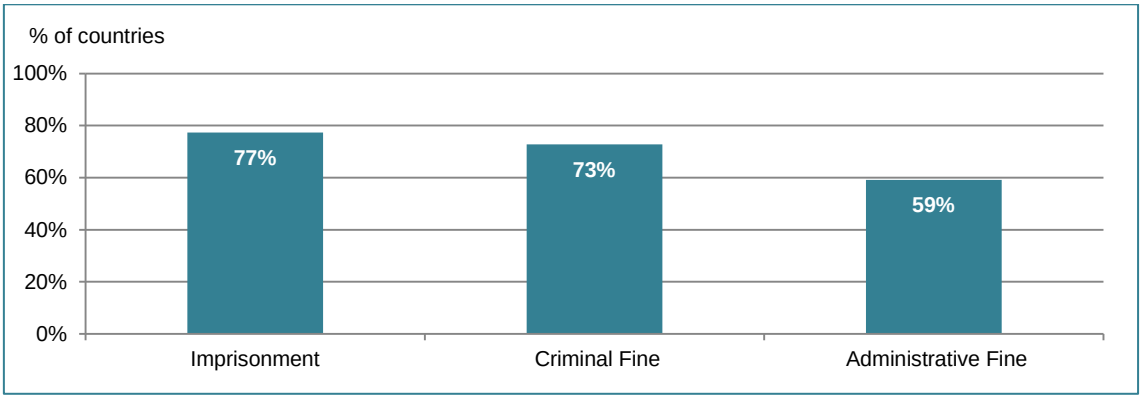
Source: FATF project questionnaire.

3.6.2 SANCTIONS AGAINST UNAUTHORISED MONEY TRANSMISSION OPERATIONS

Most countries have some form of sanctions available for unlicensed/unregistered money transmitters, but few surveyed countries appear to have used them. Surveyed countries indicate having both criminal and administrative sanctions available if HOSSPs keep operating as money transmitters without a license or registration after initial warnings. Most of the surveyed countries consider unauthorized operations as a criminal violation and apply sanctions such as imprisonment and criminal fines. As shown in Figure 3.8, in respectively 77% and 73% of the 22 countries that provided data, imprisonment and criminal fine can be imposed for unauthorized money transmission operations. In only 59% of the countries administrative sanctions are available.

17 Only FATF member countries responded to this question. Out of 25 FATF member countries that responded, 21 countries provided an answer to this question. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

Figure 3.8 **Sanctions against Unauthorized Operations (percentage of countries)**



Source: FATF project questionnaire.

Note: Out of 25, 22 FATF member countries provided the data on sanctions. This question was not included in the abbreviated APG questionnaire, therefore, no response from APG member countries.

Though sanctions are available, the survey shows that countries have not used them effectively against unauthorized operations in the last five years.

3.6.3 IMPORTANCE OF SUSPICIOUS TRANSACTIONS REPORTING OBLIGATIONS IN IDENTIFYING ILLEGAL *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS

Suspicious Transaction Reporting (STRs) can be a very effective tool in identifying illegal *hawala* and other similar service providers. The survey sought information on suspicious transaction reports (STRs) submitted by regulated *hawala* and other similar service providers or by banks on unregulated *hawala* and other similar service providers for the last three years. The majority of the surveyed countries were unable to provide the data, with only seven countries providing such statistics. For these countries, STRs filed by both regulated *hawala* and other similar service providers and banks on unregulated *hawala* and other similar service providers ranged from about eight reports per year to about 220 reports per year.

It is important that all types of money service businesses including regulated *hawala* and other similar service providers report promptly to the financial intelligence unit (FIU) or any relevant authority if they suspect or have reasonable grounds to suspect that funds are the proceeds of a criminal activity, or are related to terrorist financing or related to unlicensed money remittance business. The information collected by FIU through STRs can be used by law enforcement agencies (or by supervisors) to conduct further investigations which can help identify illegal *hawala* and other similar service providers. STRs can be very useful technique to track down flow of money especially when banks and other financial institutions are used as a medium of settlement.

To improve STR reporting by regulated *hawala* and other similar service providers as well as by banks and other financial institutions on illegal *hawala* and other similar service providers, the regulatory authorities, in collaboration with the FIU, may issue specific guidelines. Such red flag indicators can be developed also in collaboration with MVTS players which can help detect suspicious transactions.

Box 3.1 **Guidance to Financial Institutions on Red Flag Indicators and Case Studies Leads to Increased STR Filings**

In September 2010, the United States Financial Intelligence Unit FinCEN published an advisory on informal value transfer systems (IVTS) to U.S. financial institutions, including recent case typologies. The advisory asked filers to include the term "IVTS" in SAR narratives to report IVTS related activity. Following publication of the Advisory, STR filings referencing IVTS increased over 500%. In October 2011, FinCEN published an analysis of STRs referencing IVTS. How many of the STR filings involved actual hawala and other similar service providers have not been determined. The findings were as follows:

a. Currency exchange and unregistered money transmissions dominate STR filings: 57% of filings referenced suspicious currency exchange, while 30% referenced unregistered Money service businesses (MSB) activity (with unregistered currency exchange being the leading cause). 48% of the suspicious currency exchange activity referenced Venezuela, Argentina, Brazil, and Mexico. While 89% of STRs before the advisory referenced Latin America, only 41% of post-Advisory STRs did. Post-advisory transactions involving exchange houses in the UAE, Jordan, and Kuwait, Yemen, and Iran were common.

b. For the subject location, over 49% (1 019 subjects) were associated with foreign addresses, almost 40% of them in Venezuela. Over 90% of New York filings reporting possible unregistered money services business activity involved convenience/grocery stores and the Middle East.

Source: United States.

3.6.4 INDICATORS TO DETECT SUSPICIOUS HAWALA AND OTHER SIMILAR SERVICE PROVIDERS

This sub-section provides guidance on transactions patterns that are often associated with illegal/unregulated money transfer providers, including *hawala* and other similar service providers. These transaction patterns can be identified through effective monitoring and CDD mechanisms and should often raise suspicions by the financial or reporting institutions. Such suspicious transaction patterns include:

1. Extensive use of collective accounts. These can be identified by the reporting institutions if lots of small sums are deposited into the bank account of individuals (often stating their name in the reference line), or if large cash sums are deposited at regular intervals before transfers aggregating all of the smaller amounts from the account are made to foreign accounts. Indicators of such collective accounts can be individuals possibly organized under the aegis of a cultural association collecting money through banking system, or one or more individuals making an aggregated transfer of a large sum of money to a bank or money remitter abroad.
2. Money being transferred at regular intervals to international locations such as Dubai. Dubai is a major international clearing house for remittances and other value transfers. Many trading companies/criminal groups route their money through Dubai to other destinations through *hawala* channel. Most of the hybrid *hawala* transactions are routed through some major international destination such as Dubai.

3. An account been used as a temporary repository and the funds are transferred in and out of the account immediately.
4. Usage of third party accounts to disguise and to avoid detection by authorities. Often such third party accounts have no business connection to the *hawaladar* or sender.
5. Frequent wire transfer activity from an account in sending country to international bank account.
6. Wire transfers frequently sent by traders to foreign countries, which do not seem to have any business connection to the destination countries.
7. Money remitter or trader conducting transactions such that they fall beneath the identification, STR or CTR reporting threshold.
8. Business accounts used to receive or disburse large sums of money but show virtually no normal business related activities such as payment of payrolls, invoices etc.
9. Frequent deposits of third party checks and money orders into business or personal accounts.
10. Frequent international wire transfers from bank accounts which appear inconsistent with stated business activities.
11. Frequent deposits by multiple individuals into a single bank account, followed by international wire transfers and /or international withdrawals through ATMs.
12. Sudden change in pattern of financial transactions from low value international fund transfers to large value transfers by a money remitter.

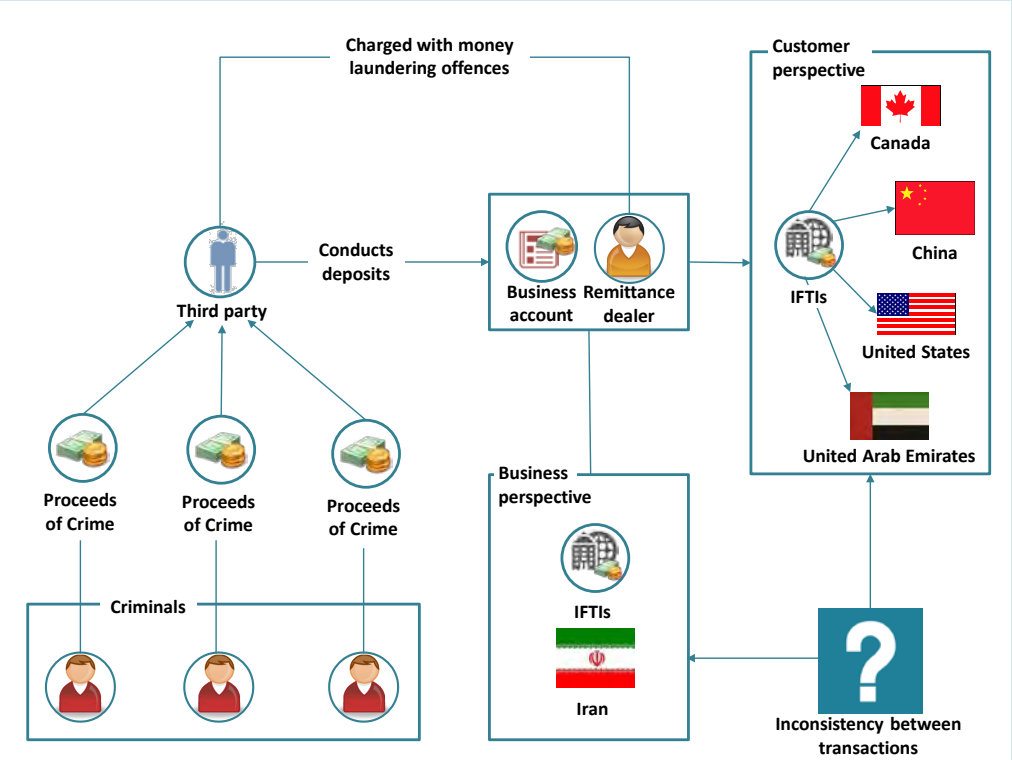
Box 3.2 **Case Study: Money laundering revealed through transaction patterns of the remittance dealer – "Suspicious Transactions"**

AUSTRAC's (Australian Transaction Reports and Analysis Centre) monitoring systems identified a substantial increase in cash activity undertaken by a remittance dealer. Further analysis identified significant inconsistencies between the information the remitter had reported to AUSTRAC, and the information reported by the financial institutions where the remitter was a customer.

This information was referred to the Australian Crime Commission's (ACC) Financial Intelligence Assessment Team (FIAT). After the AUSTRAC referral, the FIAT undertook further investigations and disseminated the intelligence to the Australian Federal Police (AFP), who conducted the investigation. As a result of the investigation two suspects were charged with money laundering offences under the Criminal Code Act 1995. One of the suspects was the remittance dealer, while the second suspect, an associate of the first suspect, allegedly acted on behalf of third parties to deposit large amounts of cash into accounts owned by the remittance dealer.

This investigation was triggered by recognized money laundering indicators. AUSTRAC data revealed significant discrepancies between the transactions reported by the remittance dealer from its own 'business' perspective, and the transactions reported to AUSTRAC by the financial institutions which dealt with the suspect remittance dealer as a customer (that is, transactions

reported from a 'customer' perspective).



Transaction reporting information received by AUSTRAC revealed a number of significant and suspicious changes in the financial transaction patterns of the remittance dealer involved:

- The remittance dealer's activities changed from facilitating small outgoing international funds transfer instructions (IFTIs), to accepting large cash deposits and facilitating large IFTIs. This spike in financial transaction activity was clearly inconsistent with the remitter's previous profile and history.
- Shortly after this increase in the size of IFTIs, business bank accounts held by the remittance business stopped receiving deposits. However, AUSTRAC analysts identified additional accounts operated by the remittance business, which had been opened under a new company name. Under this new company name, the remitter's business practices appeared to change. While the remitter continued to report to AUSTRAC that the majority of its remittances were being sent to Iran, information received from institutions dealing with the remitter as a customer reported that a significant proportion of the business's outgoing IFTIs were now being sent to the United Arab Emirates (UAE).
- The remitter's transaction activity continued to escalate while operating under the new company name. Over a three-month period the remitter recorded cash deposits of AUD34 million and outgoing IFTIs of AUD33 million. At the peak of activity, the remitter was receiving cash deposits into its bank account of AUD1 million each day, and on one occasion received almost AUD4 million in two days. The third party making these large cash deposits made no attempt to conceal them, and they were conducted at the same bank branch.
- Information provided by reporting entities was also invaluable in highlighting discrepancies in

the remitter's activities. The value of the remittance dealer's business activity as reported to AUSTRAC was significantly less than that reported by the financial institutions that dealt with the remitter as a customer. This discrepancy in reporting strongly suggested to authorities that the remittance dealer was dealing with proceeds of crime, rather than funds generated by legitimate business activities.

The following table highlights the discrepancies in the remitter's transaction activities as reported from customer and business perspectives, over a 10-month period:

Transaction Types	Value as reported by the remittance business (*i.e.*, from the "business perspective")	Value as reported by reporting entities dealing with the remittance business (*i.e.*, from the "customer perspective")	Difference
Cash deposits recorded in TTRs	AUD 48 million	AUD 92 million	AUD 44 million
Outgoing IFTIs	AUD 55 million	AUD 95 million	AUD 40 million

As the remitter's cash activity escalated, law enforcement agencies executed warrants against the syndicate and stopped its operations. The AFP arrested two individuals, and restrained AUD1.2 million. While the original source of the funds could not be established, the large amount of cash involved led authorities to suspect that the funds were the proceeds of crime.

Source: Australia.

3.6.5 STRATEGIES TO IDENTIFY UNREGULATED *HAWALA* AND OTHER SIMILAR SERVICE PROVIDERS AND POSSIBLE AVENUES TO CREATE INCENTIVES TO FORMALISE THEIR BUSINESS

There are many different strategies and techniques used by countries to identify illegal *hawala* and other similar service providers [18]. Many of those are used in combination.

Some of the most common methods used to detect such operations are:

1. identifying advertisements placed by such businesses in community newspapers,
2. conducting internet search,
3. searching through social media,
4. following up on leads from general public or service providers,
5. use of AML monitoring systems especially leveraging on useful indications originating from STRs filled by financial institutions,
6. working in partnership with other agencies and gathering information from law enforcement and AML regulatory authority's investigations and inspections and
7. specific targeted investigations and physical surveillance of suspicious entities.

[18] See also FATF (2003).

It is important for countries to foster close co-ordination within the relevant authorities for the purpose of developing inter-agency strategies and efficiently utilizing the available resources to identify illegal operators.

Box 3.3 **Specific strategies used by some surveyed countries to identify illegal hawala and other similar service providers**

Australia: AUSTRAC (Australia's FIU and AML/CTF regulator) along with relevant law enforcement and intelligence agencies identify illegal hawala and other similar service providers. AUSTRAC has an extensive transaction reporting regime entailing threshold transactions reports (TTRs), International Funds Transfer Instructions (IFTIs) and Suspicious Matter Reports (SMRs). The use of transactions reports is one of the mechanisms that are used to highlight potential illegal remittance service providers; particularly those using the banking systems to bulk settle transactions. In addition, AUSTRAC's supervision teams engage with various ethnic communities who may provide useful intelligence about the illegal operators. There have been instances where regulated remittance businesses have provided information in relation to the operation of unregulated remittance businesses.

Malaysia: A surveillance team has been formed within the Central Bank to identify unlicensed money services business (MSB) operators, generally based on public tip off and information from the licensed MSB operators. The surveillance team is also increasingly moving towards gathering its own intelligence to detect illegal hawala and other similar service providers through collaboration with the Financial Intelligence and Enforcement Department and MSB supervision team, as well as information from the internet and public database (such as company registry etc.).

Austria: Awareness training programs for the financial sector, the non-financial sector, law enforcement and supervisory authorities are organized in order to raise awareness as regards the way hawala and similar unregulated value transfer systems work to facilitate the process of cracking down illegal money transfer businesses including hawala and other similar service providers.

United States: The Department of Homeland Security's Homeland Security Investigations (HSI) runs the Cornerstone Initiative to identify illegal operators including HOSSPs. The Cornerstone Outreach Initiative seeks to: 1) Identify the means and methods used by criminals to exploit financial systems in order to transfer, launder and otherwise mask the true source of criminal proceeds, 2) Works with specific private sector industries to gather new information and reduce vulnerabilities found within existing financial systems and 3) Investigate and prosecute criminal organizations exploiting traditional and non-traditional financial systems.

In 2010, HSI published a Cornerstone report dedicated to HOSSPs. The Cornerstone Report is a public facing document and is a mechanism by which private partner sectors are informed about risks of dealing with various players in the market; the sharing of information allows the financial, trade, and retail communities to take precautions in order to protect themselves from exploitation.

The FBI makes extensive use of the over 1 million STRs filed each year in the US to identify HOSSPs. HOSSPs are also identified through linkages with FBI cases and leads from the Joint Terrorism Task Force.

Source: Country Authorities, FATF project questionnaire.

Box 3.4 **FinCEN's Unregistered Money Service Business Outreach Initiative**

FinCEN, the U.S. FIU, has adopted a strategy to identify unregistered money services businesses (MSBs) and coordinate appropriate regulatory actions. FinCEN aims to reduce the number of unregistered MSBs that should be registered by using information from Suspicious Transaction Reports (STRs) and other FinCEN data to assist in identifying these businesses. Once identified through analysis of STRs and other data, institutional outreach is conducted to raise awareness of BSA requirements for MSBs, including registration.

FinCEN data is regularly searched using special search terms (e.g., "unlicensed," "unregistered," "illegal") to identify potential unregistered MSBs named as subjects in STR filings. The FinCEN database is further queried to determine whether any additional FinCEN data exists on the subject(s), and FinCEN's MSB Registrant Search web site is also queried to determine whether they are currently registered. All subjects are also reviewed prior to outreach to identify recent or on-going investigations for determination of whether or not they should be contacted. As a result of FinCEN's July 2011 re-definition of MSBs that included foreign-located entities, foreign-located entities that may be required to register with FinCEN will now be identified for purposes of outreach as well.

An entity identified for outreach is contacted to learn more about the types of activities the entity conducts that may make it an MSB, in order to determine whether the entity must register and to assist it in the registration process. Depending on the outreach results, cases may be referred for possible BSA examination or for possible enforcement actions.

Source: United States.

Box 3.5 **Dutch Migrant Study on Payment Channels**

One potential method to better understand which payment methods remitters prefer and why is through a survey. For instance, The Netherlands Central Bank in April 2013 published a paper investigating the determinants in migrants' choice of payment channels when transferring money to relatives abroad. The paper's authors surveyed 1,680 migrants in the Netherlands and identified five remittance channels: bank services, money transfer operator services, in-cash transfers via unregulated intermediaries, ATM cash withdrawals abroad and carrying cash when travelling home. The survey identified that migrants who regularly used internet banking for other purposes were more likely to use bank services for remittances as well. The paper also found that other drivers exist in determining the choice of payment channels used, such as personal characteristics and country-specific factors, costs (real and perceived), ease of use and availability of remittance transfer options. The paper concluded that financial education, cost reduction, and mobile remittance solutions could expand use of regulated channels.

Source: Kosse, Ameka and Vermeulen, Robert (2013).

Box 3.6 **UK Project QUAVER**

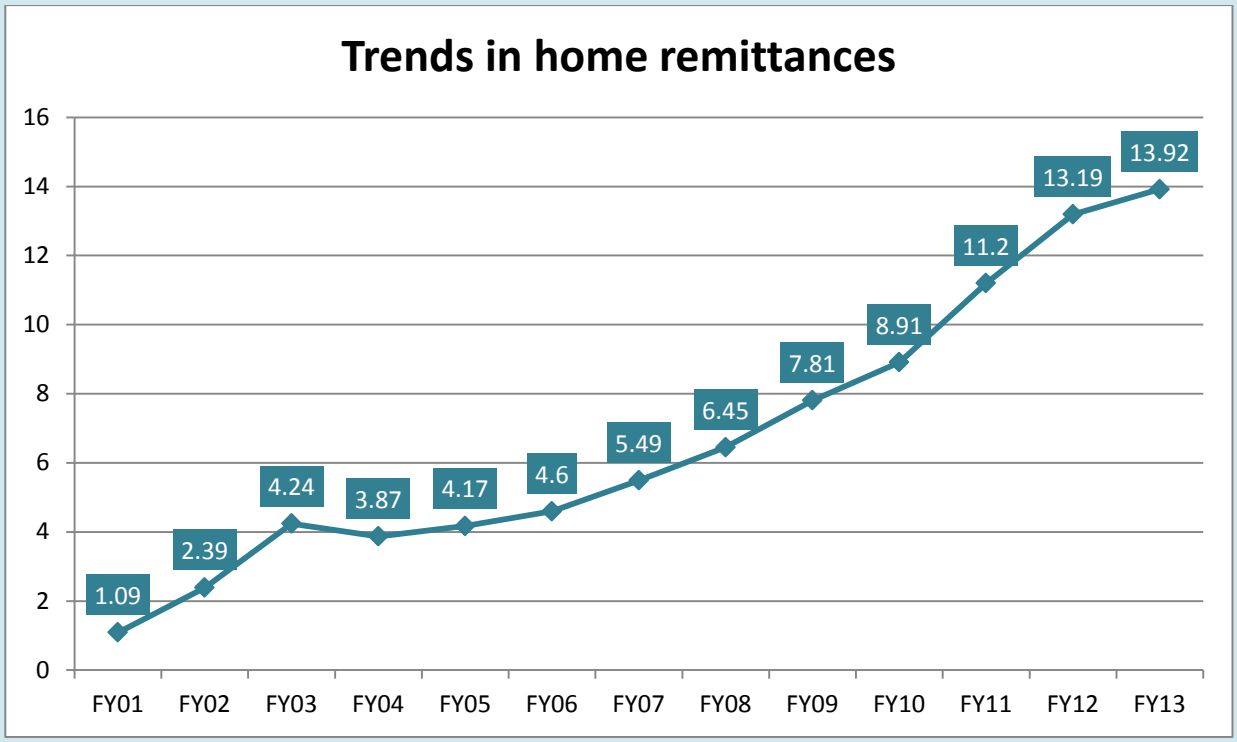
In the UK, all HOSSPs are defined by law as money service businesses (MSB) and are regulated and supervised as such, but are still subject to widespread exploitation by criminal groups. Law enforcement and regulatory bodies have for the last two years been co-operating closely on Project QUAVER, an initiative designed to minimize this criminal exploitation. The project focuses on the communication of commonly seen criminal techniques to the MSB sector, Banks and other financial institutions, designed to improve understanding and facilitate a better appreciation and management of risk in the regulated sector and, accordingly, enhanced compliance with AML/CTF requirements. In addition Serious Organized Crime Agency (SOCA) has been educating regulators and law enforcement colleagues and advising them on how to best approach criminal prosecutions of complicit HOSSPs; the UK has a number of trained Expert Witnesses in money laundering and has delivered similar expert evidence training to colleagues from the USA, Australia and the Netherlands.

The reaction to the project has been positive, with a number of banks and other financial institutions (including large scale MSBs providing payment services for other MSBs) displaying an improved attitude to risk, for example, by closing high risk bank accounts, refusing to carry out third party payments, and by insisting on independent audits of the processes of MSB customers; in addition, a number of MSBs have changed their business practices and are now unwilling to carry out the type of transactions favoured by criminal HOSSPs. The quality and number of Suspicious Activity Reports submitted by businesses in the regulated sector has also increased significantly.

Source: United Kingdom.

Box 3.7 **Pakistan Remittance Initiative (PRI)**

One possible model for moving remittances into regulated channels is the Pakistan Remittance Initiative. A sharp jump had been witnessed in inbound remittances to Pakistan after Financial Year (FY July- June) 2001 as home remittances rose from USD 2.3 billion in FY01 to USD 4.2 billion by FY03 (Figure 1). However, these inflows moderated in subsequent years and reached USD 13.92 billion by FY13. There was increasing realization that a substantial part of these inflows are routed through unregulated channels. Initially, State Bank of Pakistan made policy interventions in the FX market to discourage hawala/hundi system in the country. These efforts helped resume an uptrend in home remittances. Accordingly, in order to provide an ownership structure in Pakistan for remittance facilitation, State Bank of Pakistan, Ministry of Finance and Ministry of Overseas Pakistanis launched a joint initiative called Pakistan Remittance Initiative (PRI) in April, 2009. This initiative has been taken to achieve the objectives of (a) facilitating and supporting efficient flow of remittances and (b) leading to provide investment opportunities in Pakistan for overseas Pakistanis.



At the outset of the drive, a comprehensive objective analysis of the Home Remittance System was carried out with a view to; collect and analyse remittance related data, identify the bottlenecks and weak links in the system, review the recent international efforts on remittances specially in the global and regional perspective, evaluate schemes implemented earlier to enhance remittance flows to Pakistan, and compile practices followed by various jurisdictions to boost remittances. The subject analysis led PRI to formulate a comprehensive strategy aimed at greater commitment of financial sector towards remittance services and resultant inculcation of remittance culture, transparency of remittance market with adequate consumer protection, efficiency of payment system infrastructure, and incentives for the remitters, beneficiaries and overseas entities. These were the basic ingredients to compete with the unregulated channels and provide quality, fast, efficient, cheap and safer services to remitters and beneficiaries through regulated channels.

Through a consultative process, the number of financial institutions involved in remittance services has increased significantly. The realization of business cases in remittances by additional financial institutions has not only facilitated the larger strata of remittance beneficiaries but also resulted in creating a more competitive environment.

PRI is encouraging financial institutions in Pakistan to enhance their outreach worldwide through new remittance- specific related arrangements. Around 400 new arrangements have been finalized by banks in Pakistan with their overseas correspondents since the inception of PRI.

Reliable and efficient payment systems are vital to facilitate delivery of home remittances securely and efficiently and State Bank of Pakistan has already taken number of steps to develop related Payment Systems Architecture of the country.

- Utilization of PRISM (RTGS) to transfer and settle inter-bank Home Remittance transactions. This has enabled banks to transfer inter-bank transactions into beneficiaries' accounts on the same day.

- Apart from RTGS, through ATM Switch, instant A/C credit facility is also available for beneficiaries through IBFT Inter Bank Fund Transfer. This has reduced turnaround time considerably.

Keeping in view of the rising trend in the Home Remittances and importance of the same for the economy, SBP has allowed banks to open dedicated Home Remittance payment centres. Payments can be made to beneficiaries via cash, demand drafts and pay orders. In addition, such Home Remittance Payment Centres would also be allowed to perform the functions of Sales & Service Centres.

In order to provide a reliable and immediate contact point, 24 hours, 7 days a week; a call centre has been established by PRI. All overseas Pakistanis and their families back home can inquire about the remittance services of banks and lodge their complaints with the call centre (0092-21-111-222-774). There are toll free numbers for overseas Pakistanis residing in 12 countries/ regions of the world. Further PRI has its own website http://www.pri.gov.pk for related purposes.

With a view to encourage and to protect the remitters / beneficiaries from any losses that they may incur due to unwarranted delays in receipts of funds in the beneficiaries' accounts, the beneficiary shall be entitled to a return of sixty five (65) paisa per thousand rupees per day from the concerned bank for the number of days credit/payment on account of remittance was delayed.

PRI have organized various training programs related to various facets of remittances services ranging from strategic framework for remittance services to policy level initiatives. PRI also awarded appreciation certificates to top performer branch managers of banks in recognition of their services for the national cause.

International Association of Money Transfer Networks (IAMTN) has awarded Pakistan Remittance Initiative (PRI) with Money Transfer Award 2011 for the category of 'Asia Pacific Including South Asia' and the same has been presented during the ceremony held on November 15, 2011 in London. This award was conferred in recognition to the efforts being made by the PRI to facilitate the flow of remittances through regulated channels to Pakistan.

At the moment, all PRI efforts are aimed at bringing structural changes in the Remittance System of the country with a long-term vision about these recurring flows. It is a daunting task to introduce changes in the decades old systems and procedures with a strongly embedded particular mind-set of the stakeholders involved. The task becomes more difficult in wake lack of financial literacy, perceptual barriers and volatility of exchange rates. Notwithstanding to the impediments, PRI is geared up to achieve its objective of maximizing the flow of remittances through regulated channels in the country.

3.7 INTERNATIONAL COOPERATION RELATING TO HOSSPS

International cooperation is an important key component to ensure effective oversight of HOSSPs necessary to mitigate the risk of HOSSPs being exploited for money laundering and/or terrorist financing. HOSSPs often transfer funds or their equivalent in value across borders and an evidential or intelligence picture cannot be obtained by one country's authorities without the open exchange of information between all the other countries in which the HOSSPs has a presence. Unfortunately,

few examples of international cooperation were provided in the responses to the survey, likely due to lack of training and expertise of law enforcement or other competent authorities related to HOSSPs.

Box 3.8 **International Controller Investigation**

In 2006, as a result of international co-operation with the Spanish authorities in respect of a UK citizen resident in Spain who was believed to be involved in drug trafficking and money laundering, the UK authorities identified a prolific International Controller operating from Dubai. In the course of UK Operation OVERGO, Dubai Police Operation CANCER and Italian Guardia de Finanza Operation KHYBER PASS it was identified that this person was using a number of Dubai registered trading companies to launder money on behalf of criminal networks in numerous jurisdictions including the UK, the USA, Italy, Albania, India and Colombia.

After a lengthy investigation involving extensive mutual co-operation and evidence gathering between the authorities in Dubai, the UK, the USA and Italy, the Dubai Police arrested the Controller in early 2007, but released him from custody a short while later. On the same day, the Italian authorities arrested further members of the Controller's network, and subsequently issued a European Arrest Warrant for the Controller himself.

The Controller subsequently left Dubai and moved his activities to India, however following further international co-operation between the authorities in the USA and India, including the freezing of several million dollars in bank accounts linked to the Controller, the Indian Enforcement Directorate commenced an investigation and subsequently instituted proceedings for Foreign Exchange and money laundering offences against the Controller; these proceedings are on-going.

Box 3.9 **Unlicensed Money Transmitter Investigations**

Case 1.

In August 2010, HSI San Francisco began investigating a U.S. based trading company (TC) suspected of operating as an unlicensed money transmitting business sending funds to Iran. Bank Secrecy Act (BSA) information disclosed wire transfers from high risk countries, as well as businesses previously identified as possibly transmitting funds to Iran in violation of OFAC sanctions. A review of bank accounts disclosed transactional activity consistent with the operation of a Money Service Business (MSB). This activity showed incoming wire transfers from suspect "Trading Companies" followed by pay-outs to individuals with no apparent logical business connection. Further investigation revealed that none of the business or individuals involved in these transactions had a license from the Financial Crimes Enforcement Network (FinCEN) or Office of Foreign Assets Control (OFAC) to transmit money and funds were being sent to/from Iran. It was discovered that the group utilized international wire transfers through a variety of overseas businesses located in the UAE, China, Sweden, and Korea to circumvent existing OFAC regulations. Once these funds were deposited into U.S. bank accounts, the funds would be paid out to other Iranians living in the U.S., or a CPA would "layer" the funds through other US bank accounts owned or controlled by the organization all in an effort to hide it from the Internal Revenue Service. In May 2012, a plea

agreement was reached for one count of Title 18 USC § 1960 and one count of 50 USC §1702 (IEEPA). The business owner later agreed to cooperate with the government admitting that he had worked with family members in Iran as well as an Iranian HOSSP to supply money transmitting services. As part of the plea agreement, it was disclosed how front companies worldwide and HOSSPs were used in conjunction with trade to circumvent OFAC sanctions.

Highlights of International Cooperation: Through numerous HSI Attaché Offices, investigative leads were coordinated with law officials from Afghanistan, the UAE and additional partner countries.

Source: United Kingdom.

Case 2

ZSQ Exchange was a HOSSP operating out of Fremont, California which had transmitted millions of dollars all over the world through a complex system of wire transfers, emails, faxes, commodity exchange and traditional hawala services. Bank Secrecy Act (BSA) documents associated with ZSQ Exchange and the owner, Qader QUDUS, indicated that over a one year period, more than USD 1.2 million dollars was deposited into Qudus' bank accounts. These deposits were followed by wire transfers to various individuals in the Middle East, Pakistan, China, Europe and Japan. A joint HSI, FBI and DEA investigation was conducted with a Confidential Informant (CI) infiltrating a Pakistani-based heroin trafficking organization operating in Maryland. The CI purchased two kilograms of heroin and was instructed to send payments through five separate bank accounts located in New York, San Francisco and Pakistan. The heroin proceeds eventually ended up in the hands of a Pakistani heroin trafficker identified as Momin KHAN-AFRIDI of Peshawar, Pakistan. KHAN-AFRIDI was known by the DEA to be a large-scale heroin and multi-ton hashish trafficker. KHAN-AFRIDI is responsible for heroin distribution throughout the United States, United Kingdom, Thailand, and Canada. The U.S. Treasury Department, Office of Foreign Assets Control (OFAC) designated Khan-Afridi as an international narcotics trafficker. (It was alleged that proceeds from the sale of heroin in the U.S. was commingled with refugee relief money and intelligence sources indicated that some of this narcotics money was being used to finance Al-Qaeda.) Qader QUDUS pled guilty to operating an unlicensed money transmitting business in violation of Title 18 USC § 1960, in the United States District Court, Northern District of California. QUDUS was sentenced to 27 months in prison and ordered to forfeit USD 406 640 to the U.S. Government.

Highlights of International Cooperation - An Internet web site for ZSQ Exchange was discovered identifying ZSQ as a HOSSP. The web site explained how money was to be deposited and identified the bank used and provided the names and address of ZSQ's overseas offices in Kabul, Peshawar, Islamabad, Quetta, Lahore, and Karachi. Bank records revealed numerous wire transfers from ZSQ Exchange to businesses and individuals in thirteen different countries, the majority of which were sent to Japan, China, and Hong Kong. Collateral leads were sent to our HSI attachés in London, Paris, Hong Kong, China, Netherlands, Germany, and Russia.

The UK Metropolitan Police began an investigation to assist HSI London. Japanese police interviewed an individual who received a large number of wires transfers from ZSQ. The individual, a former Mujahedeen General, stated that ZSQ is used to settle large financial transactions between terrorist organizations.

Source: United States.

3.7.1 REGULATOR TO REGULATOR COOPERATION

In order to understand fully the regulatory position of HOSSPs, it is important that the regulators in individual countries are able to share information about the regulatory status of companies that they supervise, and the legal framework under which they are obliged to operate. In order to facilitate this and to allow banks to determine whether HOSSPs are legally licensed or registered before providing banking services, a number of countries make these details available on line. This is the case in Pakistan, United Kingdom, United States, and others. This can be helpful when considering if an unregulated HOSSP has been used for part of the transaction. A transaction may be commenced in accordance with the regulations in the host state, but it may be settled using an operator that is illegal in the destination state. In such cases, there is a greater possibility that the unregulated HOSSP could divert the funds at a later stage and use them for other purposes, such as the payment of an unrelated business transaction between two third parties, as they pass through another jurisdiction, and not be caught.

Alternatively a transaction may be commenced by regulated entities, such as through the banking system at the 'first mile,' but may be paid out by unregulated entities. This is typically seen with remittances from European countries and the United States to Somalia, which are generally initiated with a licensed or registered money transmitter receiving customer funds and remitting them via the banking system to associated companies in the UAE, after which point the UAE companies connected to the international clearinghouse operations of the money transmitters use the funds to purchase goods for export into Somalia, with the ultimate settlement of the transaction being made from the proceeds of the sale of the goods there.

Box 3.10 **EU Passporting System**

In the EU, businesses conducting remittance activity are required to comply with the terms of the EU Payment Services Directive (full title Directive 2007/64/EC on payment services in the internal market). This directive is enacted into law in the domestic legislation of each of the EU member states. The main purpose of the directive is prudential, *i.e.,* to ensure that anyone using payment services in the EU has their money protected by a single legal framework.

Amongst the provisions of the directive is one which allows a business that is regulated in one member state to carry out payment services in another without the need to be supervised by the regulator in that state. This is known as 'passporting'. In such circumstances it is essential that, in order to adequately fulfil their regulatory responsibilities, the regulatory bodies in each country into which the business passports enter into an open information sharing agreement with the authorities in the host country.

Source: European Commission (2007).

3.7.2 EGMONT REQUESTS

The Egmont Group of Financial Intelligence Units was formed in 1995 with the aim of providing a forum for financial intelligence units around the globe to improve international co-operation in combating money laundering and terrorist financing. The group currently has 139 members. Amongst other things, the group facilitates the exchange, on an intelligence only basis, of

information and intelligence relating to suspected offences impacting the group member states. This information exchange takes place between the FIUs in the relevant jurisdictions. It also publishes information relating to typologies and indicators of criminal activity, including fraud, money laundering and terrorist financing identified in the course of its co-ordination activities.

Sharing information in this manner has led to numerous examples of persons being convicted of offences in their country of residence where information received from an overseas FIU generated a new and significant line of enquiry.

Box 3.11 **Egmont information sharing**

An African national residing in a European country (Country Z) declared that he performed hawala banking activities. His account was exclusively credited by cash deposits and numerous transfers for small amounts.

Over the course of several months the funds were transferred to company A in Africa. Shortly thereafter the funds were transferred to company B in Country Z. Companies A and B performed international money remittance services. According to the subject, he performed hawala activities for fellow countrymen wishing to send money to Africa. However, he did not hold any position within companies in country Z where he executed the transactions and he was not registered as a representative of an authorized exchange office.

Police enquiries revealed that he was known to be a member of a terrorist organisation and it is thought that this alternative remittance system may have been used for terrorism financing.

Source: Egmont group website – www.egmontgroup.org/library/cases.

3.7.3 JOINT INVESTIGATION TEAMS (JITS)

A Joint Investigation Team is an investigation team set up for a fixed period, based on an agreement between two or more European Union member states and/or competent legal authorities for a specific purpose. Non EU member states can also participate in a JIT with the agreement of all other parties. The concept of JITs is set out in Article 13 of the 2000 EU Convention on Mutual Legal Assistance.

JITs are specifically geared towards assisting EU member state law enforcement and judicial authorities tasked with instigating complex investigations into organized crime groups, by virtue of which cross jurisdictional serious criminality can be tackled by different Law Enforcement agencies and Prosecutors working in single teams. The JIT is usually set up in the member state in which the investigation begins.

Europol, the European Law Enforcement Agency, and Eurojust, the European Union's judicial co-operation unit, assist in the setting up, implementation and conduct of JITs. In addition, Eurojust, can provide legal advice to member states engaging in JITs.

The key advantages of a JIT are:

- No requirement for international mutual legal assistance requests
- Intelligence and evidence sharing between JIT members. Such evidence can be used in court

- Members of the JIT can be present at house searches, interviews of suspects and other associated areas of operational activity in all jurisdictions covered.

Funding for the establishment of JITs is available from Eurojust. This funding is available for reimbursing travel costs, accommodation, translation and interpretation; in addition, Eurojust can fund/host operational meetings.

3.7.4 MUTUAL LEGAL ASSISTANCE (MLA)

In contrast to Egmont requests, which allow for the sharing of information for intelligence purposes only, MLA requests are required (although not in all circumstances) when the authorities in one country wish to gather, or have gathered, material in another country which will be required to be used as evidence in criminal or other proceedings.

MLA requests are generally required when a request for evidence to be gathered in another jurisdiction requires some form of judicial oversight, a degree of coercion or the invasion of privacy; for example when a request is made for the obtaining of evidence by questioning of a suspect after arrest, the search of a premises under warrant, or a judicial order for the production of information, such as banking or other information held under the presumption of confidentiality.

MLA requests can result in certain types of evidence being obtained and used in one country that would not be permissible under that country's domestic legislation; for example, transcripts of telephone intercepts conducted outside the UK are in certain circumstances admissible as evidence in UK courts, even though the law in the UK explicitly excludes the use of such material gathered in the UK as evidence.

MLA requests are issued by the competent legal authority in one jurisdiction on the application of either a prosecuting authority or, where proceedings have been instituted, on behalf of the person charged. The judicial authority can only issue an MLA requests if it appears to them that an offence has been committed, or if there are reasonable grounds for suspecting that an offence has been committed, and that proceedings in respect of the offence have been instituted, or the offence is being investigated. The nature of the assistance sought must be specified in the request, as must the use to which the resulting information is to be put.

Whilst MLA requests have a vitally important role in supporting prosecutions of HOSSPs, it is frequently the case that, for various reasons, such as for example a simple lack of resources, or because the requesting country does not fully understand the legal requirements of the receiving country for dealing with such requests, that the servicing of the request by the receiving country is delayed (on occasions the results can be received after the conclusion of proceedings). This can have significant implications for the prosecution in the country issuing the MLA requests, ranging from the proceedings being delayed, to vital evidence being unavailable during court proceedings. Regular and on-going communication between the authorities in the issuing and receiving countries is therefore vital during the MLA requests process.

Ironically delays in the MLA requests process can work to a defendant's advantage as there are numerous cases whereby a defendant's legal team has been able to adduce evidence gathered in an

overseas jurisdiction, due to them not having to follow the MLA requests procedure, when an MLA requests in respect of similar prosecution evidence has been held up by judicial procedures.

Financial Action Task Force

Groupe d'action financière

REPORT ON NEW PAYMENT METHODS

13 OCTOBER 2006

Executive Summary

New and innovative methods for electronic cross-border funds transfer are emerging globally. These new payment tools include extensions of established payment systems as well as new payment methods that are substantially different from traditional transactions. New payment methods raise concerns about money laundering and terrorist financing because criminals can adjust quickly to exploit new opportunities.

The present study analyzes prepaid cards; Internet payment systems; mobile payments; and digital precious metals in order to: (1) Identify trends in the adoption of new payment technologies; (2) Assess money laundering (ML) and terrorist financing (TF) vulnerabilities; and (3) Determine whether the Financial Action Task Force (FATF) Forty Recommendations and Nine Special Recommendations (40 + 9) adequately address any potential vulnerabilities.

The study found there is a legitimate market demand served by each of the payment methods analysed, yet potential money laundering and terrorist financing vulnerabilities do exist. Specifically, offshore providers of new payment methods may pose additional money laundering and terrorist financing risks compared with service providers operating within a jurisdiction.

While it is believed that the FATF 40 + 9 provide the appropriate guidance to address the vulnerabilities associated with these new methods of payment, the study does suggest further examination of the effect these evolving technologies may have on cross-border and domestic regulatory frameworks in order to ensure their compatibility with the FATF 40 + 9.

Table of Contents

1. Introduction

Payment innovations that use the Internet, wireless devices, and even well-established payment networks are appearing globally. Both domestic and offshore service providers may offer these new payment methods (NPMs). While a few NPMs operate or are used in multiple countries or even globally, most are limited in their operational reach or use to specific geographic markets or for specific types of transactions involving the purchase of goods and services. Some NPMs also support domestic, and in some instances, cross-border fund transfers between individuals.

The present study analyzes prepaid, cards; Internet payment systems; mobile payments; and digital precious metals to: (1) Identify trends in the adoption of new technologies; (2) Assess actual money laundering (ML) and terrorist financing (TF) vulnerabilities; and (3) Determine whether the Financial Action Task Force (FATF) Forty Recommendations and Nine Special Recommendations (40 + 9) address any vulnerabilities identified.

This report updates a review of NPMs that FATF members conducted in 1996-1997.[1] Most of the specific payment tools described in this report were not yet in use when the previous FATF study was conducted, which was at the dawning of the Internet era. Accordingly, the previous FATF study of new payment methods concluded: "It is premature to consider prescriptive solutions to theoretical problems."[2] Many of the concerns of ten years ago, however, no longer appear to be theoretical.

More recently, in the FATF 2004-2005 Typologies Exercise, participants re-examined new payment methods as part of the Alternative Remittance Systems (ARS) typologies project.[3] The ARS report stated: "[T]his study very briefly touches on the issue of new payment methods including e-money. Although many of these systems might also be included in the term *alternative remittance systems*, their characteristics are so atypical that they would almost deserve a separate study." Some of the tools and techniques identified in that report are considered in more depth in this study.

The research underlying this report began with a questionnaire that attempted to identify the new payment methods appearing around the world and to estimate market size; how or if those payment tools were subject to regulation, supervision, or licensing; whether there was evidence of ML or TF activity associated with those new payment methods; and whether there were relevant law enforcement cases. Thirty-eight jurisdictions responded to the questionnaire.

The results of the questionnaire show in general that it is not always easy to identify new payment methods (NPM). As a consequence, these results may not mirror the real supply of NPM around the world, but only the perceived supply in the jurisdictions which have provided responses to the questionnaire. The periodic surveys of NPMs conducted by the Committee on Payment and Settlement Systems (CPSS) of the Bank for International Settlements (BIS)[4] are a useful complement to this report. However, these surveys on developments in

[3] 10 June 2005, section I, see http://www.fatf-gafi.org/dataoecd/16/8/35003256.pdf

[4] The CPSS, under the auspices of the BIS, regularly publishes reports analyzing developments in domestic and cross-border payment, clearing, and settlement systems. See "Survey of developments in electronic money and internet and mobile payments," CPSS publications no. 62, March 2004, at http: www.bis.org/publ/cpss62.htm. For the most recent statistical information on payments and settlement systems (including certain NPMs), see CPSS, "Statistics on payment and settlement systems in selected countries—Figures for 2004," BIS, CPSS #74, March 2006, at http://www.bis.org/publ/cpss74.htm.

payments market do not focus on anti-money laundering (AML) or countering the financing of terrorism (CFT) as they apply to NPMs, which is the purpose of this study.[5]

The project team, which included representatives from Asia, the European Union member countries, and the United States, conducted additional primary research by consulting public and private sector experts. At the 2005-2006 Typologies Experts Meeting on ML and TF in Rio de Janeiro, the project team heard Mr. Joshua Peirez of MasterCard and Mr. Allen Love of PayPal describe their respective company's payment tools and markets; Mr. Vicente S. Aquino, Executive Director of the Philippines' Anti-Money Laundering Council Secretariat, described that nation's mobile payment systems; and Ms. Sheri Dunlop of the United States Secret Service presented a ML case study involving the use of digital precious metals. At other times, core project team members met with representatives from Visa and American Express and prepaid card program management firms in the United States.[6] Finally, project team members reviewed a variety of related media articles and public sector reports.

This report reflects the contributions of payment system and anti-money laundering and regulatory experts from a variety of countries. In many cases, the definitions and terminology used to describe similar payments systems or payments activities vary from country to country. To provide clarity and consistency within this report, the members of the working group have chosen to adopt, as much as practical, the terms and definitions applied to payments systems by the CPSS.[7] Whenever the terms or definitions used in this report diverge from this source, the variation is highlighted and explained.

The report is divided into six sections. Sections 1 and 2 provide an executive summary and a brief introduction. Section three describes how the new payment methods addressed in this study operate and are used.[8] Section four introduces a ML and TF risk matrix developed by the project team to assess the potential ML/TF risk of each NPM in this study. Section five addresses how the FATF Forty Recommendations and Nine Special Recommendations apply to NPM, and presents selected jurisdictional regulations. Section six summarizes the 38 responses to the FATF NPM questionnaire prepared by the project team.[9] Section seven offers conclusions and highlights areas for further consideration by the FATF.

2. Background

How payment system innovations emerge is associated with a number of factors specific to each country, including the underlying economic environment, technology, preferences, actual and perceived costs, along with regulations, policies, and practices of government and private entities with significant influence on the payments system. The fundamental trend, however, across all nations is the migration from paper to electronic payments.

Moving away from paper payments to standardized electronic transaction processing has had the effect of breaking down the payment system into distinct business segments. Hardware, software, communications lines, systems management, accounting, marketing, and distribution have all emerged as distinct business lines for distinct payment services. This segmentation, and the specialization that has resulted, has led to the entry of

[5] Another reliable source of information about the development and the state of the market of NPM's is the website of the electronic payment systems observatory (ePSO), managed by the European Central Bank: www.e-pso.info.

[6] NetSpend, Green Dot, and Wild Card Systems (now eFunds).

[8] A detailed presentation of traditional credit and debit payment methods (on which most new payment methods are based) is contained in Appendix A.

[9] A detailed summary of the questionnaire responses can be found at Appendix B.

nonbanks as both outsourced service providers to the banking industry and sometimes competitors in the market for clearing services.[10]

While banks remain the core providers to end-users for most retail payment instruments and services, payment applications are now available from a wider range of service providers. The move from paper to electronic transactions has enabled non-bank service providers to customize their payment instruments and to package them with complementary products in order to serve niche markets.

Nonbanks now serve as Internet payment portals, transferring payments between payers, payees and their account-holding institutions. Nonbank intermediaries also transfer payments between buyers and sellers who transact through Internet retail storefronts and through online auction sites. Nonbanks, in fact, pervade the payments industry, processing transactions, maintaining databases, and even operating as value providers in e-money schemes. The result is that "the line between the direct provision of retail payment services to end users by non-banks and the provision of related support services to users and payment providers is much less clear than in the past."[11]

Traditional and Non-traditional Retail Payments

Traditional retail payments are generally low-value, consumer payments that do not require immediate settlement.[12] Traditional electronic payments include bank payment products and services and money transfers that are carried out through nonbank intermediaries such as Western Union, which generally work as credit transfers but do not rely directly upon the transfer of funds between bank accounts.

The FATF defines a money or value transfer system as a "financial service that accepts cash, cheques, other monetary instruments or other stores of value in one location and pays a corresponding sum in cash or other form to a beneficiary in another location by means of a communication, message, transfer or through a clearing network to which the money/value transfer system belongs."[13]

Supplementing these traditional retail payments are newer, innovative payment products, or non-traditional retail payments. For the purposes of this report, we refer to these types of payments as "new payment methods", although they are also often referred to as "e-money" by international payments system experts. NPMs include a variety of innovative products that involve new ways of initiating payments through, or extending the reach of, traditional retail electronic payment systems. NPMs also include products that do not rely on traditional payment systems to transfer value between individuals or organizations.[14] This report considers the following NPMs: prepaid cards, electronic purses, mobile payments, Internet payment services, and digital precious metals. Table 1 below provides for a schematic distinction, amongst NPMs, between those that are an extension of traditional payment instruments and those which are *strictu senso* new payment methods.

---

[10] Clearing and Settlement Arrangements for Retail Payments in Selected Countries, Committee on Payment and Settlement Systems, Bank for International Settlements, September 2000 (CPSS #40)

[11] Policy Issues for Central Banks In Retail Payments, Committee on Payment and Settlement Systems, Bank for International Settlements, March 2003 (CPSS #52)

[12] Paper non-cash retail payment instruments include checks, demand drafts, cashiers checks, money orders, traveler's checks, and other related bank drafts. Electronic non-cash retail payment instruments include credit and debit cards as well as credit transfers and direct debits completed through systems such as an automated clearinghouse (ACH). See Appendix A for detailed descriptions of traditional debit and credit card systems.

[13] Interpretative Note to FATF Special Recommendation VI: Alternative Remittance, February 2003.

[14] For the purposes of this study, we have excluded from consideration any non-traditional means of clearing and settling paper check payments or bank drafts through the use of electronic information or electronic check images, including their conversion to electronic funds transfers via ACH systems.

New Payment Methods (NPM)

Extensions of traditional retail electronic payment systems	New non-traditional retail electronic payment systems
Prepaid payment cards	Electronic purse
Internet payments based on bank accounts[15] *(not covered in this report)*	Internet payments not based directly on a bank account
Mobile payments based on bank accounts	Mobile payments not based directly on a bank account
	Digital precious metals

Table 1

Prepaid cards

Prepaid payment cards provide access to monetary funds that are paid in advance by the cardholder. While there are many different types of prepaid cards that are used in a variety of ways, they typically operate in the same way as a debit card and ultimately rely on access to an account. There may be an account for each card that is issued or, alternatively, there may be a pooled account that holds the funds prepaid for all cards issued. The cards may be issued by, and accounts may be held at, a depository institution or a non-bank organization; pooled accounts would be normally held by the issuer at a bank.

Prepaid cards can be issued for limited or multiple purposes. Limited-purpose or *closed system* prepaid cards can be used for only a limited number of well-defined purposes and their use is often restricted to specific points of sale or for specific services. Examples include merchant-issued gift cards, prepaid long distance service, and mass transmit system cards. These cards may either be limited to the initial value posted to the card (non-reloadable) or may allow the card holder to add value (up to a certain limit) and reuse the card (reloadable). The issuer of the card or its service provider typically operates the network on which the cards can be used. The value on the cards generally is linked to a prepaid account established by the issuer or service provider. Transactions are processed in a similar fashion to transactions involving debit or credit cards.

Multipurpose or *open-system* prepaid cards can be used across a broader range of locations for a wider range of purposes. Such cards may be used on a national or international scale but may sometimes be restricted to a certain geographical area. Multipurpose cards may be used by the person who purchased the card or by someone else. Examples include payroll cards and general purpose "cash cards" for individuals without bank accounts or a credit card. These cards are usually associated with a card payment network, such as Visa or MasterCard, which permits them to be used in the same manner as a debit card to make purchases or to get cash from an automated teller machine (ATM). Some issuers do not require the cardholder to have a depository account. These cards are distributed by merchants, depository financial institutions, and money/value transfer (MVT) systems for a variety of purposes. Most are reloadable.

[15] The expression "bank account" used in this box refers to accounts held at financial institutions that are subject to AML requirements.

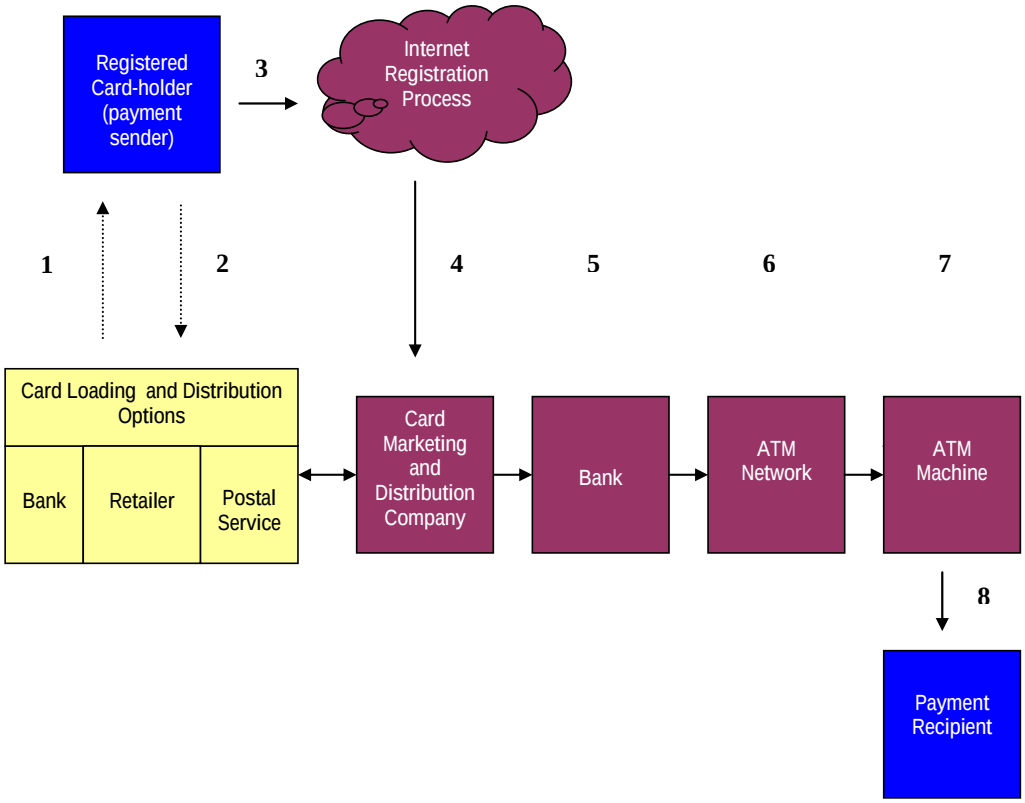

Figure 1 The process of issuing an open-system, magnetic strip, prepaid card varies by issuer. Steps (1), (2), and (3) above may occur in any order. In those three steps an individual completes the registration process for a prepaid card, prepays funds into the card account, and receives the card. Step (4) is the transfer of registration information to the service provider. When a card carries a bank association service mark (as in the case of MasterCard- or Visa-branded cards), the service provider must contract with a bank (5) in order to have access to the global ATM networks (6). Individual ATM machines (7) connect to local networks and often global networks allowing individuals in one country (8) to access funds held in another country.

Electronic purse

An electronic purse, or e-purse (also referred to as a "stored value card" as the value is stored on the card), is value stored electronically in a device such as a card with an integrated circuit chip (called a smart card or chip card).[16] Unlike a card with a magnetic stripe, which stores account information, an e-purse actually stores funds on the card's memory chip. The user is literally carrying his funds with him on the card (hence the name electronic purse).

In some e-purse programs value can be transferred from the card directly to participating merchants or another individual without the transaction going through an account at an intermediary. This may limit the amount of

[16] This definition augments slightly the normal CPSS usage of the term "electronic purse" to also encompass the term "electronic money". For the purposes of this report, the term electronic purse is "a reloadable, multi-purpose prepaid card which may be used for small retail or other payments instead of coins" where the "value is stored electronically in a device such as chip card."

identifying information available with such transactions. To obtain funds from an e-purse payment, however, the merchant or individual must redeem the value from an account held by the e-purse provider at the e-purse issuing institution. As the funds are on the card, no online connection and no cardholder identification are needed to make a payment. The electronic purse function was designed to substitute for cash in everyday situations. Today, electronic purses are mainly used for micropayments such as for public transportation, parking tickets or vending machines.

The development and use of card-based e-purses has declined considerably over the past decade so that very few e-purse systems remain in existence. In addition, these few remaining e-purse solutions are generally not interoperable regardless of the market in which they operate. Only one system, the German GeldKarte that operates in the border area of Germany and Luxemburg (See Figure 2), is known to be used in multiple national jurisdictions. Furthermore, e-purses usually have a limited storing capacity for funds (e.g. the German GeldKarte has a load limit of EUR 200).

Figure 2

Mobile Payments

Mobile payments refer generally to the use of mobile phones and other wireless communications devices to pay for goods and services. Payments are initiated from a mobile communications device using voice access, text messaging protocols (such as short/single messaging service or SMS), or wireless application protocols (WAPs) that allow the device to access the Internet. Authorization often occurs by keying in a unique personal identification number (PIN) associated with the customer or mobile device. Adoption of mobile payments varies from country to country. Use of mobile phones as a means to initiate payments is relatively widespread in Southeast Asia and in some European countries.[17]

Most mobile payment services simply use the phone as an access device to initiate and authenticate transactions from existing bank accounts or payment cards.[18] This is the equivalent of using the Internet to initiate a direct debit or credit transfer from a bank account, or a credit or debit card transaction. This is an extension of traditional payment methods.

New mobile payments: Where mobile payment services are not based on an underlying bank or payment card account, the telecom operator typically acts as a payment intermediary to authorize, clear, and settle the payment.[19] Telecom companies engaged in these activities may not be overseen by a country's central bank or other banking regulator but may be subject to AML/CFT measures.

The telecom operator may either allow the phone owner to charge certain transactions to the phone bill (post-paid) or may permit the phone owner to fund an account held by the telecom operator or other service provider for the purposes of making payments (prepaid). Prepaid mobile payments accounts operate in the same manner

[17] See CPSS, "Policy issues for central banks in retail payments," BIS, CPSS #52, March 2003, at http://www.bis.org/publ/cpss52.htm.

[18] See CPSS, "Survey of developments in electronic money and internet and mobile payments," BIS, CPSS #62, March 2004, at http://www.bis.org/publ/cpss62.htm.

[19] Telecom companies offering mobile payment services provide for the settlement of the payment transactions completed via their systems through normal banking channels.

as a prepaid card or an electronic purse. When the phone is used in the same manner as a prepaid card, the phone owner uses the phone as a payment system access device to authorize the deduction of value from the prepaid account. When the phone functions as an e-purse, the prepaid value is stored on the subscriber identify module or SIM card within the mobile phone.

Post-paid and prepaid card-like mobile payments are much more common than e-purse mobile payments. In the case of prepaid mobile payments, telecom providers often offer this service in conjunction with a bank. For example, in the Philippines two telecom companies offer mobile payment services, Globe Telecom and Smart Communications. Smart Communications' Smart Money is co-branded with Banco de Oro. The transactions and funds transfers Smart Money users initiate via their mobile phone are authorized against a prepaid account held at Banco de Oro. Smart Money users can also send cross-border remittances by providing relatives with a MasterCard-branded prepaid card linked to the Smart Money account that can be used to withdraw cash from an ATM.

Globe Telecom serves as the intermediary for funds transfers using G-cash and operates without a bank partner. As a result, Globe customers cannot withdraw funds from their prepaid accounts at ATMs but only over the counter at participating businesses. Figure 3 illustrates a G-Cash funds transfer from one Globe Telecom subscriber to another using SMS. Both G-Cash and Smart Money are subject to AML/CFT regulations (including suspicious transaction reporting) and supervision.

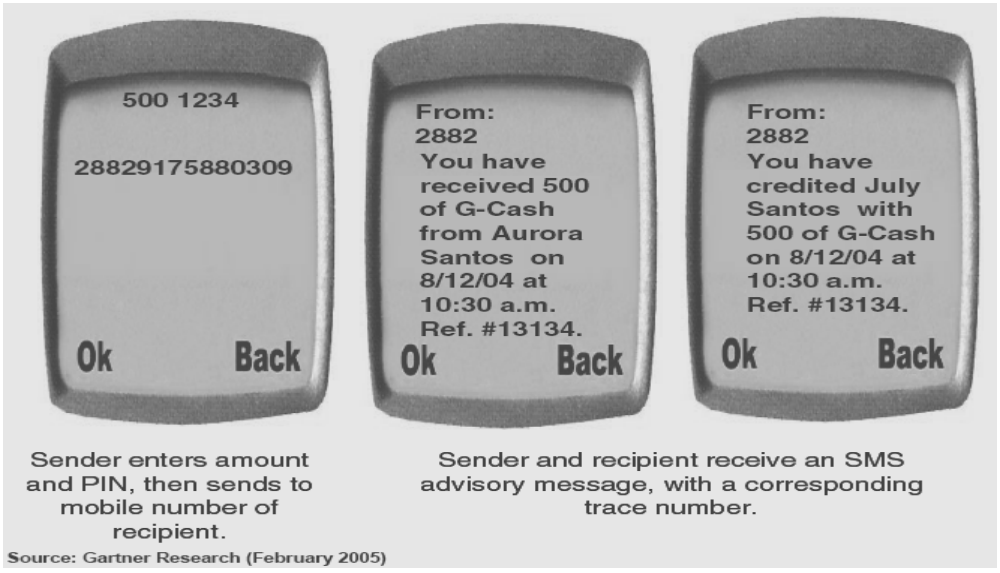

Figure 3 G-Cash Phone-to-Phone Remittance

Internet payment services

The expression "Internet payment services" is generally used to address: (i) payment services that rely on a bank account and use the Internet as a means of moving funds to or from a bank account; and (ii) payment services provided by non-bank institutions operating exclusively on the Internet and that are only indirectly associated with a bank account.

In the former case, Internet payment services refer to traditional payment methods where the Internet is only an innovative channel to exchange the information that is needed to move the funds from one account to another, which allows customers to access their bank accounts from home, 24 hours a day.

Where Internet payment services do not rely directly on a bank account, such as PayPal, individuals can transfer funds, shop online, or participate in online auctions, using a pre-funded account; however, the payment service provider may not be subject to the same AML/CFT measures that apply to banks. The service provider usually

will not have a face-to-face relationship with its customers. Depending upon the accessibility of the Internet payment service, these activities can involve payments or funds transfers across national borders.

Some non-bank Internet payment services allow customers to hold accounts with the payment service provider, while others offer only to send or receive individual payments using the customer's existing bank or credit card account. When non-bank Internet payment services offer customer accounts they may pool those customer funds in a single account at a bank. The account may be held in the name of the service provider. In that case, the bank holding the service provider's account may have no direct relationship with the service provider's individual customers.

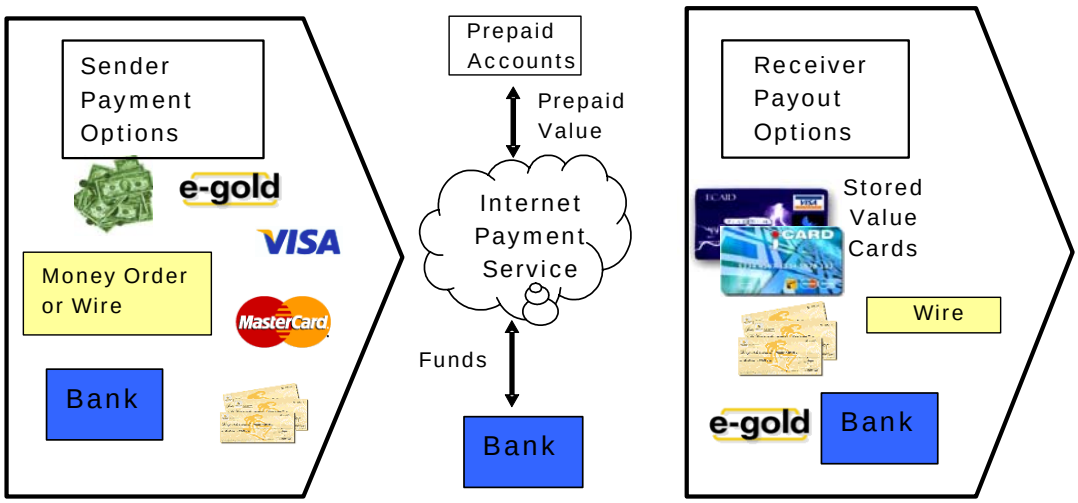

Figure 4

While a limited number of similar products exist in certain countries, PayPal appears to be the most widely used non-bank, Internet-based NPM. PayPal primarily functions as a payments intermediary for individuals and organizations that wish to trade with each other or transfer funds via the Internet. PayPal operates by allowing an individual to set up a pre-paid account in his name with PayPal that can be funded from a credit or debit card or a bank account via a credit transfer. Using those pre-paid funds, individuals can buy items or transfer funds to other PayPal account holders. The payment or transfer of funds occurs as a book-entry transaction between the PayPal accounts. When an individual wishes to access the funds in his PayPal account, he directs PayPal to credit his credit or debit card or bank account via a credit transfer or even a paper check.

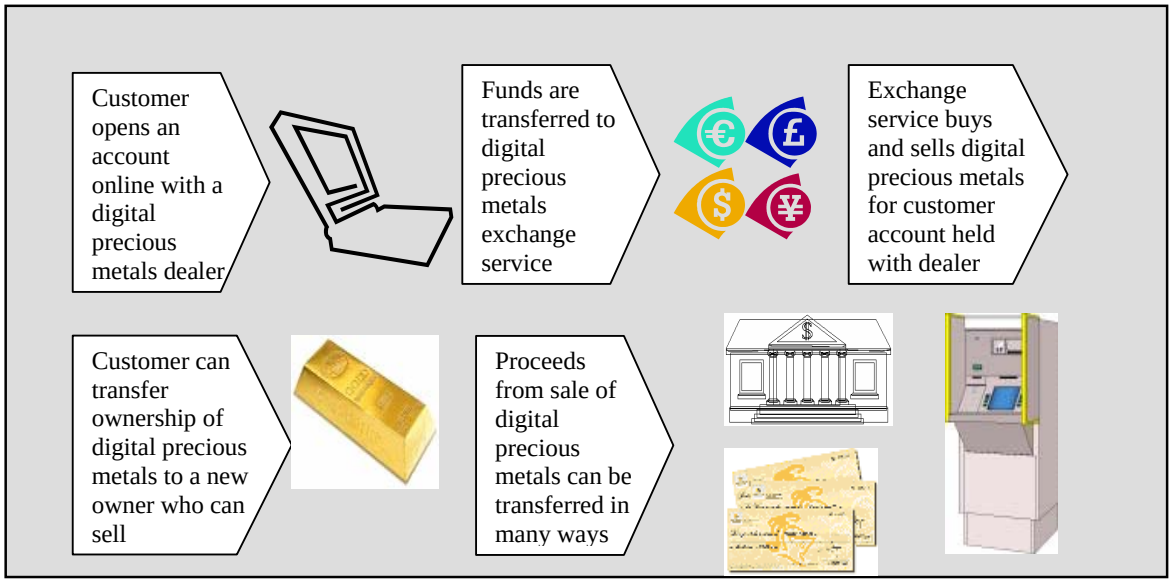
Service providers will differ as to the methods of payment they will accept to initiate a funds transfer, and the methods of payment they will use to distribute funds to the recipient. Figure 4 above illustrates how an individual can use a bank-issued credit card or other traditional payment methods to fund an Internet-based transaction account and subsequently make purchases or transfer all or a portion of the prepaid value to another account holder via book-entry by the service provider. The recipient can then use those funds to conduct additional transactions or withdraw the money via a traditional retail payment method. Online money transfer services set their own terms as what form of payment they will accept from senders and what forms of payment they make available to receivers.

Digital precious metals[20]

Digital precious metals are a relatively new online MVT system that involves the exchange of options or the right to purchase an amount of precious metals at a specific price. These derivatives can be exchanged, like traditional commodity or securities derivatives, between account holders in a digital precious metal service. Consumers purchase a quantity of virtual precious metal holdings based on the current price of the metal on the world commodity exchanges. Once a purchaser has acquired a quantity of the virtual precious metal, those holdings or a portion of them can be transferred either to another individual or a merchant in exchange for goods and services.

The oldest and best known of the digital precious metals dealers is e-gold Ltd., which claims to have almost 2 million accounts.[21] According to e-gold and other digital precious metals dealers, the rationale for using this store of value is to facilitate online transactions without regard for underlying currencies or access to foreign exchange. Transactions involving digital precious metals have immediate finality, which may appeal to online merchants that must pay high credit card interchange fees due to high fraud rates. Some digital precious metals dealers also allow users to maintain anonymous accounts. These traits are concerning to U.S. federal law enforcement agencies.

The transaction process associated with transferring the virtual holdings of precious metals between account holders can involve two separate service providers: the digital precious metals dealer, which maintains the accounts that contain the virtual holdings of precious metals; and the digital precious metals exchange service, which can act as a broker for the digital precious metals that the dealers buy or sell. Some dealers transact directly with account holders. Upon completion of a transaction, the selling account holder transfers ownership of his virtual precious metal holdings to the purchaser and can receive the proceeds of the sale through a variety of traditional and non-traditional payment methods (See Figure 5).



[20] The issuers of digital precious metals use the term "digital currency" to describe the barter arrangement they facilitate. Because of the potential confusion this common industry term would create with the term "e-purse" and "e-money", we have adopted the term "digital precious metals" for this report.

[21] E-dinar is a spin-off of e-gold and is affiliated with the Islamic Mint, a private organization working to revive the gold and silver currencies described in the Koran, the gold dinar and silver dirham. See: www.e-dinar.com.

Figure 5 Buying and selling digital precious metals typically involves working with two separate service provider categories: the digital precious metals exchange service and the digital precious metals dealer.

3. NPM Risk Assessment, Typologies, and Case Studies

The potential ML/TF risks posed by an NPM can vary from one service provider to another where there is no applicable AML/CFT law or regulation that establishes a uniform standard. To define high and low ML/TF risk characteristics of NPM operations, the project team developed a risk evaluation matrix (Table 1). The matrix identifies the essential risk criteria, applies those criteria to cash, representing the extreme high risk example, and provides generic NPM high and low risk scenarios.[22] Each NPM then is evaluated individually against the ML/TF risk criteria and wherever possible case studies and typologies are presented. The individual NPM risk assessments are summarized in Table 2.

To assess an NPM's ML/TF risk accurately, all of the risk factors have to be weighed in relation to the needs of the target market and applicable risk mitigating laws, regulations, and industry rules and practices. Taking all these factors into account, a particular NPM can be effective for all legitimate purposes while rendered ineffective or at least inconvenient for illegitimate purposes [23]

Few countries have identified criminal cases or typologies indicating ML or TF directly related to new payment methods. While this appears to indicate that NPMs are little used by criminals or terrorists, it may also indicate a more limited awareness of these NPMs within the AML/CFT community. The following typologies, therefore, should not be considered exclusive to any jurisdiction.

Payment Method Risk Factors			
Criteria	Cash	NPM High Risk	NPM Low Risk
Identification	Anonymous	Anonymous accounts with no identification or verification requirements	Payment methods that conduct verification of full customer identification
Value Limits	No limit	Any anonymous payment method without funding or transfer limits	Specific limits are placed on funding and transaction values[24]
Methods of Funding	Anonymous, no intermediary, no transaction record	Using an anonymous funding source (e.g. cash or money orders) to fund or receive funds from an NPM account that also can be used anonymously to	Using funding, pay out and value transfer methods that require verification of customer identification and maintain transaction records for each value transfer.

[22] Physical cash is often the ideal method of value transfer for criminal activity because it is anonymous, untraceable, requires no intermediary, is widely accepted, and provides for immediate settlement. The money laundering (ML) or terrorist financing (TF) risks posed by the new payment methods discussed in this report can be measured by how closely these alternatives match the attributes of cash. The main problem with cash for money launderers is its bulk, which creates difficulty moving the currency across borders. Criminals turning to cash alternatives, including NPMs, can eliminate the problem of moving large quantities of currency, but may encounter other limitations.

[23] In practice, no single category of the ML/TF risk criteria determines the relative ML/TF risk of a particular NPM. In addition to evaluating the NPMs considered in this report, the risk matrix presented may provide a useful framework for analyzing the level of risk associated with other payment systems or commercial activities.

[24] Account limits may not be necessary when full customer identification is verified and a transaction record is maintained, otherwise limits may be appropriate

		transfer value to an anonymous recipient	
Geographical Limits	Some currencies are accepted more widely than others	Payment methods that can be used to send and/or receive funds across national borders	Payment methods that can only be used to send and/or receive funds domestically
Usage Limits	No limit	Payment tool can only be used to access cash or can be exchanged for cash	Payment tool can only be used to acquire goods and/or services

Table 2

Prepaid Cards: Open System

Identification. Open-system prepaid cards may be used to support anonymous cross-border funds transfer (See Figure 6). When cards are issued without a bank account and applications are accepted online, via fax, or over the counter at retailers and check cashing outlets, insufficient customer due diligence in the application process may increase the potential ML/TF risk. This risk may be mitigated by account and transaction limits. Some service providers tier the customer identification process to the value held in the account and the frequency or value of account activity. Although prepaid cards have a unique account number and create an electronic transaction record, without adequate cardholder identification the transaction trail alone may be insufficient to help law enforcement trace the cardholder. Depending on the jurisdiction, offshore card issuers may pose additional ML/TF risks.

Value limits. Open-system prepaid card programs often target distinct market segments (e.g. children; teenagers away from home; adults without a bank account; and adults unable to qualify for a credit card). Each market segment may have distinct needs, which may be reflected in the funding and value limits which are set by the card-issuing bank. These limits include how much value can be held in a card account, how much can be prepaid at one time, and how often value can be added or withdrawn. The more money that can be moved through a card account, either at one time or through a series of ATM transfers, the greater the risk, relative to the other risk criteria.

Method of funding. Prepaid cards draw on a prepaid account that can be funded in a variety of ways. The card-issuing bank and its partners determine how card accounts can be funded. Some methods, such as credit transfers from a bank account or credit card, involve payment sources that: (i) independently verify the identity of the prepaid cardholder; (ii) will maintain a record of the funds transfer to the prepaid card; and, (iii) will usually have AML policies and procedures that include monitoring transactions for suspicious activity. Other methods of account funding, such as cash and money orders, are anonymous and leave no paper trail, increasing the potential ML/TF risk independent of the other risk criteria.

Geographic limits. Open-system prepaid cards that have the capability to provide access to cash at automated teller machines (ATMs) increase the potential ML/TF risk independent of the other risk criteria and risk mitigation. Access to cash through the ATM networks, however, usually requires the use of a personal identification number (PIN) that must be pre-set with the issuing institution. The requirement of the PIN may not, however, provide sufficient information within the transaction record to identify with full certainty the recipient.

Usage limits. Open-system prepaid cards can have usage limits. Physical cards may be limited to point-of-sale (POS) networks, allowing only the purchase of goods and services and barring access to cash via ATMs. Virtual cards provide the cardholder only an account number to be used for online and telephone transactions; there is no physical card to access cash via ATMs. However, most open-system prepaid cards are physical cards and facilitate access to POS and ATM networks. In some countries, physical cards may also be used to withdraw cash at retailers whereby an amount higher than the price of goods purchased is paid to the retailer and the difference between the price of the goods and the amount paid is given in cash to the cardholder. For the reasons

discussed previously, cards that can provide access to cash via ATMs on a global basis may increase the potential ML/TF risk independent of other risk criteria and risk mitigation.

Typology. The transfer of illicit proceeds from one country to another using debit cards associated with personal bank accounts and the ATM networks is an established method of ML. Instances of ML have been identified as having occurred even when a customer identification program is in place at the time the bank account is opened. This can occur when a customer uses false identification documents. Some open-system prepaid cards offer similar ATM access without requiring the cardholder to open a bank account or verify identification, creating the potential for greater use of this typology.

Case Studies.

A. In 2001, a suspicious activity report (SAR) filed in the United States detailed the acquisition of more than 300 prepaid cards by a single individual who used them to transfer almost $2 million to Colombia. No further information is available to the public.

B. In 2001, the El Dorado Task Force[25] in New York, identified a significant trend in the number of individuals who appeared to be using ATMs as a means of laundering money through cash withdrawals in foreign countries. Analysis identified more than fifty SARs involving the structured deposit of cash into New York area accounts with subsequent ATM withdrawals in Colombia, Mexico, Peru, Ecuador, and Panama. A similar study conducted by the Financial Crimes Enforcement Network (FinCEN, the U.S. financial intelligence unit) over a four-year period found the most common withdrawal locations were Colombia, Venezuela, Mexico, Argentina, and Brazil. In almost all of the SARs, the banks described the suspected violation as ML-related.

C. In 2004, German tax investigators discovered a case of ML through prepaid cards. Two participants of a criminal fraud/embezzlement scheme had transferred parts of their shares of the criminal proceeds onto several prepaid cards. They used the funds on the cards for cash withdrawals (domestic only, not in foreign countries) and payments for goods. The card accounts were kept only for short periods (6 – 24 months) after which they were closed again and new ones were opened. In this case more than 350.000 EURO were hidden and laundered this way.

[25] Created in 1992 to target money laundering in New York, the El Dorado Task Force became one of the nation's most successful money laundering task forces. It is led by the Immigration and Customs Enforcement federal law enforcement agency and includes representatives from 29 federal, state, and local law enforcement agencies.

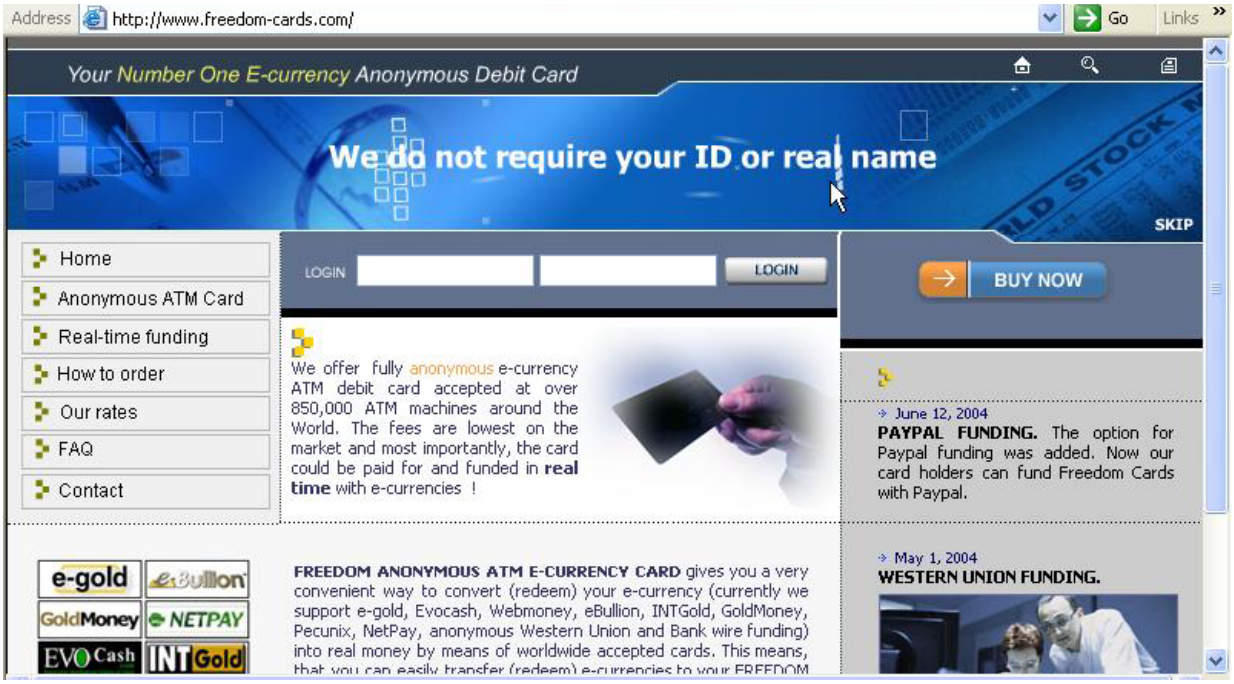


Figure 6

Prepaid Cards: Closed System

Identification. Anonymous, closed-system prepaid cards may be resold for cash, which could facilitate ML and TF. This risk, however, is mitigated by the demand for the goods and services that can be purchased with the card as well as the geographic scope of a card's acceptance.

Value limits. A high-value, closed system prepaid card that can be resold may be a convenient substitute for cash when moving value across borders. The higher the value limit on a closed system prepaid card the greater the potential ML/TF risk, independent of other risk criteria and risk mitigation.

Method of funding. As with open-system prepaid cards, closed-system cards draw on a prepaid account that can be funded in a variety of ways determined by the merchant selling the card.

Geographic limits. The resale potential of a closed-system prepaid card depends upon the availability of resale markets and the level of demand for the card. The greater the geographic scope in which the card is accepted, the greater the potential ability to resell it, which may increase its potential use as an ML/TF tool.

Usage limits. Closed-system stored value cards are by definition limited in their potential usage. Generally, these cards can only be used to buy goods and services sold by the card issuer. As noted above, the greater the availability of resale markets and the level of demand for the card, its potential ML/TF use may be increased. Unlike open-system prepaid cards, closed-system cards cannot be used to access cash via ATMs, although they can potentially be resold for cash and can be purchased for cash.

Typology. The wholesale distribution of prepaid long distance calling cards is, according to the U.S. Federal Bureau of Investigation, a $4 billion a year cash-intensive industry that can provide cover for ML. At the retail level, closed-system prepaid cards can potentially be purchased anonymously in large quantities for cash,

transported across borders, and resold. Unlike currency, the value held on prepaid cards is not apparent to customs and border officials, although the quantity of cards may be.

Case Studies.

A. In 2001, FinCEN reported that more than 160 Suspicious Activity Reports were filed on telephone card businesses with dollar amounts that ranged between $300,000 and $50 million.[26] The FBI reported in 2005 that a review of the Suspicious Activity Report database revealed that financial institutions are increasingly reporting suspicious activity related to the prepaid calling card industry.

B. In 2005, U.S. Immigration and Custom Enforcement initiated an investigation into an employee of a state agency in Ohio selling fraudulent drivers' licenses and identification cards in exchange for prepaid telephone cards.[27]

Electronic Purse

Identification. A cardholder with an electronic purse linked to a bank account is identified through the account-opening process. There are other chip card programs, however, not linked to a bank account, which may not require customer identification and provide no transaction record. Independent of other risk factors and risk mitigation methods, insufficient customer identification may increase the potential ML and TF risk.

Value limits. Although chip card technology does not prohibit electronic purses from holding unlimited value, current card programs are generally used for small value transactions and therefore tend to have low value limits. Germany's *GeldKarte*, for example, has a value limit of €200.

Method of funding and receipt of funds. Electronic purses linked to a bank account can only have funds added through the account. Some e-purse programs also allow for card-to-card value transfers. An e-purse that is not linked to a bank account may have the ability to add value via cash. Independent of any risk mitigation methods, a card with a high value limit, anonymous card-to-card transfers, and cash as an option for loading and withdrawing value could pose a significant ML and TF risk.

Geographic limits. The lack of significant cross-border capability associated with any electronic purse program significantly reduces the ML/TF risk posed by these payment tools.

Usage limits and receipt of funds. Electronic purses generally are limited to small value retail transactions, although some programs do allow for card-to-card and card-to-cash functionality.

Typology. There are no observed ML/TF typologies associated with the current use of electronic purses.

Case Studies. There are no observed ML/TF cases associated with current use of electronic purses.

Mobile Payments

Identification. Most mobile payment systems use the mobile phone as a device to access a bank account or credit card. These systems establish customer identification when the underlying bank or credit card account is opened. A similar customer identification process takes place when a telecommunications service provider,

---

[26] Department of the Treasury, FinCEN, SAR Bulletin, June 2001.

[27] U.S. Immigration and Customs Enforcement, News Release, Ice Arrests 9 in Ohio Fraud Driver's License Scheme, available at: http://ice.gov/graphics/new/newsreleases/articles/drivers022405.htm.

rather than a financial institution, holds the mobile payment account and extends credit to the account holder. If mobile phone service is prepaid and the funds used to facilitate mobile payments are also prepaid, the service provider may not be motivated to fully identify customers because of the absence of credit risk.

Value limits. Where mobile phones are access devices to underlying bank and credit card accounts, limits may not be necessary. In the Philippines, Globe Telecommunication requires prepayment for transactions through its G-Cash mobile payment program and imposes a maximum per transaction of 10,000 pesos ($182, €145), a maximum per day of 40,000 pesos ($728, €580), and a maximum transfer per month of 100,000 pesos ($1,825, €1455).

Method of funding. Mobile payment programs that draw on a prepaid account can be funded in a variety of ways. Payment sources that have independently verified the identity the phone owner and that maintain a record of the funds transfer to the mobile payment account present a low risk. The use of cash to fund a mobile payment account, independent of other risk factors or risk mitigation strategies, may present some limited ML/TF risk.

Geographic limits. Mobile payment systems currently do not facilitate cross-border transactions due to incompatible systems. An attempted joint venture (SIMPAY) of several European telecommunications service providers failed in 2006.

Usage limits. Payments can only be received by a participating merchant or fellow service subscriber.

Typology. There are no observed ML/TF typologies associated with the current use of mobile payment systems.

Case Studies. There are no observed ML/TF case studies associated with the current use of mobile payments systems.

Internet Payment Systems

Identification. Internet payment systems may permit anonymous accounts.

Value limits. Individual service providers usually determine the limits on account or transaction value, which affects the relative ML/TF risk.

Method of funding. Internet payment systems set their own terms regarding what methods of payment they will accept to fund accounts and how funds transfers are paid out to recipients. Service providers accepting cash and money orders or transfers from anonymous prepaid cards may present a greater ML/TF risk than service providers that limit funding sources to a bank account or credit card.

Geographic limits. Offshore Internet payment systems may facilitate transactions that are illegal in the payer's home jurisdiction. The online payment service acts as an intermediary, receiving funds that are passed on to a final recipient. In some cases, where direct funds transfers to the final recipient would be blocked under a jurisdiction's domestic laws, the payer can transfer the funds through an offshore online payment system operating under a different regulatory regime

Usage limits. Individual service providers determine the usage limits for the service.

Typology. Internet payment systems offer the potential for anonymous cross-border funds transfers. The risk is greatest when the service provider operates offshore in a jurisdiction with a weak anti-money laundering and counter TF regime. Even when customer due diligence is undertaken, where the customer relationship exists entirely online, the extent to which service providers attempt to verify customer identification determines the ML/TF risk relative to the other risk criteria and risk mitigation efforts.

Case Studies. There are no observed ML/TF cases associated with current use of Internet payment systems.

Digital Precious Metals

Identification. Digital precious metals dealers may permit anonymous accounts.

Value limits. There may be no value limits on digital precious metals accounts other than the amount of funds that can be placed into the online account through the use of traditional or non-traditional payments systems.

Method of funding. Each service provider sets its own terms as to what methods of payment it will accept. The serve provider's ability to accept any specific method of payment will also be limited by the willingness of the providers of these other payment services to offer digital precious metals brokers or dealers access to their services.

Geographic limits. Service providers may operate globally with no geographic limitations, although natural limits do exist based upon access to the Internet. Some governments, such as China and others, and may also place limits on the types of services to which they permit their citizens access. Web hosting and other Internet service providers may also place limits on the types of web sites and businesses they are willing to support.

Usage limits. Digital precious metals accounts may have no usage limits. Each service provider sets its own terms as to how it will disburse the funds, but its ability to do so also depends on the willingness of the providers of other payment services to offer precious metal brokers or dealers access to their services.

Typology. Digital precious metals offer the potential for anonymous cross-border funds transfers. The risk is greatest when the service provider operates offshore in a jurisdiction with a weak anti-money laundering and counter terrorist financing regime. Even when CDD is envisaged, where the customer relationship exists entirely online, the extent to which service providers attempt to verify customer identification determines the ML/TF risk relative to the other risk criteria and risk mitigation efforts.

Case Studies.

A. In March 2004, an Oklahoma man admitted to a financial fraud scheme involving an online investment fund. Thousands of people lost almost $9 million. According to the U.S. Federal Bureau of Investigation, the online investment scheme, E-Biz Ventures, laundered investor money through e-gold Ltd. The Oklahoma man who created this criminal enterprise may have been targeting tax evaders and other criminals because he "allegedly highlighted his reliance on e-gold to appeal to his victims' fear of the federal government and their desire for anonymity."[28]

B. In October 2004, the United States Secret Service shut down ShadowCrew.com, one of the largest illegal online centres for trafficking in stolen identities and payment cards. There were 21 arrests, and to date 12 of the defendants have pleaded guilty. ShadowCrew.com had approximately 4,000 members from all over the world dedicated to malicious computer hacking and the sale of stolen and counterfeit identification and credit and debit card numbers.[29] Those who pleaded guilty "acknowledged that ShadowCrew members sent and received payment for illicit merchandise and services via Western Union money transfers and digital currencies such as e-gold and Web Money."[30] One, "who used the nickname Voleur -- French for thief -- boasted in a chat room that he moved between $40,000 and $100,000 a week," was receiving Western Union money orders from accomplices, which, for a fee, he laundered through e-gold accounts.[31]

C. Estonia reports a case involving the laundering of illicit proceeds from unauthorized bank account withdrawals through the use of digital precious metals. Account information was gathered through the use of fraudulent e-mails that claimed to be sent on behalf of the recipient's bank which sought to confirm the information. If the recipient responded with the account information, the criminals initiated unauthorized withdrawals. The money was laundered through a series of steps involving cross-border transactions via Western Union and Money Gram, and ultimately Web Money, a digital precious metals service.

Off-shore provision of NPMs

A potential risk factor that may be common across many types of NPMs is that of jurisdiction. In some cases, NPM issuers or service providers may be located in an offshore financial centre and therefore subject to a less robust system of laws and regulation. Additionally, processes related to NPMs often flow through multiple jurisdictions, which has the effect of making the product more complex. The involvement of multiple jurisdictions and resulting segmentation of various parts of the chain of transactions increases the difficulties of designing effective supervisory strategies for NPMs. When NPMs are provided over the Internet, the jurisdiction risk is increased due to the potential difficulties in identifying to which jurisdictions the service providers belong, where they are incorporated, which authorities are responsible for their supervision and what AML/CFT regime is applicable. In this case it becomes extremely complicated for any of the jurisdictions where the NPM is accessible to national customers to intervene and stop illegal activities that are taking place. International cooperation among authorities may be an essential tool to face these situations, especially where efficient and effective exchange of information systems are in place. In this regard, the Early Warning System proposed by Germany at the ASEM symposium which took place in Berlin at the end of 2003 and described in the box below, could represent a good example.

Germany's Proposal for an Early Warning System

Offshore card issuers and payment services, whether acting through an agent or via the Internet, do not always follow the law in the countries where they seek to do business. Germany introduced the „Early Warning and Information Sharing System" at the ASEM Symposium in Berlin in October 2003 to promote coordination and information sharing between jurisdictions in the context of Alternative Remittance Systems and Underground Banking. The ASEM[32] experts „agreed to nominate a point of contact from the competent law enforcement or supervising body or FIU in each ASEM country in order to promote coordination including exchange of information and, when possible, joint action between relevant domestic and foreign authorities to deter illegal activities or abuse. Experts from ASEM countries agreed that this kind of early warning system would help to disrupt illegal international transactions simultaneously in all affected countries and would enable law enforcement and supervisory authorities to take the necessary co-ordinated action within their own jurisdictions. The experts welcomed the involvement of other countries in this process."[33]

The Early Warning and Information Sharing System was later approved and joined by several FATF members to whom it was introduced during the FATF Seminar on TF in Paris in February 2004.

Although originally intended for fighting Underground Banking, the Early Warning System could also be a very effective tool for the fight against the abuse of new payment systems. These NPM, especially those making use of the Internet, have an international structure very much like Underground Banking Networks. New payment methods can be used to transfer funds worldwide. The Early Warning System therefore is a very useful and effective tool to not only take co-ordinated actions against the abuse of such NPM but also to raise awareness of such abuse not only in singular jurisdictions, but worldwide.

---

[32] The acronym ASEM stands for Asia-Europe Meeting, an informal forum for dialogue between European and Asian jurisdictions. For more information on ASEM and its members see www.aseminfoboard.org

[33] Final conclusions of the Berlin Symposium on Alternative Remittance Services and Underground Banking 30-31 October 2003, sec. IV.

NPM Money Laundering and Terrorist Financing Risks

Payment Method	Potential Risk Factors	Current and Potential Risk Mitigants
Prepaid cards: open-system	• Anonymous card holder • Anonymous funding (inflow) and anonymous access to funds (outflow) • High card value limit and/or no limit on the number of cards an individual can acquire • Access to cash globally through ATMs • Offshore issuers may not observe laws in all jurisdictions	• Verify cardholder identification • Limit funding options • Limit card value and/or the number of cards that an individual can acquire and/or value per transaction • Limit cross-border access to cash • Monitor transactions and report suspicious activity • Implement a card/account block • Limit access to network by undesirable merchants and ATM providers/networks
Prepaid cards: closed system	• Anonymous card holder • Anonymous funding • High card value limit • Substitute for bulk cash smuggling • No limit on the number of cards an individual may purchase	• Verify cardholder identification • Limit card value and/or the number of cards any one purchaser may acquire • Limit funding options • Monitor transactions and report suspicious activity • No direct cash access via ATM • Implement a card/account block
Electronic Purse	• Anonymous card holder • Anonymous funding and receipt of funds • High card value limit • No transaction record	• Verify cardholder identification • No card-to-card transfer capability • Limits on the amounts that can be spent/stored • Limited cross-border functionality • Limit funding options • Monitor transactions and report suspicious activity • Implement a card/account block
Mobile payments	• Anonymous accounts • Anonymous funding and receipt of funds • High or nonexistent account funding limit	• Account holders are identified when phones are used as an access device to a bank or credit card account or when the telecom verifies phone owner identification • Limited cross-border functionality • Limited account and transaction value • Limit funding options • Monitor transactions and report suspicious activity • Implement a card/account block • Limit access to network
Digital precious metals	• Anonymous accounts • Anonymous funding and receipt of funds • High or nonexistent account funding limit • Offshore service providers may not observe laws in other jurisdictions	• Identify account holder • Maintain transaction record with payer and recipient • Monitor transactions and report suspicious activity • Limit funding options • Implement account block • Limit access to service
Internet payment systems	• Anonymous accounts • Anonymous funding and receipt of funds (ATM) • High or nonexistent account funding limit • Offshore service providers may not observe laws in other jurisdictions	• Identify account holder • Maintain transaction record identifying payer and recipient • Monitor transactions and report suspicious activity • Limit funding options • Implement account block • Limit access to the service

Table 3

5. Application of FATF Recommendations and Special Recommendations; and Selected Regulatory Approaches[34]

The FATF 40 Recommendations and nine Special Recommendations highlight potential ML and TF risks associated with new payment methods and provide guidance for regulating domestic service providers.

Recommendation Five addresses anonymous accounts, which is the principal ML/TF vulnerability identified in the new payment methods analyzed in this report. Recommendation five states: "Financial institutions[35] should not keep anonymous accounts or accounts in obviously fictitious names."

Recommendation Eight specifically addresses the ML/TF risks that may be associated with new payment methods: "Financial institutions should pay special attention to any ML threats that may arise from developing technologies that may favour anonymity, and take measures, if needed, to prevent their use in ML schemes."

Recommendation 23 underscores the need for all providers of financial services to be subject to adequate regulation and supervision. With regard to the broad category of money or value transfer services, Recommendation 23 states: "At a minimum, businesses providing a service of money or value transfer, or money or currency changing should be licensed or registered, and subject to effective systems for monitoring and ensuring compliance with national requirements to combat ML and TF."

Special Recommendation VI amplifies Recommendation 23, stating in part: "Each country should take measures to ensure that persons or legal entities, including agents, that provide a service for the transmission of money or value, including transmission through an informal money or value transfer system or network, should be licensed or registered and subject to all the FATF Recommendations that apply to banks and non-bank financial institutions."

Special Recommendation VII specifies the information that should accompany domestic and cross-border wire transfers, but allows wide latitude in how financial institutions and jurisdictions may interpret and react to the completeness of the wire transfer information received.

Recommendation 21 signals the potential need to close off "business relationships and transactions with persons, including companies and financial institutions, from countries which do not or insufficiently apply the FATF Recommendations."

The FATF Glossary includes among the activities that are performed by financial institutions as a business for or on behalf of their customers "issuing and managing means of payment (e.g. credit and debit cards, cheques, traveller's cheques, money orders and bankers' drafts, electronic money)".

Regulatory Approaches

Determining either the volume or nature of transactions that use the new payment methods described in this report is difficult because few countries appear to be either aware of these payment tools or to be monitoring their use. The Bank for International Settlements (BIS) notes: "With technology facilitating the breakdown of traditional banking services into multiple components and the addition of analytical tools and other capabilities into traditional banking services, more unlicensed non-bank entities are likely to provide bank-like services via the

[34] The regulatory approaches mentioned in this section have been verified with the jurisdictions concerned. Some measures were not adopted specifically for anti-money laundering purposes but rather by financial supervisors or monetary authorities to protect other financial interests.

[35] The term "financial institutions" refers to service providers that transfer money or value in both the formal and informal sectors.

Internet, including those that are extended cross-border. Differences in definitions as to what constitute a "bank" among jurisdictions would likely be magnified and will increasingly challenge how bank supervisors deal with financial entities with no home supervision."[36] The BIS notes: "Over time some technology companies offering "e-banking-like" services might relocate into jurisdictions where their specific mix of products and services does not require a banking license just as offshore centres developed previously."[37]

"The trend toward a broader range of service providers and to greater networking in end-user markets has raised some regulatory questions. The regulatory approaches taken by different countries to the overall efficiency, risk and consumer concerns associated with new payment instruments, providers and market arrangements have differed somewhat. In some European countries a response to the challenge has been to limit the provision of some payments services to financial institutions. In other countries the provision of payment instruments and services has not been restricted."[38]

Germany's Regulatory Provisions With Regard to Prepaid Cards

In a prepaid card scheme, German financial supervisory authorities focus on the card issuer (mainly banks) and the card broker (the intermediary service provider between the bank and the cardholder). By acting as an agent to arrange customer relationships between the card issuer and a customer/cardholder, a card broker is considered to be conducting deposit brokering. This is because, in Germany, taking in funds to issue a prepaid card is considered to be the same as taking in deposits. As a consequence, a full banking license is required to issue prepaid cards. The card issuer is considered as a credit institution and therefore subject to full AML compliance including customer identification.

As regards those prepaid card schemes where the card issuer is located abroad, the card issuer may rely on an intermediary service provider (so-called "card-broker) to promote the card in the targeted market. By acting as an agent to arrange customer relationships between the card issuer and a customer/cardholder, a card broker is considered to be conducting "deposit brokering". This business type of deposit brokering does not require a license if the deposit taker (in this case the card issuer) is domiciled within the European Economic Area.

If however a card broker is acting as an agent for a card issuer domiciled outside the European Economic Area, the card broker is considered a financial services institution and is required to be licensed. As a financial services institution, a card broker is subject to full AML compliance including customer identification.

The EU Regime for e-money

In the EU, there are currently two pieces of legislation which regulate e-money: Directives 2000/46/EC[39] (the e-money institutions Directive)[40] and 2005/60/EC (third money laundering Directive); the latter shall be transposed by Member States into national legislation by December 2007.

Whilst it is widely accepted that the definition of e-money covers prepaid cards, e-purses and internet payments such as PayPal, there is some controversy as to whether pre-paid mobile payments are covered. In the whole EU, there are only 6 "purebred" e-money issuers, as the majority of entities issuing e-money are banks conducting other banking business as well.

[39] Official Journal L275, 27/10/2000

[40] Official Journal L 309, 26/10/2005

Following the flexibility provided for by the Directive on e-money institutions as regards the application of AML/CFT provisions, EU Member States (MS) currently apply different regimes to e-money: a majority of MS applies the same AML/CFT provisions as for banks, some apply a lighter regime but the situation is expected to change after the third Money Laundering Directive is transposed by MS in their national legislation.

In particular, the third AML Directive gives the possibility to EU MS to allow e-money issuers not to apply customer due diligence in respect of e-money, where, if the device cannot be re-charged, the maximum amount stored in the device is no more than EUR 150 or where, if the device can be recharged, a limit of EUR 2500 is imposed on the total amount transacted in a calendar year, except when an amount of EUR 1000 or more is redeemed in that same calendar year by the bearer.

Simplified CDD applies to other products or transactions carrying a low risk of ML or TF, in accordance with technical criteria identified to help assess whether situations represent a high or a low risk of ML or TF.

Notwithstanding the technical criteria identified, simplified CDD shall not apply in the case where there is information available that suggests a product is subject to a high risk of being misused for ML or TF purposes.

Regulating Internet Payments, and Other New Payment Systems, in the United States

The comprehensive AML/CFT regime in the United States requires "financial institutions" (as defined in the Bank Secrecy Act and in implementing regulations) to, among other things, establish and maintain anti-money laundering programs, file cash transaction, suspicious activity and other reports, perform CDD, and obtain and retain records regarding customer identification and verification. Within this framework, non-depository financial institutions that provide payment services tend to belong to some category of "money services businesses" (MSBs). MSBs are defined to include five distinct types of financial services providers: currency dealers or exchangers; check cashers; issuers of traveller's checks, money orders, or stored value; sellers or redeemers of traveller's checks, money orders, or stored value; and money transmitters. The five types of financial services are complementary and are often provided together at a common location. Money services businesses have grown to provide a set of financial products that one would traditionally look to banks to provide.

As noted above, money transmitters and issuers, sellers or redeemers of "stored value" are MSBs subject to the US AML/CFT regime, which requires certain MSBs to register with FinCEN (the FIU), as well as to establish an AML programs and to comply with various reporting and recordkeeping requirements. Many types of MSBs also are required to be licensed on the state level. Whether a particular online payment service, stored value provider, digital precious metals service or other value-service provider or payment system or digital currency service meets the definition of an MSB under the regulations is a fact-specific determination. That determination is dependent upon such factors as the structure, location, operations and services of the particular business. If the service or business is found to be an MSB under these regulations, then it would be subject to all of the programmatic, reporting and record-keeping requirements described here. Many payment systems, particularly online payment system providers, are based outside the United States and are not subject to U.S. jurisdiction. U.S. federal banking agencies, FinCEN, and others also routinely provide guidance to depository institutions regarding potential risks associated with non-bank payment service providers and available means to mitigate those risks.[41]

[41] For example, sections of the Federal Financial Institutions Examination Council (FFIEC) BSA/AML Examination Manual relating to electronic cash, prepaid products and third-party payment processors were updated in July 2006 to outline risk factors in these products and to recommend steps that depository institutions should take to mitigate those risks.

Use of "Special Measures" in the United States

The United States can take action against an NPM based outside the country that poses a ML threat to the U.S.[42] In the United States, the Secretary of the Treasury is authorized – in consultation with the Department of Justice, the State Department, and the appropriate Federal financial regulators – to designate a foreign jurisdiction, institution, class of transactions, or type of account as being of primary ML concern.

There are a range of options available to target the specific ML concern most effectively. Through the imposition of various "special measures," the Treasury Secretary can gain more information about the jurisdictions, institutions, transactions, and accounts that are of concern, and take appropriate action to safeguard U.S. financial institutions.

The special measures available to the Secretary include requiring of domestic financial institutions: (1) Recordkeeping and reporting of certain financial transactions; (2) collection of information relating to beneficial ownership; (3) collection of information relating to certain payable-through accounts; (4) collection of information relating to certain correspondent accounts; and (5) prohibition or conditions on the opening or maintaining of correspondent or payable-through accounts.

India Forbids Use of Digital Precious Metals

In October 2002, India's central bank, the Reserve Bank of India, forbid the use of "e-gold" as violating national rules requiring only sovereign currencies be used in domestic transactions. The central bank stated in a news release: "An impression is sought to be created among the members of public by some agencies/persons that transactions involving e-gold, purportedly an electronic currency, are freely permitted in India and that e-gold has the status of a foreign currency… The Reserve Bank clarifies for the information of [the] public that 'e-gold' is not a currency of any sovereign state."[43]

Australia: Unlicensed Digital Precious Metals Sites

In 2004 the Australian Securities and Investments Commission (ASIC) identified several online digital precious metals dealers including some based outside the country as conducting business without a proper license: "Following an examination of electronic currency trading websites, ASIC became aware of three Australian-based businesses that were operating such sites or were acting as agents for similar businesses based overseas. These businesses exchanged conventional currencies to electronic currencies and vice-versa, and charged a commission for their services… ASIC believes that such products can be defined as non-cash payment systems and that people who deal in such products with Australian consumers must hold an Australian financial services licence (AFSL)." The identified businesses "all withdrew their websites and closed down their businesses voluntarily."[44]

6. NPM Questionnaire Results and Analysis

Objectives and methodology

This section gives an overview of the responses to the questionnaire issued by the project team to which there were 37 responses. Most respondents identified NPMs in their jurisdiction. In some countries, respondents have either not identified NPMs (e.g. Argentina, Cambodia and Slovenia) or have only provided information about

---

[42] Some online payment systems may be licensed in one country and maintain operations (including staff, computer systems, and customers) in various other countries without a physical retail presence anywhere.

[43] http://www.rbi.org.in/scripts/BS_PressReleaseDisplay.aspx

[44] http://www.asic.gov.au/asic/asic_pub.nsf/byheadline/04-366+ASIC+acts+to+shut+down+electronic+currency+trading+websites?openDocument

traditional means of payment (e.g. Qatar, Latvia, Macao and Slovakia), or even traditional means of payment which can be accessed in new ways such as Internet banking (Azerbaijan). Some respondents privately indicated to the project team there were unsettled cases and investigations underway regarding NPMs, but that these cases could not be disclosed.

Summary findings from the questionnaires are presented below for each payment method with more detailed information presented in Appendix B in the following fields of information: NPM category, market size, regulation of access to activity, AML/CFT provisions and AML/CFT cases as well as the existence of illegal operators. Conclusions are provided at the end of this section as well as for each category of NPM.

Prepaid cards

Fourteen countries, approximately one-third of respondents, report the presence of prepaid cards, both closed-system and open-system cards are reported. With regard to open-system cards, ATM functionality is often present and sometimes allows transferring funds worldwide.

Little information was reported regarding market size, but where such information is available it often indicates a small or emerging market.

Most of the reported types of prepaid cards are submitted either to registration or licensing requirements or under supervision (exceptions are Palau and New-Zealand). The picture is mixed concerning AML/CFT provisions, as for less than half[45] of the countries, no AML/CFT provisions have to be applied (ex. USA and Czech Republic). It is interesting to note that all the payment methods which are not under CFT/AML regulation have a limit to the transferred amount.

Except for the USA and New-Zealand, no AML/CFT cases are reported. The same goes for illegal operators, but with no exceptions.

Payments initiated by means of a mobile phone (and linked to a bank-account)

Four countries reported mobile phones are used to access bank accounts (Korea, Finland, New-Zealand and China). As the payment method is based on bank accounts, registration/licensing apply, as well as supervision and AML/CFT provisions.

No AML/CFT cases or illegal operators are reported.

E-purse

Four countries (Belgium, Switzerland, Germany and the Netherlands) reported e-purses are issued in their jurisdiction. In all cases, e-purse issuers are required to be licensed and supervised and AML/CFT provisions apply. In all cases, there are limits to transferred amounts. There is no evidence of ML or examples of law enforcement actions in any of those countries.

Internet payments

This is the largest group of new payment methods, as they are reported by 15 out of 37 countries (40%). Systems differ per country; some of them (e.g. Paypal, Neteller) operate in several jurisdictions.

Most countries apply registration/licensing requirements and supervision or are working towards putting in place such regulations. Most countries also apply AML/ CFT provisions (sometimes even when registration/licensing/supervision are not applied).

Amongst countries where no AML/CFT provisions apply (NL, ES, CN), only CN has found evidence of ML/TF. Examples of law enforcement cases can be found in the USA, ET, and CA.

[45] "Half" is only correct when taking into account that Palau and New Zealand both indicate that even though they apply AML/CFT requirements, they have no registration or licensing requirements nor supervision.

One of the problems reported regarding this NPM is the possibility for payment service providers to offer their services offshore and therefore circumvent the destination country's registration/licensing rules as well as supervision and AML/CFT requirements.

Mobile Payments

Only five countries (about 10% of the countries responding to the questionnaire) reported this NPM. In those countries, this NPM seems to be used for micro-payments. The picture is mixed as regards regulatory framework and application of AML/CFT requirements.

None of the countries reported evidence of ML/TF or law enforcement cases.

Digital precious metals

This NPM does not seem to be widespread, as only 2 countries (Estonia and the USA) report its presence in their jurisdiction. Not much information is provided by Estonia,. In the USA case, a significant number of operators are active, but are not necessarily based, in the jurisdiction of the USA and numerous accounts are held. The applicable regulatory framework and AML/CFT provisions depends upon which state the payment method is located. However, most of the digital currency services are based outside the USA and are not subject to US law although they can be used by US-citizens. Law enforcement cases have been reported.

7. Conclusions and Issues for Further Consideration

The answers provided by countries to the questionnaire that was sent at the beginning of this study, reflected a legitimate market demand served by each of the payment methods analyzed, yet some actual and potential ML and TF vulnerabilities do exist. The FATF 40+9 Recommendations seem to allow for the pursuit of payment system innovation and AML/CFT, since they provide for the needed degree of flexibility in the application of AML/CFT standards to new emerging technology-based payment methods.

Among the main risk factors identified, specifically, this study notes that providers of new payment methods that are located outside the jurisdiction of a given country may pose additional risks compared with domestic service providers, especially when: (i) the distribution channel used is the Internet; (ii) no face-to-face contact with the customer takes place; and (iii) the NPM operates through an open network that can be accessed in a high number of jurisdictions.

The extent to which the new payment methods identified in this study are used for illegitimate purposes is difficult to determine at this time. The responses to the questionnaire issued by the project team provide only a limited number of typologies and show that the level of development and/or awareness of new payment methods is not uniform across the world. In this regard it should be noted that new payment methods are developing quickly and considerably; law enforcement cases may consequently increase as well in the near future.

As previously noted, it is believed that the FATF Forty Recommendations and Nine Special Recommendations provide an appropriate framework to address the vulnerabilities associated with these new methods of payment that have been identified by the project team. However, given the different characteristics and development that new payment methods may have in each jurisdiction, the study does highlight an opportunity for further examination of specific measures that could be adopted by countries to limit identified risks. In the case of new payment methods, technology plays a twofold role: on the one hand, it may increase typical ML/TF risks (i.e. anonymity, global use, speed of transfers, legal arbitrages, offshore provision of services) and on the other hand, help prevent or limit such risks (e.g. usage and spending limits, electronic record of transactions, etc.). Such additional measures could be applied in addition to or instead of traditional AML provisions (for example, CDD could be replaced by spending and loading limits on a payment instrument, which would represent thresholds, or by usage limits – such as non-reloadability or geographic limitations in the use of a payment instrument).

In light of the findings of this project, it is recommended that the WGTM considers the following possible future actions on this topic:

a) Providing guidance to jurisdictions as to what preventive measures may be taken to limit the risk of NPMs being used to launder money and/or finance terrorism (this could occur under FATF Recommendation 8);

b) Updating this study on the development of new payment methods as well as the relative typologies and risks analyses after a period of two years;

c) Proposing the inclusion of new payment methods as a specific issue to be monitored – during the two years period mentioned under letter b) above - under the project on ML and TF trends and indicators.

Appendix A: Description of Traditional Credit and Debit Card Networks

Network description

There are at least six global credit card networks: Visa (market leader), MasterCard, American Express, Diners Club, JCB, and Discover. Proprietary credit card networks, which may also be global in scope, also exist for the limited purpose of purchases at associated merchants. In addition, there are a variety of networks that support debit card and ATM transactions: Plus (Visa), Cirrus (MasterCard), Electron (Visa), and Maestro (MasterCard) operate internationally; Interact (Canada), STAR (U.S.), and others operate within one or more countries or regionally within a country. Historically, the card and EFT/POS network services have been somewhat distinct, not only in terms of the differences in credit and debit as products but also in terms of the authorization approach for those products. Credit cards grew from a point-of-sale (POS), charge card model and initially used "off-line" or signature-based authorization approaches. EFT/POS networks grew from an "on-line" or Personal Identification Number (PIN)-based card and dedicated automated teller machine (ATM) model. More recently, particularly in Europe and other regions outside the United States, the use of PINs and chip-based card infrastructures have become common for both credit and debit cards.

Infrastructure

The supporting infrastructure of the major credit card and EFT/POS networks has been migrating from proprietary networks and platforms to open systems. As these networks annually process billions of electronic payment transactions, the standards and security adopted by these organizations affect the future technology available to the payments industry. The traditional electronic connection between the merchant and the association, and the connection between the banks in the association for the card networks is typically a proprietary one.

The card associations/companies have proprietary, centralized backbone payment networks that connect retail merchants and associations, and banks within the association using special software and hardware. Regional or national EFT/POS networks provide similar access to other financial institutions and the ability to perform ATM and POS transactions. These networks can offer financial institutions a full range of switching (routing), authorization, clearing, and settlement services, including related back-office operations. Others only maintain a switch, relying on third-party processors to handle much of the data processing related to these services. Financial institutions affiliated with these networks may choose among the menu of options offered by these networks.

Clearing and Settlement

There are three phases within a credit card transaction: authorization of the underlying payment and purchase request, clearing of the accounting entries among the parties, and settlement among the parties in actual funds along with the payment of various interchange and other transaction-related fees.[46] Authorization and clearing of credit and signature-based debit transactions occurs through a "double message" process that involves two separate electronic transmissions; PIN-based debit transactions, by contrast, are "single message" processes in which authorization and clearing occurs during a single transmission. Credit and debit transactions involving PINs and chip-based card infrastructure may follow either of these authorization and clearance routes.

Credit cards

The first transmission within a credit card or signature debit transaction is the near real-time authorization request at the time of purchase. Payment information from the card and the merchant is sent from the merchant terminal to the acquiring bank and switched to the credit card processing network, which routes it to the issuing bank. The

[46] The exact processes involved in all three phases can vary significantly depending upon the individually negotiated arrangements between member banks and the card networks or the specific characteristics of the transaction and the parties involved. The remainder of this discussion is meant only to provide a general overview of these processes.

issuing bank responds with an "OK," indicating that the customer's credit card account is valid and that the customer has not surpassed his credit limit. The issuing bank then reduces the cardholder's "open-to-buy" credit line balance by the purchase amount. A stand-in processor may also provide the authorization as an alternative to the issuing bank. Certain PIN and chip-based credit cards may operate similarly.

Later in the day (though this may vary as well), either at multiple pre-determined times or once at the end-of-the-day, the merchant initiates a second batch-file clearing message of all the transaction data processed to his acquiring bank since the last such transmission. The acquiring bank reconciles the data against the authorization information. Once reconciled, the acquiring bank posts a credit to the merchant's account for the amount of the transactions, minus a merchant discount fee. The bank transmits a separate file of all merchant transaction data to the credit card association.

Final settlement generally begins with the credit card association using the member banks' aggregated transaction information to compile each member's net settlement position. The credit card association provides this information to members through proprietary settlement software or an "advisement" message that produces an audit trail and converts the data to a format interpretable by the bank. To settle these net positions, each issuing bank in a net debit position (or its correspondent bank) initiates a credit transfer to the credit card association's settlement bank and its special settlement account. The card association retains some of this payment to cover interchange, foreign exchange, or other association fees. The settlement bank then initiates a credit transfer from the settlement account to the acquirer's account with the remaining amount, minus its association fees. Member banks must maintain collateral with the credit card associations' settlement banks in the case of default. Banks can also settle both credit and debit card transactions directly with each other, through regional settlement bank, or by other net settlement arrangements. There can be significant variation in the settlement process depending upon the member involved.

Signature debit

A signature-based debit transaction is authorized similar to a credit card transaction, except that the issuing bank validates against the cardholder's demand deposit account or a stand-in authorizing system run by the card network. The clearing process is the same as a credit card transaction. Credit and signature-based debit transmissions may be sent separately. Settlement largely occurs in the same fashion as a credit card transaction. Some EFT/POS networks also process signature-based debit transactions with final settlement involving either credit transfers or direct debits. Overall, the card networks view signature-based debit and credit card transactions as almost identical for processing, clearing, and settlement. Certain PIN and chip-based credit cards may operate similarly.

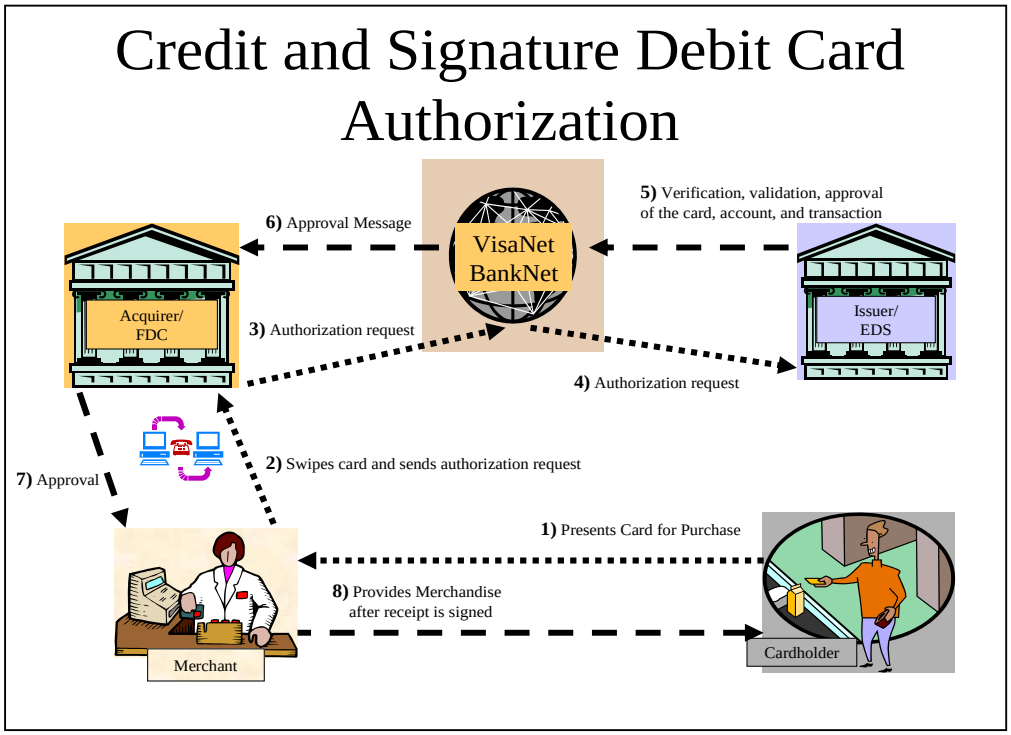

Figure 7

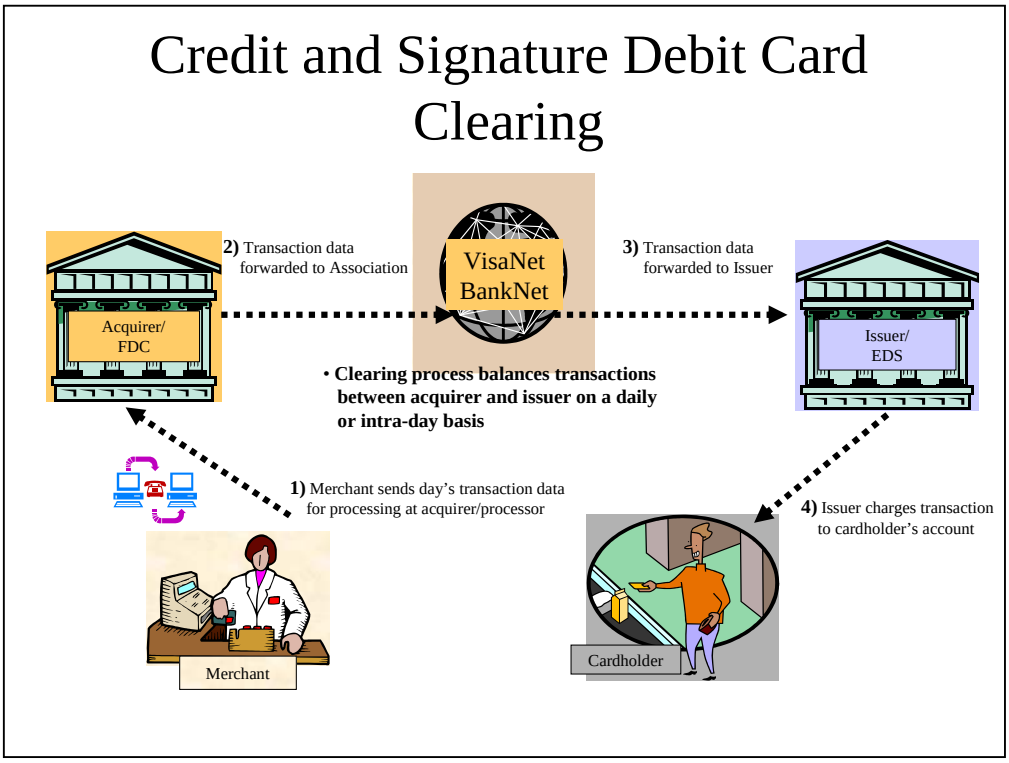

Figure 8

PIN-based debit

In the U.S., the card networks consider PIN-based debit fundamentally different and separate from signature-based debit and credit card transactions. This is not the case in other countries where PINs and chip-based cards are common. For PIN-based debit, the authorization and clearing of the transaction occurs within a single transmission. It can be routed through either an regional EFT/POS network, such as STAR, or a national or international PIN-based debit networks, such as Interact (POS or ATM) or Maestro and Interlink if it is a POS transaction and Cirrus and PLUS if it is an ATM transaction.[47] A stand-in processor may also be used. The authorization process at the issuing bank is the same as the authorization for signature-based debit, save that the consumer must enter a PIN at the merchant terminal or at the ATM. The issuing bank typically debits the cardholder's account immediately as the final amount of the transaction is confirmed at the time of purchase. The acquiring bank or its processor also obtains a full transaction record as a result of the transmission, clearing the transaction between the banks. The acquiring bank typically credits the merchant for the amount of the transaction at that time.

Final settlement among EFT/POS members can occur in a number of different ways, just as it can with the card networks. One way involves book-entry net settlement at the EFT/POS network's chosen settlement bank. Each member bank funds a settlement account at the EFT/POS network's settlement bank. The EFT/POS network and its settlement bank debits and credits the issuing and acquiring members' accounts to finalize the transfer of funds. This includes both the actual transaction amount and any network-related fees. A second option is for members to have their processing agent set up a settlement account at a settlement bank other than the EFT/POS network's or for the member to hold the account. In this case, the EFT/POS network originates a direct debit of the issuing member's settlement account (authorization for this is given as part of the requirements of network membership) to credit the acquiring member's account (or the EFT/POS network's settlement account at

[47] Where transactions can flow over either regional, national, or international EFT/POS networks, the regional network normally take precedence according to their regional routing rules. However, the merchant and acquiring bank may be able to prioritize that routing order to some extent.

its settlement bank in the case of network fees). Depending upon the EFT/POS network, the daily settlement process may include just the individual transaction amounts or there may be separate settlements of the day's transactions and their associated network fees. Some EFT/POS networks will delay the settlement of the network fees until the end of the month.

Alternatively, if the transaction flows through a card network, the clearing among the banks and the national network occurs later, through a similar net settlement process as that used with signature-based debit and credit card transactions. Settlement may use traditional national direct debit or credit transfer systems. Settlement is based on the issuing bank's positive response to the authorization request. The issuer rather than the acquirer pays the network interchange fees for PIN-based ATM transactions.

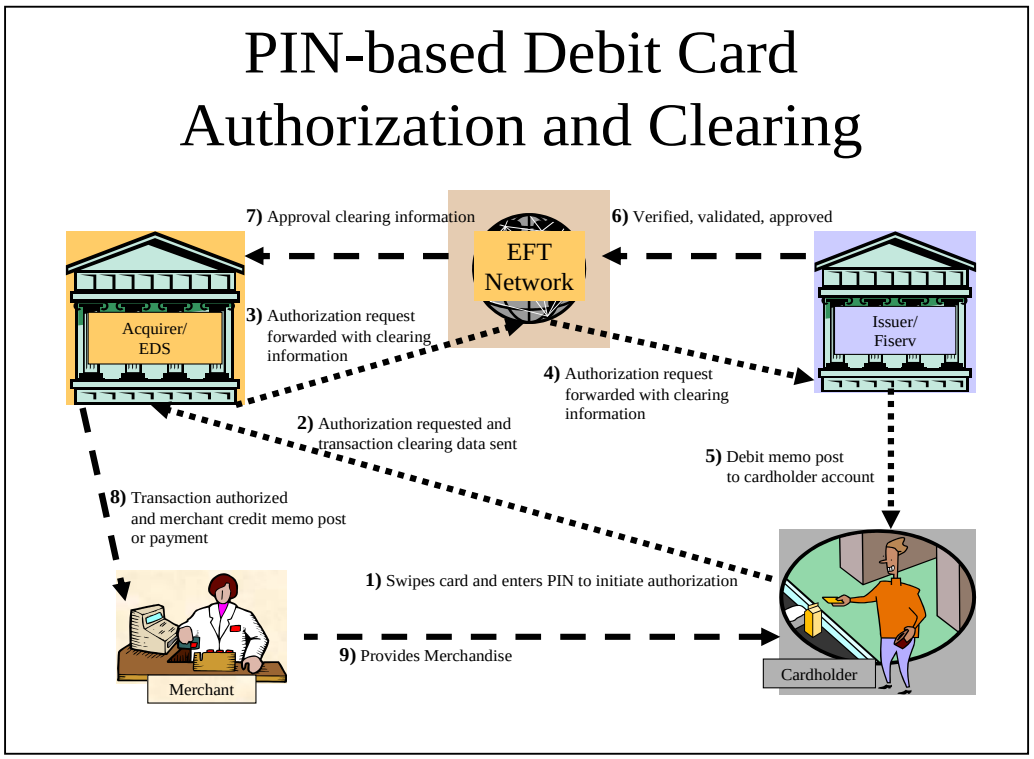

Figure 9

Appendix B: Supplemental NPM Questionnaire Results and Analysis

Table A: Short description of the NPM.

Table B: The two main indicators for market size are the estimated number of domestic service providers and the estimated number of accounts held or cards issued.

Table C: Information on regulatory provisions. The distinction between registration (R) and licensing (L) is noted. The main difference between these two categories is that licensing pre-supposes authorization to provide payment services (subject to conditions such as prudential rules, etc), whereas registration is not subject to conditions. As regards supervision, different approaches are also possible, and whenever detailed information is provided, it is reported under "additional information".

Table D: AML/CFT provisions can derive from regulations in place or from business practice (a typical example of business practice being limits to transferred amounts).

Table E: Reports of AML/CFT cases or if any illegal operators have been found (illegal operator means those which are not registered or licensed).

Prepaid or prepaid payment cards

A. Description of the NPM

Countries	Short description of the NPM
Ireland (IE)	"Virtual visa voucher" – offered by permanent TSB bank in association with Visa and 3V transaction services – available since September 2005 – customer registers online, voucher is printed upon request at a participating retailer, and a "disposable" pre-paid card is issued; this card can be used to purchase goods on the internet or by mail/telephone order.
Turkey (TR)	"Pre-paid debit cards" are mentioned, but no detailed information is provided.
Lebanon (LB)	Prepaid cards are mentioned but insufficient information is provided (e.g. in relation to Visa/ Mastercard branded networks)- "Liters plus" referred as limited-purpose pre-paid card)
Palau (PA)	Reference to pre-paid debit cards that can be used in ATM networks, no additional information is provided.
Lithuania (LT)	Reference to pre-paid debit cards issued by banks or shops, but no detailed information is provided.
New Zealand (NZ)	"Visa Cash passport" (available for purchase in NZ and for ATM cash withdrawal in NZ and overseas); other store-value cards used in NZ for purchases in closed systems (transport operators, educational institutions, etc.)
Cyprus (CY)	Pre-paid card issued by a bank; it can be used at venues where Visa electron is accepted and for internet payments; the information is limited
Czech Republic (CZ)	E-tickets for the payment of public transport; this service is not cross-border.

Italy (IT)	Rechargeable prepaid cards require full CDD, and AML provisions fully apply. Prepaid cards that may not be recharged may not exceed the amount of 500 EUR and do not require CDD to be applied, they may thus be anonymous. Such cards are issued by financial institutions (i.e. banks and e-money institutions). In some cases the customer originally holds a credit with a telephone company (the card is at this stage a telephone card) and then converts such credit into a credit with a financial institutions which is legally the prepaid card issuer (at this stage the card is a payment instrument).
Austria (AT)	Pre-paid debit cards (2 systems) which do not require a bank account and which can be used for cash withdrawals at an ATM or for purchases at a point of sale; funding methods include cash and credit transfers. No information on market size.
USA	Different types of prepaid cards are identified, covering a variety of uses and technologies, both operating within either an "open" or "closed" system.
Spain (ES)	Hal-Cash; it is based on a pre-paid account which allows ATM cash withdrawal cross-border; mobile phone is issued as an access device and as a messaging system; this product is mainly offered to un-banked, immigrant populations.
Switzerland (CH)	A pre-paid multi-purpose debit card. Micro-payments can be made through the internet and/or mobile phone by online merchants. Users scratch off a panel on the card to access a code which corresponds to their pre-paid credit amount. When executing the payment of products or services ordered over the internet or by means of a mobile phone, users have to indicate the card's code, which gives access to the pre-paid account held in the issuer's server. The amount is then deducted from the actual card balance.

B. Market size

Payments initiated by means of a mobile phone (and linked to a bank-account)

A. Description of the NPM

Countries	Short description of the NPM
Finland (FI)	"Mobiiliraha" – linked to a bank account; no detailed information is provided.
New Zealand (NZ)	Mobile phone banking, meaning access to a bank account by means of a mobile phone device.
China (CN)	Mobile phone banking, meaning access to a bank account by means of a mobile phone device.
Korea (KO)	The use of mobile phones or PDA's for cross-border payments from a bank-account to a (foreign) bank-account.

E-purse

A. Description of the NPM

Countries	Short description of the NPM
Germany (DE)	Geldkarte: The funds of the card are on the card itself; in general, the funds are loaded from a bank account and no online connection and no cardholder identification are needed to make a payment; this card has almost no cross-border

	operability. Geldkarte is actually a common technological standard for chipcards; many banks issue their own Geldkarte cards. However, as all these cards are fully inter-operable, for the purpose of this report Geldkarte can be considered as a singular payment instrument.
Netherlands (NL)	Chipknip: The money is loaded from a bank-account and can be used as an independent electronic purse.
Switzerland (CH)	CASH system: The money is loaded form a bank-account and can be used as an independent electronic purse.

B. Market size

[48] In Germany, e-purses can be legally issued only by credit institutions which are subject to full AML policies and procedures with only one exception: due to the low loading limit, customer identification/CDD is not deemed necessary.

	DE, NL, CH		DE, NL, CH		DE, NL, CH

Internet payments

A. Description of the NPM

Countries	Short description of the NPM
Canada (CA)	Many providers, including offshore.
Belgium (BE)	Paypal (which is regulated by the FSA in the UK, and provides its services in Belgium under the license of e-money institutions granted by the UK's FSA, which provides for the possibility to operate all across the EU). It is therefore not under Belgian, but UK's supervision.
Finland (FI)	"Digiraha" described as “digital purse for internet payments”. No detailed information.
Estonia (ET)	Fogott, Paypal, Netteller- no detailed information is provided.
New Zealand (NZ)	Paypal
Austria (AT)	Emerging server-based system for purchases on the Internet.
China (CN)	Different emerging e-business enterprises and third party intermediaries are providing their own business and online payment intermediaries.
Czech Republic (CZ)	Internet shopping; the user has a virtual account on the website and the provider debits this account at the moment of purchase; limited information is provided.
France (FR)	Neosurf: customer exchanges funds for a scratch card (of various amounts), which gives a code to pay on the internet. This system is active in France, Belgium and Switzerland.
Germany (DE)	Paypal (which is regulated by the FSA in the UK, and provides its services in Germany under the license of e-money institutions granted by the UK's FSA, which provides for the possibility to operate all across the EU). It is therefore not under German, but UK's supervision.
Indonesia (ID)	Online payment for on-line merchants and person-to-person money transmission; the services can be used for local and cross-border payments; these payment methods are still under construction and do not operate yet.
Italy (IT)	1) Moneta On Line: This is a scratch card issued by a bank to make low-value purchases over the internet at merchants adhering to the VISA circuit; the users are not identified; 2) BankPass Web: This is an electronic wallet to pay on the internet.
Netherlands (NL)	Several providers, including Paypal
Spain (ES)	1) Paypal: Spain seems to have imposed stricter AML/CFT provisions on

	Paypal than Germany and the Netherlands. 2) Click & Buy: This is an internet billing mechanism for enterprises; it can be used to buy at merchants in different parts of the world.
Switzerland (CH)	Click and buy micro-payments through the internet at online merchants other than the issuer of the card.
USA	There are several domestic online payment services, including PayPal, and others offshore that access the U.S. market.

FATF, *FATF Report: Money Laundering Using New Payment Methods*
(Paris: FATF, 2010)

FATF • GAFI
FINANCIAL ACTION TASK FORCE GROUPE D'ACTION FINANCIÈRE

FATF Report

Money Laundering Using New Payment Methods

October 2010

THE FINANCIAL ACTION TASK FORCE (FATF)

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering and terrorist financing. Recommendations issued by the FATF define criminal justice and regulatory measures that should be implemented to counter this problem. These Recommendations also include international co-operation and preventive measures to be taken by financial institutions and others such as casinos, real estate dealers, lawyers and accountants. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit the website:

WWW.FATF-GAFI.ORG

ACKNOWLEDGEMENTS

The FATF would like to thank Vodafone, Moneybookers and the Consultative Group to Assist the Poor (CGAP) for presentations provided to the project team during the 2009/2010 annual typologies experts' meeting in the Cayman Islands and MasterCard Europe for their presentation on prepaid cards at the project team's intersessional meeting in Amsterdam in 2010. In addition, comments received from the GSMA and Western Union, during the FATF private sector consultation, were also much appreciated.

TABLE OF CONTENTS

EXECUTIVE SUMMARY

1. After the 2006 New Payment Method (NPM) report, the growing use of NPMs and an increased awareness of associated money laundering and terrorist financing risks have resulted in the detection of a number of money laundering cases over the last four years.

2. The project team analysed 33 case studies, which mainly involved prepaid cards or internet payment systems. Only three cases were submitted for mobile payment systems, but these involved only small amounts. Three main typologies related to the misuse of NPMs for money laundering and terrorist financing purposes were identified:

- Third party funding (including strawmen and nominees).
- Exploitation of the non-face-to-face nature of NPM accounts.
- Complicit NPM providers or their employees.

3. While the analysis of the case studies confirms that to a certain degree NPM are vulnerable to abuse for money laundering and terrorist financing purposes, the dimension of the threat is difficult to assess. The amounts of money laundered varied considerably from case to case. While some cases only involved amounts of a few hundred or thousand US dollars, more than half of the cases feature much larger amounts (four cases involved over 1 million US dollars mark, with the biggest involving an amount of USD 5.3 million).

4. The project team retained and updated the 2006 report´s approach to assessing money laundering and terrorist financing risk associated with NPMs and assesses the risk of each product or service individually rather than by NPM category.

5. Anonymity, high negotiability and utility of funds as well as global access to cash through ATMs are some of the major factors that can add to the attractiveness of NPMs for money launderers. Anonymity can be reached either "directly" by making use of truly anonymous products (*i.e.*, without any customer identification) or "indirectly" by abusing personalised products (*i.e.*, circumvention of verification measures by using fake or stolen identities, or using strawmen or nominees etc.).

6. The money laundering (ML) and terrorist financing (TF) risks posed by NPMs can be effectively mitigated by several countermeasures taken by NPM service providers. Obviously, anonymity as a risk factor could be mitigated by implementing robust identification and verification procedures. But even in the absence of such procedures, the risk posed by an anonymous product can be effectively mitigated by other measures such as imposing value limits (*i.e.*, limits on transaction amounts or frequency) or implementing strict monitoring systems. For this reason, all risk factors and risk mitigants should be taken into account when assessing the overall risk of a given individual NPM product or service.

7. Across jurisdictions, there is no uniform standard for the circumstances in which a product or service can be considered to be of "low risk". Many jurisdictions use thresholds for NPM transactions or caps for NPM accounts in order to define "low-risk scenarios"; but the thresholds and caps vary

significantly from jurisdiction to jurisdiction. Likewise, different views may be taken on the relevance of certain risk factors or of the effectiveness of certain risk mitigants, due to respective legal and cultural differences in jurisdictions.

8. Some jurisdictions allow firms to apply simplified CDD measures in cases of predefined low-risk scenarios. Again, there is no uniform standard across jurisdictions on the definition of "simplified CDD measures". Some jurisdictions even grant a full exemption from CDD measures in designated low-risk scenarios.

9. Not all NPM services are subject to regulation in all jurisdictions. While the issuance of prepaid cards is regulated and supervised in all jurisdictions that submitted a response to the project questionnaire, the provision of Internet payment and mobile payment services is subject to regulation and supervision in most, but not all jurisdictions (FATF Recommendation 23; Special Recommendation VI).

10. The project team also identified areas where the current FATF standards only insufficiently account for issues associated with NPMs:

- Where NPM services are provided jointly with third parties (*e.g.*, card program managers, digital currency providers, sellers, retailers, different forms of "agents"), these third parties are often outside the scope of AML/CFT legislation and therefore not subject to AML/CFT regulation and supervision. The concept of agents and outsourcing is only marginally addressed in the FATF 40 Recommendations and 9 Special Recommendations (in Recommendation 9 and Special Recommendation VI). More clarification or guidance from FATF on this issue would be welcome, especially as a few jurisdictions are considering a new approach on the regulation and supervision of agents.

- Many NPM providers distribute their products or services through the Internet, and establish the business relationship on a non-face-to-face basis, which, according to FATF Recommendation 8, is associated with "specific risks". The Recommendations do not specify whether "specific risks" equates to "high risk" in the sense of FATF Recommendation 5; if so, this would preclude many NPM providers from applying simplified CDD measures. While FATF experts have recently come to the conclusion that non-face-to-face business does not automatically qualify as a high risk scenario in the sense of Recommendation 5, it would be helpful if this could be confirmed and clarified within the standards.

11. It would be desirable if other Working groups within FATF decided to pick up the discussions described above to provide more clarity on the interpretation of the FATF Recommendations involved. Such work would not only be relevant and helpful for the issues of money laundering and terrorist financing, but also for the issue of financial inclusion.

12. NPMs (as well as other financial innovations) have been identified as powerful tools to further financial inclusion. Many of the challenges mentioned above (*e.g.*, discussion on simplified CDD in cases of low risk, full exemption from CDD, or the regulation and supervision of agents) are of high relevance for the entire discussion around financial inclusion, going beyond the issue of the vulnerability of NPMs to ML/TF purposes alone.

CHAPTER 1: INTRODUCTION

The 2006 report

13. In October 2006, the FATF published its first report on New Payment Methods (NPMs). The report was an initial look at the potential money laundering (ML) and terrorist financing (TF) implications of payment innovations that gave customers the opportunity to carry out payments directly through technical devices such as personal computers, mobile phones or data storage cards.[1] In many cases these payments could be carried out without the customer needing an individual bank account.

14. As these NPMs were a relatively new phenomenon at the time, only a few ML/TF case studies were available for the 2006 report. In addition, clear definitions of various NPM products and how they should be regulated were just beginning to be addressed by a limited number of jurisdictions. Therefore the report focused on raising awareness of these new products and the potential for their misuse for ML/TF purposes.

15. The 2006 report found that ML/TF risk was different for each NPM product and that assessing the ML/TF risk of NPM categories was therefore unhelpful. Instead, it developed a methodology to assess the risk associated with individual products.

16. The report concluded that it should be updated within a few years, or once there was greater clarity over the risks associated with these new payment tools. This report updates the 2006 report on NPMs and provides an overview of the most recent developments.

Objectives of the present report

17. Since the publication of the 2006 report, NPMs (prepaid cards, mobile payments and Internet payment services) have become more widely used and accepted as alternative methods to initiate payment transactions. Some have even begun to emerge as a viable alternative to the traditional financial system in a number of countries.

18. The rise in the number of transactions and the volume of funds moved through NPMs since 2006 has been accompanied by an increase in the number of detected cases where such payment systems were misused for ML/TF purposes. The NPM report in 2006 identified potential legitimate and illegitimate uses for the various NPMs but there was little evidence to support this. The current report will compare and contrast the "potential risks" described in the 2006 report to the "actual risks" based on new case studies and typologies. Not all potential risks identified in 2006 were backed up by case studies. This does not mean that those risks are no longer of concern, and jurisdictions should continue to be alert to the market´s development to prevent misuse and detect cases that went unnoticed before.

19. The report will also develop red flag indicators which might help a) NPM service providers to detect ML/TF activities in their own businesses and b) other financial institutions to detect ML/TF

[1] Including different storage media such as magnetic stripe cards or smart card electronic chips.

activities in their business with NPM service providers, in order to increase the number and quality of suspicious transaction reports (STRs).

20. Although more case studies are now available, issues surrounding appropriate legislation and regulations for NPMs are still a challenge for many jurisdictions. Consequently, the report also identifies the unique legal and regulatory challenges associated with NPMs and describes the different approaches national legislators and regulators have taken to address these. A comparison of regulatory approaches can help inform other jurisdictions' decisions regarding the regulation of NPM.

21. Finally, this report considers the extent to which the FATF 40+9 Recommendations continue to adequately address the ML/TF issues associated with NPMs.

Steps taken by the project team

22. The project team analysed publications about NPMs and ML/TF[2]. It also analysed the responses to questionnaires which covered the spread of domestic NPM service providers[3], the role of regulation in relation to NPMs and case studies detected in jurisdictions (the latter also including foreign service providers). Thirty-seven jurisdictions and the European Union Commission submitted a response.[4]

23. The majority of the respondents identified NPMs within their jurisdiction. Prepaid cards were the most common (34 of the countries have such providers), followed by Internet payment services (IPS) providers with 17 countries and mobile payment services with 16 countries offering each NPM respectively. Case studies were provided for the three NPMs: 18 cases involving prepaid cards, 14 cases involving Internet payment services and three cases involving mobile payment services.[5] A detailed summary is attached in Appendix A.

24. The project team also consulted with the private sector in several ways. During the 2009-2010 annual typologies experts´ meeting in the Cayman Islands, representatives from NPM service providers, including the Internet payment sector, the mobile payments sector and a representative from the Consultative Group to Assist the Poor (CGAP), provided presentations to the project team. At the project team´s intersessional meeting in Amsterdam in March 2010, a representative from a card technology provider in Europe gave a presentation on prepaid cards. A more wide-ranging private sector

---

2 See Appendix C for a list of publications used for this report.

3 Including a description of the biggest or most significant products and service providers.

4 The FATF and the NPM project team would like to thank all jurisdictions and organisations that have contributed to the completion of this report by providing experts to participate in the project team and by submitting responses to the project questionnaire, including (sorted alphabetically): Argentina, Armenia, Australia, Austria, Belarus, Belgium, Brazil, Bulgaria, Canada, Cayman Islands, Colombia, Denmark, Estonia, European Commission, France, Germany, Gibraltar, Italy, Japan, Jersey, Lebanon, Luxembourg, Macao, Mexico, Netherlands, Norway, Oman, Peru, Philippines, Poland, Portugal, Russia, Singapore, Slovak Republic, South Africa, St. Vincent & the Grenadines, Sweden, Switzerland, UK, Ukraine, USA, and the World Bank. The project team would also like to thank the secretariat of the Egmont Group for circulating the questionnaire among its members, thus increasing the outreach of the entire project.

5 Various reasons have been proposed for the low number of cases, including that transaction value and volume remains very small for mobile payments, or that these systems may not be attractive to money launderers, or that mobile providers and law enforcement have failed to detect criminality or that criminals, or indeed law enforcement are unfamiliar with the technology.

consultation was also conducted through the FATF electronic consultation platform where a draft of this report was presented for consultation.

Structure of the present report

25. This report is based on the FATF 2006 report. It attempts to avoid repetition as much as possible. The report therefore does not describe the general working mechanisms of NPMs.[6] Instead, it focuses on recent developments, updates the risk assessment and introduces new case studies.

26. The report is divided into 4 sections:

- Section 1 (chapters 1 and 2) introduces the project work as well as the key overarching issues. It also provides an overview of recent developments;
- Section 2 (chapters 3 and 4) addresses the risks and vulnerabilities of NPMs and presents case studies and typologies.
- Section 3 (chapter 5) addresses regulatory and supervisory issues, exploring the different national approaches to AML legislation as well as the prosecution of illicit NPM service providers.
- Section 4 (chapter 6) concludes the report and identifies issues for further consideration.

6 Relevant sections of the 2006 report (including definitions) are cited as excerpts in Appendix B.

CHAPTER 2: BACKGROUND

"New Payment Methods" and their development since 2006

27. In 2006, bank-issued payment cards and transactions via the internet or over the telephone were not really new. Depository financial institutions have offered remote access to customer accounts for decades. What was new about these technologies in 2006 was their use by banks outside of traditional individual deposit accounts and by non-banks, some of which did not fit traditional financial service provider categories and therefore sometimes fell outside the scope of regulation despite providing financial services such as the carrying out of payments or holding accounts. Indeed there are still several jurisdictions where NPM service providers are not subject to prudential and/or AML regulation.

28. The development of NPMs has created new opportunities for criminals to misuse such technologies for the purposes of ML and TF. This has, in turn, resulted in new typologies and created new challenges for law enforcement authorities.

The promotion of NPMs through jurisdictions and government agencies

29. NPMs have developed as a result of the legitimate need of the market for alternatives to traditional financial services. In some cases, this was driven by the demand for more convenient or safer ways to pay for online purchases; in other cases, their development was fostered by a desire to provide access to financial services for those who were excluded from traditional financial services (*e.g.*, individuals with poor credit ratings, minors, but also inhabitants of under-banked regions),[7] and the assumption that NPMs may have a positive effect on national budgets as well as overall national and global economic development.[8]

Box 1.

United States: Four million people who receive Social Security benefits lack bank accounts. To reduce reliance on paper checks, the United States began distributing these benefits using prepaid cards, which beneficiaries can use to purchase goods or get cash. Previously, beneficiaries cashed checks at non-banks and conducted transactions using cash or money orders.*

Pakistan: Fighting forced more than a million people from their homes in 2009. The Government of Pakistan

7 The World Bank, the Consultative Group to Assist the Poor (CGAP), the G-20 Access Through Innovation Sub Group and other organisations have also identified NPMs, mobile payment services in particular, as a possible tool for financial inclusion of the poor and/or the under-banked and launched initiatives to promote and support the implementation of NPMs in jurisdictions concerned.

8 This is due to efficiency gains in terms of transaction speed, finality of payments, security features of technology based payment methods and their lower costs compared to paper payment instruments. Another important characteristic of NPMs that explains policy-makers' support for their sound development is their accessibility: especially pre-paid cards and mobile payments grant easy access to the payment system by the whole population, including the unbanked. Given these potentialities, central banks in their capacity of payment system overseer have long since devoted specific attention to the development of NPMs. Ultimately, the Bank for International Settlements has launched an initiative to study the innovations in retail payments.

needed a way to deliver financial assistance to these displaced individuals quickly. Rather than distributing cash, the Government of Pakistan partnered with a bank to distribute prepaid cards with access to 25,000 Pak rupees (about USD 300). At the same time, a Pakistani bank and a payment card company installed wireless point-of-sale terminals at retailers where people could buy basic supplies. By using cards rather than cash, the Government of Pakistan provided immediate assistance to nearly 300,000 families through transparent distribution channels.**

* Direct Express Media (2008)
** Visa Corporate Site (2010)

30. As a result, some jurisdictions have adapted their regulatory framework to actively promote NPMs within their domestic market.

Box 2. The EU Commission openly encourages and promotes the development of NPMs and concluded in its Explanatory Memorandum to the original E-Money-Directive of 1998:*

"Electronic money has the potential to develop into an efficient and effective means of payment; it can play a significant role in the development and improvement of electronic commerce; and it can be an important tool in the completion of the single market and monetary union. The Commission is of the view that it is in the interests of both business and consumers alike that electronic money develops within a regulatory environment that instils trust and confidence in this new and developing payment instrument. At the same time it is vital that development is allowed to take place unimpaired by strict technological rules which will hamper innovation and restrict competition.

The Commission proposal (…) introduces the regulatory regime necessary to ensure the financial integrity of non-bank issuers without stifling developments in the domain of electronic money and will help to cultivate an environment in which the development of this new means of payment is promoted in the interests of business and consumers."

In a review of the original E-Money-Directive, the Commission kept up the aforementioned goals and intentions:**

"The general objective of the review of the EMD is to promote the emergence of a true single market for electronic money services in Europe. Contribute to the design and implementation of new, innovative and secure electronic money services. Provide market access to new players and real and effective competition between all market participants, thereby generating significant benefits to the wider European economy."

Accordingly, recital (4) of the amended E-Money-Directive*** reads:

"(4) With the objective of removing barriers to market entry and facilitating the taking up and pursuit of the business of electronic money issuance, the rules to which electronic money institutions are subject need to be reviewed so as to ensure a level playing field for all payment services providers."

Other studies on NPMs and ML/TF risks and vulnerabilities

31. NPMs have attracted a significant amount of press coverage. They have also been the subject of an increasing number of public and private sector research initiatives. In addition, there are a number of recent or ongoing typologies projects of FATF and FSRBs that touch upon this subject.[9] This shows that the awareness of the opportunities and risks associated with NPMs has increased since the publication of the 2006 report.

32. These studies have often focussed on one category of NPMs only. This report is different as it will provide a broader comparative analysis of these issues and identify the commonalities shared by all types of NPMs. It will also identify the specific challenges within each category of NPMs.

9 Recent or ongoing typologies projects include: FATF typologies report on *Money Laundering and Terrorist Financing vulnerabilities of commercial websites and Internet Payment Systems* (FATF (2008)); MONEYVAL workshop on Cybercrime (ongoing); EAG workshop on internet payments (ongoing).

2.1 Recent Developments Related to Prepaid cards

33. Prepaid cards can be split into two broad categories, open-loop cards and closed-loop cards.[10] This report focuses mainly on open-loop cards[11] because closed-loop cards only have a very limited negotiability. This does not mean that the ML/TF risk in closed-loop prepaid cards is very low: in fact, a few case studies involved closed-loop cards. However, in most of these case studies closed-loop cards were not used as a payment instrument, but as a mere intermediary store of value. This can be illustrated by the following two case examples:

Box 3. Stolen credit card information used to purchase closed-loop cards

In 2007, two defendants were prosecuted for purchasing closed-loop prepaid gift cards with stolen credit card account information. The defendants used the gift cards to purchase merchandise, which they then returned to the store in exchange for new gift cards, or they sold the merchandise for cash. Because the new prepaid cards were not linked to the stolen credit card account numbers, they were not affected when the theft of the credit card information was discovered. The defendants were convicted and ordered to pay USD 82 000 in restitution. One defendant was convicted of conspiracy and fraud and sentenced to 45 months imprisonment and three years supervised release. The other defendant was convicted of conspiracy and money laundering and sentenced to five months imprisonment and three years supervised release.

Source: United States.

Box 4. Suspected use of a closed-loop card company for money laundering and terrorist financing

Law enforcement information indicated that the owner of a prepaid phone card company was suspected of money laundering and having links to a terrorist organisation.

The owner conducted many large cash deposits into personal and business bank accounts and when questioned would indicate that prepaid phone cards were sold to retailers and convenience stores, and cash payments were received instead of cheques. This was apparently due to the fact that the owner was not confident that cheques would be honoured.

Some of the deposits were also conducted into accounts held by prepaid phone card suppliers.

Electronic funds transfers were also ordered by the owner to the benefit of individuals in Europe and the Middle East, sometimes through accounts which previously had not seen much activity. The owner was also the beneficiary of funds ordered by the same individuals.

Source: Canada.

34. During the June 2010 FATF plenary in Amsterdam, the plenary asked the project team to provide information regarding the nature and inherent risks of closed-loop prepaid cards.[12] However, beyond the two case examples above, the project team does not have sufficient data to assess the risk of such cards, as the questionnaire circulated at the beginning of the project explicitly excluded closed-loop cards from the scope of this project. Nevertheless several of the risk factors as well as the corresponding

10 For more details see the definition of prepaid cards as given in the FATF 2006 report (included as Appendix B to this report).

11 For the purposes of this report, the term prepaid cards includes the types of cards that were named "e-purses" in the FATF 2006 report.

12 The issue had come up after the mutual evaluation of Brazil; the assessment team had criticised Brazil for applying reduced CDD measures to such cards without having conducted a thorough risk assessment to determine the risk of such products first (FATF (2010)).

risk mitigants evaluated in this report that apply to open-loop cards may also apply to closed-loop cards (*e.g.*, regarding CDD measures or value limits).[13]

35. The overall volume of prepaid card transactions can only be estimated, as in most jurisdictions data on annual transaction volume for prepaid cards is not reported separately by the leading payment card networks, card-issuing banks, or non-bank issuers and service providers.[14] For the US, the total funds loaded onto prepaid cards in 2009 are estimated to have been USD 120.2 billion, according to research commissioned by MasterCard, Inc. and conducted by the Boston Consulting Group (BCG).[15]

36. While about 17% of U.S. consumers have a prepaid card,[16] outside the U.S. the percentage of consumers with a prepaid card tends to be lower and the market potential may be lower as well.[17]

37. Prepaid cards have been introduced in a number of countries, but in most countries the use of prepaid card appears to be less prevalent compared to the US. The BCG study mentioned above (see footnote 21) forecasts that the US will account for 53% of the global prepaid card market in 2017, and that UK and Italy will remain the largest markets for prepaid cards in Europe, with the UK accounting for 25% and Italy 20% of the entire European market by 2017.[18] The BCG study roughly supports a 2009 survey sponsored by the international payments processing firm First Data that found that Italy was the "most advanced prepaid market in Europe," while the UK market was described as "established," and the markets in Germany and Austria were described as "embryonic." [19] As a general trend it is safe to say that the usage and spread of prepaid cards has grown in recent years. According to the Basel Committee on Payment and Settlement Services (CPSS)[20] the number of issued "cards with an

---

13 Based on the discussion during the evaluation of Brazil and the indicators available, it may be worthwhile to analyse the money laundering and terrorist financing vulnerabilities of closed-loop prepaid cards in a separate typologies project.

14 MasterCard and Visa mix prepaid card transaction volume in with their debit card data. For the 12 months ending 30 June 2009, Visa reported 935 billion USD of consumer debit transactions for purchases of goods and services, with just over 84% of that volume taking place in the United States (United States Securities and Exchange Commission (2009a)). For MasterCard, in the year ending 31 December 2009, total debit card transaction volume was $814 billion, with 55% taking place in the United States (United States Securities and Exchange Commission (2009b)).

15 Payment News (2010)

16 Foster K., Meijer E., Schuh S., and Zabek A. (2010).

17 According to United Kingdom-based PSE Consulting: "US prepaid products rely on displacing check wage payments, and often the less well off are obliged to spend c.$50 - $60 per month on 'check cashing', paying their utility bills or sending money home to their families. In Europe the greater prevalence of electronic salary payments and government benefits plus free 'basic banking' products means the unbanked population is significantly smaller than in the US and consumers are unused to paying such high charges." (see: www.pseconsulting.com/pdf/articles/sep06/pse_repaid_press_release_110806.pdf)
This view is supported at least within the UK by the UK Payments Council, which in its new report, The Way We Pay 2010, finds that 89% of workers in the UK are paid by direct deposit to individual bank accounts with the remainder paid by check or cash. The report does not mentions prepaid cards. (Payments Council (2010)).

18 Master Card (2010)

19 First Data (2009)

20 Bank for International Settlements (2009)

e-money function"[21] has grown from 107.6 million in 2004 to 275.28 million in 2008 in selected CPSS countries.[22]

38. The project questionnaire asked jurisdictions for an estimate of prepaid cards issued by domestic payment service providers. Out of those jurisdictions that provided an estimate, the eight jurisdictions with the most cards issued are listed in the following table:

Jurisdiction	Cards issued (estimate)	Jurisdiction	Cards issued (estimate)
Japan	100 million	**Slovak Republic**	4 million
Singapore	15 million	**Mexico**	2.6 million
Italy	8 million	**Russia**	2 million
Norway	6 million	**France**	1.3 million

39. Since the first report was published in 2006, there have been no significant technical developments, most open-loop prepaid cards still rely on magnetic stripes. Where so-called "smart cards" are used featuring an electronic chip, this chip is usually used for processing additional customer information. Prepaid card systems that use the chip to store the funds on the card ("e-purses")[23] are usually still limited to domestic use and often have rather low value limits.

40. As described in the FATF 2006 report, prepaid cards can be an alternative to a variety of traditional banking products and services, such as debit or credit cards or traveller cheques. Many prepaid cards enable customers to make international payments, and some are increasingly offering features similar to conventional bank accounts: such card products may allow the customer not only to make payments, but also to receive payments from third parties. They may also allow cross-border remittances, *e.g.*, by issuing several "twin" or "partner" cards to one customer, which they can pass on to remittance receivers anywhere in the world. These "twin" or "partner" cards grant their holders access to the original card holders´ funds through the global ATM network.[24]

41. Some providers of Internet payment services and mobile payment services are known to provide their customers with an additional prepaid card to facilitate access to cash through the use of ATMs domestically and worldwide. This link was identified for mobile payments in the 2006 report, but has now been associated with IPS as well.

2.2 Recent Developments Related to Internet Payment Services

42. Internet payment services (IPS) can be provided by financial institutions and firms outside the financial services sector. They can rely on a bank account or operate independently from a bank account.

---

21 These are defined as "Reloadable multi-purpose prepaid cards which can be used at the sites of several service providers for a wide range of purposes and which have the potential to be used on a national or an international scale, but may sometimes be restricted to a certain area", Statistics on payment and settlement systems in selected countries – Figures for 2008 (December 2009), p. 312.

22 Statistics on payment and settlement systems in selected countries – Figures for 2008 (December 2009), table 10, p. 262. These figures include data from Belgium, France, Germany, Italy, Japan, Netherlands, Singapore and Switzerland; they do not include Canada, Hong Kong, Sweden, UK and the US ("nav"-data was not available).

23 See definition of e-purses in the FATF 2006 report on NPM, added to this report in Appendix B. For the purposes of this report, e-purses are included in the category "prepaid cards" (also see glossary s.v. "electronic purses").

24 See also: 5.2., *Identification of secondary card holders*, para. 196 ss.

43. Internet payment methods fall into one of three categories:

- Online banking, where credit institutions offer online access to traditional banking services based on an account held at the credit institution in the customer's name. Online banking is outside the scope of this document.
- **Prepaid Internet payment products**, where firms who may not be credit institutions allow customers to send or receive funds through a virtual, prepaid account, accessed via the Internet;
- **Digital currencies**, where customers typically purchase units of digital currencies or precious metals which can either be exchanged between account holders of the same service or exchanged against real currencies and withdrawn.

44. The market for prepaid Internet payment products has diversified and grown steadily since 2006 in parts of the world, possibly as a result of increased Internet usage and acceptance of Internet payments by online merchants. They are also increasingly being used to support person-to-person (p2p) transfers.

45. Recent years have seen the emergence of electronic currencies linked to **virtual worlds**, where users convert real currencies into virtual currencies in order to complete purchases within the virtual world environment. Within that same environment, p2p transfers are often conducted among users (*i.e.*, users sending virtual currencies to fellow users). These virtual currencies are not confined to a particular online game, as they can be traded in the real world and be converted into real currencies.

46. **Cash vouchers** have gained popularity in some markets. These vouchers can be bought anonymously at retailers, petrol stations etc. and are usually sold in units ranging from as low as 10 EUR up to 500 GBP (approx. 750 EUR).[25] Cash vouchers are originally designed for person-to-business (p2b) payments on the Internet, but can also be used for p2p transactions where they are accepted as a funding method by other NPM service providers (*e.g.*, prepaid card issuers or digital currency exchangers), or where they can be used for online gambling.

47. **Internet payment services are increasingly interconnected with different new and traditional payment services**. Funds can now be moved to or from a variety of payment methods, ranging from cash, money remittance businesses (*e.g.*, Western Union), NPMs, bank wire transfers, and credit cards. Furthermore, some IPS providers have started to issue prepaid cards to their customers, thus granting them access to **cash withdrawal through the worldwide ATM networks**.

48. As indicated previously, 15 of the jurisdictions responding to the questionnaire indicated that IPS providers were operating in their respective jurisdiction. Statistics regarding the number of such providers and active client accounts were not consistently provided. However for countries providing such statistics, the estimated number of providers varied between one and 23. As for the estimated number of active IPS accounts, it varied between 45 000 and over 80 million accounts.

---

25 Cash vouchers share some characteristics with prepaid cards and are therefore considered to be prepaid cards by some, rather than IPS. As this report examines all NPMs, it is not necessary to make a final decision whether these should be considered prepaid cards or IPS.

2.3 Recent Developments Related to Mobile Payment Services

49. For the purposes of assessing risks and vulnerabilities it is essential to differentiate between "mobile payments" based on individual bank accounts or securities accounts for each customer (and recipient) held at a financial institution that is subject to adequate AML/CFT regulation and supervision, and those services offered separately from such accounts.[26] In this respect, it may be helpful to use the four categories of mobile payment systems described by the World Bank:[27] [28]

- Mobile financial information services: Users may view personal account data and general financial information, but there is no capability for any financial transaction and therefore may be considered low risk.

- Mobile bank and securities account services: Users may transact, in a similar fashion to internet banking. The service will be tied into individual bank or security accounts and is therefore (like internet banking) not considered a NPM in the strict sense of this report. Mobile bank and securities account services are likely to be regulated and supervised.

- **Mobile payment services**: Allows non-bank and non-securities account holders to make payments with mobile phones. However, payment service providers may be non-traditional financial institutions with widely varying controls and supervision measures.

- **Mobile money services**: Subscribers are able to store actual value on their mobile phone. They may use phone credits or airtime as tender for payment. Such systems offer versatility but may often fall out of regulation and prudential supervision altogether.

50. The scope of this report covers the last two categories only. However, some of the issues discussed in this report may apply for mobile bank and securities account services as well (*e.g.*, the issue of outsourcing business activities or using agents; or simplified due diligence measures; or non-face-to-face account opening).

51. Advances in mobile phone technology since the 2006 report should reasonably have been expected to facilitate a marked increase in the use of mobile payments systems. The expected proliferation of such systems was regarded as symptomatic of the trend for migration from paper to electronic payments common to all payment systems innovations.

52. Despite a predicted marked increase in the use and spread of mobile payments,[29] only a few providers have managed to run a successful and profitable business model[30] in the long term so far.[31]

---

26 These services may as well rely on the involvement of banks; however, in these business models the technical handling of payment transactions does not rely on individual bank accounts for each customer and recipient.

27 World Bank (2008)

28 Other terms and definitions may exist in the mobile payment service market such as "mobile wallets", "mobile money transfer" (indicating person to person payments) or "mobile payment" (indicating person to business, *i.e.*, retail or bill payment). In this report, these definitions are not used in this sense.

29 Estimates varied; it was suggested that 1.4 billion people will use cell phones to remit money domestically and across borders by 2015 (Michael Klein, World Bank (2008)). Other sources suggest that mobile phone transaction services will grow at 68% per year reaching almost USD 250 billion in 2012

53. As indicated previously, 15 of the jurisdictions responding to the questionnaire indicated that mobile payment service providers were operating in their respective jurisdiction. Statistics regarding the number of such providers and active client accounts were not consistently provided; not all responding jurisdictions made a clear distinction between mobile payments in the sense of this report and mobile banking. For countries providing such statistics, the estimated number of providers varied between one and 21 (including mobile banking models). As for the estimated number of active mobile payment service accounts, it varied between 26 000 and 15 million accounts.

54. Technological developments in mobile payment systems have included the fusing with other payment methods, including traditional payment methods as well as other NPMs:

- Some mobile payment service providers offer open-loop prepaid cards that are connected to the accounts of their customers; through this originally domestic providers may offer cross-border services, as this grants customers or third persons who were handed over the prepaid card access to the global ATM network.
- Some providers even allow for ATM withdrawals without the need for a card. Customers can initiate p2p transactions by passing on a certain code to third parties, who can enter the code into an ATM in order to receive the amount of money linked to that specific code.[32]
- Some providers cooperate with traditional money remittance services (*e.g.*, Western Union); the remittance service enables third parties that are not customers of the mobile payment service provider to send or receive to or from a customer, also across borders.

(Arthur D Little (2009)). These estimates do not only refer to mobile payments services in the sense of this report, but also include mobile banking services.

30 This observation only refers to mobile payments business models in the sense of this report, which does not include "bank based" models (*i.e.*, business cooperation models between banks and telecom companies where each customer needs to have an individual bank account).

31 There are several potential reasons for this, including the following: profit margins in mobile payments services are rather small; in order to make profits, a large number of customers and accepting merchants must be acquired; technological and security issues must be overcome to win the trust of customers. Prudential regulation as well as AML/CFT regulation has also been identified as a potential impediment for market success of NPMs in general, and mobile payment service providers in particular (see chapter 5 for more detail).

32 These non-card ATM withdrawals are currently restricted to domestic ATMs in the provider´s jurisdiction, and only to ATMs of the specific cooperating bank.

CHAPTER 3: RISK ASSESSMENT OF NPMS

NPMs: risk vs. opportunity

55. On the one hand NPMs, like all financial services and products, can be abused for ML/TF purposes. Most jurisdictions have therefore subjected NPM service providers to AML/CFT obligations and regulation.

56. On the other hand, where NPM providers are subject to AML/CTF obligations and appropriately supervised for AML/CTF purposes, NPMs can make payment transactions more transparent and help prevent corruption or other abuses. NPMs can shift customers from the unsupervised or even illegal sections of the payments market (*e.g.*, *hawaladars*, underground banking services) into the formal sector. This means that where providers are subject to AML/CTF legislation and supervision, more transactions are monitored and suspicious transactions are identified and reported to a competent authority. Ultimately, this should result in better oversight of payment activities within a jurisdiction.

Box 5.
Example: Afghan police officers and US soldiers in Afghanistan

In May 2002, at the request of the Afghan Government, United Nations Assistance Mission for Afghanistan and the United Nations Development Program established the Law and Order Trust Fund for Afghanistan (LOTFA) to enable the Afghan police to return to work throughout the country with the first priority being the provision of police salaries. Working with the Afghan ministries of the Interior and Finance, and the United States Military Combined Security Transition Command Afghanistan, LOFTA opened more than 62 000 bank accounts for Afghan police officers and facilitated electronic funds transfers to make salary payments. In addition, the UN, Afghan, and U.S. authorities have been using M-paisa, launched in 2008 by the Roshan mobile company, in collaboration with First Micro Finance Bank, to make salary payments through mobile cell phones. Mobile payments were used in order to avoid police officers having to leave their posts to collect their salaries. Using electronic funds transfer rather than cash disbursement also helped to avoid corruption and bribery.*

Source: United States.

* United Nations Development Programme Afghanistan (2009)

57. Contrary to cash, NPMs can provide additional investigative leads for law enforcement agencies. This is because a transaction carried out through a NPM will always generate an electronic record, whereas cash does not. Even where CDD measures are not applied (*i.e.*, where the customer remains anonymous), the electronic record can, in some cases, still provide law enforcement with at least minimal data such as an IP address or the place where a payment was executed or funds withdrawn; this can potentially support the location or identification of a user suspected of money laundering or terrorist financing.[33] [34]

[33] For example, law enforcement might be able to obtain images of a suspect by analysing CCTV (video surveillance) data at point of sale or in locations where the product was used (ATMs, internet cafes etc.).

[34] Critics challenge the usefulness of the electronic traces rendered by anonymous services or products, pointing out that IP-addresses may be forged; or may be from public places such as “hot spots” or internet

58. This report refers to a number of cases where NPMs were used for money laundering purposes where cash or other traditional payment methods could instead have been chosen. It can therefore be assumed that some criminals consider NPMs to be a better option than cash for ML/TF purposes. This especially applies to cases where NPMs are a substitute for bulk cash to carry, or where the non-face to face nature of the business relationship facilitates the use of straw men or fake identities.[35]

NPMs and Terrorist Financing

59. Based on the case material submitted to the project team, this report focuses mainly on money laundering. Where terrorist financing issues are concerned, this will explicitly be noted in the text; otherwise most findings relating to money laundering apply to terrorist financing *mutatis mutandis*.

60. Out of the 33 case studies analysed in this report, only one has an obvious link to terrorist financing (see section 4: "Typologies", ***case 4***).

Common risks of NPMs

61. The 2006 report identified a number of characteristics shared by most NPMs. These include the absence of credit risk, speed of transactions and (often) non- face to face nature of the business relationship:

- Absence of credit risk

  Funds for use with NPMs are generally prepaid. This absence of credit risk means that service providers may have fewer incentives to obtain full and accurate information about the customer and the nature of the business relationship.

- Speed of transactions

  NPM transactions can be carried out and funds withdrawn or converted much quicker than through more traditional channels. This can complicate monitoring and potentially frustrate efforts to freeze the funds.

- Non-face to face business relationship

  Many (but not all) NPM providers' business model relies on non-face to face business relationships and transactions, which FATF Recommendation 8 identifies as presenting "specific"36 ML/TF risks due to increased impersonation fraud risk and the chance that customers may not be who they say they are.

---

cafes; in such cases, the information is of little use to law enforcement in jurisdictions where public and private video surveillance is less prevalent.

35 See *4.4.1, Cross-border transport of prepaid cards* and Chapter 4.2, *Case 20: Use of "ghost employees" to launder illicit funds through prepaid cards* for "cross-border transport of cards and "ghost employees" examples in the typologies sections.

36 If read in conjunction with the Interpretative note to Recommendation 5 (para. 7) and the Basel CDD paper (section 2.2.6, para. 48), "specific" risk appears to mean "higher" risk: "48. In accepting business from non-face-to-face-customers (…) there must be specific and adequate measures to mitigate the higher risk". See also para. 165 ss.

Assessing individual providers and products, not NPMs as such

62. One of the findings of the 2006 report was that ML/TF risks and vulnerabilities varied significantly among service providers and products, even within one and the same category of NPMs such as prepaid cards. This is due to the fact that the different products have different features that will affect their risk profile.

The Risk Matrix

63. The 2006 report developed a risk matrix which featured several risk factors to assess the risk associated with individual NPM products.[37] This matrix has been updated as follows:

- "Identification" has been renamed "CDD" and now encompasses identification, verification and monitoring.
- "Record keeping" has been added as an additional risk factor.
- "Value limits" and "usage limits" have been broken down into more detail; and
- "Segmentation of services" has been integrated into the risk matrix. Segmentation of services had already been identified as a challenge for regulators and law enforcement in the 2006 report, but had not been included in the risk matrix then.

64. Some of the risks (such as anonymity, methods of funding, value limits etc.) are the direct result of product design, while others result from the providers´ CDD measures (such as verification and monitoring procedures).

65. The risk factors listed in the following matrix should not be looked at in isolation but as a whole; a "high risk" rating in one risk factor does not necessarily mean an overall rating of "high risk" for the product. It is important to look at the whole picture not only including all risk factors, but also all risk mitigants implemented in order to effectively assess the risk associated with a particular NPM product.

Box 6.
Example: Risk factor "Usage limits / utility"

The risk matrix considers services that facilitate person-to-person (p2p) payments to be of a higher risk than services that facilitate person-to-business (p2b) payments only. This consideration is based on the fact that the p2p functionality enables a user to transfer funds to a much higher number of potential recipients, and without the need for an underlying purchase or any other "reason" for a transaction.

However, the p2p functionality of an NPM service does not automatically lead to an overall risk assessment of "high risk" for that service. Likewise, NPM services that are restricted to p2b payments cannot automatically be regarded as "low risk" services. Instead, the other risk factors listed in the risk matrix must be taken into account as well (*e.g.:* Are there identification/verification measures? Are there value limits? …)

Payment Methods Risk Factors				
Criteria		Cash	NPM High risk	NPM Low risk
CDD	Identification	anonymous	Anonymous	Customers are identified
	Verification	anonymous	Customer's identity (where obtained) is not verified on	Customer's identity is verified on the basis of reliable,

[37] Other publications on risk assessment have developed different approaches, using different risk factors, which are not adopted here. See for example World Bank Working paper (2008), p. 17 ss.

Payment Methods Risk Factors				
Criteria		**Cash**	**NPM High risk**	**NPM Low risk**
			the basis of reliable, independent source documents, data or information (*cf.* Recommendation 5)	independent source documents, data or information (*cf.* Recommendation 5)
	Monitoring	none	None	Ongoing Monitoring of business relationships
Record keeping		none	Electronic transaction records are generated, but not retained or not made accessible to LEA upon request	Electronic transaction records are retained and made accessible to LEA upon request
Value Limits	Max. amount stored on account / accounts per person	no limit	no limit	Amount limit (cf. para. 112 ss.)
	Max. amount per transaction (incl. loading / withdrawal transactions)	no limit	no limit	Amount limit (cf. para. 112 ss.)
	Max. transaction frequency	no limit	no limit	Transaction limit (cf. para. 112 ss.)
Methods of funding		n.a.	Anonymous funding sources (*e.g.,* cash, money orders, anonymous NPMs); also multiple sources of funds, *e.g.,* third parties	Funding through accounts held at a regulated financial or credit institution, or other identified sources which are subject to adequate AML/CTF obligations and oversight
Geographical limits		Some currencies are accepted more widely than others; currencies can be converted through intermediaries	Transfer of funds or withdrawal across national borders	Transfer of funds or withdrawal only domestically
Usage Limits	Negotiability (merchant acceptance)	Generally accepted	High number of accepting merchants / POS (*e.g.,* through usage of VISA or MasterCard standard)	Few accepting merchants / POS
	Utility	p2b, b2b, p2p, no online usage possible	p2b, b2b, p2p, online usage possible	p2b, b2b, online usage possible, but no p2p
	withdrawal)	n.a.	Anonymous and unlimited withdrawal (*e.g.,* cash through ATMs)	limited withdrawal options (*e.g.,* onto referenced accounts only); limited withdrawal amounts and frequency (*e.g.,* less than a certain fixed sum per calendar year)
Segmentation of services	Interaction of service providers	n.a.	Several independent service providers carrying out individual steps of the transaction without effective oversight and coordination	Whole transaction carried out by one service provider
	Outsourcing	n.a	Several singular steps are outsourced; outsourcing into other jurisdictions without appropriate safeguards; lack of oversight and clear lines of responsibility	All processes completed in-house to a high standard

66. Some types of NPMs are more affected by certain risk factors than others, but most risk factors apply to all types of NPMs to a certain degree. The following discussion of **risk factors (section 3.1)** will therefore be presented in a consolidated section for all NPMs together.

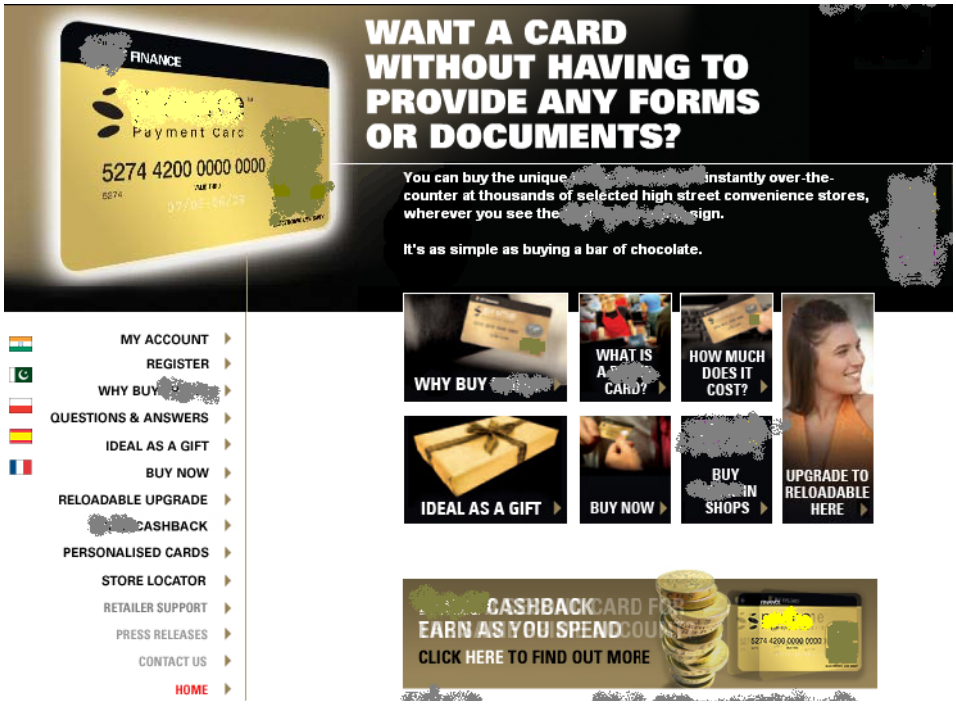
67. The ML/TF risks associated with NPMs can effectively be mitigated by firms' own AML/CTF policies and procedures and regulatory oversight. Like risk factors, the **risk mitigants** appear to be similar for all types of NPMs and are therefore presented in a consolidated **section 3.2.**

3.1 Risk factors

Customer Due Diligence

68. **Prepaid cards** can be designed to afford the customer absolute anonymity while maintaining a high degree of functionality. For example, some prepaid card issuers attract customers with anonymous prepaid cards with no or high loading and transaction limits.

Figure 1. Example of a prepaid card



Source: Internet screenshot July 2010

69. Prepaid cards can also easily be passed on to anonymous third parties who in some cases will be the beneficial owner. Where additional "twin cards" or "partner cards" are issued that are specifically designed and advertised for being passed on to third parties to allow remittances, these third parties/beneficial owners are often not identified. This emphasizes the significance of identifying at least the primary account holder /card holder.[38]

[38] There is always the potential for any payment card (including traditional debit or credit cards) to be shared with third parties who remain anonymous to the card issuing institution; but if the institution has adequately identified the primary card holder, law enforcement has a point of contact to associate with reports of suspicious transactions.

70. For many NPM providers, customer contact is often minimal as a result of business relationships being conducted on a non-face to face basis. As recognised by FATF Recommendation 8, this increases risks like identity fraud, impersonation fraud or the use of the product by third parties for illicit purposes. Absence of face to face contact is particularly common among **IPS providers** who generally conduct most of their business activities online. It may also be relevant for other types of NPMs (*e.g.*, online purchase of prepaid cards).

71. Most IPS providers ask for their customers´ names, but the levels of customer verification vary significantly, ranging from no verification at all (some providers only require a pseudonym) to sophisticated verification measures (see section 3.2 "risk mitigants").

72. The verification of the customers´ identity may be further hampered or impossible in jurisdictions that have no national identity card scheme, or other appropriate alternative forms of identification; this is a challenge often encountered by NPM providers operating in underbanked regions, especially **mobile payment services providers**. For this reason, the World Bank has recommended to jurisdictions intending to promote financial inclusion (*e.g.*, through mobile payment service providers) that if the jurisdiction´s "national identification infrastructure and other private databases lack coverage, integrity, or are not easily and cost-effectively accessible to financial institutions for verification purposes, the state should address these deficiencies".[39] Where customer data cannot be reliably verified, it may be appropriate to apply alternative risk mitigation measures (*e.g.*, imposing low value limits in order to qualify as a "low risk" product and be allowed to apply simplified CDD measures; see also below section 3.2, "value limits" as a risk mitigant (para. 112 ss.).

73. Where no identification or verification based on reliable and independent sources takes place, NPM providers run the risk of customers' holding multiple accounts simultaneously without the provider noticing.

Record keeping

74. According to FATF Recommendation 10, both identification data as well as transaction records should be maintained for at least five years. Transaction records must be sufficient to permit reconstruction of individual transactions so as to provide, if necessary, evidence for prosecution of criminal activity. While neither Recommendation 10 nor the Interpretative Note to Recommendation 10 provides a definition of the term "transaction records", examples of necessary transaction records are provided by the FATF Methodology (10.1.1):

> *"Examples of the necessary components of transaction records include: customer´s (and beneficiary´s) name, address (or other identifying information normally recorded by the intermediary), the nature and date of the transaction, the type and amount of currency involved, and the type and identifying number of any account involved in the transaction."*

75. These examples do not explicitly list the IP addresses of customers initiating a payment transaction through a personal computer. Only in a few cases have jurisdictions, regulators or industry have issued guidance that it can be advisable to do so.[40]

---

39 World Bank (2009a), Annex 1 (A 1.1), p. 173 ss.; these World Bank recommendations are based on and quoted from: Bester, H., D. Chanberlain, L. de Koker, C. Hougaard, R. Short, A. Smith and R. Walker (2008), p. xi,; p. 39, 40.

40 For example, the *UK JMLSG Guidance (2007)* Part II Sector 3, explains how IP addresses can form part of a customer´s identity.

76. Law enforcement agencies have reported investigative cases where providers had not kept record of IP addresses at all, or not sufficiently, or had already deleted them before law enforcement agencies could access them. The increased ML/TF risk with providers that have no robust record keeping policy regarding all relevant transaction data lies in the fact that weak record keeping impedes criminal prosecution.

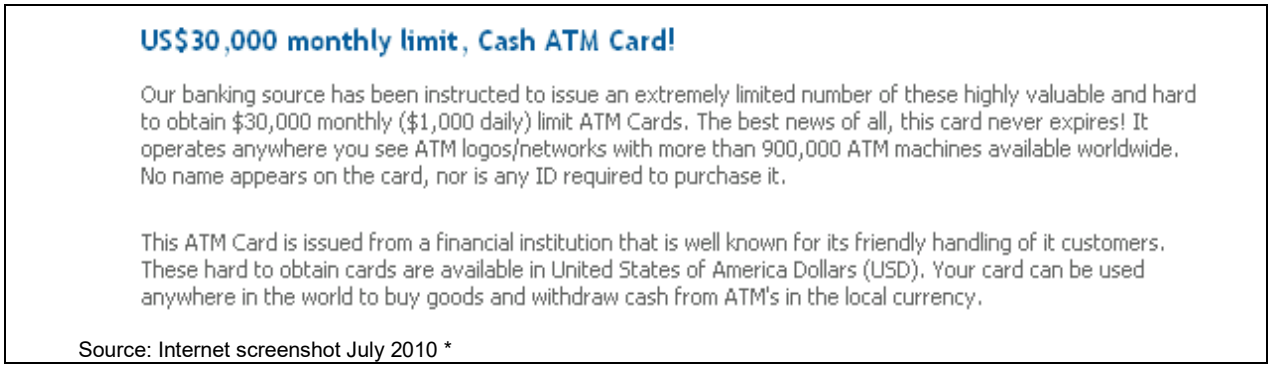
Value limits

77. The term "value limits" refers to limitations on the maximum amount that can be held in a NPM account or product; or limitations on the maximum amount per single payment transaction; or limitations on the frequency or cumulative value of permitted transactions per day/week /month/ year; or a combination of the aforementioned limitations. Also the number of accounts or cards allowed per customer can be considered a type of value limit.

78. Where value and transaction limits are not imposed, the availability of funds is limited only by the amount loaded onto the account. This increases the product's appeal to would-be money launderers and consequently the ML/TF risk the product is exposed to.

79. The higher the value and/or frequency of transactions, the greater the money laundering and terrorist financing risk. Similarly, high, or no, account limits increase the risk as well.

80. Most **Mobile payment service providers** impose rather low (*i.e.*, strict) value limits on their products, whereas a wide variety of approaches can be found for **Internet payments services and prepaid cards providers.** For example, prepaid cards may be designed as a non-reloadable card with a rather low account cap (such as USD 100); on the other hand, there are reloadable cards with no or rather high account caps such as USD 30 000 per month.



US$30,000 monthly limit, Cash ATM Card!

Our banking source has been instructed to issue an extremely limited number of these highly valuable and hard to obtain $30,000 monthly ($1,000 daily) limit ATM Cards. The best news of all, this card never expires! It operates anywhere you see ATM logos/networks with more than 900,000 ATM machines available worldwide. No name appears on the card, nor is any ID required to purchase it.

This ATM Card is issued from a financial institution that is well known for its friendly handling of it customers. These hard to obtain cards are available in United States of America Dollars (USD). Your card can be used anywhere in the world to buy goods and withdraw cash from ATM's in the local currency.

Source: Internet screenshot July 2010 *

* As mentioned above, some offers of anonymous prepaid cards are fraud. The project team did not investigate whether the product advertised by this screenshot is fraudulent or not.

81. Providers of products with high or no value limits are often based in jurisdictions where NPM providers are not or insufficiently regulated and supervised for AML/CTF purposes, but sell their product internationally (through agents or over the Internet). However, such providers of anonymous prepaid cards with high or no limits have also been found to operate in jurisdictions whose regulatory regimes and supervision are generally considered robust.[41] Such anonymous cards are often not promoted by the issuing institution itself, but by intermediaries some of which have specialised in founding and selling companies abroad, preferably in tax havens, thus providing a complete "privacy

[41] In 2007, the German *Bundeskriminalamt* (BKA) conducted a special investigation on payment cards; during that investigation, the BKA detected six cases of anonymous prepaid cards sold via the internet; the issuing banks were located in Europe and Central America.

package" to their customers. Some of those anonymous prepaid cards however have been discovered to be fraudulent.

82. Value limits may be linked to the product´s CDD requirements (*i.e.*, strict limits where the level of CDD measures is low, and higher or no limits where the level of CDD measures is high; see also below section 3.2 "risk mitigants", value limits).

Methods of funding

83. NPMs can be funded in different ways - including anonymously through sources such as cash, money orders or funds transfers from other anonymous NPM products. Anonymous funding methods may result in no or insufficient paper trails regarding the funding transaction and the origin of the funds.

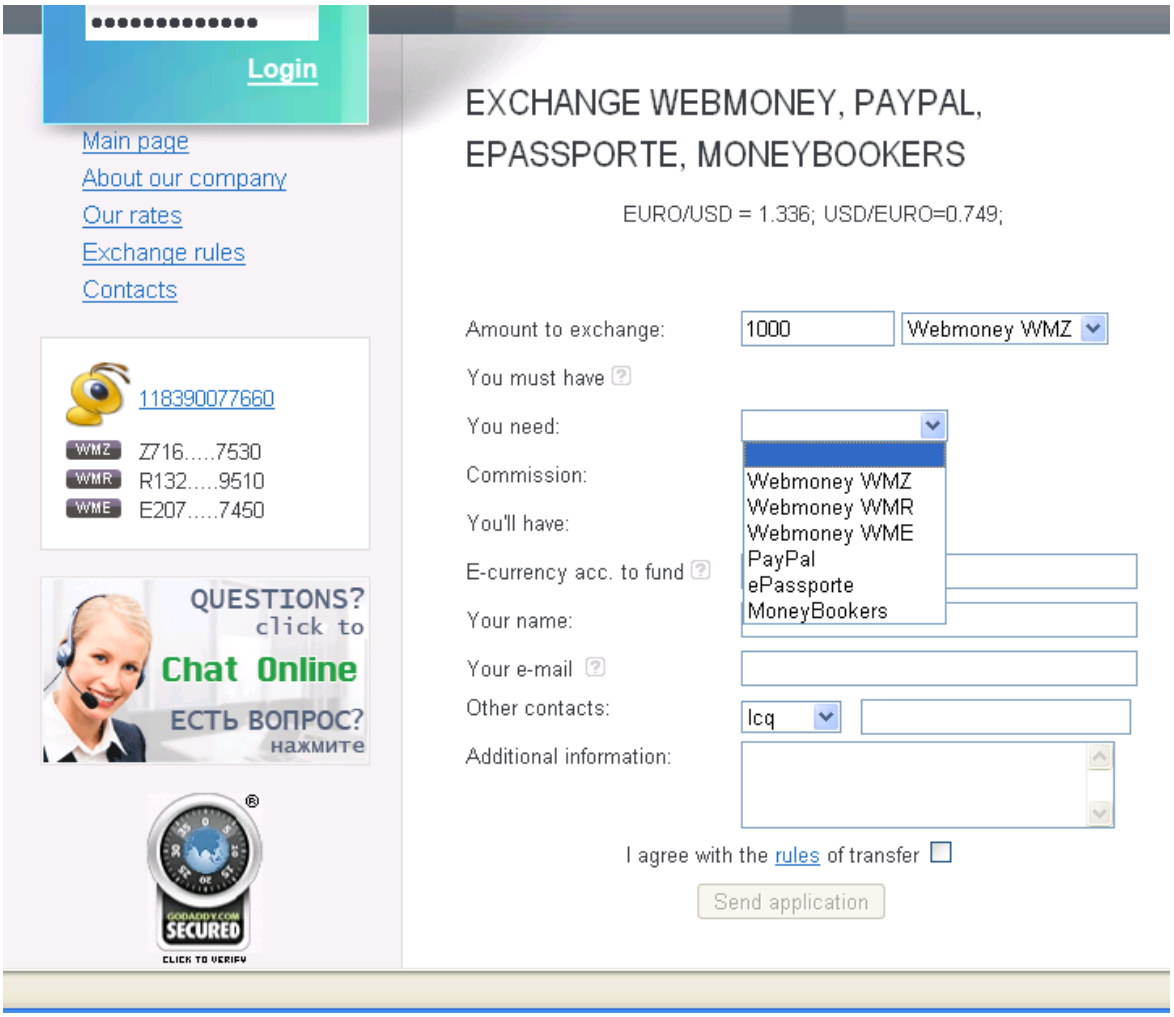
84. Cash funding is especially popular with NPM providers that sell pre-funded products through distribution agents (*e.g.*, prepaid cards and cash vouchers sold by retailers, or mobile prepaid funds sold by phone shops.)[42] Cash funding through distribution agents can increase ML/TF risk, especially where the distributing staff have no CDD obligations and/or no sufficient training in AML/CFT compliance.

85. Other than funding through anonymous sources, the ML/TF risk will increase where the funds can stem from different sources, including third parties. For example, where there is a co-operation with money remittance businesses, these may be used to not only fund the customer's own personal account, but also to fund the account of third persons.

86. As most IPS and mobile payment services are account-based, another possibility of "indirect funding" arises when the service provider allows for person-to-person (p2p) transactions within the system. In such cases the provider's funding restrictions may be circumvented by funding an account in cash through a digital currency exchanger (or other third parties), who will then transfer the funds into the customer´s account.

[42] In under-banked regions where few customers have bank accounts, and where the NPM service (often mobile payment services) is supposed to substitute for the lack of bank accounts, there may be few alternatives to cash funding.

Figure 2. Example of online exchange of currency



Source: Internet screenshot May 2010.

87. As different NPM providers have different funding and withdrawal methods, exchangers enable customers to circumvent these procedures by simply converting the funds into a more suitable provider's currency.

Geographical limits

88. The wider the geographical reach of a NPM product, the higher the ML/TF risk will be. Cross-border functionality renders a service more attractive to launderers; it also enables payment service providers to conduct their business from jurisdictions where they may not be subject to adequate AML regulation and supervision, and where they may be outside the reach of foreign law enforcement investigations.

89. While many payment service providers who offer cross-border services may cooperate well with their domestic supervisors and law enforcement agencies, some providers may refuse to provide information to foreign agencies or may face legal obstacles for doing so. Formal legal assistance requests can be very time-consuming and often have only little chance of success. As a result, some agencies may refrain from requesting legal assistance and close the investigation instead. This

phenomenon is exacerbated if the service is provided by several providers interactively who are located in several different jurisdictions (see "segmentation of services", para. 96 ss.).

90. Open-loop prepaid cards can be used to quickly move cash around the world by using the ATM network to withdraw funds, with no face-to-face transaction required. The global network providers (VISA, MasterCard) can limit the use of prepaid cards to certain jurisdictions or regions, but most open-loop prepaid card business models are designed to function globally. Although the ATM network was not designed to be used as a person-to-person money transmission system, it is now also being marketed as one.

Figure 3. Example of internet transfer

Source: Internet screenshot August 2010.

91. Internet payment services providers can be headquartered or licensed in a jurisdiction different from where the customer is located, and because IPS can use a variety of funds transfer methods, payments can potentially be initiated and received from anywhere in the world. Most IPS providers offer their services globally, thus facilitating cross-border transactions.

92. Most mobile payment service providers were originally designed for domestic transactions only. An increasing number of providers offer the possibility to effect cross-border payments between specific countries, opening so-called payment corridors (*e.g.*, from the UK to Kenya, or Philippines to Malaysia). While there have been attempts to implement multinational business models for mobile payments, currently there still is no truly global mobile payment service provider yet.

93. However, some mobile payment service providers have extended their outreach by connecting with the global ATM network (by providing their customers with prepaid cards) or by cooperating with

global money remittance businesses. Through this, an originally domestic service provider can effectively carry out cross-border transactions into and out of its original jurisdiction.

Usage limits

94. The usage limits for NPM products can differ by product and by service provider. NPM products with limited functionality are exposed to fewer AML/CFT risks than those that allow customers to use the product more widely.

95. Open-loop prepaid cards, especially when they are based on a well established and widespread technical standard (VISA, MasterCard) generally have the least usage limits, as they can rely on an existing extensive infrastructure for payment transactions, including the global ATM network and a very high number of accepting merchants / point-of-sale (POS).

- Negotiability(merchant acceptance)

  Visa and MasterCard branded prepaid cards are accepted by domestic and foreign merchants that are part of VISA or MasterCard's payment networks. As the standards used for prepaid card payments typically are largely identical[43] with those of regular debit or credit card payments, such prepaid cards are accepted as a means of payment almost everywhere where a credit card would be accepted for payment (as long as the prepaid funds are sufficient for the intended payment), including online shops.

  When using IPS and mobile payment services providers, payment transactions can often only be carried out between customers of the same IPS provider. Payments services that are widely accepted will be more attractive to money launderers than those that allow funds to be spent with a limited range of merchants only.

  In some markets, mobile payments services are used exclusively for micropayments (*e.g.*, mass transport tickets, vending machines, and ringtones); the number of accepting merchants is limited. In other markets where mobile payment services may be used as a substitute for bank accounts and wire transfers, the negotiability is often much higher, resulting in greater risk.

- Utility

  In order to carry out a classic prepaid card payment, the receiver/payee needs to have the necessary technical equipment (card reader, online access to system). Therefore, most card payment receivers are businesses (p2b-payments). However, where prepaid cards are designed to receive payments / funds from external sources, or where the cards or specific partner cards can be passed on to third parties or used to fund other NPM accounts, p2p payments are also facilitated.

  Most IPS and mobile payment services feature p2p-payments, but some are designed to facilitate p2b payments for underlying shopping transactions only (*e.g.*, cash vouchers), which generally decreases the ML/TF risk. However, where "merchants"[44] accepting such payments

---

43 There are controls that countries or institutions can apply that prevent cards from being used for certain purchases; or in ATM machines; or that limit the transaction value etc. Because of this, the functionality of prepaid cards can vary and does not necessarily equal that of credit cards.

44 Which is a wider term and encompasses more than the classic online shop.

are being used for financial services provision (*e.g.*, money transmission service accepting these payment methods as a funding method) or criminal purposes (*e.g.*, illicit online gambling providers accepting this payment method), the ML/TF risk remains high.

- Funds withdrawal

  Cash can be withdrawn from many open-loop prepaid cards via the ATM networks. In addition, in several jurisdictions merchant points of sale may be easily used to withdraw cash by overpaying purchased merchandise and receiving the overpaid amount in cash ("cash back").[45] Easy cash access and high negotiability, coupled with the fact that prepaid cards[46] are much easier to transport than bulk cash (an ISO standard financial transaction card can be considerably more compact than currency[47]), may make prepaid cards a convenient substitute for cash in bulk cash smuggling ML schemes,[48] assuming a high account limit and/ or no verification of customer identification.

  Most IPS and mobile payment services providers restrict the possibility of redeeming money in the same way they restrict the funding methods. For example, redemption of funds may be restricted to a transfer of funds into an account held in the customer's name at a credit or financial institution.

  Where cash is used as a method of funding, it is usually also possible to withdraw cash from the mobile payment account, *i.e.*, through agents. This not only increases the ML/TF risk, but may also create additional challenges for the mobile payment service provider. For example, there have been reports about fraudulent agents, or problems with the cash supply for requested withdrawals.

  Providers may facilitate cash payouts through cooperation with money remittance businesses or brick-and-mortar exchangers that will trade electronic funds for cash. Some IPS and mobile payment providers also offer to load the funds onto a prepaid card, thus granting their customers access to cash withdrawal through the worldwide ATM network. One mobile payment provider (in cooperation with a domestically operating bank) even enables access to the cooperating bank´s ATMs without the customer needing to have a bank account or a prepaid card: upon request, the customer is provided with a one-time authorisation code which he (or a third party) can enter into the ATM, together with the customers phone number and the amount he wishes to withdraw.[49]

Segmentation of services

96. NPMs can be more exposed to risks where several parties are involved in performing the payment service jointly, such as card issuers, program managers, exchangers, distributors and other

---

45 This "cash back" method of withdrawing funds has originally been developed for and is commonly applied with regular credit or debit cards.

46 The card often acts as an access device to withdraw the funds and initiate payments.

47 The volume of an ISO standard "financial transaction card" is 3 525.8 cubic millimetres. The volume of a 20 EUR note is 1 435.6 cubic millimetres. The volume of a 20 USD bill is 1 129 cubic millimetres. Thus, a payment card with access to just 100 EUR or 100 USD is already considerably more compact than five 20 EUR notes or five 20 USD bills.

48 See *4.4.1. Cross-border transport prepaid cards.*

49 *Cf.* Finextra (2010).

types of intermediaries or agents. The number of these parties generates potential risks of segmentation and loss of information. This may be exacerbated if important services are outsourced to potentially unregulated third parties without clear lines of accountability and oversight, or which are located abroad. Payment schemes with a high degree of segmentation may raise issues for supervisors in terms of competences, international cooperation, powers and means to supervise and to safeguard them effectively.

97. Providers often use **agents** not only for cash acceptance and cash withdrawals, but also to establish new customer relationships. In most jurisdictions agents who are not credit or financial institutions are not themselves subject to AML/CFT obligations. The legal and regulatory responsibilities for complying with relevant AMLCFT legislation or regulation remain with the NPM provider. This means that the NPM provider will be liable for any failure by the agent to meet the provider´s AML/CFT obligations on its behalf ("agent's risk").[50] The provider therefore has to be satisfied that the agent carries out their function effectively. Given the vast number of agents that some providers have to rely on (*e.g.*, hundreds of branches of a big retailer), this may be difficult – even more so where agents are based in a foreign jurisdiction, or potentially, where the agent makes use of further agents ("sub-agents").[51]

98. Where a provider cooperates with money remittance businesses, these are generally used to accept cash for funding and/or pay out cash for withdrawals. This can to some extent add an additional level of AML/CFT compliance, as in most jurisdictions money service remitters are subject to AML/CFT regulation and supervision themselves. However, the regulatory requirements may be different: for the money service businesses, the customer´s transaction usually being a one-off transaction, whereas for the NPM provider the transaction is part of an ongoing customer relationship. Furthermore, the risk may increase if the cooperating money remittance business is located in a jurisdiction that does not enforce equivalent AML/CFT standards.

99. A special phenomenon of segmentation of services is associated with a certain type of IPS, so-called digital currency providers (DCP), which use "exchangers" as an integral part of the payment transaction chain. DCP do not directly issue their "digital currency" to their customers / account holders, and as a consequence do not receive an equivalent incoming flow of money from their customers. Instead, customers have to purchase their digital currency from exchangers, who will then transfer the purchased amount of digital currency into the customers DCP account. Some exchangers are subsidiaries of DCP, but many are legally independent businesses or natural persons. Exchangers may be brick-and-mortar businesses (*i.e.*, exchanging cash and other traditional payment methods for digital currency and vice versa) or pure online businesses (exchanging electronically transferred money for digital currencies, or exchanging digital currencies for other digital currencies or IPS funds).

3.2 Risk mitigants

100. Like any financial product, the AML/CTF risk associated with NPMs is high in the absence of appropriate safeguards. However, there are effective risk mitigants that can significantly reduce the identified risks.

---

50 The term "agents risk" comes from the FATF paper "*Risk Based Approach: Guidance for Money Service Businesses*", FATF (2009a), pages 32 ss.

51 While this phenomenon of sub-agents has not yet been observed with NPM service providers, it has become apparent in the latest typologies report on money service businesses.

101. The following risk mitigants should not be looked at separately but as a whole; some of them are intertwined or affect more than just one specific risk factor. It is important to look at the whole picture including all risk factors and all risk mitigants in order to effectively assess the risk associated with a particular NPM product.

Identification and verification measures

102. Identification and verification measures allow firms to understand who their customer and, where relevant, the beneficial owner is. This is important in that this information forms the basis for ongoing monitoring of the business relationship. It also allows firms to verify that the customer is who they claim to be, identify whether a customer is associated with multiple accounts (or cards; or cash vouchers), and create a paper trail for law enforcement.

103. For products and services that rely on the internet, the internet protocol address (IP-address) should be part of the identification data collected and retained by the provider. The IP-address can help minimise the potential for a customer to access multiple accounts, even if those are anonymous.

104. Some jurisdictions exempt providers from applying customer due diligence measures where the ML/TF risk is considered very low. Sometimes, these exemptions are conditional on the imposition of low value and transaction thresholds. Some jurisdictions also allow NPM providers to benefit from a one-off transaction exemption from CDD. In those situations, it is important that institutions have systems in place to detect if a customer holds multiple cards or accounts, which can be an indicator for a customer circumventing the CDD procedures by structuring the funds into several "low risk" products.

105. Where verification takes place on a non-face to face basis, it is important that firms employ anti-impersonation fraud checks to be satisfied that their customer is who they claim to be. Anti-impersonation checks include, but are not limited to: correspondence with the customer at their verified home address; requiring the first payment to be carried out through an account in the customer's name with a regulated credit institution from a FATF-equivalent jurisdiction; and requiring copy documents to be certified by an appropriate person.[52] Accompanying anti-fraud checks, such as using dynamic codes which change with each single transaction or access to an IPS, or checking of biometric data (such as fingerprint and voice recognition systems),[53] can add to the AML policies of a provider and help prevent a single customer from opening multiple accounts unnoticed.

106. Where a payment service provider uses third parties to establish customer contact and to accept and pay out cash (*e.g.*, retailers or money remittance businesses), firms can mitigate risk by ensuring that these are appropriately trained and qualified in AML/CFT compliance, preferably subject to regulation and supervision themselves in a jurisdiction with equivalent AML/CFT regulatory standards.

107. Where NPMs can be used for p2p remittances, providers can mitigate risk by ensuring that the recipient of the payment does not remain anonymous and that safeguards are put in place, which are similar to those expected from firms executing wire transfers.

---

52 Basel Committee on Banking Supervision (2001), section 2.2.6; Joint Money Laundering Steering Group Guidance (2010), Part I Chapter V;

53 *Cf.* World Bank (2009b)

Monitoring

108. NPMs are based on computer technology and therefore provide good prerequisites for effective monitoring and reporting procedures. Transactions carried out through NPM services always leave electronic footprints which can be monitored and analysed, even where NPMs benefit from exemptions from customer due diligence (*i.e.*, the customer remains anonymous). This means that providers can block accounts where they detect abnormal transaction patterns or otherwise become suspicious that their product might be abused for ML/TF purposes.

109. Monitoring systems can be a very effective tool to mitigate an NPM product's financial crime risk.

To be effective, such systems must at a minimum allow the provider to identify:

- Discrepancies, for example between submitted customer information and the IP address.
- Unusual or suspicious transactions.
- Cases where the same account is used by multiple users.
- Cases where the same user opens multiple accounts.
- Cases where several products are funded by the same source.

110. Where products benefit from customer due diligence exemptions, systems should detect where a customer approaches a limit (on one product/transaction or cumulatively) beyond which full customer due diligence has to be applied.

111. Effective monitoring systems are also the basis for effective reporting of obligated NPM providers.

Value limits

112. Account balance and transaction limits as well as restrictions in the frequency of transactions may prevent criminals from having continuous access to large amounts of money for illicit purposes. Applying a risk-based approach, value limits can be tailored to reflect the needs and risks attached to each market segment and NPM product. For example, there may be effectively no transaction limits when the service is linked to a fully identified and verified bank or credit card account, but a reduced transaction limit or service where there is a reduced ID requirement.

113. Where NPM providers are subject to AML/CFT regulation and supervision, in application of a risk-based approach their products often do not require the full application of customer verification measures ("simplified CDD" or "reduced CDD"), ranging from reduced normal CDD to total exemptions from the CDD requirements. [54] Value limits are often a decisive factor whether a product can be considered to be of "low risk" and therefore apply for simplified CDD or not.

114. Value and transaction limits can be a very powerful risk mitigant as they render a product less attractive to money launderers, especially when coupled with effective monitoring systems and procedures that prevent multiple purchases of low-value cards or multiple low-value accounts for a

[54] See *5.2, Exemptions from AML obligations.*

single customer. For example, the restrictive value limits implemented by most mobile payment service providers are thought to be one of the main reasons that so few ML case studies involving mobile payments have been detected so far.

115. One of the challenges for applying value limits is to define an appropriate threshold which can be considered low risk. Different jurisdictions and service providers have come to different conclusions as to what thresholds they consider to be "low risk".[55] Furthermore, low transaction amounts that may deter Money launderers might still be attractive for the purpose of terrorist financing, which is generally thought to involve much smaller amounts than ML.

Methods of funding

116. The ML risk associated with anonymous funding methods can be mitigated by restricting funding methods to sources where providers can rely on another institution´s CDD measures, such as previously identified bank accounts, credit or debit cards or other personalised payment methods.[56] While excluding cash or other anonymous sources as a funding method significantly reduces risk, it may not be feasible in such markets where NPM service providers are the only access to the financial system for a good part of the under-banked population (*e.g.*, mobile payment services in jurisdictions with weak banking infrastructure).

117. Issuers with restricted funding methods should be in a position to detect indirect funding through third parties (*e.g.*, exchangers) by attentive monitoring. They can further reduce ML/TF risk by not only restricting the funding method, but also restricting the number of parties allowed to fund the product (*e.g.*, regarding cards: the cardholder alone, or the employer in the case of payroll cards), thus limiting the possibility of third party funding.

---

55 See 5.2, *The definition of low risk cases*, para. 161.

56 This does not constitute reliance as per FATF Recommendation 9, and is unlikely, by itself, to satisfy Recommendation 5´s requirement for using a reliable and independent source to verify a customer´s ID.

CHAPTER 4: TYPOLOGIES AND CASE STUDIES

118. In 2006 when the FATF New Payment Methods report was released, the potential for the misuse of NPMs was already apparent. However, at that time there was little evidence to support this. Since then, both the availability and adoption of NPMs have grown significantly as has evidence of misuse (especially with prepaid cards and IPS), as demonstrated by the following case studies. It should be noted that most case studies concern money laundering and there are only a few isolated cases with suspected links to terrorist financing, even though NPMs have been identified as being vulnerable to terrorist financing.[57]

119. The case studies demonstrate the following typologies: *1)* Third party funding (including strawmen and nominees); *2)* Exploitation of the non-face-to-face nature of many NPM accounts; and *3)* Complicit NPM providers or their employees. The typologies are presented in an order based on whether or not all NPMs, or two of them or at least one NPM has been used in such a way.

120. The project team came to the conclusion that it was not appropriate to present a fourth typology on "anonymity". While many case studies involved taking advantage of the possibility of remaining anonymous, only three cases (***cases 8,10 and 31***) involved NPM products that provided "direct" anonymity, *i.e.*, the product did not require ID/VER at all. Numerous other cases that involved products that may provide "indirect" anonymity, are dispersed over the other three typologies identified (*e.g.*, strawmen, stolen or fake customer data or online data manipulation). "Anonymity" as such may be a general and overarching issue with NPMs, but it is too vague to construct a separate typology.

4.1 Typology 1: Third party funding (including straw men and nominees)

121. NPM accounts can be funded anonymously where the specific business model permits.

122. Prepaid cards can be funded by cash, bank transfers, and person-to-person (p2p) transfers. Customers of most IPS providers can also conduct p2p transfers. These funding methods may allow complicit third parties to fund the prepaid cards or the IPS accounts willingly (*e.g.*, by paying for the sale of illicit merchandise or for gambling, refer to ***cases 1-3, 6***),[58] or may be used by fraudsters to get funds from unwilling victims of their illegal activities. In such cases the distinction between the predicate offence and the subsequent placement phase of money laundering may be difficult. Nine case studies illustrate how prepaid cards and IPS accounts can be funded through third parties for the purpose of money laundering.

123. Similar to IPS providers and prepaid cards, mobile payment services allow third-party funding which can be exploited by criminals. In three cases, criminals used the p2p payment feature of a mobile payment service provider to fund their accounts. In all cases, the third parties were defrauded or tricked

---

57 UN Counter-Terrorism Implementation Task Force (2009), p. 14; also confer World Bank (2009b).

58 EUROJUST has also indicated that NPM are often used to buy or sell child obscenity/child pornography images online to avoid attention from public authorities. Presently the EFC (European Financial Coalition against the Commercial Sexual Exploitation of Children Online) is in contact with a certain number of such NPM providers.

into sending money to the criminals, making the use of the mobile payment service provider also part of the predicate offence. It should be noted that the amounts involved in these cases were small.

124. There is also evidence that even robust identification and verification requirements can be circumvented by the use of third parties such as straw men or financial agents/financial mules.

a. Prepaid Cards:

Case 1: Laundering of proceeds gained through illegal online steroid sales

In 2007, there were three cases with a total of seven defendants who were charged with selling athletic performance enhancing drugs, such as human growth hormone and anabolic steroids, illegally online and laundering the proceeds. All three cases involved loading the defendants' prepaid cards as an optional payment method for completing the online sale of the illegal substances. In one case, the defendant earned USD 60 000 in 11 months from his online steroid business. In another case, the defendant laundered about USD 125 000 in 21 months using prepaid cards. All three cases were resolved with guilty pleas. Defendants received prison sentences.

Source: United States.

Case 2: Laundering of illegal gambling proceeds through prepaid cards

In 2007, a number of defendants were charged with facilitating illegal gambling. The organisation involved onshore agents in the United States who recruited gamblers, collected losses, and distributed winnings, and an offshore organisation that operated an Internet site that processed bets and set odds.

Among the methods used to transfer the illicit gambling proceeds between the onshore agents and offshore organisers was to open and load U.S. prepaid card accounts and then send the card information (card number, expiration date and card verification value) to the website operators. The cards themselves were not sent out of the country. Instead, the offshore organisers would use the card accounts to make online or phone-based purchases. The online gambling operation earned about USD 100 000 a month.

Six defendants pleaded guilty to illegal gambling and were sentenced to three years probation. One defendant pleaded guilty to illegal gambling and money laundering and was sentenced to three years probation and six months home confinement. One defendant pleaded guilty to conspiracy and was sentenced to four years probation. One defendant pleaded guilty to bulk cash smuggling and was sentenced to four months imprisonment and three years probation.

Source: United States.

Case 3: Payment for drugs using prepaid cards

In 2009, a number of defendants were charged with running a drug trafficking ring in a federal prison and receiving payment outside the prison through prepaid cards. Gang members outside the prison allegedly established prepaid card accounts in the name of the defendants, who allegedly instructed their customers — their fellow prisoners — to pay for the drugs by having family members outside the prison deposit payments into the defendants' prepaid card accounts. The defendants have not yet gone to trial.

Source: United States.

Case 4: Possible use of prepaid cards for terrorist financing purposes

In a particular case, a father and his son, suspected to be operating as money remitters, held numerous prepaid cards which were charged daily from all over Italy. Shortly after, the sums were withdrawn so as the cards accounts' balances were almost always near to zero. A portion of the sums withdrawn from the prepaid cards was transferred to a bank account held by the father; funds were also credited to the same bank account from Pakistanis. The funds on the account were further used to order credit transfers. Both persons were found to be involved in the terrorist attacks which occurred in Mumbai in 2008.

Source: Italy.

Case 5: Prepaid cards used to launder drug proceeds

Following the dissemination of Suspicious Transaction Reports (SUSTRs) received by AUSTRAC to a law enforcement agency, an AUSTRAC alert was raised on a suspect and his associate. The information related to a student who on a number of occasions loaded structured amounts of AUD 9 900 to avoid reporting thresholds onto prepaid debit cards in his own name and that of his associate (i.e., conducting third-party loading transactions). The suspect had previously come to the notice of law enforcement agencies in relation to a cocaine seizure which he was alleged to have organised. Following further research and intelligence gathering a joint operation commenced involving multiple law enforcement agencies.

A further 15 SUSTRs were recorded on the AUSTRAC database, showing both the suspect and his associate conducting deposits of structured amounts onto prepaid debit cards. AUSTRAC information detected a further series of financial transactions linked to both targets. An assessment of AUSTRAC information was disseminated to the law enforcement agencies and assisted the investigation, resulting in the arrest of both targets. The associate departed Australia for South America and returned to Australia from another South American destination 12 days later with approximately 5.8 kilograms of cocaine in his baggage. He later admitted that he had previously brought drugs into Australia on two occasions for a payment of AUD 28 000 each time. He was arrested and charged with importing and possessing a prohibited import. The suspect was also charged with conspiracy to bring into Australia approximately 5.8 kilograms of cocaine, structuring and money laundering of almost AUD 400 000. He was found guilty and sentenced to seven years imprisonment.

b. Internet Payment Services:

Case 6: Use of IPS to move illicit proceeds gained through the sale of forbidden racist propaganda

In at least two proceedings regarding the illegal distribution of right wing propaganda music CDs, an IPS provider played a decisive role.

The service was used to effect the transfer of funds (purchase prices) to natural persons in Germany and abroad, involving buyers, retailers and most likely also wholesale dealers and producers (as can be concluded from the high amounts of some transactions) of racist propaganda material.

Distributing such material constitutes a criminal offence under German criminal law.

Source: Germany.

Case 7: Use of an IPS to move illicit proceeds gained through the sale of stolen goods on a commercial website

In 2004, an individual was charged with possession of stolen goods and benefiting from proceeds of crime. Over a three year period, the individual stole goods, bought stolen goods, and then sold them on a commercial website. The proceeds passed through an IPS account attached to his commercial website user accounts. The individual sold over 9 000 items including DVDs, computer hardware and software, and Nintendo Gameboys, for a total of over USD 459 000. Local law enforcement found CAD 188 000 in savings bonds that had been purchased with a portion of the proceeds. The individual was sentenced to two years in jail and fined CAD 83 000.

Source: Canada.

Case 8: Use of cash vouchers to collect extortion money

An unknown criminal sent an extortionate letter to a food discounter in Germany and demanded EUR 250 000 in cash vouchers issued by an IPS provider situated in the UK. The IPS provider ensured that the cash vouchers were supplied in the form requested. The provider was able to monitor the voucher numbers in the computer system and reported the point of sale where one of the vouchers was used to the police. The money was not paid out because the criminal was already arrested in an Internet cafe after observation by the police in Germany.

Source: Germany

Case 9: Suspected laundering of illicit proceeds gained through the possible online sale of counterfeit goods

An individual, working in France for a foreign company, had an account with an IPS provider and a bank account in France. The foreign company suspected to be involved in the scheme also held a bank account in France.

The account of the individual was credited for 138 operations and an amount of EUR 357 245. Among those, 44 operations were credited via the IPS provider – for more than EUR 300 000. Those latest operations seemed to come from sales made on a commercial website. Shortly after, nearly all of the money was transferred to the foreign company account in France.

The individual was suspected to be a strawman possibly used by the company to open an IPS account since companies cannot open accounts with IPS providers in France. Besides, the individual was known by the French customs for being involved in counterfeiting. This individual was found to have sold 18 650 articles over a period of five years.

Source: France.

Case 10: Laundering of illicit proceeds through cash vouchers

In 2010, several cases of the following pattern were reported to the German FIU. The average amount of the laundered proceeds of crime ranged from EUR 4 500-6 000. Transaction numbers were initially "phished" by Trojans from a bank account held in Germany. The "phishing transfer" was made to a bank account held by the financial agent.

The financial agent withdrew the money – deducting his commission – in cash. He subsequently purchased cash vouchers (max. EUR 500 per voucher) of an IPS provider at various issuing offices, like petrol stations, newspaper kiosks. The purchase was anonymous without identification of the buyer. The financial agent (*i.e.,* third party) sent the voucher number or a scanned copy of the voucher by e-mail to the person giving instructions. The PIN code was used on the Internet for payment of goods and services and for gambling websites on the Internet.

The law enforcement authorities were unable to trace the transaction channels.

It should be noted that, in such a case, several vouchers for smaller amounts –also if purchased at different locations- can be used jointly and combined. A conversion to other digital currencies by using various exchangers acting on the Internet is also possible.

Source: Germany.

Case 11: Use of digital currency account to facilitate Internet fraud and money laundering

A young person, acting as a nominee, opened a digital currency account to enable him to receive the proceeds of Internet banking thefts from an offshore associate. He then attempted to redeem the value of the digital currency account by requesting the digital currency exchanger to provide him with postal money orders. In an effort to conceal his identity he informed the cash dealer that he had lost his passport and requested that the exchanger call a money service business and inform them that a person matching his description would present himself to collect the money orders at a particular time. It is believed that he was not going to send money offshore but would keep the proceeds for himself. He has been arrested and prosecuted.

Source: Australia.

Case 12: IPS providers and nominees used to purchase illegal substances and launder proceeds from their sales

A law enforcement investigation targeting smugglers of steroids, growth hormones and other illegal performance enhancing drugs identified a number of targets involved in importation and distribution, operating throughout Australia. The traffickers within Australia were found to be sending funds overseas totalling several hundred thousand dollars to purchase the illicit substances. Additionally, they were found to be receiving several thousand dollars each week in revenue from the sale of the illicit substances.

The traffickers used legitimately issued identities, obtained in false names, to open multiple post office boxes to receive the drugs. Internet chat rooms and forums were used for networking and for online ordering. Individuals used IPS providers and money remittance services in Australia to make payments which were mainly under AUD 1 000.

Overseas suppliers were aware of prohibited imports into Australia and intentionally provided false descriptions of the goods to circumvent controls. The traffickers enlisted friends and spouses to make payments on their behalf and chose different branches from which to make payments. They would also regularly change names and purposely misspell names and addresses. The full addresses of the overseas beneficiaries were never reported, only the region.

Law enforcement executed over 140 warrants across Australia throughout this operation.

Source: Australia.

c. Mobile Payment Services:

Case 13: Suspected use of mobile payments to move funds related to fraud

A victim was fooled into believing that the spouse was involved in an accident and the victim was asked to send money using a mobile payment provider to pay doctor's or hospital's bill.

Source: Philippines.

Case 14: Suspected use of mobile payments to move funds associated to telemarketing fraud

SMS messages were sent to victims claiming that they had won an electronic raffle. To claim their prize, they were asked to send money using a mobile payment provider to pay for taxes related to prizes.

Source: Philippines.

Case 15: Selling stolen phone credits through mobile P2P payments

In April 2010, an individual was sentenced in Cayman Islands for using stolen credit card information to illegally obtain phone credits which he then sold through the mobile P2P payment services. Although the amount of money was small, the individual was charged for money laundering activity under the Proceeds of Crime Law of Cayman Islands.

Source: Cayman Islands Attorney General´s Office.

4.2 Typology 2: Exploitation of the non-face-to-face nature of NPM accounts

125. Many NPMs rely on a business model where face to face customer contact is minimal or nonexistent. This can facilitate abuse by criminals for money laundering purposes.

126. In a number of cases NPM products were used to launder illicit proceeds gained from fraud following identity theft or from stealing money from bank accounts or credit/debit cards using computer hacking or phishing methods. Since the bank accounts or credit and debit cards were held in the names of legitimate customers, the criminals were able to use them as reference accounts for the funding of prepaid cards or IPS accounts. In such instances, the NPM providers could not detect that the transactions were actually not initiated by their legitimate customer, or detect any other suspicious activity.

127. In other cases, stolen or fake identities were used to create NPM accounts which were also used as transit accounts in the laundering of illegal proceeds, or to commit both criminal activities (*e.g.*, fraud) and money laundering at the same time.

128. The prepaid card or IPS account appeared to be mainly used as transit accounts in most cases. Once the illicit funds had been transferred to those accounts, criminals or their associates withdrew them at ATMs or spent the funds for purchases of goods (often on the Internet).

129. Although in many of the case studies presented below, the IPS or prepaid card provider could not have detected suspicious activity, some shortcomings in some providers´ identification and verification processes and monitoring systems is likely to have contributed to the illegal activity going undetected for some time. For example, in Case 27, although individual bank transfers appeared legitimate, the use of four reference bank accounts in different cities for the same IPS account should have raised suspicion with the IPS provider.

a. Prepaid Cards:

Case 16: Laundering of proceeds stolen from individuals' bank accounts

In 2007, six defendants were prosecuted for using stolen information to transfer money illegally from bank accounts to accounts controlled by the defendants, including prepaid cards. The defendants used a freely available software program to scan the Internet for vulnerable personal and commercial computers holding financial account information. The defendants then initiated fraudulent transactions to transfer funds from the victims' accounts to accounts created in the names of front companies. A portion of the illicit proceeds in the front company accounts was used to load prepaid cards which the defendants used to make purchases. The defendants were accused of laundering about USD 166 000 in eight months. The six defendants each pleaded guilty to conspiracy charges and were sentenced to from 3 to 36 months in prison.

Source: United States.

Case 17: Laundering of proceeds stolen from a company's payroll accounts

Two defendants were charged in 2009 with illegally accessing business computer systems via the Internet and fraudulently transferring funds from the victims' bank accounts to prepaid cards. The defendants allegedly used stolen account logins and passwords to access victims' online personnel management accounts, which, among other things, allowed users to establish direct deposit of employee wages. The defendants allegedly directed employee wage payments to the hackers' prepaid card accounts. Over a period of 11 months, the defendants allegedly transferred USD 19 967.43 in illegally obtained funds. The defendants have not yet been tried.

Source: United States.

Case 18: Laundering of phishing activity proceeds through prepaid cards

In this case, prepaid cards are used as transit accounts where criminals sent funds from bank accounts after identity theft of the accounts' holders. The phisher pretended to be the bank account holder and sent funds to the prepaid card that was issued in the name of a strawman. After the funds were transferred to the card, a corresponding amount of cash was withdrawn at ATMs.

Additional typology: Use of strawman.

Source: Italy.

Case 19: Laundering of counterfeiting and fraud proceeds through open-loop prepaid cards

Within a few months, the accounts of Mr. POL and company BE were credited by international transfers for some 500 000 EUR from a Swiss company acting as an agent and trader in securities. These funds were used to load prepaid cards. In most cases, these cards were loaded with EUR 5 000 (maximum limit). Mr. POL claimed to have loaded these prepaid cards because he had given them to his staff for professional expenses. As soon as the money was loaded on the cards, the card holder quickly withdrew the money by repeatedly withdrawing cash from ATM machines.

Mr. POL was the subject of a judicial investigation regarding counterfeiting and fraud. Given the police information on Mr. POL, the funds from Switzerland may have been of illegal origin and linked to the fraud and counterfeiting for which Mr. POL was known. This hypothesis was confirmed by the ingenious scheme (international transfers, prepaid cards and cash withdrawals) used to repatriate funds to Belgium.

Source: Belgium.

Case 20: Use of "ghost employees" to launder illicit funds through prepaid cards

In 2009, a defendant was charged with embezzling from his employer and laundering the stolen funds through prepaid payroll cards. The defendant, a manager with a janitorial service, interviewed job applicants for the purpose of stealing their personal information which he used to create fake employment positions which came with prepaid payroll cards. The defendant kept the payroll cards, using them to withdraw money from ATMs and purchase goods. In three years, the defendant laundered about USD 200 000. The defendant has not yet been tried.

Source: United States.

Case 21: Credit card fraud and money laundering

In 2006, two defendants were prosecuted for using 61 stolen credit card account numbers to fund "virtual prepaid cards," which provide an account number, expiration date, and card verification value, but no physical card for consumer non-face-to-face transactions. The defendants then used these "virtual cards" to overpay their tuition at a university in the United States. The university issued a check for USD 31 045, the amount of the over-payment, thus helping the defendants to launder their illicit proceeds. One defendant pleaded guilty to wire fraud and was sentenced to 38 months imprisonment and five years supervised release. The other defendant was convicted of making a false statement in a loan application, money laundering, mail fraud, aggravated identity theft and possession of unauthorised access devices. He was sentenced to 61 months imprisonment and five years supervised release.

Source: United States.

Case 22: Laundering of proceeds gained through ID theft

In 2006, a defendant who managed a prepaid card program was prosecuted for using his prepaid card program to launder illicit proceeds for identity thieves. The identity thieves created 21 card accounts with stolen identity information, and loaded the cards with approximately USD 1 million stolen from victims' bank accounts. The bank account information had been stolen from user accounts of one IPS provider. The identity thieves withdrew funds from the prepaid card accounts at ATMs in Russia. The defendant pleaded guilty to money laundering charges and was sentenced to 120 months imprisonment.

Additional typology: Complicit NPM provider or program manager.

Source: United States.

Case 23: Fraud and money laundering

In 2007, three defendants were prosecuted for illegally accessing a payment processor and initiating fraudulent transactions resulting in approximately USD 700 000 being credited to 80 prepaid cards. The defendants allegedly operated from a hotel room using a laptop computer, a payment card encoder, and the phone line to access a commercial payment processor, misrepresenting themselves as businesses entering refund transactions, and using the card encoder to transfer the value of the fraudulent refunds to their prepaid cards. The defendants withdrew approximately USD 200 000 a day of the value loaded onto the prepaid cards at nearby ATMs and by purchasing Postal money orders. The principal defendant was convicted, but has appealed the conviction. Two other defendants plead guilty.

Source: United States.

Case 24: Fraud and money laundering

In 2009, three defendants were charged with stealing USD 5 million by hacking into a prepaid card company's database, stealing card information and manipulating account balances and transaction limits. The defendants allegedly used the card information to create duplicate prepaid cards and used them to withdraw money from ATMs throughout the world. In one month the defendants withdrew USD 750 000. Two defendants pleaded guilty to conspiracy, money laundering, bank fraud and counterfeit access device product but have not yet been sentenced. A third defendant pleaded guilty to conspiracy and access device fraud charges but has not yet been sentenced.

Source: United States.

b. Internet Payment Services

Case 25: Laundering of illicit proceeds through a digital currency provider

In 2009, the suspect illegally accessed individuals' Internet banking accounts and instructed the computer system to remit about JPY 740 000 (USD 8 300) to a digital currency exchanger to get e-currency units. Then, the suspect sold off a portion of the e-currency units to another digital currency exchanger to get real money. Finally the suspect made the digital currency exchanger deposit the money into some bank accounts that were acquired illegally and controlled by him.

Source: Japan.

Case 26: Fraud scheme and money laundering conducted through Internet payment services

An individual devised a scheme to defraud users seeking to purchase textbooks on a commercial website. The individual created approximately 384 phony bank accounts which were opened at a bank in Jurisdiction Z, for non-existent employees who he indicated to the bank, would sell college textbooks. The individual then used the bank account information to open approximately 568 seller accounts with the commercial website using P2P online payment services (i.e., an IPS provider).

The defrauder advertised the college textbooks for sale on all of the phony commercial website seller accounts he had created. Buyers, believing they were purchasing books from the commercial website sent over USD 5.3 million in payment to the seller accounts, using the IPS provider.

The defrauder subsequently transmitted the illicit proceeds from the IPS provider seller accounts to several Singapore-based bank accounts.

The law enforcement agency from Jurisdiction Z contacted Singapore's law enforcement agency, who then responded quickly to seize the tainted funds. With the close cooperation between the law enforcement agencies, the seized funds were successfully repatriated to the victims. The defrauder was also charged for wire fraud in Jurisdiction Z.

Source: Singapore.

Case 27: Funds stolen from bank accounts laundered through IPS accounts

A computer criminal stole the victim´s personal data for online banking (including customer and account data) then opened a fraudulent account with an IPS provider under the name of the victim. The personal data provided in the opening of the account (phone number, home address, date of birth etc.) were fake. The email addresses given were issued by so-called "free providers" that do not conduct any identification or verification of their customers themselves.

The criminal named a reference bank account for funding the fraudulent IPS account. This reference account was the victim's.

Then the criminal effected a fraudulent transaction from the victim´s reference bank account to the fraudulent IPS provider account. As the funds came from the referenced bank account, the transaction appeared legitimate to the IPS monitoring system. The received funds were transferred to other accounts held with the IPS. The law enforcement authorities were neither able to trace the money flows nor find out the criminals´ identity.

The criminal repeated this scheme with several victims, but always using the same IPS account. Thus, he changed the reference bank account for this IPS account four times in two months; the four named reference bank accounts were held with different banks in different cities.

Source: Germany.

4.3 Typology 3: Complicit NPM providers or their employees

130. A number of submitted cases feature prepaid card and IPS providers or their employees, which are controlled by criminals and wilfully or recklessly assisting money laundering and terrorist financing activities. In such cases, market entry restrictions such as fit and proper tests have failed or are not applicable to the respective entity under that jurisdiction.

131. In some instances (case studies #28, #30 and #31), both IPS and prepaid card providers were suspected to be complicit and colluding in facilitating the laundering of illicit proceeds.

a. Prepaid Cards

Case 28: Suspected use of open-loop cards & online payment systems to launder drug proceeds

This case was generated following the receipt of information from a foreign FIU which indicated that a number of individuals were charged for laundering millions of drug proceeds through a company providing open-loop prepaid cards in Country A. The funds were suspected to be loaded on prepaid cards and moved, for example, from Country A to South America, that is, back to the drug traffickers. Other criminal activities were also suspected to be the source of the illicit funds.

Two of the individuals, associated to the prepaid card company, were found to have addresses in both Country A and Canada, and had opened bank accounts and established at least one company in Canada.

The prepaid card company was located in Country A, but held many accounts in that country and in Canada. The bank accounts in Country A and in Canada were used to receive funds from various individuals and entities located in a number of different countries in Central America, Europe, Caribbean, Africa, Asia, South Asia as well as in Country A and Canada.

It was further revealed that two Canadian Internet Payment System providers (IPS) sent funds to the same prepaid card company in Country A. Based on available information, it appeared that both IPS offered a prepaid card service to their clients, which was provided by the prepaid card company in Country A.

One of the Canadian IPS was the subject of another case in which it was suspected of facilitating the laundering of Ponzi scheme proceeds.

Suspicious transactions included third-party cash deposits and international electronic funds transfers (EFTs). Most of the funds received in the Canadian accounts were transferred back to the accounts held in Country A by the prepaid card company and two other associated companies also located in Country A.

Additional typology: Third party funding

Source: Canada.

Case 29: Embezzlement activities and money laundering

In 2007, a defendant was prosecuted for embezzling more than USD 375 000 from his employer, a national chain convenience store, by fraudulently loading the proceeds onto prepaid cards. The defendant allegedly processed routine transactions that involved adding value to prepaid card accounts which appeared to be held by actual customers, but did not take in funds to cover the transactions. Although these transactions were processed by the prepaid card company, the defendant allegedly ensured that the transactions were not being recorded internally to avoid the detection of his embezzlement.

Source: United States.

b. Internet Payment Services

Case 30: Suspected use of IPS (including digital precious metals) and open-loop prepaid cards to launder proceeds of fraud schemes

This case was initiated following the receipt of information from law enforcement and a foreign financial intelligence unit (FIU) which indicated that a Canadian IPS provider, its subsidiary in the United States and other associated entities were suspected of laundering illicit proceeds derived from pyramid schemes (Ponzi schemes) and telemarketing fraud schemes.

It was revealed that the Canadian IPS also had subsidiaries in a European and an Asian country. In addition, it was found that at least five digital currency exchangers (located in Canada, the United States and a Northern European country), two digital precious metals providers (United States), three open-loop prepaid cards providers (in Canada and the United States) were knowingly or unknowingly used in this complex money laundering scheme. One of the prepaid card providers was found to have offered its product for the use of a virtual world´s gamers who could fund their virtual world accounts and withdraw their virtual currencies into real currencies directly at ATMs.

Generally, funds sent from foreign countries to Canadian bank accounts held by the Canadian IPS and prepaid cards providers were either used to load prepaid cards or to settle accounts* with other IPS or prepaid card providers located in other countries. In some instances, suspicious funds entered the financial system in Canada and appeared to be then layered through other countries, sometimes coming back to Canada.

Suspicious transactions included large deposits of cash and bank drafts often followed by international electronic funds transfers (EFTs) and the layering of illicit funds through EFTs sent between various bank accounts.

Source: Canada.

* In most instances, the reporting of these transactions were provided by financial institutions and involved the transfer of funds between the pooled bank accounts held by the IPS and prepaid card providers. Information about clients of the IPS and prepaid card providers were not available.

Case 31: Laundering of illicit funds through digital currency and prepaid cards

Within the scope of an investigation, an international group of offenders transferred illegally- obtained money through a financial service provider to Eastern European countries, where it was withdrawn by members of the group and converted to electronic currency through digital currency exchangers.

The digital currency was then transferred to accounts held by offenders with a financial service provider handling electronic currency in the countries involved. In co-operation with a bank located in an offshore region this financial service provider issued MasterCard "Cirrus-cards" (prepaid cards), which were acquired anonymously and loaded with electronic currency. The cards could be used worldwide in payment transactions at points-of-sale (POS) and cash dispensers which accept "Cirrus".

In this way, the flow of illegally obtained money was effectively concealed, and the offenders were able to access the secure illicit money promptly and anonymously.

Source: Germany.

Case 32: Laundering of illegal online gambling through an IPS

In 2007, an Internet payment business based in the Isle of Man and publicly traded on the Alternative Investment Market ("AIM") of the London Stock Exchange — admitted to criminal wrongdoing and agreed to forfeit USD 136 million in criminal proceeds as part of an agreement to defer prosecution.

The IPS business participated in a conspiracy to promote illegal (according to U.S. legislation) Internet gambling businesses and to operate an unlicensed money transmitting business.

Source: United States.

Case 33: Money laundering through a digital precious metals provider

In 2008, an Internet-based digital currency business, and its three principal directors and owners, pleaded guilty to criminal charges relating to money laundering and the operation of an illegal money transmitting business.

Several characteristics of the digital currency business operation made it attractive to users engaged in criminal activity, such as not requiring users to provide their true identity, or any specific identity. The digital currency business operation continued to allow accounts to be opened without verification of user identity, despite knowing that the business was being used for criminal activity, including child exploitation, investment scams, credit card fraud, money laundering and identity theft. In addition, the digital currency business assigned employees with no prior relevant experience to monitor hundreds of thousands of accounts for criminal activity. They also participated in designing a system that expressly encouraged users whose criminal activity had been discovered to transfer their criminal proceeds among other accounts of said digital currency business. Unlike other IPS providers, the digital currency business operation did not include any statement in its user agreement prohibiting the use of its services for criminal activity.

Source: United States.

4.4 Cross-border transport of prepaid cards

132. The 2006 FATF report featured another perceived risk / typology for the abuse of prepaid cards, namely the replacement of illicit cross-border movement of cash with the cross-border transport of prepaid cards. The best example to illustrate this does not involve open-loop prepaid cards, but traditional bank-issued debit cards. In 2007 in the United States, two defendants were charged with money laundering in connection with the transfer of drug profits to Colombia via the ATM network. The defendants allegedly instructed family members, friends and others to establish 380 bank accounts in six states. The defendant then made deposits between USD 500 and USD 1 500, allegedly depositing more than USD 100 000 in 112 bank accounts in a single day. For each account, the account holder obtained two ATM cards. The defendants kept one ATM card and mailed the other to Colombia where the funds were withdrawn via ATMs.

133. There are similar cases involving the cross-border movement of closed-loop payment cards as well as a few instances involving the cross-border movement of open-loop prepaid cards. For example:

- Prepaid cards were sent from the US to Canada with no balance, and a limit of USD 1 000. Although the cards were sent to Canada they were redeemable only in the United States. These cards were suspected to have been fraudulently purchased with cloned credit cards.

- In another instance, prepaid cards were sent from South America to Canada. These cards were sent to one individual, but were in the name of a number of other individuals. The issuer of the cards had surfaced in another investigation in the past. The individual to whom the cards were sent had also surfaced in the past and been of interest to European and American law enforcement authorities. As a result of the investigation, the cards were cancelled as the bank did not wish to tarnish its reputation.

- In Australia, the holder of a prepaid card was found to have regularly loaded value by paying cash just below the AUD 10 000 reportable threshold. A second card linked to the same account was sent overseas where the funds were withdrawn through ATMs. The process was repeated, with more than AUD 100 000 laundered through the scheme.

- An Australian investigation identified an individual as the holder of 12 legitimately issued driver's licences under fictional identities, as well as one licence issued under his real identity. In addition, the individual was identified as being in possession of numerous false identity documents and foreign passports. When the individual was detained by law enforcement officers he was found to be carrying approximately AUD 140 000 in cash generated by criminal activities and 46 prepaid cards. A search warrant at a storage unit rented in his name located further prepaid cards and gift cards. It was alleged the money was being taken to India for the purposes of money laundering. It appears that the individual purchased these cards, which are available over the counter at post offices and service stations in values of AUD 50 and AUD 100. Markings on some of the cards indicated they were valued at AUD 500, which suggested that they were purchased online.

134. While the first two aforementioned examples raise concerns about potential misuse of prepaid cards for money laundering purposes, they could not clearly be linked to money laundering or terrorist financing. However, the last two examples have been linked to money laundering and the fourth one also demonstrates how anonymous prepaid cards can be used in such criminal schemes.

135. Two of the case studies submitted (***cases 22 and 28***) also imply that cross-border movement of prepaid cards was involved, as the funds were withdrawn from the card in a jurisdiction different from

where they had been loaded. However, there are no additional details that would confirm that assumption (*e.g.*, detecting or confiscation of cards due to cross-border controls).

136. Based on the above, it appears that since 2006, a limited number of cases involving cross-border transport of prepaid cards have started to emerge. However, given the small number of examples available to date, the project team believed that it may be premature to combine these cases under one typology on its own. The lack of examples can be explained by the fact that prepaid cards are neither considered currency nor bearer negotiable instruments in the sense of FATF Special Recommendation IX in most jurisdictions. Accordingly there is no obligation to make a declaration when crossing borders. It is also very difficult for customs officers to easily differentiate prepaid cards from regular credit cards given that both share very similar physical attributes.

4.5 Red Flags

137. The analysis of the case studies identified red flags which are relevant to all NPM products and services. In addition, a small number of red flags appear to be associated predominantly with suspected complicit prepaid card providers. A few case studies are referred to as examples of the red flags and do not constitute the complete list of cases associated with each of the red flags.

138. Red flags will be indicators of suspicious activity where a product's actual use deviates from its intended use or does not make economic sense. For example, cash withdrawals in foreign jurisdictions will be expected where the product is a prepaid traveller card, but unusual where the product is marketed to minors. Red flags should therefore not be applied unthinkingly, but tailored to the product's characteristics.

All NPMs:

- Discrepancies between the information submitted by the customer and information detected by monitoring systems (***case 19***).
- Individuals who hold an unusual volume of NPM accounts with the same provider (***cases 21 and 23***).
- A large and diverse source of funds (*i.e.*, bank transfers, credit card and cash funding from different locations) used to fund the same NPM account(s) (***cases 6, 7, 16 and 17***).
- Multiple reference bank accounts from banks located in various cities used to fund the same NPM account (***case 27***).
- Loading or funding of account always done by third parties (***cases 1 and 3***).
- Numerous cash loading, just under the reporting threshold of USD 10 000 (*i.e.*, structured loading of prepaid cards), of the same prepaid card(s), conducted by the same individual(s) on a number of occasions (***case 5***)
- Multiple third party funding activities of a NPM account, followed by the immediate transfer of funds to unrelated bank account(s) (***cases 9 and 26***).
- Multiple loading or funding of the same accounts, followed by ATM withdrawals shortly afterwards, over a short period of time (***cases 18 and 19***).

- Multiple withdrawals conducted at different ATMs (sometimes located in various countries different from jurisdiction where NPM account was funded) (***cases 4 and 24***).

- NPM account only used for withdrawals, and not for POS or online purchases (***cases 18 and 19***).

- Atypical use of the payment product (including unexpected and frequent cross-border access or transactions) (***cases 2 and 24***).

Specific to suspected complicit prepaid card providers:

- Large number of bank accounts held by the same prepaid card company (sometimes in different countries) apparently used as flow-through accounts (may be indicative of layering activity) (***case 28***).

- Prepaid card company located in one country but holding accounts in other countries (unexplained business rationale which could be suspicious) (***case 28***).

- Back and forth movement of funds between bank accounts held by different prepaid cards companies located in different countries (may be indicative of layering activity as it does not fit the business model) (***case 30***).

- The volume and frequency of cash transactions (sometimes structured below reporting threshold) conducted by the owner of a prepaid card company do not make economic sense (***case 30***).

CHAPTER 5: LEGAL ISSUES RELATED TO NPMS

139. This chapter addresses how the provision of NPMs is regulated in different jurisdictions.[59] **Section 5.1** introduces different regulatory approaches that are currently being applied to NPMs. **Section 5.2** deals with specific challenges for regulators, law enforcement and supervisors.

5.1 Regulatory models applied to NPMs

140. The FATF Recommendations require all entities or persons conducting certain activities to be subject to AML/CTF obligations and oversight. These include entities or persons transferring money or value, or issuing and managing means of payment.[60] Most NPM providers are therefore financial institutions and should be regulated and supervised in line with Recommendation 23 or Special Recommendation VI.

141. In NPM business models with a strong segmentation of services, *i.e.*, with several entities carrying out the financial activity jointly, it can be difficult to judge whether the respective contribution of one single entity in the chain is sufficient to designate it as a financial institution (and consequently subject it to regulation and supervision). Examples for this are the business models of digital currency providers,[61] but also the use of agents.[62] In both examples, different views are taken on whether these activities should be regulated and supervised or not.

142. Analysis of the questionnaire responses for this project showed that there are three different approaches to regulating New Payment Methods. In some jurisdictions NPM providers are not subject to AML/CFT regulation at all, or only certain types of NPMs are regulated. In others, the regulatory regime developed for more traditional financial institutions (such as banks or Money Service Businesses) also applies to NPM providers, or they are subject to new regulatory regimes specific to NPM providers.

5.1.1 Not subject to regulation

143. In some jurisdictions certain NPMs are not subject to regulation. In others, the degree of regulation differs depending on the type of NPM.

---

59 The World Bank is preparing work on regulation of "innovative retail payment products", which includes the NPM services featured in this report. To this end, a questionnaire has been launched in July 2010. The World Bank survey builds upon the *Survey on Electronic Money and Internet and Mobile Payments*, published in 2004 by the Committee on Payment and Settlement Systems (CPSS) of the Bank for International Settlements, Basel.

60 FATF Glossary – "financial institution".

61 This is discussed in more detail below, see para. 170 ss.

62 This is discussed in more detail below, see para. 175 ss.

144. Issuers of **prepaid cards** are subject to both prudential and AML regulation in every jurisdiction that responded to the project questionnaire and that has domestic issuers of such cards.[63]

145. However, where there is a segmentation of services through the use of third parties that do not fit into the traditional definitions of financial institutions, these are usually not subject to regulation (*e.g.*, card program managers, retailers etc.). Third parties include agents and outsourcing arrangements. This issue is discussed in more detail below (See chapter 5.2 (*The use of agents / Outsourcing CDD measures*), para. 175 ss.).

146. As regards **Internet payment services**, 15 jurisdictions have reported Internet payment service providers seated in their jurisdiction. Of these, four jurisdictions did not require providers to obtain a licence or register for the provision such services.[64] As a result, there are no legal AML/CFT obligations for such providers in these jurisdictions. One of these unregulated providers (a digital currency provider) holds about 11 million customer accounts, serving customers from all over the world. While other unregulated providers may also operate globally, they do not reach the same size.

147. Third parties associated with Internet payment services are usually needed for funding the IPS account or withdrawing funds from it. They can be regulated or unregulated entities. Regulated entities are themselves subject to AML obligations and include traditional money remittance businesses (*e.g.*, Western Union), prepaid card issuers or banks.

148. Unregulated third parties are not normally within scope of AML legislation and include digital currency exchangers, which are a vital component of digital currency providers´ business models as they sell digital currencies for regular money or other e-currencies.

149. The provision of **mobile payment services** is regulated in most of the 15 jurisdictions that have identified domestic providers of such services.[65] However, in some jurisdictions the service is provided by unregulated entities (such as telecommunications companies) which have no legal AML/CFT obligations.

In its Working paper no. 146,[66] the World Bank has recommended that mobile payment services providers should be subject to regulation:

"1. The FATF may wish to consider treating telephone companies that facilitate transactions as financial institution (...).

2. After this, assessors should consider mobile financial services when applying the FATF methodology to country AML and CFT compliance (...)."

150. Mobile payment service providers often use agents for the distribution of their services, opening new customer accounts, as well as receiving and paying out cash from or to customers. Such agents typically are numerous and are themselves not subject to immediate regulation.

63 See Appendix A, *Prepaid Cards*, Table B.

64 See Appendix A, *Internet Payment services*, Table B.

65 See Appendix A, *Mobile payment services*, Table B.

66 World Bank (2008), p. 53.

5.1.2 Subject to existing regulation for traditional financial services

151. Some jurisdictions apply the same regulatory regime to NPM service providers as they apply to traditional financial institutions. As a consequence, in these jurisdictions, the provision of NPM services is restricted to banks or other traditional financial institutions.

152. For all jurisdictions that have submitted a response to the questionnaire, **open-loop prepaid cards** may only be issued by regulated financial institutions due to regulatory requirements. It is also the policy of card technology providers (*e.g.*, VISA, MasterCard) to only cooperate with such regulated entities.[67]

153. Although not enough details were provided by jurisdictions when responding to the questionnaire to provide exact numbers, it appears that in relation to **Internet payment services** some jurisdictions subject IPS providers to the same legal and regulatory requirements as traditional financial institutions, while others restrict IPS provision to banks or classify IPS providers as money services businesses or remittance providers.[68]

154. Finally, some jurisdictions restrict **mobile payment services** to banks or co-operation between banks and telecommunication companies. Such "bank-based models" usually result in each customer having an individual bank account which they can access through the mobile phone, rendering such services a type of mobile banking rather than mobile payment in the sense of this report.

155. Even though such mobile banking schemes fall outside the scope of this project, they do have to cope with some of the same issues and risks as mobile payment services (especially as regards such risks resulting from non-face-to-face business and the use of agents, or the application of simplified CDD measures), as can be seen from the following examples.

Box 7
Example: Mexico

As part of the efforts to promote financial inclusion, Mexico´s financial authorities have implemented a Mobile Banking model, making use of the existing telecommunications network to provide elemental banking services to the population, also in rural and remote areas.

The Mexican authorities distinguish between two types of Mobile banking:

In the classic mobile banking model, mobile phone users can link their mobile phone to an existing bank account (debit or credit card).

In the newly introduced mobile payment* model, phone users may open (bank) accounts at a telecommunications provider´s who acts as a banking agent. These so-called "low transactional accounts" are limited to basic banking services (deposits, withdrawals and incoming/outgoing payments), and transactions are limited to approx. 700 USD per month, resulting in lower CDD requirements.**

* The term "mobile payment" used by the Mexican authorities is not identical with the term "mobile payment" used in this report; see glossary.

** See 5.2, *The definition of low risk cases*, para. 161 for more details.

67 These are mostly credit institutions, but may also be other types of regulated institutions, *e.g.*, electronic money institutions in the EU (see 5.1.3, *Subject to specifically designed regulation*).

68 See Appendix A, Table B and C for Internet Payment services.

Box 8
Example: South Africa

In South Africa, a bank entered into a partnership with a mobile phone service provider to provide a banking service where accounts could be opened and activated via the phone without personal contact with the bank or a representative of the bank. The South African Reserve Bank has issued a Guidance note to determine the minimum set of criteria that must be met in the identification and verification process for such account openings.[69]

5.1.3 Subject to specifically designed regulation

156. Some jurisdictions have implemented a dedicated regulatory regime for providers of NPMs. For example, the EU´s "Electronic Money Directive" introduced "electronic money institutions", a new category of financial institutions. These are subject to the same AML obligations as traditional financial institutions, but the prudential requirements differ in recognition of restrictions imposed on e-money institutions´ activity.

Box 9
The EU concept of "electronic money"

According to Article 2 no. 2 of the revised EU Electronic Money Directive(EMD)* the term electronic money (or "E-money") is defined as follows:

"'*electronic money' means electronically, including magnetically, stored monetary value as represented by a claim on the issuer which is issued on receipt of funds for the purpose of making payment transactions as defined in point 5 of Article 4 of Directive 2007/64/EC, and which is accepted by a natural or legal person other than the electronic money issuer;..:"*

This definition has been carefully chosen to ensure technological neutrality and to encompass business models where the value is stored either individually on a customer´s device (such as a card or a mobile phone) or collectively on a central server. As a consequence, the term electronic money covers all types of NPMs discussed in this report.

The issuance of e-money is reserved to banks and "electronic money institutions", a new type of financial institution created by the EMD. Both types of financial institutions are subject to prudential and AML/CFT supervision. Compared to banks, the scope of activities in which electronic money institutions may engage is limited to a) issuing electronic money; b) the full range of payment services as defined in the EU Payment Services Directive**; c) provision of credit facilities linked to the payment services provided; and d) other business activities other than issuance of electronic money. However, e-money institutions cannot accept deposits. This constraint in activities is counterbalanced by an alleviation of prudential requirements for electronic money institutions. This is intended to facilitate market entry to newcomers.

The EMD, in conjunction with the 3rd Money Laundering Directive, leaves it to each member state´s discretion to allow simplified Customer Due Diligence for low risk products that do not exceed certain thresholds. The vast majority of member states has made use of this option to allow simplified Customer Due Diligence.***

* Official Journal of the European Union (2009)
** Official Journal of the European Union (2007)
*** For more details on the EMD and its interconnectivity with the Payment Services Directive, see Appendix D.

157. The United States is currently considering the introduction of a new subtype of money services business called "provider of prepaid access".[70] Unlike the EU legislation described above, this legislative initiative does not intend to facilitate market entry to new competitors in the market for payment services, but to close what has been identified as a gap in regulation.

69 South African Reserve Bank (2008)

70 See *Box 11 – United States* on FinCen´s *Notice of Proposed Rulemaking*.

5.2. Specific issues in regulation and supervision of NPM

158. Where NPM service providers are regulated, supervisors, law enforcement agencies and legislators are faced with a number of legal and practical challenges. Some guidance already exists in relation to some of these issues, but others have yet to be addressed.

The issues highlighted in the following are:

- Simplified Customer Due Diligence
  - The definition of low risk cases
  - Exemptions from AML obligations: Low risk financial activities and institutions -vs.- Low risk customers/products
  - Non-face-to-face business models: level of required CDD measures
- Digital currency providers: the use of exchangers
- The use of agents / outsourcing CDD measures
- "Hybrid" service providers
- Suspicious transaction reporting in cross-border scenarios
- Law enforcement and supervisory action against foreign providers
- Identification of secondary card holders

159. This list is not comprehensive or exhaustive; it focuses on issues related to the prevention and prosecution of Money Laundering and Terrorist Financing, regulation and other aspects of the FATF 40 + 9 Recommendations.[71]

Simplified Customer Due Diligence

160. Several jurisdictions allow financial institutions to apply simplified or reduced Customer Due Diligence measures in cases of low risk. There is however no uniformity of approach or a shared understanding with regards to (1) when a product can be considered low risk and (2) to what degree CDD measures can be reduced.

The definition of low risk cases

161. Several jurisdictions have identified in their legislation certain low risk scenarios in which simplified due diligence can be applied. With regard to NPMs, most jurisdictions rely mainly on value limits and transaction thresholds to define low risk scenarios, while others look at more risk factors including *e.g.*, the cross-border functionality of a product, the funding mechanisms and the usage limits of a product (see for example the South African approach in the text box below). According to the approach promoted by this report, a risk assessment should consider as many risk factors (as listed in the

[71] Other challenges may include the creation of fair competition and a level playing field, consumer protection aspects etc.

risk matrix above)[72] as possible in order to be more reliable and meaningful. The FATF standards currently do not provide guidance on or definitions of low-risk scenarios or related monetary thresholds specifically for NPM. Some private sector representatives have indicated that such guidance would be welcome.

162. Where jurisdictions use value limits to designate low risk situations, they differ significantly among jurisdictions, ranging from USD 5100 per year (Switzerland),[73] or USD 700 per month (Mexico)[74] to USD 1 000 per day (USA).[75]

Box 10
European Union:

The vast majority of member states has made use of the option to allow simplified Customer Due Diligence according to Article 11 par. 5d of the 3rd Money Laundering Directive* as amended by the second e-money Directive**, which states that member states may allow their institutions to apply simplified CDD measures with regard to electronic money

"where, if it is not possible to recharge, the maximum amount stored electronically in the device is no more than EUR 250, or where, if it is possible to recharge, a limit of EUR 2 500 is imposed on the total amount transacted in a calendar year, except when an amount of EUR 1 000 or more is redeemed in that same calendar year upon the electronic money holder's request in accordance with Article 11 of Directive 2009/110/EC. As regards national payment transactions, Member States or their competent authorities may increase the amount of EUR 250 referred to in this point to a ceiling of EUR 500."

* Official Journal of the European Union (2005)
** Official Journal of the European Union (2009)

Box 11
United States

According to a US Notice of Proposed Rulemaking*, certain low value prepaid programs shall not be subject to the new regulation:

"Providing prepaid access to funds subject to limits that include a maximum value (...)where such maximum value is clearly visible on the prepaid access product:

(i) Not to exceed USD 1 000 maximum value that can be initially loaded at the time of purchase of the prepaid access;

(ii) Not to exceed USD 1 000 maximum aggregate value (such as through multiple transfers of value to a single prepaid access product) that can be associated with the prepaid access at any given time; and

(iii) Not to exceed USD 1 000 maximum value that can be withdrawn from the prepaid access device on a single day.

The reason for exempting such prepaid programs is that it is believed "that the potential for misuse is slight".**

* Federal Register (2010)
** Federal Register (2010), p. 40.

72 See above para. 63 ss.

73 Amount converted into USD for reasons of comparability; the actual threshold is CHF 5 000.

74 Amount converted into USD for reasons of comparability; the actual threshold is 2 000 UDIs ("inflation-indexed units").

75 Some of the following value limits refer to other products than NPMs, *e.g.*, bank accounts. However, they were included here to give a better overview over different approaches to handling low risk.

Box 12
South Africa:

In May 2010 South Africa has enacted an exemption for low risk prepaid products which exempts financial institutions issuing prepaid products from certain CDD obligations if the following criteria are met:

"(a) the value of every individual transaction initiated through the use of the prepaid payment instrument cannot exceed ZAR 200;

(b) the available balance cannot exceed ZAR 1 500 at any time;

(c) the monthly turn-over of value loaded onto the prepaid instrument cannot exceed ZAR 3 000;

(d) can only be used to purchase goods or services in the Republic;

(e) the reloading of value to the prepaid instrument to enable use or further use of the prepaid instrument can only be done by means of an online system requiring the client to enter a personal identification number;

(f) the use of the prepaid instrument cannot enable the remittance of funds, the withdrawal of cash or the receipt of cash as part of a transaction for the payment of goods or services or in any other form whatsoever." *

* South African Government Gazette (2010)

Box 13
Mexico:

In order to promote the financial inclusion of in particular the low income population, Mexico introduced a simplified regime of low risk products with simplified KYC and CDD requirements for specific transactions, products and financial services. These low risk products include the following two subtypes of bank accounts that are different from traditional bank accounts:

"Low Transactional accounts" are restricted to natural persons whose monthly deposits transactions are below 2 000 Units of Investment "UDI" (approx. USD 700). Simplified rules apply for KYC, account opening and Monitoring and Reporting.*

"Low Risk Accounts" are available for natural and legal persons whose accumulated transactions, including deposits and withdrawals, on a monthly basis do not exceed 40 000 UDIs (approx. USD 14 000). Simplified rules similar to those for "low transactional accounts" apply to these accounts, but more customer data needs to be collected when opening such an account.**

* The file requires to be integrated only with the client basic data (name, address and birth date) and it is not required to maintain a copy of the documentation. However, there is the obligation for the applicant to actually display a formal ID when initially opening this type of account.

** The file requires to be integrated with the client´s whole list data requirements, and it is not required to maintain a copy of the documentation. However, there is the obligation for the applicant to actually display a formal ID when initially opening this type of account.

5.2 Exemptions from AML obligations: Low risk financial activities and institutions -vs.- Low risk customers/products

163. The current FATF standards provide some flexibility that allow jurisdictions to allocate resources in the most efficient way to address the most pressing ML/TF risks. To deal with low ML/TF risks, the standards provide two options that must be clearly differentiated: (1) partial or full exemption from AML regulation and supervision for low risk activities and institutions; and (2) simplified or reduced CDD for low risk customers or products.

1. According to the glossary of the FATF Methodology (see definition of the term "financial institution"), there are two theoretical possibilities for partial or full exemption from regulation and supervision:

    a. Jurisdictions are permitted to exempt from or limit the application of the standards for **certain financial activities** on the basis of a proven low risk, and only in strictly limited and justified circumstances. Such an exemption would apply to the respective financial activity as such and automatically affect all institutions carrying out such an activity. As regards NPM, the project team is not aware of any jurisdictions that have

declared the provision of NPM as such exempt (fully or partially), based on a proven low risk.

Box 14
Example: Australia

Under the Australian AML/CTF Act, issuing a stored value card, or increasing its value, only constitutes a designated service if the value stored on the card is greater than:

- AUD 1 000, if whole or part of the monetary value stored on the card may be withdrawn in cash; or
- AUD 5 000, if no part of the monetary value stored on the card may be withdrawn in cash.

Where stored value cards are issued under amounts of AUD 1 000, the services associated with them are not designated services for the purposes of the AML/CTF Act and consequently not subject to any of the AML/CTF obligations imposed by that Act.

b. In addition, when a financial activity is carried out by a person or entity **on an occasional or very limited basis** (having regard to quantitative and absolute criteria) such that there is little risk of money laundering or terrorist financing activity occurring, a jurisdiction may decide that the application of anti-money laundering measures is not necessary (either fully or partially) for that particular person or entity. This provision aims at non-financial institutions that occasionally carry out financial activities on the side (*e.g.*, hotels that occasionally exchange small amounts of currency for their guests).

2. Where a certain financial activity is not exempted from AML regulation and supervision, Recommendation 5 requires that financial institutions should undertake customer due diligence measures. The extent of such measures may be determined on a risk-sensitive basis, allowing for the application of **reduced or simplified CDD measures** in cases of low risk.

Box 15
Example: EU

According to EU legislation, the issuing of electronic money is a regulated financial activity, regardless of any value limits or thresholds that may apply to a certain product. Accordingly, issuers of electronic money are subject to the member states´ national AML/CFT laws.

The 3rd EU Money Laundering Directive grants member states the opportunity to allow their financial institutions to apply simplified CDD measures in designated cases of low risk. For the issuing of electronic money, concrete low risk scenarios are defined by Art. 11 para 5 lit. d of the Directive (see above para. 161 for more detail).

164. Although the term "simplified CDD measures" has not been defined (neither by the FATF standards nor by most of the national regulatory regimes or guidance), an exemption from CDD measures can only be granted in the cases described above under option 1), not in the cases of option 2). As a result, where firms carry out a designated financial activity and therefore are subject to AML/CFT obligations, exemptions from the CDD requirement are considered a breach of FATF Recommendation 5[76]. Accordingly, over the last five years more than ten jurisdictions have been criticised in their mutual evaluation reports for granting exemptions from CDD measures in low risk cases.[77]

165. In spite of this, several jurisdictions argue that in the absence of a definition of "simplified or reduced CDD" in the FATF standards an exemption can be considered as a case of simplified or reduced

[76] The FATF has also confirmed this understanding of Recommendation 5 in several publications on the Risk Based Approach (*cf. Guidance on the Risk-Based Approach to combating Money Laundering* and *Terrorist Financing: High Level Principles and Procedures*, June 2007, para. 1.24 and 1.26 (p. 6); also *cf. Risk Based Approach: Guidance for Money Service Businesses*, July 2009, para 48 (p. 14)).

[77] These exemptions did not necessarily relate to the provision of NPM services.

CDD measures, and that therefore the wording of Recommendation 5 does not necessarily exclude exemptions in low risk cases. For example, according to EC legislation, EU member states are allowed to exempt issuers of electronic money from applying any CDD measures in designated low risk cases,[78][79] and many member states have made use of this option. As a result, several NPM products issued in the EU are effectively anonymous.[80]

Non-face-to-face business models: level of required CDD measures

166. Non-face-to-face business is currently addressed by FATF Recommendation 8, which recommends that "*financial institutions should have policies and procedures in place to address any **specific risks** associated with non-face-to-face business relationships or transactions."* While the wording of Recommendation 8 does not explicitly speak of "high risk", the Interpretative Note to Recommendation 5 (para. 7) makes a reference to the Basel CDD paper (section 2.2.6) for specific guidance, which says:

> *"48. In accepting business from non face-to-face customers (…) there must be specific and adequate measures to mitigate the **higher risk**."*

Within the work being currently done by the FATF in the perspective of the 4th round of mutual evaluations, there is a clear recognition that non-face-to-face business relationships or transactions represent **a higher ML/TF risk**.

167. Recommendation 5 suggests that "*for **higher risk categories**, financial institutions should perform **enhanced due diligence***". Furthermore, the Interpretative Note to Recommendation 5 (para. 13) adds:

> "Simplified CDD measures are not acceptable **whenever** there is suspicion of money laundering or terrorist financing or **specific higher risk scenarios apply**."

The FATF standards do however not clarify whether "specific risk" in the sense of Recommendation 8 equates to "higher risk scenario" in the sense of Recommendation 5. If this interpretation were correct, NPM products relying on non-face to face transactions should not be eligible for simplified CDD.

168. To base a product or service´s risk rating on one risk factor alone (here: non face to face) would not take into account the principles of risk assessment developed in the 2006 NPM report (and retained by the project team in this report). According to these principles of risk assessment for NPMs, all risk factors featured in the risk matrix presented in para. 65 of this report should be taken into account when assessing the risk of an individual NPM service or product. Non-face-to-face business relationships and transactions do increase the risk rating of an NPM service or product, but other product features (*e.g.*, solid identification and verification procedures; or strict value limits) can considerably mitigate the risk, and even lead to the product or service being assessed as "lower risk" after all. Accordingly, such business models would not categorically have to apply enhanced CDD measures, but might even qualify for the application of simplified CDD measures in certain circumstances of low risk.

---

78 For more detail see Appendix D, section 3:*The Third Anti-Money-Laundering Directive (2005/60/EC).*

79 The European commission has defined technical criteria that will classify certain scenarios as "low risk" in Art. 11 and 40 of Directive 2005/60/EC in conjunction with Art. 3 of Directive 2006/70/EC.

80 Mainly cash vouchers and some prepaid cards (open-loop and closed loop), whereas IPS providers usually ask at least for the customer's name (which may remain unverified though).

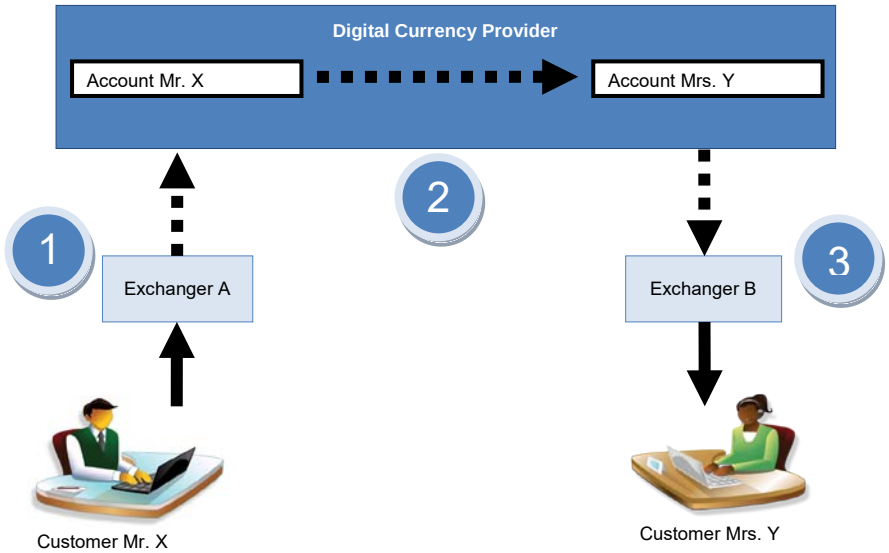
169. The project team has been informed that this issue is currently being discussed within FATF. It was indicated that the qualification of non-face-to-face business models as "higher risk" by the FATF standards might not automatically lead to a qualification as a higher risk scenario in the sense of Recommendation 5. It would be helpful if this conclusion was reflected in the standards (*e.g.*, in an Interpretative Note to Recommendation 5 or Recommendation 8).

Digital currency providers: the use of exchangers

170. The segmentation of services in digital currency business models makes it difficult to determine who the provider of the payment service is and thus subject to regulation.

171. The following diagram illustrates the segmentation of services in a digital currency provider business model, in which the actual payment is broken down into three separate steps, each carried out by a different entity:

Figure 4. Digital Currency Provider



Step 1: Funding of the customer account
Customer Mr. X pays an amount of real money to Exchanger A, who holds a certain amount of the digital currency. In exchange for the money received, the exchanger transfers an equivalent amount from his digital currency account to customer Mr. X´s digital currency account.

Step 2: Transfer of Digital currency
Customer Mr. X instructs the Digital Currency Provider to transfer a certain amount of digital currency to the Digital Currency account of Customer Mrs. Y.

Step 3: Withdrawal of funds
Customer Mrs. Y transfers a certain amount of digital currency from her own Digital currency account to the Digital Currency account of Exchanger B. In exchange for the digital currency received, the exchanger transfers an equivalent amount of real money to Customer Mrs. Y.

Source: NPM project team

172. In some jurisdictions, none of these steps would be considered a regulated activity in their own right:

- The exchangers exchange real money for digital currency, or even digital currency for another type of digital currency from different providers. They transfer value, but only between accounts of one and the same principal; they do not transfer money to third persons.
- The Digital currency provider transfers value from one person to another; however, he neither receives real money from the payer, nor does he pay out real money to the payees.

173. Other jurisdictions consider these activities to be regulated, and as a consequence consider all entities involved to be subject to supervision.

Box 16
US: MSB´s

The prosecution of an offshore Internet payment service marketing online to U.S. citizens prompted the application of existing law regarding money transmitters to any online payment service facilitating money transmission. The money transmitter definition in the U.S. states, in part:

"*Any person, whether or not licensed or required to be licensed, who engages as a business in accepting currency, or funds denominated in currency, and transmits the currency or funds, or the value of the currency or funds, by any means…*"

In addition to successfully applying this definition, and the associated registration, recordkeeping, and reporting obligations, to online payment services, including digital currency providers, U.S. prosecutors have applied it successfully to offshore service providers sending and receiving funds to U.S. customers.

Box 17
Germany: Involvement in unlawful business / Teilakttheorie ("theory of partial acts")

According to the German Banking Act, supervisory authorities may issue a cease-and-desist-order not only against entities conducting unlawful business themselves, but also against undertakings which are involved in the preparation, the conclusion or the settlement of such business.

Similarly, a provider is considered a "de facto branch" of a financial institution if it carries out relevant steps ("partial acts") of a financial service for that institution. As a consequence, the "de facto branch" needs to be licensed unless the financial institution it works for is licensed either in Germany or another member state of the European Economic Area.

Based on the aforementioned principles, the German authorities have initiated an administrative proceeding against an unlicensed, Germany-based digital currency exchanger that traded in digital currency issued by a provider seated in South-East Asia. The administrative proceeding is still ongoing.

174. The problem of regulating and supervising Digital currency providers and their related entities such as exchangers is exacerbated by the fact that their services often require no physical presence in a jurisdiction, but can be carried out from anywhere via the Internet. The entities involved are therefore able to choose a jurisdiction where they are not subject to regulation as their seat and provide their services from there.

The use of agents / Outsourcing CDD measures[81]

175. CDD and other AML measures are usually carried out by officers or employees of the regulated financial institution itself. However, in many NPM business models these tasks are in practice performed by third parties, including agents, intermediaries, or are outsourced. While these can be

81 For the purposes of this report, the terms "agent" and "outsource" shall be used synonymously.

different legal concepts entailing different legal obligations and requirements, for the purpose of this report these concepts shall be used interchangeably.

The FATF 40+9 Recommendations address the issue of agents and outsourcing in two different contexts, namely in Recommendation 9 and Special Recommendation VI.

176. Recommendation 9 only marginally touches on this subject. It refers exclusively to third party reliance and introduction; it does not cover agents and outsourcing agreements, nor does it provide a definition of outsourcing or agency. However, a footnote in the Methodology text accompanying Recommendation 9 is actually the only place within the standards that explicitly explains the current FATF approach towards agents and outsourcing: "*the outsource or agent is to be regarded as synonymous with the financial institution i.e., the processes and documentation are those of the financial institution itself.*"[82]

177. The only Recommendation explicitly mentioning agents is Special Recommendation VI, which recommends that "*each country should take measures to ensure that persons or legal entities, including agents, that provide a service for the transmission of money or value, including transmission through an informal money or value transfer system or network, should be licensed or registered and subject to all the FATF Recommendations that apply to banks and non-bank financial institutions.*" The interpretative note to Special Recommendation VI defines an agent as "*any person who provides money or value transfer service under the direction of or by contract with a legally registered or licensed remitter (for example, licensees, franchisees, concessionaires).*"

178. The general interpretation of Special Recommendation VI is that it does not require agents to be subjected to AML obligations and supervision in their own right either. While the wording of Special Recommendation VI may leave room for other interpretations, this can be concluded from the definition of "agent" in the glossary of the methodology (which implies that the agent is subdued to the regulated principal) and the Interpretative Note to Special Recommendation VI, which in paragraph 8 finds it sufficient that the principal business maintains "*a current list of agents which must be made available to the designated competent authority"*

179. According to these principles in the current FATF standards, in most jurisdictions agents and outsources of financial institutions are not normally subject to AML legislation or regulation themselves, thus having no legal AML/CFT obligations of their own.[83] Instead, the principal (or outsourcer), being a regulated institution, will remain solely responsible for meeting the AML/CFT obligations for its activity, including actions (and omissions) of its agents or outsources. Shortcomings of the agent are attributed to the principal (*i.e.*, financial institution), which may be sanctioned for any breach of its own AML/CFT obligations, conducted by its agent.

180. As regards Money Services Businesses, FATF has issued some guidance on the handling of agents, providing some useful input on the notions of "know your agent", agent monitoring and agent training. While this guidance does not explicitly refer to NPM service providers, these concepts appear to be applicable those as well.

---

82 Footnote 16 of the FATF Methodology for assessing compliance with the FATF 40 Recommendations and the FATF 9 Special Recommendations.

83 Agents are often subject to contractual AML/CFT responsibilities that are imposed on them by the agency contract with their principal. However, there is no direct legal liability of the agents and no possibility for authorities to sanction agents if they breach their contractual AML/CFT obligations. There are usually no legal requirements for the principal to impose contractual AML/CFT responsibilities on their agents.

181. Some jurisdictions, including the U.S. and Germany, have recently reassessed their approach and have come to the conclusion that there is a gap in regulation. As a consequence, they propose to impose legal AML/CFT obligations on agents. The term "agent" in this sense may cover many different activities, including for example card program managers or sellers of prepaid funds.

a) Card program managers

182. In some business models, the prepaid card program is effectively run by card program managers. The card program manager may have ownership and control of the business model and take any important business decisions, while the issuing bank only provides access to the technical card platforms. As a result, a card program manager´s role in an NPM business model may be greater than that of a traditional outsource or agent.[84] Still, like a regular agent, the card program manager usually is not supervised and outside the scope of AML legislation, while the issuing financial institution remains legally responsible for meeting its legal and regulatory obligations.

183. This separation of business responsibility and regulatory liability situation is exacerbated if the card program manager and the issuing bank are located in different jurisdictions. If, for example, the card program manager is based in a jurisdiction with a robust regulatory regime (to which the card program manager is not subject though), this strict regime could be circumvented by cooperating with an issuing bank that is based in a jurisdiction with lower AML/CFT standards or less effective supervision.

184. A related issue is market entry. As most card program managers are not currently subject to regulation and supervision, they are also not subject to market entry requirements like fit-and-proper tests carried out by the supervisory authorities. It is therefore often down to the issuing institution themselves to identify whether its agent/program manager´s intentions are legitimate. Case studies evidence that some institutions have failed to discover the illegitimate intentions of their program managers, or have even knowingly and collusively entered into a co-operation with illegitimate program managers (see above section 4 "Typologies", *cases 22 and 28*).

185. As a result, some jurisdictions are currently considering subjecting card program managers and other third parties subject to legal AML/CFT obligations. No such regime has been finalised yet. The most advanced initiative is a US notice of proposed rulemaking (NPRM) by FinCEN, which was published for public consultation on June 28, 2010.[85]

Box 18

According to the NPRM, FinCEN proposes to implement a new subtype of Money Service Business (MSB) called "provider of prepaid access". The provider of prepaid access is described by FinCEN as follows:

"*In general, this term will apply to any person that serves in the capacity of oversight and control for a prepaid program. The determination of the applicability of this term to any given player in the program's transaction chain will be a matter of facts and circumstances; we do not "assign" this term to any particular role. We recognize that there may be situations in which no single party alone exercises exclusive control. However, we do believe that there will always be a party in the transaction chain with the predominant degree of decision-making ability; that person plays the lead role among all the others, and is in the best position to serve as a conduit for information for regulatory and law enforcement purposes. We wish to state clearly and emphatically that identifying the provider of prepaid access is not simply an arbitrary decision by the program participants. As with other MSBs, the role of the provider of prepaid access is determined through the facts and circumstances surrounding the activity; no single act*

84 The definition of "agents" for the purpose of Special Recommendation VI in the glossary of the FATF methodology states that agents work "*under the direction of or by contract with a legally registered or licensed remitter*" This implies that the agent usually is considered to be subordinated to the principal, *i.e.*, the financial institution.

85 Federal Register (2010)

or duty alone will be determinative. While not exhaustive, we consider the following activities to be strong indicators of what entity acts in a principal role:

• The party in whose name the prepaid program is marketed to the purchasing public. For example, whose press release trumpets the launch of a new product? Whose name is used in print, on-line advertisements, and on the face of the card/device itself? In legal parlance, the individual or entity who "holds himself out" as the lead player will be a very important determining characteristic.

• The party who a "reasonable person" would identify as the principal entity in a transaction chain—the principal decision-maker.

• The party to whom the issuing bank looks as its principal representative in protecting its network relationship and its brand integrity.

• The party who determines distribution methods and sales strategies.

• The party whose expertise in the prepaid environment is recognised by the others, particularly by the issuing bank, as instrumental in bringing together the most appropriate parties for the delivery of a successful program.

We intend for these enumerated characteristics to illustrate that there is no one single determinant; the provider of prepaid access need not do, or refrain from doing, any single activity. The totality of the facts and circumstances will identify the provider of prepaid access."

As a type of MSB, providers of prepaid access would have to be registered with FinCEN. According to the NPRM, they should be obligated to establish and maintain AML programs (incl. staff training), to collect identification data and transaction records and retain them for five years, and to file CTRs and SARs. FinCEN also proposes to impose the same obligations on the "sellers" of prepaid access; these however should not be considered MSBs and accordingly would not have to register with FinCEN.

The new obligations of providers and sellers of prepaid access shall not affect the legal liability of any involved banks or financial institutions: their AML obligations remain unchanged.

b) Sellers of prepaid funds

186. Several NPM providers use a network of partners (*e.g.*, retailers, pharmacies etc.) to sell their product to the customers. In some jurisdictions, there are moves to treat these as agents acting on behalf of the NPM provider, while in others they are treated as plain merchants rather than agents.

Box 19

United States

In the Notice of proposed rulemaking (NPRM) described above,* FinCEN proposes to impose direct AML/CFT obligations not only on the issuing bank and the "providers of prepaid access", but also on the seller of prepaid products:

"We are also mindful that, among all the typical parties, a very important role is that of the seller. The seller alone has face-to-face dealings with the purchaser and is privy to information unavailable elsewhere in the transaction chain. For that reason, we believe the seller to be secondarily important among all the entities involved in the program. (…) The seller is uniquely situated to see the first step in the establishment of a prepaid relationship, and to interact directly with the purchaser who may, or may not, be the ultimate end-user of the card. The requirements of this party to maintain records over a five-year time period and to report suspicious activity, also serve the law enforcement´s needs.

(…)

The seller of prepaid access is the party with the most face-to-face purchaser contact and thus becomes a valuable resource for capturing information at the point of sale, unlike any other party in the transaction chain. Typically, the seller is a general purpose retailer, engaged in a full spectrum product line through a business entity such as a pharmacy, convenience store, supermarket, discount store or any of a number of others. Precisely because this party deals face-to-face with the purchaser, and has the ability to capture unique information in the course of completing the transaction, we believe the seller should fall within the regulation´s direct reach.

Because the seller´s role is complimentary with, but not equal to, the authority and primacy of the provider of prepaid access, we choose not to require registration with FinCEN. The seller, we believe, is generally acting as an agent on behalf of the provider and this treatment is consistent with other agents under the MSB rules.

However, the seller´s agency does not excuse compliance with the other responsibilities assigned under this

proposed rule: (1) the maintenance of an effective AML program, (2) SAR reporting, and (3) recordkeeping of customer identifying information and transactional data."

* Federal Register (2010)

187. Similarly, in Australia besides issuing prepaid cards the activity of "increasing the monetary value" (*i.e.*, loading or reloading funds onto cards) of certain stored value cards[86] is considered a designated service which makes providers of such services a reporting entity under the Australian AML/CTF Act and incurs a range of important obligations. These include the requirement to have an AML/CTF program, customer identification and ongoing customer due diligence, record keeping and reporting obligations.

188. Other jurisdictions do not share the point of view described above, *i.e.*, that the current approach to agents would constitute a gap in regulation, and do not support the idea of subjecting agents to AML obligations in their own right. As an alternative, it has been suggested to reinforce or clarify the requirements on the outsourcing / agency agreements of financial institutions, especially as regards AML/CFT obligations. Many jurisdictions have legislation in place on requirements for outsourcing contracts; however, this is currently not mirrored in the FATF 40+9 Recommendations.

"Hybrid" service providers

189. Some non-financial business companies have started to take up providing NPM services (*e.g.*, telecommunications companies providing mobile payment services). These "hybrid" payment service providers may challenge existing regulatory regimes because due to their financial activities, in many jurisdictions they would either be excluded from the market (as such activities are limited to credit institutions only);[87] or they would be subject to regulation regarding all their lines of business, not only their financial activities. Furthermore, if the hybrid provider is a big company, due to its size it would be impossible to make use of regulatory waivers in many jurisdictions.

190. These hindrances may force interested hybrid providers to either provide their financial services through a separate legal entity focussed on financial services, or may deter some potential candidates from entering into the market of NPM altogether.

Box 20
Example European Union

The new EU regime for the issuance of e-money as revised by the second E-Money Directive (EMD) aims at facilitating market access to newcomers, namely telecommunication companies or large-scale retailers who want to engage in the market of e-money. Following the Payment Services Directive, the exclusivity principle will no longer apply to electronic money institutions, who are now entitled to engage in any business activity besides issuing electronic money (Art. 6 para 1 lit. e) EMD).

For the calculation of an electronic money institution´s own funds or safeguarding requirements, only the funds relating to the e-money business are taken into account, excluding the funds relating to other lines of business activity ("ringfencing").

Suspicious transaction reporting in cross-border scenarios

191. The provision of cross-border services, which is typical for many NPM business models (especially most IPS providers) raises issues as regards filing suspicious transaction reports and the effectiveness of law enforcement. In most jurisdictions, NPM providers are only obligated to report

86 Australian Attorney-General's Department (2006)

87 See 5.1.2, *Subject to existing regulation for traditional financial services.*

suspicious transactions to their home FIU, even if the persons involved in the suspicious transaction (customer / sender / receiver) are based in a different country. That country´s FIU will depend on an effective international cooperation and information sharing with the NPM provider´s home FIU. Where such cooperation is lacking, the effectiveness of the STR reporting regime and law enforcement of suspicious cases may be seriously impeded.

192. Where agents are used to provide cross-border services, the situation is similar. Agents are usually not subject to the STR regime in most jurisdictions. If they report suspicious transactions, it will most likely be towards their principals (*i.e.*, the NPM service provider) on a contractual basis. As described above, the NPM provider would then file an STR to its home FIU, but not necessarily to the FIU of the country where the agent is based.

Box 21
European Union

Within the EU Committee on Money Laundering and Terrorist Financing (CPMLFT), it is currently being discussed to which Financial Intelligence Unit reporting should be done in cross-border situations, as well as issues of attribution of competence among AML supervisors where a payment institution under the Payment Services Directive has a recourse to an agent to sell services in another Member State than the one where it is established.

While this discussion arose with regard to agents of money remittance services, the outcome of the discussion will have an immediate impact on NPM providers for whom the same provisions regarding agents apply.

Law enforcement and supervisory action against foreign providers

193. Where NPM providers provide their services across borders online only (*i.e.*, without any physical presence in the jurisdiction of the customer), foreign authorities will have limited possibilities to take action, but will normally have to rely on their counterparts in the jurisdiction where the provider is based.

194. However, some national authorities have successfully taken action against foreign providers by making use of the tools of their national criminal law and their national administrative law.

195. For example, United States authorities have used the provisions of US criminal law to impose sanctions on foreign providers located in the Isle of Man (see above **case 31**) and in the Caribbean (see above **case 33**). These national sanctions could be applied as the defendants (*i.e.*, the directors and owners of the foreign providers) either resided in the US or travelled into the US.

196. German authorities have issued administrative cease-and-desist orders against IPS service providers located in South-East Asia and Central America. According to German supervisory law, such measures can be taken only if business is conducted in Germany. However, authorities have considered activities that were provided from abroad, to take place “in Germany” when certain conditions were met. As regards the provision of financial activities through the internet, the activity will be considered to be conducted in Germany if the content of the website is designed to target the German market. Indicators for this include (list not exhaustive): domain of the website (“.de”), website in German language, customer information that is specific to Germany or the German financial sector, references to the German legal framework, and appointment of German contact persons.

Identification of secondary card holders

197. Several prepaid card providers issue cards that are specifically designed to facilitate cross-border remittances. In such business models, a main card is issued to the customer / cardholder; in addition, the customer will dispose of one or several additional cards (also “partner cards”; “remittance cards”) which they can pass on to third persons; these are the intended recipients of the remittance

transactions. The remittance is then carried out in two steps: first the cardholder loads the remittance amount on the prepaid card; secondly, the recipients may withdraw the amount at any ATM worldwide with the help of their secondary cards.

198. In a number of these business models, only the main cardholder is identified. The holders of the additional cards often remain unknown to the card issuer.

199. In the 2009 Mutual Evaluation Report for New Zealand, one such business model and the related supervisory practice have been described in much detail:

Box 22
New Zealand Mutual Evaluation 2009

According to the Mutual Evaluation Report at the time the assessment was conducted, where there were three or more "facility holders" (=account or card holders) financial institutions in New Zealand were generally "only required to perform CDD on the principal facility holders (*i.e.,* those whom the financial institution reasonably regards, for the time being, as principally responsible for the administration of the facility", while all other facility holders who remained **unidentified** were also able to conduct transactions via the facility held at the financial institution. This was criticised by the assessment team and affected the rating for Recommendation 5. *

However, as regards the **verification** of such secondary cardholders, the assessment team apparently had no objections to the application of simplified CDD:

"419. Simplified CDD is allowed when the facility provided is a remittance card facility. In such cases, there is no requirement to verify the identity of the second card holder (2008 Interpretation Regulations). These types of remittance card facilities are only offered by one bank in New Zealand. The authorities advise that the remittance card regulation exemption was designed to mitigate the AML/CFT risks that could attach to remittance products, and places a number of conditions and constraints on the eligibility for exemption. These conditions and constraints include: *i)* a maximum total annual remittance, and maximum balance on the card of NZD 9 999.99; *ii)* eligible cards can only be used on international bank Automated Teller Machine (ATM) and *Electronic Funds Transfer at Point of Sale* (EFTPOS) networks; *iii)* full FTRA verification and record keeping requirements apply to the primary card holder (account opener); *iv)* identification and record keeping requirements apply to the one other permitted card holder (who cannot be resident in New Zealand); and **v)** the issuing institution is required to carry out ongoing due diligence and transaction monitoring on the facilities. The authorities concluded that the above limitations mitigate the AML risk to an acceptable degree for the product to be offered in New Zealand on the basis that full CDD is applied to the primary card holder and simplified CDD is applied to the second card holder. This conclusion was based on a review co-ordinated by the Reserve Bank and involving officials including the Ministry of Justice, the Ministry of Pacific Island Affairs and the FIU. The review considered material from the NZ Police, APG and FATF, including typologies and evidence of misuse of stored value card and travel card-type products. Discussions were also held with several banks about product options and AML/CFT risk management options, and sample data was collected about remittance volumes and average size. A Public Discussion document and subsequent Cabinet paper were produced justifying the limitations in the regulation to mitigate the AML/CFT risk to reasonable levels consistent with the expected form and approach of the new AML/CFT Bill and New Zealand's longer term compliance with the FATF Recommendations."

* FATF (2009b), p. 84, 93.

200. While generally all holders (*i.e.*, primary and secondary holders) of an account or a card should be identified, there is room for discussion whether this is still necessary if the specific card model can be qualified as "low risk" and therefore simplified CDD measures might be applied. While a full exemption from CDD measures regarding the (primary) customer has been criticised as not in line with Recommendation 5,[88] it is unclear whether this should also apply to an exemption of secondary card holders (assuming that the primary card holder has been appropriately identified and verified). This will be dependent on the degree of control the secondary card holder has over the product, and whether he needs to be qualified as a customer of the NPM provider, or might be considered the customer´s beneficial owner, or some kind of beneficiary.

88 See 5.2, *Exemptions from AML obligations.*

CHAPTER 6: CONCLUSIONS AND ISSUES FOR FURTHER CONSIDERATION

201. Market adoption of NPMs has increased since the 2006 report, and is likely to increase even more in the future. More and more NPMs offer the opportunity to transfer funds globally. As a result, evidence of the misuse of NPMs for purposes of ML and –to some extent- TF have also increased.

202. New types of NPMs are likely to emerge in the future. Because of the convergence and combination of NPMs it will be more complex for supervisors and legislators to assess if such payment systems are vulnerable to ML/TF abuse. The continued development of NPMs therefore requires an appropriate, flexible and 'future proof' FATF framework.

203. In addition to the risk assessment (section 3) and the development of typologies (section 4), this report examines whether the FATF 40+9 Recommendations continue to provide an adequate framework to address recent technological and regulatory developments in the field of NPMs.

204. The project team has come to the conclusion that the FATF Forty Recommendations and Nine Special Recommendations provide a broadly adequate framework to address the vulnerabilities associated with new payment methods, although there is a need for the FATF to explore some issues in the international standards that require further development or clarification. The project team is aware of the fact that FATF has already launched a thorough review of its standards and that some issues raised in this paper are being addressed in this context.

205. The project team has concluded that it would be desirable for FATF to provide more clarity on some issues that arise in relation to NPMs. It is understood that some of those issues are already being addressed in the context of the preparation of the fourth evaluation round.

206. When discussing the questions listed below, the responsible working groups should take into account not only aspects related to the prevention of ML and TF, but also the positive and beneficial effects of NPMs (*e.g.*, financial inclusion, shifting transactions from the informal to the formal sector, promotion of competition and economic growth in national markets) as well as legitimate market demand and private sector concerns in order to find an appropriate balance.

207. In all cases the cost/benefit ratio should be taken into account when making policy decisions on NPMs. Decision makers should carefully consider *e.g.*:

- Whether the AML/CFT benefit justifies the potential extra costs and efforts that may arise for institutions as well as for supervisors, FIUs or other agencies.

- Whether there is a risk that specific measures might lead to significant disadvantages for NPM customers (*e.g.*, regarding cost or "convenience" of the NPM service) and whether these potential disadvantages might tempt some customers to make their payment transactions through unregulated payment service providers instead.

208. Policy decisions should strive to find the right balance between an efficient and comprehensive AML/CFT regime and legitimate market demand and private sector concerns.

Questions relating to simplified CDD:

1. Should Recommendation 5 provide for an exemption from CDD measures in cases of "low risk"? (Recommendation 5)

209. Recommendation 5 recommends that "*financial institutions should not keep anonymous accounts or accounts in obviously fictitious names.*"

210. Furthermore, Recommendation 5 recommends that "*financial institutions* ***should apply each of the CDD measures*** *(as listed in Recommendation 5) but may* ***determine the extent of such measures on a risk sensitive basis*** *depending on the type of customer, business relationship or transaction. The measures that are taken should be consistent with any guidelines issued by competent authorities. For higher risk categories, financial institutions should perform enhanced due diligence. In certain circumstances,* ***where there are low risks, countries may decide that financial institutions can apply reduced or simplified measures***."

211. The standards do not provide a definition of "reduced or simplified CDD measures", and they do not explicitly exclude exemptions from this term either. A number of jurisdictions currently grant institutions a full exemption from CDD measures in designated low risk cases. While this has been criticised to be not in line with Recommendation 5 in some mutual evaluations, there are also others (including a number of jurisdictions, organisations such as the World Bank and private sector representatives) that take the view that Recommendation 5 does (or should) provide the possibility to grant exemptions from CDD measures in low risk cases.

212. In the context of the review of the standards, the FATF will be proposing some changes to the standards that aim at addressing these concerns. The following aspects should be taken into account:

213. Exemption from verification:

- The overall risks of a product or service can also be mitigated by other means such as applying account and transaction limits. Imposing very restrictive limits on the transactions or other functionalities may have an even more deterring effect to would-be launderers than the prospect of being verified. Furthermore, intensive monitoring can help mitigate the ML risk of products as well.

- In some jurisdictions, verification of the customer´s identity may be difficult to accomplish, especially where ID documentation or other reliable documentation is not available for a great part of the population.

- Verification can also prove to be a financial burden for institutions or customers (*e.g.*, where customers must travel a long distance to the bank or vice versa to be verified), deterring customers and institutions alike, and potentially endangering the economic success of individual NPM providers.

- Case studies indicate that criminals were able to launder money even where verification had taken place, *e.g.*, by using stolen or fake identities, or strawmen.

214. Exemption from identification:

- Unlike verification, identification does not seem to cause a lot of cost or effort; the NPM provider simply needs to ask the customer's name.

- In the case of additional cardholders, can it be acceptable to exempt institutions from the identification of the additional cardholders (*e.g.*, if the primary cardholder is thoroughly identified and verified, and other measures and systems such as monitoring are in place)?

2. Is the application of simplified CDD acceptable for non-face-to-face business models? (Recommendations 5 and 8)

215. FATF should provide clarity whether non-face-to-face business models automatically qualify as "high risk scenarios" in the sense of Recommendation 5. While FATF experts have recently discussed this, there is no official statement yet that "specific risk" should not automatically equate with "higher risk" in the sense of Recommendation 5. It would be helpful if FATF could provide greater clarity on this by amending the standards, taking into account the following aspects:

- The approach to risk assessment chosen in this report (and the 2006 report) suggests that all risk factors and all mitigants should be taken into account in order to find an overall risk rating of an individual product or service. It would be against this approach to assess a product as high risk just because it features one particular risk factor (*i.e.*, non face to face), without looking at the all the other risk factors and mitigants.

- Several NPM providers currently apply simplified CDD to non face to face business models and would be seriously affected if this practice was declared inacceptable. Private sector representatives have indicated that this might jeopardize the commercial viability of some NPM services.

Questions relating to the treatment of agents:

3. Should agents of NPM providers be subject to regulation and own AML/CFT obligations? (Recommendation 23, Special Recommendation VI)

216. Depending on the type of activities carried out by agents, they can play a very important role in the execution and completion of a payment transaction. Compared to more traditional financial services, the use of agents to carry out functions related to AML/CFT appears to be more common among NPM providers. Such agents may be required as an intermediary or an interface between traditional financial services and more "virtual" payment services. Using agents may also be an effective and inexpensive alternative to opening branches for NPM service providers, especially when providing NPM services abroad.

217. The FATF 40 + 9 Recommendations do not require agents to be subjected to AML/CFT obligations in their own right. While some jurisdictions have recently suggested that this might constitute a gap in regulation, others consider the current approach appropriate and sufficient.

218. FATF should consider whether the standards should more explicitly address issues relating to the effective oversight of agents carrying out key operational functions, either through direct supervision or through indirect supervision carried out by the principal

219. When making this consideration, the following aspects should be taken into account:

- FATF should consider providing guidance to NPM providers on how to design the contractual relationship with their agents and to enable supervisors to control whether the institution fulfils its AML/CFT obligations through its agents. While some guidance has already been introduced for Money Service Businesses (*e.g.*, the concepts of "know your agent", agent

monitoring and agent training),[89] it remains unclear whether FATF considers this guidance applicable for other financial institutions (such as NPM providers) as well.

- Where agents are subjected to AML obligations, this should not result in a reduction of the principals´ own AML obligations.

- Suspicious transaction reporting: agents are often the only persons having actual face-to-face contact to the customer. Valuable information for suspicious transaction reporting (*e.g.*, suspicious customer behaviour) may therefore only be available to the agent. Such information may be lost or delayed if the agent has no reporting obligations or needs to report to the principal only.

- A reporting obligation for agents should not result in a reduction or waiver of the institution´s own obligation to file suspicious transaction reports. The financial institution may have additional information on the customer and his transactions that is not available to the agent, and may therefore be able to detect suspicious transactions that would not be noticed by an agent.

- Furthermore, FATF could consider which authority the principal and/or agent should be reporting to if agents located in a different jurisdiction than their principal are subjected to reporting obligations: the FIU in the principal´s ("home") jurisdiction; or the FIU in the agent´s ("host") jurisdiction; or double reporting to both jurisdictions?[90]

- Staff training: where agents are subjected to AML/CFT obligations, they should also be required to appropriately train their staff. This training may also be provided by the principal.

- Cost of compliance: where new AML obligations are imposed on agents, this may lead to additional costs and efforts, rendering the service less attractive for agents and/or customers. However, in business models where agents currently already are subject to contractual AML obligations towards their principal, it is unclear whether subjecting them to legal (rather than contractual) AML obligations should effectively result in a relevant increase of costs and efforts.

- Subjecting agents to direct legal AML/CFT obligations may potentially serve as a strong disincentive to act as an agent, potentially making it difficult for NPM providers to find agents and thereby reducing the number of access points to regulated and supervised NPM service providers.

- Efficiency of oversight: if agents are regulated and subjected to AML/CFT obligations, there will be a significant increase in the number of entities to be supervised by the financial supervisors. There are doubts whether this can be accomplished effectively in all cases.

89 FATF (2009)

90 For example, Jersey has issued guidance that agents should report to both FIUs.

4. How should the term "agent" be defined (Recommendation 9, Special Recommendation VI)?

220. Regarding the term "agent", the first difficulty is to find a valid delineation to the terms "outsourcing" and "reliance" or "third party introduction" (as addressed by Recommendation 9). The project team understands that this issue is currently being addressed within FATF.

221. Secondly, FATF does not define the types of activities that can be considered as creating an agency relationship. For example, exchangers used in digital currency business models may argue that they are independent businesses trading in electronic currency. Sellers of prepaid funds (*e.g.*, retailers selling prepaid cards or cash vouchers) might argue that they are just merchants, acting outside the financial sector.

Other issues:

5. Should the scope of Special Recommendation IX be expanded to include "electronic money" or "stored value", especially prepaid cards? (Special Recommendation IX)

222. Special Recommendation IX recommends that "countries should have measures in place to detect the physical cross-border transportation of **currency and bearer negotiable instruments**, including a declaration system or other disclosure obligation."

223. The 2006 report identified the cross-border movement of prepaid cards as a potential ML risk. The project team still considers this a significant potential risk, even though only few case studies have been submitted to prove that criminals have made use of that potential typology in the past.

224. In order to control and counter the cross-border movement of stored value, it would be helpful for customs authorities if they could make use of the tools that have been implemented for the cross-border movement of cash and bearer negotiable instruments according to Special Recommendation IX, such as a declaration or disclosure system and the possibility to confiscate funds. However, in most jurisdictions, these tools (that have their origin in Special Recommendation IX) are only applicable to currency and bearer negotiable instruments, which means that prepaid cards do not have to be declared when crossing borders.[91]

225. Most jurisdictions do not classify prepaid cards, or other means of "stored value" or "electronic money", as cash or bearer negotiable instruments in the sense of Special Recommendation IX. In order to be able to subject these cards to cross-border controls, it would therefore be necessary to widen the scope of Special Recommendation IX (and resulting from that national custom laws) to include such cards as well (alternatively, the text of Special Recommendation IX might remain unchanged, but the definition of either "cash" or "electronic money" might be widened to include stored value or electronic money). When considering expanding the scope of Special Recommendation IX, the following aspects should be taken into account:

- There are currently different opinions whether Prepaid cards should fall under the scope of Special Recommendation IX. While some jurisdictions stress the point that such cards

---

[91] Only few jurisdictions apply these rules to prepaid cards. For example, section 12a of the German Customs Administrative Act (*Zollverwaltungsgesetz*) applies cross-border controls to "cash and equivalent means of payment" including a.o. "cheques, bills of exchange, precious metals and stones and electronic money" (section 1, para 3a *Zollverwaltungsgesetz*).

resemble cash in many ways, others find them to be a type of debit or credit card, which were intentionally kept outside the scope of Special Recommendation IX.

  - Prepaid cards resemble cash in that they are anonymous, represent a certain currency value and can be widely used for the purchase of goods or services. The cards are paid in advance (no credit system) and can be transported across borders.

  - On the other hand, prepaid cards are also similar to the use of debit or credit cards, which undoubtedly do not fall under the scope of Special Recommendation IX. The value of prepaid cards is usually not stored on the card itself, but on a server, with the card being only an access device to the funds.

- It should be examined further whether the reasons that excluded credit and debit cards from the scope of Special Recommendation IX are valid for prepaid cards as well.

- Effectiveness: Currently, there are still technical difficulties with the verification of prepaid cards. It is unclear how custom officials would determine the actual value that is stored on a card. Would card readers have to be installed, and would these work for all technical standards from different card providers? However, technical challenges may be overcome once a legal foundation has been laid for cross-border controls for prepaid cards.

- Where prepaid cards can be transported across borders with no or only minimal funds on it, and then be funded (or "activated") after they have arrived at their destination, this can also effect the efficiency of a cross-border declaration regime for such cards.

6. Should Recommendation 10 include IP addresses for transactions initiated through a personal computer?

226. There is currently no explicit requirement under Recommendation 10 to retain the IP addresses of personal computers through which a payment transaction is initiated. While most NPM providers would most likely do so in their own interest, there are reports from law enforcement about providers who do not retain the IP addresses of their customers, or delete them too soon (*i.e.*, before the 5-year period suggested by Recommendation 10). The FATF should take note of this issue and consider adding the IP address to the list of examples of "necessary records on transactions" in crit. 10.1 of the Methodology.

7. Updating this study

227. Taking into account the continuous development in the sector of NPMs, regarding the technical development as well as the corresponding reaction of legislators and responsible authorities, the project team suggests that this study be updated after an appropriate period of time. Depending on future developments in certain sectors, and on future case studies detected, it may be reasonable to alternatively publish separate typologies reports on single categories of NPMs (*e.g.*, typology report on prepaid cards).

APPENDIX A: SUPPLEMENTAL NPM QUESTIONNAIRE RESULTS AND ANALYSIS

This section gives an overview of the responses by a total of 37 jurisdictions plus the European Union Commission to the questionnaire issued by the project team. The majority of the respondents identified NPMs in their jurisdiction with prepaid cards being most popular (34 of the countries have such providers), then followed by IPS providers with 17 countries and mobile payment services with 16 countries.

The summary of the information provided by each jurisdiction is provided in the following tables and is presented by NPM category, that is, prepaid cards, Internet payment services and mobile payment services.

- Table A: Short description of the NPM and market (when provided)
- Table B: Information on regulatory provisions and any additional information
- Table C: AML/CFT provisions can derive from regulations in place or from business practice
- Table D: Reports of AML/CFT cases or if any illegal operators have been found

Prepaid Cards

Prepaid cards is the largest NPM category with thirty-four countries (more than double the number (14) of countries identified in 2006) reporting its presence in their jurisdiction. All prepaid cards are issued by financial and credit institutions. However, the prepaid card programs are often managed by third parties that are not, in some instances, directly covered by the AML/CFT regime. Information regarding the market size is rarely available and when provided varies extensively, that is 300 to over 100 million card holders.

Thirty-three out of 37 jurisdictions reported some form of licensing and registration requirements, as well as supervision and AML/CFT provisions for prepaid card issuers and program managers. One country reported no licensing or registration requirements but indicated that such providers were supervised. Some countries such as United States and Mexico are currently in the process of making changes to their legislation and regulations to ensure a better AML/CFT coverage of such organisations.

Twelve countries indicated that it was possible to acquire prepaid cards anonymously in cases where the maximum account balance was limited. For other countries, it is not possible to do so.

A total of 18 case studies included in this report were provided by seven different countries. Seven additional countries referred cases for which not enough details were provided or it was impossible to provide them because of legislative limitations. All countries reported that no illegal operator was known to operate in their jurisdiction.

A. Description of Prepaid Cards

Countries	Short description of NPM	Examples of limits
Argentina	Prepaid cards are offered by about 7 providers; some cards issued are associated to a bank account, and for the other prepaid product the customer must be a client of the bank to obtain the card. Normal CDD measures must be applied (overall estimate of 929 000 cards and 7 providers)	
Australia	Prepaid cards are offered but no statistics regarding the number of providers and users were provided	Only the prepaid cards issued with a value limit of AUD 1 000 or more are covered by the Australian AML/CTF Act.
Belarus	Prepaid cards are offered by at least two providers and are issued by banks, and therefore fall under the same regulations as banks	
Belgium	About 106 providers mainly issued by banks	
Brazil	Prepaid cards issued by banks jointly with VISA and Mastercard but no further information provided	
Bulgaria	Two providers with about 5 000 cards – regulations are in accordance with EU Directives	
Canada	Six providers with nine products – all issued by banks jointly with credit card providers; cards loaded by online bill payment function from a bank account, cash at MSB agent location or authorised retailer location or financial institution, direct deposit in some instances, card to card transfers through SMS on cell phones; multiple cards can be linked to one account in at least one instance	Varies depending on card type but with maximum balance up to CAD 10 000; daily withdrawal limit up to CAD 2 000; daily purchases up to CAD 2 000; maximum per load up to CAD 10 000
Cayman Islands	One provider (money services business) with about 140 cards – no additional information was provided	
Colombia	2 providers with over 410,000 accounts; cards are issued by financial institutions and are Visa or Mastercard branded; they are used for low value payments; one the available cards is rechargeable	
Denmark	Prepaid cards issued by banks in conjunction with VISA and Mastercard but little information provided as to the features of the products.	
Estonia	No providers in jurisdiction and prepaid cards not used as payment instrument in Estonia – however, one prepaid card company registered in a foreign country and issuing cards in another country were found to be active in Estonia and other countries – that prepaid card company no longer active in Estonia	

Countries	Short description of NPM	Examples of limits
European Union	13 prepaid card issuers operating with e-money license. Of the 3 biggest prepaid products offered, 2 non-reloadable have a maximum limit of 150 EUR and one is a Mastercard reloadable prepaid; estimated 164 million cards at end of 2008	When maximum limit of 150 EUR for non-reloadable and 2 500 EUR for reloadable cards – no CDD necessary
France	All credit institutions can issue open-loop prepaid cards (about 1.3 million issued in 2008); most common type of prepaid card funded by bank transfers or credit cards held by parents; Among many other products, one virtual card is loaded with credit card or through SMS on cell phone; one other card is used for international money transfers and managed from the Internet or a mobile phone by SMS and is funded by credit card or mobile phone... latter can only be purchased in France but will be soon available to other European customers	First type is reloadable up to 600 EUR but initial load amounts no more than 100 EUR; for virtual card, transactions must be under 150 EUR; international money transfer card can be used for maximum 6 000 EUR per year for both receiving and sending (total)
Germany	About 100 providers and 300 000 to 500 000 cards – most of the cards issued by banks, often in association with retail companies, and can be used at ATMs and POS; also have some prepaid cards that are solely virtual, *i.e.,* only used online and no physical card provided to client	
Gibraltar	Two providers with 70 000 cards (one is only marketed in the UK and the other one is marketed in EU and EEA); due diligence limited to registered cards only	
Italy	180 providers with over 8 million cards for use at ATMs and credit card payment systems - various types including ones issued by post offices in Italy which can receive payments by one major IPS provider and can be funded by cash, transfer of funds from other card holder; another one issued by a bank can be funded by cash at bank branches, at ATMs belonging to same bank as issuer of the card, through Internet and mobile banking	Post office prepaid card is reloadable for a maximum of 3 000 EUR; another card can have a maximum load of 10 000 EUR; another one reloadable up to 5 000 EUR
Japan	8 major e-purses companies with over 105 million accounts; also referred to as prepaid certificates; funded and redeemed through bank transfers and credit cards; available at convenience stores, vending machines and department stores etc.	
Lebanon	Issued by banks and financial institutions and Visa or Mastercard branded with over 39 000 accounts; mostly purchased and used by individuals for Internet purchases	On average, total balance of USD 300
Luxembourg	2 providers – one provider estimated at 200 000 reloadable cards; another card is provided through EPT (postal services) which must be linked to a personal account at EPT	
Macao	Only one prepaid product and no further information provided with estimated 304 accounts – only credit card institutions can issue prepaid cards	
Mexico	6 credit institutions (4 in process) with overall number of over 2.6 million which provide anonymous and personalised cards	

Countries	Short description of NPM	Examples of limits
Netherlands	3 providers (2 offering only non-reloadable cards and one reloadable card used for payroll); issuers of prepaid cards are licensed as a credit institution or as an electronic money institution	Non-reloadable cards are from 5 to 50 EUR; Payroll prepaid card has a total maximum balance of 10 000 EUR and a daily maximum of 5 000 EUR
Norway	Prepaid card issued by all commercial and savings bank. And VISA mentioned as a prepaid but no further information provided (140 banks issued about 6 million)	
Peru	No providers seated in jurisdiction and no regulations currently exist but are under consideration	
Philippines	24 banks (including branches of foreign banks) have issued prepaid/cash cards; providers are considered electronic money issuers (EMIs) which are required to determine individual and consolidated balances of their e-money instruments; a total of over P350 million outstanding balance as of December 2009 and February 2010 in one instance and over 500 000 card holders for one provider (info not provided by other two providers) – see questionnaire response for more info on legislative framework	Aggregate monthly load limit of P100 per e-money (or card) holder – deemed very low
Portugal	5 providers and about 75 500 accounts; one is used by corporations which provide them to employees;	one reloadable card only used in Portugal has a maximum balance of 15 000 EUR, a maximum payment of 5 000 EUR or 20 transactions per day
Republic of Armenia	Six banks have issued over 1650 cards; only banks can issue prepaid cards	
Republic of Poland	4 types of prepaid cards all issued by banks licensed under Polish law and have either the VISA or Maestro logo. No further information provided in terms of limits, funding and withdrawal.	
Russia	18 providers with over 2 million cards; one of provider distributes the card on website, post office and couriers and it can be funded through mobile payments; some of the cards are virtual	
Singapore	The banks are fully liable for the stored value collected (more than 20 providers and over 15 million open-loop prepaid cards in circulation); one provider uses contactless technology primarily in transport sector and small retail (close to 10 million cards); another provider uses smart card technology retail purchases (close to 6.5 million cards)	
Slovak Republic	12 providers (banks) have issued almost 4 million cards; agents can serve as intermediaries and are covered under the Payment Services Directive (2007/64/EC)	
South Africa	Four different card types all issued by one bank and branded by Visa; over 100 000 cards	

Countries	Short description of NPM	Examples of limits
St. Vincent & the Grenadines	Two providers have issued over 16 000 cards; prepaid debit cards are only issued by local banks and there no intermediaries	
Sultanate of Oman	All prepaid are bank issued of which 2 are Visa International linked. No further information provided on products. (4 providers with close to 120 000 accounts)	
Sweden	Swedish credit institutions and Swedish financial institutions are allowed to issue prepaid debit cards.	
Ukraine	Not much info provided – just stats regarding STRs and possible cases involving prepaid cards	
United Kingdom	FSA regulates e-money issuers. Not all issuers are also providers of prepaid cards	
United States	Federal Reserve estimated that there were USD 13,3 billion worth of open-loop prepaid card purchase transactions in the US in 2006 (compared to $2,4 trillion for credit cards) – many different prepaid cards are available and can be funded using wire transfers or with cash at agents locations; some programs are managed by third parties who are responsible to identify customers and provide all transaction data to the issuing bank and notify the bank of suspicious transactions; some issuing banks manage their own programs; a new regulation currently under consideration, would require among other things that certain non-bank businesses managing prepaid card programs register with the US federal government	

B. Access to Activity

Slovak Republic	N	N	No info provided
South Africa	N	No details provided but mentioned that cases usually involve 419 scams (telemarketing fraud) and ACB credit fraud	N
St. Vincent & the Grenadines	N	N	N
Sultanate of Oman	N	No details provided but referred to phishing and skimming cases – details with Royal Oman Police	N
Sweden	N	N	N
Ukraine	no info	2 schemes and 2 cases provided but not very clear	no info
United Kingdom	N	2 generic examples – not real cases	N
United States	Y (Mastercard and Visa limit anonymous cards to 500 USD and 750 USD respectively)	Y	N

Internet Payment Services

The number (17) of countries reporting the presence of IPS providers remains almost the same as the one reported (15) in 2006. These refer to services which include online payments to merchants, to individuals (p2p) which are account-based. They can be funded by bank transfers, credit card, prepaid card, other IPS accounts and digital currency providers. Three additional countries only reported the presence of online banking services which are directly linked to bank accounts and not covered in this report.

Nineteen out of 37 jurisdictions reported some form of licensing and registration requirements, as well as supervision and AML/CFT provisions for IPS providers. One country reported no licensing or registration requirements but indicated that such providers were supervised. Only four countries indicated that it was possible to open IPS accounts anonymously under certain conditions such as when transactions are conducted under a low threshold.

A total of 14 case studies included in this report were provided by seven different countries. Five additional countries referred cases for which not enough details were provided or it was impossible to provide them because of legislative limitations. All countries for the exception of two countries reported that no illegal operator was known to operate in their jurisdiction.

A. Description of Internet Payment Services

Countries	Short description of NPM
Argentina	Cannot determine the numbers – same regulations than for financial institutions
Australia	A few providers are operating in this jurisdiction but no statistics were available
Belarus	A few providers appear to be operating in this jurisdiction and to fall under same regulations as banks but response to questionnaire was not clear
Belgium	No stats re providers and number of accounts
Brazil	2 providers
Bulgaria	Three providers with a total of about 45 000 accounts
Canada	One Internet payment services provider • Funding through local bank deposits, bank transfers (domestic & international), credit and debit cards • Redemption through prepaid cards, bank transfers (domestic and international) and cheques Four digital currency exchangers
Cayman Islands	No providers – however, such providers would be considered money remitters and therefore would be covered by Cayman Islands' Money Services Law
Colombia	Online payment service providers are not authorised in Colombia, therefore not subject to regulation and supervision; however, some online payment service providers seating in other jurisdictions are active in Colombia
Denmark	No info regarding online payment services
Estonia	11 credit institutions provide online banking services (not covered in this report) – not clear if it also includes online payment services; however, a new legislation which should be effective by the end of May 2010 will cover new payment institutions and electronic money institutions
European Union	18 online payment service providers in the EU (over 90 million accounts but not all active) – two main ones have 65 million and 10 million accounts respectively
France	Few online payment services in France (23 million customers by end of 2009)
Germany	No Internet payment system provider seated in jurisdiction but a number of IPS seated in

Countries	Short description of NPM
	European Economic Area (EEA) conducting business in Germany – licensed through the "European passport"
Gibraltar	No legislation currently in force requiring providers to register
Italy	One main provider – no other info provided
Japan	No info about providers
Lebanon	No providers seating in jurisdiction
Luxembourg	Only one provider – about 60 million in Europe and about 18 million that are active
Macao	Information provided appears to involve online banking services and not online payment services such as IPS providers covered in this report
Mexico	No information provided
Netherlands	One IPS linking customer's bank account to online purchases; also allowing payments to other Dutch bank accounts – 45 million transactions made in 2009 by 10 million bank accounts with a total turnover of 3.4 billion EUR
Norway	Information appears to be referring to online banking services (140 banks and 12 million accounts?)
Peru	No providers seated in jurisdiction and no regulations currently exist but are under consideration
Philippines	No statistics provided as both online banking services (not covered in this report) and online payment services cannot be distinguished; only banks were mentioned for their online banking services
Portugal	Not aware of any online payment service seated in jurisdiction
Republic of Armenia	No providers yet but draft legislation has been prepared to cover such providers
Republic of Poland	No info provided
Russia	About 23 providers – two main ones sharing about 90% of the market; total of about 13 million accounts; accounts can be funded through cash-in terminals (cash is deposited at the terminals and funded into e-money account by providing account number), post office, prepaid cards and e-currency exchangers
Singapore	MAS does not regulate non-FI online payment services and therefore does not have relevant info on them.
Slovak Republic	Provided info on both online banking services (not covered in this report and online payment services) for a total of 21 providers – number of online payment services not clearly identified
South Africa	No providers but Banks Act would cover such accounts since such providers would need to obtain a bank licence or partner with a bank
St. Vincent & the Grenadines	No providers
Sultanate of Oman	23 providers with almost 80 000 accounts – however appears to refer to online banking services and MSB services (*i.e.,* related to remittances?)
Sweden	Swedish credit institutions and Swedish financial institutions are allowed to offer online payment services – no other info provided
Ukraine	No information available as the online payment service is just about to be established
United Kingdom	Three main providers
United States	One main provider reported to have 81 million active accounts, and others are operating in the US

B. Access to Activity

Countries	Registration/Licensing (Y/N)	Supervision (Y/N)	Additional Information
Argentina	Y	Y	
Australia	N	Y	
Belarus	Y	Y

Mobile Payment Services

The number (16) of countries reporting the presence of mobile payment services providers has tripled in relation to the number (5) reported in 2006. These refer to services that are account-based which can be funded by bank transfers, credit card, prepaid card, and other NPMs. They are the services that use SMS or NFC technology. Two additional countries reported the testing of mobile payment services in their jurisdiction while two other countries only reported online banking services (directly linked to bank accounts) which are really the extension of banking services that are not covered in this report.

Twenty-one out of 37 jurisdictions reported some form of licensing and registration requirements, as well as supervision and AML/CFT provisions for mobile payment services providers. Only three countries indicated that it was possible to open mobile payment service accounts anonymously.

Only three case studies included in this report were provided by two countries. All countries reported that no illegal operator was known to operate in their jurisdiction.

A. Description of Mobile Payment Services

Countries	Short description of NPM	Examples of limits
Argentina	No information provided	
Australia	A number of mobile banking providers are operating in this jurisdiction but no specific statistics were provided regarding the number of accounts	
Belarus	No information provided	
Belgium	One provider recently established offering payments for small purchases and P2P payments; account loaded by bank transfers, credit card or debit card; payments done by SMS or by Internet mobile; considering offering international wire	

Countries	Short description of NPM	Examples of limits
	transfers in the future between Belgium and Northern Africa	
Brazil	One mobile service model is being tested	
Bulgaria	Three providers with a total of about 26 000 accounts	
Canada	Seven providers including five which are an extension of online banking and two that offer mobile banking through SMS – one of the latter, offered by telecommunications company, also offer a prepaid card on which funds can be transferred from mobile banking account; accounts can be funded by credit card, debit or prepaid card, or through wire transfers	Individual transactions limited to 250 CAD and 1 000 CAD is the maximum balance for the account
Cayman Islands	No providers – however, such providers would be considered money remitters and therefore would be covered by Cayman Islands' Money Services Law	
Colombia	No providers in jurisdiction but legislation covers such services which can only be offered by credit institutions	
Denmark	A number of mobile payment providers are available but no details were provided.	
Estonia	3 credit institutions offer mobile banking with over 250 000 accounts (however, nearly 82 000 seem to be inactive); SMS and NFC technology are both used	
European Union	Estimate of 8 providers in EU; accounts can be funded by credit card or bank transfers, and between account holders with the same mobile payment provider; payments done using SMS	
France	No providers yet but mobile payment services using NFC technology are being tested	
Germany	No mobile payments provider available	
Gibraltar	No providers	
Italy	Discussions about offering such services, some initiatives underway but no provider yet established	
Japan	No information provided	
Lebanon	No providers seating in jurisdiction	
Luxembourg	3 providers but no details	
Macao	No information provided	
Mexico	No providers but legislation applied to banking institutions could apply in terms of operational limits	
Netherlands	Two services available that are linked to a bank account and payments are made through SMS; one model using near-field communication (NFC) technology was tested but was not successful	One of them has a limit of 2 500 EUR in payments per year
Norway	2 providers with about 5 million customers	
Peru	Four banks offer online banking services through mobile phones and therefore are covered under AML regime; mobile payment services offered by non-bank entities are not currently regulated but such measures are under consideration	
Philippines	21 providers including banks and one non-bank provider; most of these relate to online banking services done through mobile phones; however, one e-money provider (non-bank institution and a wholly-owned subsidiary of a telecommunications company) offers a digital currency	

Countries	Short description of NPM	Examples of limits
	service (with over 1 million accounts) on mobile phones at the same time as providing digital currency exchange services (cash to e-money and vice-versa); another provider offers SMS technology to banks providing mobile services	
Portugal	Not aware of any mobile payment service seated in jurisdiction	
Republic of Armenia	No providers yet but draft legislation has been prepared and is under discussion.	
Republic of Poland	No information provided	
Russia	A number of different providers with the number of accounts reaching about 15 million in 2009 and the volume of mobile payments reaching about USD 230 million; SMS technology used to purchase services and goods, as well as transferring funds to another mobile payment account holder	
Singapore	There are several mobile payment service operators testing various types of services including ones using NFC technology. MAS does not supervise or regulate such service operators and therefore does not have additional info.	
Slovak Republic	3 providers	
South Africa	One current provider (with 40 000 active accounts) and another one under development	
St. Vincent & the Grenadines	No providers	
Sultanate of Oman	4 providers with over 120 000 accounts offered by telecommunications companies and banks, using SMS at least for one program	
Sweden	Swedish credit institutions and Swedish financial institutions are allowed to offer mobile payment services – no other info provided	
Ukraine	No information available as the mobile payment service is just about to be established	
United Kingdom	The industry has yet to take off in the UK. Mobile phones only used as a communications methods with a payment service provider, rather than the phone being the payment instrument itself.	
United States	Mobile payment services market is still in the start-up stages but some providers are present – some services are linked to bank accounts (extension of online banking) but some are linked to IPS and sometimes offered in combination with prepaid cards or credit card providers

APPENDIX B: EXCERPTS FROM THE 2006 REPORT ON NEW PAYMENT METHODS

This section provides an overview of the general characteristics and functions of specific New Payment methods, as described in the 2006 typologies report on New Payment Methods. These excerpts are presented in order to provide readers that are not familiar with the general working mechanisms of NPMs, with a general overview of the technical background of these instruments. For more detailed information, interested readers are referred to the 2006 report itself, which contains more information and features additional instructive appendices (www.fatf-gafi.org/dataoecd/30/47/37627240.pdf).

Prepaid cards

Prepaid payment cards provide access to monetary funds that are paid in advance by the cardholder. While there are many different types of prepaid cards that are used in a variety of ways, they typically operate in the same way as a debit card and ultimately rely on access to an account. There may be an account for each card that is issued or, alternatively, there may be a pooled account that holds the funds prepaid for all cards issued. The cards may be issued by, and accounts may be held at, a depository institution or a non-bank organization; pooled accounts would be normally held by the issuer at a bank.

Prepaid cards can be issued for limited or multiple purposes. Limited-purpose or *closed system* prepaid cards can be used for only a limited number of well-defined purposes and their use is often restricted to specific points of sale or for specific services. Examples include merchant-issued gift cards, prepaid long distance service, and mass transmit system cards. These cards may either be limited to the initial value posted to the card (non-reloadable) or may allow the card holder to add value (up to a certain limit) and reuse the card (reloadable). The issuer of the card or its service provider typically operates the network on which the cards can be used. The value on the cards generally is linked to a prepaid account established by the issuer or service provider. Transactions are processed in a similar fashion to transactions involving debit or credit cards.

Multipurpose or *open-system* prepaid cards can be used across a broader range of locations for a wider range of purposes. Such cards may be used on a national or international scale but may sometimes be restricted to a certain geographical area. Multipurpose cards may be used by the person who purchased the card or by someone else. Examples include payroll cards and general purpose "cash cards" for individuals without bank accounts or a credit card. These cards are usually associated with a card payment network, such as Visa or MasterCard, which permits them to be used in the same manner as a debit card to make purchases or to get cash from an automated teller machine (ATM). Some issuers do not require the cardholder to have a depository account. These cards are distributed by merchants, depository financial institutions, and money/value transfer (MVT) systems for a variety of purposes. Most are reloadable.

---

[15] The expression "bank account" used in this box refers to accounts held at financial institutions that are subject to AML requirements.

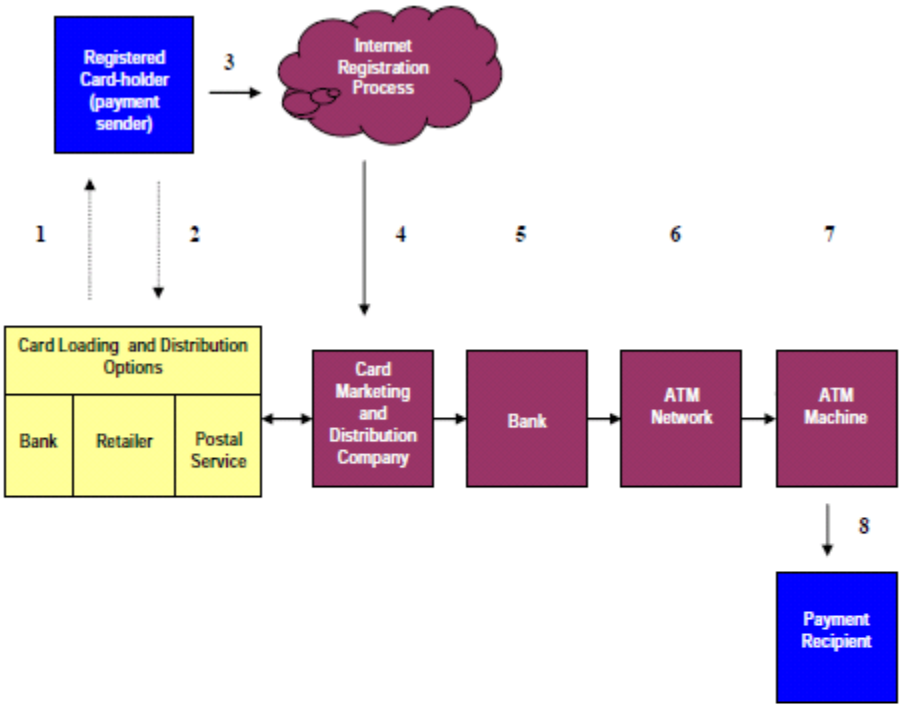

Figure 1 The process of issuing an open-system, magnetic strip, prepaid card varies by issuer. Steps (1), (2), and (3) above may occur in any order. In those three steps an individual completes the registration process for a prepaid card, prepays funds into the card account, and receives the card. Step (4) is the transfer of registration information to the service provider. When a card carries a bank association service mark (as in the case of MasterCard- or Visa-branded cards), the service provider must contract with a bank (5) in order to have access to the global ATM networks (6). Individual ATM machines (7) connect to local networks and often global networks allowing individuals in one country (8) to access funds held in another country.

Electronic purse

An electronic purse, or e-purse (also referred to as a "stored value card" as the value is stored on the card), is value stored electronically in a device such as a card with an integrated circuit chip (called a smart card or chip card).[16] Unlike a card with a magnetic stripe, which stores account information, an e-purse actually stores funds on the card's memory chip. The user is literally carrying his funds with him on the card (hence the name electronic purse).

In some e-purse programs value can be transferred from the card directly to participating merchants or another individual without the transaction going through an account at an intermediary. This may limit the amount of

[16] This definition augments slightly the normal CPSS usage of the term "electronic purse" to also encompass the term "electronic money". For the purposes of this report, the term electronic purse is "a reloadable, multi-purpose prepaid card which may be used for small retail or other payments instead of coins" where the "value is stored electronically in a device such as chip card."

identifying information available with such transactions. To obtain funds from an e-purse payment, however, the merchant or individual must redeem the value from an account held by the e-purse provider at the e-purse issuing institution. As the funds are on the card, no online connection and no cardholder identification are needed to make a payment. The electronic purse function was designed to substitute for cash in everyday situations. Today, electronic purses are mainly used for micropayments such as for public transportation, parking tickets or vending machines.

The development and use of card-based e-purses has declined considerably over the past decade so that very few e-purse systems remain in existence. In addition, these few remaining e-purse solutions are generally not interoperable regardless of the market in which they operate. Only one system, the German GeldKarte that operates in the border area of Germany and Luxemburg (See Figure 2), is known to be used in multiple national jurisdictions. Furthermore, e-purses usually have a limited storing capacity for funds (e.g. the German GeldKarte has a load limit of EUR 200).

Figure 2

Mobile Payments

Mobile payments refer generally to the use of mobile phones and other wireless communications devices to pay for goods and services. Payments are initiated from a mobile communications device using voice access, text messaging protocols (such as short/single messaging service or SMS), or wireless application protocols (WAPs) that allow the device to access the Internet. Authorization often occurs by keying in a unique personal identification number (PIN) associated with the customer or mobile device. Adoption of mobile payments varies from country to country. Use of mobile phones as a means to initiate payments is relatively widespread in Southeast Asia and in some European countries.[17]

Most mobile payment services simply use the phone as an access device to initiate and authenticate transactions from existing bank accounts or payment cards.[18] This is the equivalent of using the Internet to initiate a direct debit or credit transfer from a bank account, or a credit or debit card transaction. This is an extension of traditional payment methods.

New mobile payments: Where mobile payment services are not based on an underlying bank or payment card account, the telecom operator typically acts as a payment intermediary to authorize, clear, and settle the payment.[19] Telecom companies engaged in these activities may not be overseen by a country's central bank or other banking regulator but may be subject to AML/CFT measures.

The telecom operator may either allow the phone owner to charge certain transactions to the phone bill (post-paid) or may permit the phone owner to fund an account held by the telecom operator or other service provider for the purposes of making payments (prepaid). Prepaid mobile payments accounts operate in the same manner

---

[17] See CPSS, "Policy issues for central banks in retail payments," BIS, CPSS #52, March 2003, at http://www.bis.org/publ/cpss52.htm.

[18] See CPSS, "Survey of developments in electronic money and internet and mobile payments," BIS, CPSS #62, March 2004, at http://www.bis.org/publ/cpss62.htm.

[19] Telecom companies offering mobile payment services provide for the settlement of the payment transactions completed via their systems through normal banking channels.

as a prepaid card or an electronic purse. When the phone is used in the same manner as a prepaid card, the phone owner uses the phone as a payment system access device to authorize the deduction of value from the prepaid account. When the phone functions as an e-purse, the prepaid value is stored on the subscriber identify module or SIM card within the mobile phone.

Post-paid and prepaid card-like mobile payments are much more common than e-purse mobile payments. In the case of prepaid mobile payments, telecom providers often offer this service in conjunction with a bank. For example, in the Philippines two telecom companies offer mobile payment services, Globe Telecom and Smart Communications. Smart Communications' Smart Money is co-branded with Banco de Oro. The transactions and funds transfers Smart Money users initiate via their mobile phone are authorized against a prepaid account held at Banco de Oro. Smart Money users can also send cross-border remittances by providing relatives with a MasterCard-branded prepaid card linked to the Smart Money account that can be used to withdraw cash from an ATM.

Globe Telecom serves as the intermediary for funds transfers using G-cash and operates without a bank partner. As a result, Globe customers cannot withdraw funds from their prepaid accounts at ATMs but only over the counter at participating businesses. Figure 3 illustrates a G-Cash funds transfer from one Globe Telecom subscriber to another using SMS. Both G-Cash and Smart Money are subject to AML/CFT regulations (including suspicious transaction reporting) and supervision.

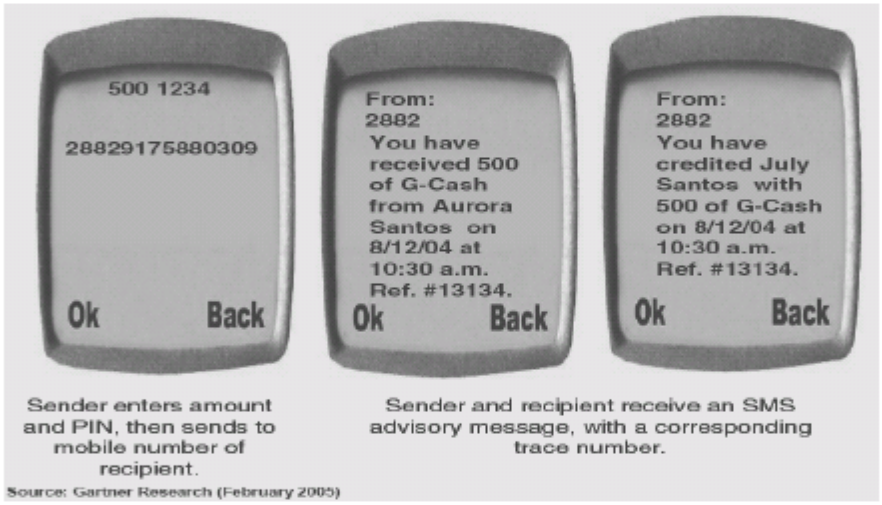

Figure 3 G-Cash Phone-to-Phone Remittance

Internet payment services

The expression "Internet payment services" is generally used to address: (i) payment services that rely on a bank account and use the Internet as a means of moving funds to or from a bank account; and (ii) payment services provided by non-bank institutions operating exclusively on the Internet and that are only indirectly associated with a bank account.

In the former case, Internet payment services refer to traditional payment methods where the Internet is only an innovative channel to exchange the information that is needed to move the funds from one account to another, which allows customers to access their bank accounts from home, 24 hours a day.

Where Internet payment services do not rely directly on a bank account, such as PayPal, individuals can transfer funds, shop online, or participate in online auctions, using a pre-funded account; however, the payment service provider may not be subject to the same AML/CFT measures that apply to banks. The service provider usually

will not have a face-to-face relationship with its customers. Depending upon the accessibility of the Internet payment service, these activities can involve payments or funds transfers across national borders.

Some non-bank Internet payment services allow customers to hold accounts with the payment service provider, while others offer only to send or receive individual payments using the customer's existing bank or credit card account. When non-bank Internet payment services offer customer accounts they may pool those customer funds in a single account at a bank. The account may be held in the name of the service provider. In that case, the bank holding the service provider's account may have no direct relationship with the service provider's individual customers.

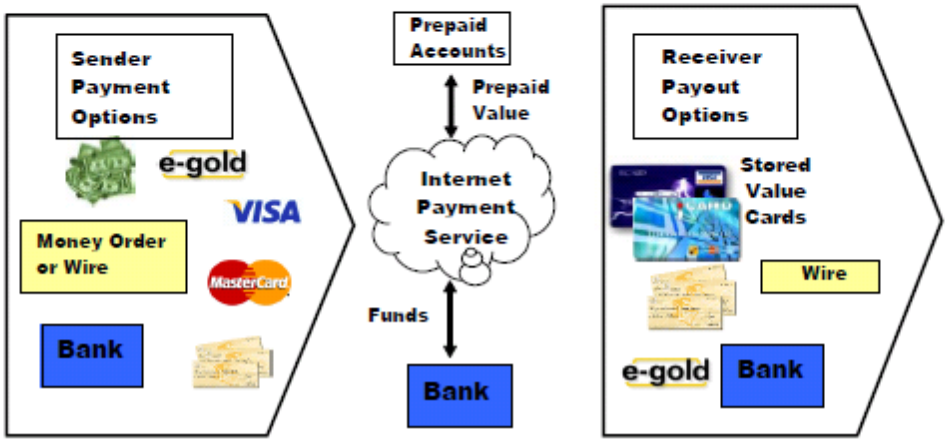

Figure 4

While a limited number of similar products exist in certain countries, PayPal appears to be the most widely used non-bank, Internet-based NPM. PayPal primarily functions as a payments intermediary for individuals and organizations that wish to trade with each other or transfer funds via the Internet. PayPal operates by allowing an individual to set up a pre-paid account in his name with PayPal that can be funded from a credit or debit card or a bank account via a credit transfer. Using those pre-paid funds, individuals can buy items or transfer funds to other PayPal account holders. The payment or transfer of funds occurs as a book-entry transaction between the PayPal accounts. When an individual wishes to access the funds in his PayPal account, he directs PayPal to credit his credit or debit card or bank account via a credit transfer or even a paper check.

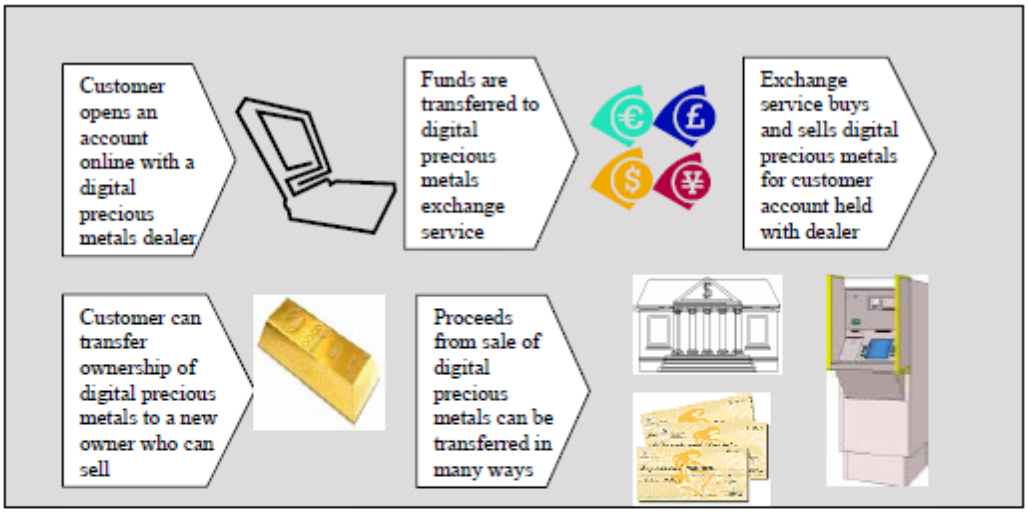
Service providers will differ as to the methods of payment they will accept to initiate a funds transfer, and the methods of payment they will use to distribute funds to the recipient. Figure 4 above illustrates how an individual can use a bank-issued credit card or other traditional payment methods to fund an Internet-based transaction account and subsequently make purchases or transfer all or a portion of the prepaid value to another account holder via book-entry by the service provider. The recipient can then use those funds to conduct additional transactions or withdraw the money via a traditional retail payment method. Online money transfer services set their own terms as what form of payment they will accept from senders and what forms of payment they make available to receivers.

Digital precious metals[20]

Digital precious metals are a relatively new online MVT system that involves the exchange of options or the right to purchase an amount of precious metals at a specific price. These derivatives can be exchanged, like traditional commodity or securities derivatives, between account holders in a digital precious metal service. Consumers purchase a quantity of virtual precious metal holdings based on the current price of the metal on the world commodity exchanges. Once a purchaser has acquired a quantity of the virtual precious metal, those holdings or a portion of them can be transferred either to another individual or a merchant in exchange for goods and services.

The oldest and best known of the digital precious metals dealers is e-gold Ltd., which claims to have almost 2 million accounts.[21] According to e-gold and other digital precious metals dealers, the rationale for using this store of value is to facilitate online transactions without regard for underlying currencies or access to foreign exchange. Transactions involving digital precious metals have immediate finality, which may appeal to online merchants that must pay high credit card interchange fees due to high fraud rates. Some digital precious metals dealers also allow users to maintain anonymous accounts. These traits are concerning to U.S. federal law enforcement agencies.

The transaction process associated with transferring the virtual holdings of precious metals between account holders can involve two separate service providers: the digital precious metals dealer, which maintains the accounts that contain the virtual holdings of precious metals; and the digital precious metals exchange service, which can act as a broker for the digital precious metals that the dealers buy or sell. Some dealers transact directly with account holders. Upon completion of a transaction, the selling account holder transfers ownership of his virtual precious metal holdings to the purchaser and can receive the proceeds of the sale through a variety of traditional and non-traditional payment methods (See Figure 5).



[20] The issuers of digital precious metals use the term "digital currency" to describe the barter arrangement they facilitate. Because of the potential confusion this common industry term would create with the term "e-purse" and "e-money", we have adopted the term "digital precious metals" for this report.

[21] E-dinar is a spin-off of e-gold and is affiliated with the Islamic Mint, a private organization working to revive the gold and silver currencies described in the Koran, the gold dinar and silver dirham. See: www.e-dinar.com.

Figure 5 Buying and selling digital precious metals typically involves working with two separate service provider categories: the digital precious metals exchange service and the digital precious metals dealer.

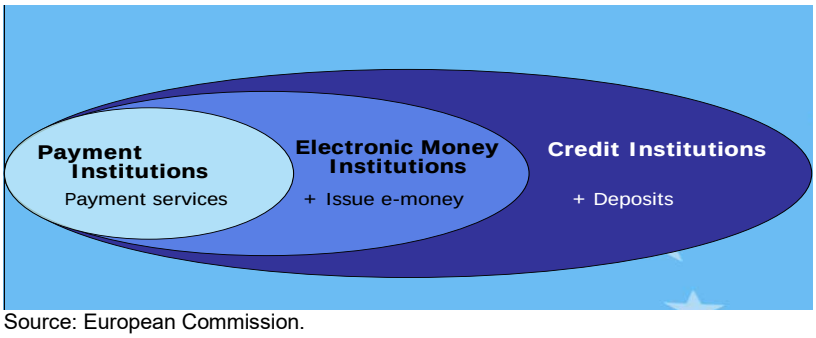
APPENDIX D: THE EU LEGAL FRAMEWORK FOR NEW PAYMENT METHODS

The EU legal landscape for payments has dramatically changed since 2006: Regulation (EC) No. 1781/2006 transposed FATF SRVII[92]; the Payment Services Directive (2007/64/EC - PSD') provided a supervisory regime for the provision of payment services by non-banks and harmonised the rules governing the provision of payment services across the EU, thus enacting FATF SRVI; the new E-Money Directive 2009/110/EC (the new EMD) will replace the current EMD (2000/46/EC). Besides such reforms, the third Anti-Money Laundering Directive (AMLD) 2005/60/EC[93], adopting a risk-based approach, envisaged thresholds for applying Simplified Customer Due Diligence to electronic money; such thresholds have been revised by the new EMD.

The Payment Service Directive: new entrants in the payments market

The PSD provides the legal foundation for the creation of an EU-wide single market for payments; from a supervisory point of view, it bans carrying out payment services without an appropriate licence or registration. A new category of payment service provider (the "payment institutions") has been created besides those which are connected to taking deposits (banks) or issuing electronic money (electronic money institutions): with a license as payment institution non-banks (such as telecommunication companies) will have access to the payments market.



Source: European Commission.

The licensing regime allows payment institutions to provide payment services across the entire EU territory. Examination of the AML/CFT scheme by competent authorities is part of the decision-making process following the application to become payment institution. In addition, following a risk-based approach, the PSD provides for a waiver regime[94] whereby natural or legal persons unable to meet all the

---

92 The provisions related to FATF SRVII were not considered relevant by the project team for the purpose of this report.

93 OJ L 309, 25.11.2005, p. 15–36.

94 This waiver regime aims to *"bring all persons providing remittance service within the ambit of certain minimum legal and regulatory requirements*

prudential requirements may nevertheless carry out payment services at national level; AML/CTF measures apply also to waived payment institutions.

A fundamental change introduced by the PSD was the abolition of the exclusivity principle pursuant to which entities engaged in financial activities could not carry out business activities: this reform allows new operators, including telecom or IT providers, to enter the payment market and develop innovative payment services.

To date, the PSD has been implemented in the vast majority of the Member States of the EU/EEA.[95]

The legal framework for e-money issuance

The issuance of e-money has been regulated in the EU since the year 2000. Electronic money can be issued by electronic money institutions or by banks: both categories of financial institutions are subject to prudential supervision.

The definition of e-money provided by the current EMD has posed many problems of interpretation mainly due to its absence of technical neutrality and the lack of clarity with regard to services falling within grey areas. This is why the new EMD refines the definition to substantially cover all situations where the payment service provider issues a pre-paid stored value in exchange for funds, which can be used for payment purposes because it is accepted by third persons as a means of payment[96].

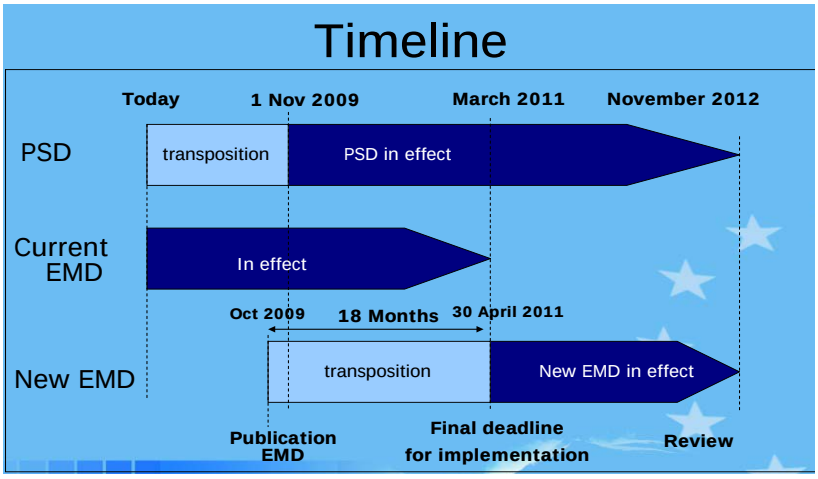
Another significant change introduced by the new directive is the further alleviation of prudential requirements for electronic money institutions and the extension of the activities they may engage in, to cover the full range of payment services and include the provision of credit facilities linked to the payment services provided. As a matter of fact, the too restrictive regime provided for by the first EMD was deemed to be the main cause of the lack of expansion of the e-money market in the EU outside the banking system[97]. The new regime for the issuance of e-money aims at facilitating market access to newcomers, namely telecommunication companies or large-scale retailers who want to engage in the market of e-money. Following the PSD, the exclusivity principle will no longer apply to EMIs. Such increased flexibility will facilitate cross-over of new payment methods (e.g., on-line payment accounts with m-payments) and with traditional payment methods used for the purpose of money remittance (e.g., money remitters with m-payments or prepaid cards).

---

95 The European Economic Area includes all EU Member States, Norway, Liechtenstein and Iceland.

96 In practice, electronic money can be either cards based or server based. In the former case the funds are stored on a chip of a physical smart card, in the latter mostly on a computer hard disk. The cards used for the storage of money can be prepaid-cards or so-called electronic purses. A special type of cards related e-money is the payment by way of using the SIM-cards of a mobile telephone. Server based e-money is also known as software or network money.

97 This legal framework restricted the e-money institutions' activities to the issuance of electronic money and the provision of closely related financial and non-financial services, such as the administering of e-money and the issuing and administering of other means of payment. This implied that activities such as mobile telecommunications services or retailing could not be performed by EMIs. Companies engaged in these businesses and willing to issue electronic money therefore had to split up their activities in two separate entities. Granting any form of credit was also an excluded activity. The framework included a strict prudential regime for electronic institutions, which was designed with the regime for banks as main point of reference.



Source: European Commission.

3. The Third Anti-Money-Laundering Directive (2005/60/EC)

The Third AML Directive (2005/60/EC) is the principal European Act setting Anti-Money Laundering measures; e-money institutions fall under its scope of application. This directive requires financial institutions and other players in key services and sectors to implement, inter alia, Customer Due Diligence (CDD) measures, *i.e.*, identify and verify the identity of their customers. Following a risk-based approach, simplified Customer Due Diligence is allowed in appropriate cases upon discretion of single Member States. Regarding the issuance of e-money products, the AMLD enables Member States to allow e-money issuers to apply simplified Customer Due Diligence where:

- if the device cannot be recharged, the maximum amount stored in the device is not more than EUR 150,
- if the device can be recharged, a limit of EUR 2,500 is imposed on the total amount transacted in a calendar year, except when an amount of EUR 1,000 or more is redeemed in that same calendar year by the bearer.

Most EU Member states define simplified CDD in this sense as applying no CDD measures at all (which is considered in line with the AMLD by the EU Commission). A few member states do not allow their EMI to refrain from CDD completely even in such "low-risk" cases as they believe this would not be in line with Recommendation 5 (cf. crit. 5.9 of the FATF methodology; this is discussed in detail in section 5.2 of the report).

The payments industry expressed some concerns according to which the requirements aimed at countering money laundering and terrorist financing - namely, full application of identification and record keeping requirements - pose a particular challenge in the case of electronic money due to the low average amounts involved in electronic money transactions; this is why the new EMD increases the former threshold for applying Simplified Customer Due Diligence. For non-rechargeable devices the threshold is increased up to EUR 250 (from the current EUR 150). Member States will also have the option to increase such threshold up to EUR 500 for national transactions only. For rechargeable devices the current threshold (EUR 2500) is maintained.

According to the information available to date, the vast majority of Member States has made use of the option for not applying CDD to e-money below the thresholds; with the transposition of the new EMD this choice could be confirmed. In those Member States where the option is not used, as well as in those cases where e-money instruments exceeding the correspondent thresholds are issued, normal CDD measures apply[98].

In all cases where the issuance of e-money instruments is linked to a bank account (*i.e.*, where it is typically the e-money institution itself issuing the product), CDD measures have to be applied when the account is opened and funded. The compliance with these obligations is subject to supervision by national competent authorities.

Notwithstanding the provisions described above, CDD measures must be applied in any case of a suspicion of ML/TF irrespective of the product or transaction.

98 These obligations apply when: (i) establishing a business relationship; (ii) carrying out occasional transactions amounting to EUR 15 000 or more, whether the transaction is carried out in a single operation or in several operations which appear to be linked; (iii) there is a suspicion of money laundering or terrorist financing, regardless of any derogation, exemption or threshold; (iv) there are doubts about the veracity or adequacy of previously obtained customer identification data.

APPENDIX E: GLOSSARY OF TERMS

Agent

A person or business which acts on behalf of a principal entity in providing payment services. If the principal is a regulated financial institution, it is responsible for the actions of its agent and also remains liable for its own AML obligations. For the purposes of this report, the terms "agent" and "outsource" shall be considered synonymous.

For the purposes of FATF Special Recommendation VI, the glossary to the FATF methodology and the Interpretative Note to Special Recommendation VI define the term "agent" as follows:

"For the purposes of Special Recommendation VI, an *agent* is any person who provides money or value transfer service under the direction of or by contract with a legally registered or licensed remitter (for example, licensees, franchisees, concessionaires). "

Sub-Agent

A person or business acting on behalf of an agent to provide payment services.

"Bank based" business models

For the purposes of this report, bank based models are such models that require each customer to have an individual bank account in order to make use of the NPM service. The term does not stretch out to any business model that has any cooperation with a bank (*e.g.*, many NPM providers need to have a bank account in order to receive funds from customers, or to pay out funds to customers).

Brick-and-mortar exchanger

An exchanger that conducts all business on a face-to-face basis.

Card program manager

The entity responsible for establishing and running prepaid card business models in cooperation with a bank or electronic money institution. The program manager will usually market the prepaid cards and establish relationships with banks and distributors or customers. They typically do not themselves issue electronic money and are therefore not a regulated entity.

Some issuing institutions also manage their card programs themselves, *i.e.*, without cooperation with card program managers.

Cash vouchers

A prepaid product which can be purchased at several retailers and used for person - to -business (P2B) or person-to-person (P2P) transactions on the Internet.

Cash-back

Merchant points of sale (POS) used to withdraw cash by overpaying for purchased merchandise and receiving the overpaid amount in cash.

Customer Due Diligence (CDD)

According to FATF Recommendation 5, the customer due diligence (CDD) measures to be taken are as follows:

a) Identifying the customer and verifying that customer's identity using reliable, independent source documents, data or information[4].

b) Identifying the beneficial owner, and taking reasonable measures to verify the identity of the beneficial owner such that the financial institution is satisfied that it knows who the beneficial owner is. For legal persons and arrangements this should include financial institutions taking reasonable measures to understand the ownership and control structure of the customer.

c) Obtaining information on the purpose and intended nature of the business relationship.

d) Conducting ongoing due diligence on the business relationship and scrutiny of transactions undertaken throughout the course of that relationship to ensure that the transactions being conducted are consistent with the institution's knowledge of the customer, their business and risk profile, including, where necessary, the source of funds.

Digital currency exchanger

(See "Digital currency provider")

Digital precious metals

(See "Digital currency provider")

Digital currency provider (DCP)

A type of internet payment service. Digital currency providers (DCP) keep and administer accounts for their customers, but typically do not directly issue "digital currency" to their customers/account holders. Instead, customers purchase their digital currency from exchangers, who will then transfer the purchased amount of digital currency into the customers DCP account. Funds kept in DCP accounts may be denominated in fictitious currencies or in real currencies. A sub-type of DCP denominates the funds in units of precious metal and supposedly invests funds received in that respective precious metal as a means of deposit protection. These DCP are also called "Digital precious metals providers".

Distributor

A company that sells products produced by other companies to consumers. Distributors may also offer a range of services to their customers, such as technical support.

Intermediary

A very general term for a person or company that acts as a mediator between parties, acting in cooperation with the NPM provider to provide services to customers. The term covers all types of third parties that are in the chain between the NPM provider and the customer, potentially including agents, distributors, retailers, exchangers and others.

(Electronic) Point of Sale – (E)POS

Merchant or shop that accepts a certain payment method as a means of payment. A POS usually requires certain technical devices or terminals in order to be able to make use of the payment method (*e.g.*, a card terminal to swipe the prepaid card, or special software to integrate the possibility for paying via Internet payment services in online shops).

Electronic Money ("E-Money")

While the term "electronic money" is used in the FATF methodology´s definition of *financial institutions*, the glossary does not provide a definition of the term *electronic money* itself.

Some jurisdictions use "electronic money" as a technical term in their legislation. For example, Art. 2 para. 2 of the revised EU Electronic Money Directive defines electronic money as follows:

"'electronic money' means electronically, including magnetically, stored monetary value as represented by a claim on the issuer which is issued on receipt of funds for the purpose of making payment transactions (…)and which is accepted by a natural or legal person other than the electronic money issuer "[99].

Other jurisdictions´ definitions of electronic money may differ.

Electronic purse

An electronic purse, or e-purse (also referred to as a "stored value card" as the value is stored on the card), is value stored electronically in a device such as a card with an integrated circuit chip (called a smart card or chipcard).[100] For the purpose of this report, the term "electronic purses" is folded into the term "prepaid cards", as the method of storing the value (either centrally on a server or on the card itself) is no longer considered of relevance for the risk assessment of the card product.

Internet payment services

---

99 EU Directive 2009/110/EC (http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:32009L0110:EN:NOT)

100 FATF Report on New Payment Methods (www.fatf-gafi.org/dataoecd/30/47/37627240.pdf)

For the purposes of this report, the expression "Internet payment services" is used to address payment services operating exclusively on the Internet that are not or only indirectly associated with a bank account and may also be provided by non-bank institutions[101]. The expression does not include payment services that rely on a bank account and use of the Internet as a means of moving funds to or from a bank account ("online banking").

Merchant

A business that sells goods or services to consumers and maintains an arrangement with an acquirer to process transactions.

Mobile banking

Users can access traditional banking services through their mobile telephone. This is different from mobile payments in the sense that the regulated entity is a bank providing traditional banking services.

- **Mobile financial information services**

  Users may view personal account data and general financial information, but transactions cannot be executed using the service.

- **Mobile bank and securities account services**

  Users may transact in a similar fashion to internet banking.

Mobile payment services

Allows non-bank and non-securities account holders to make payments with mobile phones. However, payment service providers may be non-traditional financial institutions with widely varying controls and supervision measures.

Mobile money services

A subtype of mobile payment service, where subscribers are able to store actual value on their mobile phone (similar to e-purses). They may use phone credits or airtime as tender for payment. Such systems offer versatility but may fall out of regulation and prudential supervision altogether.

Money or value transfer service

Money or value transfer service refers to a financial service that accepts cash, cheques, other monetary instruments or other stores of value in one location and pays a corresponding sum in cash or other form to a beneficiary in another location by means of a communication, message, transfer or through a clearing network to which the money/value transfer service belongs. Transactions performed by such services can involve one or more intermediaries and a third party final payment.[102]

Money remittance

---

101 FATF Report on New Payment Methods (www.fatf-gafi.org/dataoecd/30/47/37627240.pdf)

102 See glossary to the FATF methodology.

A term commonly used to describe international money or value transfers by economic migrants to their home nation.

Negotiability

The level of acceptance across retailers for different payment methods. Some payment methods may have high negotiability because they are widely accepted but others may be very limited.

New payment methods (NPM)

For the purposes of this report, the term "New Payment Methods" encompasses prepaid cards, mobile payment services and internet payment services (IPS).

Open-loop prepaid card

A prepaid card which can be used at a wide range of terminals (vs. closed-loop prepaid cards with limited negotiability)

Outsourcing

An arrangement between a company and a service provider to provide services which would otherwise be carried out by the company itself. It is important to note that responsibility for ensuring compliance ultimately remains with the company. For the purposes of this report, the terms "agent" and "outsource" are used synonymously.

P2B

Person-to-business transaction.

P2P

Person to person transaction.

Phishing

Phishing is a criminal technique used to illegally obtain valuable information. For example, consumers will be sent fake e-mails from addresses that mimic those of banks. These emails will then dupe consumers into entering their account details.

Ponzi schemes

An investment scam that appears to pay high returns to investors. However these returns are paid from the investor's money or by incoming funds from new investors. The fraudster will either disappear with the money invested or the scheme will collapse.

Prepaid card

A payment card pre-loaded with funds. The card can then be used at businesses where the card type is accepted, including on the internet and abroad.

Prepaid card issuer

A bank or other financial institution that issues prepaid cards.

The term issuer is also used in connection with other types of NPM "value", *e.g.*, issuer of electronic money, or of digital currencies. The issuer is the entity that the customer has a contract with, and from whom the customer can demand redemption or withdrawal of funds.

Prepaid internet payment products

Products offered by firms which allow customers to send or receive funds through a virtual prepaid account. In some jurisdictions these firms may not fall within the definition of a "credit institution".

Processor

A company that processes transactions on behalf of an acquirer or merchant.

Red Flags

Indicators of suspicious activity where a product's actual use deviates from its expected usage. Red flags should therefore be tailored to the product's characteristics.

Smart cards

Cards featuring an electronic chip. This is usually used to process additional customer information.

Straw man

A real or fictitious individual used by others as a front for illegal activities such as money laundering and fraud.

Utility

A measure of the variety of payment options offered by a particular type of payment method. For example, some payment methods may offer person to business (p2b) transactions only while others may also allow for person to person (p2p) payments.

Virtual worlds

A simulated world which exists within a virtual environment. This commonly refers to computer games which are based on the internet such as Second Life. Often the economy is based upon a digital currency which can be bought and/or converted into real money.

COUNCIL OF EUROPE – COUNTERING MONEY LAUNDERING AND FINANCING OF TERRORISM (MONEYVAL)

The Committee of Experts on the Evaluation of Anti-Money Laundering Measures and the Financing of Terrorism - MONEYVAL (formerly PC-R-EV) was established in 1997. At their meeting of 13 October 2010, the Committee of Ministers adopted the Resolution CM/Res(2010)12 on the Statute of the Committee of Experts on the Evaluation of Anti-Money Laundering Measures and the Financing of Terrorism (MONEYVAL). This new statute elevates MONEYVAL as from 1 January 2011 to an independent monitoring mechanism within the Council of Europe answerable directly to the Committee of Ministers. The aim of MONEYVAL is to ensure that its member states have in place effective systems to counter money laundering and terrorist financing and comply with the relevant international standards in these fields.

For more information about MONEYVAL, please visit the website:

WWW.COE.INT/T/DGHL/MONITORING/MONEYVAL

THE FINANCIAL ACTION TASK FORCE (FATF)

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering and terrorist financing. Recommendations issued by the FATF define criminal justice and regulatory measures that should be implemented to counter this problem. These Recommendations also include international co-operation and preventive measures to be taken by financial institutions and others such as casinos, real estate dealers, lawyers and accountants. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit the website:

EXECUTIVE SUMMARY

1. This joint FATF/MONEYVAL report contains information on money laundering and terrorist financing methodologies associated with the money remittance and currency exchange sector. The findings contained in the report derive from information provided by 61 FATF, MONEYVAL and Egmont Group member States and other open source material. Though the focus of the report is to a certain degree on the MONEYVAL region and the wider European area, the experience of countries from other regions of the world was actively sought and integrated into the report.

2. Apart from providing a useful general overview of the sector of money transfer remittances and currency exchange providers, the regulatory framework, the supervision and sanctioning regimes, the report sets out identified money laundering and terrorist financing methods and techniques involving money remittance and currency exchange providers.

3. Several case studies described in this report illustrate that money remittance and currency exchange businesses have been both witting and unwitting participants in laundering activities, in all three stages of the process (placement, layering and integration), and in certain instances, for terrorist financing purposes. The identified risks of ML/TF through the sector detailed in the report are related to clients, owners or agents. The cases highlight also the links between money laundering in the money remittance sector and other criminal activities (*e.g.*, fraud, trafficking in human beings, smuggling, drug trafficking, economic crime).

4. A number of vulnerabilities to money laundering across the sector that make up the money remittance and currency exchange sector were identified. The analysis of the case studies and other materials enabled the project team to compile numerous examples of indicators of potential money laundering activities related to transactions, customer profile and behaviour as well as specific indicators for bureaux de change and money remittance providers that may help the industry to identify and describe suspicious behaviours and protect themselves against money launderers and other criminals.

5. Clearly, laundering through money remittance and currency exchange providers poses a number of regulatory and enforcement challenges. At the same time, it was observed that there is low detection of money laundering in comparison to the size of the industry as a whole. The money laundering and terrorist financing threat in the sector not only results from direct penetration of criminals into operations of money remittance or currency exchange providers. The absence or lax implementation of AML/CFT standards and adequate related policies provide opportunities which are being exploited by money launderers and other criminals.

6. Finally, the report maps also a number of issues and areas which were identified in this context as appearing to require additional efforts, both from regulatory and supervisory authorities as well as from the industry, in order to reduce the misuse of the sector and ensure that ML/TF risks are adequately addressed. These issues will likely require further investigation together and updating research, not only to continue the development of a better understanding of specific money laundering and terrorist financing risks in the money remittance and currency exchange sector but also to ensure that regulatory responses are proportionate and effective.

INTRODUCTION

7. Specialised financial businesses have for many years played an increasing role in providing certain types of services, including money remittance (MR), foreign currency exchange (CE) and the issue/management of means of payment to a variety of actors. The globalisation of financial markets and the development of information technology have made the movement of funds across the world easier and have thus further spurred the growth of these specialised financial services. The service providers in this field (the "MR/CE sector") are quite diverse and range from simple businesses to complex chain operators.

8. In order for criminals to move, hide and eventually use the funds generated by their illegal activities, they must seek ways to launder those funds without drawing the attention of law enforcement or other authorities. Given the range of products and services offered, the variety of distribution channels, the high transfer speed and the fact that they are often cash-intensive businesses, the MR/CE sector may provide significant opportunities for criminals desirous of laundering funds unless appropriate safeguards are in place. Particular risks involved with the sector are related not only to the misuse of MR/CE businesses for laundering money but also to the owning of such businesses by criminal groups and corrupt employees co-operating with criminals.

9. Typologies reports published by the Financial Action Task Force (FATF) over the years have highlighted money laundering risks posed by *bureaux de change* (FATF typologies report, 1996-1999 and 2001) and examined money laundering and terrorist financing vulnerabilities of alternative remittance systems (FATF typologies report 2004-2005). At the time that these studies were conducted, little information was available on the MR/CE sector in MONEYVAL member States or on the ML/TF risks facing the sector. Thus, MONEYVAL and the FATF decided in 2008 to undertake a joint project on methods of money laundering through MR/CE businesses.

Scope of research

10. In most jurisdictions, MR/CE businesses are not defined as banks. While in some countries, such as the United States[1] and the United Kingdom, national legislation has defined this group of financial service providers, the MR/CE sector in most countries is not explicitly defined. In the FATF 40 Recommendations as well as in the third EU Money Laundering directive[2], those financial businesses providing MR/CE services are considered to be a subset of financial institutions[3]. Using the term *non-bank financial institutions* to refer to MR/CE services can also be misleading in that the term as defined by the FATF also included broker dealers in securities and casinos. The term is even less helpful now, as the FATF currently makes the distinction between financial institutions on the one

1 In the United States, the term *money services business* has been defined since 1999 when the Secretary of the Treasury issued a ruling revising the regulatory definitions of certain non-bank financial institutions for purposes of the Bank Secrecy Act. These revised definitions were grouped into a separate category of financial institution called *money services businesses* or *MSBs*.

2 Directive 2005/60/EC of the European Parliament and of the Council of 26 October 2005 on the prevention of the use of the financial system for the purpose of money laundering and terrorist financing.

3 For further details, please see the glossary of the FATF 40 Recommendations and article 3 (2) (a) of the Directive 2005/60/EC.

hand and *designated non-financial businesses and professions (DNFBPs)* on the other. The former category includes all of the activities that are provided by MR/CE services.

11. Typically, MR/CE services include three types of activity:

- Currency dealers/exchangers;
- Money remitters; and
- Issuers, sellers and redeemers of stored value and monetary instruments, such as money orders and traveller's checks.

12. The category "money remitters" is diverse, ranging from large organisations, like Western Union, to what are often termed "informal value transfer systems". This latter category includes systems that often operate outside the "regulated" financial system and are deeply rooted in historical, cultural and economic backgrounds. Well known examples include "hawala", "flying money" systems indigenous to China, India's *hundi* system, and the *padala* system used in the Philippines[4].

13. Given the research already conducted on the subject by the FATF other international organisations, this study does not attempt to duplicate already existing information. For this reason, it was decided to exclude from its scope the analysis the misuse of new payment methods[5], of traveller's checks and money orders. The methods and trends of money laundering and terrorist financing through alternative remittance systems are also not analysed in-depth[6] because the potential misuse of such systems for terrorist financing was already covered in the 2008 terrorist financing typologies report produced by the FATF.[7]

14. This research report therefore focuses on non-bank financial institutions that provide at least one of the following services: (1) money remittance, (2) currency exchange/dealing and (3) issuing, cashing or redeeming of cheques/money orders/stored value cards.

15. The research conducted on this subject also provided an opportunity to take stock of potential money laundering threats arising from the changeover to the Euro in certain countries. This is an important issue for many MONEYVAL members in that a number of EU members from MONEYVAL have yet to adopt the Euro as official currency and are looking to develop best practices based on measures already adopted by euro zone countries to address those threats. This research thus attempts to lay out relevant findings, in the light of developments in this specific sector as well as in the EU regulatory area, resulting from the adoption and implementation of the EU legislation that directly impacts upon the MR/CE sector.

16. After examining how MR/CE businesses may be misused for money laundering purposes and identifying vulnerabilities that may be exploited by criminals, the report will look at appropriate measures which could be taken to address the identified vulnerabilities. It should be stressed that

---

4 HM Treasury (2006). For more details about the alternative remittance system, the profile of the users of the system and its role in ML, please refer to Chene (2008).

5 See FATF (2006). The FATF has since updated this research , and a report on the subject was published in October 2010 that considers the vulnerabilities of new payment methods to ML/TF (the report focuses on prepaid debit cards, mobile payment services, on-line payment systems). Additional literature on ML/TF schemes through new payment technologies is also available (see US Department of Justice (2006), Sienkiewicz (2007), Choo (2008)).

6 See FATF (2005), MENAFATF (2005), Carroll (2007). See also for further information the IMF (2005a, 2005b)

7 See FATF (2008a)

available information has allowed the money laundering threat facing MR/CE businesses to be documented. Regarding the threat of terrorist financing facing such businesses however, there was far less sector-specific information to work with. This report then focuses primarily on the range of ML techniques to which MR/CE businesses may be vulnerable and provides a series of illustrative typologies. A non exhaustive list of indicators of potentially suspicious activity has been included in the report, which is intended to assist the private sector, law enforcement and regulators detecting ML within the sector. Finally, the report also briefly lays out a series of issues and areas for further consideration.

Methodology and sources

17. The research and analysis of the material used to develop this report was conducted by a small joint project team of experts from MONEYVAL and FATF jurisdictions. The experts contributed to the analysis and drafting of the report through a series of working meetings and exchanges of written material that took place over a period of about two years. The project was led by Estonia, with Mr Raul Vahtra and Ms. Kerly Krillo of the Estonian financial intelligence unit heading up the work, including the main task of drafting this report. The following countries and organisations contributed to the project with either substantive material or expertise: Australia, Bulgaria, Cyprus, Germany, Italy, Mexico, the Netherlands, Poland, Romania, Sweden, Spain, the United States, the Egmont Group and the European Bank for Reconstruction and Development.

18. One of the main sources of information for the project was a detailed questionnaire which solicited a range of range of material, including case studies, national-level typologies research and other relevant expertise. Well over 50 questionnaire responses were received and analysed by the project team from FATF, MONEYVAL and Egmont Group members.[8] The project team also used the discussions and findings of the Joint FATF/MONEYVAL meeting of experts on typologies (held in Monaco, 24-26 November 2008, which gathered participants from 40 countries, 2 international organisations and 3 FATF-style regional bodies), as well as other FATF typologies reports, case studies and open source information.

19. While the focus of this report is to a certain degree on the MONEYVAL region and the wider European area, the experience of countries from other regions of the world was actively sought and integrated into the report.

Acknowledgements

20. This project was conducted by a team of experts from both FATF and MONEYVAL members, who have contributed to the project throughout the working meetings and by providing written contributions and comments which have been reflected in this report. The project team would like to thank all FATF, MONEYVAL and Egmont Group members which responded to the survey and provided other valuable input to this research.

8 See Annex 1 for a list of contributing jurisdictions.

CHAPTER I –OVERVIEW OF MONEY REMITTANCE & CURRENCY EXCHANGE SECTORS

1.1 General

21. The globalisation of the financial sector and the vast development of information technologies has contributed to a considerable increase in the volume of the activity carried out by the MR/CE sectors during the past two decades. In the US for example, the estimated value of financial services provided by the money service business industry, which includes MR/CE activity,[9] was approximately USD 200 billion annually in 1997; however, by 2005 the industry had grown to approximately USD 284 to USD 305 billion (FinCEN 2005). Unfortunately there are no similar figures available for the equivalent sector in other parts of the world; therefore it is impossible to estimate the size of the MR/CE industry globally.

1.2 The money remittance sector in MONEYVAL/FATF member States

22. The World Bank estimate of money remittance (MR) worldwide is 443.5 billion USD for 2008 and 420.1 (estimated) for 2009. Not all countries are able to determine the total volume of incoming and outgoing MR activity. It is therefore difficult to provide an indication of the proportion of global MR that MONEYVAL/FATF countries represent. Nevertheless certain jurisdictions are able to provide reliable estimates of the volume of MR activity, and these are included in Table 1 below. From this information, countries can be divided into two groups:

- *Senders, i.e,.* countries where the amount of outgoing money transfers are remarkably higher than incoming.
- *Receivers, i.e.,* countries where the amount of incoming money transfers are remarkably higher than outgoing.

23. At European level, the first group mostly includes primarily the "old" EU member states (Germany, Greece, Italy, and Spain), along with Croatia, Cyprus, Malta, and Monaco; while in the second group southeastern European countries and former Soviet republics (Armenia, Bulgaria, Georgia, "the former Yugoslav Republic of Macedonia" and Ukraine) predominate.

Table 1. Volume of money remittances sent and received in selected MONEYVAL/FATF member States (2006-2008, million EUR)

Country	Sent			Received		
	2006	2007	2008	2006	2007	2008
Armenia	615.6	787.7	722.0	971.0	1 353.7	1 433.5
Bulgaria	NA	11.1	8.6	NA	94.7	73.5
Cyprus	190.5	212.1	227.3	17.0	37.1	29.8

9 See paragraph 10 above for an explanation of the difference between MSBs and MR/CE service providers as the terms are used in this report.

Country	Sent			Received		
	2006	2007	2008	2006	2007	2008
Germany	1 830.1	1 927.3	1715.5	548.0	1 026.7	1 200.1
Spain	4 891.0	6 267.0	NA	202.0	222.0	NA
Georgia	92.9	77.5	77.5	387.1	606.0	701.1
Greece	570.4	775.4	NA	178.4	203.9	NA
Croatia	44.5	42.0	43.9	21.9	22.3	22.0
Italy	4 528.9	6 044.1	5 980.0	248.2	252.2	191.6
Monaco	10 732.0	11 471.0	11 833.0	1 469.0	1 382.0	1 389.0
"the former Yugoslav Republic of Macedonia"	5.6	7.1	10.3	68.6	78.8	95.3
Malta	68.3	80.7	78.7	31.0	64.9	35.2
Ukraine	97.2	133.6	267.2	1 070.4	1 444.7	1 773.5

NA: not available.

24. Among those MONEYVAL/FATF countries that provided information for this study, MR systems are very heterogeneous. Even within the same geographical regions, countries often have very different MR systems. Therefore, it is difficult to highlight any 'typical cases'.

25. The number of independent MR service providers[10] varies greatly from one MONEYVAL/FATF country to another (see table 2 below, data reflecting 2008 figures). At one end of the scale are the United States with more than 25 000 MRs (this number does not include agents)[11], the UK (approximately 2 800 MRs) and Mexico (approximately 1 100 MRs). At the other end of the scale are Austria, Japan, Monaco, Moldova, San Marino, Serbia and Turkey. In these countries, there are no companies that provide MR services alone. In these jurisdictions, MR services are provided by either banks and/or post offices, which also offer other services in addition to MR. Most countries, however, are in between the two extremes.

Table 2. Number of money remittance service providers in FATF and MONEYVAL member States

Country	N° of MR providers	Country	N° of MR providers	Country	N° of MR providers
USA	25 096	Chile	15	Poland	2
UK	2 818	Greece	14	Croatia	1
Hong-Kong, China[1]	2 008	Armenia	11	Liechtenstein	0
Mexico	1 085	Slovakia	11	Austria	0
Denmark	334	Bulgaria	7	Japan	0
Argentine	122	Cyprus	7	Monaco	0
Sweden	96	Malta	7	Moldova	0
Finland	70	Latvia	6	San Marino	0
Spain	46	France	4	Serbia	0

10 Note: throughout this study 'independent MR service providers' refers to the companies to whom the money transferring is a core business, it does not include banks, post offices, and other agents of the MRs to whom MR is side-business.

11 As at 13 February 2009.

Country	N° of MR providers
Germany	38
Estonia	34
Italy	30
Netherlands	28

Country	N° of MR providers
Lithuania	4
Romania	4
Macau, China	2
"the former Yugoslav Republic of Macedonia"	2

Country	N° of MR providers
Turkey	0
Albania	NA
Georgia	NA
Ukraine	NA

Table Notes:

Remarks: only independent MR services providers (excluding banks, post offices, agents).

1. Please note that in Hong-Kong, China no distinction is made between money remittance and currency exchange providers. Remittance agents and money changers (RAMCs) are entitled to provide both services. Although not all RAMCs provide both services, most of them do so.

26. In some countries, MR providers have well-developed agent systems, with post offices, currency exchange offices, banks, travel agencies, hotels and other companies providing remittance services as agents of the MR companies. Examples in which MR services are offered by other than specific MR businesses include:

Albania:	currency exchanges (as agents of Western Union and MoneyGram);
Bulgaria:	banks, currency exchanges and financial houses;
Chile, Liechtenstein, Monaco:	post offices (in the first two as agents of Western Union and in the latter as agents of Western Union and MoneyGram);
Croatia:	post offices and one bank[12] (as agents of Western Union);
Estonia:	post offices, banks, currency exchanges and travel agencies;
Finland:	currency exchanges, travel agencies and miscellaneous shops;
France:	post offices (through an agreement with a branch of Western Union licensed as a financial company);
Germany:	post offices, currency exchanges and banks;
Greece:	post offices and currency exchanges (as agents of Western Union);
Italy:	currency exchanges, travel agents, hotels, phone centres, internet centres, news agents and stationers;
Malta:	post offices, travel agencies and hotels;
Moldova:	banks (as agents of Western Union, MoneyGram);
Mexico:	post offices, currency exchanges, banks and travel agencies;
Netherlands:	travel agencies;
Poland:	banks, one credit unions' financial services provider, travel agencies and a few other providers of selected banking

12 Société Générale Splitska Banka.

	services;
Romania:	both post offices and banks (as agents of Western Union, MoneyGram);
Slovakia:	post offices, currency exchanges and banks;
Spain:	post offices;
Sweden:	post offices, currency exchanges, banks, money transaction offices, travel agencies and hotels;
"The former Yugoslav Republic of Macedonia":	currency exchanges, banks, travel agencies and hotels;
UK:	post offices, travel agents and other outlets like restaurants and general stores; and
US:	currency exchanges, banks, travel agencies and hotels.

27. Post offices usually provide money transfers as an independent side-business of their main activity or act as agents for other MR companies. Typically they are registered / licensed as money remitters in several countries. For example, in San Marino 5 out of 10 post offices operating domestically are authorised to perform money transfer services.

28. Banks offer MR services in Argentina, Chile, Cyprus, France[13], Greece, Malta, the Netherlands, Poland and Serbia, and Spain.

29. Both post offices and banks are authorised to perform MR services as side-businesses in Albania; Armenia; Denmark; Georgia; Hong-Kong, China; Italy; Latvia; Macau, China; Poland; Turkey and Ukraine.

30. Furthermore, currency exchanges (in Argentina, Chile, Malta, the Netherlands, Romania), travel agencies (in Cyprus, Romania) and hotels (Romania) also offer MR services, although money transfer is not their core business activity. This distinguishes them from companies that are defined as 'independent MR providers' in this report.

31. The distinction between national/international MR providers also differs greatly. In some countries, like Croatia, Liechtenstein and Lithuania, Western Union is the only MR service provider. In others, like "the former Yugoslav Republic of Macedonia" and Poland, where Western Union and MoneyGram operate as MR providers, there are no similar domestic MR operators. In other countries on the other hand, such as Japan and San Marino, no international companies operate. Latvia combines both systems. Latvian Post is the only national provider of money remittance services. The foreign providers are not registered and are supervised by banks that provide money transfer service.

32. When an MR service establishes a permanent business relationship, the identification of the client is mandatory for money remitters in most jurisdictions. For occasional transactions, the thresholds triggering certain measures vary from the obligatory identification of all customers in Argentina, Austria, Cyprus, Germany, Italy, Netherlands, and Spain, to EUR 15 000 in Finland, San Marino, and Serbia. In respect to the identification requirements for clients initiating money

[13] The particular feature of the France is the presence of foreign banks (mostly African and Asian) that are specialised on offering money remittance services to their customers. Quite naturally, the customers of these banks are foreigners living in France.

remittance, countries can be placed into the following three broad categories (for more details, please refer to table 6 in annex 3):

1. Identification of the client is mandatory for each MR transaction;
2. Identification applies starting from a EUR 1 000 threshold (as required in the EC Regulation No 1781/2006) and
3. Identification applies starting from some other threshold.

33. If there is a suspicion of ML or TF, as a general rule, the threshold does not apply and identifying the client and informing the FIU is mandatory.

Table 3. The client identification threshold in MONEYVAL/FATF member States

No threshold, mandatory identification	Argentina; European Union State members[1]; Liechtenstein; Macau, China[2]; Monaco
EUR 1-999	Armenia, Georgia, Japan, Turkey, Ukraine
EUR 1 000	Croatia, Mexico[3], Moldova[4], San Marino
EUR 2 000-2 999	"The former Yugoslav Republic of Macedonia" and US
EUR 3 000-11 999	Chile
EUR 12 000	Albania
EUR 15 000	Serbia

Table Notes:

1. In EU Member States, financial institutions must identify and verify the complete information on the payer/originator before executing any wire transfer regardless of any threshold. Only where the wire transfer is (1) executed from an account of a customer who has been identified and whose identity has been verified in the course of the account opening and whose identification records have been stored according to requirements of the 3rd EU AML Directive or (2) of an existing customer whose identity has to be verified at appropriate times according to the 3rd EU AML Directive financial institutions stating that there is no requirement to repeatedly verify the originator's identity (Art. 5(3) of Regulation (EC) No. 1781/2006). In case a wire transfer is not made from an account, the financial institution must verify the identity of the originator only when the amount is above EUR 1 000 unless the transaction is carried out in several operations that appear to be linked and together exceed EUR 1 000.

2 In Macau, China, under the regulations for cash remittance activities, cash remittance companies are required to record the identification and address of remitters and beneficiaries regardless of the amount of the remittances in Macau. For wire remittances done through banks and post office, the threshold is MOP 8 000 (appr. USD 1 000).

3 In Mexico, there are three different thresholds in order to require information for individual cash operations or with travellers cheques, as follows:

- between USD 1000 – 3000, information is requested

- between USD 3000 – 5000, information is requested along with a copy of the official identification

- for USD 5000 or more, information is requested and a whole file is integrated to the system.

4 In Moldova, the threshold for occasional transactions is 50,000 lei (appr. EUR 3 500) and for electronic and wire transfers 15 000 lei (appr. EUR 1 000). At the same time, according to the foreign exchange legislation, payment/ transfers shall be made by licensed banks upon the submission by the individual of the identity document regardless of the amount of the payment/ transfer.

1.3 The currency exchange sector in MONEYVAL/FATF member States

34. Similar to money remittance, the currency exchange[14] (hereinafter CE) services vary somewhat in MONEYVAL/FATF member. However, due to the standardised nature of the business, the differences are not as noteworthy as for MR.

[14] The terms '*bureaux de change*' and 'currency exchange providers' refer to the same type of activity. For the sake of consistency within this report, the term 'currency exchange provider' is used.

35. According to the data received, the number of currency exchange service providers shows considerable variation from one MONEYVAL/FATF member to another (see table 4 below). In a number of countries (*e.g.*, Croatia; Georgia; Hong Kong, China; Mexico; Poland; Serbia; Spain; United Kingdom, Ukraine and United States) the number exceeds 1 000. At the other end of the scale, there are Finland and Monaco with less than 5 currency exchange providers.

Table 4. Number of bureaux de changes[1] in selected MONEYVAL/FATF member States

Country	No. of bureaux de change	Country	No. of bureaux de change	Country	No. of bureaux de change
Albania	NA	Bulgaria	625	Sweden	56
Argentina	NA	France	515	Denmark	44
Poland	4 193	Italy	489	Germany	24
US [2]	3 294	Romania	470	Macau, China	17
Mexico [3]	2 757	Slovak	455	Greece	12
Spain	2 256	"the former Yugoslav Republic of Macedonia"	271	Netherlands	12
Hong Kong, China[4]	2 008			Malta [5]	7
Serbia	1 781	Moldova	319	Finland	4
UK	1 404	Armenia	246	Monaco	2
Croatia	1 242	Japan	196	Austria [7]	0
Ukraine [6]	1 104	Estonia	163	Cyprus[7]	0
Georgia	1 050	Chile	128	Liechtenstein[7]	0
Turkey	755	Latvia	75	San Marino[7]	0
		Lithuania	62		

Table Notes:

1. Only independent service providers, i.e. excluding banks and other businesses for which CE is not a core business.
2. As of 13 February 2009, the date of the US response to the questionnaire for this project.
3. currency exchange services providers.
4. Please note that in Hong-Kong, China no distinction is made between money remittance and currency exchange providers. Remittance agents and money changers (RAMCs) are entitled to provide both services. Although not all RAMCs provide both services, most of them do so.
5. In Malta CE (as well as MR) providers form part of a wider category of entities defined as "financial institutions". Therefore, the number of MR and CE providers in the tables refers to the same institutions
6. In Ukraine, the following institutions are authorised to open currency exchanges for conducting currency exchange transactions: banks operating under a banking license and having prior written permission, and financial institutions/national operators of postal services that obtain general license from the National Bank of Ukraine for conducting non-trade transactions with currency values.
7. Only banks provide currency exchange services.

36. Naturally in most (if not in all) countries, banks are authorised to perform CE services. In a few countries – Austria, Cyprus, Liechtenstein and San Marino – CE is provided exclusively by banks, and no independent currency exchanges exist. Although it is not obvious from the first sight, in Lithuania the system is quite similar. All CE businesses (approximately 60) in Lithuania are operated by banks. Furthermore, divisions and branches of banks as well as credit unions (22 at present) are also authorised to perform currency exchange.

37. In Mexico, the currency exchange service providers can be divided into two groups:

- 'Foreign exchange houses' (*casas de cambio*) are legal entities that require a license to engage in currency exchange services with the public; and

- 'Foreign exchange centres' (*centros cambiarios*) are either natural or legal persons that do not require a license in order to engage in currency transactions, but whose operations are limited to the equivalent of USD 10 000.00 per customer per day. They must be registered with the Tax Administration Service.

38. In Slovakia there are three types of foreign currency exchange providers:

- *Currency exchanges* – require a 'simple FX license' that authorises natural or legal persons to purchase or sell local currency against foreign currency (money transfers are not included);
- *FX business providers* I – legal persons with a minimum capital requirement of EUR 333 333. Their license allows them to both purchase and sell local currency against foreign currency on their own or their client´s behalf but only in cashless form. They are permitted to make only domestic money transfers; and
- *FX business providers II* – legal persons with minimum capital requirement of EUR 33 333. Their license authorises them to carry out or intermediate cross-border money transfers both in local or foreign currency in cash. They are permitted to make foreign money transfers through banks only.

39. Regarding customer identification, the same thresholds apply as for MR in most countries. The exceptions are:

Table 5. Threshold Exceptions to Applicable Customer Identification Requirements

COUNTRY	THRESHOLD (as of 2008)
Croatia	HRK 105 000, *i.e.* appr. EUR 15 000
Estonia	EEK 100 000, ie. appr. EUR 6 400
France	EUR 8 000
Japan	YEN 2 000 000, *i.e.* EUR 15 566
Germany	EUR 2 500 threshold applies if the transaction is carried out through an account other than the customer's account;
Georgia	GEL 3 000, *i.e.* appr. EUR 1 400
Greece (and Italy, Malta, Poland, Sweden, United Kingdom)	EUR 15 000
Latvia	LVL 5 000, *i.e.* appr. EUR 7 117
Lithuania	EUR 6 000
Moldova	MLD LEI 50,000 (approx. EUR 3 500)
Macau, China	MOP 20 000 , *i.e.* appr. EUR 1 740
Mexico	Thresholds vary for transactions involving cash or travellers' cheques
Slovakia	EUR 1 000
United States	USD 1 000, *i.e.* appr. EUR 820

Table Notes:

1. In Mexico there are three different thresholds in order to require information for individual cash operations or with travellers cheques, as follows:
   - between USD 500 - 3000, information is requested;
   - between USD 3000 – 5000, information is requested along with a copy of the official identification (identical threshold applicable also to MR);
   - for USD 5000 or more, information is requested and a whole file is integrated to the system (identical threshold applicable also to MR).

1.4 Licensing, supervision and sanctioning system of money remittance and currency exhange providers[15] in MONEYVAL / FATF member States

Licensing/registration

40. In most MONEYVAL and FATF member states the MR provider must be registered or licensed (see table 7 in annex 1)). In countries that require licenses in order to provide MR service, either the central bank, as in Albania, Bulgaria, Cyprus, Slovakia, Spain, or the financial supervisory authority, as in France, Germany or Malta, is the competent authority to grant licenses.

41. In the European Union, new rules on payment services in the EU internal market provide for an evolution regarding the licensing of providers of money remittance services. Directive 2007/64/EC on payment services in the internal market (which was due to be integrated into the EU legal framework in November 2009) establishes the obligation to licence payment service providers (except for certain financial institutions that already have a licence, such as banks). The Directive creates two levels of licences. Firstly, the EU-wide licence for the newly created category of 'payment institution'. This category includes payment service providers which are not allowed to accept deposits from the public (which banks do) and which do not issue electronic money (which is done by banks or so-called 'e-money' institutions). Obtaining an authorisation as a 'payment institution' is subject to a set of strict conditions, including prudential requirements. The authorisation granted by a EU Member State to a 'payment institution' is valid for the entire EU territory, which can, for instance, provide its services in other EU countries including through local agents. There is a specific procedure to approve agents, where AML checks can be done by the relevant competent authorities. Therefore, it is possible that a payment institution licensed in one EU country operates in another EU country without the need to obtain a second licence from that second EU country. Secondly, the EU directive on payment services allows EU Member States to establish a lower level (but this level is not compulsory): natural or legal persons unable to meet all the strict conditions for becoming 'payment institutions' may nevertheless carry out payment services in the Member State where they have their head office or legal residence after having been registered in that EU Member State. Some of the Directive requirements for 'payment institutions' are nevertheless applicable to this lower level. The goal of this lower level regime is to "bring all persons providing remittance services within the ambit of certain minimum legal and regulatory requirements" (cf. paragraph 15 of the preamble of the Directive). As a result, the provision of money remittance services in the EU is forbidden for other categories of undertakings or individuals.

42. In the countries that require registration of MR service providers, one of three entities generally oversees the registration process:

- The financial intelligence unit (FIU) (for example, in Chile; Hong Kong, China, and the United States[16]);
- The financial supervisory authority (for example, in Georgia); or
- Another government authority (for example, the Ministry of Economic Affairs and Communications in Estonia; State Provincial Office of Southern Finland in Finland; the Monetary Authority in Macau, China; the Tax Administration Service in Mexico; HM Revenue and Customs in the UK).

---

15 In this section we focus solely in independent money remittance /currency exchange providers, *i.e.* those that do not operate as a part of banks, post offices and/or agents of the MR providers.

16 In addition to federal registration, MSBs must be licensed or registered in 48 of the 50 US States.

43. Latvia is an exception, as money remitters need neither register nor obtain a license to operate; however, legislation addressing this matter was in the process of being drafted at the time of the survey.

44. As regards the provision of CE services, a license is required in most countries.[17] As a general rule, the authority responsible for issuing licenses is the central bank.

45. In a few countries, the CE businesses do not need to be licensed, but have to be registered in order to be permitted to provide currency exchange service. Usually the institution responsible for keeping the registry is a governmental authority (for example, National Revenue Agency in Bulgaria, the Commerce and Companies Agency in Denmark, the Ministry of Economic Affairs and Communications in Estonia, HM Revenue and Customs in the UK, etc.).

46. In Chile in 2009 there was no mandatory registering/licensing system for money remitters and currency exchange at the state level, and the FIU had in the interim taken on the task of keeping the record instead. The current system was considered to be ineffective and amendments to the legal framework were being discussed in order to introduce the statutory registering system.

47. In Japan there is no registering/licensing system for currency exchange at all. In Finland, there is a legal requirement to establish a registering/licensing system for currency exchanges, but its concrete implementation had not yet taken place at the time the survey was carried out.

48. In most countries (with the exception of Chile; Georgia; Hong Kong, China; and Japan where no specific 'fit and proper' controls apply to MR/CE businesses) the 'fit and proper' control is applied in some form at least during the licensing/registration process. As a minimum standard, this background check usually includes evaluating the qualification, creditworthiness (*i.e.* absence of tax duties) and criminal record (for serious offences) of the owners and managers of the company. In Denmark the 'fit and proper' controls cover beneficial owners, too.

49. However, there are countries that apply more in-depth control mechanisms. For example, in Armenia the central bank also checks the qualification through examination of the employees of the currency exchange business. The qualification document is valid for three years.

50. After granting the license/registration to the company, in most countries no permanent on-going monitoring is applied and further action is taken only if there is evidence of unlawful activities or a change in the company's management board. In some countries this system is somewhat standardised; for example, in Germany prosecution authorities and courts have to notify *Bundesanstalt für Finanzdienstleistungsaufsicht* (BaFin – the Federal Financial Services Supervisor) of criminal proceedings against managers. The same system is applied in Estonia, where the registration of the company is cancelled if the member of the administration of the company is convicted of criminal offences.

51. However, there are a few countries that monitor the eligibility criteria more or less on an periodic basis. For example, the information about meeting the eligibility criteria of the managers and owners is updated at least once a year in Albania, Croatia, Italy, Lithuania, Mexico, and Sweden.

AML/CFT supervision

52. In most countries, the central bank, the FIU and/or financial supervisory authority carries out AML/CFT supervision over the money remitters and currency exchanges.[18]

---

17 See Annex 3, Table 7.

53. In the countries that apply the registering system of money remitters/currency exchanges, usually the authority responsible for keeping the register also supervises the entities.

54. Typical sanctions applied to an unregistered /unlicensed money remittance providers are fines and/or imprisonment.[19] Maximum levels of fines imposed vary from EUR 5 000 in Bulgaria to unlimited amounts in the UK.

55. Most responding countries indicated that existing sanctioning regime was considered to be effective in deterring the illegal MR providers. In the United States, for example, there are federal and state sanctions for operating a money remitter or currency exchange that fails to become licensed or registered. For example, knowingly operating a money remittance business without a proper state license/registration and federal registration is subject to a fine of up to USD 5 000 a day and imprisonment for up to five years. Furthermore, an unlicensed or unregistered MR/CE service providers may be subject to civil and criminal penalties for violations of the Bank Secrecy Act. In contrast, in Denmark, the current system is considered to be relatively ineffective because it takes a long time for law enforcements to investigate and prosecute persons in the case of unregistered activities. However, Danish AML supervisors in close co-operation with the State Prosecutor have decided to intensify the sanctions in cases of non-compliance.

56. In Mexico, the Tax Administration Service, a decentralised entity of the Ministry of Finance and Public Credit) is in charge of the supervision of money remitters (*transmisores de dinero*) and currency exchange centres (*centros cambiarios*) regarding the AML/CFT preventive measures in Mexico. With regards to supervision, in the case of *casas de cambio*, these are by decree of law supervised by the National Banking and Securities Commission (CNBV).

57. Although there is no agency that supervises CE service providers in Japan, such businesses must report the volume and number of transactions to the Ministry of Finance when they exceed a certain volume.

---

18 See Annex 3, Table 4.

19 See Annex 3, Table 5.

CHAPTER II - MONEY LAUNDERING METHODOLOGIES INVOLVING MONEY REMITTANCE AND CURRENCY EXCHANGE PROVIDERS

58. This chapter describes some of ways in which money remittance and currency exchange providers have been exploited for ML/TF purposes through a series of selected case studies provided by responding jurisdictions. The focus of this material is primarily on "traditional" *i.e.* formal money remittance and currency exchange providers; however, a few observations have also been included about informal systems.

59. Generally, these MR/CE providers can be used for money laundering and terrorist financing in two ways: either by performing relevant transactions without knowledge of the illegal origin or destination of the funds concerned or by a direct involvement of the staff/management of the provider through complicity or takeover of such businesses by the criminal organisation.

60. Several features of the MR/CE sectors make them an attractive vehicle through which criminal and terrorist funds can enter the financial system, such as the simplicity and certainty of MR/CE transactions, worldwide reach (in case of money remitters), the cash character of transactions, low-thresholds, the often less stringent customer identification rules that apply to such transactions compared with opening bank account and reduced possibilities for verification of the customer's identification than in credit or other financial institutions , etc. The nature of the customer's relationship with the MR/CE service provider and the brevity of contacts is also a significant vulnerability.

61. Money remittance providers are used at all stages of the money laundering process. Currency exchanges specifically are an important link in the money laundering chain, particularly during the placement stage. Once the money has been exchanged, it is difficult to trace its origin. Also, it has been noted that considering that they are small businesses, currency exchanges can be easily prone to takeover by criminals and used to launder money.

62. From responses received to the survey questionnaire for this project, the most important factors that may indicate possible misuse of MR/CE service providers:

- Use of underground remittance systems;
- Use of mules / straw accounts;
- Mismatch between the economic activity, country of origin, or person and the money remittances received;
- Periodic transfers made by several people to the same beneficiary or related persons;
- Transfers over a short period of time of low amounts that together represent a large sum of money;
- Transfers from one or more senders in different countries to a local beneficiary.
- Sudden inflow of funds in cash followed by sudden outflow through financial instruments such as drafts and cheques;
- Structuring of transactions and/or changing of MR/CE provider for subsequent orders to keep a low profile; and
- False information during the identification procedure/lack of co-operation.

63. Many cases involve small value wire transfers, however, given that the total value of funds involved in these cases is quite significant, this could imply the involvement of highly organised criminal groups. However it is also interesting to note that a number of cases deal with high-value wire transfers. The information gathered highlights the links between money laundering in the money remittance sector and other criminal activities (*e.g.*, fraud, trafficking/smuggling in human beings, drug trafficking, economic crime, etc). The identified ML vulnerabilities associated with the MR/CE sectors can be related to customers, owners or agents as highlighted below.

2.1 Customers

64. Structuring or "smurfing" was frequently reported and appears to remains the most usual ML method identified in regard to MR/CE providers and the most frequently reported suspicious activity in many countries. Structuring occurs when a person carries out several cash transactions by breaking them into smaller amounts in order to avoid the mandatory threshold reporting and/or customer identification requirements. Such transactions can be carried out either in a single day or over a period of days, through the same or several agents.

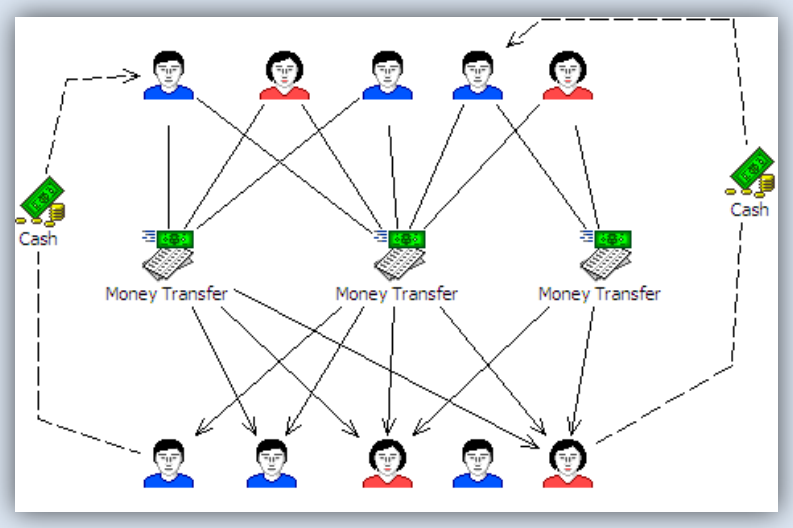
Box 1. Structuring

Customer: individual/ business

Mechanism: money remittance

Red-flag indicators: use of several currencies, structured transactions, a great number of persons involved, large number of transactions related to each other during a short time period.

Case description: Several Bulgarian individuals and companies sent/received a large number of remittances to/from different persons and destinations (often in a number of foreign countries) during a short period of time. Then they temporarily stopped their activities for a while and after a short period of time, the transfers started again. In this scheme large amounts were fragmented into smaller amounts, sent to a great number of persons in different countries and finally returned to the originators. The total sum of received and sent remittances was almost equal, and the persons declared they knew the persons who were the beneficiaries of the transfers ordered by them. Transfers were made in several currencies, where the change from one currency to another was performed between the transfers without any reasonable explanation. The investigation detected that many of the foreign persons involved in the scheme had a criminal background or had been convicted for drug trafficking, prostitution, etc.



Source: Bulgaria.

65. In countries where there are many MR/CE service providers, it is difficult to cross-match data, and the risk of being involved in "smurfing" schemes is therefore typically higher than in countries where there are few service providers. The abundance of MR/CE service providers makes structuring a relatively "safe" choice for the criminals in most countries and minimises the possibility that law enforcement agencies might detect such activity unless there is well-functioning co-operation at the national level that then helps to identify smurfing schemes that may be using multiple service providers.

66. It is often very difficult to find a link between persons using money remittance services for the transfer of funds because the transaction paper trail is often lacking. The nature of MR/CE business is that service providers often carry out one-off transactions with occasional customers, and many of the customer relationships that do exist are not of a durable nature. In the case of one-off transactions, some MR/CE service providers are not able to monitor the financial behaviour of their customers in the same way as a traditional bank is able to do with its customers.

67. As a consequence, due diligence measures applied by some MR/CE service providers in less developed markets are usually at most confined to identification and verification of the identity of the person, without the possibility of ongoing monitoring of the customer's activities. In addition to the name of the customer, the indication of the beneficiary (sender or receiver), the destination or origin of the funds, limited additional information is typically available for MR/CE providers.

68. Another method commonly identified in money laundering schemes is the use of straw men (so-called 'money mules'). A money mule is a natural person who makes his (bank) account available to a criminal or criminal organisation receiving some form of remuneration in return. A money mule is often solicited via a spam e-mail to accept a transfer of money –received from the victim(s) of a criminal or of a criminal organisation – which he/she then is instructed to transfer to the account of another person, whose personal details the money mule also receives via e-mail. The money mule is allowed to retain a part of the money for the services rendered to the criminal or criminal organisation.

Box 2. Use of 'money mules'

Customer: individual

Mechanism: money remittance

Red-flag indicators: use of straw men, organised criminals involved

Case description: An FIU from country A received a request for information from country B that involved among others company X, known to be alleged to have laundered funds by making multiple wire transfers to launder fraudulent card billing proceeds. According to this request a criminal network involved in credit card fraud schemes was using mules to transfer the profits of the illegal business to different parts of the world. The mules were instructed to send money only via money remittance services to hide the origin of the profits.

The undercover agent of country A succeeded to come in contact with one of the leading persons of this network (person C). The undercover agent convinced person C that it is better to use wire transfers through banking institutions instead of money remittance offices. This was done because the authorities of country A were trying to identify persons behind bank accounts instead of mules sending money via money remittance services.

Person C instructed the undercover agent to send money to company's X account in country A. From analysis carried out, it appeared that the money was transferred from country A to country B and most probably to accounts owned by the leaders of organised crime in that country.

Source: Cyprus.

69. The ultimate purpose for structuring transactions is to conceal the true beneficiary of the transaction and the origin of the money. Therefore, another potential risk for the MR/CE provider

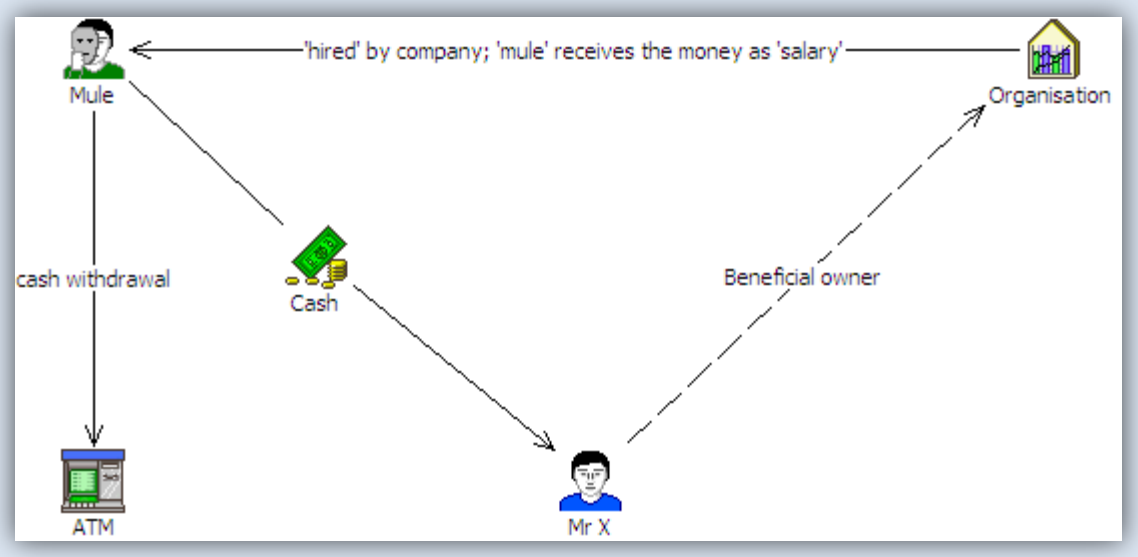
comes from accepting the money of straw men and persons identified on the basis of forged documents. Some examples of money laundering schemes obtained as part of this study involved straw men who were hired as 'employees' of a foreign company.

Box 3. Use of persons hired as employees to launder money originating from internet fraud

Mechanism: money remittance

Red-flag indicators: using 'money mules'

Case description: A person is 'contacted' (for example through the internet) for a job in a company established abroad. The person receives money on a personal bank account as a 'salary', withdraws most of money in cash immediately after the transaction (the 'commission', typically approx. 8% is often maintained in the bank account), and sends the money through money remittance abroad. Typically the true beneficiary of the transaction is a criminal and the scheme is used to launder money originating from internet fraud (phishing).



Source: Cyprus.

70. Yet another commonly reported method involves the use of a third person to transfer funds. Transactions carried out by the customer using (without a reasonable basis) multiple branches or agencies and third parties (for example relatives, minors) on behalf of another person are often aimed at concealing the sender and/or receiver (true beneficiary of the transaction).

71. Another way the MR/CE services may be misused in order to facilitate criminal or terrorist access to the financial system is through schemes with multiple money remittance transactions between persons not directly related. A reporting entity is not always able to effectively determine the connection between the transfers of funds and the related reason of the customer that sends or receives the funds. It is particularly difficult to understand the origin of the money and the scope of the transactions. For example, money transfer transactions initiated over a short time period by several persons to beneficiaries known to be linked to organised crime, executed in certain areas (in case of drug trafficking, in ports, for example), sent to 'dangerous' destinations (known as drug trafficking routes for example) should raise the concern of the remitter. It is often difficult for law enforcement agencies to detect whether the transaction is of a legal nature (for example, persons working abroad and sending income to his/her family via MR services) or as part of an illegal network (forced transactions, for example in relation to prostitution/human trafficking).

72. One of the patterns associated with such schemes also appears to be an indicator of possible ML is receiving transfers from unusually high number of people (often from different countries and in different currencies). The linked nature of the transaction often becomes apparent because several individuals go to the same institutions in the short time period to send money in the same countries and often to the same beneficiaries[20]. These elements usually indicate that the senders and/or receivers may be part of the organised networks[21].

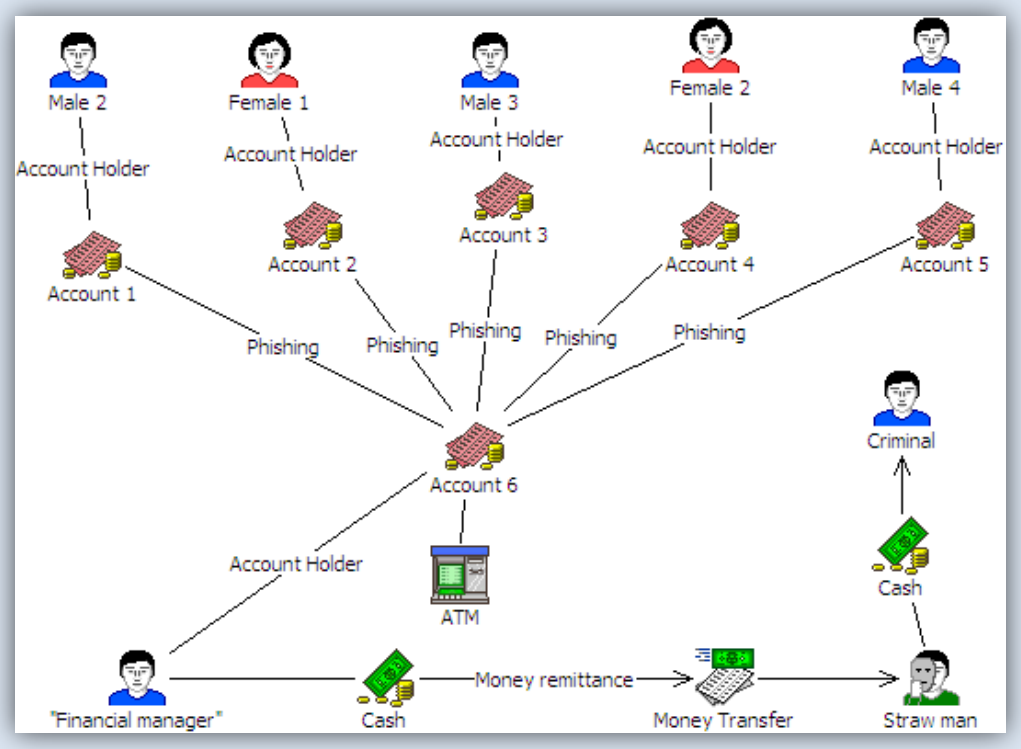
Box 4. Linked nature of the transactions

Customer: individual

Mechanism: money remittance

Red-flag indicators: receiving funds from high number of senders over a short period of time, large-sum transactions compared to person's living standard

Case description: A person is a beneficiary of a great number of remittances (often in relatively small amounts) during a short time period. Sometimes 'mules' are used as intermediaries to make the scheme more complex and harder to follow by the law enforcement agencies. In this case intermediaries re-order the remittances immediately again through the money remitter. Often the value of money remitted does not correspond to senders' economic profile.



Source: Bulgaria.

73. MR services offer widespread and legitimate services to immigrants. They serve the unbanked, provide a convenient, efficient and cost-effective means to send money to an immigrant's home country and often can reach remote areas and locations beset by political instability that are

20 See CTIF-CFI (2003), *pp* 106-107.

21 FATF (2005), *pp* 74.

otherwise outside the networks of the international banking system. However, investigations in some countries have shown that the services provided by some MR businesses have also been linked to human trafficking and the repayment of 'human trafficking agents'. As an example, in certain trafficking cases, money remittance providers have been used to pay mules, intermediaries, airplane tickets, etc.

74. Other ML methods detected in cases involving MR/CE services include transactions with companies incorporated in countries with low or no taxation (no or insufficient AML/CFT measures, known routes for ML/TF, etc.), the use of new payment methods to launder funds, often without a physical presence, and the potential for offshore service providers to access a foreign market online or via a wireless ATM network, evading AML/CFT requirements of jurisdictions.

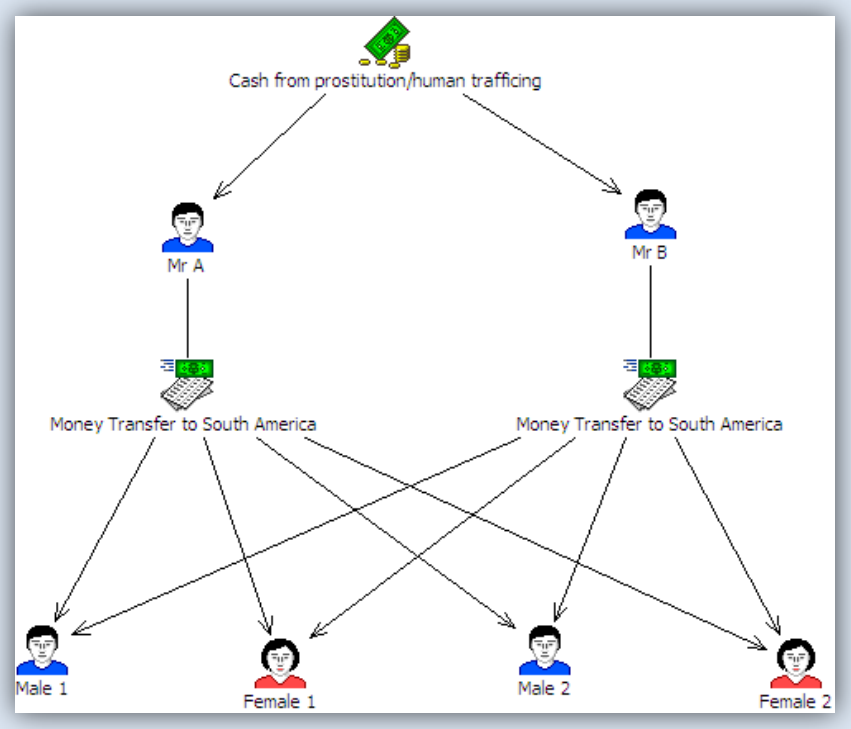
75. The use of forged identity documents is another method commonly identified and which appears to be to be increasingly used. This is particularly difficult to detect by MR/CE providers, especially due to the increasing quality of those forged papers or given that customers are often occasional and the business relationship is not of a continuing nature. False identities are often used to hamper further investigation on the transfers/ operations.

Box 5. Use of false identities

Mechanism: money remittance

Red-flag indicators: structuring, same beneficiaries, a large number of transactions during a short time period

Case description: Persons A and B repeatedly made cash deposits sent via money remittance to South America to the same recipients. In a few months time the money remitted amounted to several thousand EUR. There was no economic background for the transactions performed. None of the individuals resided at the stated address. The remittance forms revealed that most of the money was sent by A, after which B took over the transactions with the same beneficiaries. When the identification papers of the two individuals were compared, it turned out that A and B were in fact one and the same person. Police sources revealed that A's identity featured in an investigation regarding human trafficking and exploitation of prostitution.



Box 6. Remittances to high risk countries

Customer: individual

Mechanism: money remittance

Red-flag indicators: structured transactions, several beneficiaries, remittances to high-risk countries, use of straw men, people involved have a criminal background, the volume of remittance is not in accordance of the economic profile of the sender

Case description: The financial intelligence unit received several unusual activity reports from the postal bank regarding money remittance through a well known money transmitter that were done by a number of entities with no apparent relation between them, from country A to several countries in South America.

Analysis of information revealed that a number of transfers sent abroad were made in small amounts. Transfers were made from different branches of the postal bank all located in the same geographical region in country A to various beneficiaries located in several countries in South America, which are considered high risk countries with regard to the manufacturing of drugs. The entities that made money remittances had no criminal or intelligence record and were usually young people with low reported income and no property. Therefore, suspicions were raised that they were straw men. A connection was found between one of the persons involved and a large criminal organisation known to be operating in drug trafficking. A co-operation with one of the South American FIU revealed that one of the beneficiaries was in jail for drug trafficking.

Source: Israel.

2.2 Owners and agents

76. Obtaining an ownership over MR/CE company either directly or via sub-agent relationships provides criminals a perfect tool to manipulate the money transfer system and to launder money. Detecting such cases is particularly difficult for law enforcement agencies, and to a certain extent, it also depends on the capacity of the entity to apply know-your-customer and reporting requirements effectively. Several examples were provided in the survey responses gathered for this research which illustrate cases where the MR/CE company was owned and used by criminal organisations to launder money or where the company was complicit in providing services to an organised group.

Box 7. Use the ownership in MR/CE company to launder money

Mechanism: money remittance company/ currency exchange

Example 1 – Mr B is the owner and CEO of a money service business registered in country A. Mr B engaged in check discounting for a commission. He used the bank accounts of various companies and provided straw men to act as beneficial owners and authorised signatories of the bank accounts. Mr B discounted cheques for his customers using these bank accounts. Mr B made use of the services of other MR/CE service providers which recorded his transactions under another name. He discounted cheques in return for cash for his customers, and in turn, discounts the cheques received from his customers at an MR/CE, with instructions not to record his name so that a report would not be filed. Stolen cheques were brought to Mr B for discounting, and so as not to be connected with them, he gave them for discounting to another MR/CE, which recoded the transaction under the name of a straw man. Mr B instructed the customer to say that he delivered the cheques for discounting to the straw man, and instructed the straw man to say that he received the cheques from a customer, in order to hide his own involvement with discounting the stolen cheques. Mr B was indicted of money laundering offences.

Source: Israel.

Example 2 – Currency exchange business providing services to organised crime group

A currency exchange company in Sweden was identified as providing services for organised criminals. A lot of “runners” came to the exchange office several times a day and made large cash

withdrawals. Some "runners" had during a period of months made withdrawals for millions. The money was used for paying to black labour. STRs were received from banks indicating money flows from different companies' bank accounts to the bank account of the currency exchange-company. The owner of the currency exchange company was later prosecuted and convicted.

Source: Sweden.

Example 3 – Criminal group obtaining ownership over sub-agents of money remitters and exchange offices

Several Bulgarian citizens and companies where the citizens were beneficial owners were involved in large ML scheme. The companies received transfers to their bank accounts in different Bulgarian banks and transferred the money to foreign company A. The ultimate beneficiary of all money transfers was company B, one of the Bulgarian companies.

The investigation carried out by FIU detected that a group of Bulgarians bought up sub-agents of MR and CE. After a change in ownership, the total number of transfers received multiplied and a great number of transfers in small sums were ordered by foreign citizens. Beneficiaries of those transfers were typically Bulgarian citizens and the company B. It was also found out that the ultimate beneficiary of the transactions received by the individuals was company B.

It is suspected that the funds originated from drug trafficking. The scheme was of a significant scale, involving dozens of natural and legal persons from Bulgaria and foreign countries. The amount of funds transferred through MR system was several millions of Euros.

Source: Bulgaria.

Example 4 - In October 2008, 5 persons pleaded guilty to one count of operating an illegal money remitting business in the US. According to documents filed with the court and statements made in court, persons operated different enterprises. From December 2005 to March 2008, the defendants managed illegal and unlicensed money transmitting businesses in Connecticut. In exchange for remitting a total of more than USD 22 million from Connecticut to Brazil and for guaranteeing the anonymity of both their customer and their customer's intended beneficiary, the defendants took a percentage of the remitted funds for their own financial gain. Several other persons have been pleaded guilty in committing the crimes similar to this, the destination of the transfers have been to Middle East countries.

Source: United States.

Example 5 - Use of agents of money remittance business

A suspicious transaction report from a money remittance business was received in the FIU. The report revealed that one of the agents of the money remittance company was making operations with the following characteristics:

- Every remittance operation was sent to country B (Country B was a drug producing country).
- The amount sent in every remittance operation was higher than usual for money remittance operations to country B.
- In the period of time of one year, the senders of money never made more than three operations.
- Every sender sent money to different receivers.
- There were no apparent relationship between the sender and the receiver of the money.
- The receivers never received money from more than three or four senders.

After making a more comprehensive analysis, other agents of different money remittance companies with similar operational profile were discovered.

Police investigations revealed that those agents were working together in a joint action with the objective to launder money for a drug trafficking organisation. Money laundering and drug trafficking organisations were dismantled. The information was shared with country B, where several police operations were carried out.

Source: Spain.

Example 6 – Ownership of bureaux de change

A suspicious transaction report was received in the FIU. The report revealed that one person owned more than 15 businesses, and three of them were bureaux de change. The characteristics of the operations of the bureaux the change were the following:

- The bureaux de change mainly change European currencies, especially one.
- The amounts changed are higher than usual.
- There is no link between the amount of money changed and holiday periods.

Police investigations revealed that not so many people enter into the bureaux de change and, from time to time, a person made contact with the owner of the bureaux the change and gave him a bag with money in foreign currency. One or two days later the owner of the bureaux de change gave back the money in the local currency to that man. It was also established that the money laundered came from drug trafficking.

Source: Spain.

77. The following indicators could be relevant in this context:

- Reluctance by the MR provider to provide information about customers' identification to relevant stakeholders;
- Use of false identification and fictitious names for customers;
- Frequent transactions or purchases of negotiable instruments slightly under the legal threshold amount in order to avoid filing a STR/CTR;
- Turnover of the MR provider exceeds to a large extent the cash-flows of other comparable businesses;
- Suspicious connections of the MR provider owner; and
- Suspicious transactions performed on the bank accounts of the MR provider or its owner.

78. To deal with these vulnerabilities, most of the jurisdictions contributing information to this study require a 'fit and proper' test to be applied to the owners and managers of the MR/CE service providers at least as a component of a licensing/registration procedure. There are exceptions, as in Chile; Georgia; Hong Kong, China; Japan; and Mexico, where no specific requirements are applied for owners and managers of bureau de change. The most prevalent 'fit and proper' checks include determining that (1) the person has not been convicted for a criminal offence, (2) the person has not been denied the right to hold certain positions/undertake certain activities; and (3) the person has no outstanding tax obligations and not been in bankruptcy for a defined number of years.

2.3 Most common predicate offences identified

79. A number of law enforcement investigations have revealed that MR service providers are frequently used as a vehicle for laundering illicit proceeds. Laundered proceeds in such cases come primarily from drug trafficking, fraud (mainly IT-fraud like *phishing*); economic crimes (document forgery, malfeasance, tax evasion, etc); trafficking in human beings, smuggling of human beings; theft (credit card fraud, currency theft, etc) and smuggling (*e.g.*, tobacco, alcohol, arms). Previous FATF typologies have identified that ML schemes involving these types of crimes often appear to avoid using the banking system, and that systems for money remittance[22] are therefore sometimes specifically preferred as offering less risk of detection.

[22] FATF (2005), *pp* 73.

Drug trafficking

Box 8. Use of MR to launder money originating from drug trafficking

Mechanism: money remittance

Red-flag indicators: large scale of funds transferred compared to the socio-economic profile of the client, frequent transactions to different beneficiaries, transfers to high risk countries

Example 1 - A person made a large number of money transfer transactions to various persons over a short time period. The total amount of funds remitted amounted to a considerable sum of money. It was detected the ultimate beneficiary in the transactions was always the same.

Additionally it was noted that the individual had sent a considerable amount of funds to seven beneficiaries having the same surname as him. The financial intelligence unit noticed that the amount sent to three of them was significant compared to the general living standard of the recipient country. Another remarkable fact was that almost 25% of funds were transmitted to persons in the Netherlands. This could be indicative of an illegal operation to finance human smuggling or drug trafficking.

Source: Malta.

Example 2 – The financial intelligence unit received an STR from a commercial bank about suspicious money transfers through a well-known money transmitter. The report indicated that a group of persons systematically transferred sums averaging between 1000-5000 USD to a Latin American country, and that when conducting the transaction, these persons were always accompanied by an unidentified person. It also indicated that the names of the receivers of funds frequently are recurrent and almost always the same. The analysis established that in a period of 4 months (in 2005), 27 money transfers operations were performed by a group of 13 persons and that the transferred sum amounted to 111 400 USD. It was established links of group: 4 persons had criminal history background, 2 persons were cousins, others lived in the same street.

A special request for further information was sent to the criminal police. Answers received indicated that the persons had links with drug trafficking networks. A joint investigative group was established and with the use of operative and special investigative techniques, it was established that the group was linked to one of the most serious organised crime group. A drug trafficking channel from that country to Europe was identified, where the senders of cocaine are Lithuanian citizens. Cocaine was delivered by ship to ports in Varna (Bulgaria), Saint Petersburg (Russia) and Talinn (Estonia), with the major part of cocaine being delivered to Russia. After the drug deals, all the money was sent to Lithuania, and then transferred through the money transmitter back to Latin America. Overall, transfers were made by about 90 persons (mostly students, asocial persons). The total amount of transfers identified amounted to USD 540 000.

Source: Lithuania.

Example 3 – The financial intelligence unit received 38 STRs made by a money remittance business involving transactions made by 38 persons to Mr A, including relatives and friends of this person. Money received had similar characteristics and circumstances, such as:

- close date of transaction (between January and June of the same year)
- same amount (USD. 6000 and/or USD 5000)
- same country of the sender
- same name of the senders or with variations in their names.

The analysis of the database enabled to identify that persons related to Mr A. had purchased luxurious vehicles in cash; that there was an indirect link with Mr and Ms B, citizens of country Y, who were suspected to be part of a drug trafficking organisation (subject to another financial intelligence report) and that there was a link with the case of Mr C, who has been detected by national and international customs authorities relocating approximately USD 980,000.00

Source: Peru.

Box 9. Use of MR for cross border transfer to "unusual jurisdictions"

Mechanism: exchange bureau

Red-flag indicators: money transmitting by criminals, MR to unusual jurisdictions

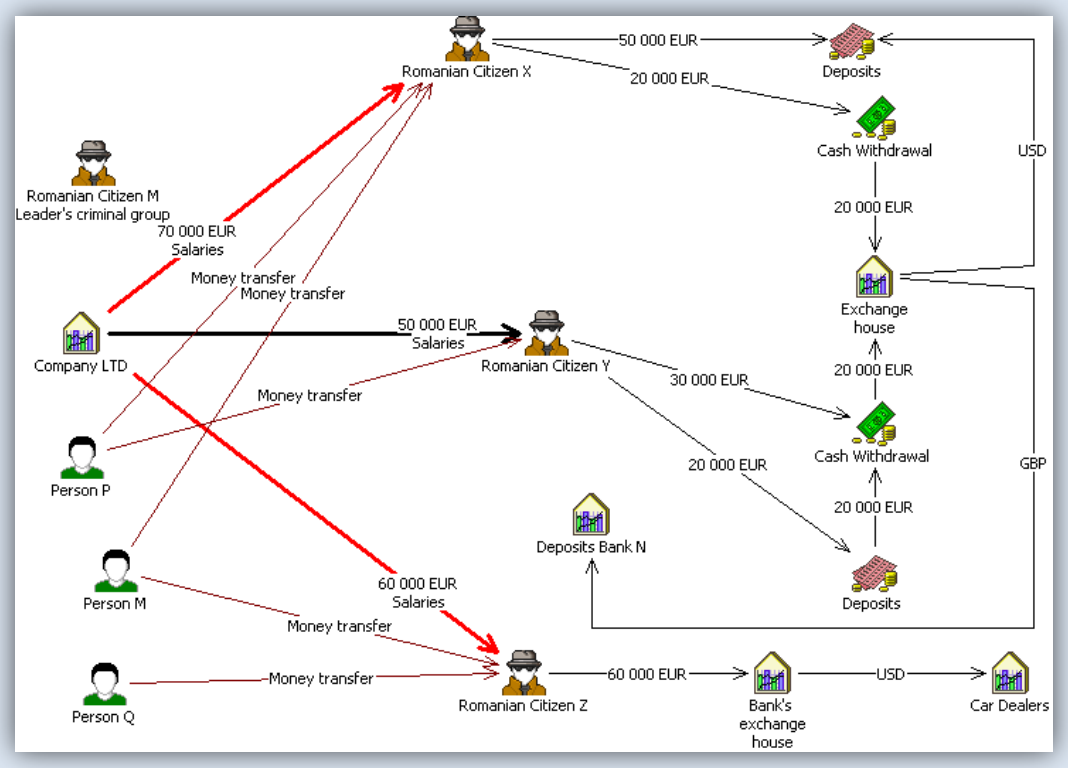
Example – the Romanian FIU received an STR sent by a bank regarding some suspicious cross-border transfers. Thus, three Romanian citizens (X, Y, Z) received small amounts from company LTD (established in country A), justified as "salaries". After receiving money, X, Y and Z used several schemes o launder money, some of which included exchange houses to change the currency. For example, on the same day when Mr X received a large bank transfer from Mr M, he withdrew the amount of EUR 20 000 in cash, went to the exchange office and changed Euros to USD dollars. At the same day he visited the bank used for receiving money once more and opened bank account where he deposited EUR 50 000. Mr Y withdrew the money received and opened bank accounts in smaller amounts in several other banks, exchange houses were used to change the currency. Mr Z changed EUR 60 000 in Bank's exchange house (whereas X and Y used private exchange houses) and used it to buy cars.

Suspicious elements:

- Cross-border transfers consisting in small amounts under the reporting threshold
- Frequency of cross-border transfers

In a short period of time amount received by the Romania citizens was around EUR 180 000.

The request of information was sent to country A and the answer revealed that company LTD was involved in funds transfers in Eastern Europe, the proceeds originated from drugs and weapons trafficking. The originator of the cross-border transfers originated by X, Y an Z was Romanian citizen Mr M, the person leading the company LTD, known as the leader of a criminal group involved in drug trafficking and skimming. It was also detected that Mr M used forged identity document in order to transfer money to Romania. It was also detected that X, Y, Z travelled to country A occasionally, but none of them worked or obtained legal income there. X, Y and Z could not prove that they worked or obtained any legal income from country A, they could not explain the large amount of money that were transferred to their accounts.



Source: Romania.

Fraud

80. The "advance-fee fraud is a classic scheme but still successful in many cases. Typically an e-mail is sent to victim where cash is promised (for example, "you won the lottery" or "please help us conduct a transaction"). The e-mail also indicates that certain costs must be paid before the winnings can be awarded and/or the transaction can place. In addition to bank transfers, money remittance agencies and agents of known money remitters (Western Union, MoneyGram, etc) are often cited as the means to effect the necessary payment. After the victim has transmitted the money, the criminals disappear, and of course the victim does not receive any reward. A variation of this type of fraud occurs when the fraud involves the offering of some sort of product or service.. In the case of dating scams, for example, fictitious profiles are created by the criminals on internet dating web sites. Through these fictitious profiles, the criminals gain trust of the victim and ask him/her to send money, for various expenses, such as plane tickets, family aid, etc. Often the potential victim is requested to send the funds through money remitters.

Box 10. Fraud

Mechanism: money remittance

Red-flag indicators: cost of receiving the winnings is asked to pay beforehand

Example - Telemarketing fraud using MR/CE service providers to launder the proceeds

Telemarketing sales persons defrauded victims mainly among older population, by posing as various officials. The victims were told that they had won the lottery and that they had to pay a certain sum as a handling fee before they could collect their winnings. These sums varied between 10.000 USD and 80.000 and were paid, among other ways, by bank cheques, or via Western Unions' postal service to fictitious beneficiaries. The cheques were apparently transferred to a professional money laundered who transferred them to MR/CE service providers in country A and territory B. The cheques were discounted and deposited in the MR/CE service provider's own bank accounts. The cheques were then sent to be cleared in the foreign banks from which they were drawn, at which time their source was revealed.

Trafficking in human beings and migrant smuggling

Box 11. Trafficking in human beings and migrant smuggling

Customer: individual

Mechanism: money remittance
Red-flag indicators: large number of transactions to the same beneficiaries, the person does not hold any bank accounts

Example 1 - An individual A residing in an Eastern Europe country received hundreds of funds transfers usually in small amounts through an MR/CE service provider initiated by more than 35 women of the same nationality as individual A. Typically the number of remittances initiated by one person was small (four on average). The addresses disclosed by the women referred to different hotels situated in Paris. Most of the women did not have a criminal record and did not hold a bank account. One of the women however had opened bank account in France and indicated as her address the address of a company whose manager was convicted for aggravated procurement some years ago.

The case was transmitted by Tracfin to the judicial authorities on a presumption of involvement in the procurement of prostitutes.

Source: France.

Example 2 - Use of MR to launder the money from prostitution mediating

The Cypriot financial intelligence unit in co-operation with the Cyprus Police conducted an investigation in relation to the activities of a lady from Asia working in Cyprus for the last eight years as a housekeeper. According the facts of the case and to information obtained from the Police, suspicions were raised that she was a prostitute. Co-operation with all the local and international financial institutions in Cyprus revealed that she did not hold any bank account in Cyprus. Further co-operation with all the Money Remittance offices in Cyprus revealed that she used MR instead. From analysis and investigation carried out from the information obtained from the Money Remittance Offices she sent a significant amount of money outside Cyprus. She also collected and sent small amounts of money from other nationals, women that according to information from the police were also involved in prostitution activities. According to the analysis the suspect sent money to her country and also to both E.U. and non-E.U. countries to different persons each time. The funds that she sent did not correspond with her salary.

Source: Cyprus.

Example 3 - A suspicious transaction report from a money remittance business was received in the FIU. The report revealed that different women were sending money to the same country. Most of the operations were sent to the relatives of the senders, but sometimes one or two operations were sent to two different persons (A and B) in the destination country in amounts higher than usual. After a first analysis other groups of women with the same operational profile were discovered and it was noticed that A and B also were receiving money from them.

A police investigation was undertaken which established that the senders were women that were working in prostitution activities and that the money sent to A and B was to pay the debt to the illegal immigration organisation in the country of origin.

Terrorism

Box 12. Terrorism

Mechanism: money remittance

Red-flag indicators: money transmitting by criminals, MR to unusual jurisdictions

Example 1 - Mr X was a defendant of operation CREVICE, a case concerning the purchase, transportation, concealment of fertilizers for use in the construction of an improvised explosive device. Mr X was found guilty in 2007 of conspiracy to murder and conspiracy to cause by an explosive substance an explosion of a nature likely to endanger life or cause serious injury and damage to property. He was sentenced to a custodial sentence of forty (40) years. Between 07/11/03 and 12/11/03 Mr X withdrew GBP 2540 (sterling) in cash from his Barclays Bank PLC account. On 12/11/03 Mr X sent £2471 to person Y in Kharian, Pakistan via UK Western Union money transfer, converting to 233,326.5 rupees. Mr Y is a US citizen and was arrested by the FBI in April 2004. He pleaded guilty to committing terrorist offences and was sentenced to a custodial sentence of seventy (70) years.

Source: United States.

Example 2 - In November 2008 a Pakistani national Mr X residing in the US was sentenced to 110 months in prison, followed by three years of supervised release, for conspiring to launder money and for concealing terrorist financing. He was also ordered to forfeit assets worth USD 2 208 000. Mr X operated company A, Inc., a money remitting business in Washington, D.C. Mr A, company X, Inc. and five other defendants allegedly conspired to launder over USD 2.208 million received from a cooperating witness working with ICE and FBI agents. The money was purported to be the proceeds of drug trafficking, terrorist financing and trafficking in contraband cigarettes.

Source: United States.

Example 3 – Between 2000 and 2007, Mr. A received 102 money transfers of a total amount of USD 203,768.91. During the same period, Mr. A sent 120 transfers abroad for USD 107,000.00. to various countries, primarily to the United States, Ecuador, Colombia, Guatemala, Mexico, India, Egypt and

Bolivia. Mr. A has been detained in 2007 by the authorities for being related to an alleged international criminal organisation responsible for smuggling persons illegally to the United States. Several persons coming from countries such as Malaysia, China, Korea, India, Iran, Irak and Egypt were sheltered in Peru by Mr. A and his local associates. Then, they followed the route to the United States through Ecuador, Guatemala and Mexico. According to the Peruvian police, there is a possible link between Mr. A and a member of the terrorist group, who is detained in Venezuela. Among indicators having triggered the suspicion was the fact that there was no link between the person making the transfers and the variety of countries to which transfers were being made.

Source: Peru.

2.4 Informal money remittance services

81. Informal money remittance systems can be used to send money around the world. They are often linked to a certain geographical region and go under specific names such as *hawala*, *hundi*, or *hawilaad*, depending on the geographical or cultural links of the persons who establish or use them. These are underground 'banking' channels in which the transactions are settled by offsetting an equivalent some at the receiving location. The transfer request is made in one location (where funds the funds to be transferred are received). The counter value is then distributed to a beneficiary at another geographic location through one of the network's correspondents. These systems have numerous advantages: they are quick, discreet and reasonably priced, which makes these services attractive for both legal and illegal use. In recent years it has become clear that informal money remittance systems play an important role in international terrorism financing and that they are a suitable medium for terrorists to transfer money[23] .

82. Detecting these underground systems is by definition very difficult. In countries with alternative money remittance systems, it is often difficult to prove illegal activities in these systems as they are often trust-based, secretive and unregistered, with indirect fund movements. It is therefore difficult to assess the degree of compliance even when informal value transfer service providers are legal. In most countries having experience with such systems, informal remittance services are illegal. In others (Denmark, Sweden, United Kingdom, and United States, and in some cases in Germany), their activities are regulated by the AML/CFT regime.

83. Underground remittance activity, particularly that which is carried out by immigrants, serves a legitimate need, but also offers a potential for misuse for ML/TF purposes. For instance, due to the lack of effective monitoring, anonymous customer transactions can take place and customer's beneficial owner can be hidden.

84. To guarantee that informal systems are not operating in an unregulated manner, the safeguards below are often used:

- Adoption of legislation, in compliance with FATF SR VI, requiring the licensing and/or registration of MR/CE services.
- Regulating the operations of the MR/CE services, including licensing and /or registration, identification and awareness-raising, the adoption of AML/CFT laws and regulations, monitoring of compliance with those laws and regulations; and creation and implementation of a sanctions regime.
- Implementation of an effective currency transaction report and suspicious transaction report system, which includes effective analysis by a supervisory agency that cooperates with law enforcement. Non-registered MR/CE services are often identified through

23 FATF (2003), *pp* 11

reports by other currency suppliers under the reporting regime; by tip-offs made to the supervisory agency; and by analysis of information coming to the supervisory agency's attention either from its own staff/activities or from that of other law enforcement/regulatory agencies.

- Effective supervision by regulatory authorities (on-site inspections; oversight over high volume/ number remittances with no apparent economic substantiation, risk-based examinations, timely law enforcement actions, etc.) and close co-operation between supervisory and law enforcement authorities.

85. Several countries, such as Austria; Hong Kong, China; France; Germany; Netherlands; Spain; and the United States indicate that they have prosecuted individuals for criminal activities related to informal money remittance service. As illustrated in the examples below, the reporting parties can play a very important role in this detection.

Box 13. Use of Informal MR System

Mechanism: informal money remittance system

Example 1 - An East African residing in Belgium, Mr X, stated that he performed Hawilaad banking activities. His account was exclusively credited by cash deposits and numerous transfers in small amounts. During several months the funds were transferred to company A in Eastern Africa. Shortly afterwards the funds were transferred to company B in Western Europe. Companies A and B performed money remittance transactions around the globe. Mr X claimed that he performed Hawilaad activities for fellow countrymen wishing to send money to Eastern Africa. However, he did not hold any position within Belgian companies and he was not registered as manager of an authorised exchange office. The individual did not have an authorisation from the CBFA (banking supervisor) either. Police sources revealed that he was known to be a member of a terrorist organisation. In this case the alternative remittance system may have been used for terrorism financing. The police are investigating.

Example 2 - In September 2008 Mr X, a Pakistani national residing in Canada, pleaded guilty in the U.S. to conspiring to launder money. According to his guilty plea, Mr X operated a money transfer business in Montreal, Canada to transfer monies abroad through an informal money transfer system called a "hawala," using a network of persons and/or businesses to transfer money across domestic and international borders without reliance upon conventional banking systems and regulations. A cooperating witness, acting at the direction of law enforcement, held himself out to Mr X and his associates to be involved in large scale international drug trafficking and international smuggling of counterfeit cigarettes. From January 2004 to November 2005, Mr X assisted co-defendant Mr Y in 10 hawala transfers from the U.S. totalling USD 828 000 in U.S. currency provided by the cooperating witness. The cooperating witness represented that the monies sought to be transferred were the proceeds of drug trafficking, and Mr X laundered these funds believing they were to be used to support those activities.

CHAPTER III - KEY FINDINGS

4.1 Assessing ML/TF risks and threats within the MR/CE sector

86. Based on the analysis of information provided through the survey, the project team identified certain potential vulnerabilities in the money remittance and currency exchange sector.

Assessments by competent national authorities

87. From the responses received, it appears that so far only a few countries have conducted assessments of ML/TF risks or threats in the MR/CE sector[24]. Countries where the risk assessments have been made and where the risks have thus explicitly addressed can be divided into two groups:

- Countries where the financial intelligence unit assessed the ML/TF risks posed by money remittances and currency exchange (Bulgaria, Estonia and Poland, for example). These risk assessments are mainly based on analysis of suspicious transaction reports and the results of law enforcement actions.

- Countries where the national risk assessment was performed on an interagency basis (Netherlands, Spain, and the US, for example).[25] In these assessments, the expertise of the FIU and the investigative authorities was used; however, significant involvement from other relevant stakeholders (representatives of the private sector, scholars, etc) also occurred.

88. In conducting risk analysis for the MR/CE sectors, it appears that such analysis cannot be done solely by looking at individual STRs. Whilst relevant disclosures usually capture specific remittance transactions, this approach lacks a more strategic perspective that could help identify relevant flows and trends. A proactive approach appears to be needed that will allow the evaluation of relevant flows, coupled with the consideration of socio-economic factors such as the distribution of immigrant communities, the destinations of remittances, the extent and features of the informal sector, the strategic location of the country, etc. This appears to be an advantage that the interagency approach can provide.

89. In addition to the STRs, intelligence developed by those authorities with supervisory responsibility over the MR/CE sector has proven to be valuable source of information when analysing the potential threats and new and emerging trends.

90. The national experience derived from identified ML/TF schemes in which money remittance and currency exchange providers were involved (the intelligence emerging from STRs analysis) can

---

24 For a detailed overview of the ML&TF threat assessments in FATF member states, please refer to FATF (2008b).

25 In the US, the National Money Laundering Threat Assessment conducted in 2005 as an inter-agency initiative included MSBs as well as online payment systems, informal value transfer systems, insurance companies, trade-based ML and bulk cash smuggling. The U.S. published a follow-up national strategy in 2007.

contribute to reviewing the legal framework at national level (and supranational/ EU level as well) to guarantee the effectiveness of the system in the light of the new services.

91. For example, in Germany and the UK[26], a periodic overview of the AML/CFT threats posed by MR/CE businesses is published. The overview contains up-to-date information on threats and trends identified on the basis of STRs.

92. A specific example is related to the assessment of risks posed by the introduction of the euro. Of the FATF and MONEYVAL member States from the euro zone, the information provided indicated that only five countries had conducted an assessment of the related ML threats[27]. The scope of each risk assessment varied substantially, while in some countries a special committee was set up that co-ordinated the risk assessment and management, in other countries the process was rather informal.

Box 14. Examples of experiences in assessing risks posed by the introduction of the euro

In the Netherlands, the ML threat assessment was addressed by an official working party which was established by the Dutch Ministry of Justice. Typologies and risk indicators were developed from the results of this working party.

France set up a task force at the national level in 2000, coordinated by the FIU (Tracfin) and comprising representatives of the judicial police, the customs, the Bank of France and the banking supervisor. The task force was in charge of conducting risk analysis, raising awareness and coordinating prevention and detection of suspicious transactions in relation with the adopting euro. At the international level, Tracfin invited its EU counterparts concerned by the adoption of the euro to a meeting in 2000 to ensure the best and timeliest co-operation in exchanging information, on the basis of MoUs already signed or via the Egmont secure website. A contact person was designated in each of the twelve FIUs to deal specifically with any transaction and information related to the Euro.

In Italy the ML/TF risk assessment of adopting euro was analysed in-depth and involved both reporting entities and competent authorities. Indications were provided to reporting entities for the detection of possible suspicions, particularly related to the need to convert cash or other means of payment of illegal origin into the single currency within the set deadline. A peak of disclosures was registered in the change-over phase, leading to the detection of possible illegal financial transactions. Together with instances of money laundering, several cases of fiscal violations were identified.

In Malta, the FIU specifically addressed the ML threat to MR and bureaux de change in the period preceding the adoption of the euro. It carried out an assessment of the legislation in force at the time and consulted its EU counterparts, both in the euro area and prospective members of the euro area. The assessment revealed that the AML/CFT measures in place were sufficiently effective and there was no need to introduce additional measures. The FIAU recommended that only credit and financial institutions (as defined under Maltese law) be authorised to exchange Maltese liri into euro. Moreover the FIAU established a set of ad hoc guidelines for CDD for all financial and credit institutions. These guidelines directed mainly to credit institutions and money remittances/bureaux de change require, *inter alia*, to identify all persons requesting to exchange currency and any other person on whose behalf the person was acting, encourage the general public to deposit any amounts of cash into existing or new bank accounts prior to changeover, strictly comply with existing record keeping and reporting obligations and prepare staff by providing intensive training on AML/CFT procedures. Also, further to adopting the euro on 1 January 2008, a National Euro Changeover Committee was set up to

---

26 The UK threat assessment of organised crime 2009-2010 (SOCA (2009), *pp* 11) indicates that money service businesses (MSBs), which include bureaux de change, money transmission agents and cheque cashers, are frequently used by organised criminals to launder the proceeds of crime. Criminals may make small value transactions in high volume through legitimate MSB outlets that are not aware that their services are being abused, while complicit MSBs knowingly facilitate large volumes of currency exchanges on behalf of criminal customers.

27 The FATF examined the money laundering implications of Euro introduction in its 1998-1999 and 2001-2002 typologies reports.

oversee the process, in which the FIU was actively involved in this Committee

Although the UK is not a member of the euro zone the country has considered the specific ML threats associated with the introduction of the euro; UK experience has been that, as anticipated, demand for the 500 euro note in the MR/CE sector has been high (for smuggling/bulk reduction); UK reporting sectors were alert to the possibility of large quantities of stored legacy currencies surfacing for exchange, but there were few STRs about this in the event (and most were tax evasion focused).

93. Responding countries indicated that the ML/TF threat in the sector was primarily a result of both the direct penetration of organised crime group into operations of MR/CE providers and of the lax implementation of AML/CFT standards.

94. The absence of a formal risk assessment of the sector however does not mean that the vulnerabilities of the MR/CE have been completely ignored however. Several countries, where the risks to the sector have not yet been addressed through a national risk assessment emphasised that competent authorities constantly monitored the sector to identify the possible risks and vulnerabilities, meet to discuss the problems, and share their experiences.

4.2 Additional measures to be considered at national and international level

95. ***Knowledge of the sector, services offered and transaction channels***: Responses received point out that competent authorities in many countries do not have a comprehensive picture of the MR/CE sector and the services provided. The sector is very heterogeneous and remittance service providers innovate and evolve in developing new transaction channels. In certain jurisdictions, regulators do not engage in a continuous dialogue with MR/CE providers, thus they do not have a clear picture of the sector and measures taken by the businesses themselves regarding the control of their agents, of audit plans, how often agent locations are visited, the turnover of operators, etc.

96. ***Guidance and training*** – Money remittance and currency exchange providers tend to lack the capacity, experience and resources to implement AML/CFT requirements. Therefore regulators and/or supervisors have a key role to play in providing appropriate guidance to MRs and CEs. In this regard, adequate guidance for detecting false documentation appears to be a recurring issue of concern.

97. ***Implementation of CDD measures*** – Especially in countries where the AML/CFT legislation concerning MR and CE service providers is still relatively weak and developing (mostly due to the fact that countries are in the process of introducing the AML/CFT rules that are in accordance with international standards, such as in many countries of the former Soviet Union), the main problem found was weakness in implementing the necessary safeguards and control mechanisms relating to customer due diligence requirements (including adequate red-flag indicators for obligated persons). Because of the absence of durable relationships with customers and the nature of transactions, money remitters and currency exchange offices find it particularly challenging to perform ongoing monitoring with a view to detect anomalies and risk profiles.

98. ***Licensing / registration systems*** – Countries have not always clearly designated the regulatory or other authority to license and/or register MR/CE service providers and to monitor such business activity. When designation has occurred sometimes the licensing and control authorities are split between two agencies which can lead to weakness on oversight of the MR/CE.

99. The data gathered through this research did not permit a conclusion to be drawn on linkages between the abuse of MR/CE services and the type of regulatory framework, for example, whether the jurisdictions with a registration regime as opposed to a licensing regime tend to face more cases of the misuse of MR/CE services or whether jurisdictions with a higher threshold on CDD for wire transfers observe higher cases of abuse.

100. ***Supervision*** – The level of vulnerability of the MR/CE sector to misuse for ML and TF was found to be rather high, with some countries indicating high levels of non compliance. There appeared to be in some cases a lack of understanding on the particular nature of the MR/CE sector that make it vulnerable to misuse for ML/TF purposes.

101. ***Fit and proper*** – As described in Section II there is a risk in some instances that MR/CE operators or agents may be owned by criminals and that an adequate 'fit and proper' test should rule out as effectively as possible. One possibility used in some countries is the regular registration renewal obligation. This has helped to detect attempts at controlling the businesses and/or agents.

102. ***Agents*** – The monitoring of agents and sub-agents of MR/CE service providers appears to be lacking in some instances. Weakness in this area provides for a potential 'loophole' whereby agents might operate at 'arms length' on behalf of other CE service providers and/or are not subject to the 'fit and proper' test. The role of smaller and local players should not be underestimated.

103. ***Reporting systems –*** The implementation of reporting requirements, including the threshold-based reporting system, appears to have contributed to detecting ML in the MR/CE sector. It is noted that in several responding countries, MR/CE service providers rank among the top five in numbers of transactions reported as unusual or suspicious. In others, reporting in this area remains rather low, which may be explained by a variety of reasons (size of the sector, recent introduction of the reporting requirement, low understanding of the STR requirements).

104. ***Law enforcement action –*** The number of referrals, prosecutions and convictions based on STRs received from the sector appears to differ greatly from one jurisdiction to another. However overall, a discrepancy can be noted between the number of referrals and the number of prosecutions. The information gathered indicated that the law enforcement in many jurisdictions is unable to gather sufficient information upon which to act, mostly due to incomplete or insufficient records, and in some cases falsified ones. Following the money trail and seizing assets are a often a real challenge, and it may be impractical to focus on the individual MR/CE transactions between customers, rather than on the elements and data that the operator needs to collect and provide to the law enforcement.

CHAPTER IV – ISSUES FOR FURTHER CONSIDERATION

5.1 Assessing ML/TF risks and threats within the MR/CE sector

105. A non exhaustive list of issues and areas were identified by the project team as requiring additional efforts, in order to ensure that ML/TF risks are adequately addressed in the money remittance and currency exchange sector.

Assessments by competent national authorities

106. As indicated in the previous section, few countries have conducted assessments of ML/TF risks or threats in the MR/CE sector, and in certain cases, the analysis that has occurred has not taken been at a such a level that would help to identify related money flows and trends. It therefore seems logical that countries should be encouraged to carry out studies of their respective MR/CE sectors – using a strategic approach that integrates information and experience from a variety of sources – so as to better understand MR/CE activity and its potential vulnerabilities to misuse for ML and TF.

107. Furthermore, countries should also use their sector-specific threat/risk assessments to help identify gaps in the existing AML/CFT regulatory framework. When conducted on an inter-agency basis, national level assessments may derive the maximum benefit of the knowledge from different authorities, and the results can then be used as another input in the development of an overall national AML/CFT strategy. A sectoral risk assessment should not be just a one-off initiatives but rather on a continuing basis. Countries may want to consider the following factors, as noted in *FATF Risk-Based Approach: Guidance for Money Service Businesses* (FATF (2009)), when conducting a risk assessment:

- Political and legal environments.
- Country's economic structure.
- Cultural factors and the nature of civil society.
- Sources, locations, and concentrations of criminal activity.
- Size of the financial services industry.
- Ownership structure of MR/CE service provider.
- The scale of and type of business done by unregistered or unlicensed MSBs.
- Corporate government arrangements at MSBs and in the wider economy.
- The nature of the payment systems and the prevalence of cash-based transactions.
- Geographical spread of financial industry's operations and customers.
- Types of products and services offered by the financial services industry.

- Types of customers serviced by the industry.
- Types of predicate offenses.
- Amounts of illicit money generated domestically.
- Main channels or instruments for laundering or financing terrorism.
- Sectors of the legal economy affected.
- Underground areas in the economy.

Assessments by the MR/CE sector itself and measures at service provider level

108. It is also essential that MR/CE service providers assist in identifying, assessing and managing ML/TF risks associated with their products, services, customer groups, and geographical location. ML and TF risks should be assessed on a regular basis at a company level to ensure that the AML/CFT measures applied are up-to-date and appropriate. AML/CFT procedures to manage and mitigate these risks also need to be constantly under review and implemented.

109. It makes sense that MR/CE service providers should implement a risk-based approach that takes into account the particular ML/TF risks that their sector faces also in terms of the different players (for example, concerning MR/CE agents) and that they implement appropriate controls for higher-risk situations. On this issue, the FATF guidance on the risk-based approach lays out some of key factors and issues that should be considered by both the public authorities and the MR/CE service providers when implementing. For example, the guidance states that these businesses should pay particular attention to categories of customers that may indicate a higher risk, including:

- Customers conducting business or transactions in unusual circumstances;
- Customers who are politically exposed persons;
- Non face-to-face customers;
- Customers who structure their transactions;
- Customers who wire money to online gambling sites or high-risk jurisdictions;
- Customers who use agents or associates to hide beneficial ownership;
- Customers who know little about or are reluctant to disclose details about the payee;
- Customers or parties with no apparent ties to the destination country;
- Suspicion that the customer is acting on behalf of a third party but not disclosing that information;
- Transactions involving charities and other non profit organisations which are not subject to monitoring or supervision, like cross-border charities;
- Customers who have been subject of a law enforcement enquiry known by the MBS;
- Customers who use false identification;

- Customers who offer different identifications or identifiers on different occasions;
- Customers who receive transactions in a pattern consistent with criminal proceeds; and
- Customers who receive transfers in seasonal patterns consistent with criminal proceeds.

110. Regarding transactions conducted by MR/CE businesses, it is essential that there be control mechanisms that will permit the identification of any money flows or customers warranting closer scrutiny. This should also apply in cases of single-person businesses. In larger MR/CE businesses, the person responsible for compliance with AML/CFT measures should ensure that internal monitoring processes provide for effective controls and readily available information concerning, inter alia:

- Who approaches as a customer, how often, when, from where, remitting or receiving how much, and the probable and plausible rationale for that;
- Many customers sending to one beneficiary;
- One customer sending to several beneficiaries (and other similar schemes);
- The use of data and IT to scan for patterns of transactions.

111. There are a number of other areas which should be considered carefully by the MR/CE service providers. For example, the background of the employees should be carefully checked. Also, at the company level, it is important that employees regularly receive appropriate training on AML/CFT measures. Such training should ensure not only that they understand their responsibilities but also have sufficient knowledge to detect any suspicious activity. For this purpose, written compliance procedures are of paramount importance. Also, other issues include the need to prevent situations when data/ input by operators could be insufficient, incorrect or subsequently modified fraudulently without any possibility to track subsequent changes, which would impact on the usefulness or accuracy of the information kept by the MR/CE service providers.

5.2 Additional measures to be considered at national and international level

112. ***Knowledge of the sector, services offered and transaction channels***: There is clearly a need for competent authorities to understand fully how the sector operates and the services it provides, as well as developments in the sector, which could be exploited for ML/TF purposes. In order to further solidify understanding of the MR/CE sector along with its vulnerabilities, regulators should therefore engage in a continuing dialogue with MR/CE providers. Such a dialogue would also make them more aware of the measures that some service providers themselves already take to oversee the activity of their agents as far as compliance with AML/CFT measures.

113. ***Awareness raising*** – Outreach to the MR/CE sector, generally, to explain and reinforce AML/CFT obligations, as well as to enhance industry supervision, is important. Making the general public more aware of the need for AML/CFT measures to be applied to MR/CE services can be equally important however. Such awareness raising may assist in building trust in the regulated system and thus help to foster the use of the system rather than underground or unauthorised means for the movement of funds.

114. ***Guidance and training*** – Since many MR/CE service providers tend to lack the capacity, experience and resources to implement AML/CFT requirements, regulators and/or supervisors have a key role to play in this process by providing adequate guidance to the sector. Given the specific nature MR/CE activity where adequate knowledge of the customer is heavily reliant on effective

identification and record keeping procedures, training on the detection false documentation could be especially useful.

115. ***Licensing / registration systems*** – Countries should clearly designate the regulatory authorities delegated the authority to license and/or register MRs/CEs and to monitor MR/CEs. Due to the particular nature of the services they are providing, it is highly beneficial for the same institution to license or register and supervise them. The institution authorised to issue licenses or registering the MR and CE service providers should have access to public as well as restricted information. Often the information held in databases that have a restricted access (for example, police databases) is of great value. As indicated in the previous section, the advantages of one type of regulatory framework (licensing or registration) over another could not be determined by this study. This issue may be worth exploring further.

116. ***Supervision*** – Given the high vulnerability of MR/CE activity to ML and TF, reinforcing supervision should be considered as essential to prevent and deter the misuse of such businesses. Training should enable the staff of relevant supervisory authorities to assess the quality of internal procedures of MR/CE service providers. It should also enable them to determine whether or not risk management policies and processes are appropriate in relation to the business's profile and whether senior management has adequate risk management policies along with the necessary procedures and controls.

117. ***Fit and proper*** – It is vital to have an appropriate 'fit and proper' system in place to effectively identify the true beneficial owner of a company and to guarantee that MR and CE providers do not operate in an unlawful manner. The 'fit and proper' control should be of a continuous nature to effectively rule out any cases where the company is controlled by criminals. Using a regular registration renewal obligation is one way that this might be implemented.

118. ***Agents*** – There should be ongoing scrutiny and monitoring of agents and sub-agents of MR/CE service providers. Whether this can be achieved by a regulatory requirement on principals to undertake more detailed background checks on their agents, or the inclusion of agents within the requirements should depend on the particular circumstances of the country.

119. ***Reporting systems –*** The detection of ML/TF activity in the MR/CE sector can be improved only if reporting requirements, including the threshold-based reporting systems, are implemented effectively. Given the risk of receiving too many (or too few) STRs from the sector and in order to avoid over-reporting in threshold-based reporting system, automatic or semi-automatic control mechanisms could be integrated into the databases of the authority that collect such information.

120. ***Information sharing*** – The legal framework should clearly define information-sharing responsibilities between the regulatory authorities, law enforcement agencies, and the private sector. Information exchange between the public and private sector is essential for an effective national ML strategy to function.

121. ***At international level –*** Closer cross-border co-operation has sometimes found lacking in this area. MR/CE business activity by its nature often involves persons and activities (as well as currency) from different jurisdictions. MR/CE services are therefore frequently provided by multinational companies. Due to the cross-border aspect of money remittance there is sometimes confusion as to which authority in which country should intervene if suspicious activity is detected. Effective and prompt international co-operation between the law enforcement agencies has proven to be of paramount importance in guaranteeing that such attempts do not remain unpunished. FIU-to-FIU co-operation has proven to be particularly important in this respect, even beyond exchanges on specific STRs.

122. The MR/CE sector provides a service that meets significant and genuine economic needs, and its vulnerability to misuse for money laundering is closely linked to the effectiveness of AML/CFT preventive measures. As with other parts of the financial sector, it may take several years for the AML/CFT regime applicable to money remittance and currency exchange providers to evolve. Moreover, criminal networks often appear able to change their laundering methods more quickly than law enforcement authorities and supervisors can adapt their detection and enforcement capacities. Therefore it is inevitable that it frequently takes time for appropriate legislation to be drafted and agreed upon and still longer for legislation to be tested by the courts and proven to be effective.

123. It clear however that certain measures, if not properly adapted to the specific situation of country, could inadvertently drive the sector further underground, particularly in developing countries where the informal sector is commonly observed. From the regulatory and supervisory perspective, enhancing the level of requirements and controls, while certainly improving the capacity to prevent the misuse of legitimate entities, might in some cases increase the cost of compliance, thus creating greater incentives for marginal businesses to shift to the underground sector, which would then escape from monitoring.

ANNEX 2 – LIST OF INDICATORS OF POTENTIAL MONEY LAUNDERING ACTIVITY

This section attempts to feature indicators which appear in the selected case studies in this report as well as additional indicators which have been developed in responding jurisdictions to assist anti-money laundering and counter-terrorism financing officers to identify and describe suspicious behaviours for inclusion in suspect transaction or suspicious matter reports. This is a non-exhaustive list. It should also be noted that the single indicators by themselves may not necessarily be linked to money laundering, as some indicators may be typically be found for many money service businesses not facilitating illicit finance.

1. Indicators for all money remitter and currency exchange (MR/CE) service providers

Transactions

- The transaction seems to involve unnecessary complexity.
- Use of front men and/or shell companies.
- Transactions in a series are structured just below the regulatory threshold for due diligence identity checks.
- The customer appears to be trying to avoid reporting requirements by using two or more MR/CE locations or cashiers on the same day to break one transaction into smaller transactions.
- Two or more customers appear to be trying to avoid reporting requirements and seem to be working together to break one transaction into two or more transactions.
- Transactions are carried out by the customer on behalf of third parties without there being an appropriate business relationship with such parties.
- Frequent transaction orders are made by the same client
- Sudden increases in the frequency/value of transactions of a particular customer without reasonable explanation.
- An unusually large (cash) transaction.
- The amount of the transaction is unusually large for the typical customer or for the MR/CE.
- The transaction has no apparent purpose or no obvious economic/financial basis.
- Unnecessary routing of funds through third parties.
- The customer uses intermediaries which are not subject to adequate AML Laws.
- A customers sends/receives funds to/from him/herself, for no apparent purpose.

- There is no genuine reason for the customer to use the services of an MR/CE business.
- Transfers of large sums of money to or from overseas locations with instructions for payment in cash.
- Customers send or receive (regular) payments from countries which are regarded as "tax havens" or non co-operating.
- One legal/natural person transfers sums to many legal/natural persons.
- One legal/natural person receives sums from many legal/natural persons (from various countries).
- Many legal/natural persons (who have no obvious blood/business relation) are beneficial owners of transfers ordered by one legal/natural person.
- An under-aged person receives funds from many legal/natural persons and/or from different locations.
- A customer sends/receives funds to/from counterparts located in jurisdictions which are known to be exposed to risks of, *i.e.* drug trafficking, terrorism financing, smuggling.
- Non face-to-face customers are not physically present for identification purposes.
- Transactions are accompanied by information which appears clearly false or contradictory.
- The customer is unwilling to provide routine information when requested or the information provided is insufficient, false, or hard for the MR/CE to verify.
- No or limited information about the origin of funds.
- The explanation for the business activity and/or the funds involved is not credible.
- Electronic transfers involving large sums of money does not include data allowing for the clear identification of such transactions.
- Rounded deposits of funds are followed by like-amount wire transfers.
- The customer is accompanied by others who keep a low profile or stay just outside.
- The customer reads from a note he apparently did not write himself.
- The customer receives instructions from others.
- The customer appears to be in doubt when asked for further details.
- Difficulty in obtaining details of the beneficial owners.
- No relationship between sender and beneficiary.
- Operations are irregular.

- The supporting documentation does not add validity to the other information provided by the customer.
- The customer is in a hurry to rush a transaction through, with promises to provide the supporting information later.
- The customer represents a business but seems to have no business experience.
- Authority for others to withdraw funds does not seem to be well-founded.
- Correspondence is to be sent to another person than the customer.
- The customer needs information on what has been deposited in the account before a large cash withdrawal or transfer to abroad.
- Form is filled in advance.
- The pattern of transactions has changed since the business relationship was established.
- Money transfers to high-risk jurisdictions without reasonable explanation, which are not consistent with the customer's usual foreign business dealings.
- Sudden increases in the frequency/value of transactions of a particular customer without reasonable explanation.
- Instruction on the form of payment changes suddenly just before the transaction goes through.
- The customer, without a plausible reason, repeatedly goes to agents located far from his/her place of residence or work.
- Funds are sent at a time not associated with salary payments.
- Remittance sent outside migrant remittance corridors.

For cash transactions

- Unusually large cash payments in circumstances where payment would normally be made by cheque, bank draft, etc.
- Cash is in used notes and/or small denominations (possible indication that the money originates from the criminal offence).
- Customer refuses to disclose the source of cash.
- Customer has made an unusual request for collection or delivery.
- Banknotes brought by customer are in small denominations and dirty; stains on the notes indicating that the funds have been carried or concealed, or the notes smell musty are, packaged carelessly and precipitately; when the funds are counted, there is a substantial

difference between the actual amount and the amount indicated by the customer (over or under); detection of counterfeit banknotes in the amount to be transferred or exchanged.

- Depositing funds in cash with further transfer of funds to other person on the same or next day.

Customer profile and behaviour

Customer profile

- Customer's area of residence is inconsistent with other profile details such as employment.
- The size or frequency of the transaction(s) is not consistent with the normal activities of the customer.
- The goods/currencies purchased, and/or the payment arrangements are not consistent with normal practice for the type of business concerned.
- The customer's address is a post office box or a c/o ('in care of') address.
- The customer's address is that of a company service provider (domiciliation service).
- The customer's address information is difficult to verify.
- The postal address for correspondence differs from the customer's official address.
- The stated address does not exist.
- A large number of persons are registered at the stated address, or there are a very large number of changing occupants, or other information is available indicating that it is not the real address of residence or domicile.
- The address of customer's residence does not correspond to the customer's financial arrangements.
- The customer changes address frequently.
- The customer is a business whose name and purpose do not correspond with its transactions.
- The customer cannot immediately provide additional identification documents.
- Identification documents appear to be unused.
- Identification documents are soiled making it difficult to read the necessary information.
- The customer is known to have a criminal past.
- The customer is close to a person who is known to have a criminal past.
- Sudden change in the customer's life style.

- The customer drives very expensive cars that do not correspond to his income situation;
- The customer hires or leases costly assets (*e.g.*, real estate or cars) that do not correspond to his income situation.

Customer behaviour

- The customer is unwilling provide details of his/her identity information and references.
- The customer needs information on what has been deposited in the account before a large cash withdrawal or transfer to abroad.
- Use of false identity documents to send money.
- Customer changes a transaction after learning that he/she must show ID.
- The customer shows no interest in costs or interests.
- The customer does not choose the simplest way to carry out a transaction.
- The customer has no connection with the area where the customer relationship is established.
- Transaction is a price-raising link in a series of transactions with no obvious reasons for the choice.
- The customer gives a rather detailed explanation that appears to be rehearsed concerning the reasons for the customer relationship or the transaction.
- The customer does not respond to letters to the stated address.
- The customer has many newly established companies.
- The customer contracts a loan secured on lodging of equivalent security.
- The customer has companies abroad that are not justified by the customer's business.
- The customer explains that expensive assets are a loan from or financed by a third party.
- The customer uses a payment card from a country which is not his country of residence.

2. Indicators for CE service providers

- Exchange of large quantities of low denomination notes for higher denominations.
- Exchange of large amounts or frequent exchanges that are not related to the customer's business.
- Structuring of large amounts.

- Repeated requests from an exchange office for foreign exchange purchasing-selling transactions in the amounts slightly less than the transaction limit for identification in a short period of time.
- The customer requests currency in large denomination notes.
- The customer buys currency that does not fit with what is known about the customer's destination.
- The customer buys currency from an unusual location in comparison to his/her own location.
- The customer apparently does not know the exact amount being exchanged.
- The customer looks around all the time and does not watch the counting of money.
- The customer is happy with a poor rate.
- Currency purchases with large cash amounts.
- Large exchanges between foreign currencies.
- Frequent exchange of cash into other currencies.
- Exchange of primarily one type of currency.
- The amounts exchanged are significantly higher than usual.
- There is no link between the amount of money exchanged and holiday periods.
- High frequency of currency exchange transactions over a period of time.
- Many currency exchange office used by a same person.
- Requests to exchange large amounts of foreign currency which is not convertible (or not frequently used) another kind of foreign currency.

3. Indicators for MR providers

- Transferring funds without any apparent economic reason.
- Unusual large cash payments in circumstances where payment would normally be made by cheque, banker's draft, etc.
- Transfers of funds without underlying transactions.
- Money transfers to high-risk jurisdictions without reasonable explanation, which are not consistent with the customer's usual foreign business dealings.
- Transfers paid by large cash amounts in different sums in a short period of time.

- Personal remittances sent to jurisdictions that do not have an apparent family or business link.
- Remittance made outside migrant remittance corridors (*e.g.*, Asian foreign domestic remits funds to South America).
- Personal funds sent at a time not associated with salary payments.
- The customer seems only after the counting to know which amount is being transferred.
- The customer shows no interest in the transfer costs.
- The customer has no relation to the country where he/she sends/receives the money and cannot sufficiently explain why money is sent there/received from there.
- The customer has a note with information about payee but is hesitating if asked whether to mention the purpose of payment.
- Large or repeated transfers between the account of a legal person and a private account, especially if the legal person is not a resident.
- Large amounts are transferred to companies abroad with a service provider address.
- Large or frequent transfers of money.
- Frequent transfer of value that is not related to the customer's business.
- Use of groups of people to send money.
- Use of different money remittance businesses.
- Amounts sent are higher than usual.
- There is not relationship between sender and the beneficial owner.
- The operations are irregular.
- Receiving money from different parts of the world (developed countries) from different people.
- Money is received during short periods of time.
- Money is received from different money remittance companies.
- Money is withdrawn in cash.
- Multiple senders toward a single individual.

Agents

- Reluctance to provide customers' identification to parent MR/CE business.

- Using false identification and fictitious names for customers.
- Frequent transactions or purchase of negotiable instruments under the reporting obligation.
- Each agent work with a different money remitter.
- Make false remittance operations.
- Use false identity documents to send money.
- Make too many operations.
- Not so many people enter into the agent office.
- Sending money to certain countries/cities.
- Amounts sent are higher than usual.
- Large volume of business in large person-to-person transactions.
- Unusual ratio of sent to received transactions (the direction of the flow of the suspicious ratio imbalance being determined by the context).
- High ratio of larger than normal transactions (the complicit operator attracts the larger-transacting criminal customers).
- Seasonal pattern of business that is different from other similar local businesses.
- High percentage of customers that are high dollar or value customers.
- High percentage of high-risk customers.
- High percentage of criminal activity corridor business, where the location is susceptible to involvement in known criminal activity, such as drugs, prostitution, certain fraud, etc..
- High percentage of total dollar business by high-risk customers.
- High volume of large or suspicious transactions in comparison to other MR/CE service providers in the same area.
- Turnover of the MR service provider, after changes in the management structure (with no development of services) exceeds remarkably the flows that were recorded before those changes.
- Conducting transactions before or after business hours.
- Common acceptance of false identification that permits structuring by customers that leave funds in the system for more than the average time before pick-up.
- Multiple transmissions to or receipts from a single customer in a high criminal activity corridor.

- Large volume of transactions for the same customer with multiple instances of using different name spellings, false addresses or identification that "evolves," *i.e.*, some parts of the identification change, while other parts remains the same, such as a person whose last name changes while his first name, date of birth, identification number and address remain the same.

- Transmission of funds by the same customer on the same day to several money transmitter locations to purportedly same or different recipients.

ANNEX 3 – TABLES : QUESTIONNAIRE RESULTS[28]

Table 1 – Overview of MR/CE service providers in jurisdictions contributing to this study

	Money orders providers	Travellers' checks issuers	Check cashing providers	Bureaux de change	Currency dealers	Currency exchange service providers	Stored value means providers[29]	Other	Remarks
Albania	X	X	X	X	X	X			
Argentina			X	X		X			
Armenia	0	X	X	X	X	0	0		Although the first field isn't marked, there are money remittance providers in Armenia (post offices, banks and others).
Austria	0	0	0	0	0	0	0	0	These activities may be carried out only by banks.
Bulgaria	X	0	0	X	X	X	0	X	Financial houses
Chile	X	0	X	X	X	X	0		
Chinese Taipei	0	0	0	X	0	0	0	0	
Croatia	X	X	0	X	0	0	0	0	

28 Tables below reflect data and information received from responding countries in 2008.

29 And other anonymous means of payment.

	Money orders providers	Travellers' checks issuers	Check cashing providers	Bureaux de change	Currency dealers	Currency exchange service providers	Stored value means providers[29]	Other	Remarks
Cyprus	0	0	0	0	0	0	0	X	Companies (legal persons) specifically licensed by the Central Bank of Cyprus to provide exclusively "money transfer services" (MTS means the operation of a business whose activities consists of the acceptance of money, exclusively for their speedy transfer from and to the Republic of Cyprus by any means)
Denmark	0	0	0	0	0	0	0		
Estonia	X	X	X	X	X	X	X		providers of payment services , money broker service providers
Finland	X	X	X	X	X	X	X	0	
France	X	X	X	X	X	X	X		MR conduct as a business is under the provision of the banking regulation.

Table 3 - Regulatory framework of MR service providers in jurisdictions contributing to this study

Country[30]	Licensing/registration	Licensing institution Authority responsible for registration	Limited for the certain time period/needs updating?
Albania	NA	Central bank	NA
Argentine	NA	NA	NA
Armenia	Yes (licensing)	NA	No
Austria	None since there operate no independent money remittance service providers		
Bulgaria	Yes (licensing)31	Bulgarian National Bank	NA
Chile[32]	Yes (registering)	FIU	NA
Croatia	No		NA
Cyprus	Yes (licensing)	Central Bank	NA
Denmark	Yes (registering)	NA	NA
Estonia	Yes (registering)	Ministry of Economic Affairs and Communications	No
Finland	Yes (registering)	State provincial Office of Southern Finland	NA
France	Yes (licensing)	French Banking Commission	NA
Georgia	Yes (registering)	Georgian Financial Supervisory Authority	NA
Germany	Yes (licensing)	BaFIN (Federal Financial Supervisory Authority)	NA
Greece	Yes	NA	NA
Hong Kong, China	Yes (registering)	FIU	NA
Italy	Yes (registering)	NA	NA
Japan	None since there operate no independent money remittance service providers		
Latvia	No**		NA
Liechtenstein	NA		NA

30 For European Union/ EEA members, please see the explanations provided under Section 1.3 regarding licensing requirements as set out in the EU Directives.

31 During the licensing process, Bulgarian National Bank (BNB) also enters the agents and branches of the money remitter to the register. Agents and branches may not commence operations prior to the registration thereof. BNB shall not register and, respectively, delete from the register any agents and branches of money remittance companies if the BNB determines that the persons who manage and represent the said agents and branches do not possess the required qualifications, professional experience or reliability. A company licensed to operate a money remittance business shall notify the BNB upon the discontinuance of the execution of money remittances by any agent or branch of the said company not later than seven days before the date of discontinuance of the operation.

32 No registration/licensing required at country level.

Country[30]	Licensing/registration	Licensing institution Authority responsible for registration	Limited for the certain time period/needs updating?
Lithuania	None since there operate no independent money remittance service providers		
Macau, China	Yes (registering)	Monetary Authority of Macau	NA
Malta	Yes (licensing)	Malta Financial Services Authority[33]	NA
Mexico	Yes (registering)	*Servicio de Administracion Tributaria* (Tax Administration Service)	No deregistration system
Moldova	None since there are no independent money remittance service providers operating		
Monaco	None since there are no independent money remittance service providers		
Netherlands	Yes (licensing)	NA	NA
Poland	Yes (registering)	NA	NA
Romania	Yes (registering)	National Commerce Register	NA
San Marino	None since there are no independent money remittance service providers		
Serbia	None since there are no independent money remittance service providers		
Slovakia	Yes (licensing)	National Bank of Slovakia	NA
Spain	Yes (licensing)	Central Bank*	NA
Sweden	Yes (registering)	NA	NA
"The former Yugoslav Republic of Macedonia"	NA	NA	NA
Turkey	None since there are no independent money remittance service providers		
Ukraine	Yes (licensing)	State Commission on Regulation of Financial Services Markets	NA
United Kingdom	Yes (registering)	HM Revenue and Customs	NA
United States	Yes (registering)***	FinCEN	Yes (every 2 years)

Remarks:
* In order to get the license from central bank, the positive report from FIU is also mandatory.
In Italy agents of MR service providers must be registered as well, provided that similar integrity and expertise requirements are met.
**The appropriate legislation is at the process of drafting.
*** A business operating as an MSB solely because that business serves as an agent of another MSB is not required to register, but an MSB that engages in activities requiring registration on its own behalf must register even if it is also engaging in activities as an agent for others. See paragraph 10 of main report for explanation of difference between MSB and MR/CE.

33 In Malta the activity of money remittance (as well as currency exchange) or transmission service forms part of a wider category of entities defined as "financial institutions"* that fall under the regulatory and supervisory responsibilities of the Malta Financial Services Authority (MFSA) for prudential purposes.

Table 6 - Threshold for identifying the customer

Country[35]	Threshold (CE)	Threshold (MR)
Albania	EUR 12 000	EUR 12 000
Argentina	obligatory	obligatory
Armenia	appr. USD 1300	appr. USD 1300
Austria	EUR 15 000	No threshold mandatory
Bulgaria	BGN 10 000 (appr. EUR 5 000)	BGN 10 000 (appr. EUR 5 000)
Chile	USD 5 000	USD 5 000
Croatia	HRK 105 000 (appr. EUR 15 000)	EUR 1 000
Cyprus		No threshold mandatory
Denmark	EUR 1 000	EUR 1 000
Estonia	EEK 100 000 (appr. EUR 6 400)	No threshold mandatory
Finland	EUR 15 000	EUR 15 000
France	EUR 8 000	No threshold mandatory
Georgia	GEL 3 000 (appr. EUR 1 400)	GEL 1 500 (appr. EUR 700)
Germany	EUR 2 50036	No threshold mandatory
Greece	EUR 15 000	EUR 1 000
Hong Kong, China	HK USD 8 000	HK USD 8 000
Italy	EUR 15 000	No threshold mandatory
Japan	YEN 2 000 000 (appr. EUR 15 566)	YEN 100 000 (appr. EUR 700)
Latvia	LVL 5 000 (appr. EUR 7 117)	EUR 1 000
Liechtenstein	CHF 5 000 (appr. EUR 3 271)	CHF 5 000 (appr. EUR 3 271)
Lithuania	EUR 6 000	EUR 600 (for local or cross-border post remittances) EUR 1 000 (for banks according to EU Regul No 1781/2006)
Macau, China	General rule: MOP 20 000 (appr. EUR 1 740) MOP 8 000 (appr. EUR 695) for wire transfers	No threshold for cash remittances MOP 8 000 (appr. EUR 695) for wire transfers
Malta	EUR 15 00037	EUR 1 000
Mexico	USD 3 000 (appr. EUR 2 086)38	USD 3 000 (appr. EUR 2 086)

35 In EU/EEA countries, there is a difference on the identification of customers depending on whether the money remittance provider is a bank (with the customer holding an account) or not.

36 If the transaction is carried out through an account other than the customer's account.

37 For one-off transactions. Customer identification is not subject to a threshold in the course of establishing a permanent business relationship.

38 *For Centros Cambiarios.*

Country[35]	Threshold (CE)	Threshold (MR)
Moldova	MDL 50 000 (appr. EUR 3 500)	MDL 50 000 (appr. EUR 3 500) for cash transfers and MDL 15 000 (appr. EUR 1 000) for electronic and wire transfers
Monaco	No threshold mandatory	No threshold mandatory
Netherlands	No threshold mandatory	No threshold mandatory
Poland	EUR 15 000	EUR 1 000
Romania	No threshold mandatory	No threshold mandatory
San Marino	EUR 15 000	EUR 15 000
Serbia	EUR 15 000	EUR 15 000
Slovakia	EUR 1 000	EUR 2 000
Spain	No threshold mandatory	No threshold mandatory
Sweden	EUR 15 000	EUR 1 000
"The former Yugoslav Republic of Macedonia"	EUR 2 500	EUR 2 500
Turkey	TRY 2 000 (appr. EUR 948) for wire transfers; TRY 20 000 (appr. EUR 9480) for cash transactions[39]	Mandatory when establishing the business relationships; TRY 2 000 (appr. EUR 948) for wire transfers; TRY 20 000 (appr. EUR 9480) for cash transactions
Ukraine	No threshold[40]	UAH 5 000 (appr. EUR 434)
United Kingdom	EUR 15 000	No threshold mandatory
United States	USD 1 000 (appr. EUR 696)	USD 3 000 (appr. EUR 2086)

39 Mandatory when *establishing* the business relationships.

40 Except for banks that may not identify their customers if the financial transaction is conducted to the amount of UAH 50 000 (USD 6 250) without *opening* an account.

GLOSSARY OF TERMS

Agent — any person who provides money or value transfer service under the direction of or by contract with a legally registered or licensed remitter (for example, licensees, franchisees, concessionaires). (*This definition is drawn from the Interpretative note to the FATF Special Recommendation VI*).

Alternative remittance systems (ARS) — Any system used for transferring money from one location to another that operates in part or exclusively outside conventional banking channels.

Beneficiary — The person who receives transferred funds.

Beneficial owner — The natural person(s) who ultimately owns or controls a customer and/or the person on whose behalf a transaction is being conducted. It also incorporates those persons who exercise ultimate effective control over a legal person or arrangement.

Cheque casher — A person that accepts cheques or monetary instruments in return for currency or a combination of currency and other monetary instruments or other instruments.

Currency — Banknotes and coins that are in circulation as a medium of exchange

Currency exchange (CE) — Activity that involves accepting currency, or other monetary instruments, funds, or other instruments denominated in the currency, of one or more countries in exchange for the currency, or other monetary instruments, funds, or other instruments denominated in the currency, of one or more other countries.

Financial institutions — *Financial institutions*[45] means any person or entity who conducts as a business one or more of the following activities or operations for or on behalf of a customer:

1. Acceptance of deposits and other repayable funds from the public.[46]
2. Lending.[47]
3. Financial leasing.[48]

---

45 For the purposes of Special Recommendation VII, it is important to note that the term *financial institution* does not apply to any persons or entities that provide financial institutions solely with message or other support systems for transmitting funds.

46 This also captures private banking.

47 This includes inter alia: consumer credit; mortgage credit; factoring, with or without recourse; and finance of commercial transactions (including forfeiting).

48 This does not extend to financial leasing arrangements in relation to consumer products.

4. The transfer of money or value.[49]
5. Issuing and managing means of payment (*e.g.*, credit and debit cards, cheques, traveller's cheques, money orders and bankers' drafts, electronic money).
6. Financial guarantees and commitments.
7. Trading in:

   (a) money market instruments (cheques, bills, CDs, derivatives etc.);

   (b) foreign exchange;

   (c) exchange, interest rate and index instruments;

   (d) transferable securities;

   (e) commodity futures trading.

Participation in securities issues and the provision of financial services related to such issues.

Individual and collective portfolio management.

Safekeeping and administration of cash or liquid securities on behalf of other persons.

Otherwise investing, administering or managing funds or money on behalf of other persons.

12. Underwriting and placement of life insurance and other investment related insurance[50].
13. Money and currency changing.

(Source: FATF)

Funds transfer

Series of transactions, beginning with the originator's payment order, made for the purpose of making payment to the beneficiary of the order.

Hawala

A specific form of an alternative remittance system.

Informal value transfer system (IVTS)

Any system, mechanism, or network of people that receives money for the purpose of making the funds or an equivalent value payable to a third party in another geographic location, whether or not in the same form. Informal value transfers generally take place outside of the conventional banking system through non-bank financial institutions or other business entities whose primary business activity may not be the transmission of money.

---

49 This applies to financial activity in both the formal or informal sector *e.g.*, alternative remittance activity. See the Interpretative Note to Special Recommendation VI. It does not apply to any natural or legal person that provides financial institutions solely with message or other support systems for transmitting funds. See the Interpretative Note to Special Recommendation VII.

50 This applies both to insurance undertakings and to insurance intermediaries (agents and brokers).

Issuer, seller, or redeemer of stored value	A person that issues stored value or sells or redeems stored value.
Money remittance (MR)	Activity that involves accepting currency, or funds denominated in currency, or other value that substitutes for currency from one person and transmission of the currency or funds, or the value of the currency or funds to another location or person, by any means through a financial agency or institution, or an electronic funds transfer network. Often postal service providers fall into this category if they provide fund transfer services.
Money service business	According to the generally accepted definition, *money service businesses* (MSBs) are non-bank[51] financial institutions that provide certain types of financial services. Although the precise scope of the activities that fall into category "money service" vary from country to country (for example, the requirements for MSBs may only apply if the value of individual transactions and/or its turnover exceeds a certain value limit.[52] They may also only apply to businesses that carry out the specified activities on regular basis or as an organised business concern, etc). Typically, the following types of financial activities are carried out by MSBs: • Currency dealing or exchange. • Cheque cashing. • Issuance of traveller's cheques, money orders or stored value. • Selling or redeeming of traveller's cheques, money orders, or stored value • Money transmitting.
Originator/ transmitter	The sender of the payment order in a funds transfer.
Stored value	Funds or monetary value represented in digital electronics format (whether or not specially encrypted) and stored or capable of storage on electronic media in such a way as to be retrievable and transferable electronically.

51 According to the US financial intelligence unit (FinCEN), the definition *money services business* does not include financial institutions, nor does it include persons registered with, and regulated or examined by, the Securities and Exchange Commission or the Commodity Futures Trading Commission.

52 For example, in US rules applicable to MSBs apply to those currency dealers/exchangers, cheque cashers, issuers of traveler's cheques, money orders or stored value who exchange currency or issue/sell/redeem cash cheques/money orders/stored value in an amount greater than USD 1 000 in currency or monetary or other instruments for any person on any day in one or more transactions.

FATF Report

Money Laundering and Terrorist Financing in the Securities Sector

October 2009

THE FINANCIAL ACTION TASK FORCE (FATF)

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering and terrorist financing. Recommendations issued by the FATF define criminal justice and regulatory measures that should be implemented to counter this problem. These Recommendations also include international co-operation and preventive measures to be taken by financial institutions and others such as casinos, real estate dealers, lawyers and accountants. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit the website:

WWW.FATF-GAFI.ORG

TABLE OF CONTENTS

EXECUTIVE SUMMARY

1. The securities industry plays a key role in the global economy. Participants range from multinational financial conglomerates that employ tens of thousands of people to single-person offices offering stock brokerage or financial advisory services.

2. New products and services are developed constantly, in reaction to investor demand, market conditions, and advances in technology. Product offerings are vast, and many are complex, with some devised for sale to the general public and others tailored to the needs of a single purchaser. Many transactions are effected electronically and across international borders.

3. Some of the features that have long characterised the industry, including its speed in executing transactions, its global reach, and its adaptability, can make it attractive to those who would abuse it for illicit purposes, including money laundering and terrorist financing. Moreover, the securities sector is perhaps unique among industries in that it can be used both to launder illicit funds obtained elsewhere, and to generate illicit funds within the industry itself through fraudulent activities. Transactions and techniques associated with money laundering and the specific predicate securities offences are often difficult to distinguish, which is why specific indicators and case studies for insider trading, market manipulation and securities fraud are relevant and included in this study.

4. The case studies presented in this report illustrate the risks associated with the various types of intermediaries, products, payment methods and clients involved in the securities industry. Unlike other sectors, the risks lie mainly not in respect of the placement stage of money laundering, but rather in the layering and integration stages. Typical securities-related laundering schemes often involve a series of transactions that do not match the investor's profile and do not appear designed to provide a return on investment.

5. Some areas of vulnerability (for example, rogue employees) are not peculiar to the securities industry, and thus this study is of relevance to the wider financial services sector. In particular, some money laundering schemes involve products and transaction types that exist in the banking and insurance sectors as well.

6. Suspicious transaction reporting in the sector remains relatively low, which can be explained by a number of possible factors, including a lack of awareness and insufficient securities-specific indicators and case studies; issues that this report attempts to address. Consultations with the private sector conducted for this project outlined the need for enhanced securities-specific guidance by international organisations and national authorities.

7. The reported incidents of money laundering in the securities industry far outweigh those relating to terrorist financing. However, the sector remains vulnerable to both money laundering and terrorist financing.

CHAPTER 1: INTRODUCTION

1.1 Introduction

1. The securities industry, along with banking and insurance, is one of the core industries through which persons and entities can access the financial system. This access provides opportunities for criminals to misuse the financial system to engage in money laundering (ML) and terrorist financing (TF).

2. Whilst the securities industry has been the subject of international and domestic efforts relating to anti-money laundering (AML) and combating the financing of terrorism (CFT) for several years, ML/TF vulnerabilities specific to this industry have not been subject to global typology research.

1.2 Need for the Typology

3. The securities industry evolves rapidly and is global in nature. It provides opportunities to quickly carry out transactions across borders with a relative degree of anonymity. It is thus imperative to highlight and share current information about potential vulnerabilities.

4. The report previously published by the FATF in 2003[1] on the securities industry provided a relatively limited overview of ML/TF vulnerabilities due to the limited availability of securities typologies. In addition, MONEYVAL and the Asia/Pacific Group (APG) on money laundering, both FATF-Style Regional Bodies (FSRBs), have carried out work in this area. MONEYVAL published a securities typology report in 2008 and the APG incorporated a section on securities into its 2009 yearly typologies report. Both reports are limited in scope to those FSRBs' regional jurisdictions.

5. The FATF decided to conduct a global study in June 2008 in order to better understand the ML/TF vulnerabilities in the securities industry. It is anticipated that this study will be of benefit to the industry, law enforcement and regulators.

6. The need for this latest typology report is also driven by the comparatively low levels of suspicious transaction reporting in the securities industry relative to other industries, such as banking. The reason for lower levels of reporting is not entirely clear, but some possible explanations are explored later in the report.

7. The variation in the securities industry particular to different jurisdictions also contributes to the need for a global typology that addresses these variations. For example, jurisdictions differ in the types of products that they define as securities, as reflected in the numerous types of securities products mentioned in the current FATF Glossary definition linked to the activities of "financial institutions."

8. Moreover, while securities intermediaries in many jurisdictions do not accept cash for securities transactions, which is traditionally used in the placement stage of ML and where potential ML/TF activities may be easier to detect and report, some do. Finally, depending on the jurisdiction, trading in securities is often not limited to securities broker-dealers, but can also involve the banking and insurance industries.

---

1 FATF (2003).

9. The following countries and international organisations joined the project team and contributed to the study: Australia, Belgium, Brazil, Canada (as project co-leader), France, Japan, Luxembourg, the Netherlands, Spain, Switzerland, the United Kingdom (U.K.) (as project co-leader), the United States (U.S.) (as project co-leader), the Asian Development Bank, the Offshore Group of Banking Supervisors ("OGBS"), the International Organisation of Securities Commissions ("IOSCO") and the World Bank. In total, over 40 countries and international organisations participated in the study.

1.3 Scope

10. The objectives of this typology report are to:

- Raise overall awareness of the ML/TF risk in the securities industry for industry participants, regulators and law enforcement;
- Identify specific ML/TF risks based on product type, intermediary, market type and payment/distribution channel;
- Provide a comprehensive set of suspicious indicators and case studies that are applicable to the securities industry; and
- Identify any current and emerging issues which would benefit from further consideration by the FATF.

11. This project examines ML/TF vulnerabilities in the securities industry based on typical products, markets, payment methods and intermediaries associated with the industry. Where practicable, the report seeks to identify the particular vulnerabilities, whether at the placement, layering or integration phase, associated with a particular product, market, payment method or intermediary. Where possible, particularly in the case studies, the report identifies the source of funds used in money laundering and any predicate offence used to generate the funds.

12. Importantly, this report highlights several situations that are of particular relevance or are unique to the securities industry.

13. For example, while money laundering generally encompasses the *introduction* of illicit assets into the financial system, securities can also be a vehicle for *generating* illicit assets within the financial system itself. The FATF glossary includes among the "designated categories of offences", three offences that are predicate offences to money laundering: insider trading, market manipulation, and fraud. Insider trading and market manipulation are particular to the securities industry, as is securities-related fraud.[2] Because these illicit activities are particular to the securities industry, they are addressed in this report in the hope that ML/TF can be reduced when these activities are themselves detected and prevented.

14. Also, the relatively detailed customer information many securities intermediaries collect as part of other regulatory obligations, such as suitability or know-your-customer (KYC), may allow for particular insights into potential ML/TF activities.

15. Although the focus of this report is on the unwilling use of the securities industry in ML schemes, typologies have demonstrated that, at times, securities industry professionals can also be complicit in

[2] Whilst insider trading and market manipulation can also occur in the commodities industry, in at least some jurisdictions commodities trading is included under the securities regulatory regime.

perpetuating ML schemes and securities-specific predicate offences. Accordingly, this report will address both phenomena.

16. Finally, although the report's primary focus is on issues particular to the securities industry, it is worth noting that a number of the vulnerabilities and suspicious indicators identified in this report overlap with those that occur in other financial services sectors, such as banking. Moreover, whilst the report is intended to be a comparative survey, it is not an exhaustive overview of all aspects of this wide-ranging industry.

1.4 Methodology

17. This report is based on four main sources. The first is a review of literature and related guidance that has been produced or undertaken by international groups, domestic regulators, trade associations, self-regulatory organisations (SROs)[3] and academia. The second is a compilation and analysis of the responses to a questionnaire that the project co-leaders distributed to FATF members and observers in November 2008. The third and fourth are the results of a typology workshop and consultations with the private sector, respectively.

18. The questionnaire results were obtained in December 2008 and January 2009 from 38 jurisdictions in the Americas, Asia, Australia, Europe, the Middle East, and two international organisations, giving a total of 40 respondents. [4] The responding jurisdictions varied in the size and organisation of their securities markets. These variations were taken into account to the extent practicable.

19. In November 2008, at about the same time that the questionnaire was distributed, a workshop on money laundering and the securities industry was held in Monaco as part of the 2008 FATF/MONEYVAL Typologies meeting. This workshop was very well supported by members of the FATF, MONEYVAL, and representatives of several international organisations. The following participants examined the issue in depth during a break out session: Australia, Belgium, Brazil, Canada, the European Commission, Finland, France, Germany, Luxembourg, the Netherlands, Norway, Russia, Switzerland, the U.K., the Ukraine, the U.S., the APG Secretariat, IOSCO, the MONEYVAL Secretariat and the Organisation for Economic Co-operation and Development ("OECD").

20. This study is also based on consultations with non-governmental persons, including the Investment Industry Regulatory Organization of Canada ("IIROC"), representatives of the private sector in the U.K. and U.S., and the Financial Industry Regulatory Authority, Inc. ("FINRA"), a U.S. SRO, and representatives of the private sector in some core group countries.

21. The project team would like to acknowledge the thoughtful work of all participants, including the FATF Secretariat. Their input has been greatly appreciated.

[3] An SRO is a non-governmental organisation that has the power to issue and enforce industry regulations and standards.

[4] The questionnaire and a list of the countries and jurisdictions that responded to it are attached as Annex D.

CHAPTER 2:
LITERATURE AND ACTIVITIES REVIEW

2.1 Overview

22. Information on ML/TF typologies, trends and techniques in the securities industry can be found in various sources. As previously mentioned, both the FATF and some FSRBs have conducted typologies in the past. In addition, financial intelligence units (FIUs), law enforcement and other agencies publish suspicious transaction indicators, trends and sanitised ML/TF cases. Significant materials have also been produced by international groups, domestic regulators, trade associations, SROs, and academics. A review of this material is provided below.

2.2 Previous Typologies Exercises

2002-03 FATF Typologies Report

23. In February 2003, the FATF published a general report on ML typologies (FATF Typology).[5] That report contained four chapters, including one devoted to ML through the securities industry. Other chapters of the 2002-03 FATF typology addressed terrorist financing, the gold and diamond markets, and other ML/TF trends.

24. The securities chapter in the FATF Typology made the following overall observations:

- The ability of the FATF to examine ML vulnerabilities in the securities industry was hampered by the lack of information regarding how, or indeed whether, the securities industry was being used for ML;
- ML in the securities industry occurs primarily at the layering and integration stages; and
- The securities industry provides the money launderer with a double advantage – the ability to launder illicit assets generated from outside the securities industry and the ability to use these external illicit assets to generate additional illicit assets within the securities industry, for example through market manipulation and securities fraud.

25. The FATF Typology also provided eight examples of the different stages through which the securities industry can be used for ML/TF, and illustrated the illicit activities that can generate illicit assets from within the industry.

26. The FATF Typology, however, did not provide a comprehensive set of suspicious indicators that compliance professionals in the securities industry could use when evaluating the particular risks that a client or series of transactions could pose. This may have been the result of the lack of information about how or whether the securities industry was actually being used for ML/TF purposes.

5 FATF (2003).

2008 MONEYVAL Typologies Report (MONEYVAL Typology)[6]

27. The MONEYVAL securities typology report focuses on countries predominantly in Eastern Europe that, in some cases, have a developing securities industry.

28. The MONEYVAL typology identified the following areas as presenting the greatest ML vulnerabilities in the securities industry:

- Wholesale markets;
- Unregulated funds;
- Wealth management;
- Investment funds;
- Bearer securities; and
- Bills of exchange.

29. MONEYVAL acknowledged that, in rare instances, cash can be placed through the securities industry. Significantly, MONEYVAL devoted a section of its report to market manipulation and insider trading, providing a number of case studies to illustrate these illicit activities.

30. The MONEYVAL typology presented a number of sanitised case studies as well as schematics to illustrate the flow of funds and the relationships between persons and entities. The MONEYVAL report also addressed suspicious indicators at the account opening stage, the execution and settlement of transactions, and the use of fictitious companies.

31. The MONEYVAL typology also described how information is shared amongst and between financial regulators, FIUs and law enforcement. In particular, MONEYVAL identified information sharing as an important issue given that certain securities transactions are effected in different sectors and may be subject to different regulatory oversight. The report provided guidance on analysis and investigation techniques as well as information on how the FIUs of specific countries perform their analysis and how cases are investigated by law enforcement.

APG Typology Workshop and 2009 Report[7]

32. In October 2008, the APG held a typologies workshop during which several member countries provided presentations. A portion of the workshop featured the securities industry and was attended by several securities regulators. The cases and suspicious indicators included in those presentations focused more on predicate offences to money laundering, such as securities fraud, than on money laundering itself. This may be because fewer APG countries require the securities industry to report suspicious transactions. Where such requirements exist, securities related suspicious transaction reporting (STR) reporting levels are low, potentially impeding the ability of these jurisdictions to investigate money laundering. In any event, the overall experience of some APG countries is that the securities industry is a method of generating illicit assets instead of a conduit for laundering illicit assets generated outside of the industry.

6 MONEYVAL (2008)

7 APG (2009)

33. Instances where ML was detected and reported were mostly at the placement stage because many APG countries still utilise cash as a payment method for securities transactions. For example, some APG country ML case studies focused on the laundering of proceeds of corruption through investments in the capital markets. As with the other typologies mentioned, the APG typology report did not present case studies where the securities industry was used for terrorist financing.

34. As reported by APG member countries, the following were the most common suspicious indicators and methods related to money laundering and predicate offences involving the securities industry:

- Changing share ownership in order to transfer wealth across borders;
- Redeeming a long-term investment within a short period;
- Opening multiple accounts or nominee accounts;
- Using brokerage accounts as long term depository accounts for funds;
- Effecting transactions involving nominees or third parties;
- Engaging in market manipulation, e.g. "pump & dump" schemes; and
- Engaging in boiler room operations.

35. There appeared to be a consensus that APG countries need to better understand the ML/TF risks and vulnerabilities of the securities industry. It was noted that although APG mutual evaluation reports have some useful information on the sector, they do not address securities related ML/TF risks in a significant manner.

2.3 International Activities and Materials

International Guidance and Best Practices

36. A number of guidance documents issued by international organisations and/or domestic authorities provide useful information on ML/TF vulnerabilities in the securities industry.[8] International organisations, such as IOSCO, the Basel Committee on Banking Supervision and the International Association of Insurance Supervisors have produced documents that set out standards and best practices that national regulators and supervisors as well as banks, securities firms and insurance companies should follow.

37. Vulnerabilities identified by these organisations requiring enhanced due diligence or a particular focus on supervision are listed below:

- Transactions involving accounts in multiple jurisdictions;
- Securities accounts introduced from one intermediary to another without adequate customer due diligence/know your customer (CDD/KYC) investigations or from high risk jurisdictions;
- The use of front persons or entities (e.g. corporations, trusts);

[8] These documents are listed in the references and bibliography section.

- Entities with complex corporate structures;
- Politically-exposed persons (PEPs);
- Dealings with financial institutions and intermediaries or customers operating in jurisdictions with ineffective AML/CFT systems;
- Unregistered or unregulated investment vehicles;
- Cross-border omnibus and correspondent accounts; and
- Fictitious trading schemes.

38. Additional areas that are identified as low risk (and where reduced due diligence can, in some jurisdictions, be acceptable) also provide useful information on ML/TF vulnerabilities. These are generally products or accounts with restrictions, such as where:

- Cash withdrawals are not permitted;
- Redemption or withdrawal proceeds are not permitted to be paid to a third party; or
- It is not possible to change the characteristics of products or accounts at a future date to enable payments to be received from, or made to, third parties.

2.4 Domestic Material

Published Law Enforcement Cases

39. Some jurisdictions publish sanitised ML or other financial crime cases. Generally, these cases are published as part of an FIU's annual report, or as specific-topic trends or as typologies reports, and provide insights into ML or TF trends and methods, including statistics and other information. Such information is extracted from STRs and other reports, as well as investigations and other enforcement actions. These sources provide essential guidance to financial institutions and can be used by regulators and other government agencies to help develop their supervisory programmes, as well as in the assessment of AML/CFT system effectiveness.

40. Although the Egmont Group also posts sanitised cases on its website, they contain relatively few references to securities.[9]

Regulatory Guidance and Reports

41. Domestic regulators, FIUs and/or SROs produce guidance to assist their financial institutions and intermediaries in meeting their AML/CFT obligations. Some countries provide industry-specific guidance, including the securities industry, while other jurisdictions provide guidance that is applicable to financial institutions more generally. Guidance in respect of customer due diligence and risk assessment is intended to provide an indication of the types of transactions, customers and delivery channels that present higher ML/TF risks.

[9] The Egmont Group, www.egmontgroup.org/library_sanitized_cases.html

42. This regulatory guidance can involve, for example, a discussion of enhanced due diligence measures that are often recommended for specific types of products/customers, such as:

- Offshore trusts;
- Non-profit or charitable organisations;
- Significant cross-border activity;
- Internet/on-line accounts; and
- Omnibus and private banking accounts.

43. Other guidance appears in the form of published suspicious transaction indicators. These indicators are often developed and published by FIUs and can be industry-specific or apply generally to all financial institutions and designated non-financial businesses and professions (DNFBPs). Some FIUs present the indicators in the context of specific cases that they have built and analysed. Each indicator individually is not an automatic trigger for reporting, but rather serves as a tool for determining whether a suspicious transaction report (STR) should be filed. A comprehensive list of such indicators has been compiled using responses to the project questionnaire, published sources, and consultation with the private sector, and is available in Annex B.

Articles and Papers

44. Specialised periodicals in the area of law, crime or finance publish research or analytical papers on topics related to money laundering written by regulators, law enforcement representatives, academics and members of the private sector. Even among such sources, little is found concerning securities. A few papers discuss the vulnerabilities of the securities industry, in particular at the layering stage, and provide indicators, cases, and discuss implications for regulators and broker-dealers.[10]

2.5 Main Gaps in Existing Material

45. In comparison to several other sectors and financial products, there is significantly less documentation on the ML risks and vulnerabilities related to the securities industry. In many jurisdictions, the literature on TF is less still.

46. By contrast, there is much more abundant information on predicate crimes committed using securities, such as market manipulation and insider trading, in particular with respect to investigations, prosecutions and convictions. The possible connections between predicate offences and money laundering in the securities industry will be examined in this report.

47. As noted above, a number of sanitised cases involving securities have been published, some of which provide detailed information on persons and entities involved and on the flows of funds. However, published cases rarely include information on the suspicious indicators or circumstances that led, or should have led, to the filing of an STR. In some cases, this limited information may be the result of the disclosure restrictions applicable to the STR filing itself. Also absent is information on any enforcement actions, e.g. prosecution or seizures, in respect of the specific case.

[10] A list of articles and papers is provided in the references and bibliography section.

CHAPTER 3:
ML/TF VULNERABILITIES IN THE SECURITIES INDUSTRY

3.1 Introduction

48. The FATF Glossary defines a "financial institution" as including a person or entity that, among other things, conducts as a business the following activities:

- The transfer of value or money;
- Trading in :

  (a) money market instruments such as cheques, bills, certificates of deposits (CDs), derivatives, etc.;

  (b) foreign exchange;

  (c) exchange, interest rate and index instruments;

  (d) transferable securities;
- Participation in securities issues and the provision of financial services related to such issues;
- Individual and collective portfolio management;
- The safekeeping and administration of cash or liquid securities on behalf of other persons;
- Otherwise investing, administering or managing funds or money on behalf of other persons; and
- Underwriting and placement of life insurance or other investment related insurance.

49. While the activities of securities industry participants do not constitute a distinct activity category under the 40+9 Recommendations[11], the activities described in the questionnaire responses fall squarely within the FATF's definition of a financial institution. However, and perhaps not surprisingly, the full scope of securities industry activity is broader still. As such, a more detailed overview of the industry is needed in order to fully appreciate its ML/TF vulnerabilities. As the complexity of products and the diversity of the actors in the securities industry continue to expand, it is suggested that the FATF keep under consideration the extent to which the definition of "financial institution" still covers persons engaged in activities associated with the securities industry.

50. The content of this chapter is principally based on the 40 responses to the questionnaire, which asked participant jurisdictions to use the definition of "financial institution" in the FATF Glossary as a point of reference for identifying:

- Products that are classified as "securities" within a jurisdiction;

[11] The FATF 40 and 9 Special Recommendations have been recognised by the International Monetary Fund and the World Bank as the international standards for combating money laundering and the financing of terrorism. They are available at www.fatf-gafi.org/document/28/0,3343,en_32250379_32236930_33658140_1_1_1_1,00.html.

- The type of market access and payment methods involved e.g. securities exchanges, over-the-counter markets, use of cash or cheques for payment;

- The type of intermediaries involved in the offer, sale, recommendation, or distribution of securities e.g. broker-dealers, financial advisers, banks, insurance companies; and

- The vulnerabilities associated with each, as well as some relevant case studies.

Organisation of Material

51. This chapter is organised into eight topical sections: (1) products classified as securities according to questionnaire responses; (2) markets and other means of access; (3) payment methods; (4) securities intermediaries; (5) client and account types; (6) determination of value; (7) rogue employees; and (8) terrorist financing. Each section provides an overview of the topic area, followed by a discussion of its particular ML/TF vulnerability. When available, these sections also present case studies.

3.2 Securities Products as Described in Questionnaire Responses

52. The FATF Glossary does not define the term "security." Because of jurisdictional differences in defining the term, this report will not attempt to provide a universal definition. However, this report does provide an overview of the products that were identified as securities by the jurisdictions that responded to the questionnaire.

53. The questionnaire asked that respondents categorise securities products under the following three broad categories: (1) ***Transferable Securities****;* (2) ***Units in Collective Investment Schemes****;* and (3) ***Derivatives***.[12]

Transferable Securities

54. The questionnaire listed: (1) equities; (2) bonds and similar debt instruments; (3) certificates of deposit; and (4) bills of exchange as transferable securities. Jurisdictions were asked to include in their questionnaire responses any other products that were considered transferable securities in their jurisdictions or indicate which, if any, of the broad categories were not.

55. Most jurisdictions indicated that the products listed in the questionnaire as transferable securities were designated as such under their laws. However, jurisdictions also identified additional products to those identified in the questionnaire that were considered transferable securities, such as:

- Bank bills and guarantees;

- Bonds that are convertible to other shares;

- Bonds with a share warrant;

- Certificates of participation;

- Commercial notes;

- Debentures;

12 A glossary is provided in Annex A that defines selected terms used in this report.

- Mortgage bonds, securities and certificates;
- Notes issued in a series that obligates a corporation to pay a certain sum at a certain date; and
- Share warrants.[13]

56. It should be noted that, while most jurisdictions treat certificates of deposit as securities, seven did not. In addition, only twelve jurisdictions treat bills of exchange as securities. The fact that they are not defined as a "security" does not in itself mean that there is any gap in the regulatory or supervisory system of the jurisdiction concerned, but highlights the complexity of the terminology used to define these products, and that different authorities (for example a banking supervisor) might be responsible for AML/CFT supervision of these products.

Units in Collective Investment Schemes (CISs)

57. The questionnaire listed: (1) unit trusts; (2) investment trusts; (3) mutual funds; (4) open-ended investment companies (OEICs); (5) open-ended collective investment schemes (SICAV/Fs); and (6) closed-end companies as units in collective investment schemes (UCIS).

58. Although jurisdictions included some variants, many of these differences may be attributable to regional language differences.[14]

Derivatives

59. The questionnaire listed: (1) options; (2) futures; (3) swaps; (4) forward rate agreements; and (5) commodity derivatives contracts; and (6) foreign exchange contracts as derivatives.

60. As with transferable securities and CISs, most jurisdictions consider these instruments to be securities, with some variations.[15]

61. In most jurisdictions where instruments are not treated as securities by law, they are generally treated as "financial instruments" or "derivatives." In some jurisdictions where particular products were not considered to be securities, it was not necessarily clear what alternative regulatory regime (if any) applied to those products. This gives rise to concerns that ML/TF risks relating to those products might not be fully identified. In any event, the complexity of and ability to customise derivatives products makes it difficult to assess the full scope of products in the marketplace.

---

13 While jurisdictions identified other instruments as transferable securities, the products listed here are intended simply to illustrate the wide scope of the instruments that were included in the questionnaire responses.

14 For example, a number of jurisdictions do not treat unit trusts as securities. In addition, OEICs, SICAV/Fs, and closed-end companies are treated as securities in 18 (mainly European) jurisdictions, but do not exist in a small number of jurisdictions.

15 Five jurisdictions do not define options as securities; six jurisdictions do not define futures as securities; seven jurisdictions do not define swaps as securities and one jurisdiction indicated that swaps do not exist in its jurisdiction; ten jurisdictions do not define forward rate agreements as securities, and three jurisdictions indicated that forward rate agreements do not exist in their jurisdictions; ten jurisdictions do not define commodity derivatives contracts as securities and three jurisdictions indicated that commodity derivatives contracts do not exist in their jurisdictions.

Other

62. The questionnaire also asked jurisdictions to list any other products that would be classified as securities but that were not captured in the categories listed in the questionnaire. Jurisdictions identified:

- Annuities;
- Credit-default swaps;
- Equity-indexed annuities;
- Profit sharing agreements/certificates;
- Subscription rights; and
- Variable life insurance and variable annuities.

63. Foreign exchange (Forex) trading is an example of an activity that is technically covered by the FATF definition, but is not always consistently treated as an activity undertaken in the securities sector. Limited suspicious indicators and typology information were available for this activity. This is an area that may benefit from further study. [16]

3.2.1 Vulnerabilities Associated with Particular Types of Securities Products

64. As illustrated by the responses to the questionnaire, different jurisdictions classify a wide range of products as securities. In this respect, any of the products listed above can be utilised in the layering and integration stages of money laundering once illicit assets are placed in the financial system. As noted above, however, the securities industry is relatively inhospitable to the placement of illicit assets into the financial system Nevertheless, as discussed below, certain securities products do pose identifiable ML/TF vulnerabilities even at the placement stage.

Physical Securities (Including Bearer Securities and Bills of Exchange)

65. Although many jurisdictions have dematerialised securities, the questionnaire responses indicated that physical and bearer securities are still available in some jurisdictions. Bearer securities consist of both physical equity and debt securities that, unlike registered securities, do not necessarily require that the owner be registered with an issuer or a transfer agent. The transfer of bearer securities can be as simple as handing the security over to a new owner. It is important to note that the transfer of ownership can, in some jurisdictions, be almost as easily accomplished through electronic means that inhibit tracking any change of ownership.[17] In addition, some bearer bonds are almost equivalent to cash because they can be easily redeemed at financial institutions.

66. The anonymity and easy transferability of bearer securities presents a significant ML/TF vulnerability at all three stages of money laundering. Illicit assets can be placed in the securities industry through the purchase of bearer securities. Once a bearer security has been issued, money launderers or terrorist financiers can hold these securities or transfer them to an intended recipient without necessarily having to use facilities that would record a transaction, conduct CDD or impose KYC obligations.

16 Ten jurisdictions do not define foreign exchange contracts as securities and four jurisdictions indicated that foreign exchange contracts do not exist in their jurisdictions.

17 *Marco Arnone* & *Pier Padoan* (2008).

Recipients of bearer securities can deposit them into brokerage accounts in order to purchase other assets, or liquidate them and withdraw or wire transfer their proceeds out of the jurisdiction, thus layering and integrating the illicit assets. Bearer securities can also be used to conceal the identities of the beneficial owners of shell companies, as discussed below.

67. In some jurisdictions, bills of exchange are treated as securities. A bill of exchange (e.g. cheque, bank draft) is a written unconditional order by a drawer to a drawee to pay money on demand or at a fixed or determinable future time to a payee (the specified person or to the bearer). Bills of exchange can be payable on sight or at a future date and can be transferred by making an endorsement or signature. The risk posed by a bill of exchange is similar to that of a bearer security: ease of transfer and redemption. Although jurisdictions did not provide specific suspicious indicators for bills of exchange, those for bearer securities may be applicable.

Suspicious Indicators for Physical Securities*[18] *(including Bearer Securities and Bills of Exchange)

68. The following are suspicious indicators that are applicable to physical securities, including bills of exchange:

- The customer deposits a large number of bearer securities at the securities firm and quickly redeems the securities or sells them in the open marketplace;
- The customer requests cashing of bearer securities without first depositing them into an account;
- The customer frequently deposits bearer securities or bills of exchange into an account;
- The bearer securities or bills of exchange, if titled, are titled differently than the name on the account;
- The customer's explanation regarding the method of acquiring the bearer securities or bill of exchange does not make sense or changes;
- The customer frequently deposits bearer securities in amounts just below a jurisdiction's threshold reporting requirement;
- Payments for bills of exchange made by way of third party cheques are payable to, or endorsed over to, the customer; and
- The physical security does not bear a restrictive legend, even though the history of the security and/or the volume of shares being traded suggest that it should have such a legend.

Insurance Products

69. In some jurisdictions, insurance contracts that contain an investment component are considered to be securities, and thus are sold through a securities intermediary. For example, a variable annuity is a contract issued by an insurance company under which an investor provides the insurer with a lump-sum premium payment or series of periodic payments. In return, the insurer agrees to make periodic payments to the investor beginning immediately or at some future date. The investor is usually permitted to invest the purchase payments in a range of investment options, such as mutual funds or unit investment trusts.

[18] Physical securities are also implicated in market manipulation, as discussed in Chapter 4.

The value of the variable annuity will vary, depending on the performance of the investment options that have been chosen.

70. In addition, variable annuity contracts typically have a "free look" or "cooling off" period of ten or more days during which the investor may terminate the contract without paying any penalties and receive a refund for the amount of the contract. The amount of the refund may equal either the account value when the contract is terminated or the amount of purchase payments, depending on the terms of the contract and applicable legal requirements.

71. This "free look" period gives rise to a particular risk: a money launderer can purchase a variable annuity and then seek a refund during the free look period. The cheque received from the insurance company may not draw suspicion when deposited at a bank.[19]

72. From a supervisory or regulatory perspective, there is potential duplication, but also a potential gap, if countries have two separate supervisory authorities looking at the insurance and securities industries. Although this is outside the scope of the current study, this is an area which might benefit from further investigation.

Suspicious Indicators for Insurance Company Products

73. The following have been identified as suspicious indicators involving insurance company products:

- The customer cancels an insurance contract and directs that the funds be sent to a third party;
- The customer deposits an insurance annuity check from a cancelled policy and immediately requests a withdrawal or transfer of the funds;
- The customer cancels an annuity product within the "free look" period;[20]
- The customer opens and closes accounts with an insurance company only to open a new account shortly thereafter with the same insurance company, but with new ownership information;
- The customer purchases an insurance product with no concern for investment objective or performance;
- The customer purchases an insurance product with unknown or unverifiable sources of funds, such as cash, sequentially numbered money orders, traveller's cheques, and/or cashier's cheques;
- The customer is particularly interested in the product's early surrender and in the amount that he will then have at his disposal;
- The customer purchases an insurance contract using a single large premium payment, particularly with an unusual payment method, such as cash or cash equivalent;

19 The placement stage risks of cheques and money orders are discussed more fully below in Section 3.4 on payment methods.

20 Although this will often be a legitimate transaction, it could also signal a method of laundering funds if accompanied by other suspicious indicators, such as purchasing the annuity with several sequentially numbered money orders, traveller's cheques, or cashier's cheques and/or the customer's having a history of cancelling annuity products during the "free look" period.

- The customer purchases a single premium policy using cash, money orders, traveller's cheques, or cashier's cheques for an amount that is clearly out of proportion to the customer's income;

- The customer enters into a contract for a considerable sum subject to payment of the premiums from abroad, particularly from an offshore financial centre;

- The customer substitutes, during the life of the contract, the initial beneficiary for a person without any apparent link to the policyholder;

- The customer cancels the contract without concern for the considerable tax or other cancellation charges that he or she has to pay as a result; and

- The customer secures a policy loan against the cash value soon after the policy is issued and repays the loan with cash or various monetary instruments.

Low Priced Securities and Private Issuers

74. Low priced securities, also known as penny stocks, refer to low-value equity interests in companies that are publicly traded or are about to become so. The issuers of these shares generally have legitimate business operations and revenue streams. However, some publicly traded penny stocks are really shell companies that may be used for a reverse merger. In any event, shares in these issuers will often be represented with physical securities that can be deposited with a securities intermediary. These shares are not likely to be traded on traditional exchanges, but rather in over-the-counter ("OTC") markets or on bulletin boards, which are discussed below. Penny stocks typically have very low trading volume but, unlike bearer securities, ownership of these shares will often be registered with the issuer and/or a transfer agent.

75. The ML/TF vulnerabilities posed by these securities are two-fold. First, these types of securities are often used to generate illicit assets through market manipulation, insider trading, and fraud. Illicit actors can either use existing shares that are already publicly traded, or start a shell company for the express purpose of engaging in those illicit activities. In addition, criminal organisations have also been known to use illicit assets generated outside the securities industry to engage in market manipulation and fraud. This first vulnerability is discussed more fully in Chapter 4.

76. Second, these securities can be acquired by investing illicit assets into a company that is about to become public. Once the company goes public, the money launderer can sell his or her stake, thereby giving funds the appearance of having been derived from a legitimate securities transaction. Moreover, criminal organisations can also initially invest in a private company that they can then use as a front company for comingling illicit and legitimate assets. They can then take this company public through an offering in the public securities markets, thus creating what appear to be legitimate offering revenues. Alternatively, criminal organisations can acquire a publicly traded company and use it to launder illicit assets.

Suspicious Indicators and Case Studies for Low Priced Securities and Private Issuers

77. The suspicious indicators associated with low priced securities and private issuers are, for the most part, identical to those that are discussed in the market manipulation section of Chapter 4.

Case Study 1: Laundering by acquisition of publicly traded shell company

Offence:	Money laundering
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	Israel
Subject:	Individual
Instruments, methods and techniques:	Front companies, publicly-traded shares of a shell company
Indicators:	• Use of a public shell company (traded on the stock exchange); • Use of a front company/straw man to perform the acquisition; • Transferring funds through several accounts; • Use of a money services business (MSB) to transfer funds; • Withdrawing the funds shortly after the acquisition by means of loans; and • Transferring funds to the same MSB.

Suspicious transaction/activity report information

The FIU received an STR from a bank regarding D, a man in his twenties with a student account. The STR stated that D bought a controlling interest in public shell company X and then proceeded to open a bank account in the name of that company. A few days later, the account received a deposit of approximately US$2.5 million.

Case description

In addition to company X, D was also the sole owner of a private company, Y. D used company Y to purchase a controlling interest in company X through the OTC market. Part of the US$2.5 million that was credited to company X was derived from a company Y account. Company Y received large deposits from several private accounts managed by criminal entities involved in drug trafficking. In one case the funds were transferred from the person known to be involved in criminal activity through an MSB account to the account of company X to further distance the source of the funds. The new controlling owners appointed new directors, including family members.

Shortly after the US$2.5 million was transferred to the account of company X, it was transferred back to the MSB account. Some of the money was transferred as a loan to company W, which was associated with the same criminal organisation that originally transferred funds to Company Y.

D and his family were well-known to the FIU for having acquired public shell companies in the past for money laundering purposes, including committing other predicate offences. They were also suspected of fraudulently influencing the movement of the stock share prices of companies owned by them, performing circular transfers of funds, and fraudulently removing funds from the companies.

Options

78. An option is a contract where one party (option seller) agrees to either buy a specified number of securities from, or sell a specified number of securities to, another party (option buyer) at a specified price per share (strike price). The option seller receives an upfront payment (premium) in exchange for assuming the obligations under the option. A put option gives the option buyer the right to sell the securities to the option writer at the specified price. A call option gives the option buyer the right to buy the securities from the option writer at the strike price. Typically, the option buyer has the right, but not the obligation, to exercise the option contract. Options can be traded on exchanges or OTC. They can be physically-settled (i.e. settled by delivering the securities) or cash-settled (i.e. settled by making a cash payment equal to the difference between the strike price and the market price of the security times the number of securities specified in the contract).

79. An OTC option presents a ML/TF vulnerability if one party agrees to enter into an options contract on terms worse than those available in a rational market to guarantee that the counterparty receives a net payment. In this respect, an OTC option can be used as a method of transferring funds.

80. For example, assume Party A has funds in a brokerage account that he wants to transfer to Party B. Assume there is a security with a market price of $7 per share. Instead of transferring the funds via a wire transfer or cheque, Party A may sell for a nominal premium to Party B, a cash-settled put option on the security with a strike price of $15 per share for 10,000 shares. Party B exercises the option

immediately, and because the option is cash settled, Party A pays Party B the difference between the strike price and the market price of the security, or $80,000. In addition, funds transfers using options may be accomplished without exercising an option, such as by charging a high premium for a worthless contract (e.g. a call option with a strike price hundreds of times higher than the market price), by exercising an out-of-the money option, or through other options contract variations.

3.3 Markets and other Means of Access

81. With the demise of the traditional trading floor located in a bricks-and-mortar securities exchange, many securities transactions are now effected electronically. In addition, some securities transactions are not conducted through an exchange at all. The following section examines the markets and mechanisms through which securities are sold and purchased.

Traditional Exchanges

82. The term securities exchange typically refers to centrally organised entities that operate as trading markets for publicly held securities. Exchanges generally have listing standards, such as minimum operating histories and revenue streams. While some exchanges only trade equity securities, other exchanges specialise in particular products, such as debt, options, and other types of derivative instruments. In addition, exchanges may require that intermediaries, such as broker-dealers, become exchange members and adhere to certain financial and operational standards.

Over-the-Counter (OTC) Markets

83. Many equity securities are traded in the OTC market and not on exchanges. The OTC market generally refers to all trading of securities otherwise than on an exchange, including various arrangements by which securities intermediaries arrange trades amongst themselves. Some OTC markets are organised and have automated quotation systems. Penny stocks, as discussed above and in Chapter 4, are also traded on the OTC markets, with their prices sometimes quoted on electronic bulletin boards.

84. Unlike traditional exchanges, organised OTC markets generally do not establish listing requirements and may not regulate issuers or trades, or have members. In some jurisdictions, however, there may be a regulator for the OTC markets as a whole. Securities traded on OTC markets may be more speculative than the securities listed on more traditional exchanges.

Alternative Trading Platforms (ATPs), Electronic Communications Networks (ECNs) and Internet-Based Trading Accounts

85. While trading on exchanges and OTC markets typically requires the use of a securities intermediary, new technologies permit institutional investors and some retail investors to engage in securities transactions with limited involvement of an intermediary.[21] Alternative trading platforms and electronic communications networks can operate in a way that, in some instances, may permit investors to trade with relative or complete anonymity.

86. Broker-dealers and others institutions licensed to effect securities transactions offer their clients the ability to transfer securities held electronically (e.g. from broker to broker, or from one customer to the account of another, such as a spouse). Some jurisdictions have indicated that this service can be abused and poses a ML vulnerability. This vulnerability results from the relative ease of the instrument's transfer,

[21] ATPs and ECNs, however, are traditionally registered as securities intermediaries.

the lack of transparency associated with some transfers, the ability to effect cross-border transfers, and even unjustifiable reliance on the CDD/KYC investigations done by others.

87. A particularly attractive feature (in some jurisdictions) to persons who wish to abuse this service for ML purposes is its lack of transparency. In some instances, a transfer can be effected without the individual having an account with the financial institution, for example through a breach in the financial institution's data security, or through the transfer of an instrument similar to a bearer security. Payment for the transferred securities can also be made in cash. As such, account statements may not reflect the fact that a share transfer has taken place. In some cases investigated, transfers of securities were confirmed to the customer by separate statements that were not consecutively numbered. Moreover, such statements were not included as part of the year-end bank reconciliation effort.

Case study 2: Securities transfers

Offence:	Tax evasion
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	The Netherlands
Subject:	Individuals and service providers
Instruments, methods and techniques:	Transfer of securities held electronically
Indicators:	• Misuse of service provided by financial institutions; • Ante-dating of documents; • Transactions without an apparent economical rationale; and • Use of false documentation.

Case description

The Tax Administration and the Fiscal Intelligence and Investigation Service has discovered methodologies involving the allocation of securities as a means to effect tax fraud. These activities involved the use of false documents, in violation of tax and criminal laws. To date, 14 cases have been detected, involving six different financial institutions. Seven cases have been investigated in greater depth. The key role played by the facilitating financial institutions in these cases was examined by the Dutch Central Bank and The Netherlands Authority for the Financial Markets.

The cases investigated have in common the misuse of a normal and legitimate service provided by banks, broker-dealers and other institutions licensed to trade in securities: the ability to transfer securities held electronically.

The misuse in the Dutch cases was triggered by a difference in the way capital gains and losses were treated for the income and corporate tax purposes. In short, capital losses are not deductable for income tax purposes, but are included in the tax base for corporate tax.

In these cases, individuals transferred securities between their personal portfolio and a corporate securities portfolio over which they had control. Depending on what was necessary in the specific case, securities were transferred in either direction. In the case of a loss that occurred in the personal portfolio, the relevant securities were transferred to the corporate stock portfolio and vice versa.

The attractive feature of the misuse of the securities-transfer service is its lack of transparency. In a transfer there is no mandatory current account relationship. As is the case with regular sale and purchase instructions, payment for securities transferred can be arranged by other means, such as cash payments. As a consequence, bank statements do not have to show that a share transfer has taken place. In the different cases that were investigated, transfers of securities were communicated to the client by separate statements that were not consecutively numbered and that did not have any connection with the year-end bank reconciliation.

What was surprising in the cases investigated was:

1. The number of cases detected;
2. The similarity of modus operandi;
3. The relative ease in which employees of financial institutions were persuaded to co-operate in the scheme;
4. The fact that the cases took place at different players in the financial sector;
5. The involvement of accountants and tax advisors;

6. The lack of AML/TF monitoring for this specific kind of transactions; and

7. The possible AML/TF risks related to share transfers were perhaps not sufficiently familiar to supervisory bodies.

Enforcement actions

All cases investigated resulted in administrative or criminal sanctions. Some financial institutions also were required by financial regulators to amend their internal procedures.

88. Although case study 2 involved tax fraud, the transfer of securities can also play a role in insider trading. It is also a vulnerability in the context of money laundering, due to the relative ease of transfer, lack of transparency, lack of indicators and the international dimension.

89. It would be possible for criminals to approach individuals and offer them cash for their securities portfolio. Subsequently these individuals could transfer their securities from their securities portfolio to the securities portfolio of the criminal. This would give criminals access to the financial system while circumventing existing AML/CTF measures.

3.3.1 Vulnerabilities Associated With Particular Types of Market Access

90. Although the survey results did not identify actual abuses involving internet trading platform services, several areas of vulnerability were noted. For example, with the continued development of technology, the number of firms providing internet trading platform services has increased. Such firms offer trading in financial contracts (so-called contracts for difference or CFD) on their trading platform linked to different kinds of underlying reference points: mostly Forex but also market indexes, and commodities (such as oil and precious metals), as well as on shares of companies. The investors are typically required to pay a margin deposit into the bank account of the firm.

91. Such website trading platforms are often designed for day trading, and can have substantial transaction volumes. As such, the trading platform could turn into a "black box" for the financial institution (often a bank) with which the trading platform firm holds its accounts, making it very difficult for the financial institution to understand transactions occurring in the account.

92. Moreover, obtaining a licence for a trading platform has become increasingly inexpensive. By providing a trading platform through a company registered in an unregulated jurisdiction, a criminal organisation could pose as a securities dealer and use this structure to launder money and/or defraud investors.

93. Internet-based securities trading accounts pose particular challenges to the implementation of CDD/KYC procedures because of the lack of face-to-face interaction between the intermediary and the customer when an account is opened. This can hamper the ability of a firm to establish an adequate customer profile, which in turn can hamper the firm's ability to detect suspicious activity. Moreover, although investors must open accounts with intermediaries to access their systems, some of these accounts allow the investor to directly access an exchange or trading system, potentially hampering the ability of an intermediary to identify suspicious transactions and trading patterns. Because positive identification of an individual can be more difficult with internet-based account opening methods, identity thieves and other illicit actors have been known to open these types of accounts to engage in market manipulation, insider trading, securities fraud, or to deposit illicit assets that can be wire transferred out of that account.[22]

[22] Please see Chapter 4 for a fuller discussion of market manipulation, insider trading and securities fraud.

94. In addition, legitimate internet-based brokerage accounts are often compromised by online intrusions from unauthorised persons. To cite one example, a criminal can effect an intrusion into multiple customer accounts. The intruder can liquidate securities in those accounts and use the proceeds to buy a penny stock. This has the effect of "pumping" up the price of the penny stock, which the intruder then liquidates at the inflated price, with profits transferred out of the intruded accounts.

Case study 3: Rapid transactions using an internet-based trading account

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Insider trading
Jurisdiction:	Austria
Subject:	Individuals
Instruments, methods and techniques:	Internet-based trading account, shares
Indicators:	• High profits within one day; • Rapid purchase and sale of shares; and • Use of the same password by several clients.

Suspicious transaction/activity report information

The FIU was informed by an Austrian internet bank about suspicious bank accounts. The suspicions were prompted by the suspicious behaviour of several clients (high profits within one day, purchase of shares and sale of the shares one day later, purchase of calls, five different clients from the same country, use of the same passwords, the same shares/calls, etc).

Case description

A number of securities deals were made in connection with a company sale (takeover of shares) yielding a stock price gain of around US$6 million. These sales were later found to have been facilitated by insider trading; Austrian accounts were used for buying and selling shares.
Thorough investigations revealed that several accounts were linked to this securities deal, i.e. the account owners (Croatian nationals residing in Germany, Croatia, and the U.S.) obtained huge profits within a very short time by (almost simultaneously) buying and selling these shares.

Enforcement actions

The FIU initiated not only the necessary financial analysis but also analysis regarding the shares (company based in the U.S. press information – insider trading) and evidence regarding the involved persons.
It was rather urgent to secure evidence (including seizure of banking accounts and/or transmitting information to other agencies to trace the money flow) therefore the FIU met the FBI to cooperate in the case.
The FIU immediately informed the prosecutor of potential money laundering and insider trading charges.

Suspicious Indicators and Case Studies Associated with Market Access

95. The questionnaire responses did not specifically identify suspicious indicators associated with market types and other means of access. However, the suspicious indicators associated with market manipulation, insider trading and securities fraud may have some relevance in this area for detecting money laundering. Accordingly, Chapter 4 contains a fuller discussion, including case studies, regarding OTC markets and internet-based securities trading. In addition, the suspicious indicators related to Customer Due Diligence in Annex B are also generally relevant.

3.4 Payment Methods Relating to Securities Transactions

96. Many of the payment methods associated with securities transactions are not unique to the securities industry, and are to be found in other areas of the financial services industry. However, there are certain peculiarities in the purchase of securities which benefit from further elaboration.

Cash

97. The questionnaire responses indicated that the use of cash in the securities industry is uncommon. However, in some jurisdictions cash is still a permissible payment method. In addition, in some jurisdictions securities can be purchased through depository institutions, where acceptance of cash is much more prevalent.

Vulnerabilities and Suspicious Indicators for Cash

98. Depository institutions and securities intermediaries that permit the use of cash for the purchase of securities products can be used to place illicit assets in the securities industry, as well as integrate and layer the assets through securities trading and redemptions.

99. The following, which are not necessarily unique to the securities industry, were identified as suspicious indicators involving the use of cash:

- The customer refuses to identify a legitimate source for the funds or provides the securities firm with information that is false, misleading, or substantially incorrect;
- The customer makes many small cash deposits that are eventually used to purchase a particular securities product which is sold or redeemed shortly thereafter;
- The customer deposits a large amount of small-denomination currency to fund the account or make securities purchases;
- There are many incoming cash deposits into a customer's account from third parties that coincide with or are close in time to outgoing cheques or wire transfers to other third parties; and
- The customer has accounts primarily used for deposits and other accounts primarily used for outgoing payments.

Case study 4: Structuring of cash deposits

Offence:	Money laundering (structuring)
Securities Related Predicate Offence (if any):	Fraud
Jurisdiction:	Australia
Subject:	Individual
Instruments, methods and techniques:	Cash deposits, contract for difference account
Indicators:	• Abuse of internet registration systems; • Multiple same day transactions; • Structuring of cash deposits; and • Use of false identification documentation.

Suspicious transaction/activity report information

D became the subject of a STR submitted to the FIU that detailed activity involving the structuring of cash deposits into an account.

Case description

A "contract for difference" (CFD) is a type of derivative where an agreement is made to exchange the difference in value of a particular security (or other financial instrument) between the time at which a contract is opened and the time at which it is closed. In this particular investigation, the profits were deposited in a major Australian bank.
D used false identification documents, including a false citizenship certificate and driver's licence, to open a trading account over the internet.
The individual became the subject of an STR because of the structuring of cash deposits into an account. The STR highlighted that over an eight-day period, approximately AUD$ 400,000 was deposited into the account in amounts

below the jurisdiction's threshold reporting requirement (i.e. structuring), and in some instances deposits were made on the same day at branches in two different locations.
The investigation identified that the account had traded and increased in value to over AUD$ 750,000, which was subsequently restrained by means of crime restraining orders.

Enforcement actions

An investigation into this resulted in criminal restraining orders being placed on the individual's assets

Cheques and Wire Transfers

100. Questionnaire responses indicated that cheques can be used to fund a securities account with a securities intermediary or used to directly purchase some securities products without an intermediary. In addition, jurisdictions indicated that the use of cheques is not limited to those drawn from a depository account, but also can involve money orders, traveller's cheques, and cashier's cheques (i.e. bank drafts).

101. While many wire transfers occur through and between banks, in some jurisdictions a securities account can be used in lieu of a depository account to wire funds.

Vulnerabilities and Suspicious Indicators for Cheques and Wire Transfers

102. Money launderers can purchase money orders, traveller's cheques, and/or cashier's cheques with cash over a period of time or through a series of transactions in order to avoid threshold currency reporting requirements. These cheques can then be deposited into securities accounts until a desired amount is reached and used to purchase a security, which is then sold or transferred. Alternatively, a money launderer can also wire the illicit assets out of a jurisdiction.

103. Cheques or wire transfers from a depository account also present an ML/TF vulnerability because they may unreasonably affect the securities intermediary's risk analysis, in particular with respect to CDD/KYC obligations. For example, if a cheque or wire transfer originates from another financial institution subject to an AML/CFT regulatory regime, a securities firm may not conduct a thorough CDD/KYC investigation because it believes that the originating financial institution has already conducted its own CDD/KYC investigation, or because the firm perceives a reduced risk because the customer was able to open an account at another financial institution. This vulnerability can become systemic if numerous securities intermediaries perceive a reduced risk based on the activities of others.[23]

104. In addition, even if the financial institution from which the cheque or wire transfer originated has conducted thorough CDD/KYC and not detected anything suspicious, there may still be an ML/TF risk that the securities intermediary, through its own knowledge of the investor, may be in a unique position to identify. In particular, CDD/KYC not only involves mere customer identification but establishing the purpose and intended nature of the business relationship.

105. Another vulnerability identified is the increasing use of the securities industry in offshore jurisdictions by criminals attempting to avoid domestic seizure of their assets. The ease by with which funds could be transferred electronically facilitates this. The use of this method of disguising funds has resulted in a reduction in the effectiveness of domestic seizure/forfeiture actions, marking a change in the laundering techniques used by criminals. The advantage of this method over, for example, the purchase of domestic real estate is that it is more difficult for law enforcement to trace and seize assets held offshore.

[23] It is noted that reliance on CDD/KYC investigations undertaken by a foreign financial institution should also involve an assessment of the AML/CFT regime operating in the country from which the institution relied upon operates. Given the global nature of the securities industry, this issue may be of particular importance.

106. The following, which may not be unique to the securities industry, have been identified as suspicious indicators involving the use of cheques and wire transfers:

- Many small incoming deposits are made using cheques, money orders, traveller's cheques, and cashier's cheques;
- Incoming payments are made by third-party cheques or cheques with multiple endorsements;
- Money orders, traveller's cheques or cashier's cheques are sequentially numbered in denominations that avoid threshold reporting requirements (i.e. structuring);
- Outgoing cheques to third parties coincide with or are close in time to incoming cheques from other third parties;
- Wire transfers are made to or from financial secrecy havens, tax havens or high-risk geographic locations (i.e. jurisdictions known to produce illegal narcotics/psychotropic drugs or are related to terrorism);
- Wire transfers or payments are made to or from unrelated third parties (foreign or domestic) or where the name or account number of the beneficiary or remitter has not been supplied;
- Many small, incoming wire transfers are made, either by the customer or third parties, that are almost immediately withdrawn or wired out in a manner inconsistent with customer's business or history;
- There is wire transfer activity that is unexplained, repetitive, unusually large or shows unusual patterns or has no apparent business purpose;
- The securities account is used for payments or outgoing wire transfers with little or no securities activities i.e. account appears to be used as a depository account or a conduit for transfers;
- Funds are transferred to financial or depository institutions other than those from where the funds were initially directed, specifically when different countries are involved;
- Transfers with no apparent business purpose are made between different accounts owned by the customer;
- Wire transfer logs, when viewed over a period of time, reveal suspicious or unusual patterns;
- The customer requests that certain payments be routed through nostro or correspondent accounts held by the financial intermediary instead of its own account; and
- Outgoing wire transfers to third parties coincide or are close in time to incoming wire transfers from other third parties.

Case study 5: Use of foreign exchange broker

Offence:	Money laundering
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	Mexico
Subject:	Individual
Instruments, methods and techniques:	Deposits of cheques, currency exchange, wire transfers
Indicators:	• Activity reported by senders to financial institutions is not related in any way to the beneficiary of funds; • Amounts transferred are not congruent with the purchase of products; • FX dealer/broker or bureau de change order the transfers abroad (and not the senders); • Common beneficiaries with other customers using the same operating procedure; and • Same day withdrawal of funds.

Case description

During the course of an investigation made by the FIU regarding proceeds from drug trafficking, an individual was identified acting as branch manager of a local foreign exchange broker involved in ML activities and, later on, acting as account executive for a broker-dealer who was arranging wire transfers for one of his customers.
Accordingly, the FIU informed the broker-dealer of this activity, and it submitted an STR, with no specific information. Further investigations showed that an account at this broker-dealer was used to send money abroad in the following way:
The broker/dealer received several cheques in local currency, in the name of different persons but all of them endorsed to the same account holder (the sender). Funds were withdrawn immediately (the same day) with a purchase of US$ and a further wire transfer abroad was arranged for one single beneficiary (different from the sender). This money was ultimately used to partially pay for the acquisition of real estate properties in the USA.

Enforcement actions

The outcome of this investigation was the seizure of many assets, including among others, bank accounts and aircraft, and the closing of the foreign exchange broker involved.

Case study 6: Company director misused family trust

Offence:	Tax evasion / False Invoicing
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	Australia
Subject:	Individual / Company
Instruments, methods and techniques:	Purchase of shares in foreign jurisdiction
Indicators:	• Several significant wire transfers into Australia from a tax haven.

Case description

An Australian resident company that was receiving funds from a known tax haven was the subject of an audit. The director/shareholder of the company was also connected to a company established in a tax haven. This tax haven company had purchased shares in a U.K. company and then sold them for a substantial capital gain. Some of the profits were repatriated to Australia via the use of false invoices issued by the Australian resident company. The funds entered the country through large wire transfers.

Enforcement actions

The director/shareholder was assessed on income earned from world wide sources and agreed, as part of a settlement, to cease his involvement in the tax haven based company and repatriate all funds held in overseas jurisdictions.
As a result, approximately AUD$ 1.4 million in tax and penalties were raised.

Case study 7: Unlicensed securities intermediary

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Providing investment services without a licence
Jurisdiction:	Belgium
Subject:	Individuals, company
Instruments, methods and techniques:	Cross-border funds transfers, use of third parties
Indicators:	• Significant wire transfers by multiple individuals; • Messages accompanying the wire transfers referred to investments; • Transactions happening shortly after opening of the bank account; • Account opened for personal use; and • Account not used as anticipated.

Suspicious transaction/activity report information

X and Y were managers of company A, active in purchasing securities for third parties. Shortly after company A's establishment, X and Y opened an account in their name for personal use. A few days later this account was credited with several transfers by order of third parties for a total amount of several thousand EUR.
The parties to the transfers were not linked to the individuals in any way. Furthermore, the references of these transfers referred to an investment fund. The name of the account also referred to an investment fund. The debit transactions consisted of transfers to accounts opened abroad in tax haven countries and the registration to investment products.

Case description

Information from the supervision authorities showed that company A did not have a licence to offer investment services.
The name of the individuals' personal account, the person receiving the transfers, the regularity and the references accompanying the transfers as well as the destination of the funds showed that the transactions were not performed for X and Y but for a third party. The money was laundered through transfers abroad and registration to investment products.

Enforcement actions

The case for providing investment services without a licence was referred in 2005 to the public prosecutor for ML.

Exchange of Securities as Means of Payment

107. One payment method that is unique to the securities industry is the use of securities in exchange for other securities. This can occur when shares of a different type are issued or new shares issued in a take-over. The exchange of shares is a potential way of moving value from one company to another, and the possibility for disguising the origin of funds is clear. For example, if illicit funds are used to purchase shares in the initial company, these may be harder to trace once the shares are exchanged for those in another company. The situation can be exacerbated when other factors are involved, such as shares traded off exchange or those from countries without robust AML/CFT controls.

3.5 Entities Involved in the Offer, Sale, Advice, Management or Distribution of Securities ("Securities Intermediaries")

Broker-dealers

108. One of the most active participants in the securities market is the broker or dealer in securities. A broker typically acts in an agency capacity for an investor, and enters the securities markets on behalf of an investor to buy or sell a security. In some jurisdictions, a dealer acts in a principal capacity and sells to investors from the dealer's own inventory or buys from an investor in order to add to the dealer's inventory. In buying and selling in this manner, some dealers also provide liquidity to the market.

109. Based on the questionnaire responses, brokers and dealers exist in most of the jurisdictions that responded to the survey. However, they are often referred to using a variety of terminology such as:

- Financial Instruments Business Operator;
- Firms for Placement in Orders in Financial Instruments;
- Investment Firms;
- Investment Service Provider; and
- Underwriters.

110. A common type of brokerage relationship involves an introducing broker-dealer and a clearing broker-dealer who allocate among themselves the tasks that would normally be performed by a single broker-dealer. Under this sort of relationship, the introducing broker-dealer typically interacts directly with the customer, opening and monitoring the customer's account and accepting orders. The clearing broker provides securities record-keeping, trade execution, clearing and settlement services, custodial services, account statements and extensions of credit in margin accounts. In contrast to a clearing broker, an introducing broker usually cannot maintain custody of a customer's cash and securities.

Vulnerabilities Associated with Broker-Dealers

111. A specific vulnerability associated with broker-dealers is their reliance on another financial institution's CDD/KYC investigation, as discussed in Section 3.4 regarding payment methods. A broker-dealer might assume that, because another financial institution has opened an account for a customer, the customer does not raise ML/TF issues. The CDD/KYC vulnerability is most problematic in relation to the funding of a securities account. If illicit assets are successfully placed at a depository institution, the broker-dealer may assume that, because the funds are from an institution which is subject to AML/CFT rules, the customer does not pose a ML/TF risk and therefore will accept cheques or wire transfers from that institution to fund a securities account. Once a securities account is funded, a customer can engage in a number of transactions that further conceal the source of his or her illicit funds, thereby successfully layering and integrating illicit assets that were placed through a depository institution.

112. With respect to introducing and clearing broker-dealers, in some jurisdictions introducing brokers delegate the responsibility of monitoring for suspicious transactions to their clearing brokers. However, it is important to note that in some jurisdictions, while a task may be delegated to another entity, responsibility for that task's execution cannot be. As a result, it may continue to be the responsibility of both the introducing broker and the clearing broker to monitor transactions for suspicious activity in brokerage transactions that occur through their respective institutions.

113. Furthermore, some jurisdictions explicitly permit a clearing broker to rely on the introducing broker to conduct certain parts of the CDD/KYC process. Some of these jurisdictions may also extend this reliance to allow the clearing broker to rely on the CDD/KYC undertaken by a *secondary* introducing broker that has itself introduced accounts to the primary introducing broker. ML/TF vulnerabilities are amplified when any of the introducing brokers come from jurisdictions that have lax AML/CFT regimes, in particular with respect to correspondent or omnibus accounts, as discussed below. As a result, some jurisdictions allow reliance on another intermediary (whether foreign or domestic) *only if* that intermediary has in place adequate AML/CFT controls.

114. Although most broker-dealers do not accept cash payments, some do. For those broker-dealers that do, the relevant suspicious indicators associated with cash have been addressed in Section 3.4. In addition, because most securities transactions require the use of a securities intermediary, the majority of the suspicious indicators listed in previous sections, as well as the indicators in Annex B, are applicable to broker-dealers. Accordingly, specific indicators are not listed here.

Case study 8: Account held by an institution located in a high risk area/jurisdiction

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Proceeds of various crimes (including drug trafficking) invested in the securities industry
Jurisdiction:	Canada
Subject:	Individuals (lawyers), bank and trust company
Instruments, methods and techniques:	Wire transfers, bank drafts
Indicators:	• Accounts used as pass-through; • Involvement of several jurisdictions; and • Transactions below the reporting threshold.

Suspicious transaction/activity report information

Securities dealers have identified transactions involving accounts in the name of what appeared to be a bank or a trust company incorporated in an island in the Pacific. Money was moving from the Asia-Pacific region to investment accounts in Canada then to beneficiaries in the U.S.

Case description

The bank was incorporated in an island in the Pacific know for the ease of setting up financial institutions.
A securities dealer reported that the client (bank or a trust company)'s account was managed (activity of buy, sell, wire transfers, etc) by two individuals employed by a law firm in a major Asian city. The two individuals were suspected to be lawyers.
In a notice issued by a regulator of financial institutions, the Canadian public was warned that the bank or trust company was not authorised to conduct banking services in Canada.
An analysis of the financial transactions involving the institution and information retrieved from public documents led to suspicions that the bank was facilitating deposits of funds generated by various criminal activities (particularly heroin and opium trade in Asia), then transferring the money to accounts at securities dealers in Canada under the supervision of the two lawyers in Asia.
The two individuals in Asia were ordering numerous wire transfers on behalf of the bank from accounts held at different locations in the Asia–Pacific region, to investment accounts in Canada and other beneficiaries. Once received, the money was transferred to different individuals whose addresses were at different locations in the United States. The purpose of the wire transfers and the relationship between the bank and the beneficiaries of the transactions could not be determined.
Although not mentioned by the securities dealers when reporting the suspicious activity, it was suspected that the primary purpose of the wire transfers from the Asia-Pacific region was to send funds to beneficiaries in the United States. The beneficiaries in Canada were just acting as intermediaries in the money laundering process; an analysis of the transaction flows revealed that they were in fact nominees.

Enforcement actions

The case was referred to law enforcement for investigation.

Case study 9: Use of margin account with little trading

Offence:	Money laundering
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	Hong Kong
Subject:	Individual
Instruments, methods and techniques:	Deposit and withdrawals of funds
Indicators:	• Client deposited funds into the broker's account and requested repayment of funds within a short period of time with no apparent reason; • Little or no trading was recorded during the period; and • The amount of funds deposited was not in line with the client's profile.

Case description

Profits from illegal bookmaking were transferred from the bank account of the syndicate head's wife and sister-in-law to the margin account of the syndicate head.
Little or no trading occurred in the margin account.
Funds were then withdrawn as cashier's cheques and subsequently deposited into the bank account of the syndicate head.

Case study 10 : Activity of wash trading

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Stock manipulation
Jurisdiction:	Canada
Subject:	Insiders
Instruments, methods and techniques:	Securities accounts, wire transfers, cheques, bank drafts
Indicators:	• Insiders conducting similar transactions; and • Purchases and sales involving stocks of specific companies in a short period of time.

Suspicious transaction/activity report information

A number of suspicious transaction reports were filed by securities dealers on three individuals suspected of involvement in wash trading. The individuals were purchasing and selling shares of three public companies for no apparent reason. The three individuals had accounts at different securities dealers.

Case description

Three individuals, who appeared to be associates, were purchasing shares of three companies (A, B, and, C) and selling them a short time later.
One of the individuals was listed as a CEO of Company A, the other two as members of the senior management team of Company B. According to public documents, Company A was linked to Company B and Company C.
The group traded shares of the companies through personal accounts held at different securities dealers.
The three individuals were conducting the same transactions at the same time. The activity was similar to a money laundering technique known as "structuring" since the three individuals in reality were dividing the purchase-sale scheme between them.
The proceeds of sales were deposited into personal securities accounts and moved shortly to bank accounts held by the same individuals or others that are suspected to be nominees.

Proceeds of crime (wash trading) in the case

- Money from the sales of shares of Company A, Company B and Company C conducted by the three associates.

Specific money laundering transactions

- Movement of money from the securities account to bank accounts (that can be used to purchase other assets or make wire transfers).

- Movement of money to suspected nominees.

Enforcement actions

The case was referred to law enforcement for investigation.

Case study 11: Rapid purchase and sale of shares

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Stock manipulation
Jurisdiction:	Canada
Subject:	Individuals, corporations
Instruments, methods and techniques:	Wire transfers, use of multiple securities accounts
Indicators:	• Buying and selling securities with no discernible purpose in circumstances that appear unusual; • Use of multiple accounts at a single securities dealer for no apparent reason (movement of funds from one account to another); and

- Proceeds of sale used to purchase monetary instruments payable to nominees.

Suspicious transaction/activity report information

A bank reported that large wire transfers ordered from a securities dealer were received into a business account administered by Person A. Once received, money was used to purchase bank drafts, and cheques were issued payable to various individuals and entities. The purpose of the transfers between the securities dealer and the bank is not known, since the individual has refused to respond to questions asked by the bank's anti-money laundering section. It was suspected, however, that the client was "dumping" in the market a large number of shares purchased earlier (evidenced by previous wire transfers sent to the securities dealer) once they reached a certain value.
The securities dealer that sent the wire transfers also reported the following on Person B:

- Listed investment advisor: Person A;
- Was the signing authority of 24 accounts held by two corporations located in two Central American countries. The review of the accounts activity revealed movement of funds from one account to another;
- Was purchasing shares of specific companies, selling them a short time later and wiring the proceeds to bank accounts held by the corporations at financial institutions located in Central America and the Caribbean; and also to a bank account administered by Person A; and
- Never held stocks long enough to take advantage of future dividend distributions.

Another securities dealer reported that an individual, whose investment advisor was also Person A, purchased a large number of shares and sold them a short time later with no economic gain. When purchasing the stocks, the client never used wire transfers but rather cheques drawn on an account held in a financial institution located in a foreign country. The transactions always involved one particular company.

Case description

The case relates to eight individuals and two corporations involved in a stock manipulation scheme:

- Person A was the investment advisor of a group of 7 individuals.
- Person B was listed as the signing officer of two corporations.
- The two corporations had addresses in two different Central American countries but also held bank accounts in other Caribbean locations.

According to information posted in a market regulator's website:

- Person A was the main subject of a stock manipulation investigation.
- One person of the group was under investigation for banking fraud in an Asian country; the fraud cost investors close to CAN$100 million (awaiting extradition).

Person A appeared to be providing information on when to purchase and sell stocks of specific firms to the rest of the group. The investors did not hold the stocks enough to take advantage of dividend distributions. Proceeds of stocks sold were:

- Wired to bank accounts held overseas;
- Used to purchase banks drafts or to issue cheques payable to individuals and entities (it was suspected that the beneficiaries were nominees).

Analysis of the financial transactions of the remaining individuals of the group revealed constant purchases and sales of securities whose proceeds were deposited in bank accounts followed by issuance of cheques or bank drafts payable to individuals and entities. Some transactions involved penny stocks and stocks traded on the pink sheets (which are less regulated, and therefore more easily manipulated).

Proceeds of crime (stock manipulation) in the case

- Wire transfers received into a business account administered by Person A.
- Money received from the sale of securities conducted by Person B and other members of the group.

Specific money laundering transactions

- Funds wired by Person B to accounts held by the corporations in financial institutions located in Central America and the Caribbean.
- Funds wired by Person B to the business account administered by Person A.
- Movement of funds between accounts (review of Person B's accounts activity).
- Purchase of bank drafts and issuance of cheques payable to individuals and entities.

Enforcement actions

The case is being investigated by law enforcement and a provincial securities regulator.

Investment Advisers and Wealth Managers

115. Brokers and dealers in securities can be distinguished from those securities intermediaries that are regulated as advisers and wealth managers. In some jurisdictions, the role of a broker and a dealer are clearly delineated from those of advisers or managers. In fact, different registration and regulatory standards may apply. Nonetheless, functions can be housed in the same entity by means of multiple registrations. In other jurisdictions, advisory functions and broker-dealer functions may be conducted under the same registration.

116. Regardless of whether a jurisdiction has dual registration regimes, the role of the investment adviser and wealth manager is generally to advise on the composition of an investment portfolio or to manage the contents of investment accounts for retail or institutional clients.

117. Wealth management typically involves the provision of financial services in a managed relationship with clients who are often of high net worth. The value and complexity of products offered to high net worth clients, together with the international nature of the business, make the provision of wealth management services potentially attractive to money launderers.

Suspicious Indicators Associated with Advisory Services/Wealth Management

- Wealthy/powerful and PEP clients – who are reluctant to provide full CDD information, and who seek confirmation that their affairs will be kept confidential;
- Clients with multiple and complex accounts in more than one jurisdiction, either within the same firm or group, or with different firms;
- Clients using wealth management services in conjunction with offshore trusts/shell companies to disguise beneficial ownership;
- Wealth management activities in countries with a tradition of banking secrecy;

- The transmission of funds and other assets by private clients that involve high value transactions, requiring rapid transfers to be made across accounts in different countries and regions of the world; and

- The use of pooled/omnibus type accounts that are used together to collect funds from a variety of sources and clients for onward transmission.

Depository Institutions

118. The survey responses indicated that in some jurisdictions, depository institutions also serve as intermediaries for transactions in securities or provide investment advice/financial planning services.

119. The most common vulnerability associated with depository institutions involves the placement of illicit assets into the financial system. Once these illicit assets are placed they can be wire transferred out of a jurisdiction or used to purchase different assets, such as securities products. The risk that illicit assets will be used to purchase securities products is increased in jurisdictions where customers can purchase securities directly through the depository institution or through an affiliated securities intermediary. Moreover, as discussed above, if illicit assets are successfully placed at a depository institution, a securities intermediary, whether affiliated or not, may unjustifiably rely on the depository institution's CDD/KYC investigation and assume that the customer poses no ML/TF risk.

120. In this regard, the vulnerabilities and suspicious indicators associated with payments methods, market access and securities intermediaries are all applicable.

121. In addition, as discussed in Chapter 4, depository institutions may be in the best position to identify and report on securities fraud that may not necessarily require the use of a securities intermediary.

Insurance Companies

122. Insurance companies issue products that in some jurisdictions are considered to be securities. The vulnerabilities and suspicious indicators associated with these products were discussed above in Section 3.2.1. In addition, where permitted, insurance companies can also serve as a securities intermediary. The vulnerabilities and suspicious indicators associated with payments methods and the previously discussed securities intermediaries are all applicable to insurance companies that engage in comparable activities.

Use or Creation of a Financial Institution for ML/TF Purposes

123. The criminal use of a financial institution for the purpose of laundering money or financing terrorism is possible in any area of the financial services system. Criminal elements can either create or gain direct control of such an entity or seek to exert influence over the management or staff in furtherance of their aims.

124. It is possible for a securities broker-dealer, for example, to be created or used for the specific purpose of laundering funds/financing terrorism. The FATF 40 + 9 Recommendations require measures to prevent criminals or their associates from "holding or being the beneficial owner of a significant controlling interest or holding a management function."[24] Clearly the risk of criminal penetration of the securities market is heightened by opaque corporate structures, but also increases when dealing with other financial institutions from countries with lax AML/CFT measures.

[24] FATF Recommendation 23.

Suspicious Indicators Associated with Criminal Influence in a Financial Institution:

- Corporate structures where beneficial ownership is difficult to determine; and
- Companies incorporated in countries without adequate AML/CFT controls.

Case study 12: Criminally-controlled securities intermediary

Offence:	Money laundering
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	Canada
Subject:	Individuals, companies
Instruments, methods and techniques:	Wire transfers, bank drafts (i.e. cashier's cheques)
Indicators:	• "Shady" or criminally-associated or criminally-convicted officers, directors and/or major shareholders. One individual was associated with a South American criminal organisation; • Cash was used to pay dividends to investors; • Establishing multiple corporations: one individual was the administrator of several corporations, all located at the same address; • Several transactions between associated and related companies: funds wired to associated entities and then quickly sent outside the group; and • Minimal movement in share price: investment in an entity whose financial statements show no economic activity.

Suspicious transaction/activity report information

In 2004, a MSB reported to the FIU financial transactions that were conducted for the benefit of a securities company operating from a Caribbean country. Two individuals (a husband and a wife) were reported to have used cash to purchase two drafts payable to the securities company. The individuals appeared to be structuring the transactions to fall below the $10,000 reporting threshold.
A foreign FIU, law enforcement agencies in Canada and the United States and a Caribbean newspaper indicated that the securities company was incorporated by a Canadian citizen suspected of being involved in laundering, through stock markets, proceeds of a cocaine trafficking operation which was believed to be controlled by a South American criminal organisation.
According to its website, the Caribbean securities company appeared to be operating worldwide; however information on the management, contact persons, names or phone numbers, and type of services offered, were not provided.

Case description

According to information provided by law enforcement to the FIU:

- intelligence sources suspected that the South American criminal organisation had set up securities companies in the Caribbean and in Canada, and used nominees to run the operations;
- money generated by cocaine trafficking worldwide on behalf of the criminal organisation was deposited in bank accounts in Western Europe in a country known for its bank secrecy as well as in the Caribbean.

In Canada, all methods used to launder the proceeds of cocaine trafficking for the organisation were not known, but one channel used to introduce the drug trafficking money into the system was the purchase of drafts at MSBs payable to the securities company in the Caribbean.
Once in the system (in the Caribbean or in Europe), the drug money was transferred to securities companies in Canada.
Eight securities companies were found to be the beneficiaries of wire transfers totalling approximately US$30,000,000.00 over a period of two years. These EFTs were ordered by the company in the Caribbean from accounts held in Western Europe and the Caribbean. The eight companies were sharing the same address and administered by the same person, who was listed as a lawyer. The suspicious movement of funds between the Caribbean company and the eight securities companies were reported by a number of financial institutions in Canada; examples of suspicious transactions or behaviours include:

- the lawyer did not want to explain the relationship between the two companies and the purposes of the financial transactions from one entity to another;
- a securities company was the beneficiary of an EFT and the lawyer withdrew the full amount in cash and

claimed that the money would be used to pay dividends to investors; and

- after receiving funds from the Caribbean, the eight companies issued cheques, bank drafts or ordered wire transfers payable to entities and other established securities companies in Canada but also in the United States and Asia: after receipt of a wire transfer, one securities company ordered a wire transfer (same amount) to the benefit of an oil and gas company that was operating in South East Asia. According to a database maintained by a non-governmental entity, the beneficiary did not have any assets or liabilities, changed name three times, was a medical equipment supplier, a music video producer and games wholesale distributor, and there was no movement in the share price for five years.

Enforcement actions

The case was referred to law enforcement for investigation.

3.6 Clients and Account Types

Trust, Nominee, and Omnibus Accounts

125. Trust and nominee accounts present ML/TF vulnerabilities in the layering and integration stages. A particular risk involves jurisdictions where the formation of a trust or nominee account does not require the collection of beneficial ownership information for individuals. Moreover, while some jurisdictions may require beneficial ownership information, the information required can be limited to information regarding non-natural persons. As with shell companies, a lack of beneficial ownership information regarding the individuals who benefit from the account may mask an individual's identity such that he or she would gain access to a financial system when such access would otherwise be restricted or forbidden.

126. An omnibus account is an account established for an entity that is acting as an intermediary on behalf of multiple individuals or entities. For example, a bank in jurisdiction X could open an omnibus account with a securities intermediary in jurisdiction Y through which the bank in jurisdiction X manages a portfolio for its clients. In this scenario, the ML/TF vulnerability is that the securities intermediary may not know who the beneficial owners of the investment portfolio are.

127. One jurisdiction reported that "hub and spoke" arrangements involving jointly held accounts posed a particular vulnerability. In these arrangements, the primary accountholder opens accounts with numerous others (secondary accountholders), who in turn open accounts with others (tertiary accountholders). This can give the primary accountholder access to dozens or hundreds of accounts, decreasing transparency and making it difficult for a financial institution to determine exactly who is originating a transaction.

Charitable and Other Non-Profit Organisations

128. Whilst most charitable and non-profit organisations are reputable and provide legitimate services or funding for their causes, some organisations have been and can be used for ML/TF. Although not unique to the securities industry, a particular vulnerability involves organisations that may be used as a front for transferring funds to suspect beneficiaries located in high-risk areas/jurisdictions or conflict zones deemed to harbour or support terrorists. For example, legitimate funds may be used to purchase securities that are donated to a charitable organisation. The charity, in turn, could liquidate the securities or use the income generated by the securities to transfer funds to, or to purchase material for, individuals who further terrorists' activities.

Shell Companies

129. The term "shell company" often refers to a non-publicly traded corporation or limited liability company that might have no physical presence and generates little or no independent economic value. These companies are commonly organised in a way that makes their ownership and transaction information easier to conceal. Thus, transactions involving shell companies present a high ML/TF vulnerability.

130. Whilst publicly traded shell companies can be used for illicit purposes, ML/TF vulnerabilities associated with shell companies are heightened when the company is privately held, such that beneficial ownership can be more readily obscured.

131. For example, a domestic or international shell company securities account can be used to evade CDD/KYC investigations regarding the beneficial owners of certain assets. In particular, individuals or entities in high-risk areas/jurisdictions or conflict zones can disguise their true identities through a series of shell companies located in various jurisdictions to participate in a financial system that they otherwise would not be able to access.

132. Shell companies can also be used to introduce illicit funds into a financial system and/or generate illicit funds through manipulative or fraudulent securities activities. For example, a brokerage account can be opened in the name of shell companies and used to engage in fraudulent conduct with regard to low priced, illiquid, low volume or privately placed securities. In addition, a shell company can be established to accept payments from criminal organisations for non-existent services. These payments, which appear legitimate, can be deposited into depository or brokerage accounts and either wire transferred out of a jurisdiction or used to purchase securities products that are easily transferable or redeemable.

Unregulated Investment Funds and Pools (i.e. Hedge Funds)

133. Generally, hedge funds are vehicles established to hold and manage investment assets. Because of the way they are structured, they may not be subject to regulatory oversight. Hedge funds may receive funds domestically or internationally, and some (feeder funds) are established to invest into other hedge funds. A hedge fund will often utilise the services of a regulated securities intermediary.

134. Hedge funds present an ML/TF vulnerability because the regulated entity that the hedge fund is using to effect transactions (e.g**.** a broker-dealer) may not know the identity of the underlying hedge fund investors. Typically, hedge fund investors are of higher net worth than other retail investors. This anonymity of ownership can also result from the opacity associated with some feeder funds.

135. In addition, some hedge funds may be used to perpetuate a securities fraud, such as a Ponzi scheme. Securities fraud is discussed in Chapter 4.

Suspicious Indicators Associated with Trust, Nominee, and Omnibus Accounts, Charitable Organisations, Shell Companies and Hedge Funds

136. The questionnaire responses did not specifically identify any suspicious indicators associated with trust, nominee, and omnibus accounts, charitable organisations, shell companies and hedge funds. However, the following general suspicious indicators (also appearing in Annex B) may be useful when evaluating risks posed by these types of accounts, organisations and entities:[25]

[25] In addition, the FATF typology entitled "The misuse of corporate vehicles, including trust and company service providers" published in 2006 contains relevant background information.

- During the account opening process, the person opening the account refuses to provide information to complete CDD/KYC (e.g. occupation, prior financial relationships, etc.), in particular with respect to beneficial ownership;

- The person opening the account is reluctant to provide complete information about the nature and purpose of the customer's business, prior financial relationships, anticipated account activity, the entities' officers and directors or business location; and

- The trust or beneficial owner of a nominee account is located in a high-risk area/jurisdiction or conflict zone.

Case study 13: Fictitious transactions involving publicly-traded shell company

Offence:	Money laundering
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	Israel
Subject:	Individuals, companies
Instruments, methods and techniques:	Shell company, third parties

Suspicious transaction/activity report information

The STR indicated that there may have been a violation of the jurisdiction's money laundering law in relation to identifying the beneficial owner of a company.

Case description

The FIU detected a connection between D, a young businessman, and an organised crime group. Person A was active in local politics and owned several businesses. Together with another very wealthy businessman whose source of wealth is unknown, he purchased a public shell company X that traded on the local stock exchange for a small fraction of its true worth. D used a shell bank account managed by the wife of someone related to D. The shares of company X were transferred to several entities, none of which constituted a "party of interest" according to the stock exchange's reporting threshold. Some of the shares were transferred on the same day they were credited to different accounts managed by related parties in what appears to be a fictitious transaction, since the debited account did not receive any funds in return. The owner of the account debited declared there were no beneficiaries. This public company later attempted indirectly to win a government bid regarding a natural resource.

Case study 14: Securities intermediary failed to identify beneficial owners of offshore trust accounts

Offence:	Regulatory violation
Securities Related Designated Offence (if any):	N/A
Jurisdiction:	United States
Subject:	Broker-dealer
Instruments, methods and techniques:	Offshore trusts; wire transfers
Indicators:	• Offshore Trusts; and • Wire Transfers.

Suspicious transaction/activity report information

None

Case description

An SRO found that an introducing broker-dealer failed to obtain beneficial ownership information relating to accounts for high risk offshore trusts, as required by the firm's AML/CFT procedures. The accounts were used in millions of dollars of international wire transfers. In addition, even though the introducing broker-dealer's clearing broker-dealer made repeated requests for information regarding the beneficial ownership of the accounts, the introducing broker-dealer did not obtain this information. It was also unable to analyse the transactions identified by the clearing broker-dealer for suspicious activity because it did not have information identifying the beneficial owners of the accounts.
In addition, the introducing broker-dealer did not have sufficient procedures in place to ensure that there was adequate communication between the firm and its parent corporation, a bank, as to whether, in general, STRs should be filed and whether a particular STR had in fact been filed. Consequently, the firm's processes did not make certain that its independent obligations regarding the filing of an STR were met. The firm was also unable to reliably

incorporate the information that STRs had been filed into an ongoing risk assessment of its customers and to evaluate account activity going forward.

Enforcement actions

The firm was censured and fined US$3 million.

Case study 15: Purchase and sale of shares of a public shell company

Offence:	Money laundering
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	Israel
Subject:	Individual; private company
Instruments, methods and techniques:	Cash deposits, shell company, use of a nominee
Indicators:	• Buying the shares of a shell public company using a bank cheque purchased with cash by a third party; • Reluctance to expose buyers of the shares to the bank; • Shares bought using a straw man (i.e. a front for the true purchaser); • Shares resold after a very short period of time; and • Withdrawing funds from the shell company by means of loans or deals with interested parties, sometimes via MSBs.

Case description

Natural Person N is suspected of buying a public shell company (company A) traded on the stock exchange and hiding his involvement in the company for the purpose of money laundering.

The FIU received an STR regarding N who previously held shares through a “straw man” in two public companies, "B" and "C”. N was suspected by the securities regulator of manipulating the share price in order to artificially push it upwards, and of transferring funds for no apparent legitimate purpose by crediting the accounts of companies B and C by transfers from related private companies and shortly afterwards withdrawing money from the accounts of B and C for no apparent legitimate purpose. Some of the funds were drawn as loans and transferred to MSBs.

In order to purchase company A, N purchased two bank cheques using large amounts of cash: one written to the order of a law firm that was dealing with the acquisition and one written to the order of the public shell company A. N informed the bank that he represented the potential buyers and received the cash from them. He was reluctant to provide any information regarding the "investors".

A week after N purchased the bank cheques, 81% of company A shares were purchased by person M, who is believed to be a "straw man" for person N. Also, 50% of the shares were purchased by person M on behalf of unidentified third parties, none of whom were actually related to the transaction. Three weeks after the acquisition, N's wife was named Secretary of company A. Two months later, the remaining shares were again sold to person O and to another family member of N.

During the first months after the acquisition of the company, several cash deposits (amounting to approximately one million dollars) were made. This was unusual for a company that was a public shell and was not performing any activity until the acquisition. Another pattern followed by firm A was the acquisition of shares of a foreign company whose activity was not related to the alleged activity of company A. Company A lent funds to the foreign company by means of an international transfer and the loan was repaid from an account abroad managed by the foreign company after a short period of time.

Several months after the acquisition, the funds were drawn from the account by different means: Loans to related parties, transfers to MSBs (company A's financial reports showed as an asset on the balance sheet large amounts of money to be paid by factors other than clients).

The company also reported the loss of millions of Israeli Shekels due to an investment in derivatives.

Case Study 16: Use of Omnibus accounts and fictitious account names to facilitate sanctions evasion

Offence:	Money laundering
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	United States
Subject:	Entity
Instruments, methods and techniques:	Omnibus account/fictitious account names
Indicators:	

Suspicious transaction/activity report information

References to “code names” in transactions processed through an omnibus account of a third country broker maintained at a securities firm in the United States.

Case description

An entity subject to an asset freezing order established an account with a securities firm in a third country. The third country firm agreed to use a fictitious name for the sanctioned party when processing stock trades on its behalf through its omnibus account held with a U.S. broker, thus disguising the identity of the beneficial owner of the stock held in the omnibus account.

Enforcement actions

The case is still being investigated.

Margin Trading

137. One of the unique characteristics of the securities industry is that it can be used to both disguise the proceeds of criminal activity and to generate further profits. The use of margin account trading involves the investor borrowing funds to carry out trading. The securities themselves are used as collateral for the loan. By influencing the timing and value of trades (and leverage), a launderer can potentially use the proceeds of a scheme to generate more funds.

Case study 17: Margin accounts

Offence:	Money laundering
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	Malaysia
Subject:	Individual
Instruments, methods and techniques:	Multiple trading and margin accounts, offsetting trades

Case description

Mr. W opened five trading accounts and two margin accounts at five broker-dealers in various names. These accounts were opened under his name, his mother's name, Mrs. F, his girlfriend's name, Ms. V, and company XYZ, which was owned by Mr. W and Mrs. F. The scheme was carried out on four separate occasions, involving two cycles where the proceeds from the first cycle were used to facilitate the scheme carried out during the second cycle. During the first cycle, Mr. W placed odd lot buy orders using his trading account and Mrs. F's trading account and simultaneously placed odd lot sell orders through another broker-dealer to match the trades, but at exorbitant prices. Mr. W controlled both the selling and the buying parties.
Mr. W then took out the proceeds at the selling brokers and defaulted on the buying brokers' side. This allowed him to raise huge amount of sales proceeds that were used to increase his margin and facilitate his scheme during the second cycle. During the second cycle, the same scheme was used but involved different broker-dealers, where he had used trading accounts of Ms. V and company XYZ.

3.7 Determination of Value

138. Securities traded on exchanges tend to have a reasonable degree of price transparency. However, both on and off-market trades can be used to disguise value, especially where there are no traditional pricing mechanisms, and such trades can be used to transfer value in circumstances which are attractive to a money launderer. For example, a difficult to price instrument can be transferred at a pre-arranged, excessive price in order to transfer value from one person or entity to another.

Transfer Pricing

139. Large capitalisation stocks are subject to a high degree of transparency and, subject to general market forces, generally fluctuate within an established price band. It is noted, however, that the market price on small capitalisation stocks, which may be rarely traded, can be subject to more extreme price movements. In addition, the price of such an illiquid stock may be substantially affected by relatively

small transactions. This mechanism has been exploited for money laundering purposes where block trades of illiquid stocks are transacted at a pre-agreed price between two parties. In such transactions, parties agree to the initial purchase of an illiquid security at an artificially low price with the same security being bought back some time later by the original seller or an associate at a significantly higher price.

140. A variation on this occurs in the derivatives market where OTC derivatives can be structured to meet the requirements of a specific customer. Such transactions may be highly leveraged or arranged so that only a small movement in the value of the underlying securities can trigger disproportionately large payments. Furthermore, the pricing model on a bespoke or custom built derivative may be extremely difficult for anyone, other than a market expert, to understand. Such transactions have frequently been used to transfer profits from high-tax to low-tax jurisdictions and for the purposes of avoiding exchange control regulations.

Case study 18: Money laundering through transfer pricing

Offence:	Money Laundering/Tax evasion
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	U.K.
Subject:	Banking/securities corporation
Instruments, methods and techniques:	Off-market prices on derivative contracts
Indicators	• Unnatural diminution in profits; • Unnecessarily complex transaction structure; and • Subsidiary companies established for no viable economic purpose in a low-tax jurisdiction.

Suspicious transaction/activity report information

No reports were filed at the time but subsequent investigations were undertaken by revenue authorities.

Case description

The investment banking arm of a global investment bank had made substantial profits on its derivative trading book. In order to transfer profits to a low-tax jurisdiction, a special purpose subsidiary company was established in that jurisdiction. A number of complex over-the-counter derivative contracts were entered into between the investment bank and the subsidiary. During the course of the contracts, variation margin payments were made to the subsidiary on each "revaluation" of the contract and a substantial loss was realised on liquidation of the contract.

Enforcement actions

Investigations by revenue authorities proved inconclusive due to the complexity of the transactions.

Short selling

141. In the securities industry short selling generally involves the practice of selling securities that are not actually owned by the seller, or that will be borrowed for delivery. In a "naked" short sale, the seller does not borrow or arrange to borrow the securities in time to make delivery to the buyer within the standard settlement period. The investment strategy behind short selling is the hope that a profit will be made from the difference in price of the assets sold and those purchased (at a lower price) for return to the borrower.

142. Short selling is a trading vehicle that can be linked to market manipulation or insider trading, which are both predicate offences that could be the basis for ML/TF. One example cited involves "PIPES", or private investment in public equities. A financial institution may solicit indications of interest from potential purchasers before committing to the deal. While potential investors are forbidden from trading on the information about the transaction, some disregard the prohibition and sell the associated public equity short, anticipating a price decline.

3.8 Rogue Employees

143. While most AML/CFT regimes are designed to detect and report suspicion surrounding customer interactions, these programs are only as reliable as the people who implement them. To this extent, employees who assist customers in money laundering, terrorist finance may, and/or in predicate offences, pose a serious vulnerability to a financial institution.

Suspicious Indicators Associated with Rogue Employees

144. A number of jurisdictions identified the following as suspicious indicators that may be associated with employees vulnerable to assisting money launderers or terrorist financiers. These indicators are not necessarily unique to the securities industry or indicative of employee misconduct, but rather should be taken into account with other indicators:

- The employee appears to be enjoying a lavish lifestyle inconsistent with his or her salary or position;
- The employee is reluctant to take a holiday or vacation;
- The employee is subject to intense job-related demands, such as sales or production goals, that may make him more willing to engage in or overlook behaviour that poses ML/TF risks;
- The employee puts a high level of activity into one customer account even though the customer's account is relatively unimportant to the organisation;
- The employee is known to be experiencing a difficult personal situation, financial or other;
- The employee has the authority to arrange and process customer affairs without supervision or involvement of colleagues;
- The management/reporting structure of the financial institution allows an employee to have a large amount of autonomy without direct control over his activities;
- The employee is located in a different country than his direct line of management, and supervision is only carried out remotely;
- A management culture within the financial institution focuses on financial reward over compliance with regulatory requirements;
- The employee's supporting documentation for customers' accounts or orders is incomplete or missing; and
- Business is experiencing a period of high staff turnover or is going through significant structural changes.

Case study 19: Employee of a securities intermediary assisting a politically exposed person (PEP) launder money

Offence:	Drug Trafficking, Bribery
Securities Related Designated Offence (if any):	N/A
Jurisdiction:	United States
Subject:	Individuals
Instruments, methods and techniques:	Stock brokerage accounts, wire transfers, foreign shell companies
Indicators:	• PEP • Widespread news accounts regarding investigation of the PEP; • Foreign wire transfers; and • Shell companies.

Suspicious transaction/activity report information

None Indicated.

Case description

D, an investment representative at a large broker-dealer, helped a PEP from a foreign jurisdiction launder over US$10 million that the PEP received from drug traffickers. The PEP received these illicit assets as payment for allowing drug shipments to safely pass through his jurisdiction. D helped the PEP establish numerous brokerage accounts at her firm in the name of various foreign shell companies and then deposited the illicit assets into these accounts. Weeks before the PEP was to lose prosecution immunity, D assisted the PEP in wire transferring the illicit assets out of the brokerage account and into a foreign account. D then set up a fictitious account for the PEP and wire transferred all of the assets back to her firm.

Enforcement actions

D was criminally indicted.

Case study 20: Use of "friendly" broker to deposit funds and conduct stock market transactions

Offence:	Money laundering
Securities Related Predicate Offence (if any):	
Jurisdiction:	Brazil
Subject:	Individual
Instruments, methods and techniques:	Use of multiple accounts
Indicators:	N/A

Suspicious transaction/activity report information

None indicated.

Case description

A businessman, M, wishes to "pay" another businessman J for "rendered services" without any apparent business relationship between them. M is a friend of N and a broker with "Stocks & Co". M continuously deposits money of unknown origin into N's current account with the broker.
N keeps these deposits of money segregated from his own. These deposits are used in transactions carried out on the stock exchange without regard to profit or loss. In time, N made deposits of small amounts of money of unknown origin into several bank accounts belonging to J.
M, N, and J apparently believed that this procedure would minimise the possibility of detecting a link between the origin of the amounts "paid" by M to J. The jurisdiction observes that the securities account was being used to hide the origin of the money that was deposited in J´s bank accounts.

Enforcement actions

The two brokers involved were subject to an administrative penalty by the securities commission, as were the directors of the brokers, for failing to file STRs.

Case study 21: Employee of a securities intermediary assisting in market manipulation

Offence:	N/A
Securities Related Designated Offence (if any):	Market manipulation; securities fraud
Jurisdiction:	United States
Subject:	Individuals
Instruments, methods and techniques:	Stock brokerage accounts; penny stocks; wash trades, shell companies
Indicators:	• Accumulation of stock in small increments throughout trading day to increase price; • Marking the closing price; • Unauthorised buying of stock through customer accounts; • Account activity not consistent with customer profile; and • Trading between numerous accounts controlled by the same people.

Suspicious transaction/activity report information

No STRs were filed. Securities intermediary faced liability for ignoring red flags and suspicious indicators and for failing to supervise a problem employee despite warning from compliance officers.

Case description

RR1, a customer and RR2 from another firm participated in scheme to manipulate the stock of a thinly traded security. They artificially inflated and maintained the price for the stock, marked the closing price, engaged in matched and wash trades, attempted to artificially create "downbids" to suppress short sales, and engaged in unauthorised and unsuitable trading in customer accounts. Certain senior executives allowed RR to operate with greater freedom than other RRs. The securities intermediary that RR2 worked for was aware of numerous red flags and suspicious indicators regarding the market manipulation but did not file an STR.

Enforcement actions

A cease and desist order was filed against the firm and the firms was required to pay disgorgement.

3.9 Terrorist Financing

145. The replies to the questionnaire and the case studies gathered suggest that there is relatively little evidence of the securities industry being used to finance terrorism.

146. However, this lack of evidence specific to the securities industry does not rule out the potential for terrorist financing in this sector.

147. Following the 9/11 attacks in the United States, various agencies worldwide engaged in studies to ascertain which sectors of the financial services industry had been used to finance the attacks. No empirical evidence was revealed to suggest that securities had been used either to finance the attacks or to generate funding from them (for example, through short selling of airline or hotel stocks).

148. The lack of information on terrorist financing in this sector might, in part, be explained by the relative newness of the provisions on terrorist financing compared with those relating to money laundering. The 8 (now 9) FATF Special Recommendations came into effect in October 2001, and the effect of them in an industry which, in itself, is expanding quickly, may not have been fully felt.

149. The information provided in Section 3.6, above, dealing with clients and account types details some of the TF threats in this and other sectors.

150. Specific indicators relating to the securities industry were not cited, but more common ones which are potentially relevant to this industry are found in the FATF typology on Terrorist Financing. [26]

[26] http://www.fatf-gafi.org/dataoecd/28/43/40285899.pdf

CHAPTER 4:
PREDICATE OFFENCES FOR MONEY LAUNDERING LINKED TO SECURITIES

4.1 Introduction

151. As previously mentioned, the securities industry is not only a vehicle through which illicit assets can be laundered; it is also vehicle for generating illicit assets that would eventually have to be laundered. Indeed, the FATF's definition of the "designated offences" that lead to money laundering include three securities-specific offences: insider trading, market manipulation, and fraud.

152. This section addresses these three securities-specific designated offences because: (1) a significant number of jurisdictions included these designated offences in their questionnaire responses; (2) the relatively low level of securities related STRs may be the result of the non-reporting of these offences;[27] and (3) in identifying and reporting these types of offences, jurisdictions may be in a position to better prevent money laundering.

153. This chapter is organised into topical sections that address each of the three designated offences that implicate the securities industry. Suspicious indicators and case studies are also included.

4.2 Insider trading

154. Although insider trading is illegal conduct, this does not mean that company insiders, such as officers, directors and employees, can never trade shares of the company's securities. In some jurisdictions, certain circumstances require such transactions to be reported to regulators and the public. Insider trading, however, involves situations where the person who buys and sells securities, whether a company insider or not, does so in violation of a fiduciary duty or other relationship of trust and confidence, while in possession of material, non-public information about the security. In some jurisdictions, this includes situations where a person in possession of material, non-public information provides this information to someone else for trading where, depending on the circumstances, the recipient of the information can violate insider trading laws as well.

155. Insider trading is unique to the securities industry and generates illicit assets. As a predicate offence for money laundering, and an offence in its own right, this type of misconduct is reportable on STRs and has proven useful in assisting law enforcement and regulators prosecute such misconduct.

156. The illicit assets generated by insider trading can be laundered through the securities industry itself or through other parts of the financial sector. The most common example of laundering would be the simple transfer of illicit proceeds to a bank account.

Suspicious Indicators Associated with Insider Trading

157. The following were identified as suspicious indicators that could implicate insider trading:

- The customer makes a large purchase or sale of a security, or option on a security, shortly before news is issued that affects the price of the security;

[27] This may also result from a perception that these securities-specific designated offences are not money laundering per se.

- The customer is known to have friends or family who work at or for the securities issuer;
- The customer lives in the locality where the issuer is located;
- The customer's purchase does not correspond to his or her investment profile. For example, the customer may never have invested in equity securities, but does so at an opportune time;
- The customer's account is opened or significantly funded shortly before a purchase; and
- The customer sells his or her position in a security in conjunction with a significant announcement about the security.

Case study 22: Insider trading and money laundering

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Insider trading
Jurisdiction:	Belgium
Subject:	Individual, companies
Instruments, methods and techniques:	Shares, affiliated companies
Indicators:	• Unusual important transactions; • Suspicion of insider trading; and • Securities sold a few months later.

Suspicious transaction/activity report information

In 2004, a Belgian bank reported several unusual important purchases of shares of two Belgian quoted companies, belonging to the same group, by company Y represented by Mr. X and a third party also in relation with company Y. Mr. X was manager in the two Belgian quoted companies, but also managed company Y.

Case description

Mr. X, manager of an important group of companies, knew that a reorganisation of the group was going to be publicly announced. This could have a favourable effect on the share price of two companies of this group after the reorganisation was announced.
Mr. X used this knowledge to purchase securities of these two companies through another company he managed and through a third party before the reorganisation was announced.
Once the reorganisation was announced, the share price of these two companies rose sharply. The shares were sold at a high profit.
The profit made by Mr. X was then invested in other securities and part of the money was transferred to other bank accounts held by him. As such, the money obtained illegally (thanks to the insider trading) was laundered.

Enforcement actions

The case was disclosed in 2005 to the public prosecutor for ML for insider trading.

Case study 23: Insider trading and money laundering

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Insider trading
Jurisdiction:	Belgium
Subject:	Individuals
Instruments, methods and techniques:	Shares, use of a nominee
Indicators:	• Unusual transaction; and • Purchases do not correspond to the customer's investment profile.

Suspicious transaction/activity report information

A Belgian bank reported that a significant purchase of shares of company M was carried out through the bank account of Mr. Y's wife. The transaction was unusual.

Case description

Mr. Y had insider information on company M, quoted on the stock exchange. Through relatives, he knew that company M would soon be acquired.
To avoid attracting attention, he transferred his assets to his wife's account over which he had power of attorney, and purchased shares of company M prior to the announcement of the takeover. The bank knew that Mr. Y's spouse did not usually perform stock exchange transactions and was surprised to find out that funds were transferred from her husband's account. It is believed that Mr. Y's wife carried out the transactions on his behalf and tried to conceal the transactions by using her account.
After the takeover, his wife's account was credited with the proceeds of the securities sold.
Mr. Y then laundered the money by having the funds transferred to his personal account.

Enforcement actions

The case was disclosed in 2006 to the public prosecutor for ML for insider trading.

4.3 Market Manipulation

158. Market manipulation generally refers to conduct that is intended to deceive investors by controlling or artificially affecting the market for a security. In particular, the manipulator's purpose is to drive the price of a security up or down in order to profit from price differentials. There are a number of methods that manipulators use to achieve these results.

159. The most pervasive market manipulation method involves what is colloquially referred to as a "pump-and-dump" scheme. This scheme involves touting a company's stock with false or misleading statements, often in conjunction with securities trades that raise the price of the security or make it appear as if the securities trading volume is higher than it actually is. Therefore the security price is artificially raised ("pumped"); the security is then sold ("dumped") for a profit. Often the underlying security is low priced, illiquid, and trades with little volume.

Penny Stock Manipulations

160. Penny stocks may represent equity interests in companies that are about to become public or that are already public. The issuers of these shares often, but not always, have legitimate business operations and revenue streams. Shares in these issuers may take the form of physical securities that can be deposited with a securities intermediary. Penny stocks are not likely to be traded on traditional exchanges, but in OTC markets or on bulletin boards. Penny stocks typically have very low trading volumes but, unlike bearer securities, ownership of these shares will often be registered with the issuer or a transfer agent.

161. Illicit actors can acquire penny stocks in several ways. They can purchase already issued penny stocks in the OTC markets, acquire large blocks of shares as compensation for bringing a company public e.g. through a reverse merger into a private shell company, or issue the shares. These shares, which usually have little or no value, can then be deposited into brokerage accounts. Fraudulent promotion

methods and wash trades may then be used to inflate the price of the security. After the manipulators exit the market, investors are often left with worthless securities. Penny stock pump-and-dump schemes have increasingly been conducted through internet-based accounts and through trading accounts held in the name of private shell companies.

Suspicious Indicators for Market Manipulation

162. The following have been identified as suspicious indicators involving market manipulation in general and penny stock pump-and-dump schemes in particular:

- The customer engages in large or repeated trading in securities that are illiquid, low priced or difficult to price;
- The issuing company has no apparent business, revenues or products;
- The issuing company has experienced frequent or continuous changes in its business structure and/or undergoes frequent material changes in its business strategy or line of business;
- The officers or insiders of the issuing company are associated with other low priced, illiquid or low volume companies;
- The officers or insiders of the issuing company have a history of regulatory violations;
- The issuing company has failed to make required regulatory disclosures;
- The issuing company has been the subject of a prior trading suspension;
- A customer's transactions show a pattern of receiving physical securities or receiving incoming shares transfers that are then sold, with the proceeds wired out of the account;
- The customer deposits physical securities together with a request to journal the shares into multiple accounts that do not appear to be related, or to sell or otherwise transfer ownership of the shares;
- One party purchases securities at a high price and then sells them at a considerable loss to another party;
- A customer journals securities between unrelated accounts for no apparent business reason; and
- A customer engages in prearranged or other non-competitive securities trading, including wash or cross trades of illiquid or low priced securities.

Case study 24: Stock price manipulation

Securities Related Predicate Offence (if any):	Embezzlement Market manipulation
Jurisdiction:	Korea
Subject:	Individuals
Instruments, methods and techniques:	Shares, funds transfers, multiple securities accounts
Indicators:	• Unusually large transactions; and • Repeated purchase and sale of shares.

Suspicious transaction/activity report information

According to an STR, person A had frequent large fund transactions with unspecified persons, including B and C, and securities accounts at three brokers. In light of repeated selling and buying of shares of U Co. Ltd in large volumes through a certain computer IP, it was suspected that A was manipulating the market price using embezzled money and a borrowed bank account using an assumed name.

Case description

Analysis revealed that B, a company director of U Co. Ltd, embezzled corporate funds deposited as payment for shares and was manipulating the market price using a securities account in the name of unspecified persons with the embezzled funds.
The executives, including the former representative director and the present representative director of U Co. Ltd and a former branch manager of the broker, conspired to manipulate the share price more than 10 times through false stock trading orders and wash sales with embezzled money and gained illegal proceeds worth 35 billion won. As a result, private investors were severely damaged. It is of significance that relevant crimes were detected and further damage was prevented because an STR was sent to law enforcement authorities.

Enforcement actions

B was prosecuted for violation of the Securities Exchange Act and bribery (sentenced to 2 years of imprisonment, stay of execution for 4 years at the first trial). C was prosecuted for violation of the Act on the Aggravated Punishment, Etc. of Specific Economic Crimes (Embezzlement and Breach of Trust) and the Act on External Audit of Stock Companies (sentenced to 5 years imprisonment and a fine of 2 billion won). Other related persons were also prosecuted.

Case study 25: Market manipulation involving the use of private shell companies

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Market manipulation
Jurisdiction:	United States
Subject:	Individuals
Instruments, methods and techniques:	Stock brokerage accounts; penny stocks; wash trades, false promotional methods; foreign accounts
Indicators:	• Individuals subject to previous securities related injunctions; • False and misleading disclosure documents; and • Brokerage accounts opened using private shell companies.

Suspicious transaction/activity report information

N/A

Case description

Individuals, some of whom were previously subject to securities misconduct injunctions, conspired to acquire controlling interests in a public company trading on the OTC markets. In perpetuating the conspiracy, the individuals acquired restricted stock of the companies and used fabricated and backdated corporate records that made it appear as if the restricted stock certificates had satisfied minimum holdings periods. The individuals then used false attorney opinion letters to get the transfer agents to issue freely tradable shares. Thereafter, the individuals prepared and distributed false and misleading disclosure documents for the companies and engaged in promotional campaigns to create demand. The individuals used brokerage accounts opened through private shell companies to sell shares of the companies in conjunction with the promotional campaigns.

Enforcement actions

N/A

Case study 26: Securities intermediary expelled for inadequate AML/CFT policies and procedures

Offence:	Regulatory violation
Securities Related Predicate Offence (if any):	N/A
Jurisdiction:	United States
Subject:	Broker-dealer
Instruments, methods and techniques:	Penny stocks; wire transfers; journaling
Indicators:	• Stock Promoters; • Penny Stocks; • Customers with money laundering convictions and regulatory actions against them; • Wire transfers to well known tax havens; and • Journaling of securities between accounts followed by immediate liquidation.

Suspicious transaction/activity report information

N/A

Case description

A broker-dealer agreed to an expulsion from SRO membership for systematic and repeated violations of AML/CFT rules and regulations, including failure to investigate and report numerous suspicious transactions.
The SRO found that, at various times from February 2004 to September 2006, the broker-dealer's customers included notorious stock promoters and others who had been barred by the SRO, disciplined by the country's primary securities regulator, or had criminal histories, including one customer who had been convicted for the sale of an illegal controlled substance and money laundering. The same individual had been previously convicted for his role in a "smurfing" scheme, a commonly-used money laundering technique involving the splitting of a large financial transaction into smaller transactions to avoid scrutiny by regulators and law enforcement.
The SRO further found that in at least a dozen instances, the broker-dealer's customers sold large blocks of penny stocks that were linked to allegedly fraudulent schemes. The country's securities regulator had filed at least two enforcement actions charging federal securities law violations involving penny stocks that were later sold through the broker-dealer and other firms. In one instance, an individual who had previously been barred by the SRO delivered over 1.8 billion shares of a penny stock issued by a company that was contemporaneously the subject of a pending, and publicly released, complaint by the securities regulator alleging manipulation and other securities laws violations. In the following 10-month period, this customer sold the shares for approximately US$8 million in 155 separate sales, wiring the proceeds out of his account after each sale.

Enforcement actions

The broker-dealer agreed to an expulsion from SRO membership.

4.4 Securities Fraud

163. Securities fraud broadly refers to deceptive practices in connection with the offer and sale of securities. In this regard, securities fraud encompasses insider trading and market manipulation.

164. For example, illicit actors can engage in confidence or boiler room schemes the structure of which would make the scheme a "security" for the purposes of a jurisdiction's securities laws. However, the actual sellers of these (mostly worthless) shares are often based in a separate country from the purchaser, making access to perpetrators of the fraud difficult.

165. In a Ponzi scheme, a fraudster lures investors with the promise of high returns that are to be generated through the investment or business efforts of the fraudster. Instead of generating actual profits, the fraudster creates the illusion of profits by paying investors returns from their original investment or paying returns from the money that new investors contribute to the fraud. This type of scheme tends to collapse when the number of new investments into the scheme do not satisfy the payment obligations for previous investors.

166. Although many Ponzi schemes do not necessarily involve the direct use of securities intermediaries or markets, the way these schemes are marketed often causes sales of interests in the scheme to be classified as securities, and thus subject to the jurisdiction of securities regulators.

Securities Offering Fraud Indicators

167. The following have been identified as suspicious indicators associated with a securities offering fraud:

- The customer opens numerous accounts for different legal entities that the customer controls;
- The customer receives many incoming cheques or wire transfers from unrelated third parties;
- The customer allocates incoming third-party deposits among numerous accounts;
- The customer makes numerous outgoing payments to third parties close in time to when the customer receives many incoming third-party cheques or wire transfers;
- The customer's profile does not suggest a legitimate business reason for receiving many third party deposits; and
- The cheques or wire transfers note that the funds are for an investment.

Case Study 27: Securities fraud

Offence:	Money laundering
Securities Related Predicate Offence (if any):	Securities fraud
Jurisdiction:	United States
Subject:	Individual
Instruments, methods and techniques:	Cheques, wire transfers, monetary transactions
Indicators:	• D established various businesses and bank accounts under his name; • Monetary transfers between various bank accounts controlled by D (or D's businesses); • Authorities had imposed cease and desist order against D and D's business; • D promised substantial guaranteed returns and secure principal investment; and • Deposited investment monies into bank account controlled by D.

Case description

The individual generated illicit assets within the securities industry by operating two Ponzi schemes. Under the first scheme, D told investors that their money would be used to purchase equipment that would be leased and resold. Under the second scheme, D sold promissory notes that were purportedly secured by stock in D's associated legal entity and by precious metal production contracts. Both schemes promised investors high rates of return and guaranteed the principal investment. In actuality, the defendant used investor funds for his personal expenses.
Investors would either wire, hand deliver or mail their investments (via cheques) to D or one of his businesses (legal entities) and the funds were deposited into bank accounts controlled by D. D would then transfer the funds among various bank accounts that he controlled in order to disguise the origin of the proceeds and to further perpetuate the fraud. After receiving the funds, D would use them to pay for personal expenses, promote another business, and to make periodic payments to investors. The periodic payments to investors were made to legitimise and disguise the underlying schemes and to avoid reporting to and detection by law enforcement.

Enforcement actions

A U.S. state investigated the investments offered by D under the first program, and issued an order against D and his related business to cease and refrain from further offer or sale of such investments in the state.
A federal action has been filed against D alleging violations of federal laws related to mail fraud, securities fraud, and money laundering.

CHAPTER 5: SUSPICIOUS TRANSACTION REPORTING AND ENFORCEMENT ACTIONS

5.1 Suspicious Transaction Reports

168. A review of the published STR reporting figures from some of the Third Round Mutual Evaluation Reports suggests that STR reporting in the securities industry is relatively low, compared with the banking industry. A selection of comparative statistics is set out below:

Country A

Financial Institution	2001	2002	2003	2004
Banks	911	1 128	1212	1 698
Money Exchange	21	28	199	330
Securities	**24**	**4**	**3**	**3**

Country B

Financial Institution	2002	2003	2004	2005
Banks	680	549	685	921
Money Exchange	102	106	39	20
Securities	**10**	**12**	**3**	**5**

Country C

Financial Institution	2002	2003	2004	2005
Banks	193	177	288	349
Money Exchange	0	0	0	0
Securities	**0**	**0**	**1**	**1**

Country D

Financial Institution	2002	2003	2004	2005
Banks	272 823	288 343	381 671	522 655
Money Exchange	5 723	209 512	269 284	383 567
Securities	**0**	**4 267**	**5 705**	**6 936**

169. The STR reporting disparity between the banking and securities industries is not surprising in light of the relative size of the banking industry in most countries compared to the securities industry. In addition, in some countries STR reporting in the securities industry is a newer legal requirement than that for submitting STRs in relation to banking activities. Nevertheless, the figures might be indicative of under-reporting in the industry, and it is suggested that the issue be examined further.

170. It is also worth nothing that some jurisdiction's reporting requirements are narrower than others', which results in the inconsistent capture of data for the same event or activity.

171. The securities typology questionnaire (see Annex D) requested information on the amount and nature of the STRs received in the securities sector. Of the 40 questionnaire responses received, 31 provided responsive data.

172. In contrast, a number of jurisdictions reported that their STR tracking and/or reporting mechanisms were not conducive to quantitative breakdowns regarding the number of securities related

STRs filed. This appears to be a reporting gap, in that data is simply not available in certain jurisdictions to enable an assessment of the potential risks in the sector.

173. One FIU reported that STRs were categorised based on the institution making the filing. Accordingly, figures for the securities business of larger banking groups are potentially being categorised as banking STRs.

Number of Securities Related STRs

174. Questionnaire responses represent the number of securities related STRs filed between 2005 and 2008 (see the summary at Annex C, Table 1). Of significance, most jurisdictions evidenced yearly increases in securities related STRs between 2005 and 2008, with a particular increase in 2007. It should be noted that most questionnaires were submitted in late 2008, making final 2008 figures unavailable for some respondents.

Breakdown of STRs Based on Type of Security

175. Fourteen of the forty questionnaire responses provided a breakdown of STRs filed by securities type. The most common type of securities product subject to an STR filing were equities, mutual funds, money market mutual funds, bonds and similar debt instruments, foreign exchange contracts, and certificates of deposit. It should be noted that not all jurisdictions consider certificates of deposit and foreign exchange contracts to be securities. Furthermore, with reference to the type of product referenced in an STR, some jurisdictions permit the designation of "any other." This may mean that the suspicious activity was related to the securities markets, even though the STR did not explicitly identify it as such.

STRs Filed By Type of Institution

176. The overall trend for STR reporting was upwards in all areas, with broker-dealers submitting the most. It is not clear if there is any incidence of double reporting amongst institutions.

Emerging Issues

177. Discussions with representatives of FIUs, law enforcement and the private sector suggest that there is a need for greater understanding of the expectations of all parties who file STRs. Reports of poor quality are often thought to hamper enforcement action. This phenomenon is not peculiar to the securities industry, and is one which greater dialogue between the competent authorities and the private sector might help to resolve. Guidance and feedback to those required to report suspicious transactions is part of the package of measures that competent authorities should provide under the FATF Recommendations.

178. Conversely, there is often a perception that the products and methodologies used in the securities industry are extremely complex. This, in turn requires specialist knowledge, which relatively few FIUs and law enforcement agencies currently have.

179. The complexity of the products and methodologies, coupled with the ability to move funds/value internationally also gives rise to practical considerations as to how best to bring actions to seize and freeze criminal assets. Again, mechanisms to share expertise between agencies and jurisdictions are to be encouraged.

180. In some jurisdictions a separate reporting regime exists for suspicions of money laundering and those of the predicate offences where the securities market can be used, such as insider trading and market manipulation. Under these circumstances, it is not always clear that the reporting institution is aware of the possibility that there might also be a requirement to report a suspicion of money laundering. This is a

potential gap in the system, and might partially explain the relatively low levels of ML/TF STR reporting in the securities sector. Again, greater awareness between competent authorities and amongst the industry is to be encouraged.

STR Referrals to Law Enforcement

181. The questionnaire responses did not give uniform results, and thus the trends, rather than the figures, are reported here.

182. The number of reported STR referrals to law enforcement, and subsequent criminal prosecutions remain relatively low. Due to the dual nature of STR reporting for ML/TF cases and predicate offences, such as insider trading and market manipulation in some jurisdictions, conclusion trends on numbers are difficult to determine.

5.2 Enforcement actions

Referrals from the FIU made to Law Enforcement

183. Out of 31 countries that reported receiving STRs involving securities, 18 reported referrals to law enforcement based on these STRs. The number of referrals in specific countries generally represents a small fraction of the number of STRs (less than 10%). Only 7 countries reported money laundering prosecutions in respect to these referrals and 3 reported convictions. It should be noted however, that a number of countries reported that statistics associating prosecutions and convictions to specific STRs or sectors were not available.

184. Eighteen countries reported no enforcement action from 2005 to 2008, either because none were taken in the securities sector or because data was unavailable.

185. Among the 21 countries that reported at least one action in that period, the large majority reported regulatory actions (i.e. actions against financial institutions or intermediaries that failed to comply with their AML obligations, including AML program requirements, CDD and reporting); five countries reported at least one criminal enforcement action (i.e. actions for criminal violations using the securities sector), and one reported joint regulatory/criminal enforcement actions.

186. Most countries noted that the enforcement actions provided no information on areas of high risk or vulnerability in the securities sector, since the action related to deficiencies in AML procedures. However, the following vulnerabilities were noted:

- Fictitious companies;
- Off market trading under conditions that were not “at arms length”;
- Trading in penny stocks;
- Trading in thinly-traded or illiquid shares; and
- Wire transfers.

CHAPTER 6:
CONCLUSION AND RECOMMENDATIONS FOR FURTHER WORK

6.1 General

187. The primary goal of this study was to consider and raise awareness of the vulnerability of the securities industry to money laundering and terrorist financing. With the help of the jurisdictions and international organisations that participated in the typology, a comprehensive set of red flags and indicators and relevant case studies have been gathered for the first time in a global study.

188. Such a study is, by its very nature, limited by the number of practical examples that have been experienced by the participants, and some threats remain theoretical rather than actual. However, in an industry which, by its very nature, facilitates the movement and investment of funds worldwide into an ever-changing array of products, often very rapidly, knowledge of the threats goes some way to raising awareness of the potential issues.

189. In a dynamic environment, the risks will evolve, and the project team hopes that this study will form the catalyst for further work on this topic by industry organisations, supervisory bodies and law enforcement. In particular, further cooperation in endeavouring to understand the risks and methodologies involved in a complex and fast-moving environment would enhance the effectiveness of the global effort to fight ML/TF.

190. In countries with less developed securities markets, some of the typologies and indicators might not currently be readily recognisable. However, given the rapid expansion of the securities industry globally in the past 25 years, it is hoped that the information provided will be of use as markets in developing economies expand.

6.2 Terrorist Financing

191. Although the literature review and the responses to the questionnaire do not readily suggest that the securities industry lends itself to terrorist financing, it remains a serious risk. In particular, the possibility that the use of opaque corporate structures and/or charities, combined with the transfer of value via securities and transactions at securities firms is a potential vulnerability. In addition, the FATF Special Recommendations relating to terrorist financing are newer than those for money laundering, and thus further trends may become apparent as suspicious transaction reporting regimes mature.

6.3 Money Laundering

192. Case studies and other intelligence gathered for this report show that the use of the securities industry to launder money constitutes an actual threat. The industry itself can be uniquely used to generate illicit proceeds from proceeds which might have had a legitimate origin. These illicit proceeds lead to almost "automatic" laundering when they are realised. This phenomenon can be contrasted with the more traditional use of the securities sector to disguise the origin of illicit funds derived from outside the sector.

193. As defences in areas more traditionally associated with ML/TF, such as banking, are tightened, the use of the securities industry may become a greater temptation to those seeking to disguise illicit proceeds, or indeed to generate them.

194. The use of cash in the securities industry does not appear to be widespread, and funds are very often introduced via other regulated sectors. Whilst reliance on other parts of the financial sector to

conduct certain aspects of CDD can be a perfectly acceptable way to facilitate transactions in the global financial system, it is important that the industry and its regulators take appropriate steps to ensure that reliance is only placed on third parties with adequate AML/CFT systems and controls. CDD itself is more than just customer identification, and ascertaining the purpose and intended nature of a transaction with funds from another part of the financial sector remains an important consideration.

6.4 STRs, Law Enforcement and Co-operation

195. The recorded figures for STRs in the securities industry suggest that reporting in this area remains relatively low. Comparisons with the banking sector do not provide much in the way of conclusive findings, given the difference in size between the relative sectors in most countries.

196. There is no one factor behind the relatively low figures for STR reporting, but the following appear to play a part:

- The reporting requirement for securities has only been relatively recently introduced in some jurisdictions;
- The separate reporting requirements for insider trading, market manipulation and securities fraud in some jurisdictions might mean that ML STRs are not being submitted to the FIU;
- Most securities intermediaries do not accept cash;
- The definition of "security" is not consistent;
- Securities in some jurisdictions can be sold by participants in other industries, such as banking and insurance companies;
- Because the securities markets are fast paced and transaction times are of critical importance, intermediaries are required to act quickly on a client's behalf, thus potentially affecting an intermediary's ability (and perhaps inclination) to scrutinise and submit STRs;
- Some in the industry may not understand STR requirements; and
- There may be a perception that the securities industry is not attractive to those wanting to launder money/finance terrorism.

197. The relative lack of referrals of STRs to law enforcement and the corresponding figures for securities-related criminal money laundering cases globally raises several issues.

198. Law enforcement in some jurisdictions report that STRs received from the securities sector do not contain a sufficient level of detail to enable them to take further action. Conversely, the products and schemes used within the industry are often complex and require specialist expertise to understand the full nature of the flows of funds. In addition, the global nature of the securities industry makes the ability to trace and seize assets more complex than more tangible domestically based assets.

199. Several of the case studies presented in this report suggest that the indicators of predicate offences such as securities fraud or market manipulations are similar to those for money laundering and that the transactions involved in both categories are closely linked, if not the same.

200. Liaison between law enforcement, regulators, FIUs, and the industry is to be encouraged, as each has relevant experience which can increase awareness of the vulnerabilities in this sector. In particular, obtaining direct private sector input and feedback in developing case studies is essential to ensure they are useful tools to the industry.

6.5 Definitions

201. This study has not attempted to produce a global standard definition of "security". It is, however, clear from the questionnaire responses that a variety of terms are used worldwide to match the financial activities specified in the FATF glossary. This might give rise to some overlap or even gaps where different regulatory authorities have responsibility for traditional activities thought to fall within the banking or securities sectors.

202. In addition, several jurisdictions note that securities products are traded by participants in other markets, such as banking, and products traditionally seen as insurance-related are in turn traded by those in the banking or securities markets, because they contain an investment element. Co-operation between the competent authorities responsible for each core sector is to be encouraged to address any potential vulnerabilities.

6.6 Issues for consideration

Securities and the "financial institution" category

203. The definition of the financial institutions in the FATF standards is broad and encompasses a variety of financial sectors, including banks, credit unions, insurance, and securities broker-dealers. Given the overlap among these sectors, it may be impractical to effectively establish mutually exclusive categories applicable to each sector in the 40+9 Recommendations and the Methodology. Nonetheless, representatives of the securities industry consulted during the development of this report have noted that they do not fully recognised themselves in the term "financial institution", which they tend to associate with the banking sector. In the future, consideration could therefore be given, when practical, to producing securities-specific material or sections in FATF documents (e.g., best practices paper or interpretative notes).

Scope of "financial institution" definition

204. This report refers to a broad range of products and intermediaries that may not be fully captured under the FATF standards. The recent financial crisis has brought the world's attention to certain products and areas where a lack of regulation has been cited as one of the causes of the turmoil. It is suggested that the FATF keep the definition of "financial institution" under review, to ensure that all products and intermediaries are captured.

RBA Guidance

205. Unlike DNFBPs, MSBs and life insurers, the securities sector has not been the object of a risk-based approach (RBA) guidance document by the FATF. Given the particular complexity of securities products, and continuing difficulties for the sector in identifying money laundering, they may be merit for the FATF in producing such guidance.

CDD/reliance

206. There are a number of synergies between the securities industry and other parts of the financial services industry. In particular, this report notes a trend to rely on customer due diligence information

gathered from the banking sector which is then relied upon to fulfilling the CDD/KYC obligations of the securities industry. This is an area which would benefit from further investigation, possibly in the context of more general work being undertaken in relation to FATF Recommendation 9.

Sector/product specific vulnerabilities

207. Whilst foreign exchange trading is an activity covered by the FATF definition of activities conducted by a "financial institution", it remains somewhat unclear what the ML/TF risks are, and there appears to be scope for some cross-over between the securities and banking sectors. Further work to clarify the risks and identify any potential gaps in supervisory responsibility would be beneficial.

208. Similarly, some securities products, most notably those with insurance elements, involve synergies within the insurance industry. It is recommended that further work (possibly work looking at the insurance industry) be undertaken to look at any potential specific risks in this sector.

209. Whilst several ML/TF vulnerabilities associated with derivatives were identified in this report, further work, perhaps involving the private sector, could address this issue in greater depth.

Suspicious transaction reporting

210. The categorisation of suspicious transaction reports by some FIUs means that some STRs relating to the securities industry are being categorised in a way that may not fully capture the full picture of the risks in this area. It is recommended that thought be given to further work to improve the categorisation of STRs, where this is necessary.

ANNEX A:

GLOSSARY OF TERMS[28]

Annuities: Form of contract sold by life insurance companies that guarantees a fixed or variable payment to the annuitant at some future time, usually retirement.

Bearer form: Securities that are not registered with the issuer and payable to the person who is in possession. Bearer bonds have coupon attachments that the holder can present on the interest date for payment. Bearer securities are negotiable without endorsement, can be transferred by delivery and can pay dividends upon presentation of a coupon.

Bearer bonds: Bond issued with detachable coupons that must be presented to a paying agent or the issuer for interest payment.

Bearer securities: Securities that are completely negotiable and entitle the holder to the rights under the security (e.g. to payment if it is a debt security, and voting if it is an equity security). They are transferred by delivering the instrument from person to person. In some cases, transfer is by endorsement, or signing the back of the instrument, and delivery.

Beneficial owner: the natural person(s) who ultimately owns or controls a customer and/or the person on whose behalf a transaction is being conducted. It also incorporates those persons who exercise ultimate effective control over a legal person or arrangement.

Bills of exchange: An unconditional order in writing, addressed by one person (the drawer) to another person (the drawee) and signed by the person giving it, requiring the drawee to pay, on demand or at a fixed or determinable future time, a specified sum or money to, or to the order of a specified person (the payee) or to the bearer.

Boiler rooms: Refers to dishonest broker-dealers who set up a group of high-pressure salespeople who use banks of telephones to make cold calls to as many potential investors as possible. These salespeople urge investors to buy "house stocks"; stocks that the firm buys or sells as a market maker or has in its inventory. Boiler room operators typically sell penny stocks.

Bonds: An IOU issued by a borrower to a lender. Bonds often take the form of fixed interested securities issued by governments, municipalities, or companies. A bond typically obligates the issuer to pay the bondholder a specified sum of money, usually at specific intervals, and to re-pay the principal amount at maturity.

Broker: A person who acts as an intermediary between a buyer and seller of securities, usually for a commission.

[28] To reflect their common usage, the terms in this glossary were derived, in part, from: (1) Barron's Dictionary of Finance and Investment Terms (6th Ed. 2003); (2) Oxford's Dictionary of Finance and Banking (3rd Ed. 2005); and from the FATF Glossary.

Block trade: Refers to a large trade that is usually at least 10,000 shares of a stock or $200,000 of bonds. It can also refer specifically to large trades that occur between institutional parties at a fixed or pre-determined price.

Bulletin boards: Electronic inter-dealer quotation system that displays real-time quotes, last-sale prices, and volume information for many over-the-counter securities that are not listed on a national securities exchange.

Call options: Call options give the buyer the right, but not the obligation, to buy the underlying currency or a security at a particular price by a particular date.

Cashier's cheque: A cheque that draws directly on a customer's account, making the bank the primary obligor. Customers requiring a cashier's check must pay the amount of the cheque to the bank. The bank will then issue a cheque to a third party named by the customer.

Certificates of participation: Certificates showing the level of participation in a business.

Certificate of deposit (CDs): A negotiable certificate that usually pays interests and is issued by a bank in return for a term deposit (ranging from months to years).

Cheques: A bill of exchange, or draft on a bank drawn against deposited funds to pay a specified sum of money to a specified person on demand.

Closed-end companies (Units in Collective Investment Schemes (UCIS)): A fund set up by an investment trust that issues a fixed number of shares to its investors.

Commercial paper: Short-term debt obligations with maturities ranging from 2 to 270 days issued by banks, corporations and other borrowers to investors with temporarily idle cash.

Contracts for difference (CFD): A type of derivative where an agreement is made to exchange the difference in value of a particular security (or other financial instrument) between the time at which a contract is opened and the time at which it is closed. The CFD allows a trader to buy and sell in any market and make profit from rising and falling prices, and to establish a deposit or margin to gain exposure to markets without tying up capital.

Correspondent account: An account whereby one financial institution regularly performs services for another financial institution in markets that may be inaccessible to the latter. Many correspondent relationships involve the wire transfer of money.

Credit-default swaps (CDS): Financial contract whose value is based on underlying debt obligations. A CDS can be tied to the performance of the debt obligations of a single entity or security, or, with more complex CDS, an index of several such entities or securities.

Dealer: A person who acts as a principal in a financial transaction rather than as a broker or agent.

Debenture: General debt obligation backed only by the integrity of the borrower and documented by an agreement called an indenture (e.g. an unsecured bond).

Dematerialisation of securities: The transfer of physical, hard-copy security certificates to book entry credits of a security holder's interest.

Depository institutions: Financial institutions that take deposits and extend loans. This definition includes banks and credit unions.

Derivatives: A financial instrument whose price is related to an underlying commodity, currency, economic variable, financial instrument or security. The different types of derivatives include futures contracts, forwards, swaps, and options. They can be traded on exchanges or over-the-counter (OTC). Market traded derivatives are standard, while OTC trades are specific and customised.

Downbid: Generally refers to a current bid less than a previous bid.

Electronic communications networks (ECN): Electronic trading systems that automatically match buy and sell orders at specified prices. Subscribers, which are typically institutional investors, broker-dealers, and market-makers; they can place trades directly with an ECN.

Equities: Ownership interest possessed by shareholders in a corporation. Often called stocks.

Exchanges: Any organisation, association, or group of persons, whether incorporated or unincorporated, which constitutes, maintains, or provides a market place or facilities for bringing together purchasers and sellers of securities or for otherwise performing with respect to securities the functions commonly performed by a stock exchange as that term is generally understood, and includes the market place and the market facilities maintained by such an exchange.

Foreign exchange contracts: Futures and options contracts based on foreign currencies. The buyer of a currency futures contract acquires the right to buy a particular amount of that currency by a specific date at a fixed rate of exchange and the seller agrees to sell that currency at the same fixed price.

Forward rate agreements: Purchase or sale of a specific quantity of a commodity, government security, foreign currency, or other financial instrument at the current or spot price, with delivery and settlement at a specified future date.

Fraud: Intentional misrepresentation, concealment, or omission of the truth for the purpose of deception or manipulation to the detriment of a person or organisation.

Free look period: A contractual provision that provides the contract owner the right to return the contract within a specified period for a refund.

Futures contract: An agreement to buy or sell a fixed quantity of a particular commodity, currency, or security for delivery at a fixed date in the future at a fixed price. Unlike an option, a futures contract involves a definite purchase or sale and not an option to buy or sell.

Hedge funds: Hedge funds pool investors' money and invest those funds in financial instruments in an effort to make a positive return. Many hedge funds seek to profit in all kinds of markets by pursuing leveraging and other speculative investment practices that may increase the risk of investment loss. Hedge funds typically issue securities in "private offerings" that are usually not required to be registered with a securities or financial regulator.

Insider trading: Buying or selling a security, in breach of a fiduciary duty or other relationship of trust and confidence, while in possession of material, non public information about the security. Insider trading violations may also include "tipping" such information, securities trading by the person "tipped," and securities trading by those who misappropriate such information.

Investment adviser: Any person who, for compensation, engages in the business of advising others, either directly or through publications or writings, as to the value of securities or as to the advisability of investing in, purchasing, or selling securities, or who, for compensation and as part of a regular business, issues or promulgates analyses or reports concerning securities.

Investment trusts: Refers to firms that, for a management fee, invest the pooled funds of small investors in securities appropriate for its stated investment objectives. See also **Unit Trusts**.

Journaling: A book entry system where assets are debited from one account and credited to another.

Margin: Arrangement whereby an investor pays for part of a securities purchase and borrow the rest from a securities intermediary. For example, an investor may buy $5,000 worth of stock in a margin account by paying for $2,500 and borrowing $2,500 from the securities intermediary.

Money manager: See **Portfolio manager**.

Market manipulation: A deliberate attempt to interfere with the free and fair operation of the market and create artificial, false or misleading appearances with respect to the price of, or market for, a security, commodity or currency.

Money orders: A financial instrument that can be easily converted into cash by the payee named on the money order. The money order lists both the payee and the person who bought the instrument, known as the payor. Money orders are issued by a variety of entities to people presenting cash or other forms of payment.

Mortgage bonds: Bond issue secured by a mortgage on the issuer's property, such as the lien on which is conveyed to the bondholders by a deed of trust.

Mutual funds (Open-end investment company): See definition of **unit investment trust.**

Nominee accounts: An account under which a person, a nominee named by another, acts on his or her behalf often to conceal the identity of the nominator.

Nostro: Account established by a domestic banking institution to receive deposits from, make payments on behalf of, or handle other financial transactions for a foreign financial institution, usually in the foreign financial institution's currency. See also **correspondent account**.

Note: A written promise to pay a specified amount to a certain entity on demand or on a specified date.

Omnibus accounts: Account opened in the name of one financial institution at another financial institution comprised of multiple individual accounts whose names are not disclosed to the former.

Options: The right to buy or sell a fixed quantity of a commodity, currency, or security at a particular date at a particular price (the exercise price). Unlike futures, the purchaser of an option is not obligated to buy or sell at the exercise price. If the option lapses, the purchaser only loses the initial purchase price of the option.

Over-the-counter (OTC) markets: A market in which securities are bought and sold outside of established securities markets.

Penny stocks: Securities with very low market price, volume and/or liquidity that are traded on a securities exchange or on the OTC markets. These shares are usually issued by companies with a short or erratic history of revenues and earnings, and therefore such stocks are more volatile than those of well established companies trading on major securities exchanges.

Pink sheets: an electronic quotation system that displays quotes of many securities traded over the counter.

Politically exposed person (PEP): Individuals who are or have been entrusted with prominent public functions in a foreign country, for example Heads of State or of government, senior politicians, senior government, judicial or military officials, senior executives of state owned corporations, and important political party officials. Business relationships with family members or close associates of PEPs involve reputational risks similar to those with PEPs themselves. The definition is not intended to cover middle ranking or more junior individuals in the foregoing categories.

Ponzi scheme: A type of fraud names after Charles Ponzi, who operated such a scheme in the U.S. in the 1920s. Under the scheme, investors are offered unsustainably high rates of interest and are initially paid their interest from a fund consisting of new deposits. When the deposits dry up, the scheme collapses. Also referred to as **pyramid schemes**.

Portfolio manager: A professional responsible for the securities portfolio of an individual or institutional investor. In return for a fee, the manager has the responsibility of choosing and managing assets.

Pump-and-dump: "Pump and dump" schemes, also known as "hype and dump manipulation," involve the touting of a company's stock (typically **penny stocks**) through false and misleading statements to the marketplace. After pumping the stock, fraudsters profit by selling their cheap stock into the market.

Put options: Put options give the buyer the right to sell underlying currencies or securities at a specific price and date.

Reverse merger: A method through which a private company can go public without an initial public offering (IPO). This occurs when a private company acquires or merges with a public shell company that is listed on a stock exchange or traded on the OTC markets.

Shell bank: a bank incorporated in a jurisdiction in which it has no physical presence and which is unaffiliated with a regulated financial group.

Shell companies: Company that often has no physical presence and generates little or no independent economic value. These companies are commonly organised in a way that makes ownership and transactions information of the company easier to conceal, particularly when the shell company is private.

Short sale: Generally, the sale of a stock that an investor does not own. Investors who sell short believe the price of the stock will fall. If the price drops, the investor can buy the stock at the lower price and make a profit. If the price of the stock rises and the investor buys it back later at the higher price, he or she will incur a loss. When an investor sells short, a securities intermediary loans the investor the stock. The stock the investor borrows comes from either the intermediary's own inventory, the margin account of another of the intermediary's clients, or another securities intermediary.

Subscription rights: A privilege granted to existing shareholders of a corporation to subscribe to shares of a new issue of common stock before it is offered to the public; better known simply as a right. Such a right normally lasts two or three weeks, are freely transferable and entitles the holder to buy the new public stock below the public offering price.

Transfer agents: Companies that have publicly traded securities typically use transfer agents to keep track of the individuals and entities that own their stocks and bonds. Many transfer agents are banks or trust companies, but sometimes a company acts as its own transfer agent. Transfer agents perform three main functions: issue and cancel certificates to reflect changes in ownership; act as an intermediary for the company; and handle lost, destroyed, or stolen certificates.

Traveller's cheques: A preprinted, fixed-amount cheque designed to allow the person signing it to make an unconditional payment to someone else as a result of having paid the issuer for that privilege.

Trust accounts: An arrangement enabling property to be held by a person or persons (the trustees) for the benefit of some other person or persons (the beneficiaries). The trustee is the legal owner of the property but the beneficiary has an equitable interest in it.

Underwriting: The process of agreeing to purchase a new issue of securities from an issuer and distribute it to investors. The underwriter makes a profit between the price paid to the issuer and the public offering price.

Unit investment trusts or unit trusts: An investment trust formed to manage a portfolio, in which investors can buy units. Open-end investment companies are often organised as unit investment trusts.

Variable annuity: A contract issued by an insurance company under which an investor provides the insurer with a lump-sum payment or series of payments. In return, the insurer agrees to make periodic payments to the investor beginning immediately or at some future date. The investor is usually permitted to invest the purchase payments in a range of investment options. The value of the account in a variable annuity will vary depending on the performance of the investment options that have been chosen.

Warrants: A security that offers the owner the rights to subscribe for ordinary shares of a company at a fixed date, usually at a fixed price. Warrants can themselves be bought and sold on stock exchanges and are equivalent to stock options.

Wealth managers: See **Investment adviser** and **Portfolio manager**.

ANNEX B:

SUSPICIOUS INDICATORS

Introduction

211. This annex is divided into two sections. Section I lists suspicious indicators that have been identified in the questionnaire responses as indicating possible ML/TF in the securities industry. Section II lists suspicious indicators and red flags that are pertinent for evaluating whether a customer may be engaged in activities that would come under the FATF's list of "designated categories of offences" that are: (i) predicate offences to money laundering and (ii) offences that are unique to the securities industry, namely insider trading, market manipulation, and other forms of securities fraud.

1. The suspicious indicators listed in these two sections are being provided here to give law enforcement, regulators and the private sector an overview of the types of activities that can be suspicious. We caution however, that this list is non-exhaustive and that some of these ML/TF suspicious indicators and red flags may be not be applicable in all jurisdictions. Furthermore, some of the suspicious indicators and red flags with respect to the designated offences may be more useful for banks in identifying securities specific illicit activities that may not necessarily require the use of a securities intermediary or markets per se (i.e. securities offering fraud).

2. We also note that the occurrence of one or more of these indicators/red flags may be a warning sign of unusual activity that may be indicative of ML/TF and/or the occurrence of a securities specific designated offence. However, this does not necessarily mean that money laundering, terrorist financing or any other illicit activity is occurring. Further investigation should be conducted if any of these indicators/red flags are present during the course of a transaction or customer interaction.

Section I:
Suspicious Indicators for Money Laundering and Terrorist Financing in the Securities Industry

Customer Due Diligence

- The customer provides the securities firm with unusual or suspicious identification documents that cannot be readily verified or are inconsistent with other statements or documents that the customer has provided. This indicator may apply to account openings and to interaction subsequent to account opening, such as wire transfers.

- During the account opening process, the customer refuses to provide information to complete CDD/KYC (e.g. occupation, prior financial relationships, etc.).

- The customer, whether a person or entity, is reluctant to provide the securities firm with complete information about the nature and purpose of the customer's business, prior financial relationships, anticipated account activity, the entity's officers and directors or business location.

- The customer, whether a person or entity, is located in a jurisdiction that is known as a bank secrecy haven, a tax shelter, or high-risk geographic locations (e.g. narcotics producing jurisdiction).

- The customer is reluctant to meet personnel from the securities firm in person, is very secretive and/or evasive or becomes defensive when asked to provide more information.

- The customer refuses to identify a legitimate source for funds or provides the securities firm with information that is false, misleading, or substantially incorrect.

- The customer engages in frequent transactions with money services businesses.

- The customer's background, whether a person or entity, is questionable or does not meet expectations based on business activities.

- The customer has no discernable reason for using the firm's service or the firm's location (e.g. customer lacks roots to the local community or has come out of his or her way to use the firm).

- The customer refuses to provide information regarding the beneficial owners of an account opened for an entity, or provides information that is false, misleading or substantially incorrect.

- The customer's address is associated with multiple other accounts that do not appear to be related.

- The customer has a history of changing financial advisors and/or using multiple firms or banks. This indicator is heightened when the customer uses firms located in numerous jurisdictions.

- The customer is known to be experiencing extreme financial difficulties.

- The customer is, or is associated with, a PEP or senior political figure.

- The customer refuses to invest in more appropriate securities when those securities would require a more enhanced CDD/KYC procedure.

- The customer with a significant history with the securities firm abruptly liquidates all of his or her assets in order to remove wealth from the jurisdiction.

- The customer appears to be acting as a fiduciary for someone else but is reluctant to provide more information regarding for whom he or she may be acting.

- The customer is publicly known to have criminal, civil or regulatory proceedings against him or her for crime, corruption or misuse of public funds or is known to associate with such persons. Sources for this information include news items or Internet searches.

- The customer inquires as to how quickly he or she can liquidate accounts or earnings without explaining why or provides suspicious reasons for doing so.

- The customer opens an account or purchases a product without any regard to loss, commissions or other costs associated with that account or product.

- The customer has commercial or other types of relationships with risky persons or institutions.

- The customer acts through intermediaries, such as money managers or advisers, in order not to have his or her identity registered.

- The customer exhibits unusual concern with the securities firm's compliance with government reporting requirements and/or the firm's AML/CFT policies.

- The customer is reluctant to provide the securities firm with information needed to file reports or fails to proceed with a transaction once asked for documentation or learns of any recordkeeping requirements.

- The customer is interested in paying higher charges to the securities firm in order to keep some of his or her information secret.

- The customer tries to persuade an employee of the securities firm not to file a required report or not to maintain required records.

- The customer funds deposits, withdraws or purchases financial or monetary instruments below a threshold amount in order to avoid any reporting or recordkeeping requirements imposed by the jurisdiction.

- The customer requests that account openings and closings in his or her name or in the name of family members be done without producing a paper trail.

- Law enforcement has issued subpoenas regarding a customer and/or account at the securities firm.

Fund Transfers and/or Deposits

- Wire transfers are sent to, or originate from, financial secrecy havens, tax shelters or high-risk geographic locations (e.g. jurisdictions known to produce narcotics/psychotropic drugs or to be related to terrorism) without an apparent business reason or connection to a securities transaction.

- Wire transfers or payments to or from unrelated third parties (foreign or domestic) or where the name or account number of the beneficiary or remitter has not been supplied.

- Many small, incoming wire transfers or deposits are made, either by the customer or third parties, using cheques, money orders or cash that are almost immediately withdrawn or wired out in a manner inconsistent with customer's business or history.

- Incoming payments made by third-party cheques or cheques with multiple endorsements.

- Deposit of large amount of small-denomination currency to fund account or exchanges of small notes for bigger notes.

- Wire transfer activity that is unexplained, repetitive, unusually large or shows unusual patterns or with no apparent business purpose.

- The securities account is used for payments or outgoing wire transfers with little or no securities activities (e.g. account appears to be used as a depository account or a conduit for transfers).

- The controlling owner or officer of a public company transfers funds into his personal account or into the account of a private company that he or she owns or that is listed as an authorised signatory.

- Quick withdrawal of funds after a very short period in the account.

- Transfer of funds to financial or banking institutions other than those from where the funds were initially directed, specifically when different countries are involved.

- Transfers/journals between different accounts owned by the customer with no apparent business purpose.

- Customer requests that certain payments be routed through nostro or correspondent accounts held by the financial intermediary or sundry accounts instead of its own account.

Bearer Securities

- The customer requests cashing bearer securities without first depositing them into an account or frequently deposits bearer securities into an account.

- The customer's explanation regarding the method of acquiring the bearer securities does not make sense or changes.

- The customer deposits bearer securities together with a request to journal the shares into multiple accounts that do not appear to be related, or to sell or otherwise transfer ownership of the shares.

Unusual Securities Transactions and Account Activity

- Transaction where one party purchases securities at a high price and then sells them at a considerable loss to another party. This may be indicative of transferring value from one party to another.

- A customer's transactions include a pattern of sustained losses. This may be indicative of transferring value from one party to another.

- The purchase and sale of non-listed securities with a large price differential within a short period of time. This may be indicative of transferring value from one party to another.

- Payments effected by administrators and asset managers in cash, bearer cheques or other transferable instruments without indentifying who they are for or providing very little information regarding the underlying account holder or beneficiary.

- A company uses cash to pay dividends to investors.

- Use of shell companies to purchase public company shares, in particular if the public company is involved in a cash intensive business.

- Transfer of assets without a corresponding movement of funds, such as through journaling or effecting a change in beneficial ownership.

- A dormant account that suddenly becomes active without a plausible explanation (e.g. large cash deposits that are suddenly wired out).

- A customer's transactions have no apparent economic purpose.

- A customer who is unfamiliar with a financial product's performance and specifications but wants to invest in it nonetheless.
- Transactions that show the customer is acting on behalf of third parties.
- The purchase of long term investments followed by a liquidation of the accounts shortly thereafter, regardless of fees or penalties.
- Transactions involving an unknown counterparty.
- Large sum cash purchases of financial instruments and mutual funds holdings followed by instant redemption.

Insurance Products (applicable to jurisdictions where some insurance products can be considered securities)

- The customer cancels an insurance contract and directs that the funds be sent to a third party.
- The customer deposits an insurance annuity check from a cancelled policy and immediately requests a withdrawal or transfer of the funds.
- The customer cancels an annuity product within the free-look period. Although this could be legitimate, it could also signal a method of laundering funds if accompanied with other suspicious indicators, such as purchasing the annuity with several sequentially numbered money orders and/or having a history of cancelling annuity products during the free look period.
- The customer opens and closes accounts with an insurance company only to reopen a new account shortly thereafter with the same insurance company, but with new ownership information.
- The customer purchases an insurance product with no concern for investment objective or performance.
- The customer purchases an insurance product with unknown or unverifiable sources of funds, such as cash, official cheques or sequentially numbered money orders.
- Securing a policy loan against the cash value soon after the policy is issued and repaying the loan with various monetary instruments or cash.

Activity that is Inconsistent with the Customer's Business Objective or Profile

- The customer's transaction patterns suddenly change in a manner that is inconsistent with the customer's normal activities or inconsistent with the customer's profile.
- There are unusual transfers of funds or journaling (i.e. book entries) among accounts without any apparent business purpose or among apparently unrelated accounts.
- The customer maintains multiple accounts, or maintains accounts in the names of family members or corporate entities with no apparent business or other purpose.
- The customer's account is not used for its intended purpose (i.e. used as a depository account).

- The customer enters into a financial commitment that appears beyond his or her means.
- The customer begins to use cash extensively.
- The customer engaged in extremely complex transactions where his or her profile would indicate otherwise.
- Customer's credit usage is in extreme amounts that do not correspond to his or her financial status or collateral, which is provided by an unrelated third-party.
- The time zone in customer's location is not consistent with the times that the trades were executed, with no apparent business or other purpose, or there is a sudden change inconsistent with the customer's typical business activity.
- A foreign based customer that uses domestic accounts to trade on foreign exchanges.
- The customer exhibits a lack of concern about higher than normal transaction costs.

Rogue Employees

- The employee appears to be enjoying a lavish lifestyle that inconsistent with his or her salary or position.
- The employee is reluctant to take annual leave.
- The employee is subject to intense job-related demands, such as sales or production goals that may make him more willing to engage in or overlook behaviour that poses ML/TF risks.
- The employee inputs a high level of activity into one customer account even though the customer's account is relatively unimportant to the organisation.
- The employee is known to be experiencing a difficult personal situation, financial or other.
- The employee has the authority to arrange and process customer affairs without supervision or involvement of colleagues.
- The management/reporting structure of the financial institution allow an employee to have a large amount of autonomy without direct control over his activities.
- The employee is located in a different country to his direct line of management, and supervision is only carried out remotely.
- A management culture within the financial institution focuses on financial reward over compliance with regulatory requirements.
- The employee's supporting documentation for customers' accounts or orders is incomplete or missing.
- Business is experiencing a period of high staff turnover or is going through significant structural changes.

Section II:
Suspicious Indicators for Predicate Offences To Money Laundering Linked to Securities

Insider Trading

- The customer makes a large purchase or sale of a security, or option on a security, shortly before news is issued that affects the price of the security.
- The customer is known to have friends or family who work for the securities issuer.
- A customer's trading patterns suggest that he or she may have inside information.

Market Manipulation, including Penny Stocks

- A customer engages in prearranged or other non-competitive securities trading, including wash or cross trades of illiquid or low priced securities.
- Securities or funds transfers between parties without an apparent relationship.
- Securities transactions occur across many jurisdictions, and in particular high risk jurisdictions.
- Two or more unrelated accounts at the securities firm trade an illiquid or low priced security suddenly and simultaneously.
- A customer journals securities between unrelated accounts for no apparent business reason.
- A customer has opened multiple accounts with the same beneficial owners or controlling parties for no apparent business reason.
- Transactions between the same or related parties structured solely so that one side incurs a loss while the other incurs a gain.
- Transaction where one party purchases securities at a high price and then sells them at a considerable loss to another party.
- The customer deposits a large number of physical securities at the securities firm.
- The physical securities are titled differently to the name on the account.
- The physical security does not bear a restrictive legend even though the history of the stock and/or the volume of shares being traded suggest that it should have such a legend.
- The customer's explanation regarding the method of acquiring the physical securities does not make sense or changes.
- The customer deposits physical securities together with a request to journal the shares into multiple accounts that do not appear to be related, or to sell or otherwise transfer ownership of the shares.
- Large or repeated trading in securities that are illiquid, low priced or difficult to price.

- The company at issue has no apparent business, revenues or products.
- The company at issue has experienced frequent or continuous changes in its business structure and/or undergoes frequent material changes in business strategy or its line of business.
- The officers or insiders of the company at issue are associated with other low priced, illiquid or low volume companies.
- The officers or insiders of the low priced, illiquid or low volume company have a history of regulatory violations.
- The low priced, illiquid or low volume company at issue has failed to make required regulatory disclosures.
- The low priced, illiquid or low volume company at issue has been the subject of a prior trading suspension.
- A customer's transactions include a pattern of receiving physical securities or receiving incoming shares transfers that are sold with the proceeds wire transferred out of the account.
- The purchase and sale of non-listed securities with a large price differential within a short period of time.

Securities Offering Fraud

- The customer opens numerous accounts for different legal entities that the customer controls.
- The customer receives many incoming cheques or wire transfers from unrelated third parties.
- The customer allocates incoming third party deposits among numerous accounts.
- The customer makes numerous outgoing payments to third parties close in time to when the customer receives many incoming third party cheques or wire transfers.
- The customer's profile does not suggest a legitimate business reason for receiving many third party deposits.
- The cheques or wire transfers note that the funds are for an investment.

[29] Two jurisdictions provided figures that appear large with respect to their securities markets. Jurisdiction one indicated that 303,054 STRs were filed between 2005 and 2008. In particular, jurisdiction one indicated that 70,405 STRs were filed in 2005, 78,705 in 2006, 86,607 in 2007 and 67,337 in 2008. It is unclear whether this figure is representative of all STRs filed in the jurisdiction or only those related to securities. Jurisdiction two indicated that 34,700 STRs were filed in 2007, but did not provide yearly figures or specify whether figures were inclusive of all STRs filed. Because of this ambiguity, Table 2 adjusts the securities related STRs figures by deducting the figures provided by jurisdictions one and two. Inclusion of these figures would bring the total numbers of securities related to 81,257 for 2005, 91,946 for 2006, 141,657 for 2007, 80,964 for 2008 for a total of 395,824 securities related STRs filed for that period.

Table 3: STR Breakdown by type of institution

Type of Institution	2005	2006	2007	2008 (to extent available)	Total
Securities Broker or Dealer[30]	8 284	8 486	13 224	7 765	**37 759**
Commodities Futures Merchant, Broker, Dealer, Pool Operator[31]	196	258	446	206	**1 106**
Fund Manager	54	15	892	351	**1 312**
Bank or Affiliate[32]	947	1 395	1 231	1 044	**4 617**
Financial Adviser	262	698	1 299	918	**3 177**

Other, Foreign FIU, Self-Regulatory Organisation[34]	1 170	1 933	3 550	1 973	**8 626**

30 This figure includes market makers, municipal or local government securities dealers, introducing and clearing brokers, securities dealers, securities floor traders, securities options brokers and dealers, specialists, and federal or national government broker-dealers.

31 This figure includes agricultural trade option merchants, commodity pool operators, commodity trading advisors, futures commission's merchants, and futures floor brokers and dealers.

32 This figure includes banks, bank holding companies and bank subsidiaries.

33 This figure includes mutual funds.

34 This figure includes STRs filed by direct participation programs, FIUs and self-regulatory organisations, and those did not indicate what type of institution was filing, if any.

ANNEX D: QUESTIONNAIRE AND RESPONDING JURISDICTIONS AND ORGANISATIONS

The following jurisdictions submitted a response to the questionnaire that is re-produced below.

Andorra	Argentina	Australia	Austria
Belgium	Brazil	British Virgin Islands	Canada
Cayman Islands	China	Denmark	European Commission
France	Hong Kong	Israel	Japan
Jordan	Lithuania	Luxembourg	Malta
Mauritius	Mexico	Moldova	Monaco
Norway	Panama	Poland	Portugal
Qatar	Romania	Singapore	Slovakia
Spain	Sweden	Switzerland	The Netherlands
Turkey	Ukraine	United Kingdom	United States

2008 FATF Securities Typology Questionnaire

I. BACKGROUND

1. The objectives of the FATF Securities Typology Questionnaire are to collect information about: (i) the range of products classified as "securities" in various jurisdictions; (ii) how jurisdictions supervise compliance with anti-money laundering/combating terrorist financing ("AML/CTF") requirements for these products; (iii) potential areas of AML/CTF vulnerabilities in the securities industry; (iv) suspicious transaction reports (STRs) in the securities industry; and (v) enforcement actions in the securities industry.

2. The results of this survey will be used to develop a securities typology report to provide insight into the how money laundering and terrorist financing ("ML/TF") may operate in the securities industry. The securities typology project team will use the responses along with information from other sources to prepare the securities typologies report.

II. INSTRUCTIONS FOR COMPLETING THE SURVEY

3. All FATF members and FSRBs are invited to submit completed questionnaires to support the securities typologies report initiative. Contributions should be submitted to the FATF Secretariat (secretariat@fatf-gafi.org) **by 19 December 2008**. All questionnaire participants are encouraged to seek input from private sector representatives operating within their respective jurisdictions, as appropriate, in developing responses to the questions contained in this questionnaire. Responses should be complete yet concise and clearly address the questions asked. Any additional information which may be relevant for the securities typologies report may be submitted along with the questionnaire response. The typology is looking at the use of the securities industry/securities products for money laundering and terrorist financing, and questionnaire responses should concentrate on this, rather than examining the predicate offence (e.g. fraud).

1. Jurisdiction/Organisation

Name of Jurisdiction or Organisation completing questionnaire

2. Contact details

Contact details for any queries arising from this response

3. Range of products classified as "securities"

Using the definition of "financial institution" in the FATF glossary as a point of reference, please use the following chart to identify: (1) products that are traded as "securities" in your country; (2) the type of financial institutions involved in selling, recommending or distributing securities (e.g. broker-dealers, banks, etc.); and (3) the supervisory authority(ies) responsible for AML/CFT supervision of that product/financial institution.

Product	**FATF definition of activity (see Glossary - below)**	**Is this treated as a security in your jurisdiction? (YES or NO)**	**If product is a security, type(s) of institutions involved in sale, advice, or distribution** (e.g. broker-dealer/fund manager/bank)	**Name of supervisory authority(ies) responsible for regulating AML/CFT compliance of applicable institution**
1. Transferable Securities				
Equities	7(a), 9, 10, 11			
Bonds and similar debt instruments	7(a), 9, 10, 11			
Certificates of deposit	7(a), 9, 10, 11			
Bills of exchange	7(a), 9, 10, 11			
Other (please specify)				
2. Units in collective investment schemes				
Unit trusts	7(d), 9, 10, 11			
Investment trusts	7(d), 9, 10, 11			
Mutual funds	7(d), 9, 10, 11			
OEICs (open-ended investment companies)	7(d), 9, 10, 11			
SICAV/Fs (an open-ended collective	7(d), 9, 10, 11			

investment scheme)				
Closed-end company	7(d), 9, 10, 11			
3. Derivatives				
Options	7(a), 7(b), 7(c), 7(e), 9, 10, 11.			
Future	7(a), 7(b), 7(c), 7(e), 9, 10, 11.			
Swaps	7(a), 7(b), 7(c), 7(e), 9, 10, 11.			
Forward rate agreements	7(a), 7(b), 7(c), 7(e), 9, 10, 11.			
Commodity derivatives contracts	7(a), 7(e), 9, 10, 11.			
Foreign exchange contracts	7(a), 7(b), 7(c), 9, 10, 11.			
Other				
4. Other				
Please detail any other product which is classified as a "security" in your jurisdiction (e.g., insurance products such as variable annuities).				

4. AML/CTF vulnerabilities in the securities industry

4.1 Please describe the types of transactions, products and/or activities in the securities industry that are considered to present high risk factors for ML/TF, if any.

4.1.2. Are any of the above designated as high risk by law/regulation/other measures in the jurisdiction?

4.2 Please describe the payment methods in the jurisdiction (e.g., cash, wire transfer, cheque, online systems, mobile phone systems, etc.) associated with higher risks for ML/TF, if any.

4.3 Please describe the delivery methods used in the jurisdiction (e.g. physical securities, book-entry, etc.) associated with higher risks for ML/TF, if any.

4.4 Please provide examples of any specific suspicious transaction triggers/indicators/red flags for the securities industry.

5. Typologies/methods/trends

Please attach or provide hyperlinks to any ML/TF typologies for the securities industry developed within your jurisdiction (such as documents that detail high risk securities products or method of distribution, as well as what caused initial suspicions in the securities industry, how assets were traced, and the outcome of investigations/prosecutions). Where relevant, please indicate at which stage of the transaction(s) you consider that money laundering/terrorist financing took place.

6. Enforcement actions for violations of AML/CFT requirements

6.1 How many criminal/regulatory enforcement actions concerning AML/CFT requirements applicable to the securities firms have been brought in the past 3 years?

Year	Number – regulatory only	Number – criminal only	Number – joint regulatory/criminal
2005			
2006			
2007			
2008 (if available)			

6.2 Do any of these enforcement actions reveal areas of high risk or vulnerability in the securities industry? If so, provide brief summaries of key enforcement actions.

7. Suspicious transaction reports

7.1 How many STRs relating to securities transactions has the FIU received in the past 3 years?

Year	Number
2005	
2006	
2007	
2008 (if available)	

7.2 Please specify the number of STRs filed in the past 3 years relating to securities transactions for each type of securities activity/product and/or relating to the each type of filing institution (if this information is maintained by the FIU).

For example, possible types of products and institutions are given below.

Type of securities activity/product	2005	2006	2007	2008 (if available)
A. Transferable Securities				
Equities				
Bonds and similar debt instruments				
Certificates of deposit				
Bills of exchange				
Other (please specify)				
Other (please specify)				
B. Units in collective investment schemes				
Unit trusts				
Investment trusts				
Mutual funds				
OEICs				
SICAV/Fs				
Other (please specify)				
Other (please specify)				
C. Derivatives				
Options				
Futures				
Swaps				
Forward rate agreements				
Commodity derivatives contracts				
Foreign exchange contracts				
Other (please specify)				
Other (please specify)				
D. Other				

Please detail any other product which is classified as a "security" in your jurisdiction.				

Type of filing institution	2005	2006	2007	2008 (if available)
Broker/dealer				
Fund manager				
Bank				
Financial advisor				
Collective Investment Scheme provider				
Other (please specify)				

7.3 Do any of these STRs reveal areas of high risk or vulnerability in the securities industry? If so, please discuss any tends or areas of risk/vulnerabilities demonstrated by STRs.

7.4 Based on STRs related to the securities industry or as a result of other information concerning the securities industry: how many referrals has the FIU made to law enforcement, how many ML/TF prosecutions have been commenced, and how many convictions have resulted?

Year	Number of Referrals	Number of Prosecutions	Number of Convictions
2005			
2006			
2007			
2008 (if available)			

8. Other proceedings

Please give details of any ancillary proceedings/tracing/freezing of assets/regulatory proceedings/criminal proceedings that revealed the use of securities.

FATF, *Guidance for a Risk-Based Approach: Effective Supervision and Enforcement by AML/CFT Supervisors of the Financial Sector and Law Enforcement* (Paris: FATF, 2015)

GUIDANCE FOR A RISK-BASED APPROACH

EFFECTIVE SUPERVISION AND ENFORCEMENT BY AML/CFT SUPERVISORS OF THE FINANCIAL SECTOR AND LAW ENFORCEMENT

OCTOBER 2015

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

I. OBJECTIVES AND SCOPE

1. The objective of this non-binding guidance paper is to describe the features of an effective supervisory system, with an aim to enhance countries'[1] understanding of the relevant FATF requirements by describing good practices and providing illustrative case examples. Effective supervision and enforcement is an important component of an effective anti-money laundering and countering financing of terrorism (AML/CFT) regime. For the purposes of this paper, an effective supervisory and enforcement system comprises a wide range of financial supervisory measures that include preventive measures and related sanctions[2] and other remedial actions[3] that AML/CFT supervisors[4] (including regulators) can apply, as well as separate yet complementary measures and actions by law enforcement and/or other relevant competent authorities. The overall effectiveness of a country's AML/CFT regime requires recognition of the important synergies that exist between AML/CFT, prudential and business conduct supervision and between those supervisors and judicial/law enforcement authorities. The recognition of this complementarity, as well as the willingness and ability to promote and encourage its application, can only further improve efforts to prevent and combat money laundering (ML)/terrorist financing (TF) in countries.

2. The practices described in this document are intended to serve as examples of the measures and means that relevant supervisors in countries may use to meet the requirement of the FATF Recommendations regarding a supervisory approach. This guidance does not pre-judge the institutional measures and other means that countries may use to achieve risk-based supervision and enforcement in their country, which vary according to each country's context, such as the size and complexity of the financial services sector and the degree of ML/TF risks (including threats and vulnerabilities) to which it is exposed[5]. As Recommendation 1 recognises that not all financial

---

1 All references in this paper to *country* or *countries* apply equally to territories or jurisdictions.

2 Examples of types of sanctions include: written warnings; orders to comply with specific instructions (possibly accompanied with daily fines for non-compliance); ordering regular reports from the institution on the measures it is taking; fines for non-compliance; barring individuals from employment within that sector; removing, replacing or restricting the powers of managers, directors, and controlling owners; imposing conservatorship or suspension or withdrawal of the license; or criminal penalties where permitted.

3 Examples of remedial actions are corrective actions such as written agreements, board resolutions/letters, supervisory letters,action plans, timelines, reprimands and fines.

4 Throughout this paper, the terms *supervisor* and *AML/CFT supervisor* refer to the designated competent authorities or non-public bodies with responsibilities aimed at ensuring compliance by financial institutions with requirements to combat money laundering and terrorist financing. This includes:

- Core Principles supervisors who carry out supervisory functions that are related to the implementation of the *FATF Recommendations*, and
- non-public bodies, including certain types of *self-regulatory bodies* (as defined in the *Glossary to the FATF Recommendations*) that have the power to supervise and sanction financial institutions in relation to AML/CFT requirements are empowered by law to exercise the functions they perform, and are supervised by a competent authority in relation to such functions.

5 This guidance is not a standard and is therefore not intended to designate specific actions or arrangements necessary to meet obligations under Recommendations 26, 27, 35 and their respective Interpretative Notes, nor does this guidance pre-empt the technical assessment of these Recommendations or the

institutions face the same ML/TF risks, there may be different approaches to supervision for different financial sectors (e.g., money or value transfer services, securities brokers and depository institutions). An actual assessment of effectiveness of the AML/CFT supervisory system in each country is part of the FATF's mutual evaluation process, where assessors evaluate whether the particular measures, controls, and actions taken by each country produce the desired effective outcomes.[6]

3. This guidance paper is intended to address AML/CFT supervision and enforcement of preventive measures for financial institutions[7] as defined by the FATF and should be read in conjunction with the relevant FATF Guidance Papers on the Risk Based Approach (RBA), such as the 2014 *RBA Guidance for the Banking Sector*[8]. Other documents that may assist countries are:

- *Sound Management of Risks Related to Money Laundering and Financing of Terrorism* (Basel Committee, January 2014);
- *Core Principles for Effective Banking Supervision* (Basel Committee, September 2012)
- *Core Principles of Securities Regulation* (IOSCO, 2015a)
- Guidance on *Credible Deterrence in the Enforcement of Securities Regulation* (IOSCO, 2015b); and
- *Insurance Core Principles* (IAIS, nd)

4. **Section II** sets out some examples of supervisory models, **Section III** sets out the features of an effective supervisory system, and **Section IV** sets out complementary processes and actions available to law enforcement. **Section V** shows a graphic representation of effective supervision and enforcement.

5. For the purpose of this guidance paper, the terms *Core Principles*, *financial group*, *financial institutions*, *money or value transfer service* (MVTS), and *targeted financial sanctions* have the same meaning as set out in the General Glossary to the FATF Recommendations.

assessment of Immediate Outcome 3. Criteria for assessing technical compliance and effectiveness can be found in the FATF Methodology.

6 Throughout this paper, use of the term *should* is not meant to infer that measures or actions described in this paper are the only way to achieve effective supervision and enforcement.

7 This paper does not address the supervision and monitoring of designated non-financial businesses and professions (DNFBP).

8 *RBA Guidance for the Banking Sector* (FATF, 2014). The FATF will also issue the *RBA Guidance for Money or Value Transfer Services (MVTS)* towards 2016 which updates the 2009 *RBA Guidance for Money Service Businesses (MSBs)*.

II. FINANCIAL SUPERVISION MODELS

6. There are many different supervisory approaches and while the FATF does not prescribe a particular supervisory model, whichever supervisory system is chosen, it should effectively address and mitigate the money laundering and terrorist financing risks in the financial sector. The basic requirements that countries should comply with are in

- Recommendation 1 (assessing risks and applying risk-based approach),
- Recommendations 26 (regulation and supervision of financial institutions),
- Recommendation 27 (powers of supervisors),
- Recommendation 34 (guidance and feedback),
- Recommendation 35 (sanctions), and
- Recommendation 40 (other forms of international cooperation), as well as
- Recommendation 2 (National cooperation and coordination).

7. Whatever the approach countries take to financial supervision, they should strive to have effective communication and coordination between AML/CFT supervisors and other supervisory agencies, central banks, finance ministries and any other relevant authorities. AML/CFT supervision can form part of the broader supervision (e.g., safety and soundness or business conduct), or it can be entirely separate. However, AML/CFT supervision must be included in whichever model a country chooses and cannot be undervalued.

8. The AML/CFT supervisory model is a national decision that should be adopted taking into consideration the structure and risk of the financial sector in each country. The FATF acknowledges that different institutional arrangements are capable of meeting the FATF Standards. The arrangements in place should meet the technical requirements noted in Paragraph 6, and be capable of being effectively implemented. Box 1 below sets out the principal models used by many countries, but is not an exhaustive set of options.

9. The integration of AML/CFT supervision into the broader framework of prudential and/or business conduct supervision can leverage synergies, expertise, and resources to enhance the effectiveness of both overall supervision of financial institutions and AML/CFT supervision. Likewise, the integration of AML/CFT supervision with the financial intelligence functions may provide strong synergies, allowing a more targeted supervision based on identified ML/TF risks.

10. The role of supervision in the AML/CFT framework is to supervise and monitor financial institutions to ensure their effective assessment and management of ML/TF risk and compliance with AML/CFT preventive measures. Sometimes these measures need to be prescriptive, for example, for foreign politically exposed persons, while at other times they need to be risk-based, for example, customer due diligence measures on other types of customers. AML/CFT supervisors assess institution's policies, procedures and controls for identifying and managing ML/TF risk, and take remedial action where appropriate. It is not a "tick the box" approach; it requires judgement in

understanding the characteristics and situation of every financial institution. In the event that weaknesses in risk management programmes or breaches of laws or regulations are identified, AML/CFT supervisors should apply a proportionate range of remedial actions to address the identified weaknesses including appropriate sanctions that may include financial penalties for more severe breaches of AML/CFT legal or regulatory requirements.

11. Additionally, the mutual evaluations conducted by the FATF from 2014 to date suggest that supervisors need to pay more attention to the implementation of targeted financial sanctions (TFS), as outlined in Recommendations 6 and 7, in the financial sector. Generally, supervisors paid a low level of attention to compliance with TFS. The FATF Standards require that supervision be applied to TFS implementation but leave it to countries to determine how to implement the requirement. A range of options is available, depending on the national institutional arrangements: for example, responsibility could be assigned to sector financial regulators, the AML/CFT supervisor or enforcement unit or law enforcement. Countries that assign TFS to their external affairs or finance ministries could assign enforcement to such agencies.

Box 1. **Examples of financial supervision models**

Integrated Approach	Single universal supervisor performs both safety and soundness supervision function and conduct-of-business regulation for all the sectors of financial services business.
Twin Peaks Approach	Separation of regulatory functions between two or more supervisors: for example, one that performs the safety and soundness supervision function and the other that focuses on conduct-of-business regulation.
Functional Approach	Supervisory oversight is determined by the business that is being transacted by the financial institution, without regard to legal status. Each type of business may have its own functional supervisor.
Institutional Approach	Financial institution's legal status determines which supervisor is tasked with overseeing its activity.

Source: *Adapted from* The Structure of Financial Supervision: Approaches and Challenges in a Global Marketplace *(Group of Thirty, 2008)*

12. For example, when AML/CFT supervision is an integrated part of the broader supervisory process, AML/CFT supervisors may have broader and more direct access to relevant information on each financial institution (such as on quality of the management, quality of the internal control systems, quality of the risk management systems, level of the compliance culture, etc.), which may allow for an advantage of resource, expertise and cost efficiencies in conducting their AML/CFT supervision. Under the scope of an integrated approach, it is also possible to have a separate team/unit within the single supervisory agency that specializes on the AML/CFT supervision. Such an approach may facilitate ongoing interaction between the prudential and AML/CFT supervision while allowing better specialization and capacity building in AML/CFT supervision.

13. Where AML/CFT supervisors are not the competent authority for prudential or business conduct supervision, countries remain responsible for ensuring that AML/CFT supervision meeting

the Core Principles standards set out in Recommendation 26 is applied effectively. Cooperation between the AML/CFT supervisor and the prudential supervisors[9] can be an effective way of applying Core Principles supervision in the AML/CFT space, avoiding the necessity for the AML/CFT supervisor to duplicate work already being done in the prudential sector.

14. Equally, prudential supervisors who are not the designated competent authority for AML/CFT supervision should be aware of the consequences and implications of their supervised institutions' failures to adequately identify and manage ML/TF risks. Conversely, AML/CFT supervisors should understand how AML/CFT deficiencies may impact prudential supervision (e.g., impact on safety and soundness). This is particularly important in cases involving global, systemically important financial institutions where prudential supervisors can advise on any unintended consequences on confidence in, and the stability of, the institution and global financial system.

[9] Throughout this paper, the terms *prudential supervisor* refers to Core Principles supervisors who may or may not have responsibilities for carrying out supervisory functions that are related to the implementation of the FATF Recommendations and requirements to combat money laundering and terrorist financing.

III. BASIS OF AN EFFECTIVE SUPERVISORY SYSTEM

15. The effectiveness of a country's supervisory regime is based on a number of factors, as set out in the Immediate Outcome 3 of the FATF Methodology, including, but not limited to:

a. How well does licensing, registration or other controls implemented by supervisors or other authorities prevent criminals and their associates from holding, or being the beneficial owner of a significant or controlling interest or holding a management function in financial institutions? How well are breaches of such licensing or registration requirements detected?

b. How well do the supervisors identify and maintain an understanding of the ML/TF risks in the financial and other sectors as a whole, between different sectors and types of institution, and of individual institutions?

c. With a view to mitigating the risks, how well do supervisors, on a risk-sensitive basis, supervise or monitor the extent to which financial institutions are complying with their AML/CFT requirements?

d. To what extent are remedial actions and/or effective, proportionate and dissuasive sanctions applied in practice?

e. To what extent are supervisors able to demonstrate that their actions have an effect on compliance by financial institutions?

f. How well do the supervisors promote a clear understanding by financial institutions of their AML/CFT obligations and ML/TF risks?

16. These are explored in greater detail below.

A. MARKET ENTRY

17. Market entry controls (e.g., licensing or registration) are meant to prevent criminals or their associates from owning, controlling, holding a significant or controlling interest, or holding a management function in a financial institution.[10] Such controls should be applied at the time of initial licencing or registration of the financial institutions, and also to the directors or members of senior management when new persons are appointed to these positions.

18. While supervisory arrangements vary across countries, all financial institutions should be created and/or licenced/registered in accordance with laws or enforceable means, and policies and procedures that include AML/CFT laws and regulations, in addition to any other requirements. Examples of practices that have proven to be effective include conducting fit and proper tests and/or background checks prior to granting market entry, including, when needed, beneficial

[10] See the FATF Methodology criteria for Recommendation 26: "26.2 Core Principles financial institutions should be required to be licensed. Other financial institutions, including those providing a money or value transfer service or a money or currency changing service, should be licensed or registered. Countries should not approve the establishment, or continued operation, of shell banks."

ownership determination. This is an instance where supervisors may seek information from law enforcement or share with the relevant authority's information discovered by the supervisor or any third party conducting a fit and proper test and/or background check.[11] This may lead to rejecting applications for reasons of criminality, fitness or propriety, as well as taking appropriate action when applicants make misrepresentations that allow them to obtain a charter or license.

Examples illustrating various approaches to market entry

Example 1. **"Fit and proper tests" (United States)**

All banking institution applicants are subjected to "fit and proper tests" that include background checks. Should applicants have a criminal history, they are either denied participation or undergo a thorough review to determine if their past criminal history would negatively impact their ability to operate a financial institution. In cases where applicants omit information that would expose their criminal record, federal and/or laws and regulations allow for civil or criminal recourse. For example, the *Background Investigations* (2009)[12] booklet of the Comptroller's Licensing Manual incorporates policies and procedures used by the OCC to review the background of persons and certain companies (filers) interested in entering the national banking system, acquiring control of a national bank, and/or influencing its operations; *Changes in Directors and Senior Executive Officers* (2009) booklet which incorporates policies and procedures used by the OCC to review and evaluate changes in directors and senior executive officers.

Example 2. **Registration of MSBs (Canada)**

The Financial Transactions and Reports Analysis Centre of Canada (FINTRAC) is the responsible authority in Canada for the registration of MSBs under the Proceeds of Crime (Money Laundering) and Terrorist Financing Act (PCMLTFA). In order to register with FINTRAC, MSBs have to provide identifying information and other business information in a registration form. FINTRAC's MSB registration program provides telephone assistance to potential MSB registrants, and throughout pre-registration, registration, renewal, denial, cessation and expiration process.

FINTRAC MSB registration process involves a criminal records check. Individuals convicted of the following offences are ineligible to own or control an MSB:

- money laundering or terrorist financing,
- an offence under certain sections under the PCMLTFA,
- an offence under most sections of the Controlled Drugs and Substances Act, and
- an offence under certain sections of the Canadian Criminal Code.

Should it be determined that an individual or entity that owns or controls the applying entity is ineligible, the application for registration is denied. It may also happen that, when FINTRAC

[11] Alternatively, supervisors may require regulated entities to obtain the relevant information themselves and certify their compliance to the supervisor.

[12] Office of the Comptroller of the Currency (2009a).

performs the criminal records check, the individuals have been charged with offence that makes them ineligible, but they are not yet convicted. In these instances, FINTRAC performs a regular follow-up on the criminal record check to ensure that the MSB registration is revoked upon conviction. FINTRAC also monitors open source information to be aware of charges laid against previously eligible MSB owners.

In addition, FINTRAC scrutinizes MSBs and potential MSBs on an on-going basis. FINTRAC requires MSBs to submit updated information on owning or controlling individuals or entities when changes occur and again when the MSB applies for renewal of its registration every two years. This information is verified again. FINTRAC also has a process of searching for unregistered MSBs through open source and by visiting them.

When an MSB registration is denied, revoked, expired or pending, FINTRAC conducts a "reporting entity validation" which is a brief off-site review or on-site visit to the MSBs' last known address to establish if the MSB is still in operation. This ensures that the entity is not operating illegally. FINTRAC may also impose administrative monetary penalties (AMPs) on MSBs for failure to register, failure to submit an application in prescribed form and manner, and failure to submit notification of changes.

Example 3. **Prudential supervisor of federally regulated financial institutions (FRFIs) (Canada)**

Under the Bank Act, the Office of the Superintendent of Financial Institutions (OSFI) arranges for criminal and other background checks on the planned owners and operators of financial institutions. In addition, OSFI has prudential guidance in place that requires banks and other financial institutions to conduct background checks on directors and senior managers of federally regulated entities when these persons change. OSFI refers to such persons as "Responsible Persons". When conducting an AML/CFT onsite assessment, OSFI reviews the FRFI's compliance with this guidance and tests the application by reviewing the conduct and results of background checks. These reviews are particularly useful for assessing the processes around obtaining background information for individuals who have not resided in Canada.

For new applicants for banking or other financial institution licences, OSFI also reviews the planned AML/CFT risk assessment and compliance programs as part of the application process with an emphasis on the Applicant's business plan and model, prior to the issue of Letters Patent by the Minister of Finance. If a potential financial institution does not seem to understand the risks, or address the AML/CFT requirements satisfactorily, the application is delayed from proceeding to Ministerial approval until issues are closed.

For applicants who already operate businesses which will be transferred to a financial institution status, the evaluation also includes an abbreviated on-site assessment as part of OSFI's general pre-commencement exercise designed to determine operational readiness.

Example 4. **Technical report before registration (Mexico)**

Derived from the Financial Reform, specifically with the modifications made to The General Law of Organizations and Auxiliary Credit Activities (LGOAAC), the obligation of Money Exchange Centers

(MSBs) and Money Transmitters to obtain the Technical Report on the prevention of Money Laundering and Terrorist Financing (ML/TF) was implemented.

Technical Report is a tool that contributes to generate confidence in the financial sector and users of Money Exchange Centers and Money Transmitters. While it does not replace the function of supervision, which is in charge of the National Banking and Securities Commission (CNBV), Technical Report evaluates and verifies the implementation of measures and recommends implementation of best practices. The report is valid for three years from their issuance.

On 8 September, 2014, the deadline for the Money Exchange Centers and Money Transmitters to process their application for renewing their registration with the CNBV expired, for which, they must had obtained in advance a Technical Report on the ML/TF prevention.

The CNBV expects that compliance with the regulations of the Financial Reform, through obtaining the Technical Report will contribute to build trust among the sectors under the supervision of the CNBV. It is important to note that the Technical Report is a requirement to apply for or renew the registration for Money Exchange Centers or Money Transmitters with the CNBV. However, obtaining Technical Report does not involve the granting or renewal of the entity's registration; it only shows the general compliance regarding the AML/CFT measures: it does not prejudge proper registration application of the entity.

Example 5. **Visit to newly authorised institutins (Mexico)**

The supervisor performs visits to newly authorised FIs, prior to its start of operations. These visits are comprehensive reviews of all aspects of compliance with AML/CFT regulations, including: fit and proper test of the corporative structure (background of the legal person members), effective customer identification programs, know-your-customer policies, AML manual (document containing all relevant AML policies, procedures and internal structure (corporate governance) schemes according to the applicable legal framework), AML risk matrix, reporting obligations and an automated system to detect and make STRs and CTRs in a timely manner.

B. UNDERSTANDING THE ML/TF RISKS

19. As stated in Recommendation 1, countries should identify, assess, and understand the money laundering and terrorist financing risks for the country, and should take action, including designating an authority or mechanism to coordinate actions to assess risks, and apply resources, aimed at ensuring the risks are mitigated effectively. Based on that assessment,[13] countries should apply a risk-based approach (RBA) to ensure that measures to prevent or mitigate money laundering and terrorist financing are commensurate with the risks identified. This risk-based approach should be an essential foundation to efficient allocation of resources across the AML/CFT

[13] The types of information that might form the basis of the supervisor's risk assessment include, but are not limited to: national risk assessments, information collected from reporting entities either off-site or on-site, the results of examinations and supervisory processes, and information from the FIU, including typologies and feedback on suspicious transaction reports.

regime and the implementation of measures throughout the FATF Recommendations. Where countries identify higher risks, they should ensure that their AML/CFT regime adequately addresses such risks

20. The 2014 *RBA Guidance for the Banking Sector*, particularly Section II – Guidance to Supervisors, contains relevant guidance explaining how to develop an understanding of the ML/TF risks which should then inform the supervisor's inspection plans and approach. It should be noted that the broad principles contained in this guidance may also be directly relevant to the supervision and monitoring of other sectors. As it notes: "When assessing ML/TF risk[14], countries, competent authorities, and financial institutions should analyse and seek to understand how the ML/TF risks they identified affect them; the risk assessment therefore provides the basis for the risk-sensitive application of AML/CFT measures[15]. The RBA is not intended to be a "zero failure" approach; there may be occasions where an institution has taken all reasonable measures to identify and mitigate ML/TF risks, but it is still used for ML or TF purposes."[16] Additionally, when financial institutions do not effectively mitigate the risks due to a failure to understand risks, implement an appropriate risk-based approach, or failure of a risk-based programme that was not adequate in its design, the competent authorities should take action to ensure financial institutions correct any deficiencies in risk management and improve future compliance with AML/CFT requirements, as set out below. [17]

C. SUPERVISION AND MONITORING TO MITIGATE ML/TF RISKS

21. Ongoing AML/CFT supervision comprises assessing the quality of controls designed to detect and deter ML and TF based on the assessed risks, including controls that are required by law or regulation. Such supervision is applied through off-site and on-site examinations, which can include questionnaires and dedicated meetings. The three global standard setting bodies have established the Core Principles: the standards for effective supervision and regulation by competent authorities, which are also relevant for AML/CFT supervision as required under Recommendation 26. Under these Core Principles, effective supervision should:

1) be risk-based, focusing on both major prudential and conduct of business risks, as well as a wide range of other risks, such as compliance risk, reputational risk, legal risk and ML/TF risks;

2) be the result of a combination of off-site and on-site supervision;

3) be based on having appropriate access to all the books and records of each supervised financial institution sufficient to collect the widest range of information that a supervisor needs; and

---

[14] *FATF Guidance National Money Laundering and Terrorist Financing Risk Assessment*, Paragraph 10, (FATF, 2010).

[15] *Ibid.* See also Section III.B for further detail on identifying and assessing ML/TF risk.

[16] FATF (2014), Paragraph 10.

[17] See the previous *FATF Guidance on the Risk-Based Approach to Combating Money Laundering and Terrorist Financing - High Level Principles and Procedures* (FATF, 2007), at par. 1.13;

4) include the international element of financial institutions or groups operating across borders by allowing for international cooperation (including arrangements for the sharing of confidential information with foreign counterparts).[18]

22. In a risk-based regime, financial institutions will adopt controls relevant to their business model and assessed risks, and thus not all financial institutions will adopt identical AML/CFT controls. Furthermore, isolated incidents of AML/CFT deficiencies that do not rise to a systemic risk level may not necessarily invalidate the integrity of a financial institution's AML/CFT controls. At the same time, financial institutions should understand that a flexible RBA does not exempt them from applying effective AML/CFT controls.

FEATURES OF EFFECTIVE CONTROL/MONITORING PROCESSES

23. The supervisor should take adequate measures to identify and understand the ML/TF risks faced by financial institutions and sectors in its country, and internationally. These risks include, at minimum, the ML/TF risks associated with financial institutions' customers, products, geographical reach and delivery channels. The risk profiles of supervised entities should be reviewed periodically, including where there has been a change in circumstances, such as changes in management or business activities. Additionally, when determining the approach to supervision in a particular sector, in line with the RBA, supervisors should consider the capacity and AML/CFT experience of the sector being supervised. Supervisors may have greater expectations of sectors with greater AML/CFT capacity and which, in turn, should inform the supervisor's approach[19]. In other words, what constitutes an effective supervisory approach for the banking sector may not be a suitable approach for other types of financial institutions (i.e., those not subject to Core Principles or prudential regulation).

Example 6. **On-going monitoring tool (France)**

Each financial institution under AML-CFT supervision of the ACPR resets, each year, its answers to a questionnaire in the field of AML-CFT compliance.

This questionnaire is composed of ten parts and includes in particular questions related to:

- the organization and governance of the AML-CTF system;
- the implementation of the customer due diligence measures and of the reporting obligations to the FIU, including collection of statistical data ;
- the internal process and the institution's tools of the targeted financial sanctions related to terrorism and terrorism financing.

It is accompanied by an annual report of internal control which completes the given answers.

[18] The Core Principles are in line with Recommendation 26.

[19] Paragraph 1, Interpretive Note to Recommendation 1.

24. Financial institutions that are assessed as higher ML/TF risk by supervisors should be subject to closer supervision, such as more frequent and/or more comprehensive AML/CFT examinations/inspections (e.g., where there are indications that a ML/TF risk may have crystalised). There should be an analysis and decision process underpinning this risk-based AML/CFT supervision. The FATF's *Guidance for a Risk-Based Approach for the Banking Sector* has more detail on this.[20]

25. Supervisory examination processes should include:

a. The supervisor should have clear and adequate methodologies and procedures for off-site supervision and on-site inspections. Off-site monitoring tools could include (self-assessment) questionnaires on the policies, procedures and controls in place in financial institutions. On-site assessment tools could include assessing the adequacy of AML/CFT controls, such as management reporting and oversight. In the Core Principles sector it is normal to include in the assessment a review of the financial institution's internal or external audits. Supervisors should consider interviewing members of the Board of Directors, staff of various levels of seniority and with different functions (e.g. senior management; compliance; internal audit/control functions; and customer-facing staff), assess procedures and policies in place and/or conduct testing (e.g., review of customer files, testing effectiveness of a transaction monitoring system, suspicious activity reporting, training and integrity of staff) to assess effective implementation of the financial institution's policies and controls. Sample testing is a particularly important tool when examining for compliance, both for risk- based and rules-based requirements.(e.g., the implementation of targeted financial sanctions).

b. The supervisor should ensure that officers carrying out AML/CFT inspections are adequately trained and have up-to-date knowledge of AML/CFT issues.

c. In addition to supervision at individual financial institutions, the supervisor should, where appropriate, conduct risk-based assessments across all or part of a financial sector where the supervisor considers the risks warrant this approach: for example, where a group of financial institutions face the same threats and vulnerabilities.

d. Where appropriate, the supervisor should conduct consolidated AML/CFT supervision of the overseas branches and subsidiaries of financial institutions headquartered in its country via off-site supervision and on-site inspections.

e. The supervisor should also consider taking risk-sensitive measures to inspect or review financial institution's governance and controls over third party service providers where AML/CFT measures are outsourced to others as agents of the financial institution, in order to determine whether the inspected financial institution's arrangements comply with its AML/CFT obligations.

[20] See footnote 3.

SUPERVISORY COORDINATION AND COOPERATION

26. Where more than one competent authority is responsible for supervising and enforcing the AML/CFT compliance of a financial institution, supervisory action should be coordinated, where appropriate, with other relevant competent authorities. Where more than one competent authority is responsible for supervising a financial institution at the domestic level (e.g., where the financial institution has both an AML/CFT supervisor and a separate prudential supervisor), such coordination and cooperation should occur among all relevant domestic supervisory authorities. Where the financial institution operates in multiple jurisdictions and is subject to supervision by competent authorities from different countries, such coordination and cooperation should occur internationally. This is particularly relevant where the institution involved is systemically important and/or operates in more than one country. Coordination can include coordination on supervisory approaches, coordination of supervisory expectations and coordination of supervisory actions (control actions, remedial actions and enforcement actions), and information exchange. Coordination with other supervisors, central banks and finance ministries, and, where relevant, law enforcement is also important.

FEATURES OF EFFECTIVE SUPERVISORY COORDINATION AND COOPERATION

27. Coordination, cooperation and information exchange with other national and international authorities on AML/CFT issues and financial sanctions may be ensured through mechanisms (either AML/CFT specific or broader) such as: legislation authorising sharing of supervisory and/or compliance information, information exchange agreements (e.g., Memoranda of Understanding), established committees, working groups or other bilateral or multi-agency meetings. The applicable confidentiality provisions should be respected and applied to these mechanisms. These arrangements should ensure the timely exchange of information to facilitate the discharge by each authority of its responsibilities.

28. National authorities with which the AML/CFT supervisor may coordinate and cooperate may include:

a. Financial Intelligence Unit (e.g., exchange of information including information on the quality of reports and information on entities; individuals and their transactions where permitted; joint policy actions);

b. Ministry of Finance and other relevant ministries (e.g., to collaborate on policy issues, preparation of laws, regulations and guidance, not exclusively directed at financial institutions);

c. Intelligence Services;

d. Other supervisory authorities relevant for AML/CFT or financial sanctions (e.g., other prudential supervisory authorities, business conduct or financial market supervisory authorities, self-regulatory bodies/organisations where relevant, or those responsible for administering data protection legislation);

e. Public prosecutor's office; and

f. Law enforcement agencies.

29. International coordination and cooperation may include:

a. Regular or ad-hoc cooperation and/or exchange of information in a timely manner, pursuant to specific requests from competent supervisory authorities in other countries;

b. Examination of foreign establishments of financial institutions with the assistance of the supervisory authorities of the host country;

c. Indirect cooperation with non-counterparts, in line with Recommendation 40;

d. Memoranda of understanding, consolidated supervision agreements between home and host supervisors of foreign-owned financial institutions, or other form of agreement which address cooperation and information exchange between authorities in different countries; and

e. Participation in the relevant international meetings (e.g., the Basel Committee, the FATF, the Financial Stability Board, International Organisation of Securities Commission (IOSCO), International Association of Insurance Supervisors (IAIS), EU meetings or other international fora).

Examples of cooperation/coordination with relevant authorities

Example 7. **Special coordinating body (Sweden)**

In Sweden there is a special coordinating body for the supervision of measures against money laundering and terrorist financing. The body comprises representatives from supervisory authorities (FI and the authorities that supervise designated non-financial businesses and professions (DNFBP's)) and the financial intelligence unit (FIU). The body has the overall coordinating responsibility for the operations of the supervisory authorities relating to methods and the issuing of rules, together with the evaluation and follow-up of the supervision performed. The body also provides the supervisory authorities with support on matters relating to training and work to promote efficient collaboration between the supervisory authorities and the FIU.

According to the Swedish AML Act, a supervisory authority shall, without delay, notify the National Police Board (FIU) if the authority upon inspecting a natural or legal person or in any other way discovers a circumstance that may be assumed to be related to or constitute money laundering or terrorist financing.

Example 8. **Regular meetings (Netherlands)**

The Dutch National Bank and the Netherlands Authority for Financial Markets cooperate with criminal justice authorities and other relevant authorities through different cooperative efforts such as the monthly Tripartite meeting (TPO) between financial supervisors, the Fiscal Intelligence and Investigation Service (FIOD) and the Public Prosecutor's Office (OM) or through the Financial Expertise Center (FEC) which is a cooperative effort between various supervisory, investigative and enforcement agencies, working together on a policy as well as operational level. In addition, bilateral cooperation and information exchange with other supervisory authorities and criminal

justice authorities takes place.

The FEC comprises all the organisations that carry out duties related to the financial sector: supervisory authorities; control, intelligence, and investigative agencies; and prosecution authorities. The FEC was founded to strengthen the integrity of the financial sector. It does this by taking preventive action to identify and combat threats to this integrity. The FEC also plays an important role in providing and disseminating information.

Within the TPO, which takes place every month, cases are discussed which might be of interest to either the supervisory authorities or criminal justice authorities. The basic principle of enforcement is that a person is not punished twice for the same offence (*ne bis in idem*). If an administrative punitive sanction has been issued, authorities are not allowed to take criminal action for that same offense (*una via*). If supervisory actions reveal criminal/economic offences (and vice versa), within the TPO the most effective means of enforcement is discussed. Depending on several factors, such as the severity of the offence, criminal intent, recidivism, complexity, damages etc., a choice is made to transfer the case to the criminal justice authorities. It is then however, still possible to also handle this case with administrative powers which are not punitive but corrective.

Example 9. **AML/CFT Steering Committee (Singapore)**

Singapore has a high-level AML/CFT Steering Committee that leads the national effort to develop and implement its AML/CFT regime. The Committee comprises the Permanent Secretary of the Ministry of Home Affairs (MHA), Permanent Secretary of the Ministry of Finance (MOF) and Managing Director of the Monetary Authority of Singapore (MAS), heads of the respective agencies.

The Committee's mandate is to coordinate the whole of government approach to prevent and combat ML/TF by overseeing the effective implementation of AML/CFT measures by the respective agencies; and identifying and mitigating emerging ML/TF risks (e.g., through the National Risk Assessment exercise). The Committee meets 3 to 4 times a year, or more often if necessary. The AML/CFT Steering Committee is supported by an Inter-Agency Committee (IAC) made up of the key agencies in Singapore's AML/CFT regime.

Example 10. **Cooperation/ coordination with relevant authorities (United Kingdom)**

The UK's Financial Crime Network (FIN-NET) facilitates the sharing of financial crime related information between members - comprising of regulators, law enforcement and government departments. Established in 1992, in response to the collapse of the Bank of Credit and Commerce International (BCCI), the network helps to ensure the right people are communicating to the right people at the right time across an array of financial crime issues, including money laundering and terrorist financing.

FIN-NET has approximately 110 members from public sector organisations from both UK and overseas authorities. It relies on each member having a single point of contact that specialises in financial crime matters. Where members have a shared interest in a case then a meeting may be held to ensure that all parties are aware of the full intelligence picture; to help avoid duplication of effort; and to assist members in collaborating on a joint investigation. Typically around 180 requests

for information are made by members each year which can lead to positive results.

FIN-NET is an independent body - it is accountable to a Steering Group which is chaired by the UK Government's Home Office. The UK's Financial Conduct Authority provides the secretarial function of FIN-NET as well as being a member of the network itself.

D. REMEDIAL ACTIONS AND SANCTIONS

SUPERVISORY REMEDIAL ACTIONS

30. As the FATF Recommendations require, supervisors should have a sufficient range of sanctions available that can be applied proportionately to greater or lesser breaches of supervisory requirements. This range should extend from taking informal remedial actions to taking formal supervisory actions. Sanctions applied in practice should address the specific deficiencies identified, effective at ensuring future compliance by the sanctioned institution, and dissuasive of non-compliance by others.

31. Remedial actions should seek not only to correct weaknesses in processes, procedures, systems or controls within financial institutions, but also to influence and foster a corporate culture that contributes to effective risk management and compliance with national laws.

32. Remedial measures imposed by supervisors should be proportionate to the severity of the deficiency identified. They may include action plans and timelines, and supervisory follow-up to ensure that the required measures are effectively implemented. These plans, timelines and follow-up may include sufficient detail in terms of required action, deadlines and the nature of supervisory follow-up.

FEATURES OF EFFECTIVE REMEDIAL ACTIONS

33. **Communication to financial institutions:** Supervisors should communicate clearly with financial institutions when issues arise, so that the financial institutions understand what their failings and shortcomings are, what supervisors expect (including the remedial action required), and the timeframe within which possible remedial work/actions must be completed. Supervisors should appropriately escalate issues to senior management and/or the Board of Directors in instances where required remedial actions respond to major issues, are of high impact or where previous supervisory intervention has not been effective. Supervisors should determine whether their finding is an isolated incident caused by a specific factor/issue or a systemic risk at the financial institution, or across the sector, and communicate their views to the relevant financial institutions.

RANGE OF TOOLS USED, COMPREHENSIVENESS AND ESCALATION PROCESS

34. The supervisor should be able to apply a wide range of supervisory measures, such as warnings, action letters, limitations and conditions for activities of the financial institution, which may be progressive in severity, requiring financial institutions to remedy AML/CFT control deficiencies and any breach of AML/CFT obligations or failure to mitigate ML/TF risks in a timely

manner. Home supervisors receiving such warnings or signals should aim at addressing the issues, and should seek to apply the necessary supervisory tools to prevent an institution from lowering the AML standards in host country. The supervisor may require the financial institution to obtain an independent audit/test of their policies, procedures and controls in place to ensure compliance with applicable rules, regulations and guidance.

35. In the case of financial institutions under the consolidated supervision of foreign regulatory authorities (home supervisor), the host supervisor may send findings to the home supervisor and head/parent office of the financial institution so that they are aware of the weaknesses identified and to seek their co-operation to ensure that the financial institution rectifies the weaknesses noted during the inspection.

36. The supervisor may follow up with external/internal auditors of the financial institution and request them to follow up on the correction of weaknesses and the adequacy of the remedial measures taken by the financial institution.

CONSISTENCY

37. The supervisor should work closely with financial institutions in order to be satisfied that the targets and deadlines of the remedial actions are well understood and capable of remediating the identified issues within acceptable timeframes. Follow-up of implementation of remedial actions should be systematic and there should be an appropriate response where financial institutions fail to fix the identified problems in a timely manner. Follow-up actions include utilizing inspection/examination information to track progress in supervised entities over time.

38. The supervisor should apply consistent policies with respect to remedial actions, while taking into account the specific characteristics of the financial institution. The supervisor should apply comparable, proportionate solutions to similar issues/cases.

39. Where more than one competent authority is responsible for supervising the same financial institution, those supervisors should coordinate to ensure that a consistent and coordinated approach is being taken to AML/CFT supervisory and compliance issues.

40. If the AML/CFT supervision and prudential supervision are being conducted by separate specialized teams or units within the same agency, these two units should coordinate to ensure that a consistent and coordinated approach is being taken to AML/CFT supervisory and compliance issues.

41. **Outcomes:** Supervisory measures should lead to adequate changes in behaviour of financial institutions (e.g., strengthening of AML/CFT controls, hiring experienced AML/CFT compliance officers, enhancing AML/CFT training of officers in the financial institutions).

Examples of sanctions and other remedial actions from various countries

Example 11. **Range of measures (Netherlands)**

When deciding on an intervention strategy a choice will be made from three different strategies for influencing the supervised institution: educational (explaining and/or supporting), normative (persuading and/or guiding) and deterrent (punishing and/or rewarding). In some cases, explaining the background to a standard or norm suffices, while in others it will be necessary to impose a sanction. A choice can also be made between a group and individual approach; formal measures will always be targeted at an individual institution. Interventions are geared to the specific situation, cause and severity. In extreme cases, a solution will have to be found on the same day. In other cases, relatively light interventions will suffice and the use of formal enforcement instruments will not be necessary. Choices made are subject to peer review by colleagues, and the choice of enforcement instruments to be used is based on the enforcement policy of the Dutch National Bank and the Netherlands Authority for Financial Markets

Example 12. **Range of measures from advice to criminal prosecution (United Kingdom)**

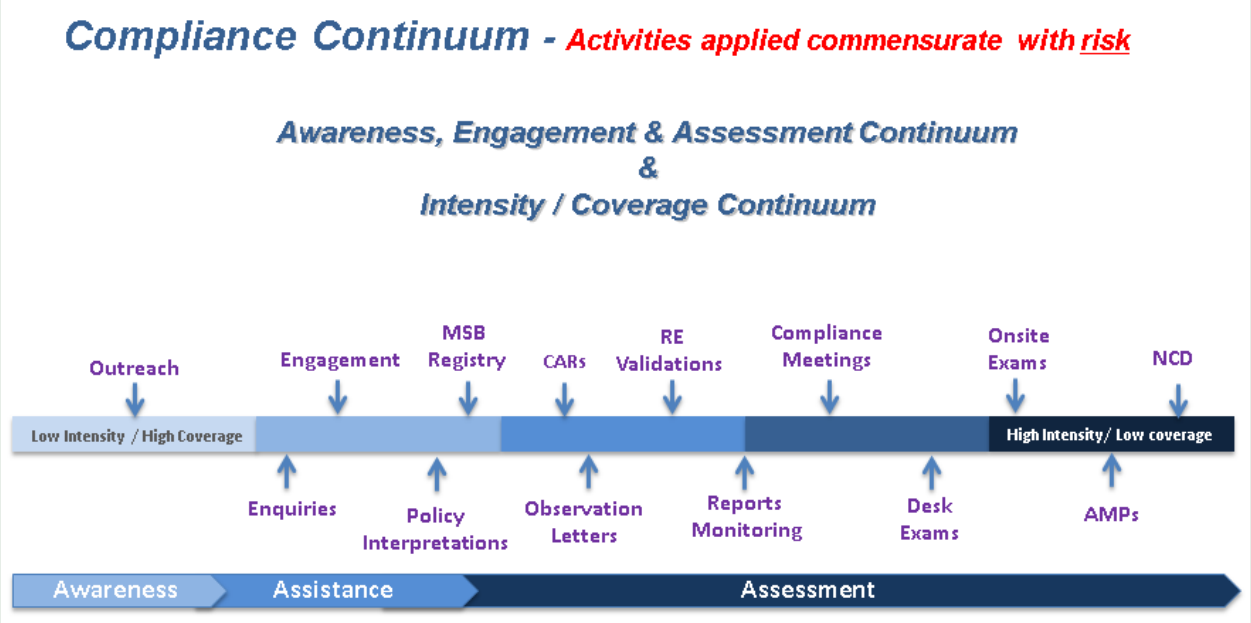
HM Revenue and Customs (HMRC) deals with AML/CFT breaches in a range of ways, depending on the seriousness and potential impact of the breach and the behaviours evidenced by the business concerned.

- Advice – where a business wants to comply but is uncertain it may be appropriate to simply issue advice and guidance to support them in understanding their obligations and ensure compliance.
- Warning letters - these may be appropriate for less serious breaches if there is no previous history of non-compliance. They will set out the improvements that the business must make within a specified timescale to avoid more serious sanctions and will be followed up by further checks to establish whether the business has taken all necessary action.
- Financial Penalties – these are intended to be effective, proportionate and dissuasive and will be applied where there is evidence of regulatory failures and HMRC is satisfied that the business has not taken reasonable steps to comply with their AML obligations.
- Refusal of Fit and Proper person status – This prevents any individual who is considered to pose a risk in relation to money laundering or terrorist financing from holding any management role or controlling an MSB, either directly or indirectly.
- Removal from the register – a business may be removed from the register because a relevant person in the business has had their fit and proper status withdrawn or because the business has failed to provide HMRC with information it has requested by notice.
- Criminal prosecution – The most serious AML regulatory breaches may be referred to law enforcement for potential criminal investigation and prosecution, leading to a sanction imposed by the courts, which could include a fine, non-custodial or prison sentence.

Example 13**. Range of measures on the compliance continuum (Canada)**

FINTRAC possesses a suite of compliance activities that are applied commensurate with various risks and to each sector. These activities range from "low intensity, high coverage" activities to "high intensity, low coverage" activities.

The initial stage of the "compliance continuum" generally refers to "awareness and assistance" as FINTRAC will obtain or provide information to the reporting entities via the following activities: compliance assessment reports (i.e. questionnaires that reporting entities are required to respond to and which help FINTRAC maintain a good knowledge of reporting entities and better assess the risks), outreach, compliance support and engagement. The second stage identifies potential compliance issues (via reports monitoring function that assesses any reporting deficiencies) and advise the reporting entities of these identified compliance deficiencies (through for example an observation letter which outlines to reporting entities their current deficiencies). The third stage comprises of the examination strategy where reporting entities are selected on a risk-based approach for either a desk or onsite exam. This stage also includes the imposition of Administrative Monetary Penalties (AMPs) and Non-Compliance Disclosures (NCD) to law enforcement for potential investigation. This "compliance continuum" is illustrated in the image below.



OSFI's administrative powers of enforcement are derived from its mandate under governing legislation as a prudential regulator. OSFI applies these powers to its AML/CFT supervisory program in the same way as for all other areas of financial institution supervision. The specifics of actions taken in exercising these powers are found in OSFI's Supervisory Framework (available at www.osfi-bsif.gc.ca/Eng/Docs/sframew.pdf) which explains how the level of supervisory intervention is determined. Intervention ratings higher than zero (normal) trigger staging of the FRFI with increased supervisory attention (frequency, depth, breadth) on the issues which caused the staging, including AML/CFT issues. In addition, the potential for staging acts as a dissuasive factor because it triggers increases in Canada Deposit Insurance Corporation premiums (for deposit taking

institutions) and Assuris policy protection (life insurance companies) - it should be noted that all financial institutions subject to AML/CFT supervision by OSFI are required by law to be members of these organizations. Finally, OSFI's findings and any lack of action by a financial institution to resolve the issues identified by OSFI could ultimately lead to the revocation of the financial institutions' licence to operate in Canada, if the issues seriously threaten the safety and soundness of the FRFI.

Example 14. **Banking: Remedial Measures to remedy AML/CFT issues (Canada)**

An AML/CFT assessment of a bank was conducted by the office of the Superintendent of Financial Institutions (OSCI) in March 2010. The bank has a significant retail banking operation in neighbouring and other foreign countries. The OSFI assessment found the bank's AML/CFT programme to be in a basic or rudimentary state. The OSFI assessment identified 27 findings, major deficiencies ranging from non-compliance to weak risk management processes and policies. A severe message was delivered by OSFI to the bank's senior management and Board of Directors.

In November 2011, a follow-up assessment was conducted by OSFI to assess implementation of the bank's plan to address the 2010 findings. There had been little progress made despite changes to governance structure and more senior management engagement.

Concurrently with the 2011 work, OSFI was aware that the regulator of the bank in the neighbouring country had identified similar concerns in respect of the bank's subsidiary operations in that country. In 2012, the supervisor initiated AML discussions with the regulator of the neighbouring country to coordinate the discussions with the bank.

In the summer 2012, OSFI called a meeting with the bank's senior management, including the CEO and the foreign regulator, to discuss concerns on execution risk. In response to the meeting, the Board of Directors and senior management directed that interim controls be developed to improve short-term risk management processes. The bank also struck a senior management committee, chaired by the CEO, to monitor development and appropriate implementation of these controls.

OSFI implemented enhanced monitoring: it typically monitors progress at major banks on a quarterly basis, however, monitoring meetings with this bank were increased to monthly.

A second follow-up on-site assessment was conducted by OSFI in 2013, which found 24 of 28 previous findings had been addressed.

OSFI's enhanced strategies with the bank resulted in a vastly improved AML/CFT programme with increased and constant focus on the implementation of controls appropriate for the size, complexity and risk of the bank.

Example 15. **Targeted Financial Sanctions: Range of measures from no action to criminal referral (United States)**

The Office of Foreign Assets Control (OFAC) administers and enforces economic sanctions programs primarily against countries and groups of individuals, such as terrorists and narcotics traffickers. On November 9, 2009, OFAC published its enforcement guidance for persons subject to the

requirements of U.S. sanctions statutes, which is outlined below.

Types of Responses to Apparent Violations: Depending on the facts and circumstances of a particular case, an OFAC investigation may lead to one or more of the following actions:

A. *No Action*: If OFAC concludes that the conduct does not rise to a level warranting an administrative response, then no action will be taken.

B. *Request Additional Information*: If OFAC determines that additional information regarding the apparent violation is needed, it may request further information from the Subject Person or third parties, including through an administrative subpoena.

C. *Cautionary Letter*: If OFAC determines that there is insufficient evidence to conclude that a violation has occurred or that a Finding of Violation or a civil monetary penalty is not warranted under the circumstances, but believes that the underlying conduct could lead to a violation in other circumstances and/or that a Subject Person does not appear to be exercising due diligence in assuring compliance with the statutes, Executive orders, and regulations that OFAC enforces, OFAC may issue a cautionary letter, which may convey OFAC's concerns about the underlying conduct and/ or the Subject Person's OFAC compliance policies, practices and/or procedures.

D. *Finding of Violation*: If OFAC determines that a violation has occurred and considers it important to document the occurrence of a violation and, based on an analysis of the General Factors outlined in Section III of its Guidelines, concludes that the Subject Person's conduct warrants an administrative response but that a civil monetary penalty is not the most appropriate response, OFAC may issue a Finding of Violation that identifies the violation.

E. *Civil Monetary Penalty*: If OFAC determines that a violation has occurred and, based on an analysis of the General Factors outlined in Section III of these Guidelines, concludes that the Subject Person's conduct warrants the imposition of a monetary penalty, OFAC may impose a civil monetary penalty.

F. *Criminal Referral*: In appropriate circumstances, OFAC may refer the matter to appropriate law enforcement agencies for criminal investigation and/or prosecution. Apparent sanctions violations that OFAC has referred for criminal investigation and/or prosecution also may be subject to OFAC civil penalty or other administrative action.

G. *Other Administrative Actions*: In addition to or in lieu of other administrative actions, OFAC may also take the following administrative actions in response to an apparent violation:

   1. *License Denial, Suspension, Modification, or Revocation*: OFAC authorizations to engage in a transaction (including the release of blocked funds) pursuant to a general or specific license may be withheld, denied, suspended, modified, or revoked in response to an apparent violation.

   2. *Cease and Desist Order*: OFAC may order the Subject Person to cease and desist from conduct that is prohibited by any of the sanctions programs enforced by OFAC when OFAC has reason to believe that a Subject Person has engaged in such conduct and/or that such conduct is ongoing or may recur.

General Factors Affecting Administrative Action: As a general matter, OFAC will consider some or all of the following General Factors in determining the appropriate administrative action in response to an apparent violation of U.S. sanctions by a Subject Person, and, where a civil monetary penalty is imposed, in determining the appropriate amount of any such penalty:

A. Wilful or Reckless Violation of Law	G. Cooperation with OFAC
B. Awareness of Conduct at Issue	H. Timing of apparent violation in relation to imposition of sanctions
C. Harm to Sanctions Program Objectives	I. Other enforcement action
D. Individual Characteristics	J. Future Compliance/Deterrence Effect
E. Compliance Program	K. Other relevant factors on a case-by-case basis.
F. Remedial Response	

Civil Penalties for Failure To Comply With a Requirement To Furnish Information or Keep Records: In those cases in which a civil monetary penalty is deemed appropriate, OFAC will make a determination as to whether a case is deemed "egregious'" for purposes of the base penalty calculation. This determination will be based on an analysis of the applicable General Factors.

See www.treasury.gov/resource-center/sanctions/Documents/fr74_57593.pdf.

Example 16. **Remedial action from various jurisdictions (United Kingdom)**

Seeking the best supervisory response to change behaviours (UK Financial Conduct Authority (FCA))

In addition to the its formal enforcement powers, the UK's Financial Conduct Authority has a wide range of supervisory responses to improve compliance in firms. It targets resources strategically to achieve 'credible deterrence' in areas of greatest concern. By this the FCA seeks the best means to change the behaviour of those who are the subject of its actions and deter non-compliance by others.

Where firms have deficient AML systems and controls, it will work with them to put appropriate remedial plans in place. Over the last year, the FCA has achieved positive results in firms, particularly around increasing senior management engagement on AML issues, by making use of its 'early intervention toolkit' where it identifies weaknesses. These are a range of measures including, for example, restricting certain types of higher risk business until deficiencies in the firm are fixed. On some occasions, the FCA requires attestations from senior management that weaknesses have been remediated. For example, the FCA recently obtained a voluntary undertaking from a small bank with serious AML weaknesses that the bank would not establish new high risk or PEP relationships until it had corrected the weaknesses the FCA identified. The bank's Chief Executive subsequently gave an attestation that remedial action had been carried out.

The FCA can also appoint a consultant (also referred to as 'Skilled Person') to test a firm's systems and controls, identify weaknesses, and in some cases, remediate the weaknesses identified. It will

also undertake regular follow-up reviews with banks to assure itself that financial crime weaknesses have been rectified and overall compliance standards have improved. Where they have not, the FCA may consider further enforcement action.

Example 17. **Range of measures (France)**

The ACPR is an independent administrative Authority chaired by the Governor of the French central bank, which is in charge of the supervision of the banking sector and insurance sector, including as regards AML-CFT. It uses a range of remedial actions depending on the breaches:

- Follow-up letter: In the context of off-site controls, financial institution must provide explanations and documentation as a case maybe within a time limit.
- Action letter: Following the on-site inspections, a letter is systematically transmitted to the financial institution detailing the authority's findings and to address recommendations within specified timetable.

The ACPR has also administrative enforcement powers which are distinct from sanctions as an escalate means when the nature of the deficiencies is more serious and the financial institution has the ability to correct these deficiencies by themselves.

In the case of enforcing AML-CFT compliance, the ACPR uses its powers of cease-and-desist orders. In this case, the ACPR requires the correction within a specific time limit. At the end of the time limit, a new on-site inspection will be undertaken to make sure that the remedial measures have taken place and, if not, the ACPR has the power to escalate to sanctions measures.

Such administrative enforcement measure may be brought to the attention of the parent undertakings on a consolidated basis.

The ACPR can take sanction measures like a blame or revocation of licence to contraventions and pecuniary sanctions (until 100 thousands euros) in case of serious lack of vigilance or a deficiency in the organization of its internal control procedures and forwards the case to an enforcement authority for criminal prosecution.

SUPERVISORY ENFORCEMENT ACTIONS (SANCTIONS)

42. Serious failures to comply with AML/CFT requirements or failures to address remedial supervisory actions to comply with AML/CFT requirements identified during supervisory examinations or through other means may lead to more severe measures, defined as supervisory enforcement actions (sanctions). The FATF Standards require that supervisory sanctions be effective, proportionate and dissuasive, and be applicable to both natural and legal persons (including the directors and senior management of financial institutions). Effective sanctions seek to change the behaviour of those who are the subject of supervisory actions, deter non-compliance by others and eliminate financial gain or benefit from non-compliance. This is one tool amongst a range of supervisory responses that might be used. Depending on the applicable legal and institutional

framework, supervisors may engage judicial or law enforcement authorities to assist in correcting deficiencies.

43. Supervisory enforcement actions may be public or non-public in nature, and supervisors may take either action, or combine them as needed. Jurisdictions should consider how to strike a balance when deciding to take either public or non-public enforcement action, and deciding on what form of enforcement action should be appropriate. In some cases, non-public supervisory enforcement actions can be highly effective. Additionally, supervisory intervention, particularly when publicised, can lead to focus on the particular area of risk at which the intervention was directed, while other areas could get neglected.

44. When making decisions on the proportionality of a sanction and whether it should be made public, supervisors should consider various factors, including the nature and severity of the identified non-compliance, the financial institution's commitment, the results of previous supervisory interventions to correct the deficiencies, and the possibility of destabilising confidence in the financial sector. Making supervisory sanctions public when appropriate, may contribute to greater transparency of enforcement and deter financial institutions from engaging in similar behaviour in the future, as well as deterring other financial institutions from acting in a similar manner. However, while there can be a deterrent effect in publicizing supervisory actions taken against a financial institution, public action may not always be appropriate, or proportionate, or achieve the intended outcome.

45. Supervisors should be able to take either public or non-public action, or both, in achieving their supervisory objectives, and as such, the absence of public action or the frequent application of non-public action should not be considered indicators of a lack of effectiveness of a country's supervisory system. The use of either public or non-public action, or both, should be recognized as part of the supervisory strategy to ensure the soundness of a country's financial system.

FEATURES OF EFFECTIVE SUPERVISORY ENFORCEMENT ACTIONS

46. There should be a broad range of enforcement measures available to the supervisor. Sanctions should be effective, dissuasive and proportionate, and be applied by different supervisors in a consistent manner, providing legal certainty to the supervised entities. The supervisor may escalate the action if remedial measures are not taken adequately and/or within reasonable timeframes as agreed with the financial institution.

47. Supervisory enforcement action can:

a. range from administrative sanctions, withdrawal of the capacity to be a fit and proper manager, imposition of a temporary limitation to business activities, imposition of a restriction or cancelation of business licences for the most egregious misconduct, to referral to law enforcement or judicial authorities for suspected criminal violation of AML/CFT preventive measures, including with respect to TFS.

b. be both punitive to penalise past behaviour as well as remedial and preventive, to compel financial institutions to take action to prevent future compliance failures and to promote future compliant behaviours;

c. be applied to legal as well as natural persons (i.e. the persons in charge of the administration or the management of the financial institution); and

d. be published, whenever appropriate, as a consolidated report or as rulings of individual cases to promote transparency as well as guidance.

48. **Proportionality of measures:** The supervisor should proportionately sanction financial institutions for AML/CFT breaches in a fair and consistent manner. While the sanction applied to each case would be determined, taking into account a range of factors, including the seriousness of the breach and the extent to which the behaviour was deliberate or reckless, the supervisor should have and inform an enforcement/penalty framework to the respective sectors.

49. **Referral to other authorities:** Where there are severe AML/CFT weaknesses, poor management oversight and/or significant breaches of AML/CFT laws and regulations, and where the supervisor does not have authority to take appropriate enforcement measures against the financial institution, the supervisor should forward the case to the appropriate competent authority. Where the supervisor finds or assumes criminal offences in activities of financial institutions, it should notify the relevant law enforcement agencies and/or prosecutor's office. Section III describes in more detail the relationship between supervisors and law enforcement, and the importance of their cooperation and coordination.

Examples of sanctions (supervisory enforcement actions) from various countries

Example 18. **Banking: Sanctions against management (Italy)**

In 2008, in connection with investigations by the judiciary on some individuals involved in organised crime, the Bank of Italy conducted an on-site inspection on the country's subsidiary of a foreign banking group. The on-site visit revealed serious breaches of AML legislation and serious deficiencies in the internal control system. The subsidiary systematically and wittingly ignored the country's customer due diligence (CDD) provisions in order to facilitate customers' transactions with off-shore entities.

The central bank decided to activate the special administration (SA) tool, which temporarily dissolves (normally up to one year) governing bodies of the bank and replaces them with special administrators appointed by the central bank, and imposed sanctions on old management. The central bank transmitted the findings to the judiciary and FIU. Information was also provided to the bank's parent country's home authorities, which conducted an overall review of the group activities. In 2010, the SA procedure ended and the bank returned to shareholders' hands. It was the first time for the central bank to test the SA for AML purposes. Cooperation with domestic and foreign authorities was also tested.

Example 19. **Currency exchange business: Face-to-face interventions uncovering disqualified person exercising control (United Kingdom)**

The supervisor of money service businesses, HM Revenue and Customs, strengthened its fit and proper person test since October 2012 and it delivered early results in February 2013. The

supervisor carried out a compliance visit to a currency exchange business. The business had previously been deregistered when the owner was convicted of fraud offences and had his fit and proper status removed, but had subsequently re-registered under new ownership. The new owner passed the fit and proper person test and provided information from accountants to evidence the transfer of ownership of the company.

The visiting officer was broadly satisfied with the business' AML procedures but discovered that the previous owner of the business was being employed by the business, which suggested that he continued to exercise control. The officer carried out a detailed investigation into the circumstances surrounding the sale of the company which eventually revealed that behind a complex set of artificial loan arrangements, share purchases and transfers, the new owner had not paid anything for the business.

The officer concluded that the new owner was simply a 'puppet' director and the previous owner was still the beneficial owner and was effectively directing the business. The supervisor withdrew the fit and proper status from the new director on the grounds that he had knowingly allowed a disqualified person to exercise control over the business and deregistered the business immediately. The situation came to light because a compliance visit was carried out at the business' premises, and this illustrates the effectiveness of face-to-face interventions when dealing with high-risk business.

Example 20. **Credit Card Issue: Limiting financial activities (Italy)**

In 2009, the central bank conducted an in-depth off-site review of a credit card issuer, following a report by the Board of Directors concerning deficiencies in the registration procedure. Subsequent on-site inspection confirmed weak AML practices over a long period. The central bank requested the firm to develop an action plan to address the deficiencies and prohibited issuance of new credit cards and imposed a specific capital add-on for operational risks, until completion of the action plan. The central bank informed the judiciary and FIU of these initiatives.

The limitation on business activity and the additional capital ratio were revoked in 2011, after a follow-up on-site visit verified that all deficiencies had been addressed and fixed.

Example 21. **Sanction against a life insurance firm (France)**

The on-site investigation team of the ACPR performed an on-site AML-CFT control at a life insurance firm. This on-site control noted serious failures in the AML-CFT system and policy of this institution, in particular in:

- the business-wide risk assessment established by the institution which did not take into account all of the ML-TF risks it could be confronted with, especially those related to the customers and the activities (those gaps are translated to vigilance defects regards to the business relationships);
- the on-going monitoring system which was insufficient for detecting efficiently all the atypical and suspicious transactions ;
- the customer due diligence measures and in particular, cases of absence of verification of

the identity of the beneficial owner and of insufficient knowledge of the business relationships ;

- the detection process of politically exposed persons which was inefficient ;
- the reporting of suspicious transactions, with identification of several suspicious transactions of high amounts for which no STR has be performed.

A disciplinary procedure has been opened against this French life insurance firm and it resulted to a censure and a financial penalty of an amount of EUR 5 000 000.

E. EFFECT OF SUPERVISORY ACTIONS ON COMPLIANCE

50. The ML/TF risks may evolve and change over time. Consequently, it is important for supervisors to understand what impact their actions are having on the compliance of supervised entities with a view to ensuring that supervision is adequate to mitigate current ML/TF risks. A number of elements can be used to achieve this: the results of follow-up actions, the evolution of a sector or a particular entity's risk profile over time and following supervisory action (e.g., taking into account the adequacy of a financial institution's AML/CFT measures which may change as a result of supervisory action), and the extent to which business moves into the formal financial system or remains in the underground/informal system.

51. In regards to TFS compliance, past recent criminal prosecutions involving large global banks have revealed that some banks engage in deceptive practices to, for example, remove originator and beneficiary information from wire transfers in order to evade sanctions—a process called "stripping." In line with the risk-based approach, given the increasing terrorist threat and this past experience, appropriate implementation of targeted financial sanctions continues to be an area warranting attention from supervisors with a view to determining whether those criminal prosecutions have had a positive impact on the behaviour of those banks.

FEATURES OF EFFECTIVE IMPACT OF SUPERVISION ON COMPLIANCE

52. Ideally, the results of follow-up actions will demonstrate that supervisory actions are having a positive impact on the compliance of supervised entities. In other words, follow-up actions should show that the supervised entity has responded to supervisory concerns in a timely manner (e.g., by correcting deficiencies, or implementing more robust AML/CFT controls) and is mitigating its ML/TF risks better.

53. Follow-up actions include using inspection/examination information and review of the supervised entities' audit reports to track progress over time.

a. **Optimal usage of findings:** The supervisor should facilitate sharing of the findings of AML/CFT inspections among its officers to ensure consistency of supervisory actions/measures. Where the AML/CFT supervision is carried out by different authorities, they should discuss and share the relevant AML/CFT information, exchange

expert guidance/opinions on AML/CFT supervision and ensure consistency in applying AML/CFT standards.

b. **Periodic review:** The supervisor should also take the results of follow-up actions into account when reviewing a sector or particular entity's risk profile, and use this information for the purposes of fine tuning and recalibrating its inspection plans and supervisory approach, as needed, in order to mitigate current ML/TF risks.

54. Entities conducting financial activity underground (i.e., without proper authorisation) are identified, moved into the formal financial system (i.e., registered or licensed), and/or sanctioned, as appropriate.

F. PROMOTING A CLEAR UNDERSTANDING OF AML/CFT OBLIGATIONS AND ML/TF RISKS

55. Effective information processes should ensure that clear, relevant, meaningful and up-to-date AML/CFT-related information is made available to financial institutions. Information provided by supervisors can take any form, be communicated in various ways, and may include changes to the AML/CFT-related legal framework, explanation of the AML/CFT regulatory requirements, relevant typologies, updates on ML/TF vulnerabilities, risks and threats, and regulatory expectations. For example, if a detected risk is new, such risks should be assessed and relevant information should be shared with financial institutions, and supervisors should determine whether additional guidance or other action is necessary. Inconsistent interpretation of AML/CFT obligations can impact the effectiveness of the supervisory regime. Information should be targeted for the audience, and may include guidance (international and domestic), updates, formal and informal meetings.

FEATURES OF EFFECTIVE INFORMATION PROCESSES

56. Disclosed information to financial institutions should:

a. be based on a clear understanding of ML/TF risks (including vulnerabilities and threats) present at both national and international level, specifically within the financial sector as a whole and within each of its subsectors;

b. be targeted, practical, up-to-date, easy to understand and apply;

c. outline supervisory expectations and explain rule-making: for example, it is based on supervisory work (e.g., best practices, bad practices, high risk areas) and on relevant documentation issued by standard setters;

d. help financial institutions to identify ML/TF risks associated with customers, products and services, geographic areas of operations, or their distribution channels, by providing risk indicators and/or typologies for identifying and monitoring risk;

e. clarify that financial institutions should not open accounts, commence business relations or perform transactions, or to terminate business relationships for customers when they are unable to apply appropriate CDD measures (pursuant to the FATF Recommendations); and

f. highlight new requirements, emerging ML/TF risks, and examples of recent supervisory actions, where appropriate.

57. The disclosed information should be easily accessible:

a. The supervisor should use as many different delivery channels as appropriate (e.g., web-based, written exchanges with individual financial institutions, bilateral meetings, seminars, conferences, outreach with representative associations, annual reports, advisory circulars) to communicate with financial institutions, and to enable the information to reach a wider audience.

b. The supervisor's website should be easy to navigate and may include a dedicated page or site for AML/CFT preventive measures, including TFS issues.

58. The supervisor should engage in an on-going dialogue with the its supervised financial institutions. The supervisor should provide a framework for open communications with financial institutions. There should be clear and effective lines of communication between financial institutions and supervisors. Where it is appropriate to give feedback, the supervisor's responses should be clear, useful, and delivered in a timely fashion. Guidance or expectations can be communicated industry-wide through written materials, such as case studies or poor/better practices, or industry-wide training/seminars, so that all financial institutions are informed of good practices.

59. Messages and guidance from the supervisor should be consistent. The supervisor should review its regulations and guidelines on AML/CFT to ensure that they are relevant and up-to-date.

60. The supervisor should consult the industry when proposing to make new regulations or regulatory amendments, and respond to and clarify issues raised by the industry.

Examples of dialogue with the sector

Example 22. **Thematic review to facilitate a root cause analysis (Netherlands)**

Thematic examinations are used to effectively influence the level of compliance of FIs. The examination was on ongoing due diligence measures of banks, life insurers and trust offices. The project focused on the measures regarding periodic review of clients, transaction monitoring, STR reporting, and screening and filtering against the sanctions lists. Thirty FIs, 10 from each sector, were selected based on several factors, such as size, client base and results of previous AML/CFT examinations. The selected FIs received a questionnaire with qualitative and quantitative questions.

The project team analysed all answers using a scoring system, 1 (compliant) to 4 (non-compliant). Based on the scores, several FIs were selected for a further in-depth on-site examination. The in-depth on-site AML/CFT examinations result in a report to the FIs and further enforcement actions in some cases. The sectors are kept informed of the thematic examinations through an annual publication on the themes and regular updates through newsletters.

The project team also made a root cause analysis in each sector: e.g., why a certain sector reports relatively few STRs, is the reason for non-compliance not being able to comply, or not

understanding the requirements? Based on the root cause analysis, additional supervisory approaches are used. For example, round table discussions or seminars in cooperation with the FIU and associations with representatives of FIs, or dialogue sessions with individual institutions to develop good and bad practices. Round table discussions or dialogue sessions result in further guidance.

Example 23. **Thematic review helps illustrate potential vulnerabilities with targeted financial sanctions compliance (Jersey)**

The supervisor is running a thematic review of AML/CFT compliance, covering systems and controls around client screening and sanctions. A self-assessment questionnaire has been completed by all deposit-takers, which was followed by a series of on-site examinations. Deposit-takers were provided with a list of names to pass through screening filters used at the FI. The list aims to test matching capacity of the system, and the exercise has proved very useful in illustrating potential vulnerabilities and demonstrating to what extent management of FIs understand the scope and calibration of their screening arrangements.

Example 24. **Thematic review helps to assess current or emerging risks (United Kingdom)**

The supervisor, the Financial Conduct Authority (FCA), uses thematic reviews to assess a current or emerging risk relating to an issue or product across a number of firms within a sector or market. In 2014, it published its report *How small banks manage money laundering and sanctions risk*. The report was a follow-up to an FSA (the FCA's predecessor) review in 2011 and paid particular attention to mid to smaller sized banks' management of higher risk money-laundering situations. As a result of these reviews, and following consultation with industry, the FCA has since updated its Financial Crime: a guide for firms. This guide provides practical guidance to firms on the steps they can take to reduce their financial crime risk. It is well utilised by industry; it does not contain rules but sets out good and poor practice on the management of higher risk situations so firms can adopt a more effective, risk-based and outcomes-focused approach to mitigating financial crime risk. To further expand its dialogue with industry on its 2014 report, the FCA broadcast its first ever AML thematic review webinar which attracted a large audience from across industry. The FCA is currently exploring similar innovative and effective methods of communicating with industry across other areas of its AML work.

Example 25. **Thematic review to have full knowledge of the sector (Mexico)**

In order to have full knowledge of financial institutions under its supervision, the National Banking and Securities Commission (CNBV) launched in May 2014 the "Know Your Entity Program", which covers in detail FIs' business model, types of their customers, products and services offered, monetary instruments, geographical areas they operate, among other key areas of topics.

Derived from the AML/CFT data analysis from each of the participating entities, recommendations to strengthen its processes and measures to manage and mitigate ML/TF risks are made.[21] This

[21] In accordance with paragraph 22 of the "Guide for Risk-Based Approach for the Banking Sector".

program represents a direct communication channel with the supervised sectors and an effective forum for sharing experiences and concerns between FIs and the authority.

Example 26. **Publication of common findings (Jersey)**

Summary findings reports, based on common findings from on-site examinations, are regularly published, so that licence-holders which did not undergo an examination can learn from issues emerging in the relevant sector. Occasional guidance notes are also published, informed by examination findings. Work is ongoing to produce a guidance note highlighting examples of effective and less effective compliance monitoring arrangements.

Example 27. **Regular meeting with the sector (South Africa)**

Quarterly meetings are held with the association for savings and investment in the country. All issues affecting the industry would be discussed. The regular meetings develop a good relationship between the supervisor and the industry and ensure industry's compliance with the regulatory frameworks, including AML/CFT measures. All issues of non-compliance are referred to the enforcement unit, and its decisions are published.

FIs complete an annual compliance report and submit it to the supervisor. The questionnaire in the compliance report guides FIs. In addition to compliance inspections to the premises of FIs, the supervisor provides guidance and training to FIs by hosting seminars and facilitating workshops on AML/CFT laws and regulations. These supervisory actions have proved effective on the part of FIs to improve overall compliance with AML/CFT legislation and the way to manage AML/CFT risks.

Example 28. **Cross section working groups (Isle of Man)**

The Isle of Man has identified that it is useful to discuss any potential issues with AML/CFT legislation with the industry and not just amongst the regulators. Therefore, if further information on a matter is needed, the FSC is able to send out electronic surveys to licence holders to gather comments / data on the matter. Also, the Isle of Man has established a working group entitled the Joint Anti-Money Laundering Advisory Group ("JAMLAG") which is made up of representatives from the industry, supervisors and professional bodies and is used as a forum to discuss any issues / areas for further development.

Considering a particular case study, the FSC recently undertook a visit to an Isle of Man-based group entity of a global financial services group. The supervisory visit uncovered some issues with AML/CFT compliance. These issues were raised firstly to the local entity and then escalated to the parent company and the supervisor in that country. It became apparent that the business had tried to use one set of procedures / processes across the business and this had not been suitable for that business.

Example 29. The French CCLCB (France)

Each instruction, guideline or position of the ACPR in the field of anti-money laundering and counter financing terrorism (AML-CFT) should, prior to its adoption by the board of the ACPR and its publication, receive an opinion of an advisory committee called the Consultative Commission Anti-

Money Laundering (CCLCB) which has been set up by the board of the ACPR. The CCLCB meets on average every two months. This commission is chaired by two members of the board of the ACPR.

It is composed of :

- all the professional associations of the French banking and insurance sectors (6 for the insurance sector; 4 for the banking sector);
- several representative persons of financial institutions designated by the ACPR.

The French Treasury Department as well as TRACFIN (French Financial Intelligence Unit) participate to meetings of the CCLCB. Other concerned authorities (for example: the Financial Market Authority or CNIL which is the competent authority on the protection of personal data) can as well be invited depending on the studied subjects.

This consultation work, including the development of guidelines, is done during meetings and can also be done by written procedure.

IV. COMPLEMENTARY PROCESSES AND ACTIONS AVAILABLE TO LAW ENFORCEMENT

61. In establishing an effective supervision and enforcement regime, prohibiting and criminalising a particular activity by law or international convention alone is insufficient: laws and regulations also need to rely on enforcement agencies and mechanisms that investigate and prosecute money laundering, financing of terrorism and predicate offences. Law enforcement should seek to prevent, deter and disrupt ML, associated predicate offences, the financing of proliferation of weapons of mass destruction and TF activity. Also, law enforcement should be aiming to deprive criminals of their illicit proceeds and terrorists of the resources needed to finance their activities.[22] While supervisors focus on the process of implementing prevention and detection measures in the financial sector, law enforcement covers investigations, prosecution, and more public punishments for criminal violations that also serve as industry-wide deterrence. Actions taken by law enforcement, where appropriate, may complement effective compliance and supervision – in other words, they take over where supervisors' mandates end.

62. Law enforcement actions are based on criminal and/or civil authority that, in some countries, is contained in the same legislation governing financial supervision. Law enforcement processes and actions are covered in the FATF Recommendations in Recommendation 30 (responsibilities of law enforcement and investigative authorities) and Recommendation 31 (powers of law enforcement and investigative authorities) and are linked to effective supervision and enforcement issues through the criminal sanctions provisions in Recommendation 35 (sanctions), as well as Recommendation 2 (national cooperation and coordination).

A. LAW ENFORCEMENT MECHANISMS

63. The law enforcement mechanism can vary, depending on what makes sense for the country. Some countries may have a dedicated or specialised unit(s) within the police force, FIU, prosecutor's office, and/or court that is able to investigate and prosecute criminal violations of AML/CFT preventive measures. Other countries may allow any law enforcement agency to bring forth criminal charges for ML/TF based on the predicate activity or criminal conduct. For further information on investigatory practices see the *FATF Financial Investigations Guidance*[23].

64. A financial institution may be administratively sanctioned by a supervisor for failure in effective management of ML/TF risks in the institution. To the extent that the failures in the institution result in violations of law or regulation, it may also be subject to criminal sanctions.

[22] See FATF (2012), paragraph 4.

[23] FATF (2010).

Box 2. **Examples of law enforcement mechanisms**

Supervisors with both regulatory and criminal power	Supervisors have the authority to take a range of supervisory actions, and the authority to take criminal actions.
Enforcement referral from supervisor	Law enforcement agency receives referral from supervisor and proceeds with investigation.
Parallel actions / investigations	Supervisor either refers an issue, or independent investigations by supervisor and/or law enforcement reveal an issue and both the supervisor(s) and law enforcement take an appropriate enforcement action.
Direct action by law enforcement agency	Action that is not prompted by supervisory action or an action undertaken independently from ongoing supervisory action.

65. Law enforcement authorities can be involved in a number of ways, and a country should determine which mechanism works best for its regime.

SUPERVISORS WITH BOTH REGULATORY AND CRIMINAL POWER

66. In some cases, supervisors have the authority to take a range of supervisory actions, and the authority to take criminal actions other arrangements.

Example of supervisors with both regulatory and criminal power

Example 30. **Supervisors with both regulatory and criminal power (United Kingdom)**

The UK's Financial Conduct Authority (FCA) takes regulatory action and imposes substantial fines against firms and individuals for AML systems and controls failures. The FCA does not have statutory powers of investigation allowing it to investigate stand-alone offences of substantive money laundering (as opposed to systems failures) but has prosecuted allegations of substantive money laundering in the context of criminal prosecutions (for offences such as insider dealing) brought in furtherance of its statutory objectives. The FCA also liaises closely with other law enforcement agencies to which it refers stand-alone investigations of substantive money laundering.

ENFORCEMENT REFERRAL FROM SUPERVISOR

67. In other arrangements, an AML/CFT supervisor may not have the legal authority to investigate potential criminal activity/conduct by the financial institution and is required by law or by common practice to communicate or make a formal referral to law enforcement. Law enforcement proceeds with the investigation, and based on their policies and procedures, determines whether or not to pursue an enforcement action.

Examples of enforcement referral from supervisor

Example 31**. Enforcement referral from supervisor (BVI)**

It is usually the case that administrative AML/CFT breaches are handled either by the Financial Services Commission (FSC) or the Financial Intelligence Agency (FIA). If during this time it is found that there is some criminal element to the breach, it is then turned over to the police. Conversely, if the police encounter cases that may reveal a breach in the AML/CFT framework, this information is passed on to the police financial investigation unit for further investigation.

The police FIU can, through established memoranda of understanding share information with the BVI FIA and BVI FSC.

Example 32. **Enforcement referral from supervisor (Denmark)**

If *Finanstilsynets* (FSA) inspection/examination reveals breaches, the FSA reports its findings to the State Prosecutor for Serious Economic and International Crime. The Prosecutor will then decide on the merits of the case after due investigation of whether to initiate criminal proceedings. The FSA will issue administrative orders and continue its investigations until all administrative orders have been complied with.

PARALLEL ACTIONS/INVESTIGATIONS

68. In other situations, the supervisor may refer an issue to law enforcement, or an independent investigation by supervisor and/or law enforcement may reveal a breach. Characteristics of parallel actions/investigations include both supervisors and law enforcement using their resources to address the issue and take the appropriate action. Effective coordination between agencies, including announcements of any enforcement decisions, is particularly important where more than one agency is conducting an investigation into the same financial institution at the same time.

Examples of parallel actions/investigations

Example 33. **Parallel investigations (United States)**

Prosecutors and the FIU have complementary authorities to investigate and sanction financial institutions that do not comply with the US AML law. In addition to separate financial supervisors' corrective actions and enforcement action, in the United States, Department of Justice (DOJ), pursuant to 31 U.S.C. § 5322, has authority to bring criminal actions against financial institutions that wilfully fail to comply with the statutory and regulatory obligations under its principal AML law (Title 31 of the BSA). For example, under this authority, DOJ may pursue criminal charges against a financial institution that wilfully fails to comply with its statutory and regulatory requirements for maintaining an AML or customer identification program, reporting suspicious activity or other relevant provisions of the AML law. DOJ does not have any supervisory authority under the BSA.

DOJ has criminal authority for money laundering violations and the ability to prosecute unlicensed

money transmitting businesses.

FinCEN is also authorized to assess civil money penalties against a financial institution, non-financial trade or business, or a partner, director, officer, or employee of a financial institution or non-financial trade or business for wilful or negligent violations of the AML law. These violations can include record keeping, reporting, or failure to maintain and an adequate anti-money laundering program.

- Further, FinCEN may assess a penalty against a person who owns or controls a money services business and does not register with FinCEN.
- For a person who violates the structuring provisions of the AML law, FinCEN may assess a civil money penalty not to exceed the amount of the coins or currency involved in the transactions.
- FinCEN may assess a civil money penalty of not less than two times the amount of the transaction up to USD 1 000 000 against a financial institution that violates the AML requirements of due diligence on correspondent and private banking or the prohibition on correspondent shell banks.
- In addition to the ability to assess civil money penalties, FinCEN is authorised to seek injunctions, enact 311 special measures regulations, and issue geographic targeting orders. FinCEN may bring a civil action to enjoin a person who has violated, is violating, or will violate the AML law.

311 Special Measure regulations are enacted when a country outside of the United States, a financial institution operating outside of the United States, a class of transactions within or involving a country outside of the United States or a type of account is determined to be of primary money laundering concern.

DIRECT ACTION BY LAW ENFORCEMENT

69. An action that is not prompted by supervisory action and undertaken independently from ongoing supervisory action is a direct standalone action. In this mechanism, law enforcement authorities that uncover possible involvement in criminal activity by financial institutions open a criminal investigation to determine if the financial institution is wittingly or unwittingly involved in the activity, and if the financial institution is complying with AML/CFT laws and regulations that are designed to prevent criminal abuse. Law enforcement action may extend to investigate criminal activity by those that abuse the financial institution. Effective coordination should be encouraged between law enforcement and supervisors as an action may have a de-stabilising impact for globally systemically important banks.

Examples of direct action by law enforcement agency

Example 34. **Direct action by law enforcement agency (Denmark)**

According to the Danish AML/CTF Act, the FSA is obligated to complete a summary of all AML/CTF investigation reports, which should include, inter alia, a summary of administrative orders. The summary shall be published by the institution in question on its website and by the FSA on its website as well. On the basis hereof the State Prosecutor for Serious Economic and International Crime may decide to initiate prosecutions *ex officio*, i.e. without a formal request from the FSA.

Example 35. **Slovak Republic (FIU as part of National Police Force)**

FIU serves as central national unit for the area of the prevention and detection of legalization and terrorist financing. FIU disseminates information to law enforcement authoritie (LEAs) obtained according to AML/CFT Law, if the facts indicate that a criminal offence has been committed. FIU within cooperation with LEAs ensures postponement of performing of unusual transaction pursuant to Section 18 of AML/CFT Law related to disseminated cases. On the basis of this act, LEAs have an appropriate time (72 hours) to make a decision about further steps (e.g. seizure of funds on the customer's bank account). In serious cases, FIU acquires information and documents from financial institutions for LEA's further utilization. FIU may also mediate direct contact between LEAs and compliance officer of obliged entity.

FIU is incorporated in the National Criminal Agency, within the organization structure of the Slovak Police Force. The most serious cases and information related to subject under special-interest of other Units of the National Criminal Agency are disseminating to LEAs within the National Criminal Agency. The National Criminal Agency has subject-matter jurisdiction for those crimes for which the Specialized Criminal Court is authorized. In other cases FIU disseminates information to LEAs pursuant to Regulation of Minister of Interior of the Slovak Republic No. 175/2010 on the definition of jurisdiction of police departments of Presidium of Police Force and departments of the Ministry of Interior of the Slovak Republic in detecting criminal offences, identifying their perpetrators and on the procedure in criminal proceedings.

LEAs are independent within process, they are authorised to request cooperation from FIU, other units of Police Force or state bodies.

B. COOPERATION AND COORDINATION

70. Even under the most thorough supervisory framework, there is a risk of a financial institution breaching AML/CFT laws or regulations. In some circumstances, these breaches can result in actions taken by the jurisdiction's judicial or law enforcement authorities, in addition to, or as an alternative to, a supervisory action. For example, a financial institution may be sanctioned by a financial supervisor for failing to effectively manage the institution's ML/TF risks and, to the extent that such failures result in violations of law or regulation, it may also be subject to appropriate criminal sanctions provided by law where appropriate and proportionate, and where it is considered that such action will be effective in improving future compliance.

71. While in some countries, cooperation and coordination may not be mandated by law or regulation, in practice, law enforcement should engage with the supervisor(s) of the investigated financial institution as supervisors can share useful information that may impact the action. For example, where appropriate, supervisors may provide the relevant supervisory information (e.g., examination findings corrective plans) that may be useful to law enforcement during the course of their investigation, as well as information about the systemic importance of the financial institution in the sector. This is also applicable to broader prudential supervisors since they review risks beyond AML/CFT that could have impact on the safety and soundness of financial institutions.

72. Additionally, a parallel investigation by both law enforcement and supervisors, direct action or referral by either authority, and law enforcement and supervisors cooperation can maximize efficiency in resources, and a coordinated approach by both may send separate yet complementary messages to the broader financial community about AML/CFT priorities.

73. On the other hand, the failure of supervisors and law enforcement authorities to cooperate and coordinate in appropriate circumstances may have serious unintended consequences which may, in the worst case, jeopardise an ongoing criminal investigation (e.g., by inadvertently tipping off a suspect).

74. Further, where a financial institution operates in a number of countries and must comply with the laws of those countries, it is essential that law enforcement authorities and supervisors collaborate and coordinate their actions with those in the other relevant countries at both state and national level. Collaboration is particularly important in cases involving global, systemically important financial institutions where enforcement action can have unintended consequences on confidence in and the stability of the institution and global financial system.

FEATURES OF EFFECTIVE LAW ENFORCEMENT COORDINATION (DOMESTIC AND CROSS BORDER)

75. Law enforcement authorities should coordinate their actions with supervisors and other law enforcement bodies. Coordination allows competent authorities to take action under their authorities and promote information sharing between them.

76. The level of coordination may also depend on information sharing practices (e.g., law enforcement authority's or other supervisor's access to STR information for the purpose of supervising implementation of the STR reporting requirements and quality of STRs, transparency of legal persons and arrangements, assessing risk, etc.) and the particular circumstances of the action (e.g., the types of action, whether criminal or civil, or whether other supervisors are also investigating the same conduct). Dialogues should be encouraged among the relevant authorities before public enforcement actions. When violations of AML/CFT regulatory requirements by financial institutions are investigated and prosecuted by law enforcement, coordination between supervisors and law enforcement should be strongly encouraged.

77. The broad objectives of maintaining financial market stability and preserving the rights of consumers may require a supervisor to carefully consider what kind of actions to take and whether they should be publicised or not. Actions by supervisors and law enforcement authorities represent separate but complementary components of a country's overall regulation of its financial

institutions and markets, focusing on different areas of potential weaknesses and deficiencies that require tailored responses.

Examples of cooperation and coordination

Example 36. **Coordination and referrals (United States)**

General Coordination: Law enforcement, the FIU and supervisory agencies coordinate or consult with each other in connection with (i) the sharing of routine BSA/AML information pursuant to Memoranda of Understanding (MOUs); (ii) enforcement actions involving areas of mutual interest, and (iii) policy matters involving BSA/AML. With respect to item (i) the agencies generally have MOUs in place with FinCEN and OFAC for sharing routine examination information and significant problems. Generally, with respect to (ii), the agencies routinely work closely with FinCEN and OFAC and coordinate enforcement actions. The level of enforcement coordination depends on the particular circumstances of the action (e.g., the type of action, whether criminal or civil, or whether other supervisors are investigating the same conduct). In certain cases, the agencies will work closely with FinCEN and law enforcement in identifying and reporting suspicious activity. The agencies will also provide expertise and support to law enforcement in complex cases. The recent high-profile interagency public enforcement actions taken against a major bank involved the efforts of multiple USG agencies (OCC, FRB, FinCEN, DOJ, OFAC and the Office of the New York District Attorney (DANY). In fact, virtually all high profile BSA/AML public enforcement actions have involved coordinated interagency efforts to ensure BSA/AML compliance.

With respect to (iii) FinCEN, the agencies and DOJ coordinate closely on BSA/AML policy matters including rulemaking and the issuance of guidance. Interagency working groups, such as the Bank Secrecy Act Advisory Group (BSAAG) and the FFIEC BSA/AML Working Group, bring together staff from, the various agencies on a regular basis to share information on threats, vulnerabilities and risks and discuss upcoming rulemakings, guidance issuances and other issues related to strengthening BSA compliance and enforcement.

Referrals Generally: Most agencies generally make and receive referrals on an ad-hoc, case-by-case basis. The process for referring matters to criminal authorities, however, can be more formalized at certain agencies because of legal issues that arise in connection with parallel criminal and civil enforcement actions. For example, the SEC has formal procedures for referring matters to the DOJ or criminal investigative authorities. The FDIC refers criminal matters through its Office of Inspector General-Office of Investigations, which acts as a primary point of contact for other criminal authorities. The OCC's Law Department acts as a primary point of contact for law enforcement and routinely coordinates on grand jury procedures and other information sharing processes. Similarly, the FRB's Legal Division acts as a primary point of contact for law enforcement matters.

Example 37. **Cayman Islands**

In 2005, a person of the Cayman Islands was sentenced to three years in prison for his role in an international money-laundering scheme. The person was convicted of assisting Mr. A and Mr. B,

both of the United States, with engaging and benefiting from criminal conduct using a "Ponzi" scheme known as Cash4Titles.

Two companies subjected to fraudulent activity were regulated by the Cayman Islands Monetary Authority (CIMA) pursuant to the Companies Management Law. Through effective exchange of information between the U.S. Securities and Exchange Commission and the Financial Reporting Authority, CIMA conducted onsite inspections of the respective entities to garner further information. This resulted in an application being filed in the Cayman Islands Grand Court with recommendations to have Controllers appointed to both entities in the interest of investors, creditors and public at large; the companies were subsequently placed into liquidation.

Following this case, CIMA implemented an onsite inspection program for trust and corporate services providers.

C. LAW ENFORCEMENT SANCTIONS

78. The role of law enforcement authorities (who operate in the criminal context) is separate from the role of supervisory authorities (who operate in the regulatory context), as are the sanctions available to them.

FEATURES OF EFFECTIVE LAW ENFORCEMENT SANCTIONS

79. Criminal sanctions are available to address instances of egregious conduct (e.g., wilful and deliberate violations of sanctions or AML/CFT measures and/or behaviour which in itself constitutes money laundering or terrorist financing).

80. The sanctions available to law enforcement authorities include imprisonment, criminal fines and confiscation.

81. Criminal sanctions apply to natural persons and legal persons, unless the latter is not permitted by fundamental principles of domestic law.

V. GRAPHIC OVERVIEW OF THESE ELEMENTS

82. For the purposes of achieving effective compliance with the FATF Recommendations, countries can be guided by the comprehensive graphic overview for effective supervision and enforcement as below.

Graphic Overview of Basic Features of Supervision and Enforcement

GLOSSARY

Glossary definitions from the FATF Recommendations, adopted February 2012.

Core Principles	*Core Principles* refers to the Core Principles for Effective Banking Supervision issued by the Basel Committee on Banking Supervision, the Objectives and Principles for Securities Regulation issued by the International Organization of Securities Commissions, and the Insurance Supervisory Principles issued by the International Association of Insurance Supervisors.
Financial group	*Financial group* means a group that consists of a parent company or of any other type of legal person exercising control and coordinating functions over the rest of the group for the application of group supervision under the Core Principles, together with branches and/or subsidiaries that are subject to AML/CFT policies and procedures at the group level.
Financial institutions	*Financial institutions* means any natural or legal person who conducts as a business one or more of the following activities or operations for or on behalf of a customer: 1. Acceptance of deposits and other repayable funds from the public.[24] 2. Lending.[25] 3. Financial leasing.[26] 4. Money or value transfer services.[27] 5. Issuing and managing means of payment (e.g. credit and debit cards, cheques, traveller's cheques, money orders and bankers' drafts, electronic money). 6. Financial guarantees and commitments. 7. Trading in: (a) money market instruments (cheques, bills, certificates of deposit, derivatives etc.);

[24] This also captures private banking.

[25] This includes *inter alia*: consumer credit; mortgage credit; factoring, with or without recourse; and finance of commercial transactions (including forfeiting).

[26] This does not extend to financial leasing arrangements in relation to consumer products.

[27] It does not apply to any natural or legal person that provides financial institutions solely with message or other support systems for transmitting funds. See the Interpretive Note to Recommendation 16.

	(b) foreign exchange; (c) exchange, interest rate and index instruments; (d) transferable securities; (e) commodity futures trading. 8. Participation in securities issues and the provision of financial services related to such issues. 9. Individual and collective portfolio management. 10. Safekeeping and administration of cash or liquid securities on behalf of other persons. 11. Otherwise investing, administering or managing funds or money on behalf of other persons. 12. Underwriting and placement of life insurance and other investment related insurance[28]. 13. Money and currency changing.
Money or value transfer service	*Money or value transfer services (MVTS)* refers to financial services that involve the acceptance of cash, cheques, other monetary instruments or other stores of value and the payment of a corresponding sum in cash or other form to a beneficiary by means of a communication, message, transfer, or through a clearing network to which the MVTS provider belongs. Transactions performed by such services can involve one or more intermediaries and a final payment to a third party, and may include any new payment methods. Sometimes these services have ties to particular geographic regions and are described using a variety of specific terms, including *hawala, hundi*, and *fei-chen.*
Targeted financial sanctions	The term *targeted financial sanctions* means both asset freezing and prohibitions to prevent funds or other assets from being made available, directly or indirectly, for the benefit of designated persons and entities

[28] This applies both to insurance undertakings and to insurance intermediaries (agents and brokers).

FATF, *Guidance for a Risk-Based Approach: Money or Value Transfer Services* (Paris: FATF, 2016)

FATF

GUIDANCE FOR A RISK-BASED APPROACH

MONEY OR VALUE TRANSFER SERVICES

FEBRUARY 2016

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

TABLE OF CONTENTS

TABLE OF ACRONYMS

AML/CFT	Anti-money laundering / countering the financing of terrorism
CDD	Customer due diligence
DNFBPs	Designated non-financial businesses and professions
FIU	financial intelligence unit
HOSSP	Hawala and other similar service providers
INR.	Interpretive Note to Recommendation
ML	money laundering
MSB	money service business
MVTS	money or value transfer services
NPPS	new payment products and services
R.	Recommendation
RBA	risk-based approach
STR	suspicious transaction report
TCSP	trust and company service providers
TF	terrorist financing

GUIDANCE FOR A RISK-BASED APPROACH FOR MONEY OR VALUE TRANSFER SERVICES

This Guidance should be read in conjunction with:

- the FATF Recommendations, especially Recommendations 1, 10, 14, 16 and 26 (R. 1, R. 14, R.16 and R. 26), their Interpretive Notes (INR) and the Glossary
- the *FATF RBA Guidance for the banking sector*

other relevant FATF Guidance documents, such as:

- the *FATF Guidance on National Money Laundering and Terrorist Financing Risk Assessment*
- the *FATF Guidance on Politically Exposed Persons*
- the *FATF Guidance on AML/CFT and Financial Inclusion*
- the *FATF Guidance for a Risk-Based Approach: Prepaid Cards, Mobile Payments and Internet-based Payment Services*
- the *FATF Guidance on the Risk-Based Approach for Effective Supervision and Enforcement*

relevant FATF typology reports, such as:

- *the FATF Report: Money Laundering through Money Remittance and Currency Exchange Providers*
- *the FATF Report: The role of Hawala and other similar service providers in money laundering and terrorist financing*

INTRODUCTION AND KEY CONCEPTS

A. BACKGROUND AND CONTEXT

1. The risk-based approach (RBA) is central to the effective implementation of the revised FATF *International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation*, which were adopted in 2012[1]. The FATF has reviewed its 2009 RBA Guidance for money service businesses (MSBs), in order to bring it in line with the new FATF requirements[2] and to reflect the experience gained by public authorities and the private sector over the years in

1 FATF (2012).

2 The FATF Standards are comprised of the FATF Recommendations, their Interpretive Notes and applicable definitions from the Glossary.

applying the RBA. This revised version applies to the money or value transfer services (MVTS)[3] sector. The FATF will also review and update its other RBA Guidance papers[4] (based on the 2003 Recommendations), to be consistent with the 2012 FATF Recommendations.

2. The first draft of the RBA Guidance for the MVTS sector was drafted by the MVTS Project group, co-led by the UK and Mexico.[5] Representatives of the private sector were associated with the work and consulted on the draft document.[6]

3. The FATF adopted this updated RBA Guidance for MVTS providers at its February 2016 Plenary.

B. PURPOSE OF THIS GUIDANCE

4. The purpose of this Guidance is to:

- Support the development of a common understanding of what the RBA to AML/CFT entails for MVTS providers, banks and other financial institutions that maintain relationship with MVTS providers and competent authorities responsible for monitoring MVTS provider's compliance with their AML/CFT obligations;
- Outline the key elements involved in applying a RBA to AML/CFT associated to MVTS;
- Highlight that financial institutions that have MVTS as customers should identify, assess and manage the ML/TF risk associated with individual MVTS, rather than avoid this category of customers;
- Assist countries, competent authorities and MVTS providers in the design and implementation of a RBA to AML/CFT by providing general guidelines and examples of current practice;

---

3 These services are included in the FATF Glossary under "Financial institutions: Money or Value Transfer Services (MVTS) at point 4.

4 Between June 2007 and October 2009, the FATF adopted a set of guidance papers on the application of the RBA for different business sectors: financial sector, real estate agents, accountants, trust and company service providers (TCSPs), dealers in precious metals and stones, casinos, legal professionals, money services businesses (MSBs) and the life insurance sector: www.fatf-gafi.org/documents/riskbasedapproach/.

5 The project group was composed of FATF-members (Spain, Switzerland, South-Africa, Singapore, Japan, Norway, European Commission, New Zealand, United Kingdom, United States and Italy), Associate members (GIABA-Secretariat, Moneyval -through Albania, APG- through Sri Lanka, GIFCS-through Guernsey) and Observers (World Bank, UNODC), co-led by the UK and Mexico.

6 Comments were received from Bank of Tokyo-Mitsubishi UFJ, Russian Electronic Money Association, MoneyGram International Inc., Mizuho Bank Ltd, Asociación de Bancos de México, Actors Federal Credit Union, Association of UK Payment Institutions, Banking Association of South Africa, European Payments Institutions Federation (EPIF), Australian Bankers' Association, Union of Arab Banks, World Savings and Retail Banking Institute/European Savings and Retail Banking Group (WSBI/ESBG), Canadian MSB Association, The Netherlands Association of Money transaction offices (NVGTK), Western Union Company and Hong Kong Association of banks (HKAB).

- Assist countries in the implementation of the *FATF Recommendations* with respect to MVTS, particularly Recommendations 14 and 26; and
- Support the effective implementation and supervision of national AML/CFT measures, by focusing on risks and on preventive and mitigating measures.

C. TARGET AUDIENCE, STATUS AND CONTENT OF THE GUIDANCE

5. This Guidance is aimed at the following audience:

- Countries and their competent authorities, including AML/CFT supervisors of MVTS providers and AML/CFT supervisors of banks that have MVTS providers as customers, and Financial Intelligence Units (FIU);
- Practitioners in the MVTS sector; and
- Practitioners in the banking sector that have or considering MVTS providers as customers.

6. It consists of four sections. Section I sets out the key elements of the RBA and needs to be read in conjunction with Sections II to IV, which provide specific Guidance to MVTS providers (Section II), to supervisors of MVTS providers on the effective implementation of a RBA (Section III) and to banks that have MVTS providers as customers and supervisors of banks that have MVTS providers as customers (Section IV). There are five annexes which provide examples of:

- countries' actions against unauthorised MVTS providers (Annex 1),
- supervisory practices for the implementation of the RBA to MVTS (Annex 2),
- supervisory practices for the implementation of the RBA to banking MVTS customers (Annex 3),
- private sector effective practices in application of RBA (Annex 4) and,
- compliance practices of and in relation to a low risk MVTS (Annex 5).

7. This Guidance recognises that an effective RBA will reflect the nature, diversity and maturity of a country's MVTS sector, the risk profile of the sector, the risk profile of individual MVTS providers operating in the sector and the legal and regulatory approach in the country. It sets out different elements that countries and MVTS providers could consider when designing and implementing a RBA. When considering the general principles outlined in the Guidance, national authorities will have to take into consideration their national context, including the supervisory approach and legal framework as well as the risks present in their jurisdiction.

8. The Guidance takes into account that any financial institution, including certain MVTS providers can be abused for ML or TF. The TF risks were also highlighted in the recent FATF report in the context of emerging terrorist threats[7]. However, the Guidance also seeks to clarify that while certain MVTS providers may act as a conduit for such illegal funds transfers, this should not necessarily result into categorisation of all MVTS providers as inherently high ML/TF risk. The

[7] FATF (2015c).

overall risks and threats are influenced by the extent and quality of regulatory and supervisory framework as well as the implementation of risk-based controls and mitigating measures by each MVTS provider. The Guidance also recognises that despite these measures, there may still be left some residual risk, which would need to be considered by competent authorities and MVTS providers in devising appropriate solutions.

9. This Guidance is non-binding and does not overrule the purview of national authorities, including on their assessment and categorisation of the MVTS sector as per the country or regional circumstances, the prevailing ML/TF risk situation and other contextual factors. It draws on the experiences of countries and of the private sector and may assist competent authorities and financial institutions to effectively implement applicable *FATF Recommendations* using a risk-based approach.

D. SCOPE OF THE GUIDANCE: TERMINOLOGY, KEY FEATURES AND BUSINESS MODELS

Terminology

10. This Guidance applies to the provision of Money or Value Transfer Services (MVTS) as defined by the FATF:

> *Money or value transfer services (MVTS)* refers to financial services that involve the acceptance of cash, cheques, other monetary instruments or other stores of value and the payment of a corresponding sum in cash or other form to a beneficiary by means of a communication, message, transfer, or through a clearing network to which the MVTS provider belongs. Transactions performed by such services can involve one or more intermediaries and a final payment to a third party, and may include any new payment methods. Sometimes these services have ties to particular geographic regions and are described using a variety of specific terms, including hawala, hundi, and fei-chen.[8]

11. There is a range of participants involved in the provision of MVTS. For the purpose of this Guidance, the following terminology is used:

- *MVTS provider*: Any natural or legal person who is licensed or registered to provide MVTS as a business, by a competent authority, including through agents or a network of agents.[9] This also includes HOSSPs meeting the aforementioned criteria.
- *Hawala and other similar service providers ("HOSSP")*: Generally referred to as entities that provide MVTS, particularly with ties to specific geographical regions or ethnic communities, which arrange for transfer and receipt of funds or equivalent value which is settled through trade, cash and/or net settlement over an extended period of time, rather than simultaneously with the transfer.[10]
- *Agent*: Any natural or legal person providing MVTS on behalf of an MVTS provider, whether by contract with or under the direction of the MVTS provider.[11]

---

8 Glossary to the *FATF Recommendations.*

9 Consistent with the definition of *financial institution* in the Glossary to the *FATF Recommendations*. This does not apply to any natural or legal person that provides financial institutions solely with message or other support systems for transmitting funds. Refer interpretive Note to Recommendation 16.

10 For a full description, refer to the FATF typology report on *The role of Hawala and other similar service providers in money laundering and terrorist financing* (FATF, 2013b, 12-13). The report also lists out legitimate reasons for existence of these services as well as their vulnerability to abuse based on survey results. In some countries, these types of transactions are considered illegal.

11 Glossary to the *FATF Recommendations.*

MVTS Key features

12. Some of the key features of MVTS are as follows:

- MVTS can be an attractive, often lower cost option for persons that need to send money quickly to another person as funds can be picked up by a recipient in a relatively short timeframe, as opposed to waiting for domestic or international wire transfers that may take several days to process in some cases. The financial service provided by MVTS providers is often cheaper than more conventional banking services and is frequently used in regions with limited or no banking services.

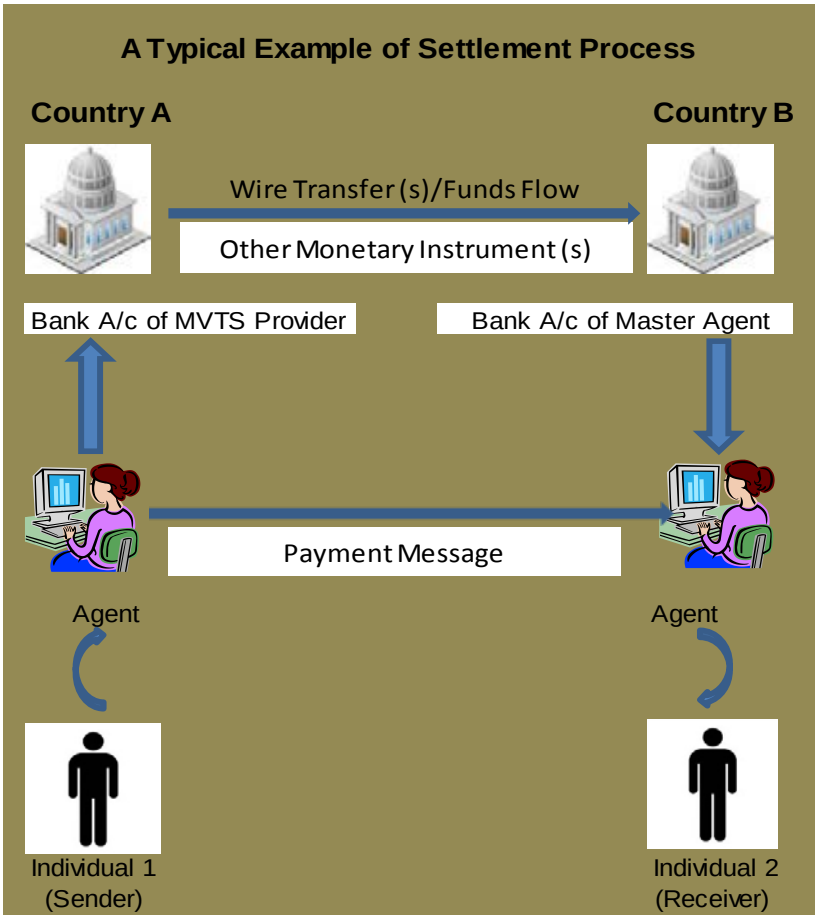
- MVTS providers operate in a variety of ways, but typically a MVTS provider or sending agent (acting on behalf of a MVTS provider) accepts payment of the money transfer, collects the required identification information, and enters the transaction and sender's applicable identification information and the destined receiver systematically at the point of origination.

- In the case of money transfer, the MVTS providers transfer the payment details to the pay-out agent that will provide the funds or their equivalent to the beneficiary of the transfer. The message is either sent directly to the agents or through a centralized clearing house that serves as a centralized hub for information that connects different agents of a provider.

- The money transfer is made available to the ultimate recipient, in the appropriate currency, at a receiving agent (acting also on behalf of a MVTS provider) location in the paying jurisdiction. The receiving agent will also collect and maintain the required identification information at the point of destination in accordance with the local applicable law.

- Pay-out methods vary by jurisdiction, but may include cash, cheque, money order, pay-out cards, mobile wallet, bank deposit or a combination.

13. A simple MVTS transaction and settlement process can be presented as follows:



14. The MVTS sector is made up of a very diverse group of organisations. An MVTS provider may be a small organisation with limited outlet locations such as grocery stores, drug-stores, pharmacies or convenience stores. It may also include a regional network of post offices or banks or other entities, which can be branches or agents. Most licensed or registered MVTS providers hold accounts at banks in order to process transfers and settle accounts with agents both domestically and internationally. However, settlement may be done through wire transfers, often involving aggregated amounts, processed through the international banking system. In addition, settlement can be done through third party payment providers.[12] However, settlement between and among MVTS providers and agents may also be undertaken through cash courier, net settlement or other mechanisms, without any direct wire transfer[13] between the originator and beneficiary.

12 FATF (2013b), p. 14.

13 The term wire transfer refers to any transaction carried out on behalf of an originator person (both natural and legal) through a financial institution by electronic means with a view to making an amount of money available to beneficiary person at a beneficiary financial institution. The originator and the beneficiary may be the same person. See Glossary Interpretative Note to Recommendation 16.

MVTS business models

15. There is a wide range of MVTS business models around the world. Not all MVTS providers are the same as they vary in size from small independent business to large multinational corporations. Some engage only in domestic transfers and others have a global footprint and transfer funds internationally. Others still may only have limited global transactions or operate in limited corridors, often between two countries that have a diaspora community. Besides the brick and mortar business models, there are also some MVTS providers that operate exclusively through the internet without any physical premise or network of agents. This Section does not seek to provide a complete description of all the MVTS business models; rather it seeks to provide an overview of common business models.

16. For the purposes of this Guidance, MVTS providers generally fall into the following broad groups:[14]

- **Banking institution offering MVTS** – Institutions that provide banking services including acceptance of deposits and other repayable funds from public; lending; and issuing or managing means of payment.[15]
- **Non-banking institution offering MVTS** – Any natural or legal person that provide MVTS as business, including through agents or a network, most commonly without the acceptance of deposits and other repayable funds from public. This includes HOSSP. Non-banking institutions offering MVTS may settle through the banking system and/or outside the banking system by cash or net settlement. Many MVTS providers may settle with agents, through the banking system either through centralized account and sub-accounts or through settlement between a centralized bank account held by the provider and individual bank accounts held by agents of the MVTS. It may also include virtual currency exchangers that fall within the definition of MVTS, where regulated as such.

17. Within the market of non-banking MVTS providers, the size and complexity of the providers vary significantly and various business models are adopted. Providers can include international MVTS providers, post offices, micro-finance institutions, mobile network operators[16], exchange houses, payment institutions[17], escrow account services, bill payment and IT and digital payment services and money transfer operators. Providers of MVTS services typically specialise along retail, commercial and wholesale lines.

---

14 Described based on financial activity being performed and may vary depending upon the regulatory framework of each jurisdiction.

15 Banking activities are activities or operations described in the FATF Glossary under "Financial Institutions", in particular 1, 2, and 5.

16 *Mobile Network Operator*: An entity that provides the technical platform to allow access to the funds through the mobile phone. In some jurisdictions, these can also be MVTS providers if they extend remittance services.

17 The term *"Payment Institutions"* is mostly related to the EU context (Payment Services Directive), which offer payment services alongside banks and other financial institutions.

18. While this Guidance is applicable to all MVTS providers, it is primarily intended for non-banking institution MVTS, including HOSSP. Banking institutions offering MVTS should consider this Guidance in conjunction with the *FATF Guidance for a Risk-Based Approach: The Banking Sector*.

Distribution channels: Agents

19. The nature and structure of agents and their relationships with MVTS providers similarly vary. International MVTS providers often have extensive agent networks spread across multiple jurisdictions. Some MVTS providers operate only domestically. Agents can include small independent entities with a contractual relationship directly with the MVTS provider to provide services on their behalf. Alternatively, agent networks may operate on a tiered structure where an agent operating on behalf of its established network of entities (e.g. through a chain of retail outlets) enters into a contractual relationship with the MVTS provider. Depending on domestic regulations, agents may require licensing or registration. Some agents may be financial institutions or obliged entities in their own right, while others may provide financial services as an ancillary business only.

20. MVTS providers may rely on foreign banks or other MVTS providers to pay funds to beneficiaries through currency drawing arrangements or otherwise, without entering into an agent relationship with these counterparties.

21. MVTS providers that are not multinational institutions may also use agents or a network of agents. The number of agents may be limited and they may be present only in certain geographical areas. In such cases, agents may have a contractual relationship with the principal MVTS provider, or services may be offered on behalf of the MVTS provider without the presence of a formal, written contract.

HOSSP

22. MVTS providers also include providers of *hawala* and other similar services. Providers of *hawala* and other similar services, like many other MVTS providers, generally send remittances of low value, though at times, this may also include high value business transfers. Such providers provide services to migrant communities, operate within a community, and are visible and accessible to their customers. Many such providers often run other businesses in addition to MVTS, and belong to networks of similar operators in other countries.[18] Some hawala providers also offer a more 'mainstream' non-hawala MVTS and mix and match the two approaches.

Relation to NPPS and VC Guidance

23. Some New Payment Products and Services (NPPS) fall within the definition of MVTS and should be licensed or registered and subject to effective monitoring systems as required by Recommendation 14. The *FATF 2013 Guidance for a Risk-Based Approach to Prepaid Cards, Mobile Payments and Internet-Based Payment Services* (FATF 2013 NPPS Guidance) is relevant for NPPS

[18] FATF (2013b), p. 13. The report further highlights that while the most significant reasons for vulnerability of these services are jurisdiction-specific, lack of supervisory resources and settlement through value or cash makes HOSSPs transactions particularly difficult for law enforcement to follow the money.

which fall within the definition of MVTS. In some jurisdictions virtual currency exchangers may fall within the definition of MVTS. The FATF published a separate Guidance document on a Risk- Based Approach to Virtual Currencies in 2015.[19]

E. FATF RECOMMENDATIONS APPLICABLE TO MVTS PROVIDERS

24. The *FATF Recommendations* relating to MVTS under Recommendation 14 and its Interpretive Note include specific requirements for countries with respect to MVTS. Additionally, MVTS providers are also considered to be *financial institutions* under *FATF Recommendations*[20] and should be subject to the full range of AML/CFT preventive measures in Recommendations 9-23, including, for example, Customer Due Diligence (CDD), record keeping and reporting of suspicious transactions. R.10 requires financial institutions to conduct CDD measures when:

i) establishing business relations;

ii) carrying out occasional transactions:

   1. above the applicable designated threshold (USD/EUR 15 000); or

   2. that are wire transfers in the circumstances covered by the Interpretive Note to Recommendation 16;

iii) there is a suspicion of money laundering or terrorist financing;

iv) the financial institution has doubts about the veracity or adequacy of previously obtained customer identification data.

25. Under Recommendation 26, MVTS providers should be subject to adequate regulation and supervision or monitoring, having regard to the ML/TF risks in that sector. This is outlined further in Section III(b) of this Guidance.

Box 1. **Recommendation 14: Money or value transfer services**

Countries should take measures to ensure that natural or legal persons that provide money or value transfer services (MVTS) are licensed or registered, and subject to effective systems for monitoring and ensuring compliance with the relevant measures called for in the FATF Recommendations. Countries should take action to identify natural or legal persons that carry out MVTS without a license or registration, and to apply appropriate sanctions.

Any natural or legal person working as an agent should also be licensed or registered by a competent authority, or the MVTS provider should maintain a current list of its agents accessible by competent authorities in the countries in which the MVTS provider and its agents operate. Countries should take measures to ensure that MVTS providers that use

19 FATF (2015b).

20 MVTS providers are considered financial institutions- Refer point 4 of the definition of the term 'financial institution' as contained in Glossary.

agents include them in their AML/CFT programmes and monitor them for compliance with these programmes.

Interpretive Note to Recommendation 14

A country need not impose a separate licensing or registration system with respect to natural or legal persons already licensed or registered as financial institutions (as defined by the *FATF Recommendations*) within that country, which, under such license or registration, are permitted to perform money or value transfer services, and which are already subject to the full range of applicable obligations under the *FATF Recommendations*.

Box 2. **Interpretive Note to Recommendation 16**

[…]

F. MONEY OR VALUE TRANSFER SERVICE OPERATORS

22. Money or value transfer service (MVTS) providers should be required to comply with all of the relevant requirements of Recommendation 16 in the countries in which they operate, directly or through their agents. In the case of a MVTS provider that controls both the ordering and the beneficiary side of a wire transfer, the MVTS provider:

(a) should take into account all the information from both the ordering and beneficiary sides in order to determine whether an STR has to be filed; and

(b) should file an STR in any country affected by the suspicious wire transfer, and make relevant transaction information available to the Financial Intelligence Unit.

[…]

Cross-border provision of services

26. Some MVTS providers provide services across national borders through establishments, including through a network of agents operating in another country. Competent authorities of the MVTS provider, acting across national borders with a physical presence through one or several agents established in another country (home country licensing/registration competent authorities), should liaise with the MVTS's host authorities to ensure any ML/TF concerns are adequately addressed[21]. Under the *FATF Recommendations*, countries should ensure that MVTS providers are

[21] Through applicable passport mechanisms. In the context of MVTS' cross border activities through agents established in another country, refer to the directive (EU) 2015/849 of 20 May 2015 on the prevention of the use of the financial system for the purposes of money laundering or terrorist financing, amending Regulation (EU) No 648/2012 of the European Parliament and of the Council, and

subject to supervision and monitoring for compliance with AML/CFT laws[22], in accordance with the institutional framework of the host country. This is without prejudice to supranational rules that would enable MVTS providers to supply services throughout the supranational jurisdiction on the basis of the legislation prevailing in the countries in which they are situated, without requiring from the host country to impose licensing or registration obligations on entities situated in another country and providing cross-border services.

27. In certain cases, MVTS are also often offered over the internet and there may be no physical presence (i.e. head office, branch or agent network) in the country where the transaction is sent or received. Competent authorities of the host jurisdiction in which the MVTS provider provides services without being physically present should liaise with the MVTS's home authority (which licenses/registers that MVTS provider and in whose jurisdiction, the MVTS provider is incorporated or resides), as appropriate to ensure that any ML/TF concerns are adequately addressed without prejudice to the right of the host country to require the submission of STRs, other threshold reports or other relevant information to the local authorities of the country where the MVTS provider operates. Similarly for AML/CFT supervision or monitoring of the MVTS providers, the home country authorities should also engage with the competent authorities of the host country where MVTS provider provides services.

28. Cross-border provision of services (including through agents or over the internet or otherwise) highlights the importance of international cooperation among the competent authorities of the relevant jurisdictions. Such international cooperation can be spontaneous or on request depending upon the nature of the specific situation.

SECTION I – THE FATF'S RISK-BASED APPROACH TO AML/CFT

A. WHAT IS THE RISK-BASED APPROACH?

29. The RBA to AML/CFT means that countries, competent authorities and MVTS providers[23], are expected to identify, assess and understand the ML/TF risks to which they are exposed and take AML/CFT measures commensurate to those risks in order to mitigate them effectively and efficiently.

30. When assessing ML/TF risk[24], countries, competent authorities and MVTS providers should analyse and seek to understand how the ML/TF risks they identify affect them and take appropriate measures to mitigate and manage those risks. The risk assessment, therefore, provides the basis for the risk-based application of AML/CFT measures.[25] For MVTS providers, this will require an investment of resources and training in order to maintain an understanding of the ML/TF risk faced

repealing Directive 2005/60/EC of the European Parliament and of the Council and Commission Directive 2006/70/EC.

22 R.14, R.16 and R.26.

23 Including both legal and natural persons, see definition of "Financial institutions" in the FATF Glossary.

24 FATF (2013a), paragraph 10.

25 FATF (2013a), paragraph 10. See also Section I D for further detail on identifying and assessing ML/TF risk.

by the sector as well as specific to its products and services, its customer base, jurisdictions operated in, and the effectiveness of actual and potential risk controls that are or can be put in place. For supervisors, this will require maintaining an understanding of the ML/TF risks specific to the MVTS providers they supervise, and the degree to which AML/CFT measures can be expected to mitigate such risks. The RBA is not a "zero failure" approach; there may be occasions where an institution has taken reasonable AML/CFT measures to identify and mitigate risks, but is still used for ML or TF purposes in isolated instances.

B. THE RATIONALE FOR A NEW APPROACH

31. In 2012, the FATF updated its Recommendations to keep pace with evolving risk and strengthen global safeguards in order to further protect the integrity of the financial system by providing governments with the tools they need to take action against financial crime.

32. One of the most important changes introduced was the increased emphasis on the RBA to AML/CFT, especially in relation to preventive measures and supervision. Whereas the 2003 Recommendations provided for the application of a RBA in some areas, the 2012 Recommendations consider the RBA to be an 'essential foundation' of a country's AML/CFT framework.[26] This is an over-arching requirement applicable to all relevant *FATF Recommendations*.

33. According to the introduction to the *FATF Recommendations*, the RBA allows countries, within the framework of the FATF requirements, to adopt a more flexible set of measures in order to target their resources more effectively and apply preventive measures that are commensurate to the nature of risks, in order to focus their efforts in the most effective way.

34. The application of a RBA is therefore not optional, but a prerequisite for the effective implementation of the FATF Recommendations by countries and financial institutions.[27]

C. APPLICATION OF THE RISK-BASED APPROACH

35. The FATF standards do not predetermine any sector as higher risk. The standards identify sectors that may be vulnerable to ML/TF; however the overall risk should be determined through an assessment of the sector at a national level. Different entities within a sector will pose higher or lower risk depending on a variety of risk including products, services, customers, geography and the strength of the entity's compliance program. Recommendation 1 sets out the scope of the application of the RBA as follows:

- Who should be subject to a country's AML/CFT regime: In addition to the sectors and activities already included in the scope of the *FATF*

26 R. 1.

27 The effectiveness of risk-based prevention and mitigation measures will be assessed as part of the mutual evaluation of the national AML/CFT regime. The effectiveness assessment will measure the extent to which a country achieves a defined set of outcomes that are central to a robust AML/CFT system and will analyse the extent to which a country's legal and institutional framework is producing the expected results. Assessors will need to take the risks, and the flexibility allowed by the RBA, into account when determining whether there are deficiencies in a country's AML/CFT measures, and their importance (FATF, 2013f).

Recommendations[28], countries should extend their regime to additional institutions, sectors or activities if they pose a higher risk of ML/TF. Countries could also consider exempting certain institutions, sectors or activities from some AML/CFT obligations where specified conditions are met, such as proven low risk of ML/TF and in strictly limited and justified circumstances.[29]

- How those subject to the AML/CFT regime should be supervised or monitored for compliance with this regime: Supervisors should ensure that financial institutions and DNFBPs are implementing their obligations under R.1. AML/CFT supervisors should consider a MVTS provider's own risk assessment and mitigation and acknowledge the degree of discretion allowed under the national RBA, while INR 26 further requires supervisors to themselves adopt a RBA to AML/CFT supervision.
- How those subject to the AML/CFT regime should be required to comply: The general principle of a RBA is that, where there are higher risks, countries should require financial institutions and DNFBPs to take enhanced measures to manage and mitigate those risks; and that, correspondingly, where the risks are assessed as lower, simplified measures may be permitted. This means that the range, degree, frequency or intensity of preventive measures and controls conducted will be stronger in higher risk scenarios. Conversely, where the ML/TF risk is assessed as lower, standard AML/CFT measures may be reduced, which means that measures must respond to each of the required four CDD components at applicable thresholds[30]. ((i) identification and verification of the customer's identity; (ii) identification of the beneficial owner; (iii) understanding the purpose of the business relationship; and (iv) on-going monitoring of the relationship), but the degree, frequency and/or the intensity of the controls conducted will be relatively lighter. In all the individual cases of MVTS providers, where risk is assessed at a standard level, the standard AML/CFT controls should apply.
- Consideration of the engagement in customer relationships with MVTS providers: Through the implementation of the RBA, financial institutions should identify, assess and understand their ML/TF risks, and manage the risk by taking commensurate action to mitigate the identified risks. This does not imply that institutions should seek to avoid risk entirely, for example, through wholesale termination of customer relationships for certain sectors. Wholesale refusal of services or termination of services to a

28 See Glossary, definitions of "Financial institutions" and "Designated non-financial businesses and professions".

29 See INR.1.

30 Recommendation 10 requires that CDD measures are always required where there is a suspicion of ML/TF.

class of customers may give rise to financial exclusion risk and may also give rise to reputational risk. Even if the MVTS services are considered as vulnerable to the risks of ML/TF based on risk assessment, it does not mean that all MVTS providers and all MVTS customers or operations pose a higher risk when taking into account the risk mitigating measures that have been put in place.

- The FATF does not support the wholesale termination or restriction of business relationships to MVTS providers (or other sectors) to avoid, rather than manage, risk in line with the FATF's risk-based approach. Rather, financial institutions should take into account the level of ML/TF risk of each individual MVTS provider customer and any applicable risk mitigation measures whether these are implemented by the financial institution or the MVTS provider customer. Usually the RBA presumes that the risk associated with any type of customer group is not static and the expectation is that within a customer group, based on a variety of factors, individual customers could also be classified into risk categories, such as low, medium or high risk, as appropriate. Measures to mitigate risk should be applied accordingly.

D. FINANCIAL INCLUSION AND AML/CFT

36. MVTS play an important role in supporting financial inclusion. In general terms, financial inclusion is about providing access to an adequate range of safe, convenient and affordable financial services to disadvantaged and other vulnerable groups, including low income, rural and undocumented persons, who have been underserved or excluded from the regulated financial sector at an affordable cost in a fair and transparent manner. It is also about making a broader range of financial services available to individuals who currently may have access to only basic financial products.

37. Money transmitters, a type of MVTS, transfer remittances. Remittances are an important financial service for people in many developing countries and are a powerful enabler of financial inclusion. However, for AML/CFT purposes, it is important that financial products and services, including MVTS, are provided through financial institutions subject to adequate regulation in line with the *FATF Recommendation.*[31] This will potentially reduce overall ML/TF risk in the financial system by bringing customers into the regulated sector. MVTS may be many customers' first or only interaction with the financial sector. Therefore, a well-designed and functioning AML/CFT policy and supervisory framework for MVTS may foster greater financial inclusion. Similarly policies that encourage financial inclusion may in turn lead to stronger AML/CFT regime, thereby reinforcing the complementary objectives of the two approaches.

38. A RBA may help foster financial inclusion, especially in the case of low-income individuals who experience difficulties in accessing the mainstream financial system. On the contrary, an indiscriminate termination or restriction of business relationships to MVTS providers without

31 FATF (2013d), p. 12.

proper risk assessment and mitigation measures could potentially increase the level of financial exclusion, diverting the customers towards services and channels bearing an increased level of risk.

SECTION II – GUIDANCE FOR MVTS PROVIDERS

39. The RBA to AML/CFT aims to foster the development of managing and mitigating measures that are commensurate with the ML/TF risks identified. In the case of MVTS providers, this applies to the types of products and services MVTS providers offer, the way they allocate their compliance resources, organise their internal controls and internal structures, and implement policies and procedures to manage and mitigate risk and deter and detect ML/TF, also taking into account agent networks.

A. RISK ASSESSMENT

40. The risk assessment forms the basis of a MVTS provider's RBA. It should enable the MVTS provider to understand how, and to what extent, it is vulnerable to ML/TF. It will often result in a stylised categorisation of risk, which will help MVTS providers determine the nature and extent of AML/CFT resources necessary to mitigate and manage that risk. It should always be properly documented, regularly updated and communicated to relevant personnel within the MVTS provider. MVTS provider's risk assessment should be commensurate with the nature and complexity of the business, the type of products and services offered, the conditions of the proposed transactions, the distribution channels used and the customers' characteristics. This includes consideration of the following factors: the nature and size of the MVTS providers' business, including whether there are multiple subsidiaries, branches or agent networks offering a wide range and variety of financial products and services; the risk profile of its customers, including whether their customer base is more diverse across different geographical locations; the extent to which the products and services offered are consistently below a given threshold; and the extent to which the MVTS provider is vulnerable to ML/TF threats.

41. Combating terrorist financing and money laundering is a global priority. MVTS providers should consult various sources of information in order to identify, manage and mitigate these risks.[32] This includes taking into account the typologies, risk indicators, red flags, guidance and/or advisories issued by the national competent authorities and FATF. Furthermore, in identifying and assessing indicators of ML/TF risk to which they are exposed, MVTS providers should consider a range of factors which may include:

- The nature, scale, diversity and complexity of their business and their target markets;
- The proportion of customers already identified as high risk;
- The jurisdictions the MVTS provider is operating in or otherwise exposed to, either through its own activities or the activities of customers, especially in jurisdictions with greater vulnerability due to contextual and various risk

[32] For example, in relation to terrorist financing, see the FATF, 2015c and 2015d, and the countries that are in the FATF's International Cooperation Review Group (ICRG) process.

factors such as the prevalence of crime, corruption, financing of terrorism, as well as the general level and quality of governance, law enforcement, AML/CFT controls, regulation and supervision, including those listed by FATF;

- The distribution channels, including the extent to which the MVTS provider deals directly with the customer and the extent to which it relies (or is allowed to rely) on third parties to conduct CDD, the complexity of the payment chain and the settlement systems used between operators in the payment chain, the use of technology and the extent to which agent networks are used;
- The internal audit and regulatory findings; and
- The volume and size of its transactions, considering the usual activity of the MVTS provider and the profile of its customers.[33]

42. Where appropriate, MVTS providers may cooperate, for example, at an industry or country level to produce institutional assessment tools that may be used by individual providers to produce their risk assessments.[34]

43. In preparing their assessment, MVTS providers should take into account quantitative and qualitative information obtained from relevant internal and external sources, such as heads of business, national and sector risk and threat assessments, crime statistics, lists and reports issued by inter-governmental international organisations and national governments, and AML/CFT mutual evaluation and follow-up reports by FATF or associated assessment bodies as well as typologies. They should review their assessment periodically and in any case, when their circumstances change or relevant new threats emerge.

44. ML/TF risks may be measured using various categories. Application of risk categories provides a strategy for managing potential risks by enabling MVTS providers to subject customers to proportionate controls and oversight. The most commonly used risk criteria are: country or geographic risk; customer risk; product/service risk and agent risk. The weight given to these risk categories (individually or in combination) in assessing the overall risk of potential ML/TF may vary from one institution to another, depending on their respective circumstances and risk management. Consequently, MVTS providers will have to make their own determination as to the risk weights; however, parameters set by law or regulation may limit a business's discretion.

45. While there is no agreed upon set of risk categories, the examples provided herein are the most commonly identified risk categories. There is no one single methodology to apply to these risk categories, and the application of these risk categories is intended to provide a strategy for

33 INR 1 and 10.

34 The *Groupe Speciale Mobile Association* (GSMA), which is a global association of mobile service providers, has developed a paper which sets out their view and interpretation of how the *FATF Recommendations* apply to mobile payment service providers and what risks and risk mitigation measures might apply. This paper has not been endorsed by the FATF, but is referenced here as one example of a relevant industry initiative. See also Chatain *et al* (2011) for a mobile money risk assessment matrix.

managing the potential risks. The following risk categories could be considered alone or in conjunction with other risk categories:

Country/Geographic Risk

46. There is no universally agreed upon definition or methodology for determining whether a particular country or geographic area (including the country/geographical area within which the MVTS provider operates) represents a higher risk for ML/TF. Country/area risk, in conjunction with other risk factors, provides useful information as to potential ML/TF risks. Factors that may be considered as indicators of risk include:

- Countries/areas identified by credible sources[35] as providing funding or support for terrorist activities or that have designated terrorist organisations operating within them.
- Countries identified by credible sources as having significant levels of organized crime, corruption, or other criminal activity, including source or transit countries for illegal drugs, human trafficking and smuggling and illegal gambling.
- Countries subject to sanctions, embargoes or similar measures issued by international organisations such as the United Nations organisation.
- Countries identified by credible sources as having weak governance, law enforcement, and regulatory regimes, including countries identified by FATF statements as having weak AML/CFT regimes, and for which financial institutions should give special attention to business relationships and transactions.

Customer Risk

47. MVTS providers should determine whether a particular customer poses higher risk and the potential impact of any mitigating factors on that assessment. Such categorisation may be due to customer's occupation, behaviour or activity. These factors individually, may not be an indication of higher risk in all cases, but a combination thereof may certainly require greater scrutiny. Categories of customers whose business or activities may indicate a higher risk include:

- Customer or counterpart is another MVTS or a financial institution which has been sanctioned by respective national competent authority for its non-compliance with the AML/CFT applicable regime and is not engaging in remediation to improve its compliance.

35 "Credible sources" refers to information that is produced by reputable and universally recognised international organisations and other bodies that make such information publicly and widely available. In addition to the FATF and FATF-style regional bodies, such sources may include, but are not limited to, supra-national or international bodies such as the International Monetary Fund, the World Bank and the Egmont Group of Financial Intelligence Units.

- Customer conducting their business relationship or transactions in unusual circumstances, such as:
  - Customer who travels unexplained distances to locations to conduct transactions.
  - Customer networks; i.e. defined groups of individuals conducting transactions at single or multiple outlet locations or across multiple services.
  - Customer owns or operates a cash-based business that appears to be a front or shell company or is intermingling illicit and licit proceeds as determined from a review of transactions that seem inconsistent with financial standing or occupation.
- Politically Exposed Person or his/her family members or close associates and where beneficial owner of a customer is a politically exposed person, as covered under Recommendation 12.
- Non face-to-face customer, where doubts exist about the identity of such customer.
- Customer who uses agents or associates where the nature of the relationship or transaction(s) makes it difficult to identify the beneficial owner of the funds.
- Customer knows little or is reluctant to disclose details about the payee (address/contact info, etc.)
- Consumer gives inconsistent information (e.g. provides different names).
- Customer involved in the transactions that have no apparent ties to the destination country and with no reasonable explanations.
- Suspicion that the customer is acting on behalf of a third party but not disclosing that information or is being controlled by someone else (his/her handler). For example, the customer picks up a money transfer and immediately hands it to someone else or someone else speaks for the customer, but puts the transaction in his/her name.
- Customer who has been the subject of law enforcement sanctions (in relation to proceeds generating crimes), known to the MVTS provider.
- Customer who offers false/fraudulent identification, whether evident from the document alone, from the document's lack of connection to the customer, or from the document's context with other documents (e.g. use of identification cards or documents in different names without reasonable explanation).
- Customer whose transactions and activities indicate connection with potential criminal involvement, typologies or red flags provided in reports

produced by the FATF or national competent authorities (e.g. FIU, law enforcement etc.).

- Customer whose transaction patterns appear consistent with generation of criminal proceeds; *e.g.* illegal drug growing season, drug trafficking, illegal immigration and human trafficking, corruption etc.; based on information available with the MVTS provider.

Product/Transactions/Service Risk

48. An overall risk assessment should also include determining the potential risks presented by products and services offered by a MVTS provider. A MVTS provider should be mindful of the risks associated with new or innovative products or services not specifically offered by the MVTS provider, but that make use of the MVTS provider's systems to deliver the product or service. The FATF 2013 NPPS Guidance determines the risks involved in the provision of NPPS, including through consideration of any relevant risk factors and risk mitigation measures. Determining the risks of products and services could include a consideration of their attributes as well as any risk mitigation measures put in place in respect thereof and could include factors such as:

- Products or services that may inherently favour anonymity or products that can readily cross international borders, such as cash, online money transfers, stored value cards, money orders and international money transfers by mobile phone.
- Products or services that have a very high or no transaction limit.
- The global reach of the product or service offered.
- The complexity of the product or service offered.
- Products or services that permit the exchange of cash for a negotiable instrument, such as a stored value card or a money order.

49. The risk associated with the transaction may also vary depending on whether the MVTS provider is sending or receiving the transaction. An overall risk assessment should include a review of transactions as a whole. This should include a consideration of such factors as:

a) Transactions sent or attempted:

- Customer's behaviour at point of origination:
  - Customer structures transaction in an apparent attempt to break up amounts to stay under any applicable CDD threshold- avoiding reporting or record keeping.
  - Transaction is unnecessarily complex with no apparent business or lawful purpose.
  - Number or value of transactions is inconsistent with financial standing or occupation, or is outside the normal course of business of the customer in light of the information provided by the customer when

conducting the transaction or during subsequent contact (such as an interview, discussion or based on information provided to tax authorities and made available to the MVTS provider etc.)

- Customer offers a bribe or a tip other than where a tip is customary or is willing to pay unusual fees to have transactions conducted.
- Customer has vague knowledge about amount of money involved in the transaction.
- Customer makes unusual inquiries, threatens or tries to convince staff to avoid reporting.
- Customer sends money internationally and then expects to receive an equal incoming transfer or vice versa.
- Customer wires money to illegal online gambling sites. Email addresses containing gambling references or transfers to countries with large numbers of internet gambling sites.
- Customer wires money to higher-risk jurisdiction/country/corridor.
- Customer attempts a transaction, but given he or she would likely be subject to the CDD monitoring, cancels transaction to avoid reporting or other requirements.
- Customer transfers money to claim lottery or prize winnings or to someone he or she met only online. Transfer towards credit card or loan fee or for employment opportunity or mystery shopping opportunity. All indicators of potential consumer fraud.
- Senders appear to have no familial relationship with the receiver and no explanation forthcoming for the transfer.

- Activity detected during monitoring (in many of these scenarios the customer's activity may be apparent both during point-of-sale interaction and during back-end transaction monitoring):
  - Transfers to the same person from different individuals or to different persons from the same individual with no reasonable explanation.
  - Unusually large aggregate wire transfers or high volume or frequency of transactions with no logical or apparent reason.
  - Customer uses aliases, nominees or a variety of different addresses.
  - Customers whose concentration ratio of transfers made to a jurisdiction is notably higher than what is to be expected considering overall customer base.
  - Customer transfers/receives funds from persons involved in criminal activities as per the information available.

- A network of customers using shared contact information, such as address, telephone or e-mail, where such sharing is not normal or reasonable explicable.
- Transfers to HOSSPs in destinations where such transactions are known to the MVTS provider to be considered illegal.

b) Transactions received:

- Concerning the implementation of R16 on wire transfers, MVTS providers should pay special attention:
  - To transactions that are not accompanied by the required originator or beneficiary information.
  - When additional customer or transactional information has been requested from an ordering MVTS provider, but has not been received.
- Large number of transactions received at once or over a certain period of time which do not seem to match the recipient's usual past pattern (e.g. during illicit drug production seasons, towards migrant smuggling etc.).

Distribution Channels Risk, namely Agent Risk

50. An overall risk assessment should analyse specific factors which arise from the use of agents as a business model to facilitate the delivery of MVTS. In some cases these agents may also use the products and services themselves. It is important for MVTS providers to ensure that they understand who the agent is, and that they are not criminals or criminal associates. Assessing agent risk is more complex for MVTS providers with an international presence due to varying jurisdictional requirements and potential risk of non-compliance by agents of the applicable local AML/CFT regulations and the logistics of agent oversight. This agent risk analysis should include such factors as the following based on the extent that these are relevant to the MVTS providers' business model:

- Agents representing more than one MVTS provider.
- Agents located in a higher-risk jurisdiction/country or serving high-risk customers or transactions.
- Agents determined to have "politically exposed person" status.
- Agents conducting an unusually high number of transactions with another agent location, particularly with an agent in a high risk geographic area or corridor.
- The transaction volume of the agent is inconsistent with either overall or relative to typical past transaction volume.
- Transaction pattern indicating value of transactions just beneath any applicable CDD threshold.

- Agents that have been the subject of negative attention from credible media or law enforcement sanctions.
- Agents that have failed to attend or complete the training programs.
- Agents that operate sub-standard compliance programs, i.e. programs that do not effectively manage compliance with internal policies, monetary limits, external regulation, etc.
- Agents with a history of regulatory non-compliance and that are unwilling to follow compliance program review recommendations, and therefore subject to probation, suspension or termination.
- Agents who fail to provide required originator information upon request.
- Agents whose data collection or record keeping is lax, sloppy or inconsistent.
- Agents willing to accept false identification or identification records that contain false information, non-existent addresses that would be known to be non-existent to a person in that area, or phone numbers that are used as fillers.
- Agents with a send-to-receive ratio that is not balanced, consistent with other agents in the locale, or whose transactions and activities indicate potential complicity in criminal activity.
- Agents whose seasonal business fluctuation is not consistent with their incomes or with other agents in the locale or is consistent with patterns of criminal proceeds.
- Agents whose ratio of questionable or anomalous customers to customers who are not in such groups is out of the norm for comparable locations.

B. CUSTOMER DUE DILIGENCE AND WIRE TRANSFERS

51. CDD processes should be designed to meet the FATF standards and national legal requirements. The CDD process should help MVTS providers assess the ML/TF risk associated with a proposed business relationship or occasional transaction above the threshold. The initial CDD comprises identifying the customer and, where applicable, the customer's beneficial owner and verifying the customer's identity on a risk basis on the basis of reliable and independent information, data or documentation to at least the extent required by the applicable legal and regulatory framework. It also includes understanding the purpose and intended nature of the business relationship (where relevant) and, in higher risk situations, obtaining further information.

52. Non-banking institution providing MVTS typically carry out occasional transactions and generally do not open or maintain accounts. However, MVTS providers sometimes may also introduce customer loyalty schemes and relationship management tools, which coupled with an agreement between the MVTS providers and customers, indicate that a business relationship has been formed. The MVTS providers should have procedures, which are effectively implemented and

used to identify and verify, on a risk basis, the identity of a customer (a) when establishing business relations with that customer; (b) when carrying out occasional transactions above the applicable designated threshold[36]; (c) where they have suspicions of ML/TF regardless of any exemption or thresholds; and (d) where they have doubts about the veracity or adequacy of previously obtained identification data.

53. The legal frameworks of some countries go further than Recommendation 10 requires[37] by requiring full CDD for all transactions performed by MVTS providers, including those which are de facto occasional transactions below the USD/EUR 15 000 threshold. Such an approach may be consistent with the risk-based approach, as set out in Recommendation 1, provided that it is justified on the basis of the country's assessment of risks (e.g. through the identification of higher risks). One factor which should be taken into account is whether this would increase the risk of driving transactions to unregulated sectors.

54. Recommendation 16 establishes the requirements for countries with respect to wire transfers. Recommendation 16 applies to cross-border wire transfers and domestic wire transfers.[38] MVTS providers must include relevant originator and beneficiary information on wire transfers and ensure that the information remains with the wire transfer throughout the payment chain as set out in the Interpretive Note to Recommendation 16. It is important to note, that countries may adopt a *de minimis* threshold for cross-border wire transfers, below which verification of the customer, and beneficiary information need not be required unless there is an ML/TF suspicion.[39] That is, for occasional cross-border wire transfers below USD/EUR 1 000, the requirements of the Interpretive Note to Recommendation 16 apply and the name of the originator and of the beneficiary will be requested, as well as an account number for each or a unique transaction reference number; however such information will not have to be verified unless there are suspicious circumstances related to ML/TF, in which case information pertaining to customer should be verified.

55. The MVTS provider should adopt effective risk-based policies and procedures for determining when to execute, reject or suspend a wire transfer lacking required originator or beneficiary information and the appropriate follow-up action.[40]

56. Based on a holistic view of the information obtained in the context of their application of CDD measures, MVTS providers should be able to prepare a customer risk profile in appropriate cases. This will determine the level and type of ongoing monitoring and support the MVTS providers' decision whether to enter into, continue or terminate the business relationship. Risk profiles can apply at the individual customer level or, where a cluster of customers displays homogenous characteristics (for example, clients conducting similar types of transactions or with the same economic activity), at the cluster level. MVTS providers should periodically update customer risk

36 The FATF Recommendations require that any national threshold is no higher than USD/EUR 15 000 for occasional transactions (other than wire transfers), including situations where the transaction is carried out in a single operation or in several operations that appear to be linked. See INR. 10.

37 Recommendation 10 required CDD measures to be undertaken.

38 INR. 16 at paragraph 3.

39 INR. 16 at paragraph 5.

40 INR. 16 at paragraph 18 and 22.

profiles[41] of business relationships, which serve to help MVTS providers apply the appropriate level of CDD. In addition, MVTS providers should take measures to comply with international sanctions lists issued by the UN and with national AML/CFT lists issued by the competent national authorities (e.g. national lists of designated persons and organisations for TF) by screening the customer's and beneficial owner's as well as beneficiary's names against such lists. Smaller MVTS providers may consider joining industry groups to have access to sanctions screening services, wherever appropriate.

57. The extent of CDD measures may be adjusted, to the extent permitted or required by regulatory requirements, in line with the ML/TF risk, if any, associated with the individual business relationship as discussed above under Risk Assessment. This means that the amount or type of information obtained, or the extent to which this information is verified, must be increased where the risk associated with the business relationship is higher. It may also be simplified where the risk associated with the business relationship is lower. It should, however be noted that the ability to apply simplified CDD or an exemption from other preventive measures, simply on the basis that MVTS is being carried out by natural or legal persons on an occasional or very limited basis is not to be applied (INR. 1.6(b)). Also SDD measures are not acceptable whenever there is a suspicion of ML or TF, or where specific higher-risk scenarios apply.

Box 3. **Examples of Enhanced Due Diligence/Simplified Due Diligence measures**
(see also INR 10)

- Enhanced Due Diligence
  - obtaining and corroborating additional identifying information from a wider variety or more robust sources and using the information to inform the individual customer risk profiling
  - carrying out additional searches (e.g. verifiable adverse internet searches) to better inform the individual customer risk profiling
  -
  - where appropriate, undertaking further verification procedures on the customer or beneficial owner to better understand the risk that the customer or beneficial owner may be involved in criminal activity
  - verifying the source of funds or wealth involved in the transaction or business relationship to be satisfied that they do not constitute the proceeds from crime
  - evaluating the information provided with regard to the destination of funds and the reasons for transaction
  - seeking and verifying additional information from the customer about the purpose and intended nature of the transaction or the business relationship

41 Based on the MVTS provider's own risk assessment and taking into account risk factors such as those outlined in the FATF standards, e.g. in INR 10 and Recommendations/INR 12-16.

- Simplified Due Diligence
  - obtaining fewer elements of customer identification data, seeking less robust verification of the customer's identity
  - not collecting specific information or carrying out specific measures to understand the purpose and intended nature of the business relationship, but inferring the purpose and nature from the type of transactions or business relationship established
  - verifying the identity of the customer and the beneficial owner after the establishment of the business relationship (e.g. if transaction values rise above a defined monetary threshold)
  - reducing the frequency of customer identification updates in case of business relationship
  - reducing the degree and extent of on-going monitoring and scrutiny of transactions, based on a reasonable monetary threshold

58. Where MVTS providers cannot apply the appropriate level of CDD, Recommendation 10 requires the MVTS provider to not enter into a business relationship or carry out an occasional transaction or to terminate an already-existing business relationship; and considering making a suspicious transaction report in relation to the customer.

Ongoing CDD and Monitoring

59. Ongoing monitoring on a risk basis means the scrutiny of transactions to determine whether those transactions are consistent with the MVTS provider's information about the customer and the nature and purpose of the business relationship, wherever appropriate. Monitoring also involves identifying changes to the customer profile (for example, their behaviour, use of products and the amount of money involved), and keeping it up to date, which may require the application of enhanced CDD measures. Monitoring transactions is an essential component in identifying transactions that are potentially suspicious. Transactions that do not fit the behaviour expected from a customer profile, or that deviate from the usual pattern of transactions, may be potentially suspicious.

60. Monitoring should be carried out on a continuous basis and may also be triggered by specific transactions. It need not require electronic systems, although for some types of MVTS activity, where large volumes of transactions occur on a regular basis, automated systems may be the only realistic method of monitoring transactions. However, where automated systems are used, MVTS providers should understand their operating rules, verify their integrity on a regular basis and check that they take account of the identified ML/TF risks.

61. MVTS providers should adjust the extent and depth of monitoring in line with their institutional risk assessment and individual customer risk profiles. Enhanced monitoring should be required for higher risk situations. The adequacy of monitoring systems and the factors leading

MVTS providers to adjust the level of monitoring should be reviewed regularly for continued relevance to the MVTS provider's AML/CFT risk programme. Transactions performed/triggered by agents must be subject to regular monitoring under the same conditions as transactions of MVTS provider itself. The monitoring should be conducted by the MVTS provider itself or in collaboration with the agent, based on appropriate agreement and under the MVTS provider's controls.

62. Monitoring under a risk-based approach allows MVTS providers to create monetary or other thresholds to determine which activities will be reviewed. Defined situations or thresholds used for this purpose should be reviewed on a regular basis to determine their adequacy for the risk levels established. MVTS providers should document and state clearly the criteria and parameters used for customer segmentation and for the allocation of a risk level for each of the clusters of customers. Criteria applied to decide the frequency and intensity of the monitoring of different customer segments should also be transparent.

63. To this end, MVTS providers should properly document, retain and communicate to the relevant personnel the results of their monitoring as well as any queries raised and resolved.

Suspicious Transaction Monitoring and Reporting

64. Recommendation 20 requires all financial institutions including MVTS providers that suspect, or have reasonable grounds to suspect, that funds are the proceeds of crime or are related to terrorist financing, to report their suspicions promptly to the relevant FIU. MVTS providers should have the ability to flag unusual movements of funds or transactions for further analysis. MVTS providers should have appropriate systems so that such funds or transactions are scrutinised in a timely manner and a determination made as to whether the funds or transaction are suspicious.

65. Funds or transactions that are suspicious should be promptly reported to the FIU and in the manner specified by competent authorities. The processes MVTS providers put in place to escalate suspicions and ultimately report to the FIU should reflect this. While the policies and processes leading MVTS providers to form a suspicion can be applied on a risk-sensitive basis, a MVTS provider should report once ML/TF suspicion has been formed.

66. MVTS providers should comply with applicable STR requirements when established through a network of agents in different host jurisdictions. The territorial approach requires the STR and any other information to be submitted, on behalf of the MVTS provider, to the FIU in the country in which the agent is established.

67. Consistent with paragraph 22 of the INR 16, MVTS providers should be required to comply with all of the relevant requirements of Recommendation 16 in the countries in which they operate, directly or through their agents. In the case of a MVTS provider that controls both the ordering and the beneficiary side of a funds transfer, the MVTS provider: (a) should take into account all the information from both the ordering and beneficiary sides in order to determine whether this gives rise to suspicion; and (b) where necessary should file an STR with the appropriate FIU, and make relevant transaction information available to the FIU.

68. The lack of required originator or beneficiary information should be considered as a factor in assessing whether an electronic funds or wire transfer is suspicious and whether it is thus required to be reported to the FIU.

C. INTERNAL CONTROLS AND COMPLIANCE

Internal Controls and Governance

69. Adequate internal controls are a prerequisite to an effective implementation of policies and processes to mitigate ML/TF risk. Internal controls include appropriate governance arrangements where responsibility for AML/CFT is clearly allocated, controls to monitor the integrity of staff and agents, which are implemented in accordance with the applicable local legislation. MVTS providers should consider national or sectoral risk assessments and controls to validate that their policies and processes are effective tools for identifying, assessing, and monitoring ML/TF risk in the region. It is appropriate that MVTS providers modify their internal controls according to relevant changes in their size, operational complexity, or risk exposure. Accordingly, MVTS providers should maintain systems that are adequate to manage and mitigate their risks. Where the risks are low (see for example Annex 5 for indicators of lower risk), less sophisticated systems will suffice.

70. For MVTS providers which work through agent networks, they should include these networks in their AML/CFT internal control processes and monitor them for compliance with their AML/CFT programs.

71. The successful implementation and effective operation of a RBA to AML/CFT depends on strong senior management leadership, which includes oversight of the development and implementation of the RBA across the MVTS provider.

72. Senior management should consider various ways to support AML/CFT initiatives:

- create a culture of compliance and promote compliance as a core value of the MVTS provider by sending a clear message that the MVTS provider will develop processes to ensure that:
- ML/TF risks can be managed before entering into, or maintaining, business relationships or offering services that are associated with excessive ML/TF risks;
- business relationships are not established when the ML/TF risks cannot be mitigated and managed.
- Senior management, together with the company board of directors, are responsible for setting up robust risk management governance and controls mechanisms that:
- reflect the company's established risk policy;
- implement adequate internal communication processes appropriate for the actual or potential ML/TF risks faced by the MVTS provider. These mechanisms should link (where applicable) the board of directors, the AML/CFT chief officer, any relevant or specialised committee within the MVTS provider (e.g. the risks or the ethics/compliance committee), the IT division and where applicable, each of the business areas;

- helps decide on the measures needed to mitigate the ML/TF risks identified and on the extent of residual risk the MVTS provider is prepared to accept; and
- adequately resource the MVTS provider's AML/CFT function.

73. This implies that senior management should not only know about the ML/TF risks to which the MVTS provider is exposed but also understand how its AML/CFT control framework operates to mitigate those risks. This would require that senior management:

- understands the regulatory and supervisory requirements where the MVTS provider operates;
- receives sufficient, regular and objective information to get an accurate picture of the ML/TF risk to which the MVTS provider is exposed through its activities and individual business relationships;
- receives sufficient and objective information to understand whether the MVTS provider's AML/CFT controls are effective;
- receives updates on government communications or enforcement actions related to the AML/CFT obligations of MVTS providers and ML/TF risks;
- ensures that processes are in place to escalate important decisions that directly impact the ability of the MVTS provider to address and control risks.

74. Responsibility for the consistency and effectiveness of AML/CFT controls should be clearly allocated to an individual of sufficient seniority within the MVTS provider to signal the importance of ML/TF risk management and compliance, and that ML/TF issues are brought to senior management's attention. This includes the appointment of a skilled compliance officer at management level.[42] The compliance officer should have the necessary independence, authority, seniority, resources and expertise to carry out these functions effectively, including the ability to access all relevant internal information (including across lines of business, and foreign branches, subsidiaries and agents). Where an MVTS provider is situated via one or more agents in various host countries, an individual with functions of compliance officer may be appointed in each host country to ensure compliance with the local AML/CFT requirements (CDD, record keeping, STR and any other reporting obligation to the host FIU among others).

75. Recommendation 18 requires countries to require financial institutions to have an independent audit function to test the AML/CFT programme with a view to establishing the effectiveness of its AML/CFT policies and processes and the quality of its risk management across its operations, departments, branches and subsidiaries, both domestically and, where relevant, abroad. Senior management will need to have a means of independently validating the development and operation of the risk assessment and management processes and related internal controls, and obtaining appropriate comfort that the adopted risk-based methodology reflects the risk profile of

42 INR 18.

the MVTS provider. This independent testing and reporting should be conducted by, for example, the internal audit department, external auditors, specialist consultants or other qualified parties who are not involved in the implementation or operation of the MVTS provider's AML/CFT compliance programme. The testing should be risk-based, taking into account the risk profile of the MVTS provider; should evaluate the adequacy of the MVTS provider's overall AML/CFT policies and programme, the quality of risk management for the MVTS provider's operations, departments and subsidiaries; should include comprehensive procedures and testing; and should cover all activities.

76. Both the compliance and audit functions should base their assessment on all information relevant to their task including, where relevant and appropriate, information obtained confidentially through relevant internal mechanisms or whistleblowing hotlines. Other sources of information can include training pass rates, compliance process or control failures or analysis of questions received from staff.

Internal Mechanisms to Ensure Compliance

77. A MVTS provider's internal control environment should be conducive to assuring the integrity, competence and compliance of staff with relevant policies and procedures. The measures relevant to AML/CFT controls should be consistent with the broader set of controls in place to address business, financial and operating risks generally.

78. The nature and extent of AML/CFT controls will depend upon a number of factors, including the nature, scale and complexity of a MVTS provider's business, the diversity of its operations, including geographical diversity, its customer base, product and activity profile, the degree of risk associated with each area of its operations and distribution channels, i.e. the extent to which the MVTS provider is dealing directly with the customer or is dealing through intermediaries, agents, third parties, or in a non-face-to-face setting without appropriate mitigating measures.

79. The framework of AML/CFT compliance function and internal controls should:

- Place priority on the MVTS provider's operations (products, services, customers and geographic locations) that are more vulnerable to abuse.
- Provide for regular review of the risk assessment and risk management processes, taking into account the environment within which the MVTS provider operates and the activity in its market place.
- Provide for an AML/CFT compliance function and review programme.
- Ensure that adequate risk assessment and controls are in place before new products are offered.
- Inform senior management of compliance initiatives, identified compliance deficiencies, corrective action taken, and suspicious activity reports filed.
- Provide for programme continuity despite changes in management or employee composition or structure.

- Focus on meeting all appropriate regulatory record keeping and reporting requirements and for AML/CFT compliance and provide for timely updates in response to changes in regulations.
- Provide for adequate controls for higher risk customers, transactions and products, agents, as necessary, such as transaction limits or management approvals.
- Enable the timely identification and filing of reportable transactions.
- Provide for adequate management and oversight of its agents, including initial agent due diligence, AML/CFT training, and ongoing risk-based monitoring.
- Provide for adequate supervision of employees who handle transactions, complete reports, grant exemptions, monitor for suspicious activity, or engage in any other activity that forms part of the business's AML/CFT programme.
- Incorporate AML/CFT compliance into job descriptions and performance evaluations of appropriate personnel.
- Provide for appropriate initial and refresher training to be given to all relevant staff.
- Provide for appropriate initial and refresher training for agents at appropriate intervals.

Vetting and recruitment

80. MVTS providers should recruit through background checks and satisfy themselves that the staff they employ have integrity, are adequately skilled and possess the knowledge and expertise necessary to carry out their function, in particular where staff are responsible for implementing AML/CFT controls, whether in compliance or in front-line function.

81. The level of vetting procedures of staff should reflect the ML/TF risks to which individual staff are exposed and not focus merely on senior management roles. Steps should be taken to manage potential conflicts of interest for staff with AML/CFT responsibilities.

Training and Awareness

82. The effective application of AML/CFT policies and procedures depends on staff within MVTS providers understanding not only the processes they are required to follow but also the risks these processes are designed to mitigate, as well as the possible consequences of those risks. It is therefore important that staff receive AML/CFT training, which should be:

- Relevant to the MVTS provider's ML/TF risks, business activities and up to date with the latest legal and regulatory obligations, and internal controls;
- Obligatory for all relevant staff;

- Tailored to particular lines of business within the MVTS provider, equipping staff with a sound understanding of specialised ML/TF risks they are likely to face and their obligations in relation to those risks;
- Effective: training should have the desired effect, and this can be checked for example by requiring staff to pass tests or by monitoring levels of compliance with the MVTS provider's AML/CFT controls and applying appropriate measures where staff are unable to demonstrate the level of knowledge expected;
- Ongoing: in line with INR 18, AML/CFT training should be regular, relevant, and not be a one-off exercise when staff are hired;
- Complemented by AML/CFT information and updates that are disseminated to relevant staff as appropriate.

83. Overall, the training should also seek to build up a working culture where compliance is embedded in the activities and decisions of the entire MVTS provider's staff.

D. AGENTS OF MVTS PROVIDERS

Agent Due Diligence

84. Agent Due Diligence is intended to enable a MVTS provider to ensure that it knows the legal and ownership structure of its agents and that it will be forming business relationships with legitimate and viable agents that will reliably implement or adhere to (depending on local regulations) AML/CFT requirements, program responsibilities, policies, and procedures. The MVTS provider's procedures must take into considerations such factors as:

- Upon application, identify the agent and perform the necessary background checks and due diligence, such as a recent change from current relationship with other product/service providers, whether the agent is representing more than one MVTS provider or is licensed/registered by the relevant national supervisory authority to provide payment services, length of time in business, ownership structure, creditworthiness, financial viability, class of trade or industry, licensing and regulatory structure and other regulatory licensing or registration to which the agent may be subject.
- Obtain appropriate additional information to understand the applicant's business, such as offering other MVTS services, the agent's past record of legal and regulatory compliance, expected nature and level of transactions and customer base, and geographical exposure.
- Upon approval, conduct new agent AML/CFT training encompassing applicable AML/CFT requirements, AML compliance program responsibilities, and MVTS internal policies and procedures. Provide AML/CFT compliance materials, tools, and training to agents on an ongoing and regular basis.

- Provide guidelines and assistance to the agent to assess its own compliance program regime and to develop its own risk assessment based upon its unique risk profile for its products and services, customers, geography, and subagents or outlets (if applicable).
- Ensure compliance regime adherence to internal policies and external regulation, such as reporting suspicious or attempted suspicious activities, large transactions, monitoring the risk behaviours described above, reporting and record keeping, through periodic AML compliance program reviews.
- Provide prompt attention and remediation of risk behaviours by onsite or offsite contact with the agent, which may result in further training, or probation, suspension or termination of the agent.

Training and Awareness of Agents

85. As a preventive measure, MVTS providers should check the agent's integrity before and during the business relationship, in order to avoid the abuse of their services. Agents must have appropriate training with regard to AML/CFT either provided by the MVTS providers or by themselves. Putting in place and maintaining effective controls relies on both training and awareness. This requires an enterprise-wide effort to provide all relevant employees and agents with appropriate information on AML/CFT laws, regulations and internal policies.

86. Applying a risk-based approach to the various methods available for training gives each MVTS provider additional flexibility regarding the frequency, delivery mechanisms and focus of such training. Agent training should be documented and training records should be maintained according to applicable record keeping requirements. A MVTS provider should review its agent base and available resources and implement training programmes that provide appropriate AML/CFT information that is at the appropriate level of detail.

87. Agent training may include onsite or offsite initial training (*i.e.* upon activation), and ongoing training via web-based programmes, periodic mailings or newsletters, websites or pop-up messages at point of origination. In conjunction with or in addition to such training, the MVTS provider may provide periodic compliance program reviews involving a comprehensive assessment of the agent's compliance with internal and external AML regulatory requirements.

Monitoring of Agents

88. Agent monitoring is a very important element for an effective MVTS provider's AML/CFT program. All agents require monitoring to assess and address systemic risks such as inadequate training, new or changing services or products, and poor individual judgment or performance. The degree and nature of agent monitoring will depend on the transaction volume of the agent, the monitoring method being utilised (manual, automated or some combination), countries where the funds are sent, outcomes of previous monitoring mechanisms (where relevant), and the type of activity under scrutiny. In applying a risk-based approach to monitoring, the degree of monitoring will be based on the perceived risks, both external and internal, associated with the agent, such as

the products or services being provided by the agent, the location of the agent and the nature of the activity. Prompt attention and remediation of risk behaviours should be addressed by appropriate means, such as enhanced examination of the agent's transaction history and data integrity, obtaining and evaluating the agent's explanation of these behaviours, confidential sampling of the questioned aspects of the agent's services, or onsite or offsite contact with the agent, which may result in further training, or probation, suspension or termination.

89. Agent monitoring under a risk-based approach allows a MVTS provider to create monetary or other thresholds or specific red flags to determine which agent activities will be reviewed. Defined situations or thresholds used for this purpose should be reviewed on a regular basis to determine their adequacy for the risk levels established. MVTS providers should also assess the adequacy and integrity of any systems and processes on a periodic basis.

90. Competent authorities and MVTS providers (as well their industry associations) may consider collaborating to address and mitigate the specific risks emanating from certain agent behaviour. Some of the measures that can be implemented in this regard may include:

- an industry-held register of high-risk agents (or the so-called "bad agents"), through which MVTS providers can share alerts with each other about potential bad actors.
- requiring application of enhanced CDD measures in appropriate cases.
- applying thresholds on cash transactions.
- providing specific training sessions on STR indicators to MVTS providers in order to enhance their understanding and improve reporting standards, with the expectation that the MVTS provider would then train its agents or alternatively training to both the MVTS providers and their agents.

SECTION III – GUIDANCE FOR SUPERVISORS

A. THE RISK-BASED APPROACH TO SUPERVISION AND/OR MONITORING

91. The RBA to AML/CFT aims to develop prevention or mitigation measures which are commensurate with the ML/TF risks identified. In the case of supervision, this applies to the way supervisory authorities allocate their resources. It also applies to supervisors discharging their functions in a way that is conducive to the application of RBA by MVTS providers.

92. Recommendation 26 requires countries to subject MVTS providers to effective systems for AML/CFT supervision and/or monitoring. INR 26 requires supervisors to allocate greater supervisory resources to areas of higher ML/TF risk, on the basis that supervisors understand the ML/TF risk in their country and have on-site and off-site access to all information relevant to determining a MVTS provider's risk profile.

Box 4. **Recommendation 26: Regulation and Supervision of Financial Institutions**

[.....]

Other financial institutions should be licensed or registered and adequately regulated, and subject to supervision or monitoring for AML/CFT purposes, having regard to the risk of money laundering or terrorist financing in that sector. At a minimum, where financial institutions provide a service of money or value transfer, or of money or currency changing, they should be licensed or registered, and subject to effective systems for monitoring and ensuring compliance with national AML/CFT requirements.

[.....]

Understanding ML/TF Risks

93. An effective risk-based regime reflects a country's policy, legal and regulatory approach. The national policy, legal and regulatory framework should also reflect the broader context of financial sector policy objectives that the country is pursuing. These would include financial inclusion, financial stability, financial integrity and financial consumer protection and include considerations such as competition. The extent to which the national framework allows MVTS to apply a risk-based approach should also reflect the nature, diversity and maturity of the MVTS sector, and its risk profile as well the ML/TF risks associated with individual MVTS providers.

94. Supervisors should also develop a deep understanding of the MVTS market, its structure and role in the financial system and the country's economy to better inform risk assessment of the sector. Supervisors should draw on a variety of sources to identify and assess ML/TF risks. This will include but not limited to jurisdiction's national or sectoral risk assessments, domestic or international typologies and supervisory expertise, as well as FIU feedback. Where competent authorities do not adequately understand the MVTS environment operating in the country, it may be appropriate for competent authorities to consider undertaking a more targeted sectoral risk assessment in relation to the MVTS sector to develop a national level understanding of the relevant ML/TF risks and to also inform the institutional assessments to be undertaken by the MVTS providers.[43]

95. Access to information about ML/TF risks is fundamental for an effective RBA. INR 1.3 requires countries to take appropriate steps to identify and assess ML/TF risks for the country, on an ongoing basis in order to make information available for AML/CFT risk assessments conducted by financial institutions and DNFBPs. Countries should keep the risk assessments up-to-date and should have mechanisms to provide appropriate information on the results to all relevant competent authorities and self-regulatory bodies (SRBs), financial institutions and DNFBPs. In situations where some parts of the MVTS sector have potentially limited capacity to identify ML/TF risks, countries should particularly work with the sector to understand their risks. Depending on their capacity, general information or more granular information and support may be required.

43 FATF (2013a), paragraphs 17-19.

96. For individual MVTS providers, supervisors should take into account the level of risk associated with the MVTS providers' products and services, business model, corporate governance arrangements, financial and accounting information, delivery channels, customer profiles, geographic location, countries of operation and the level of compliance with the AML/CFT measures. Supervisors should also look at the controls in place, including the quality of the risk management policy, the functioning of the internal oversight functions etc. Other information, which may be relevant in the AML/CFT context, includes the fitness and propriety of the management and the compliance function.

97. Some of this information can be obtained through prudential supervision in countries where MVTS providers are subject to prudential regulation. This involves appropriate information-sharing and collaboration between prudential and AML/CFT supervisors, especially when the responsibilities belong to two separate agencies. In other regulatory models, such as those focusing on licensing/registration at the national level, but with shared oversight and enforcement at the state level and/or with SRBs, information sharing should include the sharing of examination findings.

98. Where relevant, information from other stakeholders such as other supervisors (including overseas supervisors, and supervisors of payment systems and instruments), the FIU and law enforcement agencies may also be helpful in determining the extent to which a MVTS provider is able to effectively manage the ML/TF risk to which it is exposed. Some regimes, such as those only requiring registration (without extensive background testing) may still enable law enforcement and regulators to be aware of the existence of the institution, its lines of business, or controlling interests.

99. Supervisors should review their assessment of both the sector's and MVTS providers' ML/TF risk profiles periodically and in any case when MVTS providers' circumstances change materially or relevant new threats emerge.

100. Examples of different ways MVTS supervisors assess ML/TF risk in the MVTS sector and in individual MVTS providers can be found in *Annex 2.*

Mitigating ML/TF risk

101. The *FATF Recommendations* require supervisors to allocate and prioritize more supervisory resources to areas of higher ML/TF risk. This means that supervisors should determine the frequency and intensity of periodic assessments based on the level of ML/TF risk to which the sector and individual MVTS providers are exposed. Supervisors should give priority to the areas of higher risk, either in the individual MVTS provider or to MVTS providers operating in a particular sector. If a jurisdiction chooses to classify an entire sector as higher risk, it should be possible to get some granularity for the appropriate categorisation of individual MVTS providers within the sector based on their customer base, countries they deal with and applicable AML/CFT controls etc.

102. It is also important that competent authorities acknowledge that in a risk-based regime, not all MVTS providers will adopt identical AML/CFT controls and that single, unwitting and isolated incidents involving the transfer or exchange of illicit proceeds do not necessarily invalidate the

integrity of a MVTS provider's AML/CFT controls. On the other hand, MVTS providers should understand that a flexible RBA does not exempt them from applying effective AML/CFT controls.

103. Examples of ways in which supervisors can adjust their approach include:

a) Adjusting the type of AML/CFT supervision or monitoring: supervisors should always have both off-site and on-site access to all relevant risk and compliance information. However, to the extent permitted by their regime, supervisors can determine the correct mix of off-site and on-site supervision or monitoring of MVTS providers. Off-site supervision alone may not be appropriate in higher risk situations. However, where supervisory findings in previous examination (either off-site or on-site) suggest a low risk for ML/TF, resources can be allocated to focus on higher risk MVTS providers. In that case lower risk MVTS providers could be supervised off-site, for example through transaction analysis and questionnaires.

b) Adjusting the frequency and nature of ongoing AML/CFT supervision or monitoring: supervisors should adjust the frequency of AML/CFT examination in line with the risks identified and combine periodic reviews and ad hoc AML/CFT supervision as issues emerge, e.g. as a result of whistleblowing, information from law enforcement, analysis of financial reporting or other supervisory findings. Other risk-based approaches to supervision could consider geographic location, customer base, cash intensity, number of accounts, the nature and number of agents, revenue, prior history of non-compliance, significant changes in management, and/or acquisitions.

c) Adjusting the intensity of AML/CFT supervision or monitoring: supervisors should decide on the appropriate scope or level of assessment in line with the risks identified, with the aim of assessing the adequacy of MVTS providers' policies and procedures that are designed to prevent them from being abused. Examples of more intensive supervision could include: detailed testing of systems and files to verify the implementation and adequacy of the MVTS providers' risk assessment, reporting and record keeping policies and processes, internal auditing, interviews with operational staff, senior management and the Board of directors and AML/CFT risk assessment in particular lines of business.

104. Supervisors should use their findings to review and update their ML/TF risk assessments and, where necessary, consider whether their approach to AML/CFT supervision and AML/CFT rules and guidance remains adequate. Whenever appropriate, and in compliance with relevant confidentiality requirements, these findings should be communicated to MVTS providers to enable them to enhance the quality of their RBA.

105. Under *FATF Recommendation* 27 and 35, supervisors should have the power to impose adequate sanctions on MVTS providers when they fail to comply with regulatory requirements. Supervisors should use proportionate actions, which may include a range of supervisory interventions, including corrective actions to ensure proper and timely correction of identified deficiencies as well as punitive sanctions for more egregious non-compliance, taking into account that identified weaknesses can have wider consequences. Generally, systemic breakdowns or significantly inadequate controls will result in a more severe supervisory response.

B. SUPERVISION OF THE RISK-BASED APPROACH

Licensing or Registration

106. *FATF Recommendations* 14 and 26 require countries to ensure that MVTS providers are licensed or registered by a competent authority, including the requirement to ensure that agents of MVTS providers are licensed or registered, or that the MVTS provider maintains a current list of its agents accessible by competent authorities in the countries in which the provider and its agents operate. These requirements should take into account the benefits of bringing MVTS providers into the regulatory framework.

General approach

107. Supervisors should understand the ML/TF risks faced by the sector and by a MVTS provider. They should have a comprehensive understanding of higher, standard as well as lower risk lines of business, with a particularly thorough understanding of the higher risk lines, leading to a sound judgment about the proportionality and adequacy of AML/CFT controls. As part of their exam procedures, supervisors should communicate findings and their views about the individual MVTS provider's AML/CFT controls. It is important to understand why institutions may decline to adopt proportionate controls. Where this is due to a lack of understanding of the flexibility available, supervisors should be able to provide appropriate guidance. Equally supervisors should understand the reasons why an institution engages in instances which go beyond the law (also called conservative or over-compliance) and provide further guidance, where considered appropriate.

108. It is important that supervisors discharge their functions in a way that takes into consideration the adoption of a RBA by MVTS providers. This means that supervisors should ensure that their staff are equipped to assess whether a MVTS provider's policies, procedures and controls are appropriate and proportional in view of the MVTS provider's risk assessment and risk management procedures. Supervisors should satisfy themselves that the MVTS provider adheres to its own policies, procedures and controls, and makes sound decisions. It is also important that supervisors should articulate and communicate clearly their expectations of the measures needed for MVTS providers to comply with the applicable legal and regulatory framework.

109. To support supervisors' understanding of the overall strength of measures in the MVTS sector, comparative analysis between MVTS providers' AML/CFT programs could be considered as a means to inform their judgment of the quality of an individual MVTS provider's controls. Supervisors should, however, note that under the RBA, there may be valid reasons why MVTS providers' controls differ.

110. In the context of the RBA, the primary focus for supervisors should be to assess whether the MVTS provider, in its own risk assessment, has reasonably and fairly gauged the risk to the business. In doing so, the supervisors should take into account the individual business circumstances; in addition to the overall sector risk. Supervisors should also determine whether or not the MVTS provider's AML/CFT compliance and risk management program is adequate to a) meet the regulatory requirements, and b) appropriately and effectively mitigate and manage the risks. The effective application of the RBA means that risk is assessed by institution and customer, not to an entire category of financial institutions or customer groups. In the case an MVTS provider

operates across different jurisdictions on the basis of a single licence or registration, the home supervisor (that licences or registers the entity) should take into consideration the risk the entity is exposed to and the extent to which those risks are adequately mitigated.

Guidance

111. Supervisors should communicate their expectations of MVTS providers' compliance with their legal and regulatory obligations, and may consider engaging in a consultative process, where appropriate with relevant stakeholders. This guidance may be in the form of high-level requirements based on desired outcomes, risk-based obligations, and information about how supervisors interpret relevant legislation or regulation, or more detailed guidance about how particular AML/CFT controls are best applied.

112. Guidance for the MVTS sector is essential and is a requirement under *FATF Recommendation* 34. Some MVTS providers may have limited experience in, or ability to, identify relevant ML/TF risk factors. In particular, for MVTS providers with lower capacity, the guidance provided would need to be more detailed than that provided for other MVTS, and could include extensive information on conducting a risk assessment and implementing a RBA. The guidance could include tools that enable small MVTS providers with lower capacity to undertake assessments and develop risk mitigation and compliance management systems to meet their legal obligations. Supporting ongoing and effective communication between supervisors and MVTS providers is an essential prerequisite for the successful implementation of a RBA.

113. Supervisors should also consider liaising with other relevant domestic regulatory and supervisory authorities to secure a coherent interpretation of the legal obligations and to promote a level playing field, including overseers of payment systems and instruments. This is particularly important where more than one supervisor is responsible for supervision (for example, where the prudential supervisor and the AML/CFT supervisors are in different agencies, or in separate divisions of the same agency or when the MVTS provider has agents in several jurisdictions). Multiple sources of guidance should not create opportunities for regulatory arbitrage, loopholes or unnecessary confusion among MVTS providers. When possible, relevant regulatory and supervisory authorities within a jurisdiction should consider preparing joint guidance.

Training

114. Training is important for supervision staff to understand the MVTS sector and the various business models that exist. In particular, supervisors should ensure that staff are trained to assess the quality of a MVTS provider's ML/TF risk assessments and to consider the adequacy, proportionality, effectiveness, and efficiency of the MVTS provider's AML/CFT policies, procedures and internal controls in light of its risk assessment.

115. Training should allow supervisory staff to form sound judgments about the quality of the MVTS provider's risk assessment and the adequacy and proportionality of a MVTS provider's AML/CFT controls. It should also aim at achieving consistency in the supervisory approach at a national level, in cases where there are multiple competent supervisory authorities or when the national supervisory model is devolved or fragmented.

Information exchange

116. Information exchange between the public and private sector is of importance in the MVTS sector and may form an integral part of a country's strategy for combating ML/TF. In situations where MVTS providers do not have experience, or have limited capacity for an effective assessment of ML/TF risk, it will be important for public authorities to share risk information to better help inform the risk assessments of MVTS providers.

117. The type of information that could be shared between the public and private sectors include:

- ML/TF risk assessments;
- Typologies of how money launderers or terrorist financers have misused MVTS;
- General feedback on STRs and other relevant reports;
- Targeted unclassified intelligence. In specific circumstances, and subject to appropriate safeguards such as confidentiality agreements, it may also be appropriate for authorities to share targeted confidential information with MVTS providers as a class or individually; and
- Countries, persons or organisations whose assets or transactions should be frozen pursuant to targeted financial sanctions as required by *FATF Recommendation* 6.

118. Domestic cooperation and information exchange between the supervisors of the banking sector and the MVTS sector, central bank and MVTS supervisors for monitoring and feedback of the remittance flows, among law enforcement, intelligence, FIU and MVTS supervisors and between the FIU and supervisor of the MVTS sector is also of vital importance for effective monitoring/supervision of the sector.

119. Cross border information sharing of authorities and private sector with their international counterparts is of importance in the MVTS sector, taking into account the multi-jurisdictional reach of many MVTS providers.

Supervision or monitoring of agent networks

120. Some MVTS providers operate through a network of agents, sometimes in different jurisdictions. The use of agents can create vulnerabilities where an agent may not itself be a financial service professional. In all cases, MVTS providers that use agents should be required to include them in their AML/CFT programs and MVTS providers should monitor them for compliance with applicable AML/CFT legislation and regulation.[44]

121. Recommendation 14 requires that agents of MVTS providers should either be licensed/ registered, as is the case for their provider, or countries could also choose another option, which is requiring the MVTS provider to maintain a current list of agents that is accessible by competent authorities. Countries should carefully consider the risks involved in each approach, the practical

[44] R.14

feasibility, and the resources required before making a final decision on whether to license/ register, or require the MVTS provider to maintain a current list of agents. In all cases, countries should ensure that under their legal framework, the MVTS provider remains responsible for its AML/CFT obligations and is accountable for the actions of its agents consistent with established principles of agency law. Supervisors that license MVTS providers to operate outside of their own jurisdiction should consider the risks such activities represent to those host jurisdictions, and should ensure that the obliged entity mitigates risks adequately.

122. Countries should determine on a risk-sensitive basis whether the supervision of agents is undertaken indirectly through the MVTS providers or through direct contact with the agents, to ensure that supervision or monitoring is proportionate and commensurate with the level of ML/TF risk. In line with the risk-based approach, countries may consider imposing AML/CFT regulation on MVTS agents, as well as the MVTS providers. Under this approach, the agents would themselves be subject to AML/CFT obligations and be directly supervised for compliance with these obligations by the relevant supervisory authority. This approach may be beneficial in situations where the MVTS provider is located in another country which creates difficulties in effectively supervising that entity. Countries could consider supervisory mechanisms such as central contact points or home/host supervisory cooperation between relevant AML supervisors of the sector, in order to ensure effective supervision and monitoring of compliance with the applicable AML/CFT obligations and to facilitate information exchange.

123. In establishing the supervisory framework, countries should clearly establish the competent authority that is responsible for the AML/CFT supervision or monitoring of MVTS providers. When a MVTS provider is a multinational entity or operates through a network of agents in different jurisdictions, the cooperation between supervisors in these jurisdictions becomes even more important. It is necessary to clarify the responsibilities of the supervisors, to ensure mechanisms and arrangements (such as protocol on cooperation in AML/CFT supervision) for effective cooperation, exchange of information about agents and the MVTS provider and to clarify the regulatory position.

SECTION IV – ACCESS OF MVTS TO BANKING SERVICES[45]

This section should be read in conjunction with the *2014 FATF RBA Guidance for the banking sector.*

A. AML/CFT REQUIREMENTS AND BANKING MVTS PROVIDERS

Regulatory Expectations

124. As a financial institution subject to FATF requirements, a MVTS provider is subject to the full range of AML/CFT controls with which it has to comply vis-à-vis its customers, such as: CDD, wire transfer rules and ongoing monitoring mechanisms apart from record keeping, suspicious transactions reporting etc. (Section II). The review of the AML/CFT measures and programme put in

45 All reference to access of MVTS providers to banking service in this section and elsewhere in the paper includes access to non-banking financial institutions, which may hold payment accounts of MVTS providers as customers.

place by the MVTS provider will often be part of the overall MVTS customer risk assessment conducted by the bank before on-boarding the MVTS provider as a customer.

125. As stated earlier, MVTS agents should either be licensed or registered with a competent authority or be part of a list maintained by the MVTS provider and accessible by competent authorities in the country where they operate. As a starting point, the MVTS provider should provide evidence or confirmation that it has conducted the relevant agent due diligence, that its AML/CFT program includes its agents and that compliance is monitored. When they are themselves MVTS providers, agents are required to establish AML/CFT programs and comply with due diligence, record keeping and other AML/CFT requirements.

B. BANKS' RISK-BASED APPROACH TO MVTS PROVIDERS

MVTS Risk Assessment

126. It should also be noted that in many cases, MVTS providers are reliant on access to the banking system in order to commence or continue their operations. It is important that banks apply the RBA properly and do not resort to the wholesale termination or exclusion of customer relationships within the MVTS sector without being informed by a proper risk assessment.

127. Where banks propose to enter into a business relationship with a MVTS provider, they should evaluate the ML/TF risk of the business relationship and assess whether those risks can be appropriately mitigated and managed. This should include control measures to mitigate the risks of the MVTS provider as a customer currently assessed as low, medium or high risk, and a process for escalation to deal with MVTS providers or particular aspects of their business, which become higher risk in the course of the business relationship.

128. When assessing the risks associated with MVTS providers, different risk factors (types of products and services offered, types of customers, distribution channels, and jurisdictions they are exposed to, experience of the provider, purpose of the account, anticipated account activity etc.) should be weighed; as MVTS providers will not present the same levels of ML/TF risk. While some will pose a higher risk, there are others that will not. An effective risk assessment should be a composite of multiple factors, and important elements in the case of MVTS will include the scope of markets served (domestic or international), the purpose of the bank account and the anticipated account activity, the regulatory oversight effectiveness in the countries of operation, and the effectiveness of the MVTS's risk management and compliance programs.

129. Depending upon the circumstances, certain factors may be weighed more heavily than others. For example, one of the elements which could act as a risk mitigant is the fact that MVTS providers are regulated financial institutions that are subject to the full range of AML/CFT obligations, supervision and monitoring. Factors which could potentially increase the ML/TF risks are the geographic coverage (especially countries with weaknesses in their AML/CFT framework), bulk transfers (where the transfer represents a collection of underlying transactions), third party payments, inadequate supervisory framework in its home jurisdiction, or the fact that the provider is a new business without an established operating history. Factors that may decrease the risk are geographic coverage (for example, where a money remitter offers services only domestically or to countries which are largely compliant with the FATF standards or present a relatively low ML/TF

risk); that the business operator has an established operating history etc. Other factors that may be relevant include whether transactions are small remittances for family members, or where there are high levels of transparency of payment information (e.g. purpose of sending funds is clearly explained, MVTS provider has visibility into both sender and recipient, all parties are adequately identified including beneficial ownership and it involves a direct transaction without any further intermediation).

130. The bank may consider, on a risk-sensitive basis whether the MVTS provider acts as a principal or is an agent of another provider. In this case, the way in which the principal monitors and controls compliance by its agents needs to be considered as an element of risk. Thus agents' due diligence procedures and adequacy and effectiveness of their supervision/monitoring by MVTS providers may be considered by banks and factored in when assessing the overall ML/TF risks being posed by such MVTS providers to banks as their customers. Where the MVTS provider itself is not a bank's customer but the MVTS agent is a customer, bank may also consider obtaining information/reference from the MVTS provider; in order to assist in its understanding of the MVTS agent's business and source of funds.

Risk-based AML/CFT Obligations for Banking MVTS Providers

MVTS Provider Due Diligence

131. Based on AML/CFT requirements applicable to banks, proper due diligence associated with opening and maintaining accounts for MVTS providers is required, in relation to the customer, the beneficial owner(s), and the business relationship (i.e. determine the structure and ownership of the MVTS provider, the nature of its business and operations including the target market, the purpose of the relationship and the expected account activity). In all cases, the level and extent of due diligence applied will be dictated by the risks associated with the particular MVTS customer provider.

132. Depending on the level and nature of risk identified, and the size and sophistication of the particular MVTS provider, banks may pursue different types of action as part of an appropriate due diligence process. When identified risks are higher, enhanced due diligence should be applied, which can include reviewing the AML/CFT (group-wide) programmes, their internal or external audit and other expert's reports, review of the list of agents and their monitoring, management and screening practices. A visit to the place of business and/or informative statements sent to third parties to verify the alignment with operating history, where appropriate, may prove helpful to check the existence and activities of the provider. Bank may also rely and/or verify from publicly available information (such as licensed or registered person lists with competent authorities) in such cases. If a bank becomes aware of changes in the profile of a MVTS provider to which services are being provided, additional steps or enhanced due diligence may be necessary.

Ongoing Monitoring of MVTS Accounts

133. Risk-based monitoring of accounts maintained for all customers, including MVTS providers, is a key element of an effective system to identify and, where appropriate, report violations and suspicious transactions. The level and frequency of such monitoring will depend, among other things, on the bank's risk assessment and the activity across the MVTS provider's accounts (including reconciling the activities of the MVTS providers together with the MVTS agents in order

to ascertain the full risk exposure where both the MVTS provider and its agents are bank's customers). Risk-based review of transactions should be conducted to detect any significant unexplained variations in transaction size, nature or frequency through the account which could reveal potentially suspicious operations.

MVTS Suspicious Transaction Reporting

134. While the policies and processes leading banks to form a suspicion can be applied on a risk-sensitive basis, a bank should report once a suspicion of ML/TF has formed. Banks should have the ability to flag unusual movements of funds or transactions conducted by MVTS providers for further analysis. They should also have appropriate case management systems so that such funds or transactions are scrutinised in a timely manner and a determination made as to whether they are suspicious. Similarly, if a bank is aware that an MVTS provider is breaching the applicable licensing or registration requirements, it should not accept the MVTS provider as a customer and should file a STR, if appropriate, in such cases.

C. GUIDANCE FOR THE SUPERVISION OF BANKS WITH MVTS PROVIDERS AS CUSTOMERS

General approach

135. Banks' considerations before providing services to MVTS providers are varied, including ML/TF risks, the compliance costs to effectively mitigate those risks, profitability, reputational risk and requirements imposed by international correspondent banks. There may also be some circumstances in which a bank may choose not to provide financial services to some or any MVTS providers for reasons including limited product lines that do not include MVTS related service, adequacy of supervision over MVTS, cross-border information-sharing barriers, the risks associated with specific jurisdictions which it deems unmanageable.

136. While the decision to accept or maintain a business relationship is ultimately a commercial one for the bank, supervisors need to ensure that they understand the drivers of and reasons for those commercial decisions and they communicate the importance of banks following the risk-based approach to managing the risks of individual accountholders. It is possible that financial institutions go beyond the requirements of relevant laws and regulations (also called conservative or over-compliance) for example, by deciding not to implement simplified due diligence measures, where allowed, in relation to lower risk products or by refusing or closing accounts due to lack of understanding of the law, lack of compliance expertise or on account of business factors that are not compliance related.[46] Where decision to restrict or terminate relationship with MVTS is due to a lack of understanding of the flexibility of the risk-based approach, supervisors will be able to provide appropriate guidance as to what the RBA entails.

137. Banks should identify, assess, manage and mitigate the risks posed by their customers, sectors in which those customers operate and the products and services offered. Banks themselves are best placed to assess and manage the risks posed by their customers and the products and services offered. Effective supervision can assist banks to understand the implementation of the RBA, thereby avoiding wholesale termination of customer relationships. Systematic termination of

46 De Koker, Louis and Symington, John (2014).

business relationships and refusal to on-board MVTS clients without proper risk assessment and mitigation measures, could, drive remittance flows to unregistered and unregulated channels. This may exacerbate the AML/CFT risk rather than address it. In any case, the wholesale cutting loose of entire classes of customer, without taking into account, seriously and comprehensively, their level of risks or risk mitigation measures for individual customers within a particular sector, cannot be considered as being in line with FATF standards. In addition to increasing ML/TF risks, such action may give rise to reputational and legal risks for banks, amongst others relating to unfair discrimination, competition and consumer protection.

Guidance

138. All supervisors should sufficiently and consistently clarify their MVTS related supervisory expectations over the RBA as part of their day-to day supervision and when wholesale de-risking occurs as a result of misinterpreting the RBA. Supervisors may take the opportunity to clarify that the intention of a RBA is not to eliminate risk by refusing services to any particular sector, but to manage risk effectively. Supervisors should provide meaningful and actionable guidance on the effective implementation of the RBA to both the banking sector and supervisory staff. With appropriate systems and controls in place, banks should be able to manage and mitigate the potential ML/TF risks posed by some MVTS providers. Other relevant FATF guidance on the supervision of banks can be found in the FATF RBA Guidance for the banking sector and the FATF Guidance on the Risk-Based Approach for Effective Supervision and Enforcement.

139. Supervisors could emphasise the varying degrees of risks in the MVTS sector and encourage banks to take into account risk mitigating factors, such as AML/CFT procedures and controls, which are put in place by MVTS providers to manage their ML/TF risks. Often, supervisors of banking and non-banking MVTS providers are different (e.g. central bank/financial regulator *vis-à-vis* FIU, non-banking supervisors/different departments within the bank/supervisors etc.). Supervisory compliance expectations and tolerance for risk in these cases are also often inconsistent. Thus, stress should be given to coordination among different supervisors so that all MVTS providers and banks could have similar expectations and similar approaches to RBA.

140. Supervisors could clarify the expectations on banks concerning the assessment of CDD policies and procedures implemented by a MVTS provider. Supervisors could inform bank decisions by providing examples of CDD practices that they deem adequate for small, lower risk MVTS providers.

141. Supervisors could encourage banks to engage with the MVTS sector on the measures that the sector could take immediately and in the longer term to meet the banks' risk standards which would enable a continuation or start of the business relationship. Such encouragement will be more meaningful when accompanied by supervisory statements on risk tolerance.

ANNEX 1. UNAUTHORISED MVTS PROVIDERS

Recommendation 14 requires countries to take action to identify natural or legal persons that carry out MVTS without a licence or registration, and to apply appropriate sanctions. Countries should take a systematic and pro-active approach by identifying and taking action against unauthorised providers on a regular basis. For many jurisdictions, proactive identification of informal MVT services and awareness-raising is an integral element of establishing and maintaining an effective registration / licensing regime.

Countries should ensure that a competent authority has the responsibility for the identification and sanctioning of unauthorised MVT providers. Depending on the institutional framework in a country, the authority may be, for example, the supervisor, the FIU, the law enforcement agencies or another agency with regulatory authority over the financial sector. Countries should consider which competent authority is best placed to be responsible for this issue, which will differ between countries depending on the circumstances and institutional structure. When determining the responsible authority, counties should consider a range of factors including the powers and capacity of competent authorities, the level of interaction with MVTS providers, and the information available to competent authorities to support this function.

There is a range of information sources which may indicate MVT activity and could be useful to identify unauthorised MVTS providers, for example:

- Applications for licencing or registration, including those that were unsuccessful or historical applications which were not renewed or where licenses or registrations have been withdrawn;
- Marketing by MVTS providers, including advertisements in the various media outlets;
- Suspicious transaction reports;
- Data by MVTS organisations, reporting those entities which do not form part of their organisation or association;
- Information provided by whistle blowers;
- Policing and intelligence reports; and
- Reports of international funds transfers or cross-border movements of funds (if applicable in a country)

Whichever authority is responsible, coordination between various authorities is important as they may hold information relating to unauthorised providers. Countries should be aware of the information that is available in their jurisdiction and ensure information is shared as appropriate to support the identification and sanctioning of unauthorised MVTS providers.

There can be a number of ways for awareness raising campaigns in respect of unauthorised MVTS. This should be done on a risk basis, i.e. not all countries should conduct awareness raising campaigns with the same intensity. Some of these examples include:

- Ensuring that the competent authorities responsible for overseeing and/or registering or licensing unauthorised MVTS providers know how to detect those services that have not registered or been licensed and are adequately resourced to do so.
- Making unauthorised MVTS providers aware of their obligations to license or register, as well as any other obligations with which they may have to comply. Using education and compliance programs, including visits to advise businesses which may be operating unauthorised MVTS of licensing or registration and reporting obligations, as opportunities to seek information about others in their industry. Using these outreach efforts by law enforcement and regulatory agencies to enhance their understanding about the operations, record keeping functions and customer bases of unauthorised MVTS operations. Extending outreach campaigns to businesses typically servicing unauthorised MVTS providers (such as shipping services, courier services and trading companies). Placing in trade journals, newspapers, web-pages or other publications of general distribution notices of the need for unauthorised MVTS providers to register or license and comply with other relevant requirements.
- Ensuring that law enforcement is aware of the compliance requirements for MVTS providers in addition to the methods by which those services are used for illicit purposes. Ensuring that the full range of training, awareness opportunities and other forms of education are provided to investigators with information about MVTS operations, their obligations under the regulatory regime and ways in which their services can be used for ML/TF. This information can be provided through training courses, presentations at seminars and conferences, articles in policing journals and other publications.
- Publishing guidelines to encourage licensing or registration and compliance with other relevant requirements. Additionally, issuing material to ensure financial institutions currently subject to STR requirements (e.g. banking sector) develop an understanding of MVTS. Informing potential customers about the risks of utilising illegal MVTS and their role in ML/TF.
- Requiring entities to display their registration/license to customers once they are registered/licensed. Legitimate clients will likely have a higher degree of confidence in using registered/licensed operators and may therefore seek out those operators displaying such documentation.
- Making a comprehensive and up-to-date list of all licensed or registered persons that provide MVTS publicly available.

The FATF has identified a number of effective practices in the area of identification strategies for unauthorised MVTS, which include[47]:

- Increasing and strengthening communication between supervisory authorities including self-regulatory bodies, MVTS organisations and the general public, in order to identify those institutions which have lost their licenses or registrations, specifically due to not complying with AML/CFT provisions.
- Examining the full range of media to detect advertising conducted by unauthorised MVTS providers and informing operators of their registration/licensing obligations. This includes national, local and community newspapers, radio and the internet; giving particular attention to the printed media in various communities; and monitoring activities in neighbourhoods or areas where unauthorised MVTS providers may be operating.
- Passing on, to the competent authorities, information about unauthorised MVTS providers uncovered during investigations effective practices include encouraging investigators to pay particular attention to ledgers of business that may be associated with unauthorised MVTS; encouraging enforcement agencies to look for patterns of activity that might indicate involvement of unauthorised MVTS; and, where possible, encouraging enforcement agencies to consider using undercover techniques or other specific investigative techniques to detect MVTS that may be operating illegally.
- Consulting with of registered / licensed MVTS providers and banks for potential leads on MVTS providers that are unregistered or unlicensed.
- Being aware that unauthorised MVTS are often utilised where there is bulk currency moved internationally, particularly when couriers are involved. Paying particular attention to the origin and owners of any such currency. Coordinating with border control agencies to identify instances of cross-border currency movement via couriers. Couriers could provide insights for the identification and potential prosecution of illegal operators with whom the couriers are associated, especially when potential violations by couriers are linked back to the source of the unauthorised MVTS operation.
- Paying particular attention to domestic suspicious transaction or unusual activity reporting, as well as to domestic and international large value cash reporting, where applicable, to identify possible links to unauthorised MVTS operations.
- Assisting banks and other financial institutions in developing an understanding of what activities/indicators are suggestive of unauthorised MVTS operations and using this to identify them. Many unauthorised MVTS

47 See FATF (2003).

providers maintain bank accounts and conduct transactions in the formal financial sector as part of other business operations. Giving banks the authority to crosscheck particular accounts against a register of these operators and notify the relevant regulatory authority as appropriate. These registers can also be made available online for easy access and search and may be updated at frequent intervals.

- Once unauthorised MVTS operations are identified, international exchange of information and intelligence on these entities between the relevant agencies can be facilitated. Consideration could be given to sharing domestic registers with international counterparts. This strategy would also assist jurisdictions to identify local operators not previously known.

Where unauthorised MVTS providers are identified, it is important to consider the reasons why they conducted their business without authorisation. If this is due to a lack of information, improved communication of the need for authorisation may be required. If operators do not register because they are concerned about their ability to meet compliance requirements, it is important to understand the concerns and to consider whether these can be addressed, for example by providing appropriate guidance.

EXAMPLES OF ACTION TAKEN BY AUTHORITIES AGAINST UNAUTHORISED MVTS PROVIDERS.

Mexico

According to Mexican Law (Article 101 of General Law of Auxiliary Credit Organizations and Activities), the provision of those services of the Mexican entity analogous to the MVTS (the "*transmisor de dinero*" or "money remitter") by someone who has not been registered for those purposes by the National Banking And Securities Commission, is a crime punished with prison from 3 to 15 years, and a fine of up to 100 000 days of wage (article 101 of the General Law of Auxiliary Credit Organizations and Activities).

The National Banking and Securities Commission (CNBV) has broad faculties to investigate and sanction natural and/or legal persons who are carrying out financial activities without authorisation. Thus, the CNBV imposes the suspension of activities to those offenders, among others effective, proportionate and dissuasive sanctions.

Moreover, in order to ensure that users and financial institutions are able to know which entities are authorised as MVTS, the CNBV website publishes a list of the registered MSBs and MVTS. Likewise, money remitters should indicate in any kind of advertisement their registration number and its issuance date. Additionally, the CNBV website has a mechanism in which people can report any MVTS without registration.

Netherlands

In the Netherlands, De Nederlandsche Bank N.V. (DNB) is authorised to supervise MVTS. Transferring money to and from foreign countries without prior authorisation by DNB is considered to be a violation of the Financial Supervision Act.

DNB is authorised to impose fines (max. EUR 4 million) and to issue a cease and desist order to stop the illegal activities. These activities also constitute a criminal offence, which is liable to proceedings by the Public Prosecutor.

In the autumn of 2014, DNB conducted several examinations into people and offices suspected of transferring money to and from foreign countries without prior authorisation by DNB. The goal of this project was to make a stand against illegal practices and to show the authorised payment institutions that illegal activities are not acceptable. These examinations involved an on-site inspection supported by the police. The on-site inspections revealed that several violations of the Dutch Financial Supervision Act had been committed. DNB has therefore imposed fines in several cases. DNB has also issued a press release on this subject in which the general public as well as the authorised MVTS providers were incited to report illegal MVTS activities to DNB. In addition, DNB used social media to get across its message[48].

Singapore:

Singapore has the following mechanism to deal with the issue:

- Physical surveillance: police look out for illegal remittance operators when patrolling areas where they are more likely to be active, such as places where migrant workers congregate.
- Public database of licensed operators: A public database of the names and addresses of licensed remittance businesses allows the public to cross-check remittance businesses and alert authorities to unlicensed activities.
- Outreach to likely users of unlicensed services: Target groups, such as migrant workers, are educated on the risks of using unlicensed remittance operators and directed towards the licensed operators. Siting licenced remittance services in convenient locations, such as foreign worker dormitories/ recreation centres.

ANNEX 2. EXAMPLES OF COUNTRIES' SUPERVISORY PRACTICES FOR THE IMPLEMENTATION OF THE RISK-BASED APPROACH TO THE MVTS SECTOR

Argentina

Law 25246, as amended, in its Section 20, subsection 2, establishes as legally bound reporting parties "the institutions governed by Law 18924, as amended, and natural or artificial persons authorized by the Central Bank of the Argentine Republic to operate in the purchase and sale of foreign currency in the form of cash money or cheques drawn in foreign currency, or by means of credit or debit cards or in the transfer of funds within the national territory and abroad".

FIU Resolution 66/2012 regulates the measures and procedures that shall be observed by fund remitters, in order to prevent, detect and report facts, acts, transactions or omissions that may constitute crimes of Money Laundering and Terrorist Financing.

Section 3 of this Resolution establishes the prevention policy for the purposes of correctly complying with the obligations arising from Law 25246. Among other aspects, said policy shall include the development of records of analysis and risk management about Money Laundering and Financing of Terrorism of detected unusual transactions and those that have been considered suspicious and thus have been reported.

As legally bound reporting parties, fund remitters shall adopt risk analysis policies. Section 18, subsection l) of this Resolution indicates that: Said risk analysis policies shall be gradual; enhanced measures shall be performed over higher risk customers and updates and analysis of information on the customer's economic, assets, financial and tax situation and corporate and control structure shall be conducted more frequently.

A regards to supervision, during 2014, the overall supervisory system has been strengthened to ensure correct implementation of AML/CFT prevention measures on part of the legally bound reporting parties, among which fund remitters are included. Verification procedure, both on-site and off-site, is performed based on a risk approach, according to FIU Resolution 229/2014. With respect to sanctions, in 2014, administrative summaries were applied to two fund remitters for non-compliance of the current AML/CFT obligations.

In addition, twice a year, the FIU coordinates intensified cross-border control of currency and negotiable instruments with the participation of country members of GAFILAT

Canada

Example of Guidance on the RBA:

FINTRAC provides guidance to reporting entities on operationalizing a risk-based approach to combatting money laundering and terrorist financing. This guidance is designed to help reporting entities to:

1) Consider business-wide elements or factors that may impact ML/TF risk and apply controls and measures to mitigate the risks, addressing:

- Products, services and delivery channels;
- The business' geography; and
- Other factors relevant to the business' specific activities (e.g. legal, environmental, etc.)

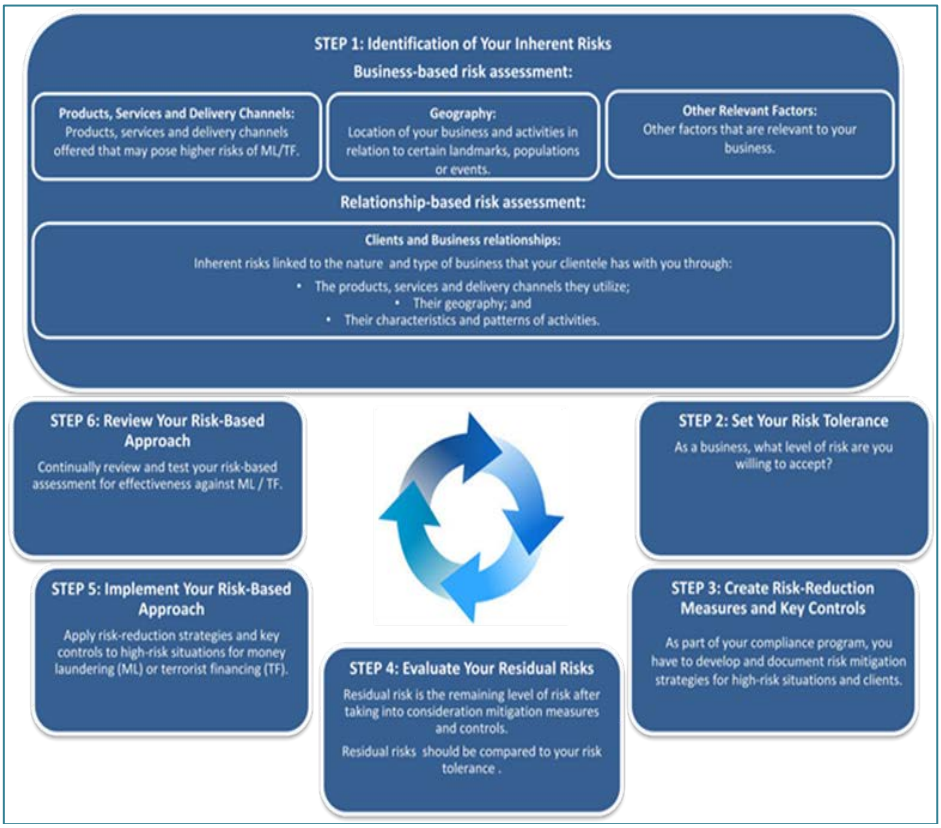
2) Evaluate the risks associated with the clients and business relationships by looking at:
   - The products, services and delivery channels they utilize;
   - The geography related to the clients (their location, links to high-risk countries, where they conduct their business and transactions, etc.); and
   - Their activities, transaction patterns, characteristics, etc.

   This specific assessment will allow reporting entities to identify high-risk business relationships and apply the prescribed special measures.

3) Identify and validate controls to mitigate high-risk activities and business relationships, including prescribed special measures; and

4) Review and assess the status of the business' compliance regime with Canada's laws as well as the adequacy of your current controls to mitigate the identified high risks.

This guidance accomplishes these four tasks through the following six step approach:



This document was prepared generally for all of Canada's FIs and DNFBPs and can be found at www.fintrac-canafe.gc.ca/publications/rba/rba-eng.asp. FINTRAC is aware that all sectors require more specific information to operationalize a meaningful risk-based assessment to combat ML/TF. To accommodate this need, FINTRAC is preparing sector specific workbooks to aid reporting entities in operationalizing their risk-based approach.

Italy

Money Transfer Proceeding ("Money River" Operation) - December 2014

As a result of systematic criminal behaviour committed by the suspects, eighteen (18) money transfer operators based in Rome were addressed by custody order on 17 December 2014 (10 out of 18 in prison and 8 under house arrest). Money transfer plays a significant role within Rome's economy and is almost exclusively consisting of foreign countries operators. The investigated operators illegally transferred abroad approx. EUR 1 billion, as a result of several predicate offences: import and sale of counterfeit goods, market fraud, sales of industrial products with false or misleading trademarks and tax evasion.

In particular, a huge sum of money was transferred abroad through a large number of illicit transfers of cash amounts (approx. EUR 785 000) below the threshold set by law, and illegally, since the operations were fictitious, performed without customer identification and with no indications of the nature of the underlying relationships. None of the requirements set by the Italian AML legislation was fulfilled.

Transfer operations were always made below the threshold – i.e. whereby the threshold for cash transactions was set at EUR 5 000 (up to 12 August 2011), operations then amounted to EUR 4 999 each; whereby the threshold was EUR 2 500 (up to 5 December 2011), operations then amounted to EUR2 499; and, most recently, with the threshold set at EUR 1 000, transactions amounted to EUR 999.

"*The money was transferred without any tax trace in Italy*" (as reported by the Judge in the mentioned custody order).

The convicted individuals were accused of: transnational criminal association and money-laundering arising from the related predicate offences (ascribed to the economic operators who made use of the activity carried out by money-launderers). In compliance with the law regulating legal persons' liability, the offences related to the crimes committed by their managers were also notified.

The case involved multiple criminal associations operating through the Rome-based Italian branch of the *XYZ* payment institution (i.e. a multinational company specialised in worldwide money transfers based in a foreign country), as well as 7 Rome-based money transfer agencies operating in the circuit headed by the mentioned Payment Institution.

The association members include the branch leaders and the representative in charge of AML checks, as well as a number of operators that violated laws on money transfer in order to carry out the above transactions.

Preliminary investigations lasted for about two years and were performed by the *Nucleo di Polizia Valutaria* of the *Guardia di Finanza* (*GdF*) through a wide array of investigative tools: wiretaps, video surveillance services, searches, seizures, watching and shadowing services, AML inspections and documentation analysis.

The investigations were inspired by the AML inspection into a Rome-based money transfer agency carried out by GdF upon own initiative. The inspection revealed abnormal operations involving a considerable amount of money transfer operations almost exclusively requested by non EU-citizens and addressed to their respective countries of origin.

Investigations (subsequently extended to another 6 Rome-based agencies of the Italian branch of the Payment Institution and numerous foreign traders) enabled shedding light on a widespread criminal network which – by making use of the services provided by the money transfer circuit headed by the Payment Institution, and taking advantage of systematic violation of AML legislation – managed to transfer huge cash flows by laundering the proceeds of tax evasion and unlawful activities related to trade of counterfeit products.

The cash was delivered to money transfer agencies or by their representatives who used to pick it up directly at the premises of the persons ordering the transfer operations.
The names used to perform the operations were invented, or belonged to deceased persons, or even to unsuspecting customers already registered in the Payment Institution management database and made accessible to the agencies operating within the circuit.

The fictitious character of the operations resulted from multiple sources:

- Documentation obtained;
- Wiretaps;
- Uneconomic character of operations compared to larger bank transfers (expressly chosen as they guaranteed anonymity, tax evasion, money-laundering and large profits to the money transfer operators, thus favouring combined economic and criminal interests for those committing predicate offences and money-launderers);
- Video surveillance agencies (few customers entering but huge volumes of transactions recorded);

Following inspections carried out by GdF at the premises of money transfer agencies, operators decided to resort to pick-up of the funds to be transferred directly from the premises of the subjects ordering the operations.

The subjects requesting money transfer operations were foreign entrepreneurs and traders operating in Italy (especially in Rome), with criminal records for committing crimes of various kinds (smuggling, counterfeiting, tax evasion).

The illegal transfer was managed and directed by persons who held important positions within the Payment Institution and enacted systems aimed at "circumventing" proper tracking of the origin of the sums. Among those addressed by restrictive measures: the temporary regional director, the AML supervisor, the sales department manager, and the head of unsettled debts office of the Italian branch. GdF executed the seizure of assets worth over EUR 13 million, equivalent to the profits

made by the Payment Institution and money transfer agencies through the illicit transactions performed.

Mexico

Ministry of Finance:

The Mexican Ministry of Finance modified the administrative rules so that the professional organisations of MVTS are able to draft the AML/CFT internal compliance manuals. This reduces costs due to scale economies, while taking into consideration the differences of specific sectors of MVTS and, ultimately, fostering AML/CFT compliance.

National Banking and Securities Commission (CNBV):

Several questionnaires have been conducted to Money Transmitters to deepen operability mechanisms, which is used to determine the risk degree of Money Transmitter. The questionnaire enables to know the geographical areas of increased operation, the number of related agents, the number of specific operations, parameters or amounts, among other data. This allows updating information on supervisory requirements based on major elements of risk and not just random or geographical information.

The Money Transmitters must inform the CNBV the name of related agents having a contractual relationship, as well as other parties that operate with their related agents; with this information corridors can be known.

Whenever an inspection is conducted, information of the entities is requested to the FIU regarding the behaviour that have generated them concern based on information analysis of relevant, unusual and internal reports and such reports sent to that authority.

The CNBV counts with a risk matrix that qualifies the risk to which every Money Transmitter is exposed; this matrix integrates information from geographic areas of major transactions, the number of branches and related agents to each society, the average number of employees, specific transactions, parameters or amounts, as well as the mitigating measures implemented by these. Based on such matrix, and concerns of the FIU, CNBV implements the Annual Inspection Visits Program with tasks that will be reviewed during the inspection visits.

Every time a Money Transmitter is cancelled because it did not complied correctly with its AML/CFT obligations, the CNBV monitors if it still sends any kind of operational report and, if it does, an specific area visits the cancelled entity and if it is still operating starts the corresponding administrative or criminal procedure to sanction the illegal entity.

Netherlands

In the Netherlands, De Nederlandsche Bank N.V. (DNB) is responsible for the supervision of MVTS. In addition to supervising MVTS authorised in the Netherlands, DNB also supervises Dutch-based agents of foreign MVTS, by virtue of the Anti-Money Laundering and Anti-Terrorist Financing Act *(Wet ter voorkoming van witwassen en het financieren van terrorisme – Wwft)*.

Each quarter, DNB analyses all money transfers made in the Netherlands and performs a network analysis on these transfers. Based on this network analysis, DNB is able to detect potentially unusual transaction patterns and take direct action by arranging on-site inspections. This working method allows DNB to perform her supervisory tasks effectively and efficiently. At present, DNB leverages this technique to supervise around a thousand locations in the Netherlands. Over the past year, DNB has imposed several formal measures as a result of this supervisory practice and made one report to the Public Prosecutor's Office with respect to a suspected case of money laundering.

Singapore

To balance the need to focus on the higher risk MVTS operators, while not being blind-sided by the broader population, supervisors could augment their resources by engaging external auditors/consultants to assist in performing periodic reviews of lower-risk entities. The MVTS sector may be more suited for such an approach where its operations and business model are generally less complex than banks.

Spain

At the end of 2009, SEPBLAC, in its FIU capacity, detected a fresh money laundering operation, carried out by criminals who, taking up the position of agents of payment institutions, were splitting amounts of cash into numerous remittances, which were attributed to fictitious identities and transferred to China. These funds were associated with payments for smuggled goods, tax fraud and other criminal activities.

SEPBLAC received suspicious activity reports with respect to this pattern of operation not only from payment institutions, but also from banking institutions in which certain agents had opened accounts, from which they were sending funds to be transferred to the MVTS. SEPBLAC examined the STRs and concluded that the suspicious activity reported did not refer to end-customer transactions, but rather that it was the agents themselves who were connected with ML/FT activities, and not the alleged customers, who were in reality inexistent.

Following a scrutiny of such reports, the relevant financial intelligence reports were sent by SEPBLAC to law enforcement agencies and Customs authorities. In October 2012, Spanish media revealed the results of this investigation, known as "*Operacion Emperador*". This large ML network is currently being prosecuted in Spain. A total of 110 people are being prosecuted in Spain, Germany and Italy and EUR 11.6 million in cash and EUR 11 million in bank accounts have been seized. The case involved laundering the proceeds of numerous predicate offences, including smuggling (undeclared or undervalued goods imported) and fiscal crimes.

At the same time, this problem was reported to SEPBLAC's Supervision Area which decided to undertake measures of a general nature applicable to the entire sector, as well as specific measures in relation to certain institutions.

1) General measures:

- Requirement for the payment institutions to send monthly statistical information broken-down by country and agent. This requirement expanded the statistical information which the Bank of Spain had been

collecting and which was accessible by SEPBLAC and it enabled SEPBLAC Supervision Area to conduct a strategic analysis on the money remittance sector. The findings of this strategic analysis were used to implement additional risk-based supervisory measures, selecting the targets according to the level of risk detected in the analysis and to adapt SEPBLAC's operational analysis to be more useful for competent authorities.

- Training and awareness-raising of institutions with respect to the need to control the activity of their agents, in order to comply with the obligation expressly contained in AML/CFT legislation. This objective was achieved by means of circulars sent to the representatives of the payment institutions and the organisation of specific meetings with the sector, where the problems posed by the laundering of money through agents and the ways to detect it and curtail it were explained.

2) Specific measures:

- SEPBLAC's Supervision Area decided to undertake extensive on-site inspections of certain money remitters in order to verify the nature of the phenomenon, its extent and how it was being managed by the various institutions. The outcome of these inspections caused, in the first place, the opening of several sanctioning case files against a number of institutions and, as a consequence thereof, there was a very significant increase in STRs filed by money remitters in relation to their agents. The result of these new STRs was incorporated by the police authorities into investigations already in progress, which made it possible to finally compile the information for initiating criminal proceedings.

Moreover, from the point of view of the activity of these companies, the outcome of this entire process has led to:

1) A "purging" process of the MVT sector, with the disappearance of several institutions and a general improvement in the controls existing among those remaining. A particularly significant development among the latter measures was the creation by the association of MVTs of a database of agents whose activity has been the subject of an STR. Money remitters are thus able to know immediately whether the person or company they are intending to contract as an agent, or which they have already engaged, has been the subject of an STR by another money remitter.

2) A reduction in the flows of illegal money channelled through money remitters, due to the improvements introduced into their AML/CFT systems and to the measures put into place by the sector overall. In 2013, SEPBLAC measured the impact of the decisions and measures taken as a result of its strategic analysis, and established that the total amount of high risk transactions in the money remittance sector has considerably decreased as revealed by graphs below:

China

Remittances to China

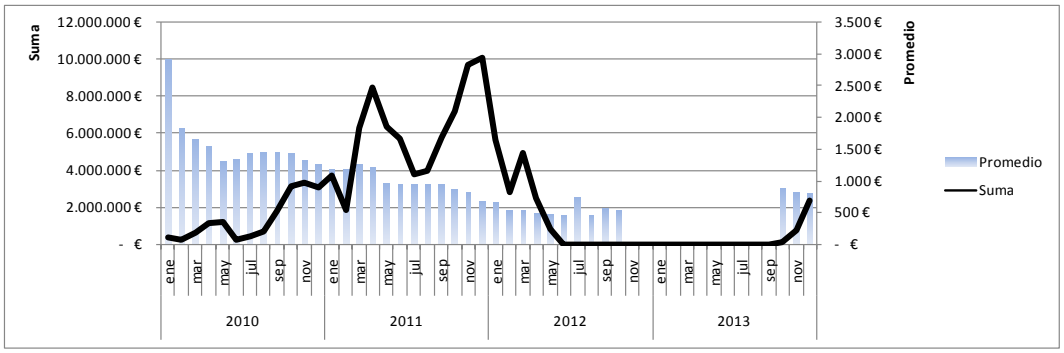
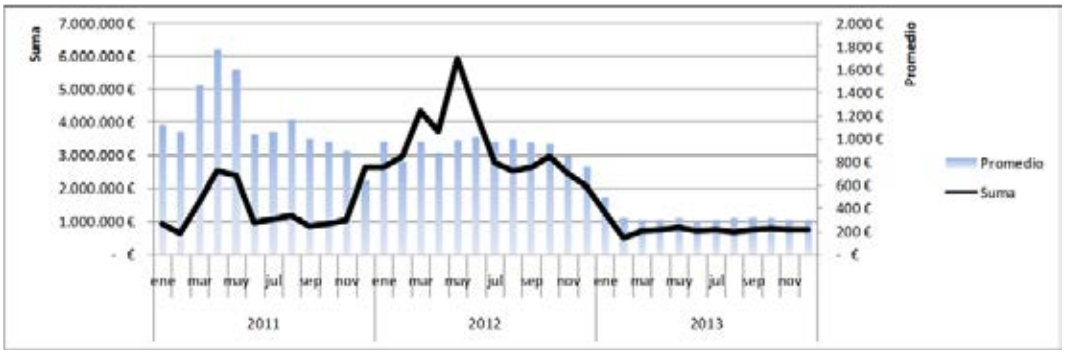
Institution B. (2010 – 2013)



Institution C. (2011 – 2013)



United States

Supervisory Guidance on Risk Management Associated with MVTS

- The office of the comptroller of the currency (OCC), a US banking supervisor, issued a "statement on risk management associated with money services businesses" to provide clarification to national banks, federal savings associations, and federal branches and agencies of foreign banks (collectively, banks) on the agency's supervisory expectations with

regard to offering banking services to money services businesses (MSB). Available at www.occ.gov/news-issuances/bulletins/2014/bulletin-2014-58.html

- Joint guidance – FIU and supervisor. In 2005, the US FIU (FinCEN), together with all the US. Banking supervisors collectively called the "federal banking agencies", jointly issued a statement to address expectations regarding banking institutions' obligations under the Bank Secrecy Act for money services businesses, such as check cashers and money transmitters. Available at www.fincen.gov/news_room/nr/html/20050330.html

ANNEX 3. EXAMPLES OF COUNTRIES' SUPERVISORY PRACTICES FOR THE IMPLEMENTATION OF THE RISK-BASED APPROACH TO THE BANKING SECTOR WITH MVTS PROVIDERS AS CUSTOMERS

Mexico

National Banking and Securities Commission (CNBV)

The CNBV published on its website a compliance chart with the levels of legal compliance on AML/CFT matters, including Money Transmitters, among others. The chart aims to increase financial transparency and build trust between the supervised entities and users of financial services.

The CNBV has practiced visits to the main FIs that send their customers' resources through concentration accounts, as well as to such banks that have opened concentration accounts of brokerage firms, it has been recommended since 2009, to this sector, to implement the following measures:

Privilege:

a) The use of a referenced number for those accounts being used in concentration and dispersion of resources.

b) The use of electronic transfers to concentrate resources on these kinds of accounts, since it allows the identification of the resource's origin.

Implement:

a) Special monitoring to identify the source of the received funds by means of transfers.

b) Random special monitoring in order to identify the origin of the resources received through documents (checks).

c) Prohibition of receiving cash deposits through concentration accounts.

d) Information exchange with FIs where concentration accounts are opened.

As a result of the financial reform published in the Official Journal of the Federation (DOF -for its acronym in Spanish-) on January 10th 2014, the CNBV will certify professionals, compliance officers and independent external auditors who provide services to entities and persons subject to supervision by the CNBV on AML/CFT matters. This certification will provide the FIs and supervised subjects with confidence and will foster stability of the Mexican financial system. On October 2nd 2014, was published in the DOF the general provisions for certification of independent, external auditors, compliance officers and other professionals in the prevention of transactions with illegal proceeds and terrorist financing; and on March 13th 2015, was published through the same means the Agreement by which it is disclosed the Calendar to start the certification process of independent external auditors, compliance officers and other professionals in the prevention of operations with resources illegal proceeds and terrorist financing.

According to this calendar the certification program will start with the banking sector, followed by brokerage firms and regulated multiple purpose financial companies (Sofoms) before the end of 2015.

ANNEX 4. EXAMPLES OF PRIVATE SECTOR PRACTICES IN APPLICATION OF RBA

Canada

Example of private sector effective practices for Agent Risk

a.) When onboarding agents, conduct beneficial ownership assessment, criminal background check, media scan for negative press, check of compliance credentials.

b) In dealing with agents on an ongoing basis, conduct an ongoing risk assessment of their business and provide training, outreach, and transaction monitoring in accordance with their risk. Conduct mystery shopping and compliance testing internally.

c) Having a clear and defined process for resolving customer complaints and de-registering agents.

d) Sharing information on de-marketed agents and customers with other industry participants.

Example of private sector effective practices for Customer Risk

e) When on-boarding clients, checking beneficial ownership, criminal background, and media scan of clientele.

Example of private sector effective practices for Internal Controls

f) Dedicated compliance staff that are not compensated in accordance with transactions, business relationships or on-boarding agents.

Japan

One MVTS provider has been voluntarily setting maximum fund transfer amount from JPY 100 000 to JPY 500 000 yen per one day according to the beneficiary countries' risk situations, and also the fund transfer has been limited to two transactions in maximum per one day (fund transfer from different business locations is not permitted).These measures have been taken due to the increasing illegal fund transfer case using money mule in Japan.

The Netherlands

In the Netherlands, the Dutch Association of Money Transfer Companies has developed a code of conduct. This code of conduct applies to all members of the Dutch Association of Money Transfer Offices (NVGTK) and is intended to set minimum requirements for risk management and compliance with regard to money laundering and other criminal activities. This code of conduct strives to implement these requirements based on the following themes: compliance, customer agreement, risk criteria, customer due diligence, monitoring, reporting unusual transactions, payment service agent due diligence, training and knowledge level, retaining evidence, and complaints procedure. (www.nvgtk.nl/actueel/gedragscode--code-of-conduct)

Spain

As a consequence of the awareness-raising process developed with this sector regarding the risks of agents, the main association of MVTS providers has created a database of "bad agents".

This is an industry-held register of high risk agents (or the so-called "bad agents"), through which MVTS providers can share alerts with each other about those agents whose transactions(not singular transactions, but the whole business managed by that agent) have been reported to the FIU and business relationships terminated. Usually, these decisions are based on the suspicious that these agents are splitting amounts of cash into numerous remittances, which are attributed to fictitious identities and transferred to third countries.

Making use of that database, every time a MVTS provider is going to initiate business relationships with a new agent, they can check whether his/her transactions have been reported to the FIU as suspicious or not.

ANNEX 5. EXAMPLE OF COMPLIANCE PRACTICES OF AND IN RELATION TO A LOW RISK MVTS

This Annex is intended to support supervisors and banks to identify lower risk MVTS providers. This Annex can assist in bridging the gap between the current guidance and supervisory and compliance practices in relation to lower risk MVTS providers.

Characteristics that may factor into lower risk MVTS may be as follows:

- Registered/Licensed with annual audits and regulatory exams.
- Publicly-traded or well capitalized.
- Stable track history with substantial infrastructure.
- Established AML/CFT program.
- Ability to quickly and accurately provide customer specific information (i.e. transaction logs).
- Direct interaction with consumers (as opposed to nested wholesalers or large commercial transactions).
- Low dollar, domestic consumer-based transactions (non-cross border).
- Low dollar, cross-border consumer remittances.
- Licensed agents monitored by licensed parent.
- Established and transparent network of counterparties (foreign).
- A small number of known, regular customers with a pattern of repeat micro-transactions often linked to a pay or salary cycle and with senders and recipients normally linked by family ties.

FATF

GUIDANCE FOR A RISK-BASED APPROACH
MONEY OR VALUE TRANSFER SERVICES

Money or Value Transfer Services (MVTS) providers play an important role in the international financial system, in particular for the migrant communities around the world.

This guidance will assist countries and their competent authorities, as well as the practitioners in the MTVS sector and in the banking sector that have or are considering MVTS providers as customers, to apply the risk-based approach to the development of measures to combat money laundering and terrorist financing for the MVTS sector.

The risk-based approach, the cornerstone of the FATF Standards, requires that measures to combat money laundering and terrorist financing are commensurate with the risks.

- Basel Committee on Banking Supervision Supervisory Guidance for Managing Risks Associated with the Settlement of Foreign Exchange Transactions, 2016

I. INTRODUCTION

A. BACKGROUND – FATF ACTION TO ADDRESS DE-RISKING IN THE CORRESPONDENT BANKING CONTEXT

1. In the wake of the global financial crisis and countries' response to it, the international community has been increasingly concerned about *de-risking.* The FATF understands this term to mean situations where financial institutions terminate or restrict business relationships with entire countries or classes of customer in order to avoid, rather than manage, risks in line with the FATF's risk-based approach (RBA). This is a serious concern for the FATF and the FATF-style regional bodies (FSRBs) to the extent that de-risking may drive financial transactions into less/non-regulated channels, reducing transparency of financial flows and creating financial exclusion, thereby increasing exposure to money laundering and terrorist financing (ML/TF) risks.

2. Analytical work undertaken so far by different bodies, including the FATF,[1] shows that de-risking is a complex issue driven by various considerations including: profitability; reputational and liability risks; changes in banks' financial risk appetites; the amount of financial penalties imposed by supervisory and law enforcement authorities, increased compliance costs associated with implementing conflicting regulatory requirements, including anti-money laundering and counter-terrorist financing (AML/CFT) and confusion caused by the term Know-Your-Customer's-Customer (KYCC). A recent survey[2] also shows that in some cases, banks will exit the relationship solely on the basis of profits ("de-marketing"), irrespective of the risk context and of market circumstances.

3. The term KYCC has created a lot of confusion. To clarify, the *FATF Recommendations* do not require financial institutions to conduct customer due diligence on the customers of their customer (i.e., each individual customer). In a correspondent banking relationship, the correspondent institution will monitor the respondent institution's transactions with a view to detecting any changes in the respondent institution's risk profile or implementation of risk mitigation measures (i.e. compliance with AML/CFT measures and applicable targeted financial sanctions), any unusual activity or transaction on the part of the respondent, or any potential deviations from the agreed terms of the arrangements governing the correspondent relationship. In practice, where such concerns are detected, the correspondent institution will follow up with the respondent institution by making a request for information (RFI) on any particular transaction(s), possibly leading to more information being requested on a specific customer or customers of the respondent bank. There is no expectation, intention or requirement for the correspondent institution to conduct customer due diligence on its respondent institution' customers.

[1] The FATF circulated a questionnaire to banks and MVTS in late 2015 to gather information from the private sector which helped to form the basis of this guidance.

[2] ACAMS/Dow Jones (2016), *Global Anti-Money Laundering Survey Results 2016,* http://files.acams.org/pdfs/2016/Dow_Jones_and_ACAMS_Global_Anti-Money_Laundering_Survey_Results_2016.pdf.

4. In June 2015, the FATF issued a public statement[3] to clarify that, when establishing correspondent banking relationships, correspondent institutions are required to perform customer due diligence (CDD) on the respondent institution, and gather sufficient information about the respondent institution to understand its business, reputation and the quality of its supervision, including whether it has been subject to a ML/TF investigation or regulatory action, and to assess the respondent institution's AML/CFT controls. It was clarified that the *FATF Recommendations* do not require correspondent institutions to perform CDD on the customers of their respondent institutions when establishing correspondent banking relationships or in the course of the relationship.

5. Although the financial sector welcomed that and other FATF public statements on de-risking,[4] it also sought further clarification on supervisory expectations for conducting customer due diligence on correspondent institution's respondents. In turn, supervisors and regulators need to be clear about how they assess financial institutions against those expectations. For that reason, the FATF committed to developing guidance to further clarify supervisory expectations for correspondent banking relationships in relation to the obligations defined by the FATF standards. This clarification is consistent with the FATF's overall approach to de-risking which is based on the effective implementation of the global AML/CFT standards, in line with the FATF's RBA. The *FATF Recommendations* require financial institutions to identify, assess and understand their ML/TF risks, and implement AML/CFT measures that are commensurate with the risks identified. Indeed, the RBA is the cornerstone of an effective AML/CFT system, and is essential to effectively managing risks.

6. Prudential and other regulatory requirements as well as the complexity, number and changes in sanctions regimes, and also uncertainty related to the interplay of different sanctions regimes and their applicability to financial institutions, were also mentioned as drivers of de-risking. AML/CFT regulations are therefore only one of a multitude of factors cited for closing correspondent banking relationships. These results are largely in line with the prevailing understanding of the FATF and other international organisations doing work in this area, including the Financial Stability Board (FSB), Committee on Payments and Market Infrastructures (CPMI), Basel Committee for Banking Supervision (BCBS)'s Anti-Money Laundering Experts Group (AMLEG), International Monetary Fund (IMF) and the World Bank.

7. Although many of the factors contributing to de-risking go far beyond AML/CFT and the FATF mandate, the FATF is committed to addressing this issue to the extent it can by issuing guidance clarifying how to implement the FATF's RBA properly and effectively, consistent with previous FATF guidance.[5]

[3] See FATF(2015), *Drivers for "de-risking" go beyond anti-money laundering / terrorist financing* www.fatf-gafi.org/publications/fatfrecommendations/documents/derisking-goes-beyond-amlcft.html.

[4] See the public statements issued by FATF on de-risking in October 2014, June 2015 and October 2015.

[5] Including *Revised Guidance on AML/CFT and Financial Inclusion* (2013).

8. Correspondent banking is an activity that has been negatively impacted by de-risking in certain regions[6] and sectors. This is of concern to the international community, as correspondent banking is an important means of facilitating cross-border movements of funds, and enabling financial institutions to access financial services in different currencies and foreign jurisdictions, thereby supporting international trade, charitable giving, commerce and remittances flows, all of which contributing to promoting financial inclusion.

B. THE PURPOSE OF THIS GUIDANCE, THE TARGET AUDIENCE, AND THE STATUS OF THIS GUIDANCE

9. The purpose of this Guidance is to address de-risking by clarifying the application of the FATF standards in the context of correspondent banking relationships and money or value transfer service (MVTS) providers rendering similar services (i.e. MVTS acting as intermediaries in processing and/or executing the transactions of their own customers through accounts – see II d) below) by:

a) supporting the development of a common understanding of what the RBA entails for banks engaged in correspondent banking activity and MVTS providers rendering similar services; respondent institutions with MVTS providers as customers; and financial institutions relying on third-party MVTS providers, in their role as intermediaries, to execute payment transactions,

b) clarifying the interplay between the FATF standards on cross-border correspondent banking (Recommendation 13) and MVTS providers acting as intermediaries, and the FATF standards on customer due diligence (Recommendation 10) and wire transfers (Recommendation 16), as well as on targeted financial sanctions (Recommendations 6 and 7),

c) highlighting the extent to which correspondent institutions and MVTS providers offering similar services may gain a sufficient understanding of the customers of the respondent institutions and the associated risks, and

d) clarifying the expectations for correspondent institutions when dealing with respondents whose customer bases include MVTS providers.

10. The target audiences of this Guidance are:

a) banks and MVTS providers engaged in providing correspondent banking or respondent banking services,

b) financial institutions with account holders that are MVTS which in turn provide correspondent banking-type services to their own customers (as opposed to MVTS providers who are holding and using their account for their own corporate purposes), and

[6] Refer to: Joint Survey by the Union of Arab Banks (UAB) and the International Monetary Fund (IMF); The World Bank's Fact Finding Summary from De-risking Surveys and Withdrawal from Correspondent Banking: Where, Why, and What to Do About It.

c) competent authorities (particularly AML/CFT regulators and supervisors of banks and of MVTS providers).

11. It should be noted that this Guidance has been prepared in collaboration with the FSB, which is coordinating work to assess and address the extent and causes of banks' withdrawal from correspondent banking to identify possible policy responses to address this issue[7], through the implementation of a four-point action plan (data collection, clarification of regulatory expectations, domestic capacity building, and strengthening the tools for due diligence) coordinated by the Correspondent Banking Coordination Group. Other international organisations doing related work in the correspondent banking area (for ex. CPMI and BCBS) have also been closely associated to development of this FATF Guidance.

12. This Guidance draws on the experiences of countries and of the private sector to assist competent authorities and financial institutions in effectively implementing applicable *FATF Recommendations* using the risk-based approach to avoid the unintended consequences of de-risking. It also uses input from other relevant standard setters, and especially the BCBS with its Guidance on *Sound management of risks related to money laundering and financing of terrorism* (Annex II on correspondent banking). This FATF Guidance is non-binding and does not overrule the purview of national authorities to, among other things, assess and regulate correspondent banking activities and MVTS sectors as per the legal, supervisory and regulatory frameworks established in each country and/or region, the ML/TF risks present in each jurisdiction, individual institution's risk assessments and other contextual factors (e.g. sophistication and maturity of the national regulatory and supervisory regime).

II. DEFINITIONS

13. The following definitions apply for the purposes of this Guidance:

a) *Correspondent banking* is the provision of banking services by one bank (the "correspondent bank") to another bank (the "respondent bank"). Large international banks typically act as correspondents for thousands of other banks around the world. Respondent banks may be provided with a wide range of services, including cash management (e.g. interest-bearing accounts in a variety of currencies), international wire transfers, cheque clearing, payable-through accounts and foreign exchange services[8].

Correspondent banking does not include one-off transactions or the mere exchange of SWIFT Relationship Management Application keys (RMA)[9] in the context of non-

[7] FSB (2015), *Report to the G20 on actions taken to assess and address the decline in correspondent banking*. www.fsb.org/wp-content/uploads/Correspondent-banking-report-to-G20-Summit.pdf

[8] FATF Glossary

[9] The SWIFT RMA is a messaging capability enabling SWIFT members to exchange messages over the network and can create a non-customer relationship in particular cases of cash management, custody, trade finance, exchange of messages with payments and securities markets infrastructure entities, e.g., exchanges depositories

customer relationships, but rather is characterised by its on-going, repetitive nature.

Correspondent banking services encompass a wide range of services which do not all carry the same level of ML/TF risks. Some correspondent banking services present a higher ML/FT risk because the correspondent institution processes or executes transactions for its customer's customers.

Hence, the focus of this guidance is correspondent banking relationships that are higher risk, in particular cross-border correspondent banking relationships involving the execution of third party payments.

This guidance also applies to money or value transfer services (MVTS) acting as intermediaries for the transfer of funds or value (see d below), in line with Recommendation 13 which applies to financial institutions engaging in cross-border correspondent banking *and other similar relationships*. This guidance does not apply to securities transactions,

b) *correspondent institution* means the bank or MVTS provider which processes and/or executes transactions for customers of the respondent institution or MVTS provider the account of which is used to process and/or execute the transaction of its customer. The correspondent institution generally does not have direct business relationships with the customers of the respondent institution, unless it provides payable-through-account services (see paragraph 21 below). Those respondents' customers may be individuals, corporations or financial services firms.[10] In addition to the processing of third-party payments, a correspondent institution may also provide other services to the respondent institution, such as trade-finance related services, cash clearing, liquidity management and short-term borrowing, foreign exchange or investment in a particular currency,

c) *respondent institution* means the financial institution that is the direct customer of the correspondent institution,

d) *money or value transfer service (MVTS)* refers to financial services that involve the acceptance of cash, cheques, other monetary instruments or other means of stored value and the payment of a corresponding sum in cash or other form to a beneficiary by means of a communication, message, transfer, or through a clearing network to which the MVTS provider belongs. Transactions performed by such service providers can involve one or more intermediaries and a final payment to a third party, and may include new payment methods. Sometimes these services

[10] This definition is generally in line with the definition of *correspondent bank* set out of page 24 of the Basel Committee on Banking Supervision guidance on *Sound management of risks related to money laundering and financing of terrorism*, which has been extended for the purposes of this guidance to also include MVTS which are providing financial services as intermediaries in the same way that a correspondent bank would.

have ties to particular geographic regions and are described using a variety of specific terms, including *hawala*, *hundi*, and *fei-chen.*[11]

MVTS providers "offer similar services" as correspondent institutions when they act as intermediaries for other MVTS providers or where an MVTS provider is accessing banking or similar services through the account of another MVTS customer of the bank,

e) from the Glossary of the *FATF Recommendations*, the definitions of *competent authorities*,[12] *and financial institutions*.[13]

III. IDENTIFYING THE RISKS – THE INTERPLAY OF RECOMMENDATIONS 10 AND 13

A. DUE DILIGENCE ON THE RESPONDENT INSTITUTION

14. The requirements of both FATF Recommendations 10 and 13 must be met in all cases before cross-border correspondent banking services may be provided to a respondent institution. FATF Recommendation 13 requires additional measures to be applied to cross-border correspondent banking relationships, in addition to performing the CDD and enhanced due diligence (EDD) measures in FATF Recommendation 10 for high risk customers.[14] Such additional measures are appropriate because cross-border correspondent banking relationships are seen to be inherently higher risk than domestic correspondent customer relationships. Consequently, simplified CDD measures are never appropriate in the cross-border correspondent banking context, when activities described in para. 13 (a) are conducted.

---

[11] This definition can be found in the Glossary to the *FATF Recommendations.*

[12] *Competent authorities* refers to all public authorities with designated responsibilities for combating money laundering and/or terrorist financing. In particular, this includes the FIU; the authorities that have the function of investigating and/or prosecuting money laundering, associated predicate offences and terrorist financing, and seizing/freezing and confiscating criminal assets; authorities receiving reports on cross-border transportation of currency & BNIs; and authorities that have AML/CFT supervisory or monitoring responsibilities aimed at ensuring compliance by financial institutions and DNFBPs with AML/CFT requirements. SRBs are not to be regarded as competent authorities.

[13] *Financial institutions* means any natural or legal person who conducts as a business one or more of the following activities or operations for or on behalf of a customer: 1. Acceptance of deposits and other repayable funds from the public; 2. Lending; 3. Financial leasing; 4. Money or value transfer services; 5. Issuing and managing means of payment (e.g. credit and debit cards, cheques, traveller's cheques, money orders and bankers' drafts, electronic money); 6. Financial guarantees and commitments; 7. Trading in: (a) money market instruments (cheques, bills, certificates of deposit, derivatives etc.); (b) foreign exchange; (c) exchange, interest rate and index instruments; (d) transferable securities; (e) commodity futures trading. 8. Participation in securities issues and the provision of financial services related to such issues; 9. Individual and collective portfolio management; 10. Safekeeping and administration of cash or liquid securities on behalf of other persons; 11. Otherwise investing, administering or managing funds or money on behalf of other persons; 12. Underwriting and placement of life insurance and other investment related insurance; 13. Money and currency changing.

[14] For information on cases in which enhanced CDD measures are required, refer to the Interpretive Note for FATF Recommendation 10, paragraph 20.

15. Although additional CDD measures always apply to cross-border correspondent banking relationships as described above, correspondent banking relationships may be diverse in nature and therefore some may be higher risk than others. Financial institutions should therefore recognise the degree of risk of different types correspondent banking activity, including in activities considered as higher risks, as described in para. 13 (a).

16. Correspondent institutions, in assessing the risks of their respondent must ensure that the assessment is sufficiently robust to consider all the relevant risk factors. By doing so, the different levels of inherent risks are clearly understood and appropriate controls applied to each, ensuring the effective management of these risks. Accordingly, the extent to which additional measures should be applied will vary on a case-by-case basis, depending on the level or type of residual risk, including the measures the respondent institution has implemented to mitigate its own ML/TF risks. Factors to consider in assessing correspondent banking risks could include for instance the respondent institution's jurisdiction, the products/services it offers and its customer base. It is not possible to develop a conclusive list of types of higher risk relationships for several reasons. First, there is no exhaustive list of risk factors that could be used to identify such relationships that would apply equally to all relationships. Second, both relevant risk factors and applicable risk mitigation measures must be considered together to form an accurate and comprehensive picture of the risks. For these reasons, any effort to define what constitutes a higher risk relationship could have the unintended consequence of encouraging rather than discouraging de-risking by promoting a more rules-based and tick-the-box approach to risk management. The risk factors included in the Annex II of the BCBS Guidelines on *Sound management of risks related to money laundering and financing of terrorism*[15] are examples of factors which correspondent institutions can use when assessing the risks of their correspondent banking relationships.

17. When entering into a business relationship, as a first step, the correspondent institution should identify and verify the identity of the respondent institution, using reliable, independent source documents, data or information (Recommendation 10 (a)). It should also identify and take reasonable measures to verify the identity of the beneficial owner(s), such that the correspondent institution is satisfied that it knows who the beneficial owner(s) of the respondent institution is/are. In order to do that, the correspondent institution should also understand the ownership and control structure of the respondent institution.[16] The information about the ownership and control structure includes conducting verification enabling the correspondent institution to be satisfied that the respondent institution is not a shell bank.[17]

18. Additionally, the correspondent institution should gather sufficient information to understand the purpose and intended nature of the correspondent banking relationship with the

[15] Para 7.

[16] FATF Recommendation 10, sub-paragraph 4(a) and (b)

[17] FATF Recommendation 13 prohibits financial institutions from entering into correspondent banking relationships with shell banks. The Glossary to the *FATF Recommendations* defines the term *shell bank* to mean a bank that has no physical presence in the country in which it is incorporated and licensed, and which is unaffiliated with a regulated financial group that is subject to effective consolidated supervision. *Physical presence* means meaningful mind and management located within a country. The existence simply of a local agent or low level staff does not in itself constitute physical presence.

respondent institution.[18] This includes understanding what types of customers the respondent institution intends to service through the correspondent banking relationship and how it will offer services (e.g. through nested relationships as noted in para. 21), including the expected activity level, the transaction volume and value, the nature of the planned transactions and the extent to which any of these are assessed as high risk by the respondent institution.

19. The correspondent institution should also gather sufficient information and determine from publicly available information the reputation of the respondent institution and the quality of its supervision, including whether (and when) it has been subject to a ML/TF investigation or regulatory action.[19]

20. In addition, the correspondent institution should assess the respondent institution's AML/CFT controls.[20] In practice, such an assessment should involve reviewing the respondent institution's AML/CFT systems and controls framework. The assessment should include confirming that the respondent institution's AML/CFT controls are subject to independent audit (which could be external or internal). A more detailed/in-depth review should be conducted for higher risk relationships, possibly including reviewing the independent audit, interview of compliance officers, a third party review and potentially an onsite visit.

21. The correspondent institution should also understand how the respondent institution will be offering services available through the correspondent banking relationship to its customers and assess the nature and level of risk associated with offering arrangements. There are several possible arrangements for offering services, e.g.

- by establishing correspondent accounts to which the respondent institution's financial institution customers do not have direct access, but instead transact indirectly through the account via payment instructions delivered to the respondent institution;
- by establishing *nested relationships*[21] (i.e. downstream banking) which require that:
  - ✓ the correspondent institution is duly informed about the existence of such relationships and the operations/transactions of the customers of the nested institutions, that the locations in which the nested institutions conduct business are transparent to, and understood by, the correspondent institution, and the respondent is transparent in formatting payment instruction so all involved parties are included for monitoring and screening purposes;

[18] FATF Recommendation 10, sub-paragraph 4(c).

[19] FATF Recommendation 13, sub-paragraph (a).

[20] FATF Recommendation 13, sub-paragraph (b). One of the tools that could be used as a starting point is the Wolfsberg questionnaire

[21] "Nested correspondent banking refers to the use of a bank's correspondent relationship by a number of respondent banks through their relationships with the bank's direct respondent bank to conduct transactions and obtain access to other financial services." (footnote 43 in Annex II of the BCBS *Guidelines on Sound management of risks related to money laundering and financing of terrorism*)

- ✓ the correspondent institution has measures in place to detect potential, undisclosed nested relationships provided by the respondent and takes appropriate follow-up action when a respondent does not disclose the existence of a nested relationship;

- ✓ the correspondent institution understands the respondent's control framework with respect to those relationships. Such review should take into account the implementation of appropriate controls to address the underlying risks posed by these relationships (for instance, if the transaction monitoring procedures are comprehensive of the relevant factors, whether they are based on manual transaction reviews and the accuracy of the automated ones, whether the institution has the resources to conduct such reviews, etc.);

- by establishing *payable-through accounts*[22] which can also be offered provided that the correspondent institution identifies risks associated with the relationship and applies enhanced controls to monitor transaction activity that are commensurate with the identified risks. The correspondent should have policies, procedures and processes in place to enable it to identify the ultimate user of the account and needs to be satisfied that the respondent institution has conducted sufficient CDD on the customers having direct access to the account of the correspondent institution, has appropriate controls in place to identify and monitor the transactions conducted by those customers and is able to provide relevant, individual CDD information upon request to the correspondent institution.[23]

B. DEVELOPING AN UNDERSTANDING OF THE RESPONDENT INSTITUTION'S BUSINESS

22. The correspondent institution should also gather sufficient information to understand the nature of the respondent institution's business in line with the risks identified.[24] This means that correspondent institutions are required to understand the target markets and customer segments that are served by their respondent (as outlined in para. 18) as part of their assessment of risks. Understanding the business profile of the respondent institution requires the correspondent to consider all relevant risk factors[25] (e.g. developing a general overview of the respondent institution's products and services and customer base, including nested relationships; countries and markets in which it operates; transactions in which it engages on behalf of its customer base and

[22] Payable-through-accounts (pass-by accounts) are correspondent accounts that are used directly by third parties to transact business on their own behalf (INR 13). They are used by foreign financial institutions to give their customers access to the domestic banking system. This enables the foreign bank's customers to write checks and make deposits at a bank in the jurisdiction like any other accountholder (in effect, giving customers of respondent banks access to more services).

[23] FATF Recommendation 13, sub-paragraph (e).

[24] FATF Recommendation 13, sub-paragraph (a).

[25] In the context of a correspondent banking relationship, the correspondent institution's customer is the respondent institution.

delivery channels it uses).[26] This includes verification by the correspondent institution that the respondent institution does not permit its accounts to be used by shell banks.[27]

IV. VERIFYING RESPONDENT INSTITUTIONS' INFORMATION, AND ASSESSING/DOCUMENTING HIGHER RISKS

23. When establishing new correspondent banking relationships, the correspondent institution may obtain information required by Recommendations 10 and 13 directly from the respondent institution. However, as noted in para. 17 above, this information needs to be verified in order to meet the requirements of those Recommendations.

24. Examples of potential reliable, independent sources of information for the verification of identity of natural persons, legal persons and arrangements include: corporate registries, registries maintained by competent authorities on the creation or licencing of respondent institutions, registries of beneficial ownership and other examples mentioned in the BCBS General Guide on Account Opening.[28]

25. Some examples of potential sources of information on level of risks include, but are not limited to: the AML/CFT laws and regulations of the home country or the host country where the respondent institution is doing business and how they apply, public databases of legal decisions and/or regulatory or enforcement actions, annual reports that have been filed with a stock exchange, country assessment reports or other information published by international bodies which measure compliance and address ML/TF risks (including the FATF, FSRBs, BCBS, IMF and World Bank), lists issued by the FATF in the context of its International Cooperation Review Group process, reputable newspapers, journals or other open source electronic media, third party databases, national or supranational risk assessments, information from the respondent institution's management and compliance officer(s) and public information from the regulator and supervisor.

26. Where the correspondent institution has identified a higher risk correspondent banking relationship, it should apply enhanced measures that are in line with the risks associated to that relationship. For example, in some circumstances, closer interaction (conference phones or face-to-face meetings) with the respondent institution's management and compliance officer(s) may be appropriate.

27. Where correspondent institutions are permitted to rely on other banks (that may already have a correspondent relationship with the respondent institution), they should ensure that a copy of the CDD information relied on will be made available upon request without delay, be satisfied they can obtain supporting documentation, be satisfied the bank being relied on is regulated and has

[26] FATF Interpretive Note to Recommendation 10, paragraph 15.

[27] FATF Recommendation 13, second paragraph.

[28] Annex 4, General Guide to Account Opening, pages 29 to 39 of the Basel Committee on Banking Supervision guidance on Sound management of risks related to money laundering and financing of terrorism (February 2016).

measures in place that are reliable.[29] The ultimate responsibility for implementing AML/CFT measures remains with the correspondent institution.

28. In all cases, the correspondent institution should obtain approval from senior management before establishing new cross-border correspondent relationships, as required by FATF Recommendation 13.[30]

V. MANAGING THE RISKS

A. ONGOING DUE DILIGENCE ON THE RESPONDENT INSTITUTION

29. Correspondent institutions are required to conduct ongoing due diligence of the correspondent banking relationship, including periodical reviews of the CDD information on the respondent institution. This is to ensure that such information is kept up-to-date in line with the risks associated with the relationship.[31] The process of managing ML/TF risk in the relationship should be ongoing, and applied to existing relationships as well as new ones. The frequency with which periodic reviews are undertaken will depend on the level of risk associated with the respondent institution. Where such reviews reveal changes in the respondent institution, the correspondent institution should consider whether it should adjust its risk assessment of the respondent institution and what further information may be needed to support this adjustment. Potential obstacles may relate to how data protection and privacy laws are applied.[32]

B. ONGOING TRANSACTION MONITORING

30. In line with Recommendation 10, ongoing monitoring of the correspondent banking account activity has to be conducted for compliance with targeted financial sanctions and to detect any changes in the respondent institution's transaction pattern or activity that may indicate unusual activity, or any potential deviations from the correspondent relationship. Depending on the risks associated with the correspondent banking relationship, various monitoring techniques and tools can be used. Correspondent institutions should put in place and periodically review risk-based procedures specifying the applicable monitoring techniques and the criteria triggering their adoption. While deciding the type and extent of the monitoring technique, correspondent institutions should take into consideration the respondent's past behaviour in the course of the correspondent relationship, in particular any failures to satisfy previous requests for information. In higher risk scenarios for example, real-time monitoring of transactions can take place to ensure that controls are effective in detecting any unusual activity that may be occurring in the account, with a view to analysing it and reporting any suspicious transactions.

[29] FATF Recommendation 17.

[30] Sub-paragraph (c).

[31] FATF Interpretive Note to Recommendation 10, paragraph 23.

[32] The FATF is currently developing best practices on information sharing (enterprise-wide, between financial institutions not part of the same group, and between public and private authorities).

C. ONGOING MONITORING AND THE INTERPLAY WITH RECOMMENDATIONS 6, 7 AND 16

31. Correspondent banking relationships should always be subject to on-going monitoring. They may also be subject to targeted monitoring depending on any unique risk factors, e.g. high suspicious activity report filing, payment flows inconsistent with stated purpose of account. The level and nature of transaction monitoring will vary, depending on the risks and the nature of the correspondent banking services being provided. For example, if the main purpose of the correspondent banking relationship is to process cross-border wire transfers[33] on behalf of the respondent institution's customers, the focus of account monitoring could be how well the respondent institution is implementing sanctions screening and its requirements under FATF Recommendations 6, 7 and 16. In such cases, particular areas of interest could include information on the respondent institution's mechanisms for screening transactions lacking required originator and beneficiary information in a manner that is consistent with straight-through processing,[34] its risk-based policies and procedures for determining how to handle such transactions, its systems for sanctions screening,[35] and its procedures and systems for clearing false positives.[36]

D. ONGOING MONITORING AND REQUEST FOR INFORMATION ABOUT TRANSACTIONS

32. Where the monitoring system of the correspondent institution flags a transaction which could signal unusual activity, the correspondent institution should have internal processes to further review the activity, which may involve requesting transaction information of the respondent institution in order to clarify the situation and possibly clear the alert. This request for additional information should be targeted on the specific transaction which created an alert in the system, and could include, depending on the risk level of the transaction, a request to access information about the customer of the respondent institution as a means to get a proper understanding of the reasonableness of the transaction. This does not amount to a requirement to conduct CDD on the customer of the respondent. In practice, the correspondent institution will follow up with the respondent institution after the transaction is completed by making a request for information on that particular transaction(s) (RFI). Subsequently, the correspondent institution should also review its control systems in order to detect similar transactions. Such questions may include some, but not necessarily all, of the following:

- Duration of customer "X" relationship with the respondent institution and whether the respondent institution classifies the customer as a high risk customer.
- Purpose of the account(s) maintained by customer "X" (business, personal, other).

[33] As defined in Recommendation 16.

[34] FATF Interpretive Note to Recommendation 16, paragraphs 17 and 18.

[35] FATF Recommendations 6 and 7 requires financial institutions to freeze the funds of persons and entities designated by, or under the authority of, the United Nations Security Council or designated by countries pursuant to resolution 1373 (2001), and prohibits financial institutions from making funds available to such designated persons and entities.

[36] This does not relieve the correspondent institution of the obligation to have procedures in place to identify the missing originator and beneficiary information.

- Details of customer's "X" parent company and the name(s) of the beneficial owner(s).
- Source of the funds of customer "X".
- Consistency between the transactional history in the account profile of customer "X", and his KYC data, or with any other information available to the bank.
- Rationale of the transaction between customers "X" and a counterparty.
- Nature of the relationship between customers "X" and a counterparty.
- Possible affiliation of customers "X" with a third-party.
- Additional details regarding the goods/services being exchanged by the customers "X"and third-parties that are not found directly in the payment details of the transaction that may explain it.
- If possible, location of customer or third-party as originator/beneficiary and/or,
- Status of the bank account of customer "X" (opened/closed).

33. Where the correspondent institution requests further information on a transaction from the respondent, it expects the respondent to respond in a timely fashion and provide documents/information to the level of detail requested. Where that does not happen, it may trigger concerns that the respondent is unable to manage its risks and lead to the filing of a suspicious transaction report by the correspondent institution. A request for information could be followed by a reassessment of the respondent's business and risk profile where/when necessary.

E. CLEAR TERMS GOVERNING THE CORRESPONDENT BANKING RELATIONSHIP

34. One way for correspondent institutions to manage their risks more effectively from the outset is to enter into a written agreement with the respondent institution before correspondent services are provided. This is consistent with FATF Recommendation 13 that requires a clear understanding of the respective responsibilities of each institution.[37] The content of the agreement should include how the correspondent institution will monitor the relationship to ascertain how effectively the respondent institution is applying CDD measures to its customers, and implementing AML/CFT controls.

35. Such an agreement could also specify the products and services to be provided under the correspondent banking relationship, the respondent institution's responsibilities concerning compliance with AML/CFT requirements, permitted third-party usage of the correspondent account and applicable internal controls to these situations, any potential restrictions that the correspondent institution may want to place on the use of the correspondent account (e.g. limiting transaction types, volumes, etc.), conditions regarding the requests for information on particular transactions, especially in the case of "payable through accounts" relationships, and cases and procedures for terminating or limiting a business relationship. Contractual details would vary depending on the circumstances including the nature of the correspondent banking relationship and the level of risk.

[37] Sub-paragraph (d).

36. Written agreements also have the advantage of documenting the intended purpose and use of correspondent banking relationships, which may have the added benefit of allowing the correspondent institution to demonstrate to its regulator some of the steps it has taken to understand the risks presented by its correspondent relationships.

F. ONGOING COMMUNICATION AND DIALOGUE

37. Correspondent banking relationships are, by their nature, based on mutual trust between the correspondent and the respondent institutions, particularly that the AML/CFT controls are being effectively implemented by the respondent institution. Consequently, it is important for correspondent institutions to maintain an ongoing and open dialogue with the respondent institution(s), including helping them understand the correspondent's AML/CFT policy and expectations, and when needed, engaging with them to improve their AML/CFT controls and processes. Such communication supports the monitoring requirement by helping to flag new and emerging risks and better understand existing ones, clear up in a timely manner any incidents that may arise during the course of the business relationship, strengthen risk mitigation measures, and resolve any issues that may arise concerning the exchange of information. This process can also assist in building the capacity of respondent institutions. It can also help to avoid unnecessary restriction on or termination of a relationship without a thorough assessment of the risks associated with the specific customer (rather than the class of customers) in line with the RBA (i.e. avoiding de-risking).[38] It can also prevent a "cascade" effect, where respondent institutions close their (highest risk) client accounts as a way to reduce their own corporate risk profile and maintain the relationships with their own correspondent institutions.

38. It is also important that regulators and supervisors maintain an open dialogue with correspondent institutions to clarify regulatory/supervisory expectations regarding the management of risks associated with foreign correspondent banking relationships.

G. ADJUSTING THE MITIGATION MEASURES TO THE EVOLUTION OF RISKS

39. As noted above, correspondent banking relationships are very diverse in nature and therefore covering a large range of high risk levels. The level and nature of risk may fluctuate over the course of any relationship and adjustments should be made in the correspondent institution's risk management strategy to reflect these changes. This is why ongoing monitoring, including periodic reviews, is important, so that the correspondent institution is aware of when the level/nature of residual risk (i.e. the risk remaining after a financial institution's AML/CFT control framework is applied to a particular situation) changes.

[38] "Regulators and supervisors should also ensure that financial institutions are taking a risk-based approach to implementing AML/CFT measures, without prejudice to rules-based measures such as targeted financial sanctions. Implementation by financial institutions should be aimed at managing (not avoiding) risks. What is not in line with the FATF standards is the wholesale cutting loose of entire countries and classes of customer, without taking into account, seriously and comprehensively, their level of money laundering and terrorist financing risk and applicable risk mitigation measures for those countries and for customers within a particular sector" (FATF Takes Action to Tackle De-risking, FATF public statement of October 2015).

40. Correspondent institutions should have policies and procedures in place tailored to the different categories of higher risk respondent relationships, and the appropriate risk mitigation required or available to retain the relationship by using enhanced due diligence. If higher risks are encountered which are not mitigated by existing enhanced due diligence, the correspondent institution should use this process to further enhance the assessment of the relationship and risk mitigation applied to the account. The objective should be to determine whether the inherent risk level is justified and if so what further, more enhanced, measures can be applied. For example, if the respondent is affected by negative news regarding its beneficial owners, the correspondent institutions could decide to limit services to such a bank.

41. The *FATF Recommendations* do require customer relationships to be terminated where identified risks cannot be managed in line with the risk-based approach.[39] However, the other options offered by Recommendation 10 should be explored prior to termination (such as refusing to conduct the transaction, and/or filing a suspicious transaction report). Alternatively, a limitation of services or restriction of individual products/transactions can be considered in order to provide the possibility for clarification or remediation by the respondent institution, before the decision to terminate activity is taken. In any event, correspondent institutions should clearly communicate their concerns to respondent institutions, at senior management level, and inform them of their concerns and the measures needed to address these concerns as a condition to maintain the correspondent banking relationship. Depending on the concerns, correspondent institutions should also consider giving notice periods to respondents, allowing them to find alternatives.

VI. ADDITIONAL GUIDANCE FOR FINANCIAL INSTITUTIONS WHICH HAVE MVTS CUSTOMERS

42. As part of their normal CDD processes, financial institutions are required to understand the purpose and nature of the intended business relationship.[40] This means that, in practice, where the customer is an MVTS provider, the financial institution should understand whether the MVTS provider intends to use the account for its own corporate or settlement purposes, or whether it intends to use the account to provide correspondent services to its own customers (i.e. the MVTS will be acting as a correspondent institution for its own customers).

43. Where the MVTS provider offers correspondent services for its own customers through its account, the correspondent institution should consider all of the factors listed above in Sections III, IV and V, on a case-by-case basis, in terms of identifying the risks, verifying information, and establishing appropriate risk mitigation measures. In particular, there is no obligation triggered by the *FATF Recommendations* to a financial institution to apply CDD measures to the customers of the MVTS.

44. To facilitate its own risk management, a correspondent institution could consider encouraging or requiring MVTS customers to open one account for conducting their own corporate or settlement activities, and another separate account for providing correspondent banking services

[39] FATF Recommendation 10, 7th paragraph.

[40] FATF Recommendation 10, paragraph 4(c).

on behalf of their customers. This procedure may facilitate effective monitoring of these two activities commensurate with the different types of risk that they present. Separate accounts may also be considered for higher risk activities or higher risk customers and nested or downstream relationships to ensure an appropriate level of transparency and effective monitoring.

45. Banks should flag unusual movements of funds and transactions conducted by their MVTS customers so that such funds or transactions are scrutinised in a timely manner and a determination made as to whether they could be suspicious. If they are suspicious, banks should file a STR.

46. In considering the risks and appropriate risk mitigation measures, it is also important to note that MVTS providers are *financial institutions* under the *FATF Recommendations*[41] and are subject to the full range of AML/CFT preventive measures in FATF Recommendations 9 to 23 applicable to MVTS providers. Countries are also required to ensure that MVTS providers are supervised and monitored in line with FATF Recommendations 14 and 26. Correspondent institutions should take into consideration the manner in which these measures are implemented, in order to understand what their MVTS customers' obligations are and how they are supervised. Countries are also encouraged to communicate their MVTS supervisory policies and approaches to promote a shared understanding of what is expected from correspondent institutions and from MVTS with respect to risk management and mitigation processes. Given the important role that MVTS providers play in facilitating financial inclusion, banks are encouraged to work closely with their MVTS customers to ensure that they understand the banks' risk management objectives and strategies for establishing and maintaining controls to ensure effective ML/TF risk monitoring and identification. The same general processes outlined in Part V above should be considered in this regard, particularly section G.

[41] See the definition of MVTS providers in the Glossary of the *FATF Recommendations.*

FATF

CORRESPONDENT BANKING SERVICES

This guidance explains the FATF's requirements in the context of correspondent banking services. In particular, it clarifies that the FATF Recommendations do not require correspondent financial institutions to conduct customer due diligence on each individual customer of their respondent institutions' customers. The guidance also highlights that not all correspondent banking relationships carry the same level of money laundering or terrorist financing risks, hence the enhanced due diligence measures have to be commensurate to the degree of risks identified.

The FATF developed this guidance with input from the private sector, and in collaboration with other interested international bodies, including the Financial Stability Board (FSB). The guidance should be read in conjunction with earlier FATF guidance and reports, as indicated in the guidance itself.

RISK-BASED APPROACH GUIDANCE FOR THE BANKING SECTOR

This guidance paper should be read in conjunction with:

- the FATF Recommendations, especially Recommendations 1 and 26 (R. 1, R. 26) and their Interpretive Notes (INR), and the Glossary.
- other relevant FATF documents, such as the *FATF Guidance on National Money Laundering and Terrorist Financing Risk Assessment*, the *FATF Guidance on Politically Exposed Persons*, or the *FATF Guidance on AML/CFT and Financial Inclusion*.

INTRODUCTION

A. BACKGROUND AND CONTEXT

1. The risk-based approach (RBA) is central to the effective implementation of the revised FATF *International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation*, which were adopted in 2012[1]. The FATF has reviewed its 2007 RBA guidance for the financial sector, in order to bring it in line with the new FATF requirements[2] and to reflect the experience gained by public authorities and the private sector over the years in applying the RBA. This revised version focuses on the banking sector[3], and a separate guidance will be developed for the securities sector. The FATF will also review its other RBA guidance papers, all based on the 2003 Recommendations[4].

2. The RBA guidance for the banking sector was drafted by a group of FATF members, co-led by the UK and Mexico[5]. Representatives of the private sector were associated to the work[6] and consulted on the draft revised document[7].

---

1 FATF (2012)

2 The FATF Standards are comprised of the FATF Recommendations, their Interpretive Notes and applicable definitions from the Glossary.

3 Banking activities are activities or operations described in the FATF Glossary under "Financial institutions", in particular 1., 2. and 5. The present guidance is intended for institutions providing these services.

4 Between June 2007 and October 2009, the FATF adopted a set of guidance papers on the application of the RBA for different business sectors: financial sector, real estate agents, accountants, trust and company service providers (TCSPs), dealers in precious metals and stones, casinos, legal professionals, money services businesses (MSBs) and the life insurance sector (www.fatf-gafi.org/documents/riskbasedapproach/).

5 The FATF Project group was composed of representatives from FATF members (Argentina; Australia; Austria; Belgium; Brazil; China; France; Germany; Hong Kong, China; India; Italy; Japan; Mexico; Spain; Switzerland; the Netherlands; the UK; the US), Associate members (Asia/Pacific Group on Money Laundering (APG) - through Bangladesh and Thailand and MONEYVAL - through Poland) and Observers (Basel Committee on Banking Supervision (BCBS), Organization for Security and Co-operation in Europe (OSCE), International Organisation of Securities Commissions (IOSCO), International Association of

3. The FATF adopted this updated RBA Guidance for the banking sector at its October 2014 Plenary.

B. PURPOSE OF THIS GUIDANCE

4. The purpose of this Guidance is to:

- Outline the principles involved in applying a risk-based approach to AML/CFT;
- Assist countries, competent authorities and banks in the design and implementation of a risk-based approach to AML/CFT by providing general guidelines and examples of current practice;
- Support the effective implementation and supervision of national AML/CFT measures, by focusing on risks and on mitigation measures; and
- Above all, support the development of a common understanding of what the risk-based approach to AML/CFT entails.

C. TARGET AUDIENCE, STATUS AND CONTENT OF THE GUIDANCE

5. This Guidance addresses countries and their competent authorities, including banking supervisors. It also addresses practitioners in the banking sector.

6. It consists of three sections. Section I sets out the key elements of the risk-based approach and needs to be read in conjunction with Sections II and III, which provide specific guidance on the effective implementation of a RBA to banking supervisors (Section II) and banks (Section III).

7. This Guidance recognises that an effective RBA will build on, and reflect, a country's legal and regulatory approach, the nature, diversity and maturity of its banking sector and its risk profile. It sets out what countries should consider when designing and implementing a RBA; but it does not override the purview of national competent authorities. When considering the general principles outlined in the Guidance, national authorities will have to take into consideration their national context, including the supervisory approach and legal framework.

Insurance Supervisors (IAIS), Group of International Finance Centre Supervisors (GIFCS), International Monetary Fund (IMF) and World Bank).

6 Amex, the Association of Development Financing Institutions in Asia and the Pacific (ADFIAP), the European Association of Co-operative Banks (EACB), the European Association of Public Banks (EAPB), the European Banking Federation (EBF), the European Banking Industry Committee (EBIC), the Latin American Banking Federation (FELABAN), the International Banking Federation (IBFed), SWIFT, the Banking Association of South Africa, the Wolfsberg Group, the Union of Arab Banks (UAB), the World Council of Credit Unions (WOCCU) and the World Savings Banks Institute/European Savings Banks Group (WSBI/ESBG) appointed representatives to the Project Group.

7 Comments were received from the Banking Association of South Africa, EBF, EBIC, EAPB, EACB, FELABAN, WOCCU, WSBI/ESBG, as well as from the International Council of Securities Association, the International Association of Money Transfer Networks, the International Consortium of Real Estate Associations, and the Russian e-money Association.

8. This guidance paper is non-binding. It draws on the experiences of countries and of the private sector and may assist competent authorities and financial institutions to effectively implement some of the Recommendations.

SECTION I – THE FATF'S RISK-BASED APPROACH (RBA) TO AML/CFT

A. WHAT IS THE RBA?

9. A RBA to AML/CFT means that countries, competent authorities and financial institutions[8], are expected to identify, assess and understand the ML/TF risks to which they are exposed and take AML/CFT measures commensurate to those risks in order to mitigate them effectively.

10. When assessing ML/TF risk[9], countries, competent authorities, and financial institutions should analyse and seek to understand how the ML/TF risks they identify affect them; the risk assessment therefore provides the basis for the risk-sensitive application of AML/CFT measures[10]. The RBA is not a "zero failure" approach; there may be occasions where an institution has taken all reasonable measures to identify and mitigate AML/CFT risks, but it is still used for ML or TF purposes.

11. A RBA does not exempt countries, competent authorities and financial institutions from mitigating ML/TF risks where these risks are assessed as low[11].

B. THE RATIONALE FOR A NEW APPROACH

12. In 2012, the FATF updated its Recommendations to strengthen global safeguards and to further protect the integrity of the financial system by providing governments with stronger tools to take action against financial crime.

13. One of the most important changes was the increased emphasis on the RBA to AML/CFT, especially in relation to preventive measures and supervision. Whereas the 2003 Recommendations provided for the application of a RBA in some areas, the 2012 Recommendations consider the RBA to be an 'essential foundation' of a country's AML/CFT framework.[12] This is an over-arching requirement applicable to all relevant FATF Recommendations.

14. According to the Introduction to the 40 Recommendations, the RBA 'allows countries, within the framework of the FATF requirements, to adopt a more flexible set of measures in order to target their resources more effectively and apply preventive measures that are commensurate to the nature of risks, in order to focus their efforts in the most effective way'.

---

8 Including both physical and natural persons, see definition of "Financial institutions" in the FATF Glossary.

9 FATF (2013a), *par.* 10.

10 FATF (2013a), *par.* 10. See also Section I D for further detail on identifying and assessing ML/TF risk.

11 Where the ML/TF risks have been assessed as low, INR 1 allows countries not to apply some of the FATF Recommendations, while INR 10 allows the application of Simplified Due Diligence measures to take into account the nature of the lower risk – see INR 1 para 6, 11 and 12 and INR 10 para 16 and 21.

12 R. 1.

15. The application of a RBA is therefore not optional, but a prerequisite for the effective implementation of the FATF Standards[13].

C. APPLICATION OF THE RISK-BASED APPROACH

16. Recommendation 1 sets out the scope of the application of the RBA. It applies in relation to:

- Who and what should be subject to a country's AML/CFT regime: in addition to the sectors and activities already included in the scope of the FATF Recommendations[14], countries should extend their regime to additional institutions, sectors or activities if they pose a higher risk of ML/TF. Countries could also consider exempting certain institutions, sectors or activities from some AML/CFT obligations where specified conditions are met, such as an assessment that the ML/TF risks associated with those sectors or activities are low[15].
- How those subject to the AML/CFT regime should be supervised for compliance with this regime: AML/CFT supervisors should consider a bank's own risk assessment and mitigation, and acknowledge the degree of discretion allowed under the national RBA, while INR 26 further requires supervisors to themselves adopt a RBA to AML/CFT supervision; and
- How those subject to the AML/CFT regime should comply: where the ML/TF risk associated with a situation is higher, competent authorities and banks have to take enhanced measures to mitigate the higher risk. This means that the range, degree, frequency or intensity of controls conducted will be stronger. Conversely, where the ML/TF risk is lower, standard AML/CFT measures may be reduced, which means that each of the required measures has to be applied, but the degree, frequency or the intensity of the controls conducted will be lighter.[16]

---

13 The effectiveness of risk-based prevention and mitigation measures will be assessed as part of the mutual evaluation of the national AML/CFT regime. The effectiveness assessment will measure the extent to which a country achieves a defined set of outcomes that are central to a robust AML/CFT system and will analyse the extent to which a country's legal and institutional framework is producing the expected results. Assessors will need to take the risks, and the flexibility allowed by the RBA, into account when determining whether there are deficiencies in a country's AML/CFT measures, and their importance - FATF(2013b).

14 See FATF (2012) Glossary, definitions of "Financial institutions" and "Designated non-financial businesses and professions".

15 INR 1, paragraph 6.

16 R. 10; INR 10, footnote 33.

D. CHALLENGES

17. Implementing a RBA can present a number of challenges:

ALLOCATING RESPONSIBILITY UNDER A RBA

18. An effective risk-based regime builds on, and reflects, a country's legal and regulatory approach, the nature, diversity and maturity of its financial sector, and its risk profile. Banks' identification and assessment of their own ML/TF risk should consider national risk assessments in line with Recommendation 1, and take account of the national legal and regulatory framework, including any areas of prescribed significant risk and any mitigation measures defined at legal or regulatory level. Where ML/TF risks are higher, banks should always apply enhanced due diligence, although national law or regulation might not prescribe exactly how these higher risks are to be mitigated (e.g., varying the degree of enhanced ongoing monitoring)[17].

19. Banks may be granted flexibility in deciding on the most effective way to address other risks, including those identified in the national risk assessment or by the banks themselves. The banks' strategy to mitigate these risks has to take into account the applicable national legal, regulatory and supervisory frameworks. When deciding the extent to which banks are able to decide how to mitigate risk, countries should consider, inter alia, their banking sector's ability to effectively identify and manage ML/TF risks as well as their supervisors' expertise and resources, which should be sufficient to adequately supervise how banks manage ML/TF risks and take measures to address any failure by banks to do so. Countries may also take into account evidence from competent authorities regarding the level of compliance in the banking sector, and the sector's approach to dealing with ML/TF risk. Countries whose financial services sectors are emerging or whose legal, regulatory and supervisory frameworks are still developing, may determine that banks are not equipped to effectively identify and manage ML/TF risk and any flexibility allowed under the risk-based approach should therefore be limited. In such cases, a more prescriptive implementation of the AML/CFT requirements may be appropriate until the sector's understanding and experience is strengthened[18].

20. Institutions should not be exempted from AML/CFT supervision even where their capacity and compliance is good. However, the RBA may allow competent authorities to focus more supervisory resource on higher risk institutions.

IDENTIFYING ML/TF RISK

21. Access to accurate, timely and objective information about ML/TF risks is a prerequisite for an effective RBA. INR 1.3 requires countries to have mechanisms to provide appropriate information on the results of the risk assessments to all relevant competent authorities, financial institutions and other interested parties. Where information is not readily available, for example where competent authorities have inadequate data to assess risks, are unable to share important information (i.e. due to its sensitivity) on ML/TF risks and threats, or where access to information is

17 R. 1.

18 This could be based on a combination of elements described in Section II, as well as objective criteria such as mutual evaluation reports, follow-up reports or FSAP.

restricted by, for example, censorship or data protection provisions, it will be difficult for banks to correctly identify (i.e., find and list) ML/TF risk and therefore may fail to assess and mitigate it appropriately.

ASSESSING ML/TF RISK

22. Assessing ML/TF risk means that countries, competent authorities and banks have to determine how the ML/TF threats identified will affect them. They should analyse the information obtained to understand the likelihood of these risks occurring, and the impact that these would have, on the individual banks, the banking sector and possibly on the national economy for large scale, systemic financial institutions, if they did occur[19]. As a result of a risk assessment, ML/TF risks are often classified as low, medium and high, with possible combinations between the different categories (medium-high; low-medium, etc.). This classification is meant to assist understanding ML/TF risks and to help prioritise them. Assessing ML/TF risk therefore goes beyond the mere collection of quantitative and qualitative information: it forms the basis for effective ML/TF risk mitigation and should be kept up-to-date to remain relevant.

23. Assessing and understanding risks means that competent authorities and banks should have skilled and trusted personnel, recruited through fit and proper tests, where appropriate. This also requires them to be technically equipped to carry out this work, which should be commensurate with the complexity of the bank's operations.

MITIGATING ML/TF RISK

24. The FATF Recommendations require that, when applying a RBA, banks, countries and competent authorities decide on the most appropriate and effective way to mitigate the ML/TF risk they have identified. This implies that they should take enhanced measures to manage and mitigate situations in which the ML/TF risk is higher; and that, correspondingly, in low risk situations, exemptions or simplified measures may be applied[20]:

- Countries looking to exempt certain institutions, sectors or activities from some of their AML/CTF obligations should assess the ML/TF risk associated with these financial institutions, activities or designated non-financial businesses and professions (DNFBPs) and be able to demonstrate that the risk is low, and that the specific conditions required for one of the exemptions of INR 1.6 are met. The complexity of the risk assessment will depend on the type of institution, sector or activity, product or services offered and the geographic scope of the activities that stands to benefit from the exemption.
- Countries and banks looking to apply simplified measures should conduct an assessment of the risks connected to the category of customers or products targeted and establish the lower level of the risks involved, and

19 Banks are not necessarily required to perform probability calculations, which may not be meaningful given the unknown volumes of illicit transactions.

20 Subject to the national legal framework providing for Simplified Due Diligence.

define the extent and the intensity of the required AML/CFT measures. Specific Recommendations set out in more detail how this general principle applies to particular requirements[21].

DEVELOPING A COMMON UNDERSTANDING OF THE RBA

25. The effectiveness of a RBA depends on a common understanding by competent authorities and banks of what the RBA entails, how it should be applied and how ML/TF risks should be addressed. In addition to a legal and regulatory framework that spells out the degree of discretion, banks have to deal with the risks they identify, and it is important that competent authorities and supervisors in particular issue guidance to banks on how they expect them to meet their legal and regulatory AML/CFT obligations in a risk-sensitive way. Supporting ongoing and effective communication between competent authorities and banks is an essential prerequisite for the successful implementation of a RBA.

26. It is important that competent authorities acknowledge that in a risk-based regime, not all banks will adopt identical AML/CFT controls and that a single isolated incident of insignificant, crystallised risk may not necessarily invalidate the integrity of a bank's AML/CFT controls. On the other hand, banks should understand that a flexible RBA does not exempt them from applying effective AML/CFT controls.

27. Countries and competent authorities should take account of the need for effective supervision of all entities covered by AML/CFT requirements. This will support a level playing field between all banking service providers and avoid that higher risk activities shift to institutions with insufficient or inadequate supervision.

FINANCIAL INCLUSION

28. Being financially excluded does not automatically equate to low or lower ML/TF risk; rather it is one factor in a holistic assessment. Financial exclusion can affect both individuals and businesses, and have many reasons. For individuals, this can include a poor credit rating or a customer's criminal background and institutions should not, therefore, apply simplified due diligence measures or exemptions solely on the basis that the customer is financially excluded.

29. A RBA may help foster financial inclusion, especially in the case of low-income individuals who experience difficulties in accessing the regulated financial system. When applying a RBA, countries may therefore establish specific cases for exemptions in the application of FATF Recommendations (based on proven low risks)[22], or allow financial institutions to be more flexible

---

21 For example, R. 10 on Customer Due Diligence.

22 As a general rule, CDD measures including the prohibition for financial institutions to keep anonymous accounts or accounts in obviously fictitious names, have to apply in all cases. Nevertheless, paragraphs 2 and 6 of INR 1 provide that: "*Countries may also, in strictly limited circumstances and where there is a proven low risk of ML/TF, decide not to apply certain Recommendations to a particular type of financial institution or activity, or DNFBP*"… and "*Countries may decide not to apply some of the FATF Recommendations requiring financial institutions or DNFBPs to take certain actions, provided: (a) there is a proven low risk of ML and TF; this occurs in strictly limited and justified circumstances; and it relates to a particular type of financial institution or activity, or DNFBP*" (para.6). This exemption has been implemented by different countries in the interest of financial inclusion policies. See also paragraphs 56

in their application of CDD measures in case of lower ML/TF risks. In this context, financial inclusion will contribute to greater transparency and traceability of financial flows.

and 57 of the FATF Guidance on Anti-Money Laundering and Terrorist Financing Measures and Financial Inclusion on the main challenges for countries seeking to make use of the proven low risk exemption.

SECTION II – GUIDANCE FOR SUPERVISORS

30. The RBA to AML/CFT aims to develop prevention or mitigation measures which are commensurate to the ML/TF risks identified. In the case of supervision, this applies to the way supervisory authorities allocate their resources. It also applies to supervisors discharging their functions in a way that is conducive to the application of a risk-based approach by banks.

A. THE RISK-BASED APPROACH TO SUPERVISION

31. Recommendation 26 requires countries to subject banks to adequate AML/CFT regulation and supervision. INR 26 requires supervisors to allocate supervisory resources to areas of higher ML/TF risk, on the basis that supervisors understand the ML/TF risk in their country and have on-site and off-site access to all information relevant to determining a bank's risk profile.

Box 1. **Additional sources of information**

Report by the European Supervisory Authorities

In October 2013, the European Supervisory Authorities (European Insurance and Occupational Pensions Authority (EIOPA) for insurance and occupational pensions, European Banking Association (EBA) for banking and European Securities and Markets Authority (ESMA) for securities) published a *Preliminary report on anti-money laundering and counter financing of terrorism risk-based supervision*. This report builds on the FATF Standards and sets out what the RBA to AML/CFT supervision entails. It also lists a series of self-assessment questions supervisors may ask themselves when reviewing their approach.

BCBS Guidelines

In January 2014, the Basel Committee on Banking Supervision (BCBS) published a set of guidelines to describe how banks should include the management of risks related to money laundering and financing of terrorism within their overall risk management framework, *"Sound management of risks related to money laundering and financing of terrorism"*. These guidelines are intended to support the implementation of the International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation issued by the FATF in 2012. In no way should they be interpreted as modifying the FATF standards, either by strengthening or weakening them[1]. The FATF's present Guidance provides a general framework for the application of the RBA, by supervisors and the banking sector. More detailed guidelines on the implementation of the RBA by supervisors can be found in the BCBS document.

1. BCBS (2014a), par. 3.

UNDERSTANDING ML/TF RISK

32. Supervisors should understand the ML/TF risks to which the banking sector is exposed[23], and the ML/TF risks associated with individual banks and banking groups. Supervisors should draw on a variety of sources to identify and assess ML/TF risks.

33. For sectoral risks, these are likely to include, but will not be limited to, the jurisdiction's national risk assessments, domestic or international typologies and supervisory expertise, as well as Financial Intelligence Unit (FIU) feedback.

34. For individual banks, supervisors should take into account the level of inherent risk including the nature and complexity of the bank's products and services, their size, business model, corporate governance arrangements, financial and accounting information, delivery channels, customer profiles, geographic location and countries of operation. Supervisors should also look at the controls in place, including the quality of the risk management policy, the functioning of the internal oversight functions etc.

35. Some of this information can be obtained through prudential supervision. Other information, which may be relevant in the AML/CFT context, includes the fit and properness of the management and the compliance function[24]. This involves information-sharing and collaboration between prudential and AML/CFT supervisors, especially when the responsibilities belong to two separate agencies.

36. Information from the bank's other stakeholders such as other supervisors, the FIU and law enforcement agencies may also be helpful in determining the extent to which a bank is able to effectively manage the ML/TF risk to which it is exposed.

37. Supervisors should review their assessment of both the sector's and banks' ML/TF risk profile periodically and in any case when a bank's circumstances change or relevant new threats emerge.

Examples of different ways banking supervisors assess ML/TF risk in the banking sector and in individual banks can be found in Annex 1.

MITIGATING ML/TF RISK

38. The FATF Recommendations[25] require supervisors to allocate more supervisory resources to areas of higher ML/TF risk. This means that supervisors should determine the frequency and intensity of periodic assessments based on the level of ML/TF risk to which the sector and individual banks are exposed. It also means that where detailed supervision of all banks for AML/CFT purposes is not feasible, supervisors should give priority to the areas of higher risk, either in the individual banks or to banks operating in a particular sector.

---

23 Consistent with Basel Core Principle (BCP) 8 (BCBS, 2011).

24 As specified in BCP 5.

25 In line with BCP 9.

39. Examples of ways in which supervisors can adjust their approach include:

a) Adjusting the intensity of checks required to perform their authorisation function: supervisors can adjust the level of information they require when working to prevent criminals or their associates from holding a significant or controlling interest in a bank. For example, where the ML/TF risk associated with the sector is low, the opportunities for ML/TF associated with a particular business activity may be limited and thus supervisors may decide to base their approval decisions on a review of relevant documentation. Where the ML/TF risk associated with the sector is high, supervisors may ask for additional information.

b) Adjusting the type of AML/CFT supervision: supervisors should always have both on-site and off-site access to all relevant risk and compliance information. However, to the extent permitted by their regime, supervisors can determine the correct mix of on-site and off-site supervision of banks. Off-site supervision alone may not be appropriate in higher risk situations.

c) Adjusting the frequency and nature of ongoing AML/CFT supervision: supervisors should adjust the frequency of AML/CFT supervision in line with the risks identified and combine periodic reviews and *ad hoc* AML/CFT supervision as issues emerge, e.g., as a result of whistleblowing, information from law enforcement, or other supervisory findings resulting from, for example, general prudential supervision or a bank's inclusion in thematic review samples.

Examples of different ways banking supervisors adjust the frequency of ML/TF supervision in line with the risks identified can be found in Annex 1.

d) Adjusting the intensity of AML/CFT supervision: supervisors should decide on the appropriate scope or level of assessment in line with the risks identified[26], with the aim of assessing the adequacy of banks' policies and procedures that are designed to prevent them from being abused[27]. Examples of more intensive supervision could include: detailed testing of systems and files to verify the implementation and adequacy of the bank's risk assessment, CDD, reporting and record keeping policies and processes, internal auditing, interviews with operational staff, senior management and the Board of directors and AML/CFT assessment in particular lines of business.

Examples of different ways banking supervisors adjust the intensity of ML/TF supervision in line with the risks identified can be found in Annex 1.

40. Supervisors should use their findings to review and update their ML/TF risk assessments and, where necessary, consider whether their approach to AML/CFT supervision and their AML/CFT rules and guidance remain adequate. Whenever appropriate, and in compliance with

26 BCP 11 considers early intervention to correct problems.

27 In line with BCP 29.

relevant confidentiality requirements, these findings should be communicated to banks to enable them to enhance their RBA.

41. In line with Recommendation 26 and the application of the Basel Core Principles relevant for AML/CFT[28], banking supervisors should consider the results of other prudential or financial supervision in their AML/CFT supervisory activities. Similarly, they should check that the broader prudential findings that drive the overall supervisory strategies of banks are informed by, and adequately address, the findings of the AML/CFT supervisory programme.

B. SUPERVISION OF THE RISK-BASED APPROACH

GENERAL APPROACH

42. It is important that supervisors discharge their functions in a way that is conducive to banks' adoption of a risk-based approach. This means that supervisors have to take steps to check that their staff are equipped to assess whether a bank's policies, procedures and controls are appropriate in view of the risks identified through the risk assessment, and its risk appetite[29]. Supervisors should make sure that the bank adheres to its own policies, procedures and controls, and that decisions are made using sound judgment. It also implies that supervisors articulate and communicate clearly their expectations of the measures needed for banks to comply with the applicable legal and regulatory framework. The aim is that supervisory actions are in most cases predictable, consistent and proportionate and to this end, training of supervisory staff and the effective communication of expectations to banks are key.

43. To support supervisors' understanding of the overall strength of measures in the banking sector, carrying out comparisons between banks' AML/CFT programmes could be considered as a means to inform their judgment of the quality of an individual bank's controls. Supervisors should, however, note that under the RBA, there may be valid reasons why banks' controls differ: supervisors should be equipped to evaluate the merits of these differences, especially when comparing banks with differing levels of operational complexity.

44. Supervisors should understand the ML/TF risks faced by the sector and by the banks. They should, in particular, have a thorough understanding of higher and lower risk lines of business, leading to a sound judgment about the proportionality and adequacy of AML/CFT controls. Supervisors should engage in a dialogue with individual banks about their views on AML/CFT controls set up by that institution.

45. The general principles outlined above in relation to domestic banks and domestic banking groups also apply to international banking groups. The application is, however, more complex as it involves legal frameworks and risks of more than one jurisdiction and also supervision by more

28 Basel Committee on Banking Supervision (BCBS) Principles 1-3, 5-9, 11-15, 26, and 29, see Annex 2.

29 See also Financial Stability Board (2014).

than one national supervisory body[30]. The BCBS's "*Sound management of risks related to money laundering and financing of terrorism*" contains more information.[31]

TRAINING

46. INR 26 provides that supervisory staff in charge of the supervision of banks in their implementation of a risk-based approach should understand the degree of discretion a bank has in assessing and mitigating its ML/TF risks. In particular, supervisors should check that staff have been trained to assess the quality of a bank's ML/TF risk assessments and to consider the adequacy, proportionality and effectiveness of the bank's AML/CFT policies, procedures and internal controls in light of this risk assessment.

47. Training should allow supervisory staff to form sound judgments about the adequacy and proportionality of a bank's AML/CFT controls. It should also aim at achieving consistency in the supervisory approach conducted at national level, in case of multiple competent supervisory authorities or because of the national supervisory model.

GUIDANCE

48. Supervisors should communicate their expectations of banks' compliance with their legal and regulatory obligations[32], after considering engaging in a consultative process with relevant stakeholders. This guidance may be in the form of high-level requirements based on desired outcomes, risk-based rules, information about how supervisors interpret relevant legislation or regulation, or more detailed guidance about how particular AML/CFT controls are best applied. Supervisors should also consider issuing guidance to banks on how to comply with their legal and regulatory AML/CFT obligations in a way that fosters financial inclusion.

49. Where supervisors' guidance remains high-level and principles-based, guidance written by industry sectors on how to meet the legal and regulatory obligations may be useful for explanatory and operational purposes. Banks should note, however, that the private sector guidance they take into consideration should be consistent with national legislation, based on international standards, and guidelines issued by competent authorities.

Examples of different approaches to banking supervisory guidance can be found in Annex 1.

50. Supervisors should consider liaising with other relevant domestic regulatory and supervisory authorities to secure a coherent interpretation of the legal obligations and to minimise disparities. This is particularly important where more than one supervisor is responsible for supervision (for example, where the prudential supervisor and the AML/CFT supervisors are in different agencies, or in separate divisions of the same agency). Multiple guidance should not create opportunities for regulatory arbitrage, loopholes or unnecessary confusion among banks. When possible, relevant regulatory and supervisory authorities should consider preparing joint guidance.

---

30 General supervisory standard set out in BCPs 12 and 13.

31 Part IV. See also BCBS (2010b), and BCBS (2014a) (Consultative document) on collaboration and exchanges of information between home and host supervisors.

32 R. 34.

SECTION III – GUIDANCE FOR BANKS

51. The RBA to AML/CFT aims to support the development of prevention and mitigation measures that are commensurate to the ML/TF risks identified. In the case of banks, this applies to the way banks allocate their compliance resources, organise their internal controls and internal structures, and implement policies and procedures to deter and detect ML/TF, including, where relevant, at group level.

52. Banking encompasses a wide range of financial products and services, which are associated with different ML/TF risks. These include, but are not limited to:

- *Retail banking*, where banks offer products and services directly to personal and business customers (including legal arrangements), such as current accounts, loans (including mortgages) and savings products;
- *Corporate and investment banking,* where banks provide corporate finance and corporate banking products and investment services to corporations, governments and institutions;
- *Investment services (or wealth management)*, where banks provide products and services to manage their customers' wealth (sometimes referred to as private banking); and
- *Correspondent services*, where banking services are provided by one bank (the "correspondent bank") to another bank (the "respondent bank")[33].

53. Banks should be mindful of those differences when assessing and mitigating the ML/TF risk to which they are exposed.

A. RISK ASSESSMENT

54. The risk assessment forms the basis of a bank's RBA. It should enable the bank to understand how, and to what extent, it is vulnerable to ML/TF. It will often result in a stylised categorisation of risk, which will help banks determine the level of AML/CFT resources necessary to mitigate that risk. It should always be properly documented, maintained and communicated to relevant personnel within the bank.

55. A bank's risk assessment need not be complex, but should be commensurate with the nature and size of the bank's business. For smaller or less complex banks, (for example where the bank's customers fall into similar categories and/or where the range of products and services the bank offers are very limited), a simple risk assessment might suffice. Conversely, where the bank's products and services are more complex, where there are multiple subsidiaries or branches offering a wide variety of products, and/or their customer base is more diverse, a more sophisticated risk assessment process will be required.

33 See FATF Glossary (FATF, 2012).

56. In identifying and assessing the ML/TF risk to which they are exposed, banks should consider a range of factors which may include:

- The nature, scale, diversity and complexity of their business;
- Their target markets;
- The number of customers already identified as high risk;
- The jurisdictions the bank is exposed to, either through its own activities or the activities of customers, especially jurisdictions with relatively higher levels of corruption or organised crime, and/or deficient AML/CFT controls and listed by FATF;
- The distribution channels, including the extent to which the bank deals directly with the customer or the extent to which it relies (or is allowed to rely on) third parties to conduct CDD and the use of technology;
- The internal audit and regulatory findings;
- The volume and size of its transactions, considering the usual activity of the bank and the profile of its customers.[34]

57. Banks should complement this information with information obtained from relevant internal and external sources, such as heads of business, relationship managers, national risk assessments, lists issued by inter-governmental international organisations and national governments, AML/CFT mutual evaluation and follow-up reports by FATF or associated assessment bodies as well as typologies. They should review their assessment periodically and in any case when their circumstances change or relevant new threats emerge.

Box 2. **Examples of ML/TF risk associated with different banking activities[1]:**

- ***Retail banking:*** provision of services to cash-intensive businesses, volume of transactions, high-value transactions, diversity of services.
- ***Wealth management:*** culture of confidentiality, difficulty to identify beneficial owners, concealment (use of offshore trusts), banking secrecy, complexity of financial services and products, PEPs, high value transactions, multiple jurisdictions.
- ***Investment banking:*** layering and integration, transfer of assets between parties in exchange for cash or other assets, global nature of markets.
- ***Correspondent banking:*** high value transactions, limited information about the remitter and source of funds especially when executing transactions with a bank located in a jurisdiction that does not comply or complies insufficiently with FATF Recommendations, the possibility that PEPs are involved regarding the ownership of a bank.

1. The proposed categorisation of banking activities is purely indicative (see par. 52) and the list of identified risks is illustrative and non-exhaustive.

34 INR 1 and 10.

58. The risk assessment should be approved by senior management and form the basis for the development of policies and procedures to mitigate ML/TF risk, reflecting the risk appetite of the institution and stating the risk level deemed acceptable. It should be reviewed and updated on a regular basis. Policies, procedures, measures and controls to mitigate the ML/TF risks should be consistent with the risk assessment.

B. RISK MITIGATION

IDENTIFICATION, VERIFICATION AND THE PURPOSE AND INTENDED NATURE OF THE BUSINESS RELATIONSHIP

59. Banks should develop and implement policies and procedures to mitigate the ML/TF risks they have identified through their individual risk assessment. Customer due diligence (CDD) processes should be designed to help banks understand who their customers are by requiring them to gather information on what they do and why they require banking services. The initial stages of the CDD process should be designed to help banks assess the ML/TF risk associated with a proposed business relationship, determine the level of CDD to be applied and deter persons from establishing a business relationship to conduct illicit activity.

60. Based on a holistic view of the information obtained in the context of their application of CDD measures, banks should be able to prepare a customer risk profile. This will determine the level and type of ongoing monitoring and support the bank's decision whether to enter into, continue or terminate, the business relationship. Risk profiles can apply at the individual customer level or, where groups of customers display homogenous characteristics (for example, clients with similar income range, or conducting similar types of banking transactions) can be applied to such groups. This approach is particularly relevant for retail banking customers.

61. Initial CDD comprises:

- Identifying the customer and, where applicable, the customer's beneficial owner;
- Verifying the customer's identity on the basis of reliable and independent information, data or documentation to at least the extent required by the applicable legal and regulatory framework; and
- Understanding the purpose and intended nature of the business relationship and, in higher risk situations, obtaining further information.

62. In addition, banks should take measures to comply with national and international sanctions legislation by screening the customer's and beneficial owner's names against the UN and other relevant sanctions lists.

63. As a general rule, CDD measures have to apply in all cases. The extent of these measures may be adjusted, to the extent permitted or required by regulatory requirements, in line with the ML/TF risk, if any, associated with the individual business relationship as discussed above under *Risk Assessment*. This means that the amount and type of information obtained, and the extent to which this information is verified, must be increased where the risk associated with the business relationship is higher. It may also be simplified where the risk associated with the business

relationship is lower. Banks therefore have to draw up, and periodically update, customer risk profiles[35], which serve to help banks apply the appropriate level of CDD.

Box 3. **Examples of Enhanced Due Diligence/Simplified Due Diligence measures (see also INR 10)**

- Enhanced Due Diligence (EDD)
  - obtaining additional identifying information from a wider variety or more robust sources and using the information to inform the individual customer risk assessment
  - carrying out additional searches (e.g., verifiable adverse media searches) to inform the individual customer risk assessment
  - commissioning an intelligence report on the customer or beneficial owner to understand better the risk that the customer or beneficial owner may be involved in criminal activity
  - verifying the source of funds or wealth involved in the business relationship to be satisfied that they do not constitute the proceeds from crime
  - seeking additional information from the customer about the purpose and intended nature of the business relationship
- Simplified Due Diligence (SDD)
  - obtaining less information (e.g., not requiring information on the address or the occupation of the potential client), and/or seeking less robust verification, of the customer's identity and the purpose and intended nature of the business relationship
  - postponing the verification of the customer's identity

Box 4. **CDD and financial inclusion considerations**

The application of a RBA to CDD may support financial inclusion objectives by providing for a more flexible application of CDD measures to certain categories of financial products or customers who might otherwise struggle to meet banks' CDD requirements. However, financial exclusion in itself is not an indicator of low ML/TF risk and banks have to take an informed decision, based on a holistic assessment of ML/TF risk, whether exemptions or SDD measures may be appropriate.

64. Where banks cannot apply the appropriate level of CDD, Recommendation 10 requires that banks do not enter into the business relationship or terminate the business relationship.

65. The BCBS's guidance on the *Sound management of risk related to money laundering and financing of terrorism* provides detailed guidance to banks on the management of money laundering

35 based on the bank's own risk assessment and taking into account risk factors such as those outlined in the FATF standards, e.g., in INR 10 and Recommendations/INR 12-16.

risk in correspondent banking and in situations where banks rely on third parties to carry out all, or part, of their initial CDD.

ONGOING CDD/MONITORING

66. Ongoing monitoring means the scrutiny of transactions to determine whether those transactions are consistent with the bank's knowledge of the customer and the nature and purpose of the banking product and the business relationship. Monitoring also involves identifying changes to the customer profile (for example, their behaviour, use of products and the amount of money involved), and keeping it up to date, which may require the application of new, or additional, CDD measures. Monitoring transactions is an essential component in identifying transactions that are potentially suspicious.

67. Monitoring should be carried out on a continuous basis or triggered by specific transactions. It could also be used to compare a customer's activity with that of a peer group. It need not require electronic systems, although for some types of banking activity, where large volumes of transactions occur on a regular basis, automated systems may be the only realistic method of monitoring transactions. However, where automated systems are used, banks should understand their operating rules, verify their integrity on a regular basis and check that they address the identified ML/TF risks.

68. Banks should adjust the extent and depth of monitoring in line with their institutional risk assessment and individual customer risk profiles. Enhanced monitoring should be required for higher risk situations, while banks may decide to reduce the frequency and intensity of monitoring where the risks are lower. The adequacy of monitoring systems and the factors leading banks to adjust the level of monitoring should be reviewed regularly for continued relevance to the bank's AML/CFT risk programme.

69. Banks should document and state clearly the criteria and parameters used for customer segmentation and for the allocation of a risk level for each of the clusters of customers. Criteria applied to decide the frequency and intensity of the monitoring of different customer segments should also be transparent.

Box 5. **Examples of monitoring in high/lower risk situations**

- Monitoring in high risk situations: daily transaction monitoring, manual transaction monitoring, frequent analysis of information, considering the destination of funds, establishment of red flags based on typologies reports, reporting of monitoring results to senior management etc.
- Monitoring in lower risk situations: thresholds, low frequency, automated systems

The BCBS's guidance on the *Sound management of risk related to money laundering and financing of terrorism* sets out in Section II 1 (d) what banks should consider when assessing whether their monitoring system is adequate. It stresses that a bank should have a monitoring system in place that is adequate with respect to its size, its activities and complexity as well as the risks present in the bank. For most banks, especially those which are internationally active, effective monitoring is likely to necessitate the automation of the monitoring process.

70. To this end, banks should properly document, retain and communicate to the relevant personnel the results of their monitoring as well as any queries raised and resolved.

REPORTING

71. Recommendation 20 requires countries to mandate that if a bank suspects, or has reasonable grounds to suspect, that funds are the proceeds of crime or are related to terrorist financing, it shall report its suspicions promptly to the relevant FIU. Banks should have the ability to flag unusual movement of funds or transactions for further analysis. Banks should have appropriate case management systems so that such funds or transactions are scrutinised in a timely manner and a determination made as to whether the funds or transaction are suspicious.

72. Funds or transactions that are suspicious should be reported promptly to the FIU and in the manner specified by competent authorities. The processes banks put in place to escalate suspicions and, ultimately, report to the FIU, should reflect this. While the policies and processes leading banks to form a suspicion can be applied on a risk-sensitive basis, a bank should report once ML/TF suspicion has formed.

C. INTERNAL CONTROLS, GOVERNANCE AND MONITORING

INTERNAL CONTROLS

73. Adequate internal controls are a prerequisite for the effective implementation of policies and processes to mitigate ML/TF risk. Internal controls include appropriate governance arrangements where responsibility for AML/CFT is clearly allocated, controls to monitor the integrity of staff, in accordance with the applicable local legislation, especially in cross-border situations and the national risk assessment, compliance and controls to test the overall effectiveness of the bank's policies and processes to identify, assess and monitor risk.

74. For larger banking groups, there should be controls in place for a consistent approach to AML/CFT controls across the group. The BCBS's *"Sound management of risk related to money laundering and financing of terrorism"* document[36] provides comprehensive guidance to banks on the effective management of ML/TF risk in a group-wide and cross-border context[37].

---

36 See part III.

37 It explains the rationale behind and principles of consolidated risk management; how group-wide AML/CFT policies and procedures should be consistently applied and supervised across the group, and, where reflecting local business considerations and the requirements of the host jurisdiction, should still be consistent with and supportive of the broader policies and procedures of the group; how banks should address differences in home/host requirements. Importantly, it also provides detail on how banks that are part of a group should share information with members of the same group with a view to informing and strengthening group-wide risk assessment and the implementation of effective group-wide AML/CFT policies and procedures.

GOVERNANCE

75. The successful implementation and effective operation of a RBA to AML/CFT depends on strong senior management leadership and oversight of the development and implementation of the RBA across the bank.

76. Senior management should consider various ways to support AML/CFT initiatives:

- promote compliance as a core value of the bank by sending a clear message that the bank will not enter into, or maintain, business relationships that are associated with excessive ML/TF risks which cannot be mitigated effectively. Senior management, together with the board, are responsible for setting up robust risk management and controls adapted to the bank's stated, sound risk-taking policy;
- implement adequate mechanisms of internal communication related to the actual or potential ML/TF risks faced by the bank. These mechanisms should link the board of directors, the AML/CFT chief officer, any relevant or specialised committee within the bank (e.g., the risks or the ethics/compliance committee)[38], the IT division and each of the business areas;
- decide on the measures needed to mitigate the ML/TF risks identified and on the extent of residual risk the bank is prepared to accept; and
- adequately resource the bank's AML/CFT unit.

Box 6. **Examples of steps taken by banks' senior management to promote compliance:**

- To carry out product development and commercial campaigns in strict compliance with national AML/CFT legislation.
- To involve senior management in AML/CFT training of staff.

77. This implies that senior management should not only know about the ML/TF risks to which the bank is exposed but also understand how its AML/CFT control framework operates to mitigate those risks. This would require that senior management:

- receives sufficient, regular and objective information to get an accurate picture of the ML/TF risk to which the bank is exposed through its activities and individual business relationships;
- receives sufficient and objective information to understand whether the bank's AML/CFT controls are effective (for example information from the Chief Compliance Officer on the effectiveness of control, or audit reports);

38 BCBS(2010a), par. 52 and 53.

- and that processes are in place to escalate important decisions that directly impact the ability of the bank to address and control risks.

78. It is important that responsibility for the consistency and effectiveness of AML/CFT controls be clearly allocated to an individual of sufficient seniority within the bank to signal the importance of ML/TF risk management and compliance, and that ML/TF issues are brought to senior management's attention. This includes, but is not restricted to, the appointment of a skilled compliance officer at management level[39].

ENSURING AND MONITORING COMPLIANCE

79. A bank's internal control environment should be conducive to assuring the integrity, competence and compliance of staff with relevant policies and procedures. The measures relevant to AML/CFT controls should be consistent with the broader set of controls in place to address business, financial and operating risks generally.

VETTING, RECRUITMENT AND REMUNERATION

80. Banks should check that staff they employ have integrity and are adequately skilled and possess the knowledge and expertise necessary to carry out their function, in particular where staff are responsible for implementing AML/CFT controls.

81. The level of vetting procedures of staff should reflect the ML/TF risks to which individual staff are exposed and not focus merely on senior management roles. Steps should be taken to manage potential conflicts of interest for staff with AML/CFT responsibilities. Their remuneration should be in line with principles on the independence of the compliance function in the BCBS paper on principles on compliance and the compliance function in banks[40].

TRAINING AND AWARENESS

82. The effective application of AML/CFT policies and procedures depends on staff within banks understanding not only the processes they are required to follow but also the risks these processes are designed to mitigate, as well as the possible consequences of those risks. It is therefore important that bank staff receive AML/CFT training, which should be:

- Of high quality, relevant to the bank's ML/TF risks, business activities and up to date with the latest legal and regulatory obligations, and internal controls;
- Obligatory for all relevant staff;
- Tailored to particular lines of business within the bank, equipping staff with a sound understanding of specialised ML/TF risks they are likely to face and their obligations in relation to those risks;

39 INR 18.

40 BCBS (2005).

- Effective: training should have the desired effect, and this can be checked for example by requiring staff to pass tests or by monitoring levels of compliance with the bank's AML/CFT controls and applying appropriate measures where staff are unable to demonstrate the level of knowledge expected;
- Ongoing: in line with INR 18, AML/CFT training should be regular, relevant, and not be a one-off exercise when staff are hired;
- Complemented by AML/CFT information and updates that are disseminated to relevant staff as appropriate.

83. Overall, the training should also seek to build up a working behaviour where compliance is embedded in the activities and decisions of all bank's staff.

ASSESSMENT OF CONTROLS

84. Banks should take steps to be satisfied that their AML/CFT policies and controls are adhered to and effective. To this end, their controls should be monitored on an ongoing basis by the bank's compliance officer. In addition, the adequacy of and compliance with banks' AML/CFT controls should be reviewed by an audit function.

85. Recommendation 18 requires countries to require banks to appoint a compliance officer at management level. In addition to advising relevant staff how to meet their obligations, their role should be to monitor and assess ML/TF risks across the bank as well as the adequacy and effectiveness of the measures the bank has put in place to mitigate the risks. The compliance officer should therefore have the necessary independence, authority, seniority, resources and expertise to carry out these functions effectively, including the ability to access all relevant internal information (including across lines of business, and foreign branches and subsidiaries).

Box 7. **Examples of internal controls to encourage compliance**

- Facilitate the reporting of suspicious transactions:
  - Set up staff training on mechanisms to adequately detect unusual transactions
  - Establish adequate channels to allow staff to report unusual transactions to the Compliance Officer
  - Ensure confidentiality to staff reporting suspicious transactions
- Allow staff to report areas of policy or controls they find unclear/unhelpful/ineffective:
  - Establish ongoing consultation channels for staff concerning AML/CFT issues
  - Ensure consistency of the answers given to staff questions concerning AML/CFT issues
  - Conduct AML/CFT activities in such a way that they are perceived by all staff as a support to the quality of the banking services provided to clients and the integrity of the bank.

86. Recommendation 18 also requires countries to require banks to have an independent audit function to test the bank's AML/CFT programme with a view to establishing the effectiveness of the bank's overall AML/CFT policies and processes and the quality of its risk management across its operations, departments, branches and subsidiaries, both domestically and, where relevant, abroad. The findings should inform senior management's view of the design and implementation of the bank's AML/CFT framework. The audit function needs to examine the adequacy of all risk determinations and should therefore not focus exclusively on higher risks.

87. Both the compliance and audit functions should base their assessment on all information relevant to their task including, where relevant and appropriate, information obtained confidentially through relevant internal mechanisms or whistleblowing hotlines. Other sources of information can include training pass rates, compliance failures, and analysis of questions received from staff.

ANNEX 1

EXAMPLES OF COUNTRIES' SUPERVISORY PRACTICES FOR THE IMPLEMENTATION OF THE RISK-BASED APPROACH TO THE BANKING SECTOR

This annex shares countries' supervisory practices which seek to illustrate the implementation of the RBA. They are presented as examples only. At the time of the publication of this guidance, the individual efforts had not been assessed for compliance with FATF Recommendations as part of the 4th Round of mutual evaluations. Therefore, their presentation here should not be considered as an endorsement by FATF.

Examples of different ways banking supervisors assess ML/TF risks in the banking sector and in individual banks

AUSTRALIA

Australia's AML/CFT regulator and specialist financial intelligence unit, AUSTRAC, applies a risk-based approach to the supervision of the banking sector at a corporate group level. Under this approach, AUSTRAC applies higher amounts of regulatory effort towards supervising entities within corporate groups that provide services and products identified as having a higher exposure and vulnerability to ML/TF risk.

Four factors are taken into account in determining the ML/TF risk profile:

- Whether the reporting entity group (RE Group) operates within an industry type identified as a major or significant channel for money laundering (as set out in Australia's National Threat Assessment on money laundering). RE Groups within these industry types are subject to higher levels of supervision by AUSTRAC.
- The exposure of an RE Group to ML/TF risk. Proxy measures used by AUSTRAC to determine the exposure of an RE Group to ML/TF activities are the size of the entity and/or the volume and value of transaction reports lodged with AUSTRAC. Larger RE Groups generally have more customers and typically provide products which are more complex using multiple distribution channels in multiple jurisdictions. In addition, large RE Groups have a greater impact on the overall integrity of Australia's financial system. Accordingly, large RE Groups, particularly those that lodge significant numbers of transaction reports with AUSTRAC, are subject to higher levels of supervision.

- Specific interest by AUSTRAC's Intelligence operations in relation to particular RE Groups or industry sectors.
- Specific interest by competent authorities (law enforcement, intelligence, revenue or regulatory agencies) in relation to particular RE Groups.

GERMANY

BaFin's risk classification of financial institutions is a combination of:

- The assessment of an individual abstract risk situation, based on 5 essential risk criteria (location, scope of business, product structure, customer structure and distribution structure). Each of the 5 elements is rated. The rating reached on customer structure weights more in the overall rating, as ML is a crime committed by customers. If the financial institution reaches an overall score which is the high limit for low risk institutions, or the low limit for enhanced risk institutions, the supervisor has discretion to decide which risk category the institution will fall in, based on its past AML/CFT history.
- The assessment of the quality of AML/CFT preventive measures (task fulfilment by the AML compliance officer, IT monitoring, Know-Your-Customer measures etc.) implemented by the financial institution, including the group-wide compliance aspects when relevant. The ratings are based on information from the annual audit reports and additional assessments from external auditors. The importance and scope of the deficiencies identified will impact the quality level and the rating of preventive measures.

The end result is a 12 cell-matrix, which will be used to determine the intensity of the AML/CFT supervision required:

		Quality of AML/CFT-prevention			
		A (high)	**B (medium-high)**	**C (medium-low)**	**D (low)**
Potential threat of ML/TF	**3 (high)**	**3A**	**3B**	**3C**	**3D**
	2 (medium)	**2A**	**2B**	**2C**	**2D**
	1 (low)	**1A**	**1B**	**1C**	**1D**

MEXICO

The National Banking and Securities Commission (CNBV), based on the inherent risks identified through the information obtained from financial institutions and other sources, establishes monitoring strategies. The strategy for effective monitoring takes into account which products or services are offered by financial entities, their types of users or customers, their flow of funds, and their geographic area of operation, among others. Considering those factors, CNBV determines which financial institutions represent higher risks in order to decide which financial institutions have to be visited during the year (annual program). Subsequently, a diagnosis for each entity to be visited is performed, where the major significant activities (products with inherent risk) and the correspondent risk mitigating action that the financial institutions have applied are reviewed. As a result of the inspection visit, a risk rating of the entity is determined, which at the same time provides the input necessary to determine the periodicity for further inspection visits on AML/CFT

THE NETHERLANDS

The Dutch Central Bank (DNB) is responsible for AML/CFT supervision and enforcement over banks. DNB applies a risk-based approach to AML/CFT supervision by focusing on institutions which pose the highest risk. For this, a thorough understanding of the risks is required. DNB analyses integrity risks on different levels, namely on a macro, meso and micro level. On a macro-level DNB takes into account country and global developments which are of importance for the Dutch financial sector. On a meso-level, DNB distinguishes between different sectors and the way in which different developments/risks might impact these sectors. On a micro-level DNB takes into account factors of specific institutions which can increase the vulnerability of those institutions.

The first step in the risk-based approach is to identify ML/TF risks through several sources, such as typologies, intelligence, international and national committees and other (foreign) supervisors which are involved in the prevention of ML/TF (i.e. FATF, BCBS, European Supervisory Authorities, IAIS). DNB also takes into account information received from the supervisory visits. DNB sends out a questionnaire to a group of selected institutions to gain insight in the inherent risk level and control measures in place. In addition, DNB has set up a trend analysis function which monitors open sources of information to detect new trends and signals which concern AML/CFT supervision.

When the risks are identified, DNB analyses these risks based on different criteria such as the potential impact on society, the institutions, and the stability of the financial sector. The risk profile of an institution is determined on the basis of two main dimensions, the ML/TF risk level and control level. Factors for the inherent risk score which DNB takes into account are geographical scope, the customer base of the institution, the products and services and the distribution channel of the institution. For the control level DNB look into the governance and control procedures of an institution, the adequacy of the compliance function, the compliance history and incidents and the quality of preventative measures in the institution.

SINGAPORE

The Monetary Authority of Singapore (MAS) adopts a risk-based approach in its supervision of Financial Institutions (FIs). This approach is articulated in the public monograph on MAS' *Framework for Impact and Risk Assessment of Financial Institutions*. At the heart of this framework is the impact and risk model which is used to assess FIs on two aspects annually:

- Impact (relative systemic importance): the impact assessment considers the potential impact that an FI may have on Singapore's financial system, broader economy and reputation, in the event of distress. Related institutions are grouped together for an assessment of their aggregate impact. Generally, the larger the FI's intermediary role in critical financial markets or the economy, or the greater its reach to retail customers, the higher its assessed impact.
- Risk (relative risk profile): the risk assessment examines the inherent risks of the FI's business activities, including ML/TF and proliferation financing risks, its ability to manage and control these risks, the effectiveness of its oversight and governance structure, and the adequacy of its financial resources to absorb losses and remain solvent. The assessment also takes into consideration intra-group linkages, where applicable, between the FI and its related entities, and risks posed by other entities in the group (e.g., for a locally-incorporated banking group, risks posed by significant subsidiaries will be aggregated with the main banking entity and monitored on a consolidated basis). To ensure robustness and consistency, the risk assessments of individual FIs are subjected to a process of peer comparison, challenge and review by other experienced supervisors, or panels of senior and specialist staff for key FIs.

Based on the combined assessments of impact and risk (with the impact component accorded greater weightage), the FI is assigned to one of four categories of supervisory significance, with Bucket 1 FIs supervised most intensely. FIs in Buckets 1 and 2 are supervised more closely with more resources allocated by MAS, subjected to more frequent inspections, and have their risk assessments approved by a more senior level of management.

MAS' risk-based approach encompasses both on-site and off-site supervision. MAS' off-site supervision involves ongoing monitoring of an FI's financial soundness and risk indicators, and developments in its businesses and home country, as well as trends in the financial sector. MAS also reviews the FI's regulatory returns and audit reports, and conducts regular meetings with the FI's management, auditors and home supervisors. Concerns impacting the FI's safety and soundness are followed up expeditiously.

SOUTH AFRICA

Bank Supervision Department of SARB Supervisory processes - Risk-based approach to on-site inspections

Due to limited resources, it is not practically possible to extend the scope of AML/CFT inspections to cover all areas within a bank, nor will it be possible to inspect all banks within a calendar year. Therefore, the AML Review Team, in executing its supervisory duties, has adopted a risk-based approach in scheduling and conducting AML/CFT inspections of the accountable institutions (banks) it supervises.

Risk-based methodology:

- The AML Review team will always request the bank's own AML risk assessment for purposes of inspection and review;
- As one of the contributing elements of the review of the risk assessment of a bank, a list of products and services offered by the bank, aligned with each business unit, should be requested;
- The AML Review team should assess the bank's ML risk assessment process to determine whether the bank has adequately identified the level of risk it has assumed;
- In the absence of an ML risk assessment of a particular bank, the AML Review team should perform its own risk assessment based on the structure provided by the bank and the inherent risk factors of the bank's activities;
- Should the bank's risk assessment be inadequate, the AML Review Team should complete its own risk assessment as stated above;
- The test for adequacy of the bank's risk assessment or completion of the team's own risk assessment on the bank should specifically be done for a particular inspection.
- The factors used for compiling the risk assessment should be benchmarked against the FATF Recommendations, the Basel Core Principles for Effective Banking Supervision, as well as known money laundering and terrorist financing typologies from reputable authorities.
- The banking institutions' activities, products, geographic locations and client types should be segmented between high, medium and low risk.
- Based on the risk assessment (high, medium and low risk), the AML Review Team should, thereafter, develop the scope of the inspection taking into account the identified high risk AML activities from the risk assessment.
- FATF requires countries to take appropriate steps to identify and assess money laundering and terrorist risks for the entire country on an on-going basis and in order to:
- inform potential changes to the country's AML/CFT regime, including changes to laws, regulations and measures;
- assist in allocation and prioritisation of AML/CFT resources by competent authorities; and
- make information available for ML/TF risk assessments conducted by banks.

UNITED KINGDOM

The Financial Conduct Authority (FCA) classifies all firms according to the risk they pose to the FCA's operational and statutory objectives. It also classifies all firms that are subject to the UK's AML legislation according to their money laundering risk. This is because money laundering risk does not necessarily correlate to the size of a firm. As a result, a firm in a lower conduct risk category may receive relatively more supervisory attention from an AML/CFT perspective.

When classifying firms according to money laundering risk, the FCA considers a number of factors. These include the nature of the firm's business, the products and services it offers and the jurisdictions where it is located or operates.

This risk assessment and the criteria the FCA uses to inform it, are reviewed on a regular basis and firms can be reclassified without delay as appropriate.

UNITED STATES

The Federal Banking Agencies (FBAs) supervisory processes assess whether depository institutions have established the appropriate policies, procedures, and processes based on their BSA/AML risk to identify and report suspicious activity and that they provide sufficient detail in reports to law enforcement agencies to make the reports useful for investigating suspicious transactions that are reported. To ensure consistency in the application of the BSA/AML requirements, the FBAs follow the examination procedures contained in the Federal Financial Institutions Examination Council (FFIEC)'s *Bank Secrecy Act/Anti-Money Laundering Examination Manual*. In order to effectively apply resources and ensure compliance with BSA requirements, the Manual is structured to allow examiners to tailor the BSA/AML examination scope and procedures to the specific risk profile of the depository institution. It also provides the private sector with a clear "road map" of FBA supervisory expectations and definition of the procedures that examiners will apply in evaluating compliance program effectiveness. The FBAs communicate their expectations to the private sector informally through on-going dialog with boards of directors and senior management and formally through the FFIEC BSA/AML Exam Manual, guidance and general outreach in workshops and seminars for banks based on size, location, product type and other factors and through speaking engagements sponsored by trade and industry associations. The FFIEC BSA/AML Exam Manual contains sections on identified risks associated with products and services and persons and entities that incorporate law enforcement information from reports such as the U.S. National Money Laundering Strategy and the U.S. Money Laundering Threat Assessment; on-going dialog with law enforcement representatives at the national, state and local levels and risks identified by FBA examiners based on information provided by law enforcement. This information is also used to prepare and issue guidance detailing supervisory expectations for risk management related to vulnerabilities identified in the jurisdiction and scope and plan exams.

Examples of different ways banking supervisors approach on-site and off-site ML/TF supervision in line with the risks identified

AUSTRALIA

AUSTRAC's current phase of supervision includes targeting high-risk entities for supervisory activity, and to test the effectiveness of entities' systems and controls in practice. AUSTRAC has developed data-mining techniques that scan the entire regulated entity population and bring to the surface issues and vulnerabilities that may impede reporting entities' effectiveness. Through these techniques, AUSTRAC is able to identify individual reporting entities whose behavioural characteristics are outliers to that of their peers. AUSTRAC utilises this information to identify entities requiring further supervisory engagement, particularly in lower risk sectors.

After AUSTRAC identifies ML/TF risk and significance, it determines the level and type of engagement required with an RE Group based on an assessment of its compliance risk. (Compliance risk is defined as the risk that an RE Group is non-compliant with its legislative obligations, and is a different measure to the ML/TF risk of an entity. An entity may have a high ML/TF risk but have a strong approach to its regulatory obligations, meaning that its compliance risk score will be low.)

AUSTRAC uses a range of compliance techniques to assess the adequacy of RE Groups' policies, practices, systems and controls to meet the requirements of the AML/CTF Act, including:

- Low intensity or 'engagement' activities such as enrolment processes, mail-outs, e-newsletters, forums, workshops and the development and distribution of guidance materials.
- Moderate intensity or 'heightened' activities such as processes associated with the registration of remitters, behavioural assessments, desk reviews, themed reviews and transaction monitoring directed at specific behaviours of cohorts of reporting entities.
- High intensity or 'escalated' activities such as on-site assessments and a dedicated management approach. AUSTRAC tailors these activities to individual reporting entities. They are designed to have a direct impact on improving compliance outcomes.

GERMANY

On-site inspections contain both:

- Regular annual inspections, carried-out on-site by external auditors, and
- Special/targeted inspections, on a regular basis or with respect to specific circumstances by external auditors (on behalf of the supervisor) or by the supervisor itself.

Employees of the supervisory authority accompany the external auditors in all special/targeted inspections and in some regular annual inspections.

According to the Banking Act, the supervisory authority is able to decree thematic priorities in the course of regular on-site inspections. This is done for example to check the implementation of new provisions in the AML law or when a certain type of deficiency is detected in a multitude of annual reports of different financial institutions.

Off-site supervision:

- The annual report contains an annex where the main results are highlighted in one or two brief sentences, in connection with a mark. Depending on the individual risk classification of a financial institution, in certain cases of low risk only a "quick check" of this annex is done and the whole annual report is only evaluated ("intensive check") in case of bad marks in this annex.
- After the evaluation of reports from on-site inspections and depending on their findings, the follow-up procedure will be conducted with different level of intensity.
- Detailed written information about AML measures applied to specific customer/product groups can be requested, or a consultation with the bank's compliance officer can be organised.
- The presentation of updated internal safeguards which have been put in place can be requested; depending on the importance of the system and the shortcomings that were analysed, an external expert can be mandated to check the proper operability of the system in place.

MEXICO

The AML/CFT supervision in Mexico is composed of the following stages:

- Financial institutions are assigned a risk rating using a RBA model. Information is requested periodically from financial institutions to elaborate a regulatory report and the offsite analysis is performed on the basis of this data. The information collected is consolidated in the same risk matrix used to determine the risk level of the entity. Based on these results, the CNBV determines the frequency with which a financial institution will be visited in order to supervise its compliance with AML/CFT laws and regulations; including the implementation of measures to mitigate AML/CFT risks.
- Based on the risk rating of a given financial institution, a monitoring strategy for onsite supervision is determined focusing on the higher risk factors identified at the previous stage. This is strengthened with a diagnosis that allows pinpointing significant activities (products and services) set as higher risks and the effectiveness of specific mitigants implemented by the financial institution for such activities.

- During the on-site inspections, supervisors request information and documentation in order to confirm if the risk level previously assigned to the financial institution is adequate, and conduct their inspection accordingly. Supervisors enhance their review of those aspects considered of higher risk.
- In accordance with the results of the inspections, various acts of authority can be carried out, including the issuance of observations and recommendations, as well as the implementation of corrective actions and/or sanctions.

Finally, the results of the inspection are taken into account to either confirm a risk level or assign a new one to the supervised entity. This new information is added to the offsite supervisory matrix, which helps determine the best timing for having the entity monitored again (supervision strategy).

HONG KONG, CHINA

The Hong Kong Monetary Authority (HKMA) supervises banks' AML/CFT systems through a combination of on-site examinations and off-site reviews, which is integrated as part of the broader banking supervisory process. AML/CFT supervision is risk-based, and the frequency, intensity and scope of supervisory activities are linked to the ML/TF risk profile of individual banks, which takes into account both impact to the financial system and risk level. On-site examinations comprise risk-focused examinations and thematic examinations, which are part of a cycle, culminating in best practices being provided to banks in training forums, which are conducted on an annual basis.

To illustrate the approach in practice, in 2012, the HKMA conducted thematic reviews for 9 banks over suspicious transaction reporting (STR). As a result of observations made, in Q1 and Q2 2013 a further 107 banks were subject to high-level desk-based reviews over STRs, with a focus on post-reporting risk-mitigation. On the basis of the risks identified, 26 banks were further selected for more intensive desk-based reviews, including policies and procedures and actions taken to mitigate ML/TF risks. Follow-up supervisory actions were determined on the basis of risk, including requiring additional action on the part of banks, external auditor reviews and a further 4 thematic on-site examinations that comprised interviews with key operational staff and reviews of STR related processes. The findings from this supervisory initiative were communicated to banks in training seminars held in October 2012 and April 2013, and were the subject of a guidance paper, developed in collaboration with the Joint Financial Intelligence Unit, issued on 16 December 2013.

ITALY

The Bank of Italy employs a mix of off-site and on-site supervision. Off-site analysis is systematic, carried out at set intervals, and based on analysis of data and information that banks report to the Bank of Italy (BI) (annual report of AML compliance function; reports by control bodies on specific irregularities, post inspection follow-up reports, etc.). Moreover, whenever necessary, BI holds meetings dedicated to AML issues with board members or AML compliance officers to gather relevant information and discuss initiatives.

Based on the off-site analysis results, inspections are planned and carried out. Inspections may be: full scope, targeted (business areas, specific risks, operational profiles, corrective action follow-up) and thematic. Following the entry into force of the Italian AML Law in 2008, Bank of Italy's reviewed its on-site control procedures: AML controls may be conducted in the framework of general on-site inspections or through thematic inspections dedicated to AML compliance.

In 2008, the Bank of Italy inaugurated yearly cycles of targeted on-site AML inspections on banks' branches in high risk areas in order to conduct an assessment on the implementation of AML rules in day-to-day operations. The assessment consists of short on-site visits (3/5 days) in a number of pre-selected branches located in areas of the country where specific criminal activities risks (organised crime, tax evasion, tobacco smuggling, usury, etc.) exist. Visits are conducted using a questionnaire on AML obligations (CDD, registration, reporting and training) to verify compliance with AML Law/regulations and banks' internal regulations by branch's staff; a sample testing of individual customer positions is also performed. Whenever the findings of the visits indicate major deficiencies, corrective actions are requested.

Moreover, the Italian FIU verifies compliance of financial institutions, both off-site and on-site, with regard to suspicious transactions reporting duties and cases of omitted reporting of STRs mainly on a RBA basis. The areas of risk are recognised by information transmitted by law enforcement, financial sector supervisory authorities, professional associations or other FIUs. In case of infringements or major organisational disorder at the financial institution, close coordination with Bank of Italy and other supervisory authorities is ensured by MoUs. Feedback to intermediaries, for corrective actions, is also warranted in cases detection and valuation of STRs result critical.

FRANCE

The French financial supervisor (*Autorité de Contrôle Prudentiel et de Résolution*, ACPR) implements a multi-level approach for the assessment of ML-FT risks, and the AML/CFT supervision of the financial sector:

- *Annual questionnaire on AML-CFT*: the answers to the questionnaire are systematically studied by off-site control services. Several priority levels are defined. The nature and time limit to set out corrective actions depend on the seriousness of the deficiencies revealed by the answers to the questionnaire.

  The questionnaire for credit institutions, investment firms, and life insurance institutions reflects the revised FATF Recommendations, and highlights key issues such as the RBA. It also takes account of the results of the analysis of thematic AML-CFT inspections (e.g., wealth management recently). Specific questions are added for financial groups, as well as targeted sectoral questions for the banking and insurance sectors respectively.

- *Different tools are used for the off-site control:*
  - Internal audit reports
  - On-site inspection reports

- Information collected during meetings (annual meetings, and other relevant meetings)
- Annual internal control reports, with an overview of business conducted and risks incurred by the institution; significant changes made in the internal control system; governance; money laundering and terrorist financing risks.

THE NETHERLANDS

DNB performs both on-site and off-site supervision in a risk based manner. In addition to the ongoing supervisory cycles, DNB performs thematic reviews which are in-depth reviews of a specific risk(area) for a selection of institutions. Thematic reviews allow DNB to benchmark practices, identify outliers and best practices. The process of thematic supervision starts with the selection of themes based on risk analyses, reviews from previous years or incidents/compliance issues that are known from ongoing supervision.

The entities to be visited are selected on the basis of a number of criteria, such as the size of the business, the risk profile, previous experience of compliance weaknesses etc. Prior to onsite visits, information is requested from institutions that are reviewed (such as policy and processes, transactions, suspicious transaction reports, customer information etc.). During the on-site, discussions with management, sampling of customer or transaction files as appropriate and an examination of the institution's risk assessment and risk management procedures are performed and analysed.

UNITED KINGDOM

The Financial Conduct Authority (FCA) allocates specialist supervisory resource according to the level of money laundering risk associated with a firm and *ad hoc*, as risk dictates. This involves both on-site and off-site assessments of the adequacy of firms' AML/CFT systems and controls.

Off-site assessments include the analysis of regulatory returns (which include specific financial crime questions), policies and procedures, audit reports, minutes of meetings, reports of previous supervisory visits and, where relevant, intelligence obtained through external sources.

On-site visits include interviews with key staff, testing the firm's AML/CFT controls and file reviews.

The focus and detail of both on-site and off-site reviews is determined by the reason for the review, e.g., a planned review as part of the FCA's ongoing supervisory programme or suggestions that a risk has crystallised.

Examples of differing frequency of ML/TF supervision in line with the risks identified

AUSTRALIA

The frequency of supervision by AUSTRAC correlates with the compliance risk associated with the RE Group. A key supervisory performance indicator for AUSTRAC is to undertake an assessment of

each high-risk RE Group within a three year period. In parallel, AUSTRAC employs data-mining techniques that scan the entire regulated entity population and bring to the surface issues and vulnerabilities that may impede reporting entities' effectiveness. Through these techniques, AUSTRAC is able to identify individual reporting entities whose behavioural characteristics are outliers to that of their peers. AUSTRAC utilises this information to identify entities requiring further supervisory engagement, particularly in lower-risk sectors.

GERMANY

Frequency aspects for on-site inspection are inter alia:

- Credit institutions with a total balance sheet below a specific threshold only need to be assessed on a biennial basis, except if certain risk factors indicate a higher risk.
- Special inspections are conducted more frequently with regard to "big players" in the financial market, due to the complexity of their business which requires a more frequent update of information for the supervisor.
- Special inspections can be conducted on a regular basis because of the (high) risk classification of a financial institution, regardless of its size.
- Additional or focused special inspections are sometimes conducted if serious deficiencies are evidenced by previous reports
- Special inspections can be conducted on an *ad hoc* basis in case of ML/TF related "bad news" revealed through investigations of law enforcement agencies, newspapers, whistleblowers, internet research etc.

MEXICO

The AML/CFT supervision frequency is determined by taking into account the risk ratings provided to financial institutions, as well as the following factors, among others:

- Unusual increases in the number and threshold of transactions performed by financial entities
- Increases in the STRs or CTRs, among other types of reports
- Change of a financial institution's business line profile
- New financial products or new lines of business
- The level of compliance of financial institutions with their regulatory obligations (submission of AML/CFT program to the authority, and submission of reports in a timely manner, among others).

The AML/CFT supervision frequency is also subject to the follow-up of the corrective measures, including specific plans and timelines.

THE NETHERLANDS

Based on the perceived risks DNB allocates its supervisory resources through ongoing supervision and thematic reviews. This applies to both frequency and intensity of AML/CFT supervision. In the ongoing reviews DNB assigns more resources to institutions which have a higher risk profile (based on their size, activities, compliance history etc.). In the thematic reviews a specific subject/high risk area is examined for a selection of institutions.

UNITED KINGDOM

The UK's Financial Conduct Authority (FCA) categorises firms according to their money laundering risk:

- Firms in the highest band are covered by the Systematic AML Programme. The programme operates on a four-year, rolling cycle and each programme lasts several months.
- Firms in the second band are subject to a regular on-site inspection programme consisting of two or three day on-site visits every two years.
- Firms in the lower risk banks are visited on an events-driven basis or when they are part of a sample of a thematic review.

All firms can be subject to events-driven supervision and form part of thematic reviews.

UNITED STATES

The Federal Banking Agencies (FBAs) are required by law to conduct Bank Secrecy Act (BSA) examinations of insured depository institutions as part of their overall prudential supervisory function. Such reviews are conducted during regular examinations of their depository institutions, on a 12-18 month cycle, which is required by statute (12 U.S.C. §§ 1820(d) and 1784). Supervision and regulation of depository institutions for compliance with the BSA is conducted through a combination of on-site examinations and off-site reviews. FBA BSA examination policies and procedures are established in the Federal Financial Institutions Examination Council (FFIEC)'s *Bank Secrecy Act/Anti-Money Laundering Examination Manual.* FBAs are required to conduct required core examination procedures for assessing compliance with the BSA/AML compliance program, regulatory requirements and related topics. Expanded procedures for products, services, persons and entities are required depending on risk. Transaction testing is required during each examination regardless of the level and nature of risk present in the institution. For larger, more complex institutions, some FBAs maintain resident on-site examiners who provide continuous supervision of the institution and obtain at least quarterly updates on the institution's condition and risk assessment.

Examples of adjustment of the intensity of ML/TF supervision in line with the risks identified

AUSTRALIA

As described above, AUSTRAC uses a range of compliance techniques to assess the adequacy of RE Groups' policies, practices, systems and controls to meet the requirements of the AML/CTF Act, including:

- Low intensity or 'engagement' activities such as enrolment processes, mail-outs, e-newsletters, forums, workshops and the development and distribution of guidance materials.
- Moderate intensity or 'heightened' activities such as processes associated with the registration of remitters, behavioural assessments, desk reviews, themed reviews and transaction monitoring directed at specific behaviours of cohorts of reporting entities.
- High intensity or 'escalated' activities such as on-site assessments and a dedicated management approach. AUSTRAC tailors these activities to individual reporting entities. They are designed to have a direct impact on improving compliance outcomes.

Where an entity with high inherent ML/TF risk is assessed and shown to have inadequate policies, practices, systems and controls in place to address its compliance risk, these entities are prioritised for remediation and/or enforcement action.

Remediation processes are undertaken through issuing a compliance assessment report to an entity, which requires that entity to take specific actions to remedy non-compliance in specific timeframes. AUSTRAC then monitors the entity against those requirements.

GERMANY

BaFin has set up a risk-matrix for credit institutions (see above), and the intensity of supervision follows the risk classification of each institution. The main reasons for this approach are the necessity of concentrating on the highest risk areas and the need to allocate resources where they are most needed.

Differences in the levels of supervisory intensity include:

- On-site inspections always include sample testing. If lots of deficiencies appear in a certain field (e.g., customer identification process), this could lead to a so called "full-size check" (i.e. the identification process of all new customers acquired in the past 6 months is checked)

- Escalation steps can be taken in the follow-up procedure to on-site inspections. Institutions are dealt with individually, when specific events occur.

MEXICO

CNBV applies the methodology set forth in the Institutional Manual of Supervision, which contains a detailed description of all the procedures that must be held in order to assess significant activities (products and services) of higher risk that are determined by the offsite supervisory area, as well as the effectiveness of the mitigating actions implemented by the financial institution.

During the inspections, if the supervisor in charge determines that some risk mitigating actions that are not originally covered in the corresponding supervision program should be reviewed by virtue of having evidence that there is a weakness in their implementation or effectiveness, it has the faculties to conduct a deeper and more comprehensive review. E.g., if, based on a transaction report, a deficiency is detected in the automated system of the bank, the supervisor should proceed to verify the system in order to detect the actual cause of the deficiency.

THE NETHERLANDS

DNB will allocate its supervisory resources through ongoing supervision and thematic reviews. This applies to both frequency and intensity of AML/CFT supervision. DNB's approach to supervision makes a distinction between different regimes, for example low, neutral, high and urgent. Each institution is assigned to a specific supervision regime, based on an assessment of the chance that the identified risks within an institution could harm the supervisory objectives. The risk profile of the institution forms the basis for this. The supervision regimes set the tone for the risk mitigation activities which ranges from no substantial intervention to immediate intervention where all possible measures are used to mitigate the risk.

UNITED KINGDOM

The UK's Financial Conduct Authority (FCA) categorises firms according to their money laundering risk. This categorisation determines the intensity and frequency of AML/CFT supervision.

- Firms in the highest band are covered by the Systematic AML Programme (SAMLP). These firms are subject to the most intensive AML/CFT supervision, which consists of extensive interviews with key staff, including senior management, compliance and front office both in the UK and elsewhere, as well as detailed testing of the firm's AML/CFT systems and controls. A typical SAMLP lasts several months and is repeated every four years.
- Firms in the second band will be subject to a regular inspection programme, consisting of two or three day on-site visits every two years.
- Firms in the lower bands are mainly supervised through thematic reviews and event-driven reactive supervision. Thematic reviews typically involve an off-site assessment of the firm's policies and procedures and detailed

testing and interviews during an on-site visit that lasts between two and three days, depending on the size of the firm and the complexity of its operations. The intensity of event-driven supervision depends on the nature of the suspected breach.

Examples of different approaches to supervisory guidance

AUSTRALIA

An extensive range of guidance information on Australia's AML/CTF reporting obligations is available on the AUSTRAC website (www.austrac.gov.au), including:

Guidance Notes

AUSTRAC's guidance notes contain information regarding legislative provisions to provide assistance to reporting entities in meeting their obligations. Current guidance notes can be found on the AUSTRAC website at www.austrac.gov.au/guidance_notes.html.

Guides

AUSTRAC has released the following AML/CTF Guides, which are available at www.austrac.gov.au/guides.html:

- *AML/CTF compliance guide for pubs and clubs,* to assist hotels and clubs, which are licensed to operate electronic gaming machines, to meet their requirements under the AML/CTF Act and the AML/CTF Rules.
- *AML/CTF compliance guide for independent remittance dealers*, to assist providers of remittance services to determine whether they are required to register as an independent remittance dealer and how to complete the registration process.
- *AML/CTF compliance guide for bookmakers,* to assist bookmakers in understanding and meeting their obligations under the AML/CTF Act.
- *AUSTRAC business profile form explanatory guide,* to assist entities with using the AUSTRAC business profile form.

Guidelines

The AUSTRAC guidelines contain information related to aspects of the *Financial Transaction Reports Act* and cover aspects of the reporting requirements for cash dealers. For example, the *Significant Cash Transaction Reporting Guideline for Solicitors*, available at: www.austrac.gov.au/files/guideline_no6.pdf.

Compliance Guide

The *AUSTRAC Compliance Guide* consolidates a range of AUSTRAC guidance material. The guide outlines and explains the obligations under the AML/CTF Act, Rules and regulations and presents

examples on how they operate and assists reporting entities to design, develop and implement systems and controls necessary to mitigate the risks of money laundering and terrorism financing.

The current guide is at:
www.austrac.gov.au/businesses/obligations-and-compliance/austrac-compliance-guide

CANADA

FINTRAC has published a series of guidelines to ensure that reporting entities understand and comply with their legislative and regulatory AML/CFT obligations. All of FINTRAC's guidelines can be found at the following link: www.fintrac-canafe.gc.ca/publications/guide/guide-eng.asp FINTRAC has recently issued new guidance (Guideline 4) on how to implement a compliance regime, including in respect of the risk-based approach (see www.fintrac-canafe.gc.ca/publications/guide/Guide4/4-eng.asp).

OSFI, the Office of the Superintendent of Financial Institutions, has also issued guidance to assist reporting entities that are Federally-Regulated Financial Institutions to comply with applicable AML/CFT requirements (www.osfi-bsif.gc.ca/Eng/fi-if/rg-ro/gdn-ort/gl-ld/Pages/b8.aspx).

ITALY

The Bank of Italy regularly provides supervised entities with general feedback on controls activities and guidance on AML/CFT risks encountered in the exercise of supervisory tasks, as well as on AML/CFT measures recommended or requested at international level (i.e. FATF black list, UN sanctions). Guidance also contains instructions on the proper procedures for fulfilling anti-money laundering obligations and compliance with the rules.

In addition, the Italian FIU, in order to ease detection of STRs, produces guidance on anomalous conduct patterns of economic or financial behaviour that may be linked to money laundering or terrorist financing (e.g., conduct patterns regarding possible loan sharking issued in 2011, on ML risk of factoring issued in 2012, on gambling and betting issued in 2013). In some cases, the Italian FIU issues "alert notes" in order to foster the awareness of financial institutions on how certain financial instruments may be exploited for ML or TF purposes (e.g., alert note on pre-paid cards in 2012). Often this kind of guidance goes along with roundtables or (in) formal meetings with ML reporting officers in order to reduce wrong interpretation regarding STRs. Such contacts are used by reporting entities for implementing an efficient RBA approach and enhance internal procedures, due to the close relationship between STRs and overall AML and CFT policies.

THE NETHERLANDS

DNB has published several guidance documents to support institutions in implementing the AML/CFT requirements. After the off-site and on-site activities, the results are benchmarked to determine outliers and good practices. Institutions receive individual feedback and potentially enforcement actions follow. The industry also gets more generalized feedback (round table, seminar, (in) formal meetings) and overviews of good practices/guidance. The sectors are kept informed of the thematic examinations through an annual publication on the themes and regular updates through newsletters.

UNITED KINGDOM

Regulatory guidance

The Financial Conduct Authority (FCA) publishes regulatory guidance on a wide range of financial crime issues. This guidance sets out the FCA's expectations of firms' financial crime system and controls. It also includes questions firms can use to test the adequacy of their systems and controls and lists examples of good and poor practice observed during on-site visits to help firms understand how they can meet their financial crime obligations.

This guidance is not binding and the FCA will not presume that a firm's departure from this guidance constitutes a breach of its rules. But firms are expected to take note of what the guidance says and use it in a proportionate and risk-sensitive way to inform their own financial crime systems and controls.

The FCA regularly updates its guidance to take account of new findings and to clarify expectations in areas where weaknesses exist across many firms. All changes are subject to public consultation before being finalised. The FCA's guidance, **Financial crime: a guide for firms** is at http://media.fshandbook.info/Handbook/FC1_FCA_20140401.pdf

Industry guidance

When assessing the adequacy of firms' AML/CFT systems and controls, the FCA also has regard to the **Joint Money Laundering Steering Group (JMLSG)'s guidance**. This is guidance written by a group of UK financial services trade associations and sets out how firms can meet their legal and regulatory AML/CFT obligations. It is formally approved by the UK Government and referred to in the FCA's rulebook and guidance. The FCA liaises closely with the JMLSG during the revision of its guidance.

UNITED STATES

The FBAs issue guidance under their own supervisory authorities and jointly with the FIU (FinCEN) to their regulated financial institutions to communicate and clarify their supervisory expectations with respect to managing ML/TF risks and complying with AML/CFT regulations. As members of the Federal Financial Institutions Examination Council (FFIEC), the FBAs have issued the *Bank Secrecy Act/Anti-Money Laundering Examination Manual* that prescribes the procedures that FBA examiners are required to apply in conducting BSA exams. The procedures contained in BSA/AML Exam Manual address compliance with both FBA supervisory expectations as well as BSA regulatory requirements and ensure transparency in the examination process. It also ensures that exam procedures are comprehensive and applied consistently across all the institutions regulated by the FBAs. The FFIEC updates the Manual regularly to incorporate changes in regulations and supervisory expectations that reflect emerging ML/TF risks and any significant changes to existing ones.

ANNEX 2

BASEL CORE PRINCIPLES DESIGNATED BY THE FATF AS BEING RELEVANT TO AML/CFT SUPERVISION (R. 26)

Basel Core Principle	Element of Supervision
Principle 1	*Responsibilities, objectives and powers:* An effective system of banking supervision has clear responsibilities and objectives for each authority involved in the supervision of banks and banking groups. A suitable legal framework for banking supervision is in place to provide each responsible authority with the necessary legal powers to authorise banks, conduct ongoing supervision, address compliance with laws and undertake timely corrective actions to address safety and soundness concerns.
Principle 2	*Independence, accountability, resourcing and legal protection for supervisors:* The supervisor possesses operational independence, transparent processes, sound governance, budgetary processes that do not undermine autonomy and adequate resources, and is accountable for the discharge of its duties and use of its resources. The legal framework for banking supervision includes legal protection for the supervisor.
Principle 3	*Cooperation and collaboration:* Laws, regulations or other arrangements provide a framework for cooperation and collaboration with relevant domestic authorities and foreign supervisors. These arrangements reflect the need to protect confidential information.
Principle 5	*Licensing criteria:* The licensing authority has the power to set criteria and reject applications for establishments that do not meet the criteria. At a minimum, the licensing process consists of an assessment of the ownership structure and governance (including the fitness and propriety of Board members and senior management) of the bank and its wider group, and its strategic and operating plan, internal controls, risk management and projected financial condition (including capital base). Where the proposed owner or parent organisation is a foreign bank, the prior consent of its home supervisor is obtained.

Basel Core Principle	Element of Supervision
Principle 6	*Transfer of significant ownership:* The supervisor has the power to review, reject and impose prudential conditions on any proposals to transfer significant ownership or controlling interests held directly or indirectly in existing banks to other parties.
Principle 7	*Major acquisitions:* The supervisor has the power to approve or reject (or recommend to the responsible authority the approval or rejection of), and impose prudential conditions on, major acquisitions or investments by a bank, against prescribed criteria, including the establishment of cross-border operations, and to determine that corporate affiliations or structures do not expose the bank to undue risks or hinder effective supervision.
Principle 8	*Supervisory approach:* An effective system of banking supervision requires the supervisor to develop and maintain a forward-looking assessment of the risk profile of individual banks and banking groups, proportionate to their systemic importance; identify, assess and address risks emanating from banks and the banking system as a whole; have a framework in place for early intervention; and have plans in place, in partnership with other relevant authorities, to take action to resolve banks in an orderly manner if they become non-viable.
Principle 9	*Supervisory techniques and tools:* The supervisor uses an appropriate range of techniques and tools to implement the supervisory approach and deploys supervisory resources on a proportionate basis, taking into account the risk profile and systemic importance of banks.
Principle 11	*Corrective and sanctioning powers of supervisors:* The supervisor acts at an early stage to address unsafe and unsound practices or activities that could pose risks to banks or to the banking system. The supervisor has at its disposal an adequate range of supervisory tools to bring about timely corrective actions. This includes the ability to revoke the banking licence or to recommend its revocation.
Principle 12	*Consolidated supervision:* An essential element of banking supervision is that the supervisor supervises the banking group on a consolidated basis, adequately monitoring and, as appropriate, applying prudential standards to all aspects of the business conducted by the banking group worldwide.

Basel Core Principle	Element of Supervision
Principle 13	*Home-host relationships:* Home and host supervisors of cross-border banking groups share information and cooperate for effective supervision of the group and group entities, and effective handling of crisis situations. Supervisors require the local operations of foreign banks to be conducted to the same standards as those required of domestic banks.
Principle 14	*Corporate governance:* The supervisor determines that banks and banking groups have robust corporate governance policies and processes covering, for example, strategic direction, group and organisational structure, control environment, responsibilities of the banks' Boards and senior management, and compensation. These policies and processes are commensurate with the risk profile and systemic importance of the bank.
Principle 15	*Risk management process:* The supervisor determines that banks have a comprehensive risk management process (including effective Board and senior management oversight) to identify, measure, evaluate, monitor, report and control or mitigate all material risks on a timely basis and to assess the adequacy of their capital and liquidity in relation to their risk profile and market and macroeconomic conditions. This extends to development and review of contingency arrangements (including robust and credible recovery plans where warranted) that take into account the specific circumstances of the bank. The risk management process is commensurate with the risk profile and systemic importance of the bank.
Principle 26	*Internal control and audit:* The supervisor determines that banks have adequate internal control frameworks to establish and maintain a properly controlled operating environment for the conduct of their business taking into account their risk profile. These include clear arrangements for delegating authority and responsibility; separation of the functions that involve committing the bank, paying away its funds, and accounting for its assets and liabilities; reconciliation of these processes; safeguarding the bank's assets; and appropriate independent internal audit and compliance functions
Principle 29	*Abuse of financial services:* The supervisor determines that banks have adequate policies and processes, including strict customer due diligence rules to promote high ethical and professional standards in the financial sector and prevent the bank from being used, intentionally or unintentionally, for criminal activities.

FATF REPORT

Financial Flows from Human Trafficking

July 2018

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

The Asia/Pacific Group on Money Laundering is an inter-governmental organisation, consisting of 41 member jurisdictions, focused on ensuring that its members effectively implement the international standards against money laundering, terrorist financing and proliferation financing related to weapons of mass destruction.

UNODC	United Nations Office on Drugs and Crime

Executive Summary

1. In addition to its enormous human cost, human trafficking is estimated to be one of the most profitable proceeds generating crime in the world, with the International Labour Organisation estimating that forced labour generates USD 150.2 billion per year. While in the past, many aspects of the crime went 'unseen', there is now an increased understanding of the breadth and gravity of human trafficking, particularly with respect to domestic human trafficking and human trafficking for labour exploitation. Human trafficking is also one of the fastest growing forms of international crime. The increased displacement and vulnerability of people in, and around, conflict zones increases instances of human trafficking, including potential involvement by opportunistic terrorist organisations.

2. As we learn more about the way human traffickers operate and exploit vulnerable humans, it is clear that this phenomenon affects nearly every country in the world. The Financial Action Task Force (FATF) and the Asia/Pacific Group on Money Laundering (APG) jointly undertook this study to improve global understanding of the financial flows associated with the crime of human trafficking, both as a money laundering predicate and potential source of terrorist financing. This study updates the FATF's 2011 report. This study has brought granularity to indicators of suspected money laundering of the proceeds of human trafficking by separating human trafficking into three categories in line with the *Palermo Protocol:* human trafficking for forced labour, sexual exploitation or for the removal of organs.

3. The project team found that the proceeds from each of these types of exploitation are realised in a different manner, and required different laundering mechanisms. In addition, each of these three types of exploitation could be better understood and detected through the financial activities of the various actors and/or roles involved to conduct each of the three types of exploitation. Further segmentation based on roles and actors provided a second opportunity to develop a more detailed understanding of the offence. The report also provides a more precise set of global money laundering indicators for use by reporting entities, financial intelligence units and other national authorities.

4. This study also identifies the challenges national authorities frequently face in detecting, investigating and prosecuting money laundering and terrorist financing from human trafficking. The study identifies good practices, and in particular the two primary good practices, to mitigate some of these challenges:

- **Assess the diverse money laundering risks from human trafficking, share with stakeholders and ensure that they're understood**
- **Leverage expertise, capabilities and information through partnerships between the public sector, private sector, civil society and NPO communities.**

5. This study updates the FATF Global Network's understanding of the financial flows from human trafficking, and provides tangible indicators and best practices for national authorities to improve their effectiveness in combatting money laundering and terrorist financing from human trafficking (see Annex B). While our

understanding is improved, it is by no means complete. This study therefore concludes with practical next steps to develop further precision to the financial flows from human trafficking, both at the global level, and at the regional/national level.

Introduction

The previous report and this report

6. In July 2011, FATF published a report titled, *Money Laundering Risks Arising from Trafficking in Human Beings and Smuggling of Migrants*, which studied the nature and scale of the human trafficking and migrant smuggling problem by looking at: countries of origin, transit and destination, operational responsibilities, challenges, and identified trends, typologies and risk indicators.

7. Since the publication of the 2011 report, global awareness of human trafficking has increased and different countries and international organisations have worked to better understand and address human trafficking. Whilst progress has been made in understanding the scale of the problem, the FATF has not updated its research on financial flows related to human trafficking nor money laundering and terrorist financing associated to human trafficking. This study updates the FATF's knowledge on the topic.

Scope

8. This report aims to provide an updated and more precise understanding of the financial flows related to human trafficking, and the various components of human trafficking that this report will identify, building on the wide body of work which has been completed since the last FATF report on the topic. It is designed to be used by FATF members, national authorities, financial institutions, non-government organisations and any other individuals or bodies with an interest in tackling the financial flows related to human trafficking.

9. For the purposes of this report, human trafficking is defined with reference to the types of exploitation set out in in the *Palermo Protocol*.

Box 1. Human Trafficking Definition from the *Palermo Protocol*

The definition utilised for the term 'human trafficking' is the definition provided in the *The Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Women and Children*, supplementing the *United Nations Convention against Transnational Organised Crime*. This protocol entered into force on 25 December 2003 and 173 jurisdictions have ratified or acceded to it as of January 2018.

The Protocol defines human trafficking as:

"the recruitment, transportation, transfer, harbouring or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of sexual exploitation, forced labour or services, slavery or practices similar to slavery, servitude or the removal of organs".

Source: UN (2003)

10. The report deliberately does not cover migrant smuggling[1] (also known as people smuggling). This is because of the three fundamental differences between human trafficking and migrant smuggling:

- **Consent:** The smuggling of migrants - while often undertaken in dangerous or degrading conditions - involves migrants who have consented to their smuggling. Victims of human trafficking, on the other hand, have either never consented or, if they initially consented, that consent has been rendered meaningless by the coercive, deceptive or abusive actions of the traffickers.
- **Exploitation:** Smuggling ends with the arrival of the migrants at their destination, whereas trafficking involves the ongoing exploitation of the victims in some manner to generate illicit profits for the traffickers.
- **Trans-nationality:** Smuggling is always transnational, whereas trafficking need not be. Trafficking can occur regardless of whether victims are taken to another country or subjected to human trafficking in the same country where they reside, even if no movement has taken place.

11. As a result of these differences, the financial flows for human trafficking and migrant smuggling are different, and are best profiled independent of one another to differentiate the two and develop a view of each of the offences. Thus, this study updates the previous report's findings with respect to human trafficking; however, the previous report's findings on migrant smuggling stand.

Objectives and structure

12. The report is designed to provide practitioners with an updated view of the scope and scale of the human trafficking problem globally, and the estimated proceeds from this offence. In addition, this report provides updated, more granular indicators of financial transactions suspected of laundering the proceeds of human trafficking. The report identifies challenges and good practices in detecting, investigating and prosecuting money laundering from human trafficking. These objectives are delivered through three parts:

- **Part One**: Provides an overview of recent developments in the nature/scope of human trafficking, including the financial flows, proceeds derived from human trafficking and the potential of human trafficking to contribute to the financing of terrorist activity.
- **Part Two**: On the basis of case study and literature analysis, this section provides context to the laundering of the proceeds of human trafficking, and develops and delivers more precise money laundering indicators to aid in the detection of transactions which may be indicative of the laundering of the proceeds of human trafficking. To provide further granularity, the indicators

[1] The definition of "smuggling of migrants" for the purposes of this study is the one enunciated in Article 3 (a) of the Protocol against the smuggling of migrants by land, sea and air, which states: "Smuggling of migrants" shall mean the procurement, in order to obtain, directly or indirectly, a financial or other material benefit, of the illegal entry of a person into a State Party of which the person is not a national or a permanent resident.

are grouped by how the perpetrators benefit, the roles and/or actors required to commit the offence, and the types of the offence.

- **Part Three**: Highlights challenges in detecting, investigating and prosecuting human trafficking, and offers good practices in overcoming some of these challenges.

Methodology

13. The Financial Action Task Force (FATF) and the Asia Pacific Group on Money Laundering (APG) jointly oversaw the project, which was co-led by delegations from Canada, Indonesia and the United Kingdom. Delegations from Australia, Belgium, British West Indies, India, Italy, New Zealand, Norway, Portugal, Somalia, South Africa, Spain, Sweden, Russian Federation, Ukraine, and United States participated in the project. Also participating in the project team were: European Union Agency for Law Enforcement Cooperation (Europol), International Criminal Police Organization (Interpol), Inter Governmental Action Group against Money Laundering in West Africa (GIABA), Liechtenstein FIU, MONEYVAL, Organisation for Economic Co-operation and Development (OECD), the United Nations Office on Drugs and Crime (UNODC), the United Nations Counter-Terrorism Committee Executive Directorate (CTED) and the Egmont Group of FIUs.

14. The methodology consisted of a review and refinement of existing material on human trafficking. This comprised of:

- A literature review conducted by FATF TREIN to identify recent developments in the nature/scope of human trafficking, and the financial flows associated with human trafficking.
- A request to FATF members and associated delegations to provide relevant material to the project team. This included material on risk (e.g. risk indicators, strategic analysis of suspicious transaction reports or other data, relevant information from national risk assessments) and on actions taken to mitigate the risk (partnerships with the private sector, examples of particular law enforcement operations, and access to different data sets). The project team was particularly interested in the use of case studies that highlighted schemes or trends associated with human trafficking.
- Workshops co-chaired by the co-leads on the financial flows related to human trafficking hosted by the APG and FATF TREIN in the Republic of Korea and MENAFATF/ESAAMLG/GABAC/GIABA in Morocco. Thanks to the numerous cases furnished by the jurisdictions and the presentations made by their representatives in the workshop, the project team gathered substantive material for the purpose of this report. Many members of the project team also provided valuable additional contributions at these typologies meetings.
- Working with financial institutions and NGOs to develop a set of updated risk indicators associated with human trafficking. The work of Standard Chartered Bank, Citibank, Barclays Bank, the Bank of Montreal, HSBC, Western Union, Wolfsberg Group, Banks Alliance Against Human Trafficking (convened by the Thomson-Reuters Foundation), Liberty Asia, Stop the

Traffik, RUSI and the Global Initiative on Transnational Organized Crime helped the project team develop such a precise set of indicators.

Part One: Overview of the scale and scope of human trafficking

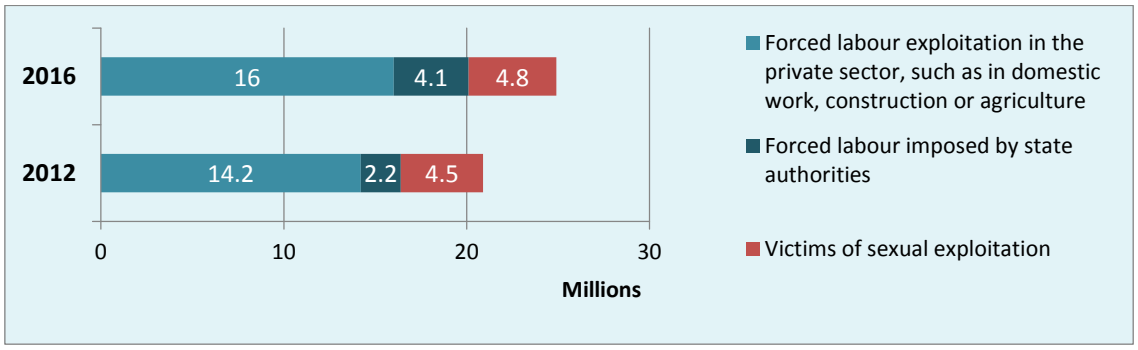
Global estimates

It is challenging to estimate the scale of human trafficking, largely due to the hidden nature of some types of the human trafficking crime and difficulties in identifying victims. There are, however, global estimates on various exploitation types of the internationally recognised definition of human trafficking, which, when aggregated, can provide an estimate of the scale and scope of human trafficking.

15. In September 2017, the International Labour Organisation (ILO) and Walk Free Foundation, in partnership with the International Organisation for Migration, published *The Global Estimates of Modern Slavery*. The report indicates that an estimated **24.9 million**[2] people were in forced labour and sexual exploitation at any moment in time in 2016. Out of the total estimate of 24.9 million:

- 16 million people (64%) were estimated to be in forced labour exploitation in the private sector such as in domestic work, construction or agriculture (compared with 14.2 million in the 2012 ILO estimate)
- 4.1 million people (17%) were estimated to be in forced labour imposed by state authorities[3] (compared with 2.2 million in the 2012 ILO estimate)
- 4.8 million people (19%) were estimated to be subject to sexual exploitation[4] (compared with 4.5 million in the 2012 ILO estimate).

Figure 1. Number of people victim of forced labour or sexual exploitation (2012-2016)



Source: ILO & Walk Free Foundation, 2017 and ILO, 2012.

[2] India has expressed concerns with the methodology used to determine, and the accuracy of, the estimates presented in the ILO/IOM/Walk Free Foundation Global Estimates of Modern Slavery report.

[3] State-imposed forced labour includes forced labour exacted by the military, compulsory participation in public works, and forced prison labour.

[4] This includes 3.8 million adults in forced sexual exploitation and 1.0 million children in commercial sexual exploitation. Where the victim is a child, there is no requirement of any of the means of the trafficking in persons' definition to occur for the child being exploited.

16. There is no such estimate for human trafficking for the removal of organs. In 2007, the World Health Organisation estimated that between 5 and 10 percent of all organ transplants conducted worldwide were conducted 'illegally', which could comprise human trafficking for the purpose of removal of organs, as well as other crimes.[5] Accordingly, there is no such estimate for the number of people affected by human trafficking for the purpose of the removal of organs.

Profile of victims

17. The UNODC's 2016 *Global Report on Trafficking in Persons* study found that in 2014, 28% of detected victims in human trafficking were children and 71% of the detected victims were female. The proportion of men and boys among the detected victims has, however, grown from 16% in 2004 to 29% in 2014. The majority of the male victims (85.7%) were trafficked for forced labour exploitation. For female victims, 72% were trafficked for the purpose of sexual exploitation.

Geographical routes and trafficking flows

18. The geographical human trafficking routes are complex. The previous FATF report considered these routes and found that it affects virtually all countries around the globe. The report considered countries of origin, transit countries and countries of destination.

19. However, the collective understanding of human trafficking has evolved since the time of the previous FATF report. The UNODC *Global Report on Trafficking in Persons 2016* identified more than 500 different trafficking flows, including both domestic and transnational human trafficking. Accordingly, this report takes a modernised approach and considers domestic, regional and trans-regional trafficking flows.

Domestic human trafficking flows

20. Domestic trafficking involves the movement of victims within a country between areas, or within their local area. Where there is movement of victims domestically, this commonly occurs from rural zones to cities or tourist centres, or from villages to industrial or economic hubs[6]

21. Studies show that the majority of forced labourers in economic activities, and almost all those in state-imposed forced labour, have not moved away from their home area. The UNODC found that 43% of victims in the period 2012-2014 were trafficked domestically.[7] The *2017 Global Estimates of Modern Slavery* found that only one in four victims of forced labour were exploited outside their country of residence.[8]

[5] Shimazono, Y., 2007.

[6] UNODC, 2016: p. 40.

[7] *Ibid*.

[8] ILO & Walk Free Foundation, 2017: p.29.

Trafficking within regions

22. Transnational trafficking flows are increasingly complex – victims are exploited within and between regions. While many countries are source and destination countries, most countries tend to be either predominantly a source or predominantly a destination of trafficking victims.[9] The UNODC found most victims detected were trafficked within the same geographical region.[10] For the majority of detected victims of transnational trafficking identified in the UNODC's study, the origin country was in the same geographical region as the destination, which includes domestic trafficking.[11]

23. Common regional trafficking flows include victims trafficked from South-Eastern Europe to Western Europe, from the Andean countries to the Southern Cone in South America, from East Asia to the Pacific, or victims trafficked across a single international border into neighbouring countries.[12]

Trans-regional trafficking

24. In trans-regional trafficking, countries with developed economies remain key destinations, while victims tend to originate from countries with less developed economies. The UNODC found that the Middle East, as well as most countries in Western and Southern Europe and North America, reported being destinations for trans-regional and long-distance trafficking.[13] In particular, they found that the wealthier the country of destination, the greater the number of detected victims from outside the immediate region.

25. In Western and Southern Europe, detected victims held 137 different citizenships, particularly from Central and South-Eastern Europe (47%), Sub-Saharan Africa (16%) and East Asia (7%).[14] Similarly, North American countries detected victims from more than 90 countries of origin. The most prominent trans-regional trafficking flow in the study was from East Asia, as 16% of the detected victims in North America are citizens of East-Asian countries.[15] Trafficking victims from countries in Sub-Saharan Africa and East Asia are trafficked to the widest range of destinations. The UNODC found that 69 countries reported to have detected victims from Sub-Saharan Africa between 2012 and 2014.[16]

[11] *Ibid*.

[12] *Ibid*.

[13] *Ibid*: p. 42

[14] *Ibid*: p. 43

[15] *Ibid*.

[16] *Ibid*: p. 5

Human trafficking, irregular migration and conflict

26. The number of persons vulnerable to trafficking in recent years has increased due to an unprecedented rise in irregular migration[17] and the number of displaced persons, often caused by armed conflict or terrorist organisations controlling territory, who are predominantly fleeing the events in an outward direction from the location of the conflict zone. Trafficking flows related to armed conflict can include human trafficking within and into conflict-affected areas for the purposes of sexual exploitation and forced labour,[18] as well as transnational trafficking flows linked to migrant smuggling.[19]

27. There is evidence that criminal networks involved in trafficking in human beings target the most vulnerable, in particular women and children.[20] On irregular migration routes around the globe, migrants who have started out their journeys by willingly placing themselves in the hands of smugglers have become victims of human trafficking along the way.[21] A report by the International Migration Organisation and UNICEF found that children and youth along irregular migration routes are especially vulnerable to trafficking because of their age and status.[22]

28. Once these migrants reach their destination, they remain vulnerable to human trafficking and other forms of exploitation.[23] Migrant workers, in particular irregular migrants, are vulnerable to exploitation due to their economic conditions, language barriers and challenges of social integration.[24]

29. Irregular migration is a macro factor that has changed human trafficking globally. These links between irregular migration and human trafficking are increasing further, particularly with respect to cases of labour exploitation in the countries of destination of the migrants.[25] Moreover, terrorist groups will continue to use human trafficking within and into conflict-affected areas to generate revenue.

Change in the scale and scope of human trafficking

30. The methodologies for determining human trafficking estimates have changed over time, making these figures unsuitable for a direct comparison. They do, however, demonstrate that with our improved understanding of the issue, the estimated scale has increased.

[17] For the purposes of this study, "irregular migration" is meant to denote the movement of people precipitated by events or conditions such as war or drought.

[18] UN University (2016) p. 6

[19] UNODC, 2016: p. 57

[20] European Commission (2016) p. 9

[21] IOM (2017) p. 3

[22] IOM & UNICEF (2017) p. 21

[23] IOM (2017) p.3

[24] ILO & Walk Free Foundation (2017) p. 30

[25] Europol & Interpol (2016) p. 11

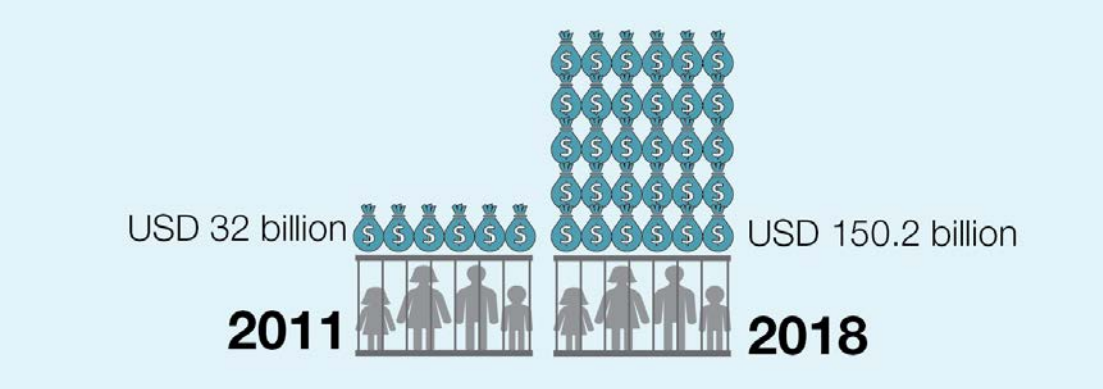
It is unknown how much of this apparent increase is due to a worsening of the issue of human trafficking, or if it is due to an improved awareness in the issue.

31. Since the publication of the previous FATF report, the global community has developed a more precise understanding of human trafficking flows. Demonstrated by findings such as UNODC's identification of 500 different trafficking flows between 2012 and 2014, as well as more information on the profiles of victims and offenders and on the forms of human trafficking. In addition, the international community has further defined and demonstrated the significance of trafficking within jurisdictional borders, and differentiated domestic, regional inter- and intra-trans-regional trafficking.

32. As a result of this apparent increase in the occurrence of human trafficking, the global community's more detailed understanding of the crime, and the macro factor of irregular migration, the global AML/CFT community is, accordingly, responding by updating its understanding of the financial flows from human trafficking, and identifying more granular ways to identify the laundering of these proceeds.

Proceeds derived from human trafficking

Figure 2. Estimated proceeds from Human trafficking



Source: ILO (2014)

33. As a result of the diversity of trafficking and exploitative crimes that produce illicit profits, it is difficult to establish an accurate aggregate figure of the total illicit proceeds from human trafficking. With certain caveats,[26] the ILO estimated that the total illicit proceeds obtained from the use of forced labour, which is inclusive of sexual exploitation, amount to USD 150.2 billion per year based on its 2012 forced labour estimates, published in 2014. This number can be broken down as follows:

- Forced sexual exploitation: USD 99 billion

[26] ILO (2014) p. 13. The estimate is the aggregation of regional profit figures for three forms of forced labour: forced labour exploitation outside of domestic work, forced domestic work and forced sexual exploitation. The estimate does not take into account the profits generated by the 2012 ILO estimate of 2.2 million victims of forced labour imposed by state authorities, nor does it account for the proceeds generated from human trafficking for the purposes of the removal of organs.

- Forced labour exploitation: USD 51.2 billion, of which USD 43.40 billion was generated by non-domestic labour, and USD 7.9 billion by domestic work

34. ILO's estimates of the global average profit per victim of human trafficking varied significantly based on the type of exploitation, ranging from USD 21 800 annually for sexual exploitation and USD 2 300 annually for domestic work. In 2005, the ILO estimated that the annual profits for each forced labourer were USD 13 000 on average. The 2014 figures do not set out a similar average estimate for all forced labourers.

35. According to the ILO, the annual total profits are highest in Asia (USD 51.8 billion) and developed economies (USD 46.9 billion). This is due to the high number of victims in Asia, and the high profit per victim in developed economies.

36. There is no accepted estimated figure for the amount of proceeds from human trafficking for the removal of organs. Figures for the illicit organ trafficking market combine human trafficking with other crimes. These figures place the financial scale at USD 1.2 billion or less, with Global Financial Integrity's[27] estimate of USD 600 million – 1.2 billion being the highest. While these are staggering numbers, even the highest estimate inclusive of other organ-related crimes would represents less than 1% of the combined figure for the other two exploitation groupings. Given that there is no generally accepted estimate, no attribution for the proceeds of human trafficking for the removal of organs will be used for this report; however, even an accepted estimate would not be anticipated to change the final figure in a material way. However, the lack of such an estimate represents a gap in the understanding of the proceeds from human trafficking.

37. The preceding proceeds figures demonstrate that the estimated proceeds from human trafficking in aggregation is approximately USD 150.2 billion, versus the USD 32 billion figure provided in the previous FATF report, which makes it the one of the most significant generators of criminal proceeds in the world. The United Nation's completed *Global Initiative to Fight Human Trafficking*[28] project also indicated that human trafficking is the fastest growing form of international crime.

Terrorist financing from the proceeds of crime derived from human trafficking

38. FATF reports, UN Security Council Resolutions[29] and Reports of the Secretary-General on the threat posed by ISIL (Da'esh) to International Peace and Security,[30] as well as jurisdictions and news media listed below, have highlighted the link between human trafficking and terrorist organisations. Trafficking flows related

[27] Haken, J., 2011.

[28] United Nations Global Initiative to Fight Human Trafficking is an initiative comprised of the International Labour Organisation, the Office of the United Nations High Commissioner for Human Rights, the United Nations Children's Fund, the United Nations Office on Drugs and Crime, the International Organisation for Migration and the Organisation for Security and Cooperation in Europe.

[29] UNSCRs 2331 (2016) and 2388 (2017)

[30] S/2016/92, S/2016/501, S/2017/97, S/2017/467 and S/2018/80

to armed conflict can include human trafficking within and into conflict-affected areas for the purposes of domestic servitude, sexual slavery, forced recruitment, forced labour and forced marriage.

39. These reports also indicate that terrorist organisations who have controlled, or partially controlled territory, have used human trafficking as a way to raise funds and support to their organisations and activities:

- **ISIL:** The UN reported that Yazidi women were being bought and sold by ISIL fighters in 'slave auctions', including via the internet.[31] The 2015 FATF report on ISIL financing noted that the prices paid for ISIL slaves were low (approximately USD 13 each), and have been reported to be transferred between ISIL fighters as commodities. The UN Human Rights Council has stated that some Yazidi women and girls were aware of the amounts paid for them, which ranged between USD 200 and USD 1 500, depending on marital status, age, number of children, and perceived beauty. There were also media reports of payments being made to intermediaries to free Yazidi women from captivity.[32] The UN reports that in January 2016, ISIL received USD 850 000 in payments from Yazidi families for the return of 200 kidnapping victims, and that estimates suggested that in 2014 ISIL earned between USD 35 million to USD 45 million in payments from the Yazidi community.[33] The US State Department has found that in Syria, ISIL used displaced children as forced labour in organised begging rings.[34]
- **Boko Haram:** The UN has noted that Boko Haram uses children as beggars to raise funds.[35] It found that Boko Haram has kidnapped thousands of women and girls to date and some of these women have been subjected to domestic servitude, forced labour, and sex slavery through forced marriages to its militants.
- **Al-Shabaab:** Based on interviews with victims, the Somali Financial Intelligence Unit (FIU) suspects that Al-Shabaab members have been involved in the trafficking of Somalis for profit. The accounts of two victims highlighted that this has occurred both from rural to urban areas within Somalia, and from Somalia to other countries. Typically, women have been promised work opportunities but their salaries have been paid directly to the Al-Shabaab. It is not clear if this has occurred in an organised fashion to raise funds for the group or if the trafficking is for the personal benefit of individual terrorists.

40. There have also been many accounts of numerous terrorist organisations profiting from the exploitation of vulnerable persons in their areas of control, including by forcing young men and boys to fight for the terrorist organisation.

[31] United Nations Human Rights Council, 2016.

[32] White, L., 2015 and Paraszczuk, J., 2015.

[33] United Nations University, 2016.

[34] US Department of State, 2015.

[35] UN University, 2016: p. 8

Fewer reports exist of terrorist organisations profiting off of the facilitation or allowance of human trafficking networks within their territory; however, such a link may be present given the well-reported proclivity of territory-controlling terrorist organisations to tax all activity occurring within their borders.

41. While there are indications that human trafficking may be a source of income for terrorist groups, particularly those that control territory, this appears not to be a key source of revenue for terrorist groups, especially considering the erosion of the territory held by terrorist groups. However, human trafficking is likely used as a tool to exploit and control vulnerable local populations, as a perceived benefit for fighters in conflict, and as an occasion to secure ransom payments. The involvement of terrorists in human trafficking is likely opportunistic and could be for the benefit of individual terrorists or for the terrorist organisation at large.

Links between human trafficking, migrant smuggling and kidnap for ransom

42. Terrorist organisations influence trafficking flows by engaging in armed conflict which causes mass migration and increases the number of displaced persons, thereby increasing the number of persons vulnerable to human trafficking. These individuals may be more susceptible to seeking the services of migrant smuggling networks, or be vulnerable to exploitation through human trafficking networks, which can utilise similar infrastructure or channels.

43. Several jurisdictions have noted that migrant smuggling due to conflict may turn into a human trafficking scenario, particularly if the victim is kept in debt-bondage until the fees for migrant smuggling operation are paid. Similarly, migrant smuggling or human trafficking scenarios can turn into a kidnap for ransom scenario if ransom is demanded from the family members to free the individual. It is not always clear if these payments are for the benefit of terrorist organisations that have territorial control. In one situation, a family member was asked to use a certain money service business provider to make the ransom payment.[36] This suggests that terrorist groups have developed ways to hide and transfer ransom payments made from other countries.

AML/CFT risk assessments

44. Of the 28 national anti-money laundering/countering the financing of terrorism (AML/CFT) risk assessments considered for this report[37], 14 specifically mention human trafficking as a money laundering risk, while none identified human trafficking as a terrorist financing risk.[38] Ten of these 14 countries rated their risk

[36] This information was provided a Somali official. The information was based on personal experience rather than on LEA investigations.

[37] Armenia, Australia, Austria, Bhutan, Canada, Cook Islands, Denmark, Fiji, Ghana, Ireland, Isle of Man, Jersey, Japan, Lithuania, New Zealand, Palau, Panama, Philippines, Portugal, Serbia, Singapore, Sri Lanka, Sweden, Switzerland, Tunisia, Ukraine, United Kingdom and the United States.

[38] It is important to note that there is no standard form for compliance with FATF Recommendation 1: assessing risks and applying a risk-based approach, however, many jurisdictions consider the proceeds of

for money laundering from human trafficking: Four rated it as high, three as medium and three as low. Some of the countries that did not mention human trafficking as a money laundering risk as part of their national AML/CFT risk assessment did have other publications detailing money laundering risks related to human trafficking.

45. National AML/CFT risk assessments that mentioned human trafficking appeared to provide some understanding of trends pertaining to the predicate crime and its links to organised crime; however, they provided little information on the financial flows or the laundering of the proceeds of human trafficking. In addition, many of the national AML/CFT risk assessments acknowledged that there are different money laundering risks for human trafficking for the purpose the exploitation of the prostitution of others or other forms of sexual exploitation (HTSE) or for the purpose of forced labour or services, slavery or practices similar to slavery, and servitude (HTFL), but also recognised that there were gaps in their knowledge related to the latter.

crime derived from specific predicate offences most prevalent in their jurisdiction as a means of understanding their money laundering risk.

Part Two: Analysis of money laundering from human trafficking case studies[39][40]

46. As a predicate crime to money laundering, the financial flows from human trafficking can differ significantly from one case to another. Some examples of this differentiation are in the direction of fund movement, the amount provided to various individuals along a human trafficking crime organisation, and the methods used to transact the funds. This differentiation is due to two primary factors:

- Diverse organisational and financial infrastructure are required depending on recruitment and transportation mechanisms utilised by the crime group; and,
- The exploitive purpose for which the human trafficking is conducted yields different types of material benefit to perpetrators.

47. Different acts can or may take place to start the human trafficking offence. These acts can range from recruitment to the transport, transfer, harbouring or the receipt of persons. Each of these steps can take place across jurisdictional boundaries. They may begin in a lower-income source country and continue in one or more transit countries, and finally end in a higher income country, or, the preliminary acts may occur entirely within a singular jurisdiction. Depending on the exact mechanism of the acts to initiate the human trafficking activity, and the organisational structure of the criminal organisation, the financial flows for the group may take different forms as the offence is carried out. This report does not classify the case studies by source jurisdictions, transit jurisdictions, destination jurisdictions and singular jurisdiction human trafficking, as the bulk of the associated proceeds would be in the destination jurisdiction where the exploitation of the individual reaps the proceeds of the crime.

48. In addition, perpetrators involved in the various types of human trafficking can benefit from it in a variety of ways. This could range from payments to perpetrators in cash to the enrichment of a corporate entity. This part of the study groups the offence into the following three categories and examines case studies based on these groupings. It also allowed for the creation of indicators of money laundering, some of which are known general money laundering indicators, but also others unique to the laundering of the proceeds of the specific type of human trafficking, which have been listed in Annex B:

- Human trafficking for the purpose the exploitation of the prostitution of others or other forms of sexual exploitation (HTSE)

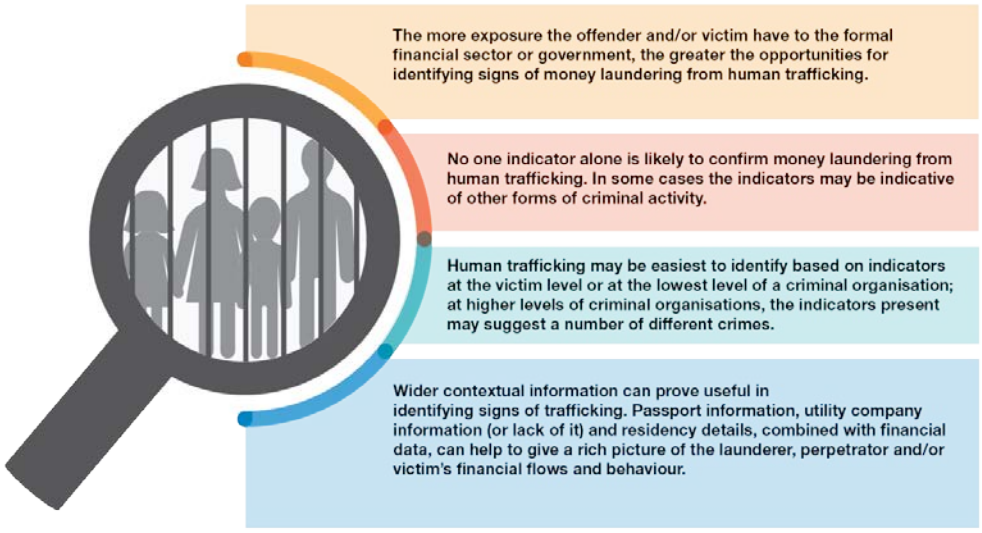
[39] This section of the report provides a selection of case studies, and associated analysis, provided by national authorities, reporting entities, and other entities involved in identifying or combatting the laundering the proceeds of human trafficking. Delegations should carefully consider this section, and also Annex A, which contains relevant case studies not found in the body of this report.

[40] Some of the indicators related to these cases are general money laundering indicators, while others are specific to human trafficking. The indicators are aggregated and segmented by whether they are a general indicator, or an indicator related to HTSE, HTFL or HTRO in Annex B.

- Human Trafficking for the purpose of forced labour or services, slavery or practices similar to slavery, and servitude (HTFL)
- Human Trafficking for the purpose of removal of organs (HTRO)

49. These categories are further segmented, to provide more granularity of the findings based on the roles and/or actors required to commit the offence, and the types of the offence. This will provide a more accurate means of detecting suspicious financial transactions.

Figure 3. Key issues to consider in design efforts to detect financial flows related to human trafficking



50. Additionally, the case studies and indicators highlight four issues which are useful to consider in designing efforts to detect financial flows related to human trafficking:

- **The more exposure the offender and/or victim have to the formal financial sector or government, the greater the opportunities for identifying signs of money laundering from human trafficking**. For example, human trafficking which involves labour via an employment agency or some form of registered business will require some degree of formal interaction with financial institutions, or potentially a government agency. Examples of such formal interaction are opening a bank account, registering for tax purposes or the payment of wages into the victim's account. Conversely, where a victim has no interaction with registered businesses, such as in the case of domestic servitude, it can be much harder to identify the signs of trafficking. In these cases, the physical appearance, such as dress not commensurate with gainful employment, or behaviour, such as deferring to a third party with no apparent relationship for no apparent reason, of the victim may be a greater clue to the likelihood of trafficking.
- **No one indicator alone is likely to confirm money laundering from human trafficking.** In some cases the indicators may be indicative of other forms of criminal activity. But by using a combination of broad primary

indicators, which raise the possibility of money laundering, followed by more specific secondary indicators that may signify money laundering from human trafficking, reporting entities responsible for detecting and combatting this activity can parse out laundering linked to human trafficking and reduce the number of false positives they receive.

- **Wider contextual information can prove useful in identifying signs of trafficking.** Financial institutions may hold passport information, utility company information (or lack of it) and residency details. Combined with financial data, they help to give a rich picture of the launderer, perpetrator and/or victim's financial flows and behaviour.
- **Human trafficking may be easiest to identify based on indicators at the victim level or at the lowest level of a criminal organisation; at higher levels of criminal organisations, the indicators present may suggest a number of different crimes**. This report therefore highlights case studies which demonstrate the financial transactions of victims, and persons at the lower levels of the criminal organisation. These can then be used to 'follow-the-money' to the greater criminal enterprise.

Human trafficking for sexual exploitation

51. This section profiles the two actors involved in human trafficking for sexual exploitation (HTSE) to identify transactions related to this offence:

- Financial transactions of victims; and,
- Financial transactions of perpetrator/launderer.

52. In general, the victims of human trafficking were identified through continued and excessive accommodation, sustenance and movement of types of expenses (e.g., airline tickets, taxi fares, car hire, train tickets). Incurring a number of these expenses is completely normal in circumstances such as vacationing or traveling for business; however, excessive continued incurrence of these expenses may demonstrate that an individual is a victim of HTSE. As demonstrated in the case studies, the identification of victims' transactions has helped reporting entities identify the individuals laundering the proceeds of this crime given their financial interactions with the suspected victim

Identifying suspicious transactions and money laundering from HTSE victim transactions

53. Victims are generally exploited through a variety of means over an extended period of time (i.e., rarely is a victim subject to one instance of sexual exploitation). Therefore, offenders are required to meet the essential needs of the victims throughout the duration of their, generally long-term, exploitation. This care includes basic housing, personal products and nourishment, as well as logistical items so that they may engage in the sexual exploitation such as transportation around a city or larger area, lodging expenses (a flat or hotel) and maintenance of a location for the purpose of commercial sex. The financial transactions for these

expenditures may be conducted directly by the victim or by the perpetrator or launderer involved in the human trafficking offence.

54. Compared to identifying money laundering from human trafficking, which intentionally appears as normal transactions, it is easier to profile a victim's expenses/financial flows. Profiling these expenses is a good first step in identifying the proceeds from HTSE by first identifying the victims of the crime. Further examining the financial transactions of the victim can help identify the individuals laundering the proceeds from the HTSE offence. These transactions can highlight a pattern of activity that can lead to the larger sexual exploitation trafficking network. The following case studies identify indicators of victim-related financial transactions:

Case Study 1.

A financial institution submitted multiple Suspicious Transaction Reports identifying a group of financially connected individuals suspected to be engaging in and/or deriving profit from HTSE. The suspicious transaction reports identified the account of Victim A, who was using excessive taxi and rider sharing services after midnight in various cities across the country where they appeared to be staying only for a few days or weeks at a time. Victim A appeared to not be paying for any accommodations in these various cities, but did incur room service and eatery bills at various motels/hotels. Victim A was also frequenting pharmacies and fast food eateries daily or multiple times a day in a manner inconsistent with normal account activity. Lastly, Victim A's telephone number was connected to multiple advertisements and Backpage postings for escort services. Further review of account activity of Victim A indicates that she was receiving email money transfers (a service in Canada which allows any holder of a bank account to automatically deposit funds into another bank account via email) from email addresses with all male names and that she was repeatedly sending funds to Subject A.

Subject A's accounts were mainly funded by third party cash deposits and frequent email money transfers from various individuals that are deemed to be excessive and do not appear to be in line with the subject's employment income and level of wealth. Subject A appears to use multiple contact email addresses and names. Funds were often depleted rapidly via cash withdrawals, credit card payments, transfers to other individuals and outgoing email money transfers without apparent economic purpose. Further review of Subject A's accounts revealed that individuals transacting with the subject reside in various geographic locations across Canada.

Subject A also received an out-of-province incoming email money transfer from Subject B. Source of funds for this specific transfer was from an email money transfer immediately remitted by another individual and Subject B appears to have used his account to facilitate the pass-through activity. The financial institution also found that Subject B's account activities demonstrate frequent account transfers between the client's bank accounts and credit card, frequent purchases at online gaming sites, Bitcoin exchanges,

payment processors, sports collectable stores, and email money transfers with various individuals with unknown source and purpose.

Subjects A and B are currently under police investigation for their HTSE of Victim A. This investigation was started based on the suspicious transaction reporting from the Canadian financial institution.

Source: Canada

55. The preceding case demonstrated the consistent pattern of activity exhibited by the victims of HTSE, in addition to a newer developing trend of payment to the perpetrator or launderer via new payment technology such as email money transfers and virtual currency. The following case displays such typical victim transactions, as well as a number of behavioural-type indicators that were used by a financial institution to identify members in a criminal organisation conducting HTSE:

Case Study 2.

A local law enforcement agency provided a bank with information about an alleged organised crime network comprising at least six individuals involved in trafficking women from Eastern Europe for the purposes of sexual exploitation in both the UK and the rest of Europe. The group had been observed spending significant funds on adult websites named by UK local law enforcement as used to advertise trafficked women.

In the initial review, the Bank identified that one of the individuals had previously been a customer who had their relationship exited for financial crime concerns and another was an existing retail customer who held an active account. The previous customer had an internal alert raised by branch staff due to staff witnessing in-branch, coercive behaviours. They noted that a customer was regularly visiting to pay in cash, using the branch automated machines and avoiding the counter, even when there were no queues. The customer was accompanied by the same male on a number of visits during the same week. That male appeared to be exerting control over them and was checking deposits and statements; seemingly controlling her actions. The existing customer was also reviewed and it was apparent that this account was being used to pay for a variety of low cost/high volume transportation and logistics-related bookings across Europe. Direct reviews of transactions also highlighted additional indicators, including: a common telephone number to two other customers; regular low level expenditure at local chemist/pharmacy and supermarket; and no evidence of full-time employment despite significant turnover in the account.

The Bank filed two further suspicious activity reports that linked six customers and their transactional activity to unusual behaviour exhibiting indicators of laundering the proceeds of human trafficking for the purpose of sexual exploitation. This extended the law enforcement intelligence picture for their ongoing investigation and also identified previously unknown subjects. Local law enforcement developed the case and arrested members of

the organised crime network who were subsequently convicted of human trafficking, modern slavery and prostitution offences.

Source: Toolkit for Tackling Human Trafficking – Thomson Reuters Foundation and European Banks Alliance

56. Lastly, the following case demonstrates the prosecution of a major facilitator of HTSE activities. This case demonstrates both the financial flows related to the commission of the HTSE offence, and the subsequent money laundering methodologies used:

Case Study 3.

On April 9, 2018 the US Department of Justice seized Backpage.com, the Internet's leading forum for prostitution ads and a place where sex traffickers frequently advertised children and adults. Backpage earned hundreds of millions of dollars from facilitating prostitution and sex trafficking and served as a platform for human traffickers. In addition, seven Backpage executives were indicted for their role in a conspiracy to facilitate prostitution and were charged with 40 counts of money laundering in various forms.

On April 12, 2018, the Justice Department announced that Backpage's co-founder and CEO, Carl Ferrer, 57, of Frisco, Texas, pleaded guilty to conspiracy to facilitate prostitution using a facility in interstate or foreign commerce and to engage in money laundering. Additionally, several Backpage-related corporate entities, including Backpage.com LLC, have entered guilty pleas to conspiracy to engage in money laundering.

In his plea agreement, Ferrer admitted that he conspired with other Backpage principals to engage in various money laundering offenses. Specifically, Ferrer admitted that since 2004, Backpage has earned hundreds of millions of dollars in revenue from publishing "escort" and "adult" ads. Over time, many banks, credit card companies, and other financial institutions refused to do business with Backpage due to the illegal nature of its business. In response, Ferrer admitted that he worked with his co-conspirators to find ways to fool credit card companies into believing that Backpage-associated charges were being incurred on different websites, to route Backpage-related payments and proceeds through bank accounts held in the name of seemingly unconnected entities, and to use cryptocurrency-processing companies for similar purposes.

Backpage advertisers used the proceeds of crime (money earned from pimping/prostitution) to purchase ads on Backpage; additionally, the fees which Backpage collected for posting prostitutions ads also constituted the proceeds of unlawful activity. The investigation revealed that laundering of criminal proceeds was conducted through numerous US-based financial institutions and banks in ten foreign countries. The indictment unsealed by the US District Court for the District of Arizona further alleged that Backpage pursued an array of sophisticated money laundering strategies, including the

following:

a) Instructing advertisers to send checks and money orders to anonymous post office boxes, depositing those payments in bank accounts held in the name of entities with no apparent connection to Backpage, and then giving the advertisers a corresponding "credit" on Backpage to purchase new advertisements;

b) Wiring the proceeds of Backpage's business to bank accounts in foreign countries and then redistributing the funds to Backpage executives (as compensation) or redepositing the funds in bank accounts held in the United States (to conceal the nature of those funds and promote Backpage's ongoing operations); and

c) Converting advertisers' payments, and the proceeds of Backpage's business, into and out of cryptocurrency.

Source: United States

Identifying money laundering and STRs from HTSE perpetrator or launderer transactions

57. HTSE can be a major source of income for individual criminals and organised crime networks operating at local, national and international levels. Given the profitability of the offence, individuals perpetrating the HTSE crime, as well as laundering the proceeds of that crime, may be identifiable by observing financial transactions and information obtained by financial institutions in the course of conducting their customer due diligence and the behaviour of offenders. Many of the typologies and indicators in this subgrouping are common to laundering the proceeds of other cash generating crimes and are generally not unique to laundering the proceeds of HTSE as observed in the following cases. For example, hawala-type systems are used to transfer the proceeds of HTSE to another country.

Case Study 4.

Between 2007 and 2010, several Thai women were sexually exploited in Thai massage parlours in Belgium. These women were lured to Belgium under false pretences of a better life in Europe. Upon arrival, they were forced to work in massage parlours where they had to perform sexual services for payment. Victims were debt-bonded to their traffickers for EUR 10 000 - 15 000 and forced to hand over their earnings to repay this debt and to pay for accommodation. Victims were also forced to hand over their passports until they had paid off the whole debt. In some instances, victims' families in Thailand were threatened to ensure co-operation. Ten defendants were convicted of human smuggling, human trafficking for the purpose of sexual exploitation, criminal organisation, and facilitation of illegal immigration.

A human trafficking for the purpose of sexual exploitation case was opened on the basis of checks and searches in massage parlours by the inspection services. In a Mechelen-based massage parlour, they discovered complete

accounts showing amounts and names. The police noted that the same company managed different massage parlours. Through the analysis of the phone contacts, the main defendant (Defendant 1) and his travel agency were identified. The police also checked advertisements in newspapers and various websites for further information on massage parlours engaging in human trafficking for the purposes of sexual exploitation. These massage parlours were put under surveillance.

The financial investigation revealed three types of transactions:

- money transfers to different recipients in Thailand through the defendants;
- cash payments; and
- the purchase of a house in Thailand.

Various suspicious transfers of funds totalling EUR 48 838 were made through a company to different people in Thailand. Funds totalling approximately EUR 50 000 were also regularly sent through an MS. Defendant 1's wife wired funds totalling EUR 20 598 to beneficiaries in Thailand. The economic justifications for the transfer of funds were not known however, investigators suspected funds were proceeds from human trafficking and/or exploitation of prostitution. The case was prosecuted and the court concluded that the defendants' cash payments and large value transfer of funds to Thailand compared to their income was inconsistent with the commercial turnover usual for a business of that size or type.

Source: Belgium; MYRIA: Trafficking and Smuggling of Human Beings Annual Report 2016

Case Study 5.

A recent major ongoing investigation uncovered tens of millions of dollars in illicit proceeds derived from sex trafficking which were laundered and smuggled by a criminal organisation. Twenty-one members of an international sex trafficking ring were identified as having various roles in the organisation including traffickers, house bosses, money launderers, and facilitators. This sophisticated criminal organisation, which operated for approximately eight years, facilitated the transportation of women from Southeast Asia to cities across the United States and forced them into prostitution. During the coordinated takedown, law enforcement seized hundreds of thousands of dollars in cash, cell phones, and multiple weapons.

This criminal organisation engaged in widespread visa fraud to facilitate the international travel by the victims. Human traffickers assisted the victims in obtaining fraudulent visas and travel documents by funding nominee bank accounts, creating fictitious backgrounds and occupations, and instructing the victims to enter into fraudulent marriages to increase the likelihood that their visa applications would be approved.

Members of the criminal organisation held more than one role, over time or

simultaneously, in order to maximise profits. Some individuals held the bondage debt of a victim until it was fully repaid or, in some instances, a victim's bondage debt was sold from one human trafficker to another. The "house bosses" owned the commercial sex houses and ran the day-to-day operations. The money launderers supported the continued operation of the criminal enterprise by making bank accounts available, coordinating deposits and withdrawals of cash, and moving money to and from Southeast Asia. The organisation's facilitators assisted with the logistics of renting the commercial sex houses, facilitating the transport of victims, assisting with money laundering, and entering into fraudulent marriages with members of the criminal organisation so those criminals could gain immigration status in the United States.

The criminal organisation dealt primarily in cash and engaged in rampant and sophisticated money laundering in order to promote, distribute, and conceal illegal profits. The organisation used funnel accounts to launder and route cash from cities across the United States to the money launderers on the West Coast. Upon entry to the United States, trafficking victims were often escorted by a member of the organisation to a bank and instructed to open an account in their own name; once the account was opened, a member of the organisation took control of it and then provided the account information to other criminal associates to coordinate deposits throughout the United States.

The organisation also engaged in bulk cash smuggling by physically transporting and mailing illegal proceeds from sex trafficking to Southeast Asia. The money launderers recruited money mules to carry large volumes of cash on their persons when traveling overseas as well as to hide cash in items such as clothing and dolls. Finally, the organisation used a hawala system to transfer money to Southeast Asia and elsewhere outside the United States.

Human trafficking for forced labour

58. HTFL involves work that is performed involuntarily and under the menace of a penalty. It refers to trafficking situations in which persons are coerced to work through the use of violence or intimidation or by more subtle means such as manipulated debt, retention of identity papers or threats of denunciation to immigration authorities. Forced labour can take many forms but at its heart is the exploitation of another individual's labour for profit.

59. According to the *ILO Forced Labour Convention, 1930* (No. 29), forced or compulsory labour is "all work or service which is exacted from any person under the threat of a penalty and for which the person has not offered himself or herself voluntarily." This definition encompasses the following three elements:

1. Work or service refers to all types of work occurring in any activity, industry or sector including in the informal economy.

2. Menace of a penalty refers to a wide range of penalties used to compel someone to work.
3. Involuntariness: The term "offered voluntarily" refers to the free and informed consent of a worker to take a job and his or her freedom to leave at any time. This is not the case for example when an employer or recruiter makes false promises so that a worker take a job he or she would not otherwise have accepted.

Types and characteristics of forced labour

60. Forced labour can take various guises depending on the method of recruitment, coercion, control and exploitation of the individual involved. Individual cases may often involve a combination of different types of forced labour. Types of forced labour include:

Types and characteristics of forced labour

Type	Characteristics
Exploitation in the workplace	
Victims exploited for multiple purposes in isolated environment	Victims who are often highly vulnerable are exploited for labour in multiple ways in isolated rural locations. Victims live on offenders' property in squalid conditions, are subject to repeated abuse and are very rarely paid.
Victims work for offenders	Victims are forced to work directly for offenders in businesses or sites that they own or control (some offenders may be gangmasters). The main method of exploitation is not paying or illegally underpaying victims.
Victims work for someone other than offenders	Victims are employed in a legitimate and often low-skilled job, with legal working conditions, by an employer unrelated to the offenders. Most or all wages are taken by offenders often through control of the victims' bank accounts.
Exploitation in the home (domestic servitude)	
Exploited by partner	Victims are forced to undertake household chores for their partner and often their partner's relatives. If married, the marriage may have been arranged or forced and the servitude often occurs alongside domestic abuse and sexual exploitation
Exploited by relatives	Victims live with and exploited for household chores and childcare by family members, usually extended family. Many victims are children
Exploiters not related to victims	Victims live with offenders who are often strangers. Victims are forced to undertake household chores and are mostly confined to the house.
Forced gang-related criminality	Victims are forced to undertake gang related criminal activities, most commonly relating to drug networks. Victims are often children who are forced by gangs to transport drugs and money.
Forced labour in illegal activities	Victims are forced to provide labour to offenders for illegal purposes e.g. victims being forced to cultivate cannabis in private residences
Forced acquisitive crime	Victims are forced by offenders to carry out acquisitive crimes such as shoplifting and pickpocketing. Offenders may provide food and accommodation to victims but rarely pay them
Forced begging	Victims are transported by offenders to locations to beg on the streets for money, which is then taken by offenders. Victims are often children vulnerable adults.
Trafficking for forced sham marriage	Traffickers will transport victims to a host country in which the individual has a legal immigration or citizenship status and sell them victims to an exploiter in a one-off transaction. Exploiters then marry victims to gain immigration advantages and often sexually abuse them.

Identifying suspicious transactions and money laundering from the types of HTFL

61. As with human trafficking for the purposes of sexual exploitation, HTFL can take many forms, meaning that the proceeds, and associated laundering of the proceeds, are realised in different ways depending on the type of HTFL. Most forms of forced labour involve some form of initial recruitment of the victim. This is often under the pretence of a better job overseas, at a significantly higher wage. In cases where the victim is forced to work in legal employment, the employer (who themselves are often unaware that they are employing trafficked individuals) can make a form of payment into either the traffickers' or victims' bank account. Where financial institutions with reporting obligations observe financial activity such as multiple employees being paid into a single account or where wage receipt is followed by rapid withdrawal or onward transfer into single accounts, they should consider assessing the situation to determine if there is a suspicion of laundering the proceeds of human trafficking.

62. In addition to the financial footprint, the victim or their trafficker will often have to interact with a government agency or reporting entity staff in person, providing further opportunities to pick up on any suspicious behaviour. Where an individual claims to act on behalf of another employee, demonstrating signs of control of the person or their documents, this may be indicative of forced labour. Unusual in-branch behaviour, such as individuals avoiding cashiers, even when there are no queues, may also indicate the presence of trafficking.

63. In the following case, the initial suspicious activity of two occupants at the same address led to the identification of other individuals at the same address working for the same company. Traffickers will often house their victims in substandard accommodation, with many victims sleeping in a single bedroom. Further similarities in the documentation used to open the victims accounts led the bank to conclude that HTFL was involved:

Case Study 6.

The retail team in a major high street bank identified a potential trend which resulted in a referral to the FIU for investigation. Two customers were living at the same address with funds received followed by multiple cash withdrawals. The purpose of the referral was to identify if any additional customers had similar account activity. A review of these two customers raised concerns due to possible Labour Exploitation in the construction sector.

After the initial referral, the investigation identified at the same address three additional customers who were of concern, making five customers in total. A profile review identified four customers showing the same pattern of account activity and one customer with different account activity.

Analysis of the four customers showing the same pattern of activity identified

the following:

- The accounts were receiving Faster Payments Inwards (FPI) from the same entity followed by ATM withdrawals and larger cash withdrawals in branch and in the same locations.
- The accounts were showing a lack of living expenses such as food, petrol, utilities and rent.

Further analysis of these four customers identified the following:

- all of the profiles identified registered the same mobile number
- Two of the 4 profiles identified registered the same email address
- All profiles had the same nationality
- The Passports used to open 4 the accounts were temporary and issued in the same month. The same home town was stated on all passports
- Income was received and immediately withdrawn in cash

Deeper analysis into these four customers identified the fifth customer residing at the address that had introduced the four customers to the Bank when opening the account. Bank records advise this fifth customer was an interpreter as the applicants could not speak English very well. The mobile number and email address registered on the profiles of the four victims linked to the fifth customers at the address.

The bank identified four customers receiving funds from the same employer. Further analysis was completed into other accounts which had received funds from this employer to identify if the network was larger than the 4 customers identified to date. Based on the foregoing indicators, the FIU suspected that the four individuals might be victims of HTFL and the fifth may have been involved in the offences.

The FIU's analysis revealed that there were further customers of concern. The case was referred to law enforcement who, following a subsequent investigation, confirmed that the customers were subject to forced labour exploitation and began enforcement action.

Source: United Kingdom

64. The following case demonstrates some of the manners in which the victims of HTFL can be also forced to be involved with providing the proceeds to perpetrators, and also used in the laundering mechanisms for the proceeds:

Case Study 7.

In 2013, Italian police started an investigation concerning a major informal strike by immigrant workmen, which led them to discover a HTFL scheme involving Bangladeshi and Indian immigrants, trafficked by three gangmasters, one Bangladeshi (Mr A) and two Italian nationals (Mr B and Mr C). The investigation was concerning Alpha, an Italian logistics firm run by

Mr A. This investigation was commenced through suspicious transaction reporting to the financial intelligence unit based on a number of factors:

- News media reports of a major informal strike by immigrant workmen;
- Rumours about unfair business practices/competition by Alpha;
- Anomalous management and ownership structure of logistics companies associated to Alpha (run and owned by foreign workmen only recently immigrated to Italy, also known to work as employees for similar firms);
- Nearly simultaneous ATM cash withdrawals through payment cards belonging to several immigrants working for the same firm at a singular location.

The investigation uncovered that Mr A had selected the workmen in their home countries, offering them temporary jobs at Alpha in exchange for a sum they would pay him through their future work in the cooperative. This arrangement would also grant them temporary work visas to Italy, so that both their residence and employment in Italy would be completely legal.

On such legal ground, once arrived in Italy, Mr A forced each immigrant workman first to address banks through him in order to get current accounts and payment cards (debit cards and reloadable cards), to which Alpha would credit the wages. The immigrant workmen then had to hand the passwords to Mr B, enabling him to take back half the wages through ATM cash withdrawals. The immigrants were forced to provide a portion of their wages to Mr A to pay back their debt, as well as payment for basic goods, such as accommodation and food etc. In spite of the HTFL, Alpha's accounting and financial records appeared compliant with the law, because each workman's weekly working time and wages were formally consistent with legal thresholds, though actually each workman worked for nearly twice as many hours for half the salary.

Alpha's profits were withdrawn through the immigrants' cards, and in some instances sent to shell companies made to look like logistics companies through a false invoicing scheme with the an apparent ownership structure owned and operated by the victims. The actual beneficial owner of the shell companies to which the funds were sent was Mr C, who was found to also be the beneficial owner of other such shell companies during the course of the investigation. These corporate vehicles provided Mr. C with a sort of multi-purpose "money laundering machine" ultimately founded on immigrants' vulnerability to threats about their dismissal from their work, which would have resulted in being sent back to their home countries.

This scheme enabled the laundering of an estimated EUR 2.5 million in two and a half years.

Source: Italy

65. The following case revealed suspicious behaviours around ATM withdrawals. A victim's ATM usage could occur at the same machine at the same time, suggesting that a third party was in control of their cards. Further use of open source tools like Google StreetView revealed inconsistencies between the number of victims living at a particular property, and the actual size of the house:

Case Study 8.

Two brothers trafficked 18 men from Poland to the United Kingdom to work in a major sports clothing warehouse. The brothers employed 'spotters' in Poland to identify vulnerable men and approach them with an offer of work and accommodation overseas. The men received coach tickets to the destination country. Once the victims had arrived, they had to hand in their passports. They were forced to live in an overcrowded house in squalid conditions. The offenders helped the victims to open bank accounts, and then seized their bank cards to control these accounts. The brothers used physical and verbal threats as a means of control. The victims found employment at the warehouse through an employment agency. The offenders took the majority of the victims' GBP 265 weekly wage, leaving each victim with just GBP 90 a week. The offenders reportedly made GBP 35 000 throughout the exploitation period.

Following work with the police the bank analysed the information it held on the address and found that there were up to 15 customers registered at that address.

They reviewed each of these customers and identified the following suspicious activity:

- The property, when looked at on Google StreetView, could only comfortably accommodate 2 or 3 people at the most
- The customers living there received weekly incomes from an agency
- A high percentage of that income was withdrawn quickly after receipt in to the accounts
- Analysis of ATM activity for these customers shows that their ATM usage often occurred at the same machine at the same time suggesting that a third party is in control of their cards.

Following a police raid on the house and arrest of the brothers, both offenders pleaded guilty to human trafficking offences, and were sentenced to six years each.

Source: United Kingdom

66. Lastly, the following case demonstrates some of the methods and techniques which have been commonly used to transfer the proceeds of HTFL to another destination, namely the use of hawala-type systems and physical transportation of cash. Such techniques can be designed to frustrate financial investigation:

Case Study 9.

In September 2016, a jury in the High Court at Auckland found 46-year-old Faroz ALI – also known as Feroz ALI – guilty of 15 counts of trafficking Fijians to New Zealand on false promises of NZD 900 weekly wages for fruit-picking. He charged the workers exorbitant fees and then exploited them upon arrival by forcing them to work illegally and live in overcrowded conditions, underpaying them and threatening them with deportation if they complained. ALI was found to be receiving large payments from legitimate New Zealand companies, for the provision of services by his construction firm, for which the Fijians forcibly worked. With the illicit proceeds of the HTFL offence, ALI was utilising a hawala-type system to return funds to Fiji, as well as the physical transportation of cash for the purposes of personal enrichment in Fiji.

ALI was also found guilty on 16 counts of aiding and abetting people to enter or remain in the country unlawfully. He pleaded guilty to charges of exploitation, including failing to pay workers minimum wage or holiday pay, as well as aiding and abetting workers to breach the conditions of their visas.

Approximately NZD130 000 was calculated to be the total loss of wages, holiday pay and the like for identified victims (noting that the number of victims and period of offending was ring fenced)

ALI, the first person to be convicted of people trafficking in New Zealand, was jailed for nine and a half years.

Source: New Zealand

Human trafficking for the removal of organs

67. Human trafficking for the purpose of the removal of organs renders significant harm to the victim, for potentially little reward, if any. This crime, significant in its impact to the victim, represents the vast minority of human trafficking cases.

This is exemplified in that this study received no viable case studies of HTRO, but did receive a few cases of organ trafficking, which is outside of the scope of this report.

Box 2. Human Trafficking for the Purpose of the Removal of Organs Versus Organ Trafficking[41]

Trafficking in organs and trafficking in persons for the removal of organs are different crimes, though frequently confused in public debate and among the

[41] Quoted excerpt from UNODC's Assessment Toolkit for the Trafficking of Persons for Organ Removal, 2015 https://www.unodc.org/documents/human-trafficking/2015/UNODC_Assessment_Toolkit_TIP_for_the_Purpose_of_Organ_Removal.pdf

legal and scientific communities. In the case of trafficking in organs, the object of the crime is the organ, whereas in the case of human trafficking for organ removal, the object of the crime is the person. Trafficking in organs may have its origin in cases of human trafficking for organ removal, but organ trafficking will also frequently occur with no link to a case of human trafficking. The mixing up of these two phenomena could hinder efforts to combat both phenomena and provide comprehensive victim protection and assistance.

68. While this study did not receive any viable cases on HTRO, UNODC's *Assessment Toolkit for the Trafficking in Persons for Organ Removal* provides detailed information on the offence which leads to two potential opportunities to detect the offence via financial flows: 1) financing the infrastructure required to effect the offence, and 2) payment to the various individuals required to effect the offence.

69. Unlike HTSE and HTFL, there is a much shorter period of caring for a victim to profit off their exploitation for HTRO, which takes away one opportunity to detect the crime via its associated financial flows. However, HTRO does require more significant infrastructure in comparison to the other classifications, such as medical facilities and equipment. There may be an ability to detect the HTRO offence through the procurement of medical equipment outside of the context of an official medical care facility.

70. The HTRO offence also provides the perpetrators with a more significant one time financial gain than HTSE and HTFL. The UNODC report provides case studies which indicate that, for example, kidney procedures can cost as high as USD 100 000 – USD 200 000 on the black market. This significant inflow provides the second opportunity to detect HTRO. The payment itself may be provided to one individual coordinating the HTRO, or to a network of individuals each contributing to conducting the offence, in the form of a payment that is not in line with what would be reasonably expected of their employment.

Box 3. Human Trafficking for the Purpose of the Removal of Organs Actors[42]

Recruiters (other terms used include brokers, organizers, connectors, coordinators, middlemen, kidney hunters, etc.);

Medical professionals (including specialist doctors such as surgeons and nephrologists [medical doctors who specialize in kidney care and treating diseases of the kidneys], as well as nursing staff and other medical staff);

Other private and public sector facilitators (such as hospitals, transplant centres, laboratories and other medical facilities, as well as their staff, insurance companies, travel agencies, airlines and their staff, as well as

[42] Quoted excerpt from UNODC's Assessment Toolkit for the Trafficking of Persons for Organ Removal, 2015 https://www.unodc.org/documents/human-trafficking/2015/UNODC_Assessment_Toolkit_TIP_for_the_Purpose_of_Organ_Removal.pdf

guards, drivers, service providers, law enforcement officials, translators, etc.);

Although **organ recipients** ('patients', 'buyers') have largely not been found to be perpetrators of trafficking in persons for organ removal, they may have been knowingly or unknowingly involved as recipients of organs that come from trafficking victims.

Victims of trafficking in persons for organ removal (also 'donors', 'victim-donors', 'sellers', 'organ suppliers') are not to be considered actors within the trafficking schemes. They may, however, take on active roles, e.g. by approaching brokers, offering their kidney for sale.

71. It should be noted that both opportunities to identify HTRO via financial flows may point to both HTRO and organ trafficking and other means will be required to distinguish the two once the situation is detected.

Indicators of money laundering from human trafficking

72. Indicators of money laundering from human trafficking derived from the above noted cases studies and information from this section, as well as the other cases provided in this report (provided in full in Annex A) are listed, in full, in Annex B. These indicators will assist obliged entities and national authorities in detecting transactions where there is a suspicion of the laundering of the proceeds of human trafficking.

Part Three: Challenges and good practices in combatting ML/TF from human trafficking

Challenges identified in the 2011 FATF Report

73. The previous FATF report identified a number of challenges in detecting, investigating and prosecuting money laundering from the trafficking in human beings and the smuggling of migrants. The top three challenges include:

1. **Limited international co-operation**: The previous FATF report identified international co-operation as the single biggest challenge in combatting ML/TF from human trafficking/smuggling of migrants. More specific challenges mentioned under this theme include, time delays in obtaining information, incomplete responses to information requests, restrictive conditions attached to the sharing of information and ineffectiveness of the mutual legal assistance process.
2. **Lack of awareness or concern from law enforcement/prosecution authorities**: The previous FATF report cited a culture of investigation and prosecution focusing on the predicate offence and not the associated laundering offence, and a lack of effective training of authorities in financial investigations.
3. **The difficulty to detect funds**: The previous FATF report identifies human trafficking and the smuggling of migrants as being crimes where there are high volumes of cash and comingling of funds as primary money laundering methodologies thereby posing problems for financial investigators in 'following the money'.

74. The previous FATF report also identified other challenges, such as the lack of investigative resources, the lack of witness co-operation, corruption, and time delays in national co-operation. The previous FATF report also notes low levels of STR submission by reporting entities on ML/TF from human trafficking and the smuggling of migrants.

Challenges identified in the current study

75. This section summarises the main challenges identified through the course of the study. Some of the challenges enunciated in the previous FATF report remained common themes throughout the project; however, a number of significant, incremental challenges have been identified.

76. **Addressing the challenges of the previous FATF study:** The challenges identified in the previous FATF report, were also identified as challenges in effectively detecting, investigating and prosecuting ML/TF from human trafficking during the current study, seven years later. Some of these challenges were structural, due to the nature of the predicate offence, some due to a lack of granular understanding of the predicate offence and associated financial flows, and some demonstrating effectiveness issues by authorities. While it is impossible to quantify

the difference in the level of effectiveness of authorities in combatting ML/TF from human trafficking between 2011 and 2018, estimated proceeds derived from human trafficking has increased substantially.

77. **Money laundering risk from proceeds of human trafficking not adequately detailed in risk assessments and understood**: Human trafficking, in many respects, remains a 'hidden crime'. From victims that do not understand that they are victims, victims who are not incentivised to declare the nature of the crime that they have been the victim of, difficulty in detecting forced labour exploitation, national authorities focusing largely on international human trafficking and human trafficking being hidden within other crimes such as prostitution (in some countries) or illegal immigration. In addition, there are incremental challenges when it comes to understanding the money laundering risk related to human trafficking. For example, assets acquired in HTFL are difficult to identify, and a significant amount of the proceeds are in cash.

78. Due to the unseen nature of some aspects of the predicate offence and the difficulty in identifying the laundering of the proceeds of human trafficking, it is hard for national authorities to gather statistics to properly assess the ML risk from human trafficking in their jurisdiction. The review of available risk assessments demonstrates this. On aggregate, the risk assessments do not identify ML from human trafficking with the gravity commensurate with the estimated aggregate global proceeds derived from the human trafficking; this places human trafficking among the most significant illicit revenue generators in the world. If the ML risks remain under-represented globally, then appropriate risk mitigation measures will not be put into place to curb this crime.

79. **Incomplete domestic information sharing**: Many stakeholders – including competent authorities, and stakeholders in the private sector, civil society and NPO sector – are working to combat human trafficking, and money laundering from human trafficking. Each of the stakeholders can have information relevant to combating ML/TF from human trafficking. Some of the stakeholders form part of a country's AML/CFT regime, others are partners of the regime, while others still have limited to no interaction historically with the AML/CFT regimes. This diversity of partnerships, some national authorities' inability to share with all partners and the associated diversity of information offered by stakeholders combatting human trafficking, and ML/TF from human trafficking, can lead to incomplete and/or misunderstood domestic information sharing which could be better co-ordinated and more complete.

80. **Detecting, reporting and analysing suspicious transaction reports**: Members of the private sector have reported issues in effectively detecting transactions where there is a suspicion that the proceeds from human trafficking are being laundered or contribute to the financing of terrorist activity. Specifically, the private sector has indicated that national authorities have provided some information on the national threat environment with respect to human trafficking. However, the information is not complete and does not allow the private sector to best identify such transactions. In addition, reporting entities have indicated that they require more precise indicators of money laundering/terrorist financing, which are responsive to the national threat environment of human trafficking. These issues may result in part from the lack of consideration or weight given to human

trafficking in national risk assessment exercises, or inadequate communication of the risk.

81. As a result of the reporting entities' difficulties in identifying transactions where there is a suspicion that the proceeds from human trafficking are being laundered or contribute to the financing of terrorist activities, financial intelligence units have reported difficulty in appropriately prioritising suspicious transaction reports related to human trafficking. In many respects, reporting entities are not equipped with sufficiently granular information to appropriately identify these transactions, or differentiate such transactions from other reported suspicious transactions. In turn, the FIU is not able to attribute the suspicious transaction report to suspected laundering of the proceeds of human trafficking and forward these transactions to the appropriate authority.

82. **Identifying proceeds in forced labour exploitation type human trafficking cases**: Competent authorities indicated significant issues in identifying the proceeds of forced labour exploitation type human trafficking cases. By nature, these types of cases provide material benefit for the individuals/entities for whom the victims are forced to work, but also for the perpetrators who trafficked the victims, who may or may not be the same individual. In some instances, the material benefit can be readily identified as the direct output of an individual over time or when an entire entity's business model is based around forced labour. In other instances, the individuals merely contributed to a gradual enrichment of individuals or entities over time. Such 'balance sheet' improvements are difficult to trace back to the specific predicate crime that have been committed. The following case exemplifies a HTFL situation where the benefit derived from the offence is difficult to quantify and identify:

Case Study 12. Domestic Servitude by a Stranger

A Tanzanian woman scientist living in London trafficked a 21-year-old woman from Tanzania to work as a slave in her home. The offender offered the victim 250 000 Tanzanian shillings (~£120 at the time) a month to work as her housekeeper. The offender's family paid for the victim's visa and arranged her flights from Tanzania to the UK. Once in the UK, the victim was taken to the offender's two-bedroom flat. The offender and her three children all lived in one room and the second bedroom was rented out. The victim was made to share a bed with the offender's 12-year-old son. The victim was forced to work for up to 19 hours a day cooking and cleaning, as well as looking after the three children. She was never paid for her work, but was given £20 on one occasion by the lodger. Her passport was taken from her and she was banned from contacting family or friends. She was regularly verbally, physically and psychologically abused. This exploitation lasted seven months. The victim was encouraged by a friend to report her exploitation to the police, leading to the offender's arrest. The offender was sentenced and ordered to pay £3 000 in compensation to the victim.

This case highlights the difficulty in determining the material benefit gained through certain types of HTFL where the proceeds are indirect, gradual

enrichment, or enrichment of an individual's lifestyle, but are not realised in a singular material good.

Source: United Kingdom

83. **Victims as sources of information and potential witnesses**: Depending on the circumstances, victims of human trafficking may provide useful insight into the financial operations of the individuals who have trafficked them. However, victims of human trafficking are frequently subject to physical and mental horrors as part of their experience in being trafficked. As a result, many victims are reluctant or unable to provide information to authorities for fear that they or their family/friends may be targeted by the perpetrators. In addition, some jurisdictions have reported problems in keeping victims in the country and motivated to providing information/testimony throughout a potentially lengthy investigative proceeding.

84. **Lack of convictions or confirmed intelligence regarding proceeds of human trafficking contributing to terrorist financing**: A number of studies, reports, press reports and victim testimonials have highlighted the link between human trafficking and terrorist financing. These reports indicate that terrorist organisations such as ISIL, Boko Haram and Al Shabaab have used human trafficking as a way to raise funds and to provide material support to their organisations and activities. Such activity has, to date, been generally confined to areas which are controlled, or partially controlled, by terrorist groups.

85. Despite these reports, there have been no specific law enforcement cases studies that confirmed the proceeds of human trafficking contributing to the financing of a terrorist group. There are many reasons why this may be the case:

- Authorities, appropriately, prioritise victim safety above evidence or intelligence gathering; their focus is thus not on gathering evidence to secure a terrorist financing conviction.
- Evidence and intelligence collection in a given geography which is controlled, or partially controlled, by terrorist groups is very challenging, even after the conclusion of a conflict. The admissibility of such information to court proceeds would also be challenging.
- Seeking a conviction for or specific intelligence on the financing of terrorist activities from the proceeds of human trafficking is simply a lower priority for national authorities combatting terrorist groups than other outcomes which could range from kinetic action to victim extraction.
- Prosecutors may opt to pursue other charges – and not terrorism finance-related charges – because the evidence is more readily available and the penalties are similar.

Good practices in combatting ML/TF from human trafficking

86. This section summarises the good practices identified through the course of this study in project team meetings, the case studies, the analysis of the literature and the workshops in Busan in November 2017 and Marrakesh in January 2018.

These good practices are focused on improving the effectiveness of regimes to combat ML/TF from human trafficking.

87. **Assess the diverse money laundering risks from human trafficking, share with stakeholders and ensure that they're understood**: Countries can benefit from the development of a comprehensive understanding of the risk they face from the laundering of proceeds from human trafficking, which may largely be an 'unseen' crime which has led to problems in assessing its significance. Detailed research and analysis into the predicate crime – and the financial flows associated with the predicate crime – can help to further this understanding. This understanding can benefit from the development and maintenance of national and regional statistics, and other contextual information such as:

- The estimated number of victims of human trafficking, broken down by type of exploitation
- The provenance, facilitation and transit arrangements of the victims for each type of exploitation occurring in the jurisdiction
- The estimated average proceeds earned, and how they are earned, for each victim for each type of exploitation
- The organised crime groups conducting the human trafficking offences
- Prosecutions and charges for perpetrators of both human trafficking and money laundering, as well as aggregated profile information
- Typical financial flows related to each type of human trafficking in the jurisdiction's context
- Methods and indicators of laundering utilised by crime groups, and typical assets (i.e. cash, real estate, cars etc.) utilised to launder
- Whether profits stay in the jurisdiction, or are moved elsewhere

88. A review of the above can benefit from the involvement of all relevant stakeholders combatting human trafficking, as well as money laundering from human trafficking. This group of stakeholders can leverage their varied expertise and data holdings, such as case information, suspicious transaction reports and open-source information, to provide an updated view on the risk posed by human trafficking, and the proceeds of human trafficking to the country. This process can also open channels to enable more effective domestic information sharing on both the strategic and tactical levels.

89. With appropriately identified criticality to the money laundering risks from the proceeds of human trafficking, and granular knowledge of the offense and associated laundering, national authorities will be able to appropriately design mitigation measures for the risks. The below provides an example of such a comprehensive understanding of risk related to human trafficking:

Box 4. Project Tsireledzani!

Tsireledzani! means 'Protect!' in Tshi-Venda (one of the 11 South African official languages) and is the name of the Government's initiative to combat Trafficking in Persons. The programme is headed by the National Prosecuting Authority and involves government departments, international organisations and civil society partners.

This coalition of goodwill has led to the establishment of a National Action Plan on trafficking in persons and to the launch of the Tsireledzani! campaign, whose primary aim is to provide a blueprint for all those working to prevent trafficking and protect the people of South Africa and other nations from human trafficking. The program's action plan is based on three pillars: prevention, victim support and response, which provide a multi-pronged response to human trafficking, including (1) research, and (2) capacity building, which provide insight into combatting human trafficking through risk assessment and anti-money laundering measures. Project Tsireledzani!:

1. Research provides a stronger knowledge base relating to human trafficking trends and responses in South Africa upon which the Government and other stakeholders can develop national frameworks, structures, policies and processes to address human trafficking.
2. Capacity building provides support in identifying trafficked persons, improving the standard of physical protection and direct assistance offered to victims of trafficking in the country, and increases the number of trafficking cases investigated and prosecuted by law enforcement and justice officials.

Source: South Africa

90. The predicate offence of human trafficking is incredibly diverse in how it is carried out. The acts required to commit each of the types of exploitation, and the methods perpetrators use to transact differ between and within the types of exploitation. In understanding these differences, and translating them into typologies, there could be more specific opportunities to identify the criminal organisation committing these crimes and the associated laundering of the proceeds. This paper provides such a segmentation and specificity, and can act as a foundation for national authorities, reporting entities, civil society and non-profit organisations.

91. **Leverage expertise, capabilities and information through partnerships between the public sector, private sector, civil society and NPO communities:** The community of participants, working to effectively combat human trafficking, and ML/TF from human trafficking, is large and incredibly diverse, and holds significant information. This community includes a variety of stakeholders from the public sector, private sector, civil society and non-profit organisations, If participants are properly coordinated, and information is appropriately shared amongst the community of participants, some of which are not traditional partners

for FIU/law enforcement, such as labour, employment and work safety agencies, then the community's size, diversity and the information it holds offer an ability to improve effectiveness in efforts to combat ML/TF from human trafficking. It is important to consider implementing adequate mechanisms for these participants to report to FIUs, while maintaining the confidentiality of the information provided as is normally the case for reporting entities.

92. The creation of a national co-ordination and information-sharing mechanism for relevant participants working to combat human trafficking and ML/TF from human trafficking may be beneficial. Such venues are successful when they:

- Ensure there is understanding between constituents of each participant's mandate/role and capabilities;
- Understand the information each organisation holds, informational needs, and when such information can be shared;
- Ensure that there is a permanent contact point for each participant to enable information sharing across the group;
- Work collaboratively on developing the national threat and risk environment for ML/TF from human trafficking; and,
- Collaboratively develop precise, suspicious transaction report indicators and risk-based assessment guidance responsive to the national threat and risk environment.

93. Such a mechanism could be part of an existing co-ordination and information-sharing channel such as the national AML/CFT risk assessment or conducted as a continuous stand-alone process. Various 'public/private partnership' models are gaining prominence and showing tangible results worldwide, despite different national AML/CFT frameworks and information-sharing legislation in the countries enacting them. Two such models for consideration, which are operationalised under separate AML/CFT frameworks and information-sharing legislation, are Canada's Project PROTECT, and the United Kingdom's Joint Money Laundering Intelligence Task Force:

Box 5. Project PROTECT

Project PROTECT is a minimal or 'no cost' initiative between several Canadian financial institutions, FINTRAC (FIU Canada), regulators, law enforcement agencies at the municipal, provincial and federal level, as well as non-profit organisations and technology companies. The project has two twin goals: Firstly, to increase the awareness of sexual exploitation-type human trafficking amongst project constituents and secondly, to increase the quantity and quality of suspicious transaction reporting to FINTRAC when there are suspicions of money laundering from human trafficking.

Project partners utilise their unique abilities and information to fulfil the needs of other project participants through ongoing dialogue and the sharing of experience in combatting human trafficking. Tangibly, the *Project Protect* partners collectively developed indicators of suspicious transactions of money laundering from human trafficking involving sexual exploitation.

These indicators were used as sourced material for the Operational Alert to all Canadian reporting entities on human trafficking involving sexual exploitation. This Operational Alert provided granular indicators for use by reporting entities and specific instructions to submit all suspicious transaction reports for the project with the label *Project Protect* for ease of identification. The resulting suspicious transaction reports are being forwarded to project participants in law enforcement, who are then able to appropriately and expeditiously address this potential money laundering.

Since its inception, *Project Protect* has been able to make all participants, individually and jointly, more effective at combatting money laundering from human trafficking through this partnership. This is demonstrated by a nine-fold increase in suspicious transaction reports on human trafficking submitted to FINTRAC, and an eight-fold increase in disclosures sent from FINTRAC to competent law enforcement authorities resulting from the submission of these suspicious transaction reports. In addition, project participants have agreed that such a model of partnership has led to such success that it should be continued in efforts to build capabilities in combatting other serious money laundering risks.

Source: Canada

Box 6. Joint Money Laundering Intelligence Taskforce

The JMLIT model

The Joint Money Laundering Intelligence Taskforce was established in 2015 to enable both tactical and strategic intelligence sharing between law enforcement agencies and leading financial institutions in the UK.

The JMLIT brings together law enforcement, the regulator, and over 30 UK and international financial institutions to exchange and analyse information and intelligence. By using the National Crime Agency's legal gateway, the JMLIT enables private sector institutions to share information with law enforcement partners and other private sector partners on a multilateral basis.

The overall aim is to identify priorities and focus the mutual effort deployed against financial crime by the public and private sectors.

How it works

The taskforce shares information through an Operational Working Group and several Expert Working Groups.

The **Operations Group** is dedicated to assisting ongoing money laundering and terrorist financing investigations. It exchanges live tactical intelligence using the Section 7 gateway of the Crime and Courts Act 2013, strengthened and safeguarded by an information sharing agreement which all members must sign. Vetted members of 17 major financial institutions are briefed every week on UK law enforcement subjects of interest, and requests are

made for specific information to fill intelligence gaps. Information is shared for intelligence purposes only, and so all information must be parallel-evidenced by law enforcement should they wish to use it evidentially. This is an entirely voluntary arrangement which complements the UK's existing Suspicious Activity Report regime.

The bank-led **Expert Working Groups** provide a platform for members to discuss current or emerging threats, and to identify innovative ways of collectively combating these threats. These groups are attended by relevant experts from across the public and private sectors. The Experts groups are aligned to the following JMLIT priority areas:

- Organised Immigration Crime /Human Trafficking
- Bribery and Corruption
- Trade Based Money Laundering
- Money Laundering Through Markets
- Terrorist Financing
- Future Threats

Source: United Kingdom

94. Such co-ordination and information-sharing mechanisms can also be conducted with international stakeholders, including the national authorities of other countries where such co-ordination and information sharing would be beneficial.

95. These venues can also provide for the sharing of best practices through co-ordinated and sustainable, technical-assistance solutions for jurisdictions in need of assistance in improving their effectiveness in combatting money laundering from human trafficking. Some such solutions could include: the provision of assistance in conducting a national risk assessment through workshops and models, assistance in co-ordinating a public/private partnership venue, the development of specialist/generalist training programmes and the facilitation of joint investigative teams. The Bali Process provides a model for such international co-ordination, information sharing and technical assistance coordination mechanism:

Box 7. Bali Process

The Bali Process on People Smuggling, Trafficking in Persons and Related Transnational Crime (Bali Process) was established in 2002 and is a voluntary and non-binding forum for regional dialogue and co-operation on people smuggling and human trafficking. It is co-chaired by the Governments of Australia and Indonesia and comprises 45 member countries from across the Asia Pacific region. Its membership also includes the United National High Commissioner for Refugees (UNHCR), the International Organisation for Migration (IOM) and the United Nations Office of Drugs and Crime (UNODC).

Under the Bali Process, the officials-level Working Group on Trafficking in

Persons (TIPWG) aims to promote more effective and co-ordinated law and justice responses to combat human trafficking in Asia Pacific by sharing information and best practices, and delivering capacity-building activities in member countries. In May 2016, the TIPWG held a Bali Process forum, *Following the Money Forum,* followed by its second annual meeting where the TIPWG agreed to progress a suite of work to promote the use of anti-money laundering and asset recovery tools to support prevention, investigation and prosecution of trafficking in persons (TIP). A key priority was the development of a new Bali Process policy guide and training module on following the money in trafficking in persons cases by a Bali Process drafting committee co-chaired by the Indonesian Attorney-General's Office and the Australian Attorney-General's Department (now the Department of Home Affairs). The guide and training module were formally endorsed at the Ad Hoc Group Senior Officials Meeting in October 2017. They will be translated into regional languages, distributed both online and in person to members, and used in training workshops for interested Bali Process countries.

The Australian Attorney-General's Department also commissioned the development of the report '*Financial Footprints: An Analysis of Financial Investigations to Combat Trafficking in Persons in the Asia Pacific Region*' to provide an overview of key global literature on the financial flows associated with trafficking in persons, and recent global experiences in using financial tools in combating trafficking in persons. Together with the Bali Process policy guide and training module on following the money, the report provides an important tool to target capacity-building activities and ensure a comprehensive and harmonised approach to using anti-money laundering and asset recovery tools in TIP cases.

Sources: Australia and Indonesia

96. **Appropriately identifying suspicious transactions linked to human trafficking and creating useful STRs**: Reporting entities and financial intelligence units may be better able to identify and report transactions where there is a suspicion of laundering the proceeds of human trafficking by considering the following:

- The financial intelligence unit can ensure that reporting entities understand the national money laundering risk associated with human trafficking and receive specific, granular indicators of the laundering of the proceeds of human trafficking
- The financial intelligence unit can guide reporting entities that reporting suspicious transactions on suspected victims are of low value. They can, in these circumstances, instead, identify victims via profiled financial transactions, and submit suspicious transaction reports on those individuals and entities to whom the victims are sending funds/assets.
- FIUs could encourage reporting entities to flag the transaction(s) with possible links to human trafficking with a specific word/phrase, tick box or

other marker when they submit their suspicious transaction report to their financial intelligence unit.

- FIUs and reporting entities could consider ways to mine open source information which provides address, phone numbers and email addresses associated with human trafficking.

97. **Raise awareness of human trafficking as a means to potentially support terrorist organisations**: Convictions for and the use of proceeds of human trafficking to materially support terrorist activity are difficult to secure for the reasons which have been enunciated in the previous section of the report, and information and credible intelligence on the issue may be difficult or impossible to collect. As a result, authorities could raise awareness about this issue to:

- Study how terrorist organisations are realizing the proceeds of human trafficking to materially support their activities. Such an understanding could include number of victims, the nature of their exploitation and the estimated material benefit derived from their exploitation. It may require a victim-based study for each territory controlled by terrorists.
- Study the financial component of human trafficking for the provision of material support to a terrorist organisation, and specifically, how the material benefit from such exploitation is used. At the time of writing this report, it is unknown if such proceeds ever leave the controlled territory of these terrorist groups, and if the proceeds are used for anything more than the sustenance and benefit of the singular terrorist engaging in such activity.

98. This information could help foster the development of appropriate AML/CFT policy and operational responses.

99. **Development of specialist and generalist training**: Authorities may wish to create and deliver training programs for individuals tasked with detecting, investigating and prosecuting ML/TF from human trafficking. Such programs will inform professionals on the use and availability of financial intelligence. Professionals can learn best practices in obtaining evidence from a variety of sources. These sources include the victims' financial documents and online sources. They will learn how to present relevant information in court and strengthen the working relationship between constituents of the regime combatting human trafficking and the ML/TF from human trafficking.

100. In addition, a leaner curriculum on financial intelligence and human trafficking can be delivered to non-specialists to ensure that national authorities can more effectively identify human trafficking and ML/TF from human trafficking, so that they can recommend and conduct appropriate actions.

101. **Other good practices**: Other good practices were identified through the course of the study (but they have also been identified through numerous other global AML/CFT regime studies on other subject matter so are not detailed in depth for the purpose of this report). These include:

- Creation of multi-agency task forces

- Focus relevant investigations on hawala-type systems and their use by facilitators in order to ensure that there is greater traceability of the financial flows of the HT
- Utilising both informal and formal international co-operation mechanisms, such as are available through asset recovery networks
- Ensuring that ML investigations operate in parallel to predicate crime investigations

Conclusion and Potential Next Steps

102. This study aimed to update our understanding of the financial flows from human trafficking. It also aimed to provide actionable ways forward for national authorities in improving their effectiveness in combatting ML/TF from the proceeds of human trafficking. While the goals of this study have been fulfilled, the study has also identified other opportunities for the global network to improve its effectiveness in the future, once time has passed and more information is available, on the following areas of work:

- Developing a better grasp of the proceeds derived from human trafficking for forced labour cases when assets are immediately identifiable;
- Developing a global estimate of proceeds derived from human trafficking for the removal of organs;
- Mapping and profiling the actors/roles involved in human trafficking for the purpose of the removal of organs, and identifying how their unique financial flows can aid in the detection of HTRO; and,
- Identifying cases of the proceeds of human trafficking contributing to terrorist activity financing to determine how proceeds are realized and used.

103. As seen in this paper, human trafficking is an offence with diverse financial flows, and where proceeds are realised differently across the world, and across the various types of human trafficking. Because of these significant differences, the findings of the international community are one aspect of what is required by national authorities to improve their effectiveness in combatting ML/TF from human trafficking. The FATF encourages all jurisdictions to better understand their ML/TF risk, share the results with relevant stakeholders, and consider implementing some the good practices identified in this report, where relevant. In addition, jurisdictions should work to better understand the challenges they have in effectively detecting, investigating and prosecuting ML/TF from human trafficking, and implement practices to overcome these challenges.

Annex A. Additional Case Studies

Human Trafficking for Sexual Exploitation

Case Study 13.

A financial institution submitted a STR on Subject A regarding financial activity occurring in Subject A's account related to possible HTSE. Subject A received an email money transfer from Subject B, who was previously reported for movement of funds and account activity indicating HTSE. Subject A's account was primarily funded by transfers from linked accounts, direct deposits, and email money transfers. Incoming email money transfers were primarily from men and outgoing email money transfers were to individuals previously unknown to the financial institution. Funds were utilised for point-of-sale transactions and included local transportation purchases and accommodation transactions.

Through the analysis of the transactions by the previously unknown individuals above, it was uncovered that they were withdrawing the funds from their personal accounts and depositing them into the accounts of 3 cash-intensive businesses to launder the proceeds of the HTSE offence.

Source: Canada

Case Study 14.

Person A was the head of a HTSE syndicate which was trafficking female victims from County X to Country Y, both located in Asia. Person A was from Country X but living in Country Y, and sought and recruited young female victims from Country X and promised them a high salary to work in Country Y. When the girls arrived in Country Y, Person A sold them to traffickers and earned USD 4,376 per Person.

To launder the proceeds of HTSE, Person A sent money to his father's bank account in Country X. To launder the proceeds from HTSE, Person A's father opened and operated a small clothing shop that had a very small customer base.

Case Study 15.

A criminal group used legitimate business activities such as bars/night club services to cater to the needs of their clientele wanting to engage in adult entertainment. Suspects were arrested and charged after promoting and hosting what was referred to as a 'vice party' for which an entrance fee of TTD 200 (USD 30) per person was requested from patrons to contribute to forced sexual activity. The suspects were also found to be involved in promoting brothels (prostitution), child prostitution and other HT related offences.

The proceeds derived from the predicate of HT were laundered using 'legitimate' cash intensive business entities such as restaurants & bars. In some instances STR's were received indicating high value cash deposits into the accounts of the suspects. In one case an analysis of accounts held by a suspect revealed that there was an increase of cash deposits by as much as 485% over a two-year period. Funds were laundered through the accounts of third parties, payments of credit facilities and for personal expenses.

Source: Trinidad and Tobago

Case Study 16.

Investigators were asked by a local-level government to investigate possible sex trafficking in residential areas. Investigators used account tracking warrants and warrants for search and seizure of property as part of the investigation. The suspects used mobile phones registered under other people's names and changed the phones regularly. The suspects concealed the proceeds of crime by keeping the money in a bank account under a third party's name. The suspects also bought gold bars with the proceeds.

Case Study 17.

A police investigation was conducted on an organised group profiting from sexual exploitation of foreign women in Spain. The police investigation was focused on a number of members of the organised criminal group. The different roles of the members of the criminal organisation were identified through the law enforcement investigation which acquired evidence that some members were involved in activities centred around controlling the victims, others on ensuring that they obtained money and work as required, and others focused entirely on the proceeds derived from their criminal activity.

The proceeds of HTSE were mainly in cash and operations of this network were detected through money remittance companies, highlighting the

following financial activities:

- Small amounts of money were sent abroad through money remitters by victims to their countries of origin.
- Some of the addresses in the country of destination were identical across multiple conductors.

Small amounts of money were sent at domestic level by the members of the criminal organisation and by the victims, who both reported an identical address.

Source: Spain

Case Study 18.

Young women from rural villages in West Africa are recruited to travel to Europe for a better life and to escape the economic and political hardship in their homeland. Recruiters or 'madams' use various coercion and deception tactics to consolidate the exploitative relationships. Once victims arrive at their destination in Europe, they are often bought and sold to criminal groups for sexual exploitation. Victims are also debt bonded to their traffickers for up to EUR 70 000.

Indicators for this typology include:

- Victims and 'madams' are known to use intermediaries with legitimate identification documents to facilitate the electronic transferal of funds via a money service business to Nigeria.
- Using intermediaries to allow for smurfing of funds.
- Perpetrators unable to suitably provide evidence of any legitimate income and/or struggle to prove that the money has a legal source.

Source: Nigeria

Case Study 19.

An investigation was initiated into the activities of a Romanian organised crime group who is suspected to be engaged in the trafficking of human beings into Ireland for the purposes of sexual exploitation, property crime and blackmail. Victims initially engaged with the NGO sector who reported it to An Garda Síochána through an established framework.

It is suspected that the group is engaged in using family networks and financial institutions and in some cases the victims of human trafficking for sexual exploitation are being used to traffic proceeds of crime out of the jurisdiction. At an early stage, financial investigations supported the identification and the movement of people and monies associated with this crime.

Source: Ireland

Case Study 20.

An operation was established by the An Garda Síochána to conduct an investigation into trafficking in human beings from Nigeria into Ireland for the purposes of sexual exploitation. The group is comprised of suspected offenders residing in both Ireland and the United Kingdom who engaged in the trafficking of young females from Nigeria into Ireland. Victims initially engaged with the NGO sector who reported it to An Garda Síochána through an established framework.

It is suspected that the group engaged in using family networks, financial institutions in numerous jurisdictions to move proceeds and in some cases the victims of human trafficking for sexual exploitation are being used to traffic proceeds of crime out of the jurisdiction. At an early stage, financial investigations identified and established money flows in a number of jurisdictions by submitting financial enquiries.

Source: Ireland

Case Study 21.

The Spanish police started an investigation into an organised criminal group in Spain trafficking women for sexual exploitation from Eastern Europe and South America.

The criminal organisation owned several nightclubs in the South of Spain and incorporated more than thirteen front companies to launder the proceeds obtained from human trafficking. During the police investigation the FIU received several STRs related to one of the front companies of the organisation. The suspicious transactions were mainly cash deposits below the customer identification threshold in the bank accounts of those companies. The bank accounts of the nightclubs showed mainly credit cards payments in exact amounts and a low volume of cash operations. Afterwards the money was withdrawn in cash in other regions of Spain and the operations were supported with false invoices linked to construction activities.

The exchange of information between the FIU and the investigative police unit fostered collaboration at an early stage. This resulted in the police unit leveraging FIU-disclosed information to uncover new operations and new branches of the organised criminal group conducting HTSE.

Source: Spain

Case Study 22.

In 2015, a federal jury convicted Hortencia Medeles-Arguello (aka "Tencha") of conspiracy to commit sex trafficking, conspiracy to harbour aliens, aiding and abetting money laundering, and conspiracy to commit money laundering.

The convicted defendants in this sex trafficking scheme owned, controlled, participated in, and operated bar/brothels where they charged entrance fees and sold drinks to customers. However, the conspirators mainly profited by offering young, undocumented Mexican women and girls for commercial sex at these establishments. The typical bar/brothel operated by the defendants would consist of a bar on the first floor and rooms on upper floors for customers to engage in commercial sex with the victims. The amount of money charged for a commercial sex act would vary from USD 65 for fifteen minutes to up to USD 500 per hour for illegal sex acts with minors.

The criminal organisation relied on pimps known as "padrotes" to recruit, smuggle, and supply the young women and girls, coerce them into engaging in commercial sex thereby generating proceeds for their illegal enterprise. Padrotes also rented out the bar/brothels, which generated additional income for Tencha.

The undocumented Mexican nationals "employed" at the defendants' establishments were compelled into commercial sex acts through the use of force, fraud and coercion. For example, the women and girls were placed in locked rooms to main control over them, and the defendants used violence to punish and control them.

Tencha recruited or directed family members, friends, and others to serve as employees at the bar/brothels. There were a number of co-defendants who managed the bars and had a role in moving and disguising the proceeds. Other managers provided false/fraudulent identifications (e.g., social security cards and Texas identification cards) to employees, including the females working at Las Palmas II. The bar managers paid Tencha USD 20 000 each week out of the money received from the operation of the Las Palmas I and kept all the monies received in excess of that amount.

To conceal the illegal proceeds derived from the sex trafficking enterprise, Tencha and others, including her family members, would obtain cashier's checks in amounts less than USD 10 000 (in order to avoid bank reporting requirements). One of Tencha's daughters who worked as a bartender assisted in counting the proceeds obtained from Las Palmas II. She also negotiated cashier's checks. The money used to obtain the cashier's checks came from the sex trafficking violations occurring at Las Palmas II. Tencha also held the physical property in the name of a nominee (her daughter), in order to conceal the true ownership and nature of the premises.

Tencha was sentenced to life in federal prison on 20 January 2016. A total of 13 additional defendants pleaded guilty to similar offences, including money laundering, for helping Tencha keep track of her profits, including by

investing proceeds in properties purchased by Tencha in the Houston area.

As part of the sentence, 15 real properties and other assets (valued at USD 2.5 million) were forfeited to the United States because they were acquired with the proceeds of sex trafficking. The forfeited assets have been used to make restitution to the victims of this crime. Tencha was also ordered to pay approximately USD 840 000 in restitution. Additional co-defendants were ordered to pay restitution amounts of USD 530 000, USD 570 000, USD 530 000, and USD 160 000, respectively.

Source: United States

Case Study 23.

In May 2015, Eric Omuro was sentenced to 13 months in prison following his conviction for the use of a facility of interstate commerce to facilitate prostitution. Omuro was the operator of the website myredbook.com. According to information available on that website as of the date of its seizure by the FBI, myredbook.com purported to provide "Escort, Massage, and Strip Club Reviews". Instead, however, the website hosted advertisements for sex workers, complete with explicit photos, lewd physical descriptions, menus of sexual services, hourly and nightly rates, and customer reviews of the sex workers' services.

Although the website could be accessed for free, myredbook.com charged fees for premier placement of prostitution advertisements and for "VIP Membership," which purportedly allowed customers access to "private forums" and to search reviews of the prostitution services. According to an affidavit submitted in connection with the sentencing hearing, the FBI identified more than 50 juveniles who were also advertised on myredbook.com for the purpose of prostitution. Co-defendant Annmarie Lanoce pleaded guilty to assisting Omuro with the operation of the myredbook site pursuant to a diversion program that ran into 2016. At sentencing, Omuro was ordered to forfeit more than USD 1.28 million in proceeds from his operation of the site.

Source: United States

Case Study 24.

In April 2016, law enforcement agents from Homeland Security Investigations (HSI) in El Paso, Texas, responded to a call made to local police regarding a woman who was being forcibly held by an individual identified as "Tae" at a motel. Two adult victims were discovered by officers who searched the motel room. Police located and stopped a suspect vehicle in the area and identified the driver as William "Tae" Harris. Police searched Harris and found a semi-automatic firearm. Harris was traveling with an associate, Dean Hall, and police determined that both subjects were

members of the West Side City Crips gang from Phoenix, Arizona.

The subsequent HSI investigation revealed that the victims came from Arizona with Harris and Hall. The victims were forced into prostitution and beaten and suffered threats of violence. HSI determined that at least three other West Side City Crips were operating a prostitution scheme in El Paso on the same weekend that Harris was stopped. During a forensic extraction of Harris' mobile phone, HSI discovered Bitcoin transaction data was able to exploit Harris' Bitcoin wallet information. Evidence revealed that the group's illicit activity revolved around the purchase of Vanilla Visa pre-paid credit cards, which were then used to purchase Bitcoin on the Paxful virtual currency exchange. Those Bitcoin were used to purchase prostitution ads on Backpage.com. Furthermore, during Harris' prosecution, HSI uncovered and disrupted an attempted murder-for-hire in which Harris planned to have a key witness and her sister murdered.

In January 2018, Hall and Harris were convicted and sentenced for violating several anti-trafficking statutes, including interstate transportation for prostitution, sex trafficking, felony in possession of a firearm and murder for hire.

Source: United States

Human Trafficking for Labour Exploitation

Case Study 25.

A case concerning Polish and Romanian bogus self-employed workers was opened following the findings of the Belgium's Financial Intelligence Processing Unit concerning a company's suspicious transactions. The main defendant managed a company specialising in building works. He had set up two British companies which, in turn, set up two other companies. Romanians were then employed as limited partners or associates in the structure of these last two companies. They worked mainly as subcontractors for the main company.

The Romanian workers were unaware of their roles as managers-partners of the company and were therefore employed as self-employed workers, earning EUR 8 per hour. Through this wage, the Romanian workers were required to pay social and tax contributions, as well as rent for accommodation.

Investigators used money tracking techniques to identify the perpetrators, criminal organisation elements, and to analyse the network. Over the course of this case's financial investigation, investigators queried banks and money transfer agencies, conducted wiretaps to track the defendants' investment and identify local hawala bankers and analysed the role of construction companies and accountants.

The defendants of the case were prosecuted for human trafficking for the

purpose of labour exploitation (conditions contrary to human dignity), with aggravating circumstances. The defendants were also prosecuted for participation in a criminal organisation, forgery and the use of forgeries, breaches of the income tax code, money laundering and fraud.

Source: Belgium; MYRIA: Trafficking and Smuggling of Human Beings Annual Report 2016

Case Study 26.

Three Romanian nationals, two males and one female, trafficked 22 male Romanian nationals into Europe for labour exploitation. The female offender was the partner of the male primary offender, and sister of the other offender. Economically vulnerable victims were recruited in a rural area in Romania, and were promised EUR 400 per week, to work eight hours a day, with food and accommodation provided. Upon arrival all victims had their passports taken, were required to sign a waiver to the EU working time directive, and sign transfer forms for their wages to be transferred into the primary offender's bank account. Fifteen of the victims were housed in a 3-bedroom property, sharing a single toilet and shower. They slept on mattresses on the floor. The male primary offender provided minimal food (such as a salami and two loaves between 15 people), and told the victims to eat stones if they were still hungry. He controlled them primarily through threats of violence and debt bondage. The primary offender acted as an unlicensed gangmaster, booking agricultural work for the victims at legitimate recruitment agencies for minimum wage, but then forcing them to work for over 12 hours a day for multiple agricultural businesses. These businesses were not aware of any exploitation having taken place. One victim worked for 68 hours a week and another for 18 days in a row. Frequent use of cheques was made to pay offenders and withdrawals were made rapidly after payments had been received, often from the same location. The primary offender made over EUR 1 000 a week in this way. The other male offender lived with the victims and assisted in monitoring and controlling them. As a result, he was allowed to keep his entire wage.

The exploitation was identified when four victims reported it at a police station, and identified the primary offender. The primary male offender was convicted of trafficking people and conspiracy to traffic people, and was sentenced to 2.5 years in prison. The other was convicted of conspiracy to traffic people. The female offender was given a suspended sentence of 2 years for acquiring and converting criminal property in the form of the victims' wages.

Source: United Kingdom

Case Example 27.

This case relates to slavery in Asia-Pacific waters by foreign charter vessels and is a combination of observed typologies which demonstrates the number of potential entities in multiple jurisdictions involved HTFL in the fishing industry.

To fish a particular region, fishing companies must go through a standard process to secure the appropriate licenses, vessels, crew, and quota. If a Northeast Asian based fishery wishes to fish in South Pacific waters, they contact a South Pacific local corporate to help arrange a quota and chartering agreement. In this arrangement, the local South Pacific corporate holds the quota allotment for the country's EEZ. They also own boats locally that are available for charter. In this case, the Northeast Asian based fishery contracts with the local South Pacific corporate for part of its quota and management of its fleets.

The boats and above deck crew are supplied by the local South Pacific corporate, often the same nationality of the true boat owner. However, the Northeast Asian based fishery contracts with a recruitment agency to find the below-deck crew. This agency may be legitimate, but others lie to jobseekers, deceive them, or steal their money. These crew members are often of a different nationality from the boat owner and above deck crew.

While on board, men who have lost their basic freedom suffer a series of indignities and abuse. The fish caught by these men are sent to market; processed at a fish processing factory; sold to food distributors; and moved to restaurants and grocery stores worldwide. Revenue from the sales of the slave-caught fish makes its way back to the Northeast Asian based fishing company, often in USD, processed through the international finance system.

The various parties involved all have been complicit in either directly facilitating or indirectly financially benefiting from this incidence of HTFL.

The following issues were identified:

1. **Direct -** Those financial institutions banking the entities that are directly facilitating HTFL may be at risk from handling and facilitating the proceeds of human trafficking.
2. **Indirect -** Entities indirectly involved i.e. involved in the global supply chain in purchasing/importing/exporting/using/selling goods produced from forced labour.
3. **Correspondent Banking -** Facilitating payments on behalf of financial institutions that may be directly or indirectly involved (payments between 1 and 2).
4. **US Clearing -** Handling USD clearing payments; facilitating trade payments in global supply chain for products from slavery.
5. **Exposed Industries/Players -** Fishing companies, fish processing companies, quota holders, vessel owners, vessel operators, vessel charterers, recruitment agencies, seafood markets, seafood distributors, grocery stores, restaurants.
6. **Trade Based Money Laundering -** Often, in association with incidences of HTFL,

in order to hide the use of slaves, company staff will maintain false ledgers of time sheets, take production logs (in this case catch logs), falsify shipping documents to show compliance with local laws and tariffs. Closer inspection will reveal that often the information on the documents does not match with other sources of information.

Source: Liberty Asia

Case Study 28.

The case started in 2014 after a labour union reported its concern of labour exploitation to the police. The union represents workers with little or no education. They were concerned because they suspected that several companies in the cleaning and transport industries in the Oslo area were using legal corporate structures for criminal activities and labour exploitation.

The Financial Intelligence Unit started a preliminary investigation and found that the companies and people mentioned in the report had a history of bankruptcies, and the FIU had received several reports of suspicious transactions from the bank system regarding a large amount of cash withdrawals from bank accounts. There were also several concerns about possible labour exploitation registered in the police intelligence system. An investigation team was put together with investigators from the National Criminal Investigation Service (NCIS), the National Authority for Investigation and Prosecution of Economic and Environmental Crime (ØKOKRIM) and the tax authorities.

An organised criminal group (OCG) operated businesses in the cleaning and transport industries. They also controlled other companies that they set up in other people's names. These companies were fronts with no actual business operations. They were created to send invoices for fictional services and to have fictional employees. The cash flows through the companies' bank accounts were controlled by the OCG. The people doing the actual work were not registered workers. They were vulnerable people whose labour was exploited, and some of them stayed in Norway only for a short period. They knew very little about how the Norwegian system works and they were followed around and "helped" by the OCG whenever they were in contact with Norwegian authorities and the banks.

Over the course of the investigation, it was revealed that the organised criminal group (OCG) was also involved in obtaining around NOK 30 million in bank loans on false premises. People in a vulnerable situation were exploited to apply for loans and the OCG falsified work contracts and pay slips that made it possible for them to be granted loans. The borrowers were not aware of how many loans were taken in their names. The funds were laundered by transferring the money back and forth between many different bank accounts before they were withdrawn in cash. While there was insufficient evidence found to pursue human trafficking for labour exploitation charge, the members of the OCG were prosecuted for tax fraud,

welfare fraud and bank fraud.

Risk indicators identified include:

- Small companies that go bankrupt within one to two years.
- Large amounts of cash being withdrawn from the companies' bank accounts or being transferred from the companies to private persons. Money received into private bank accounts is then immediately withdrawn in cash.
- Companies registered in the names of EU citizens that live outside of Norway. These EU citizens had origins from outside the EU.
- Employees who work for short periods before becoming ill and receiving welfare.
- Abuse of identities. In some cases we suspect that individuals were forced into signing applications for and taking up bank loans. In other cases people were sent from other European countries to start up a company and open bank accounts; these then sold their identities.

Source: Norway

Case Study 29.

In 2016, a major case involving labour-market crime in grocery stores brought forth charges including aggravated human trafficking, social dumping, money laundering, bank fraud, social welfare fraud, tax evasion and threats. The defendants were investigated for excessive profit from running grocery shops, which normally would not have been as profitable if the business was run legally. Financial investigation revealed that the exploitation of labour in combination with unreported profit to IRS led to considerable illegal profits which were being used to reinvest in businesses.

The prosecutor has submitted confiscation claims totalling NOK 103 million and restraining orders amounting to about NOK 100 million on various properties to secure the confiscation claims against the defendants. As this is a very complex case, a judgement from the district court is expected in 2018.

Source: Norway

Case Study 30.

A male Vietnamese national trafficked at least three other Vietnamese nationals (two adult women and a 16 year-old boy) to work at his nail bar in Europe. The child had been transported to Europe from Vietnam through a long series of different transportation methods which were paid for by the trafficker, and had no idea what country he was in. The victims were housed in the offender's residence in a private housing estate. By opening bank accounts for the victims the trafficker acted as custodian, despite the fact that he was not related to any of the victims. Some of the victims were controlled

through debt bondage, and were paid only small or irregular amounts for their work for the offender in the nail bar; they were also forced to undertake domestic work for him. None of the victims' accounts showed evidence of payment of taxes or of other payments to a regulatory body typically associated with legitimate full-time employment of workers. They relied on the offender for their basic accommodation and food. Some victims had been in this situation for over a year. The child only received 'pocket money' for being a 'trainee' at the bar. As part of a larger operation, the police visited the offender's nail bar, and recovered the child victim, as well as gaining evidence of exploitation. They obtained a search warrant for the nail bar and the offender's residence, recovered the two female adult victims and arrested the offender. The offender was found guilty of Human Trafficking.

Case Study 31.

A man kept his wife in domestic servitude for two years. The victim was well-educated and from a relatively affluent family. The arranged marriage took place in Pakistan. When the victim arrived in the host country her husband reportedly told her that her only purpose was to look after him and his mother, who had ill health. The victim cooked, cleaned and did household chores for her husband and mother-in-law. She often worked 19 hour days and was unpaid, only being given £10 a month to top up her mobile phone. Her husband controlled her through a combination of fear, mental abuse and repeated physical violence. She was not allowed to leave the house unaccompanied or to make friends. In February 2014, the offender was taken into police custody after he was spotted pulling the victim back into the house by her hair. She was found to have a black eye and a broken nose, requiring surgery. The victim then signed a document asking for the offender's release, stating that she was not acting under pressure. The exploitation continued for 18 months, until the victim attempted suicide by taking an overdose of painkillers. She was taken to her brother-in-law's house for safe-keeping, and there notified the police of her exploitation by calling 999. This led to an 18-month investigation, which culminated in the offender being sentenced to two years.

This case highlights the difficulty in determining the material benefit gained through certain types of HTFL where the proceeds are indirect, gradual enrichment, or enrichment of an individual's lifestyle, but are not are realised in a singular material good.

Source: United Kingdom

Case Study 32.

A 13 year-old Romanian girl was trafficked to Western Europe by an organised crime group to undertake forced begging. Her father paid the gang 200 euros for this. She was driven to Spain and then flown to other Western European capitals, accompanied by one male offender. The victim used her own Romanian identity card to travel, but her flights were paid for by the offenders using a stolen USA credit card. The victim was placed with a male and female offender, and was instructed to call them 'aunt' and 'uncle'. The victim was driven by one offender 40 miles to another town, 5 days a week, where she was made to beg and sell unofficial copies of a charity magazine outside the entrance to a Post Office for over 7 hours a day. She was beaten and searched at the end of each day, and was not allowed to keep any of the money she had made. The offenders, who had no legitimate explanation for the repeated low value deposits, wired the money to Romania as soon as it was in their account.

The victim was poorly fed and clothed, and this was noticed by members of the public. She was also exploited for domestic servitude by the offenders, looking after their children. The victim was identified by the police during a raid following a large-scale investigation by the police into the trafficking of Romanian nationals to other European countries by an organised crime group for the purposes of forced criminality. She was placed into social services, and then returned to her mother in Romania. The victim gave evidence against her father and three other offenders who were convicted for trafficking a child for forced criminal exploitation. The father was sentenced to four years, served two, and then returned to his family (including the victim) in Romania.

Case Study 33.

Between October 2015 and January 2017, two Bulgarian men brought at least nine other Bulgarian individuals to Sweden with promises of construction or other jobs. The organisers' *modus operandi* was to target economically vulnerable individuals in Bulgaria, paying for their transportation to Sweden in order to put them in their debt. However, once the latter had arrived, it became clear that there were no jobs, and they were forced to beg on the streets (in Sweden, begging is not illegal). The two organisers made the nine individuals pay for transportation, food, housing (in dilapidated property) and for the "right" to beg in particular spots, collecting and keeping detailed accounts of the money from each person by the end of each day. The two men were apprehended in January 2017 and were later charged with trafficking and aggravated money laundering offences.

On a typical day, a beggar would earn about SEK 300 (~ EUR 30). The two organisers would collect the money, keeping detailed records of the beggars' earnings and of how much remained of their debt. The organisers would keep half of the earnings for themselves as payment for the "right" to beg in a particular spot, and deduct expenses as well as debt payments from the other half. During 2016 alone, the bank account of one of the organisers received cash deposits of about SEK 135 000. Funds from that account were transferred to other accounts or sent to relatives of the organisers (but not of the beggars) in Bulgaria via money transfer services.

In the prosecutor's estimation, 38 persons in total, over different periods in time, could have been forced to beg. The seized bookkeeping belonging to the two organisers, combined with other forms of evidence, suggest a grand total of about SEK 1 270 000 collected through begging during 2016.

In November 2017, the two men were convicted of the trafficking offence and were sentenced to 4 years and 2 months in prison followed by deportation. Just under SEK 120 000, an amount roughly equivalent to the recorded earnings of the beggars who were parties in this case, was confiscated in order to be returned to the beggars. A further SEK 340 000 SEK was awarded to the beggars in damages. The verdict has been appealed.

Case Study 34.

On December 18, 2017, two defendants plead guilty to an alien harbouring scheme involving labour exploitation at a Nebraska motel. According to documents filed in court, the defendants admitted to conspiring to harbour the victim, an Indian national who lacked immigration status, at a Motel in Kimball, Nebraska, between October 2011 and February 2013. During that time, the defendants required the victim to work long hours, seven days a week at the motel, performing manual labour, including cleaning rooms, shovelling snow, and doing laundry. Although the defendants promised to pay the victim, they never did, but rather claimed to apply that amount to a debt the victim owed. The defendants further restricted the victim's movement, isolated him, and verbally abused him.

The defendants face a possible sentence of up to 18 months in prison according to their plea agreements, and they are expected to be removed from the United States at the completion of their sentences. The defendants also paid the victim USD 40 000 in restitution at the change of plea hearing as a condition of their guilty pleas.

Source: United States

Case Study 35.

In 2015, two Ukrainian nationals were found guilty of conspiracy to participate in a racketeering enterprise in connection with a human trafficking scheme. The defendants, who were brothers, operated a human-trafficking organisation, the Botsvynyuk Organisation, for seven years which smuggled young Ukrainians into the United States and then forced them to work for little or no pay. The defendants promised the victims that they would earn USD 500 per month with free room and board by working for their organisation. In reality, they smuggled the migrant workers into the United States and put them to work as cleaners in retail stores, private homes, and office buildings—but did not pay them. The defendants used physical force, threats of force, sexual assault, and debt bondage to keep the victims in involuntary servitude. Even after some of the victims escaped, the defendants continued with their extortionist activities in order to recoup the organization's investment in the workers.

The Botsvynyuk Organisation also engaged in visa fraud by bringing the victims to the United States legally using tourist visas to travel first to Mexico and then coaching the workers on how to enter the United States illegally. While some of the victims successfully gained entry into the United States, others were taken into custody by US immigration officials, where they remained in detention for almost two months. Once the victims were released from US custody, with immigration documents and summonses to appear for immigration hearings, the Botsvynyuk Organisation transported them to Philadelphia, Pennsylvania, either by bus or by plane. The brothers then confiscated the immigration documents and summonses from the workers and put them to work cleaning large chain stores at night. Other members of the organisation would wire money to smugglers in Mexico and the United States to finance the journeys of the victims.

Omelyan Botsvynyuk was sentenced to life in prison plus twenty years and was ordered to pay restitution in the amount of USD 288 272.29; Stepan Botsvynyuk was sentenced to twenty years in prison and was ordered to pay restitution in the amount of USD 288 272.28.

Annex B. Indicators of Laundering the Proceeds of Human Trafficking

There are four considerations to note with respect to the indicators of laundering the proceeds of human trafficking identified in this study:

1. The indicators have been positioned to best identify those who are laundering the proceeds of human trafficking. From the cases that have been identified, the most unique and identifiable indicators of money laundering occur at the level of the victim, or at the lower level of criminality or individual criminals levels of the criminal organisation. The money laundering mechanisms utilised at the higher levels of the criminal organisation are already well identified in other, more general, money laundering typologies documents. This may make the indicators case studies have identified solely 'small time', lower value or local human trafficking networks. However, they are positioned deliberately in this manner to prioritise the ability to identify money laundering uniquely from human trafficking.
2. This study organises the indicators according to the three types of exploitation identified earlier in this study. These three classifications have identified unique indicators, and the granular ability to identify each will be helpful to reporting entities and operational authorities.
3. The identification of victims is one of the most reliable ways, when there is interaction with the financial system, to identify laundering the proceeds of human trafficking. This is particularly prescient for HTSE and HTFL when victims endure an extended period of exploitation under which perpetrators profit, whereas HTRO allows comparatively little opportunity to identify victims given that their exploitation, albeit horrible, is relegated to a singular experience. Reporting entities must take care that when identifying victims, they must either use the transactions of the victims to identify the perpetrators and launderers related to human trafficking, or to clearly identify to national authorities when they are reporting on suspected human trafficking victims.
4. Some indicators identified in the cases submitted to the study, and other material that was used to create this paper, are indicators that can be utilised to detect money laundering specifically from human trafficking. Other indicators demonstrated in the materials, which are indicators of general money laundering, have been identified by the global AML/CFT community previous to this study. These common money laundering indicators have been provided in a separate section below to be used in conjunction with the unique indicators of laundering the proceeds of human trafficking to provide reporting entities with national authorities with an enhanced ability to detect, using them in conjunction with each other.

Indicators of money laundering related to human trafficking

Indicators of money laundering of the proceeds of all types of human trafficking

- Common mobile number, address and employment reference being used to open multiple bank accounts in different names
- Customer makes deposits/withdrawals or otherwise generally operates an account accompanied by an escort, handler or translator (who may hold the customer's ID)
- High and/or frequent expenditure at airports, ports, other transport hubs or overseas, inconsistent with customer's personal use or stated business activity
- Income received and immediately withdrawn in cash
- Newly-opened customer account appears to be controlled by a third party, including forms completed in different handwriting and/or the customer reads their address from a form
- Payments to logistics, airlines, coach companies, car rental or travel agents inconsistent with customer's personal use or stated business activity
- Relatively high or recurrent expenditure on items inconsistent with customer's personal use or stated business activity, such as food, necessities, or accommodation for workers

Indicators of money laundering related to human trafficking for sexual exploitation

Indicators of money laundering unique to human trafficking for sexual exploitation

- Account holder contact information linked via open sources to advertising related to escort services
- Account is funded primarily via cash deposits and funds transfers from other individuals
- Addition of an unusual number of unrelated individuals as joint account holders, or authorised users of products such as credit cards
- Cash deposits conducted at different cities across the country
- Client makes deposits accompanied or watched by a third party who may, on separate occasions, accompany or watch clients who are making deposits: the third party may be handing over to the client what is subsequently confirmed to be the client's identification
- Credit card payments for purchases made after the establishments' normal hours of business (e.g. strip clubs, massage parlours, beauty salons, model agencies)
- Deposits conducted in one city followed by same-day or next-day withdrawal and/or purchases conducted in another city

- Frequent cash deposits made via an ATM rather than with a cashier, sometimes followed by ATM withdrawals in a different location
- Frequent low-value payments to advertisers, classified services involved in the sex industry or to escort agencies
- Frequent purchases in multiples of small amounts of Bitcoin or virtual currencies, directly by the client or through exchanges
- Funds transfers involving third parties with alternative names provided in brackets
- Hotel transactions by the same individual for two separate rooms for the same dates
- Identical address reported by numerous, seemingly unrelated, individuals
- Media coverage of account holder's activities relating to human trafficking in the sex trade and/or prostitution rings
- Multiple accounts making repeated transfers to the same third party, or multiple individuals reporting similar information (i.e. address, phone number etc.)
- Multiple low value remittances to jurisdictions known to be of a higher risk for HTSE
- Outbound international funds transfers directed to countries at higher risk for human trafficking or between two countries/areas on a known trafficking route
- Outbound international wire transfer in an amount commonly associated with a subscription or payment fee (i.e. 9.99 or 29.95) to a jurisdiction of concern for human trafficking, to a company with a name denoting its involvement in the provision of sexual services, or to a company with a name denoting involvement in the video industry between the hours of 10pm – 4am local time
- Payments to hotels, serviced apartments and other accommodation inconsistent with customer's personal use or stated business activity
- Personal account activity inconsistent with expectations involving frequent deposits and payments through an online payment service in small amounts typically under USD 100; account funds may then be used for virtual currency deposits/redemptions, or payment of bills, such as personal or third-party credit cards
- Recurring payment for transportation or logistics services in the late night or early morning
- Significant payment for transportation or logistics (car rental, taxi, and/or ride sharing service transactions)
- The use of cash intensive legitimate businesses (bars, restaurants, guest houses, etc.) for apparent daily sustenance

- Transactions conducted in an area suspected to be a sex trafficking location (possible 'hot spot')
- Transactions with classified advertising services involved in the sex industry or to escort agencies
- Use of a third party to execute transactions (for example, under the pretext of requiring an interpreter)
- Use of addresses where prostitution is reported to occur by media, law enforcement, or classified ads
- Use of aliases for the purpose of opening multiple accounts in different banks, or in different branches of the same bank
- Use of someone else's identification, or opening an account in the name of an unqualified minor

Indicators of money laundering related to human trafficking for forced labour

Indicators of money laundering unique to human trafficking for forced labour

- A high percentage of income withdrawn quickly after receipt in the accounts
- A property, when looked at on Google Street View, could only comfortably accommodate two or three people at the most, but seems to have more people living there
- Analysis of ATM activity shows that their ATM usage often occurred at the same machine at the same time suggesting that a third party is in control of their cards
- Customer displaying a poor standard of dress and personal hygiene
- Lack of living expenses such as food, petrol, utilities and rent (one utility may be set up for the purposes of confirming ID for account opening)
- No evidence of payment of taxes or of other payments to a tax authority or other government or regulatory body typically associated with legitimate full-time employment of workers
- One-way flight purchase from high-risk country by non-family member
- Payment for visa by non-family member
- Payments to labour agencies, recruiters or employment websites, especially if those entities are based overseas
- Personnel numbers and costs, if known through the provision of information by the entity, is not in line with wages paid out, or what you know of the entity
- Repeated (at least weekly) transfers of funds to the same third party (where known), often in round amounts
- Reports or indication of cheap labour or unfair business practices towards an entity

- Signs of bruising or other physical abuse on customer
- The customers receive weekly incomes from an agency
- Use of an interpreter at account opening or for conducting transactions

Indicators of money laundering identified in suspected human trafficking cases which common across different predicate crimes

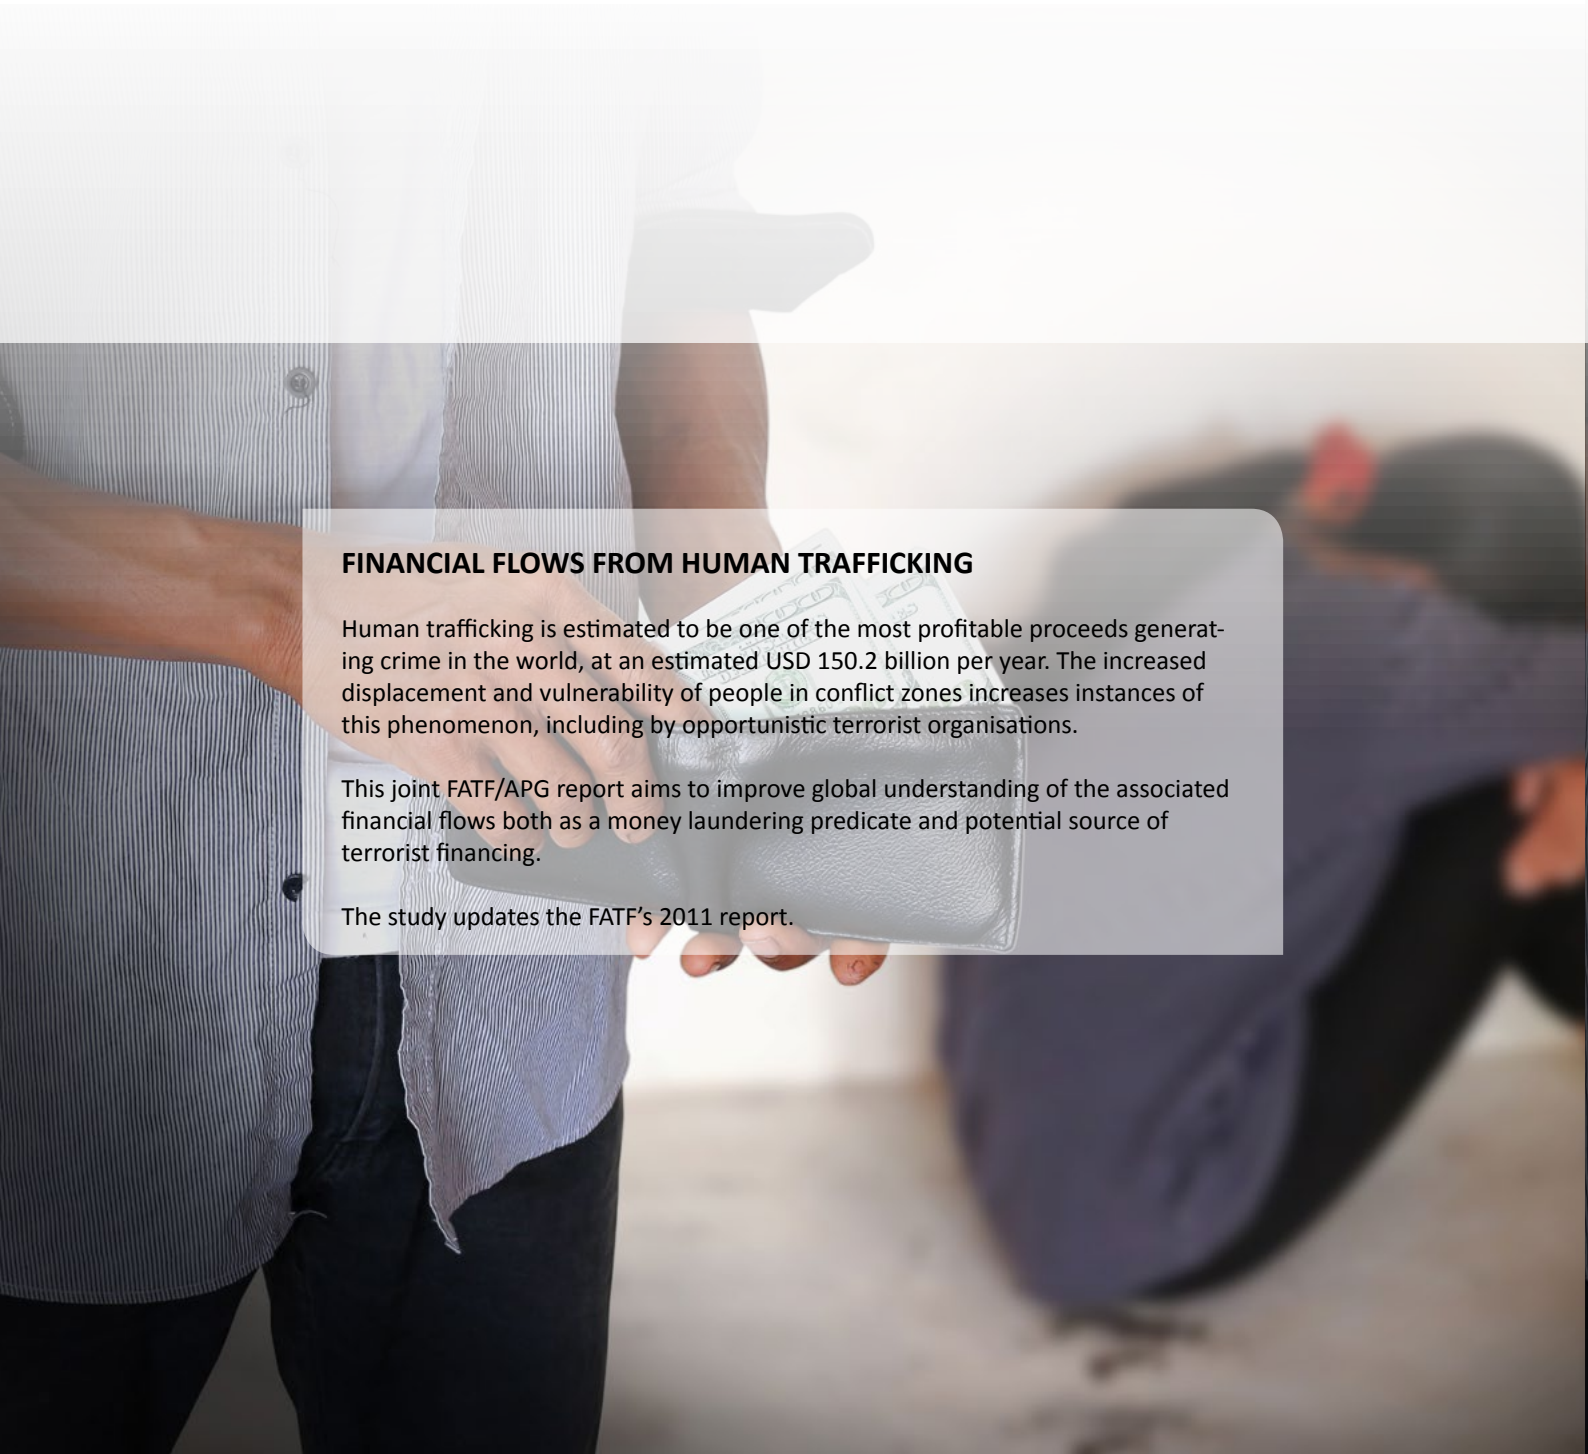
- Account appears to function as a funnel account
- Cash-intensive business with unclear source of cash or capital
- Commercial entity's capital consists of no-term deposits
- Cross-border transfers of funds to the same individual, financial institution or to an overseas location that are inconsistent with customers' personal profile or stated business activity
- Customer accounts which display unusual withdrawal patterns, such as lump sum withdrawals
- Customer requesting direct payment in a branch, as they have not been receiving their wages
- Customer's accounts display unusual deposit or withdrawal patterns, in other regions and overseas
- Deposits and/or other transactions inconsistent with what could be reasonably expected for the customer's personal profile and/or stated occupation
- Deposits much larger than are usual or reasonably expected for the customer's personal profile and/or stated occupation
- Frequent low-value/below threshold cash deposits in low-denomination bank notes
- Funds transfers received from or to the benefit of unrelated third parties
- Inability to contact client at their reported phone number, or the phone number changes very frequently
- Income received and immediately withdrawn in cash
- Incurring and payment of credit facilities or credit card charges not commensurate with the client's confirmed wealth
- Large cash deposits into an account quickly followed by electronic funds transfers, bank draft purchases and/or the issuance of cheques
- Large cash or cheque deposits followed by domestic wire transfers or cash withdrawals
- Loans provided by a shareholder to the related legal person and subsequent transfer back of funds
- Media or other reliable sources suggest that a client may be linked to criminal activity which could generate proceeds of crime

- Multiple deposits from varying geographies and apparent different individuals, consistent with smurfing
- Numerous personal cheques deposited into business accounts for no apparent purpose
- Numerous transfers into business accounts from personal accounts
- Profits or deposits much larger than are usual or reasonably expected for the customer's size or type of business, or where financial turnover is incommensurate with the commercial turnover usual for a business of that size or type
- Purchase of commodities in manners inconsistent with normal business practice
- Rapid transfers of funds through accounts
- Small irregular payments from the same account
- Source of funds used for transactions is unknown
- Structuring via commercial entities and transfer of money using loan contracts
- Transactions with apparent front, shell or shelf companies
- Use of a third party, with no apparent relationship to client, to conduct financial transactions
- Use of third-party accounts

Annex C. National actions to consider to ensure an effective system in combatting money laundering/terrorist financing from human trafficking

The following is an abridged version of the good practices identified in the FATF's 2018 *Financial Flows from Human Trafficking* report. National authorities may wish to consider adopting some of these practices to improve the effectiveness of their efforts to combat money laundering and terrorist financing from human trafficking.

Develop Understanding of Risks of ML/TF from Human Trafficking	• National regime creates an inclusive partnership with the private sector and civil society to ensure that all threat and risk information is available to those that need it, within the bounds of national privacy laws. • National regime conducts a granular assessment of the risks of ML/TF from human trafficking, reflecting the diverse types of human trafficking exploitation.
National Coordination to Combat ML/TF from Human Trafficking	• A national action plan to combat the identified ML/TF risks from human trafficking sets out responsibilities and commitments of public stakeholders, and private sector/civil society actors (where relevant). • Training is provided to specialists combatting ML/TF from HT – abridged training available for generalists who may be implicated.
Information is Shared Across all Relevant Stakeholders Combatting ML/TF from Human Trafficking	• Strategic perspective of human trafficking in national context and assessment of ML/TF risks shared with all relevant stakeholders. • Country-specific indicators of ML/TF from human trafficking developed and shared among public/private/civil society sectors. • Open source information is used to identify potential cases of ML/TF from human trafficking in a coordinated manner. • National authorities share information across the regime.
Information is Readily Identifiable to Authorities Combatting ML/TF from Human Trafficking	• The private sector submits STRs on those laundering the proceeds of human trafficking, even when the victims of human trafficking may display the financial flows most unique to human trafficking. • Suspicious transaction reports identifying potential ML/TF from human trafficking are appropriately identified via tick box or textual indicator.
Law Enforcement Authorities Working in a Coordinated Manner	• Law enforcement conducts a parallel money laundering investigation to human trafficking investigations. • Multi-agency task forces are used to coordinate enforcement and intelligence resources to combat ML/TF from human trafficking.
Leverage International Information and Good Practices	• Informal assistance channels are used early in investigations, and responses are provided to formal and informal assistance requests with expediency. • Good practices from counterparts and international organisations are considered for implementation into national regime. • Technical assistance is provided in a coordinated and sustainable manner.



FINANCIAL FLOWS FROM HUMAN TRAFFICKING

Human trafficking is estimated to be one of the most profitable proceeds generating crime in the world, at an estimated USD 150.2 billion per year. The increased displacement and vulnerability of people in conflict zones increases instances of this phenomenon, including by opportunistic terrorist organisations.

This joint FATF/APG report aims to improve global understanding of the associated financial flows both as a money laundering predicate and potential source of terrorist financing.

The study updates the FATF's 2011 report.

FATF REPORT

Money Laundering Through the Physical Transportation of Cash

October 2015

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

For more information about the Middle East & North Africa Financial Action Task Force (MENAFATF), please visit **www.menafatf.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

EXECUTIVE SUMMARY

Despite the increasing prevalence of non-cash payment methods in developed economies, cash remains an important means of settlement across the globe, with an estimated USD 4 trillion in circulation and between 46% and 82% of all transactions in all countries being conducted in cash.

Similarly, cash is still widely used in the criminal economy and it remains the raw material of most criminal activity. In many cases, even when the proceeds of a crime are initially generated in electronic form (such as the theft of funds from a bank account), criminals choose to withdraw the funds from a bank account in cash, transport it to another country, and pay it into another account in order to break an audit trail. The physical transportation of cash across an international border is one of the oldest and most basic forms of money laundering[1], but this report shows that it is still widespread today. There are no fully reliable estimates for the amount of cash laundered in this way, but the figure would seem to be between hundreds of billions and a trillion US dollars per year. The majority of countries surveyed during the compilation of this report were of the opinion that cash smuggling is an increasing problem.

Physical transportation of cash as a method of money laundering is not restricted to a particular type of crime. Although many jurisdictions report the use of this typology by drug trafficking organisations, it is also linked to the illegal trafficking of other commodities, such as alcohol and tobacco, and it is also used widely by criminals involved in other activity including tax fraud, weapons and arms smuggling, organised immigration crime and the financing of terrorism. There are no cash smuggling methods more associated to one form of criminality than another, and no guarantee that criminals committing the same type of crime will move their proceeds in the same way and by the same route.

Instead, the methods used to physically transport criminal cash are dependent on a decision making process undertaken by the criminal. This process begins with the criminal deciding what the purpose of the cash movement is (for example, to break the audit trail, to pay a supplier, to bank it in another jurisdiction etc.). This will dictate the ultimate destination, which will in turn inform the method used, and ultimately the route chosen. At all stages, influences such as risk, familiarity, simplicity and the demands of partners will affect the decisions made. Understanding the decision making process can assist in developing control techniques by authorities tasked with combatting the problem.

Once the cash has been moved to its destination and used for its intended purpose it will eventually enter the legitimate financial system and will be recycled by banks and other financial institutions. Countries that use their own unique currency have the opportunity to monitor the repatriation of their currency from overseas, and while this is by no means straightforward, proper analysis can in some cases identify high risk routes, money laundering networks and drive national programs to raise awareness of risk.

[1] Techniques which can be used for money laundering, can also be used for terrorist financing (see Box 31), so the report is also of interest for combating terrorist financing.

Key findings:

Notwithstanding the influence of criminal decision making on the methods used, some common features and trends emerge from the study of the information gathered during the compilation of this report.

- The use of physical transportation of cash distances the criminal proceeds from the predicate offence that generated them, and breaks audit trails.
- The amounts of cash being concealed in cargo and adapted freight being far in excess of what can be carried by a natural person.
- The currencies most frequently encountered in consignments of criminal cash – the US dollar, the euro, the British pound, the Swiss franc, etc. – are the most stable, widely used and readily traded in the world
- Although by no means universally seen, high-denomination notes are often used to reduce the bulk and weight of criminal cash when concealment of the cash is a prerequisite to smuggling it
- Criminals exploit mechanisms of cash declaration systems, particularly as a method of lending a veneer of legitimacy to criminal cash introduced into the legitimate financial system
- Because of the legitimate demand for cash, it is moved in huge quantities on a daily basis across the world, by natural persons (whether carried on their person, in their personal effects, or in a vehicle), in cargo and mail. However it appears that although most countries have a reasonable knowledge and understanding of transportation of cash by natural persons and have comprehensive measures in place to monitor and control this issue, substantially less have any appreciation of the legitimate movement of cash in cargo and mail, and pay little attention to this phenomenon despite the amounts moved in cargo being much larger than those being moved by natural persons. A possible reason for this lack of knowledge is that although FATF Recommendation 32 sets standards for the control of physical cross-border transportation of cash by natural persons, cargo and mail, its focus on 'natural persons' may help explain why many jurisdictions seem to consider that their obligations under this recommendation to be limited to having in place a disclosure or a declaration system for transportation of cash by natural persons only.

  When transported in cargo, cash is treated as a form of goods and in most cases only a basic customs declaration is required – most countries do not require a specific cash declaration in addition to the normal customs declaration. The amount of detail required on this declaration is minimal – not even the actual value of the cash is required – which means that, in most cases, there will be insufficient information available to customs to form a view on whether the shipment is suspicious or not. Some countries noted that this absence of ability to form a suspicion restricted the ability of their

customs authorities to open and inspect shipments, require the provision of further information and exercise effective control of cash in cargo.

These factors can significantly hamper efforts to identify consignments of criminally derived cash. There are indications from research carried out by some countries that criminal groups have become aware of this and seek to infiltrate large amounts of cash into the legitimate system used by banks and other financial institutions to transport cash traded between themselves, effectively hiding it in plain sight.

Every physical transportation of cash across international borders involves at least two countries, and most of those surveyed raised the importance of effective international co-operation in controlling the phenomenon. Countries need to make every effort to share information and intelligence and facilitate the gathering of evidence by international partners in order to ensure that efforts to combat money laundering are not hampered unnecessarily. Similarly, in many countries several agencies need to work together to control borders and it is of paramount importance that these agencies are not hindered by issues such as poor communication and co-ordination of resources.

1. THE SCOPE AND EXTENT OF THE PROJECT

1.1 THE BACKGROUND TO THE PROJECT

Cash remains a significant raw material for criminal groups and is used by choice as an anonymous financial instrument by a wide range of criminals, even in complex money laundering systems.

Physical transportation of cash (i.e. bulk cash smuggling (BCS) and cash couriers) as a means of money laundering continues to be a problem in many countries worldwide. It is an issue that concerns both developing countries with cash based economies as well as countries with developed and sophisticated financial systems. Despite there being an incomplete understanding of the issue globally, responses to the questionnaires imply that the increasing robustness of Anti Money Laundering (AML) regimes in the financial sector has led to the increasing prevalence of physical transportation of cash as an alternative method to move the proceeds of crime and ensure its security by keeping it away from the traditional financial system. Criminals who need to make use of their ill-gotten gains are looking for options as more preventive measures are implemented by the traditional financial sector.

Having adequate measures in place to detect and prevent illicit cross-border transportation of cash and bearer negotiable instruments (BNIs) is a requirement of all countries. It is covered by Recommendation 32 of the FATF standards[2], and the associated interpretive note, which defines physical cross-border transportation as '… any in-bound or out-bound physical transportation of currency or BNIs from one country to another country. The term includes the following modes of transportation:

- physical transportation by a natural person, or in that person's accompanying luggage or vehicle;
- shipment of currency or BNIs through containerised cargo or
- the mailing of currency or BNIs by a natural or legal person.'

To date, there has been no global study and typology report issued by FATF dedicated to BCS and cash couriers. However, the issue of BCS and cash couriers has been referred to in a number of FATF typologies reports in addition to the FATF international best practices paper *Detecting and Preventing the Illicit Cross-border Transportation of Cash and Bearer Negotiable Instruments*, published in February 2010. The issue of physical transportation of cash has also been referred to in some studies conducted by FATF-style regional bodies (FSRBs) and the Egmont Group. This paper is intended to complement, not replace, the 2010 FATF best practices paper. While the 2010 paper sets out a range of policy responses, this paper is intended to develop the knowledge base about the methods and trends used by criminals to smuggle cash to further inform policy work in this area.

[2] The FATF Standards comprise the FATF Recommendations and their Interpretive Notes.

The project was proposed by the Middle East and North Africa Financial Action Task Force (MENAFATF) secretariat and the Netherlands authorities and adopted by the FATF in October 2013. The UK volunteered to co-chair with Tunisia. The project was the subject of discussion at the joint experts meeting in Doha, Qatar in December 2013. The project team meetings were very well attended, with as many as 70 delegates attending and contributing and presentations were delivered by the Financial Action Task Force of Latin America[3] (GAFILAT), the Kingdom of Saudi Arabia, Lebanon, MENAFATF, the Netherlands, the State of Qatar, the World Customs Organization (WCO), the UK and the USA.

Interest in, and collaboration with the project remained strong throughout 2014 with in excess of 60 countries contributing information and case examples in response to a questionnaire devised by the co-chairs and issued by the FATF secretariat in March 2014. As recently as October 2014 the UAE requested to join the project team, and the typology was further discussed, and additional presentations and case examples presented over two days at the Typology Workshop jointly held by MENAFATF and EAG in Doha in December 2014.

1.2 THE OBJECTIVES OF THE PROJECT

The main aim of the project is to fill the knowledge gap identified by the FATF in course of the review of the work done , and to explore and understand the extent, scope and operating models of using physical transportation of cash in ML schemes[4] to provide a basis for identification of policy implications that may ultimately help in the effort to improve its prevention, detection and disruption.

- In order to achieve that goal, the key objectives of this project are the following:
- To develop an understanding of the scope and extent of the problem of the physical transportation of cash on a global and regional level through data collection and reviewing of existing literature.
- To identify trends, methods and techniques used for ML through physical transportation of cash and provide a compilation of case examples.
- To identify the main challenges and problems faced in the detection and disruption of physical transportation of cash.
- To compile a set of red flags and/or indicators and any other information that might be used later for developing best practices on preventing, detecting and disrupting ML through physical transportation of cash.

1.3 THE PREVALENCE OF THE USE OF CASH

The definition of ‘cash’ in the Oxford English Dictionary is ‘money in coins or notes, as distinct from cheques, money orders or credit’. The Oxford American Dictionary further qualifies the definition as

[3] Formerly known as the *Financial Action Task Force of South America (GAFISUD).*

[4] And also terrorism financing (TF) schemes.

'money in any form especially that which is immediately available'. Dictionaries in other widely spoken languages, such as Spanish, Mandarin and Arabic, give very similar definitions.

The concept of cash has existed for millennia. It was the original type of money which was in existence long before the advent of the modern banks and other financial institutions which have become an integral and indispensable part of modern life. Yet despite the proliferation of such financial institutions, cash is still the preferred method of settlement for goods and services for billions of people in the world today. There are many reasons for this. Not the least of these is the fact that there are still 2 billion adults in the world today who do not have access to banking services[5]. For these people, cash is still the only thing that they can use to procure the goods and services that they need to live their lives day to day. It is no coincidence that many of the poorest and least developed countries of the world have economies that are predominantly cash based.

However cash is still prevalent as a method of payment in many of the world's biggest economies. This infers that there are factors other than ease of access to financial services that influence the preference to use cash rather than more advanced instruments, such as cheques, credit and debit cards to settle transactions.

These factors include;

- **Cultural issues.** In some countries, the bulk of the population are inherently mistrustful of any form of officialdom, such as governments and large financial institutions. They feel the need to conduct their day-to-day activities, including financial activities, with a minimum of official scrutiny. They may also wish to hide the value and location of their assets from the government, perhaps for tax purposes. In these countries cash is seen as an anonymous instrument which facilitates these needs.
- **Cash is widely accepted**. Numerous studies[6] have demonstrated that, in most countries, even those with highly developed financial systems, cash is the preferred method of payment for low value transactions. Very few retail outlets in the world that sell day to day items such as food or clothing will refuse to accept cash, and most AML regimes recognise this when dictating *de-minimis* levels for suspicious transaction reporting.
- **Cash is quicker**. A cash transaction is conducted in real time and payment is received immediately. Transactions through the banking system can take days, weeks or months depending on a host of variables such as delays in clearance, non-banking days, credit terms etc.
- **Cash reduces spending**. Academic studies[7] suggest that persons purchasing goods and services with cash tend to spend less money overall as they are more 'connected' with the transactions they are undertaking. These studies find that the use of debit and credit cards has the effect of

5 World Bank (2015).

6 Bagnal, J., Bounie, D. et al (2014)

7 For example: Knouse, K.C. (1996).

making a transaction feel less 'real', meaning that the holder of the card is less likely to budget effectively.

- **Cash reduces indebtedness**. Persons who transact only in cash can only spend money that they actually possess, as opposed to persons who use debit and credit cards, which can result bank overdrafts and credit card bills.
- **Discounted Goods**. In many countries it is possible to negotiate a lower price when paying for goods and services in cash, as some banks charge a fee for processing credit and debit card and cheque transactions. Some businesses may also be selling goods 'off record', thus evading sales or value added tax, meaning they can afford to sell goods at a lower price.
- **Interest and fees**. Persons buying and selling goods for cash are not charged interest on credit balances or fees for operating a bank account, meaning that for small businesses overheads can be reduced and profits increased.
- **Cash is dependable in a crisis**. Large-scale natural disasters, such as floods or earthquakes, can cause widespread disruption to critical infrastructure such as transport links, buildings and power supplies, which in turn affects the operation of financial institutions. In these circumstances, cash can often be the only method of conducting any form of financial transaction.
- **Store of value**. In volatile economies, or in jurisdictions threatened by war or natural disasters, cash is often used to store wealth in a way that is considered safer than a financial institution. In some areas, the use of a foreign currency that is perceived to be more stable or secure than the local one (such as the US dollar or the euro) is used for this purpose.

Yet there are numerous disadvantages to using cash to fund anything other than very small transactions;

- **Large amounts of cash are heavy and bulky.** In countries where high denomination banknotes in the local currency are not printed, or not widely available, the amount of cash required to make a major purchase, such as a car, is invariably physically big and heavy. In the UK, GBP 10 000 in a mixture of used GBP 5, GBP 10 and GBP 20 notes weighs in excess of 1 kg and is a pile of banknotes 13 cm high.[8] This has obvious drawbacks in terms of storage and transport to where they are needed.
- **Large amounts of cash are vulnerable to theft.** If a person or business chooses to keep their wealth in cash in a non-secure location such as their house or business premises, or to carry it about their person, then they are much more vulnerable to opportunist or planned theft. Such thefts are often

[8] Source: Bank of England data sourced by UK authorities.

carried out using the threat of, or actual violence. Large amounts of cash stored or carried in this way are unlikely to be covered by home or personal insurance, meaning that the owner has no recourse in the event of a loss.

- **Cash hoarding restricts wealth.** Storing using and cash outside financial institutions restricts access to currency markets, meaning that the cash cannot be used for investment purposes, and cannot therefore generate interest and additional income for the beneficial owner. This is all the more important as money declines in value through inflation; in volatile economies this decline can be extremely rapid.
- **The use of cash restricts purchasing options.** Cash cannot be used to purchase goods in certain circumstances, for example using online portals, and in some countries governments have placed restrictions on the maximum value of cash transactions, or have imposed strict AML regulatory requirements on businesses accepting large amounts of cash in payment for goods and services[9].
- **Making remote payments requires the cash to be transported.** Purchasing goods and services from persons or businesses situated a long way from the purchaser generally requires that the cash for the purchase be transported to the vendor (assuming that neither the purchaser nor the vendor wish to have the cash paid into a bank account). This obviously presents security and logistical problems and results in additional costs. Similar problems are faced by persons wishing to gift money to relatives and/or friends.
- **Cash is costly to count and process.** For businesses, counting and processing cash efficiently requires additional investment in security, distribution, staff recruitment, training and equipment. For businesses and financial institutions; these costs cannot always be passed on to the customer. Large banks and other financial institutions often find it more economical to outsource cash handling systems to specialist companies, which may be cheaper but which creates additional requirements in respect of contract arrangements etc.
- **Restricted access to other financial services.** Deliberately choosing to conduct transactions in cash rather than through a bank means that a person builds up less of a financial 'profile', which can be a hindrance when that person wishes to save or invest their earnings, or to apply for another financial produce such as an emergency loan, or insurance on their house or car.

[9] See section 2.5

1.4 LEGITIMATE CASH USAGE

The total value of cash in circulation in the world was estimated in 2009 to exceed USD 4 trillion[10]. Figures from the European Central Bank (ECB) and the US Federal Reserve point in the same direction, although they only give an indication for an order of magnitude of the legal circulation of banknotes, as they represent only two currencies out of the top 5 currencies in the world[11].

In 2014, there were around 17.5 billion euro banknotes in circulation with a total value of EUR 1.02 trillion.[12] 20-25% of the banknotes were held by people outside of the euro area.[13]

In 2014, there were about 3.4 billion US dollar banknotes in circulation with a total value of USD 1.3 trillion[14] (partly held outside of the US as well).[15]

The use of euro banknotes outside of the euro area cannot be estimated with exact precision, but the ECB estimated around EUR 143 billion worth of euro banknotes to have been in circulation outside the euro area at the end of 2013. This was around 16% of the total euro currency in circulation in that month in the euro area.[16]

This estimate is regarded as a clear lower bound, given that the banking channel is just one of the several channels through which euro banknotes leave and re-enter the euro-area. According to the ECB, anecdotal evidence suggests that the outflows of euro banknotes via non-mainstream financial institution channels (*e.g. via tourism or workers' remittances*) are, for most countries, greater than the inflows via such channels.[17] Therefore, the net shipments by banks offer an incomplete picture of true net flows of banknotes. Other estimates suggest that around 25% of euro currency in circulation (potentially slightly higher) were circulating outside the euro area at the end of 2013.

Movements of currency across US borders cannot be precisely measured for several reasons[18] There is no legal requirement to monitor movements of USD10 000 or less, and many tourists and migrants carry amounts considerably less than this across US borders on a daily basis. In addition, even when there is a legal requirement to report currency flows, mechanisms are not always in place to capture the data; also some reporters might not comply with requirements.

The Federal Reserve provides currency on demand to numerous international customers from within the USA. This banknote shipping business is highly concentrated and data available from this process currently captures the vast majority of banknote shipments that cross US borders through

10 Hewit, Mike (2009)

11 According to Swift, the 3 other top 5 currencies are the Japanese Yen, British Pound and Chinese Yuan (Swift, 2015).

12 ECB (nd a and nd b).

13 ECB (nd a).

14 Federal Reserve (2015a and 2015b)

15 "The Federal Reserve estimates that the majority of the cash in circulation today is outside the United States" (Federal Reserve Bank of New York, 2013)

17 ECB (2014), p. 23.

18 Judson, R. (2012), p.4.

commercial banking channels.[19] However the data does not cover US banknote flows among other countries, which can be substantial.[20]

Moreover, in countries with underdeveloped banking sectors, US dollar banknotes are used to settle transactions of all magnitudes and even in some countries with developed banking sectors and stable currencies, US dollars are the preferred currency for travelers, cross-border trade, settlement of large cash transactions and for transactions in the informal sector.[21]Nonetheless, the Federal Reserve has developed several statistical models for estimating the stocks and flows of US currency abroad. These models suggest that around USD 751 billion was in circulation outside of the US in 2003.[22]

A recent study published by the ECB[23], found that throughout seven major developed economies around the world, including Australia, Canada and the USA, cash was still used extensively, particularly for low-value transactions. The number of cash transactions differed widely between the jurisdictions but were between 46% and 82% of the total number of transactions. The value of such transactions as a percentage of the total was in excess of 50% in Austria and Germany, whereas in Canada, France and the USA it was only about 25%. Moreover, this study found that the use of cash decreases with transaction size; in all countries examined cash was predominant for the smallest 50% of transactions. The study also found a direct correlation between the use of cash and acceptance of credit and debit cards at the point of sale.

Therefore, even in countries with sophisticated financial systems and a wide range of payment options, banks and other financial institutions need cash on a day-to-day basis in order to conduct their normal business activities and to service their customers. Cash will be required for loading into ATMs, for passing across the counter and for foreign exchange purposes, such as for sale to holidaymakers visiting a foreign country, amongst other reasons. Financial institutions receive cash on a day-to-day basis, for example from private or business customers depositing it into their bank accounts.

In recognition of this, the project team agreed that, in order to identify physical cross-border transportation of criminally derived cash and to understand the drivers behind this activity, it was necessary to study the legitimate cash market. By doing so, not only would it become possible to define 'red flags' for identifying criminal cash movements, but it would also aid in the identification of vulnerabilities in the legitimate systems that could be exploited by criminals.

In order to facilitate this, section 2 of the questionnaire was entirely focussed on gathering data regarding the scope and extent of legitimate cash movements. Countries were asked about the following subjects:

- methods used to move legitimate consignments of cash;

19 Judson, R. (2012), p.4-5.

20 Judson, R. (2012), p.5.

21 US Treasury (2006).

22 J. Botta (2003), p. 155.

23 Bagnal, J., Bounie, D. et al (2014).

- the extent of the legitimate cash movements into, transiting and out of their country;
- the types of legitimate cash movements;
- the way in which movements of cash are recorded at their borders.

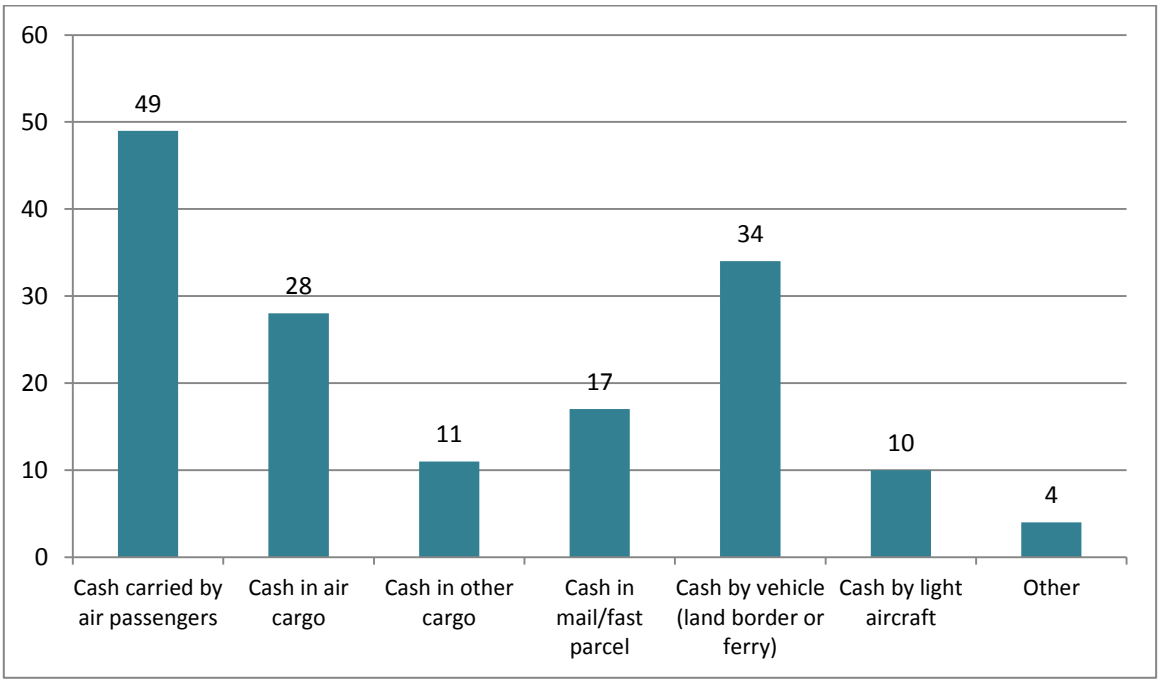
1.5 LEGITIMATE CROSS BORDER CASH TRANSPORTATION

Every day, around the world, businesses and persons transport cash according to their own particular needs, perhaps for the purposes of spending money whilst on holiday, or to pay for goods and services purchased in another country. In the EU for example, where there is a common currency, many countries sharing land borders and a right for any EU citizen to live and work in any EU country, cross-border cash movements take place for legitimate purposes extremely frequently.

In addition, banks and other financial institutions need cash for their day to day operations, in the currency of the country where they operate, and also in numerous other currencies according to the demands of their business, and also that of their customers. This legitimate demand for cash from financial institutions cannot always be serviced from the local market and the reserves of the country in which the bank or branch is physically located, either because the reserve does not have sufficient stocks of the required currency at a particular time, or because the relevant financial institution does not have an agreement with the local reserve to supply it. Accordingly, banks and other financial institutions buy and sell banknotes on global markets, both to meet their demands for cash, and also to enhance their profits by taking advantage of exchange rate fluctuations. The result of this is that cash is physically transported in huge volumes across international borders on a daily basis.

It was apparent from the questionnaire responses that this phenomenon of legitimate cross-border cash transportation was not well understood generally. In the questionnaire, countries were asked to state which methods, in their experience, were most frequently used to transport legitimate consignments of cash across their borders. A summary of the responses are shown in the chart below. The responses showed that most countries were aware that air passengers and persons in cars carry cash legitimately across borders. However, substantially fewer had any experience of cash moving in cargo and mail for legitimate purposes, and yet huge amounts of cash (the equivalent of tens, and sometimes hundreds of millions of US dollars in a single shipment) are transported between major financial institutions by air cargo every day, shipments that are generally subject to very little scrutiny by customs authorities.

Chart 1. **Methods used to move <u>legitimate</u> consignments of cash out of and into a country**



Graphic showing the methods that are used to move legitimate consignments of cash into and out of countries.

Respondents to the questionnaire were also asked if they knew how much cash was moved legitimately across their borders. Again, the majority (60%) said that they knew how much was transported legitimately by air passengers, but substantially less had any knowledge about the value of cash movements in cargo (32%) and mail (21%).

This general lack of knowledge and/or understanding is significant. Without a thorough understanding of the methods and techniques of legitimate crossborder cash transportation, the customs procedures and documentation applicable and the mechanisms that drive these methods and techniques, it can be very difficult for the authorities in a country to be able to tell if a shipment of cash is legitimate or not. Moreover, without this understanding, countries will not be able to assess whether their legislative processes are sufficient to allow their customs and border authorities to control cross-border cash transportation effectively. However, any regulated financial institution involved, e.g., in the case of a (real) bank-to-bank transaction, falls under AML/CFT legislation so that to this extent cash transportation is already regulated (implying compliance management and specific rules defined by supervisory authorities). National authorities can take this into account to identify priorities and operational procedures, including the role of Customs and supervisory authorities. Furthermore, an objective assessment requires specialised expertise which is primarily available in the financial sector and their supervisory authorities.

In line with FATF Recommendation 32, most countries now have in place some form of cash declaration system, a legal requirement for natural persons entering and leaving the country to declare cash in excess of a certain value. However only a few countries have such a system in place for cash in cargo and mail; most rely on the customs procedures applicable to general movements of goods.

1.5.1 CONTROL OF LEGITIMATE CASH MOVEMENTS - NATURAL PERSONS

Specific cash declaration systems (as opposed to general customs declarations) are used by most countries in the world for natural persons (passengers). In some countries, the central bank places restrictions on the amount of currency that can legally be exported, and who can export it, and also what can be done with it once it has been exported. For example, Pakistan prohibits the export of in excess of PKR 3000 (Pakistani Rupees) by natural persons, and stipulates that this currency can only be exported by natural persons who intend to keep it for use when they next return to Pakistan. The exchange of Pakistani Rupees for another currency is prohibited.[24] Similarly, in Tunisia, only the Central Bank has the authority to conduct cross-border transportations of cash in cargo[25].

It is not surprising that most countries that responded to the questionnaire said they had some idea of the value of cash shipped by passengers as most have some form of cash declaration or disclosure system in place, in accordance with FATF Recommendation 32. However, these systems only record amounts above the declaration threshold level – anyone carrying less than this amount need not make a declaration and so those details will not be recorded.

Cash declaration systems are covered by the interpretive note to Recommendation 32, which states that, *inter alia*, all countries should implement a system requiring either all travellers to declare or disclose any currency they are taking in out of a country, either orally or in writing, or only those carrying in excess of a certain value (the interpretative note states this should be USD or EUR 15 000 or equivalent, but many jurisdictions specify a lower amount). In addition the interpretive note states that travellers should be required to make truthful declarations, that penalties should apply for false or non-declaration, and that the relevant authorities should have powers to detain cash and conduct enquiries in such cases.

The questionnaire distributed for this research included questions in relation to the cash declaration systems in effect in the responding country. The responses indicate that the methods by which this recommendation is implemented vary considerably from one country to another, with some countries saying, for example, that all cash declarations by natural persons are checked for accuracy (by counting the cash), whilst others say this is only done occasionally[26]. The responses also reveal that some countries keep detailed statistics on the amount (value) of cash that is transported into, out of or through their country by legitimate financial institutions (as opposed to natural persons), whereas others keep no such records and effectively have little oversight of the matter.

The responses also reveal that there is little collaboration between neighbouring countries when establishing cash declaration systems, resulting in significant incongruences. For example, Guatemala's system requires the declaration of any amount of cash being taken into or out of the country, whereas Mexico and Honduras, with whom it shares lengthy land borders, only requires the declaration of amounts in excess of USD 10 000. Likewise, Brazil's entry and exit declaration

[24] State Bank of Pakistan (2014).

[25] Source: Tunisian authorities.

[26] Recommendation 32 makes no reference to extent to which verifications of cash declarations should be carried out

threshold is BRL 10 000 (Brazilian real), (about USD 3 900), whereas those in its neighbours Colombia, Peru etc. are USD 10 000.

Perhaps inevitably, case examples reported by a number of countries show that criminal groups have learned that they can exploit cash declaration systems for criminal purposes by various means, including:

- using the fact that cash has been declared on entry as a way of legitimising criminal cash paid into a bank account,
- re-using cash declarations several times for the same purpose, or
- over-declaring cash on entry (where there is no confirmatory count) to cover the receipt of criminally derived cash in the country of import.

These issues are examined in more detail in Section 3.

1.5.2 CONTROL OF LEGITIMATE CASH MOVEMENTS - CARGO

A significant percentage (21%) of countries who responded to the questionnaire stated that import and export of cash consignments in cargo and mail are not declared at customs at all. A possible explanation for this may relate to the interpretation of customs legislation – some countries do not acknowledge cash as a type of goods, and consequently they do not require customs declarations (or, for that matter, any other types of declarations) for cash in cargo and mail.

For customs purposes, including import, transit and export, cash (banknotes) are a type of goods and subject to the same procedures as other goods; a customs declaration is required. In the international "Harmonized System", developed by the WCO, cash (banknotes) is given a unique goods nomenclature code: 4907 ("Unused postage, revenue or similar stamps of current or new issue in the country in which they have, or will have, a recognised face value; stamp-impressed paper; banknotes; cheque forms; stock, share or bond certificates and similar documents of title[27]").

"The Harmonized Commodity Description and Coding System (generally referred to as "Harmonized System" or simply "HS") is a multipurpose international product nomenclature developed by the WCO. It comprises about 5 000 commodity groups; each identified by a six digit code, arranged in a legal and logical structure and is supported by well-defined rules to achieve uniform classification. The system is used by more than 200 countries and economies as a basis for their customs tariffs and for the collection of international trade statistics. The HS contributes to the harmonisation of customs and trade procedures, and the non-documentary trade data interchange in connection with such procedures, thus reducing the costs related to international trade. It is also extensively used by governments, international organisations and the private sector for many other purposes such as

- internal taxes,
- trade policies,
- monitoring of controlled goods,

[27] World Customs Organisation (nd)

- rules of origin,
- freight tariffs,
- transport statistics,
- price monitoring,
- quota controls,
- compilation of national accounts, and
- economic research and analysis.

The HS is thus a universal economic language and code for goods, and an indispensable tool for international trade. The HS is governed by "The International Convention on the Harmonized Commodity Description and Coding System"[28].

As cash is a normal cargo consignment a custom declaration has to be lodged. These declarations are always recorded in customs systems. However, neither the denomination or currency need to be specified in the declaration. The customs declaration requires only the weight of a shipment and a proper description of the goods. Opinions between countries differ when it comes to the need to state the value in the customs declaration. Some countries think it is not necessary, as the commodity code for banknotes has no VAT or duty implications so a value would not be required.

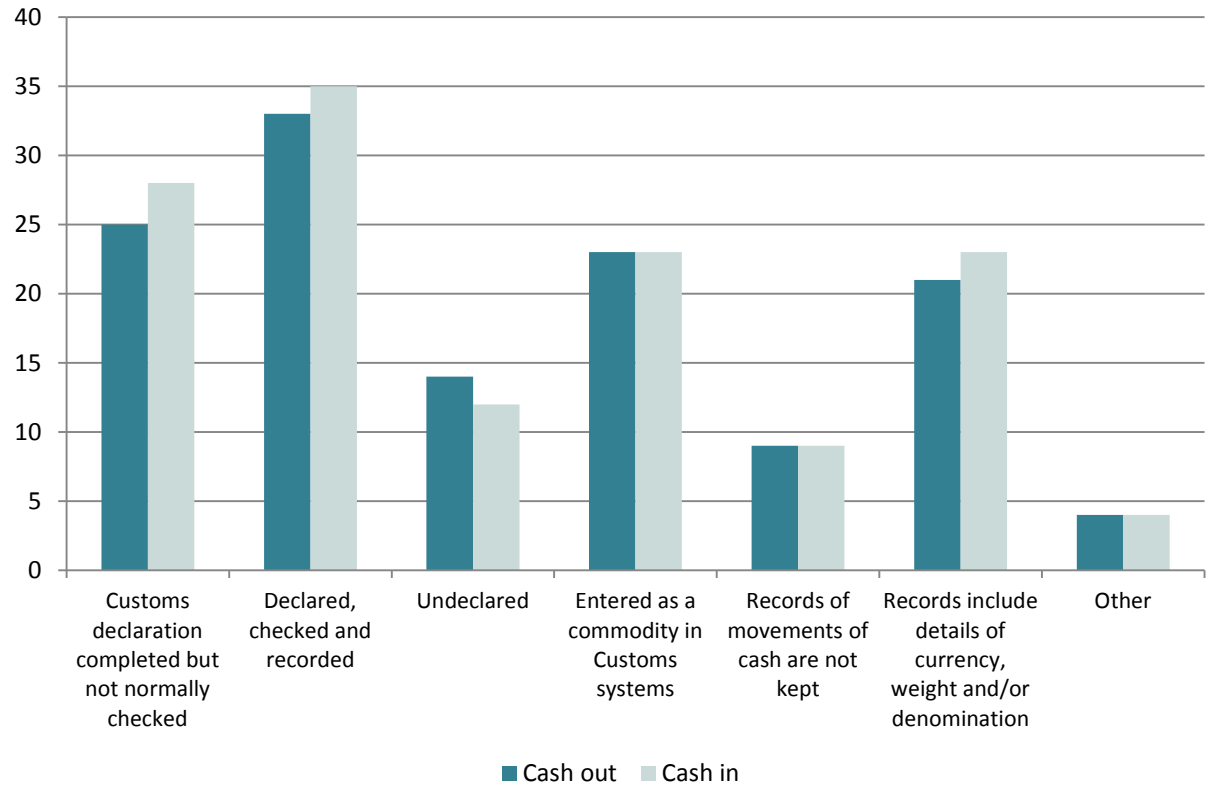
Other countries are of the opinion that the value of the goods declared at customs is always an obligatory element of the declaration, for example as it is mandatory in legislation on statistics. This cannot be the normal transaction value, as the cash has not been bought by the owner (as is mostly the case with all other goods). This means that the intrinsic value of the cash has to be declared (the value of the paperwork, the ink, etc.). In a summary declaration, however, no value at all has to be stated. Apart from the customs declaration, some 20 countries state that they use a specific cash declaration form more or less like the declaration to be used for passengers. In most cases this cash declaration has a threshold of USD 10 000.

Although there is a specific tariff code for banknotes within the HS, some jurisdictions have observed that not all freight forwarders or shippers use the correct commodity code when completing customs clearance documentation. A wide variety of other codes have been incorrectly applied, such as those for 'printed matter'. Because there is no customs duty implication on shipping banknotes, there are no revenue implications for doing so, and in fact not using the correct tariff code can add an extra layer of security as it can help to mask the value and nature of the shipment. This can make it very difficult for national authorities to identify shipments of banknotes, and gather statistics on the trade.

The questionnaire asked counties to detail how movements of cash in cargo and mail were recorded or controlled at their borders. The chart below summarises the responses.

[28] World Customs Organisation (nd)

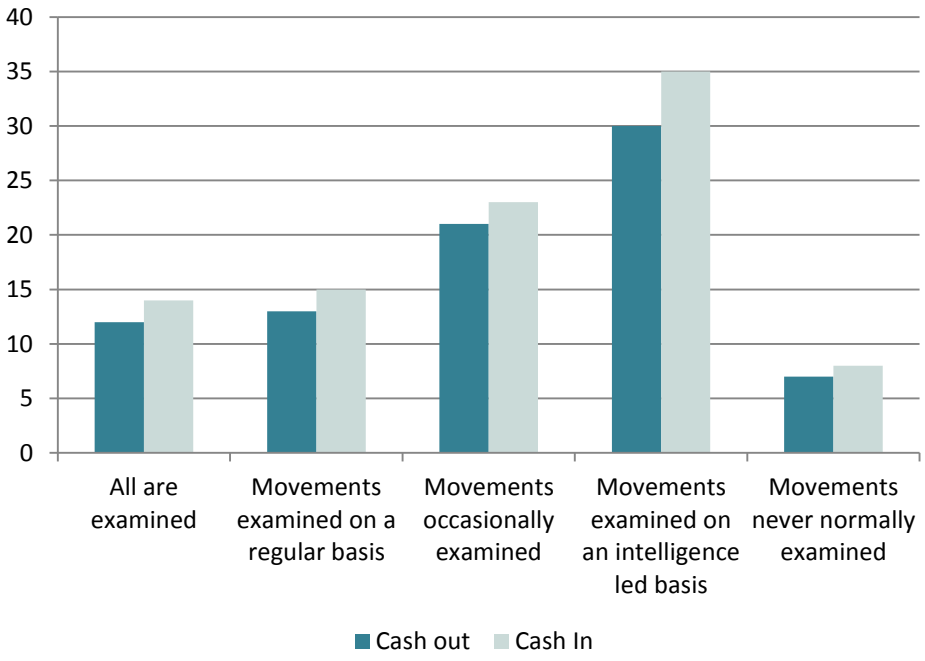
Chart 2. **Movements of cash in cargo and mail**



The chart above shows that most countries stated that shipments of cash in cargo and mail were declared, checked and recorded. However, as the value of the cash is not normally stated on the customs documentation, the checks that are made cannot routinely include the actual value of the shipment (as opposed to the value of the paper, print etc.), which explains why most countries have little or no idea of the value of the cash that is shipped using this method. The fact that there are few figures available is confirmed by the fact that most other countries stated that movements of cash were subject to a customs declaration that was not checked, entered simply as a customs commodity, not declared at all or that they kept no records of cash moved in this way.

Countries were also asked to state what controls were exercised on movements of cash in cargo and mail, other than those transiting their country. The next chart summarises their answers. Some countries stated that they examined all such movements, and about the same number said that they examined them on a regular basis. However, more countries indicated that they only examined them occasionally. The option most commonly selected was that movements were selected for examination on an intelligence-led basis. However, due to the way the customs documentation in respect of these shipments is completed, there is little intelligence available on which to make a judgment (these issues are discussed in more detail in section 4 of this report.). Eight jurisdictions stated that such movements were never examined at all.

Chart 3. **Controls exercised on movements, other than transit, of cash in cargo and mail**



The questionnaire also asked respondents to state why movements of cash were selected for examination; options given were violation of customs regulations, suspicion of money laundering, notifying unusual transactions, profiling or routine selection. All of these reasons were selected, with no one reason standing out from the others.

The countries listed in the table below stated that they have, in addition to the regular customs declaration, a specific system in place that requires the declaration of all transport of cash in cargo and mail above a certain threshold. The threshold is in many cases is USD 10 000, similar to many cash declaration systems for natural persons.

Table 1. **Specific declaration form for cash movements in cargo and mail**

CARGO		MAIL	
1. Argentina	10. Korea	1. Argentina	10. Korea
2. Australia	11. Malaysia	2. Australia	11. Malaysia
3. Azerbaijan	12. Mauritius	3. Azerbaijan	12. Mauritius
4. Bermuda	13. New Zealand	4. Bermuda	13. New Zealand
5. Colombia	14. Panama	5. Bulgaira	14. Panama
6. Guyana	15. Qatar	6. Colombia	15. Qatar
7. Israël	16. Uruguay	7. Israël	16. Uruguay
8. Jordan	17. United States	8. Jordan	17. United States
9. Kingdom of Saudi Arabia		9. Kingdom of Saudi Arabia	

The US[29] and Australia indicated that such a declaration is also obligatory for transit shipments in cargo and mail. Although not explicitly stated, it seems that this is the case in most of the other countries with a specific cash declaration as well.

Box 1. **The global banknote trade**

There is a significant global market in trading of currencies for profit between banks and between banks and non-bank financial institutions. This trade serves to fulfil not only the day to day cash needs of the institutions involved, but also as a means of generating profits by speculating on and taking advantage of exchange rate fluctuations. Banknotes are often traded in packages of mixed currencies, such that a business with a need for euros may only be able to obtain them as part of a package which includes US dollars, Japanese yen etc. In these circumstances the unwanted currencies will be sold on wherever possible to other banks and other financial institutions such as money service businesses (MSBs). Less common currencies will often be sold on as quickly as possible to avoid unfavourable exchange rate fluctuations.

Major international currencies such as the US dollar and the euro are held in reserves away from the countries where they are issued and printed. In the case of the US dollar, the Federal Reserve Bank of New York (FRBNY) operates the Extended Custodial Inventory Programme, where US dollars still in the ownership of the FRBNY are held in secure locations in segregated vaults owned and managed by private sector banks in Frankfurt; Hong Kong, China; London; Singapore and Zurich.

Currency traded both nationally and internationally is generally physically transported by specialist Cash/Valuables In Transit (CVIT) companies who have access to a wide variety of high security measures, such as secure cash centres, safes, cash counting and processing facilities, secure packaging and armoured vehicles. Some of the large CVIT companies also provide a complete 'end to end' service that involves collection, consolidation, counting, customs documentation and clearance and delivery to the intended destination.

Legitimate shipments of cash between financial institutions in different jurisdictions can be transported in a variety of ways, including by the postal service, CVIT company armoured van or in air cargo. The common factor between all shipments of this nature is that the cash handler has strict protocols and procedures in place to ensure that, in event of a challenge from one of the parties to the transaction, or a serious incident occurring, any losses are covered by their insurance and the company and its staff are indemnified against legal action.

In most cases these procedures will include an independent count of the cash, following which it is sealed in tamper evident packaging to guard against external interference (it is worth noting here that any examination of the consignment by customs authorities will immediately be evident because of this). International airports that function as freight hubs will usually have high-value freight sheds, with stringent security measures in place to process high-value shipments.

The percentage profits involved in this activity are small. Currency pairs (the currencies traded against one another, for example USD and EUR or GBP and EUR) are usually traded in exchange rates quoted to four decimal places, and profits often involve differences of one or two 'pips'(a pip

[29] Department of the Treasurey (nd).

is a difference of one hundredth of one percent in an exchange rate), meaning that currencies have to be traded in large volumes to make the process worthwhile.

Because of the small profit margins involved, it important for financial institutions to keep the costs involved in the process as low as possible. This includes the costs related to counting, packing and shipping the cash; these costs are included in the fees charged by the CVIT companies to the financial institutions. In order to minimise these costs, cash is generally shipped in a way that makes processing and counting as easy as possible. The cash is usually packed in blocks of 100 notes of the same currency and denomination, secured with a plastic strap, with blocks of 100 notes subsequently combined to make bigger blocks of 1000 notes, also secured in plastic straps. These blocks are then sealed in robust plastic sacks, with each sack secured with a uniquely numbered seal (the tamper evident packaging referred to above).

Although a shipment of cash may contain multiple currencies and notes of different denominations, each sack will generally contain a set amount of only one denomination of notes of one currency (although some shipments may contain a single sack of 'left over' multiple currencies and denominations that are not sufficient in themselves to make up a complete sack). The customs documentation will usually not give a full value of the shipment, but there may well be additional documents available from the shipping company, including packing lists detailing what currencies and denominations should be in each sack. As mentioned above, the shipping company will have an insurance policy specifying a maximum value of cash that can be transported in a single shipment, and so the shipments will not exceed that value.

Packaging and shipping the cash in this way makes it much easier to count and process and reduces costs to a minimum. Any other type of packaging, such as multiple currencies and denominations in a sack (other than in the circumstances described above), or blocks of notes of varying sizes without the correct banding or strapping dramatically increases processing and counting costs and would be rejected by the beneficial owner of the cash due to the impact on their profits. The financial institutions who volunteered this information to the project team stated that packaging of this nature could be considered as a 'potential indicator of criminal origin of the cash.

In addition to the measures carried out by the CVIT companies, banks and other financial institutions are obliged under their domestic laws to conduct extensive customer due diligence (CDD) enquiries in respect of all of their customers. Typically, this will involve enquiries into the business model of the customer – whether the cash is sourced from its own internal operations, or whether the customer is acting as a consolidation point for other cash rich businesses in the local area. If this is the case, the CDD will extend to obtaining additional information, such as a breakdown of these points of origin of the cash. The financial institution may also conduct research into the customer's market, perhaps to satisfy themselves that the volume and breakdown of the cash they are purchasing is consistent with local conditions (a bank in a destination popular with European tourists may sell more cash in euros during the summer, for example).

The effectiveness of these CDD enquiries is extremely important as the security of a system is only as strong as its weakest point. For example, if the customer bank is acting as a consolidator of cash from smaller businesses, it is important that potential risks are taken into account in the CDD process. If the business model or relationship is one that is assessed to be higher risk in principle, the bank may decide that enhanced due diligence enquires are appropriate, possibly including

having a good understanding of their customer's client base.

Recent work undertaken by both the UK and the Netherlands' authorities has identified that the customs control of large, (ostensibly) bank to bank shipments of banknotes may often not be as rigorous as it could be (or, in many cases, are not controlled at all). Because there are no outward reasons for suspecting these shipments, they are not (and in some cases, due to a lack of the necessary authority, cannot be) routinely selected for examination, and in most cases banknotes transiting a country are not examined at all. In addition, examples of poor practice by CVIT companies, such as removing shipments of banknotes from customs controls before they have been customs cleared, have been identified.

Source: UK authorities, based on liaison and interviews with international companies involved in currency trading and the associated cash transportation.

1.5.3 CONTROL OF LEGITIMATE CASH MOVEMENTS – MAIL

The Universal Postal Union (UPU), established in 1874 by the Treaty of Bern, is the second oldest worldwide international organisation. With 192 member countries, the UPU is the primary forum for cooperation between postal sector players. As a specialised organisation of the United Nations the organisation sets the rules for international mail exchanges.

Member countries provide the International Bureau of the UPU with the name and address of the operator or operators officially designated to operate postal services. The designated operator is any governmental or non-governmental entity officially designated by the member country to operate postal services and to fulfil the related obligations arising out of the Acts of the Union on its territory. Member countries ensure that their designated operators accept, handle, convey and deliver letter-post items.

Letter-post items are:

- priority items and non-priority items, up to 2 kg;
- letters, postcards, printed papers and small packets, up to 2 kg;
- parcels up to 20 kg.

This means that other shipments that are not part of the UPU definition should be treated as cargo, and all cargo procedures are then applicable. This also applies to international courier companies. Consignments handled by these companies are not 'caught' by the above definition. On other legal grounds, however, the same prohibitions and legal constraints as for letter-post are applicable for these companies.

The treaty also defines restrictions and general prohibitions (such as narcotics and psychotropic substances, obscene or immoral articles, etc.), general exceptions to the prohibitions and any extensions of the prohibitions on a country by country basis.

Article 18.6 UPU sets rules on coins, banknotes and other valuable articles, stating that…"It shall be prohibited to insert coins, bank notes, currency notes or securities of any kind payable to bearer, travellers' cheques, platinum, gold or silver, whether manufactured or not, precious stones, jewels or other valuable articles…"

However, some countries have used the possibility of making exceptions (extensions of the general prohibition) in the treaty itself. For example regarding letter-post some countries do not accept registered items containing cash and equivalent items. Other countries do not accept insured parcels containing such items.

The key point is that the UPU restrictions and prohibitions (and national extensions) are not directly binding for the designated operator and the persons using the postal service. All of the prohibitions should be implemented in national postal legislation. Even where this is the case, in general terms, it is not the task of customs to control these prohibitions (80% of the responding countries stated that customs is the prime responsible agency[30]). This will only be the case when violating the prohibitions has been criminalised in that national legislation. Otherwise, not complying with the prohibitions will just mean that the sender didn't comply with the regulations of the designated postal operator.

Some countries' questionnaire responses stated that the UPU prohibits sending cash in mail. As this is not actually the case, these countries may have been referring to a prohibition in their own national (postal) legislation based on UPU guidelines. Another explanation could be that these countries are not fully aware of the legal situation regarding cash in mail as this is not seen as a risk or as something of interest to them. One of the conclusions, however, is that countries differ widely in their approach to cash control in mail. Some of them treat this as being prohibited, other countries treat it as if it is permitted.

Box 2. **Prohibition of sending mail in post - France**

France prohibits sending currency, coins and precious metals by mail by their national *Décret n° 2013-417 du 21 mai 2013 portant modification du code des postes et des communications électroniques*.

In this legislation which was enacted, the French government decreed that it is forbidden to send all forms of currency - coins and cash and all forms of precious metals – coins, bars and jewellery by mail.

Source: France.

For all letter-post consignments with legal constraints, such as cash, a specific customs declaration has to be submitted: the CN 22 or CN 23. Apart from the customs declaration, some 20 countries state that they use a specific cash declaration form more or less like the declaration to be used for passengers. This cash declaration has a threshold of USD 10 000 in most cases.

Some countries have separate systems for postal clearance, while others have integrated postal clearance functions into their national customs systems. It is, however, not unusual that even when customs clearance procedures in one country are automated, this functionality is missing in clearance of postal items.

[30] Most probably this percentage will be even considerably higher, as clearly some countries did not answer section 3 question 1 in the right way. For example, a country with a prohibition and licensing scheme for cash in mail most definitely will have a controlling agency, but the country's answer was "none".

Customs control of letter-post has at least one difference with normal customs control that makes control more difficult. If customs want to open letter-post within a customs control, they are confronted with legal issues regarding the confidentiality of correspondence (for example, in the UK, opening a letter is treated as an interception of a communication in the same way as a telephone interception; this cannot be done without a warrant signed by the home secretary).

Besides these special procedures to open letter-post, there is also the enormous volume of letter-post to be considered: in 2013 3.5 billion items were carried by postal systems worldwide. Considering these amounts and the simplified customs procedures regarding letter-post, modern risk management tools are not very useful.

Responses to the questionnaires indicate that many (but not all) countries do not pay attention to the phenomenon of cash transportation in mail. It seems clear that if countries only look superficially, by simply examining formal declarations of cash in mail, in all probability they would conclude that there is no reason to give cash in mail any attention as it would seem that there is very little to study.

Only two countries provided details in respect of legitimate cross-border shipments of cash in mail. One of those countries paid special attention to this issue during over a defined period of time, to gain an insight into this phenomenon, and to establish if there were any money laundering (ML) and terrorism financing (TF) issues at stake. This research revealed that there were very few formal import and export declarations made (just 1 in 2013). However, over the period that the project ran, the customs authorities in that country made numerous detections of cash concealed in mail. This led them to conclude that cash is transported in mail items quite frequently, but is hardly ever declared at customs, regardless if it is a legal or illegal transportation of cash. One of the outcomes of this exercise was that the customs authorities in that country found it had insufficient legal powers to effectively control ML and TF risks in cargo and mail. As a result, that country is in the process of drafting new ML and TF specific legislation on cash in cargo and mail.

The above mentioned research appears to imply that the phenomenon of cross-border transportation of criminally derived cash in mail may be a higher risk that most countries appreciate. However, it is important to consider also the experiences of Germany and France who also conducted focused exercises to study the issue. The outcome of both of these exercises was that, despite the examination of a very large number of fast parcels and mail, no (undeclared) cash was identified.

The fact that the experiences of three ostensibly similar European countries were very different is in itself significant. Such differences would imply that there may be regional or local factors at play which affect the phenomenon, e.g., the fact that it is public knowledge in some countries (Germany) that international post and parcels are regularly controlled/scanned by post and customs and that they can be opened, while in other countries/regions it is public knowledge that a judicial decision is needed to open post and parcels, or that no regular controls are implemented in this area. Taking these facts into consideration, it appears that more needs to be done to understand the issue[31].

[31] Due to the fact that it is common knowledge that post and parcels are regularly controlled and opened in Germany, the German authorities consider their cases of criminal cash in mail and fast parcels presented in Box 22 and Box 28 to be exceptions.

1.5.4 ESTIMATING THE VALUE OF LEGITIMATE CASH MOVEMENTS – NATURAL PERSONS

Responses to the questionnaire reveal that, because many countries do not keep records of how much cash crosses their borders for ostensibly legitimate purposes, it is not possible to come up with an accurate figure of how much legitimate cash is being transported across the globe, as opposed to sitting in treasury reserves[32]. Likewise some countries do not verify or check the accuracy of cash declarations made by natural persons at their borders. In many cases, declarations that are made are not subject to any form of confirmatory scrutiny, so there is no guarantee that what has been declared was the amount that was transported.

In August 2010, the European Commission (EC) produced a report[33] compiled from data from all but one EU countries which analysed the effectiveness of EU cash controls. (EC regulations dictate that natural persons must declare cash in excess of EUR 10 000 when entering or leaving the EU – there is no requirement to declare intra-EU cash movements.)

This report identified that, between July 2007 and July 2009, natural persons entering or leaving the EU declared a total of approximately EUR 80 billion. No figures were available for the amount of cash transported between financial institutions. In the same period, cash detections (i.e. cash movements by natural persons that were not declared for some reason, but instead were detected by customs or other authorities) amounted to EUR 1.6 billion.

It is likely that the actual amount of cash derived from criminal activities transported across EU borders was significantly in excess of this figure, however no reliable estimates for this trade currently exist.

1.5.5 ESTIMATING THE VALUE OF LEGITIMATE CASH MOVEMENTS – CARGO & MAIL

The questionnaire responses provide more insight into the extent of the legitimate cash movements into, transiting and out of countries. On average[34], at least 65% of the countries that answered the relevant questions indicated that they did not know how much cash is legally transported out of and into their country through cargo on a yearly basis, and 71% of the countries did not know how much cash is legally transported through mail.

This means that only 35 % of the countries that responded would be able to reveal the extent of cash legally transported out of and into their country through cargo and mail on a yearly basis[35]. This figure coincides more or less with the 20 countries that, according to the questionnaires[36], use a specific declaration system for cash in cargo and mail, and the approximately 30 countries that

[32] Alternatively, cash in a foreign denomination may circulate domestically, e.g. in countries with a cash based and dollarised economy.

[33] European Commission (2010).

[34] The average of the number of countries that reported on import and the countries that reported on export.

[35] These figures represents the cash declared at customs (by means of a customs declaration or specific cash declaration). As most of this cash has not been checked on ML and TF, formally countries do not know if all of this cash is legal.

[36] When asked additional information of some of these countries, the project group found that legally nor in practice not all of these countries has a specific declaration system for cash in cargo and mail.

state they have a specific database (other than the normal customs declaration database) that records the import and export of banknotes in cargo and mail[37].

Nevertheless, only 7 countries were able to provide information on the extent of cash legally transported out of and into their country through cargo on a yearly basis[38]. For the other countries, there is no understanding on the extent of legitimate bulk cash movements across their borders and the total amount of physical cash movements declared. The conclusion seems to be justified that cash in cargo and mail is not an item of interest of almost all countries; most of them don't pay attention to this phenomenon, again highlighting that the concept of cross-border transportation of cash in cargo & mail is, with a few exceptions, not very well understood.

This conclusion is underlined by the fact that 39% of the responding countries indicate that legitimate cash movements transiting their country in cargo and mail, are not subject to any form of control, declaration or examination. Almost a third of the responding countries do not know if these movements are subject to any form of control.

The above mentioned 7 countries specified how much legitimate cash on a yearly basis moved into, through and out of their countries in cargo and mail[39]. The figures for 2013 for cargo are:

- the import of cash ranged between USD 26 million and USD 108 billion;
- the export of cash ranged between USD 8 million and USD 296 billion;
- transit of cash ranged between USD 3 million and EUR 3.4 billion[40].

In these 7 countries, around USD 500 billion legitimate cash crosses the border in cargo on a yearly basis. Extrapolating, this would mean that each year USD several trillion in cash is moving across the world's borders.

The details submitted by some of the 7 countries lead to the conclusion that on average, a transportation of cash in cargo contains EUR 3 million, ranging between EUR 100 000 and EUR 150 million per transportation. As a matter of course, a container, even a small one, can contain much larger amounts of cash than a passenger can carry. Compared with the amounts of cash transported across the border by passengers, the amounts transported each time are incomparably higher in cargo.

Overall, the questionnaire responses indicate that, with a few notable exceptions, most countries do not pay a great deal of attention to the phenomenon of cash in cargo and mail. Based on the limited international research that has been carried out in recent years (see section 1.9) an educated guess of the amount of cash being transported across borders in cargo and mail could be several trillions

37 See for a more detailed description section 1.6.

38 There are 21 other countries which reported figures and/or text on the extend of cash legally transported out of, through and into their country through cargo, mail and by passengers. In fact, they reported a total figure without distinguishing between the three (mail, cargo, passengers). It can be assumed that in almost all cases this total figure is only related to passengers.

39 It is worthwhile noting that, as 4 out of these 7 countries have no specific declaration for cash in cargo and mail, they won't have a specific database for these data. It can be assumed that the figures given are based on their national customs declaration database.

40 Only two countries gave figures on transit. It is hard to find any figures related to transit, because in transit situations, a summary goods description may suffice, which makes it more difficult to assess the type of goods.

of US dollars each year, worldwide. The amounts of cash transported each time are incomparably higher in cargo then by passengers (and, it would seem, in mail). Individual consignments of up to USD 150 million in cargo are not unusual. Cross-border transportation of cash in mail is mostly an unknown quantity, but the experiences of one country suggest that it may well be vulnerable to money laundering and terrorism financing.

1.6 CRIMINAL USAGE OF CASH

Criminal markets continue to generate large amounts of cash that pass up the supply chain for criminal goods or form the raw material that criminals and money launderers need to process.

Criminals frequently need to use a significant portion of the cash that they have acquired to pay for the illicit goods they have sold, to purchase further consignments, or to pay the various expenses incurred in transporting the merchandise to where it is required. Despite the advantages and disadvantages of dealing in cash (detailed earlier in this report), for criminal groups, there is often little choice. The criminal economy is still overwhelmingly cash based[41]. This means that, whether they like it or not, criminals selling some form of illicit product are likely to be paid in cash. The more successful the criminals are and the more of the commodity they sell, the more cash they will generate. This can cause criminals significant problems in using, storing and disposing of their proceeds. Yet despite these problems, cash is perceived to confer some significant benefits on them.

The principal benefit is often said to be that **cash is anonymous and leaves no audit trail**. The anonymity of cash is often quoted as one of the main reasons for its use in the criminal economy and there is no doubt that, up to a certain level, this is the case. Demonstrating the provenance of small amounts of cash can be problematical for law enforcement officials. For example, so the sale of dealer quantities of prohibited drugs for cash, can be harder to identify and prove when payment is received in cash. The dealer may be able to give an acceptable (or at least, non-disprovable) account of the wad of cash in his wallet. However the reality is that cash is only truly anonymous in smaller amounts. Criminals tend to be able to justify holding small to medium levels of cash when challenged. However the possession or movement of large amounts of cash with no explanation of their origin or purpose becomes increasingly difficult for criminals and criminal groups.

Once the amount of cash exceeds these limits, there is a general expectation that the person in possession of it will be able to account for it if required. Even in cash-based economies, if a large transaction is undertaken there will generally be some record of it somewhere – a receipt, an entry in a ledger, the physical existence of the goods sold or purchased, evidence of withdrawal from a bank etc. Therefore, the inability of a criminal to adequately account for the large amount of cash in his possession – the fact that it is anonymous - can actually be a hindrance, rather than an advantage.

This absence of a legitimate explanation is a major drawback when trying to introduce funds into a bank or other financial institution. Thanks to the FATF Recommendations, and specifically Recommendations 10, 11 and 20 concerning customer due diligence and reporting suspicious transactions, most financial institutions across the world would now question the origin of a large

[41] This has been concluded in several studies, such as the 2015 report of the Europol Police Office *Why is cash still king. A strategic report on the use of cash by criminal groups as a facilitator for money laundering* (Europol, 2015).

amount of cash that someone was trying to pay into a bank account. Accordingly, criminals seek to avoid such issues by retaining the cash they have generated, and if it is required elsewhere, simply physically moving cash across international borders. [42]

As AML measures are progressively tightened across the world, criminals will face ever increasing difficulties when attempting to place their cash into the legitimate financial system. It seems likely, therefore, that the phenomenon of money laundering through the physical transportation of cash is likely to progressively increase

The way criminally derived cash moves will be covered in more detail later in this report, but based on the questionnaires and the case examples submitted, the most prevalent methods are as follows;

- **By cash courier.** In the context of this report, as cash courier is a person who has been recruited by a criminal organisation to transport criminally derived cash across an international border on their person. The courier may have the cash concealed within his clothing, on his body (for example in a money belt or similar), concealed in his luggage (either within his personal effects or within the structure of the luggage itself) or even concealed internally. Cash couriers may use air, sea or rail transport to cross an international border.
- **Concealed within a method of transport.** This refers to the cash hidden within the structure of the method of transport, rather than in any form of cargo. Methods of transport can include cars, lorries or maritime craft ranging from small pleasure boats to larger vessels such as container ships and ferries. In these circumstances, the person in charge of the vehicle may be fully aware of the concealed cash and complicit in the smuggling attempt. Alternatively, the driver of a vehicle may genuinely not know that the vehicle he is driving has cash concealed within it. Similarly, members of a ship's crew may have hidden the cash in a void on the vessel without the knowledge of the captain or the rest of the crew.
- **In containerised or other forms of cargo.** Cash is heavy and bulky and there is a limit to the amount that a cash courier can carry, either about his person or in the structure of his luggage. Likewise, the physical bulk of cash can restrict the amount that can be concealed in voids in the structure of vehicles or other modes of transport. If a criminal organisation wishes to move very large amounts of cash, often their only option is to conceal it in cargo that can be containerised or otherwise transported across borders.
- **Concealed in mail or post parcels.** Some countries report examples of sophisticated concealments of cash within goods sent by regular mail or post parcel services. Although these concealments tend to be smaller than those within vehicles, or on the person of cash couriers, the use of high denomination banknotes can result in seizures of significant value.

[42] Source: based on research by UK authorities.

- **Hidden in 'plain sight'.** Research conducted in the course of gathering information for this paper, and also by the customs authorities in contributing jurisdictions, has identified that some criminal groups have, by taking advantage of the limited requirement for information regarding cash shipments in customs declarations, or by falsifying such documentation, been able to infiltrate large quantities of criminally derived cash into the systems used by legitimate financial institutions to transport cash intended for use in regular financial systems. The extent of this criminal exploitation is currently unknown.

1.7 THE STATUS OF THE PROBLEM

In April 2014, the project team distributed a questionnaire to FATF and FSRB members which asked responders to give their assessment of whether the phenomenon of ML through physical transportation of cash was increasing, static, declining or fluctuating, and why they thought this was the case.

Two-thirds of the respondents recognised cash smuggling as a significant risk, and of those, half reported that it was an increasing problem. However the remaining third of respondents were unable to assess the scale of the problem in their country.

One country stated that the phenomenon was declining, as a result of improved border controls which were believed to have made it harder for criminals to move cash across the country's borders undetected, and this had resulted in a steady decline in the amount of cash seized.

The countries that said that the problem was increasing gave a variety of reasons for their answers. These included:

- **An increase in the robustness of banking controls**. As AML/CFT measures become more effective and better enforced, criminals find it more difficult to introduce cash into the financial sector, and are forced to physically transport it across borders instead. This was the most common reason cited.
- **An increase in criminal activity**. Some countries perceived that the level of acquisitive crime in their jurisdiction (or a neighbouring jurisdiction) had increased, leading to an increase in the level of criminally derived cash generated.
- **Lax border controls, or a lack of resources or will to implement border controls effectively**. Some countries believe that certain criminal groups have identified that border controls are ineffective in some areas and take advantage of these weaknesses to move cash with little risk of detection.
- **Economic and/or political instability**. In countries where the regular financial system is disrupted due to conflict or serious instability, all types of persons, including those engaged in criminal activity, will seek to move their assets to somewhere safer.

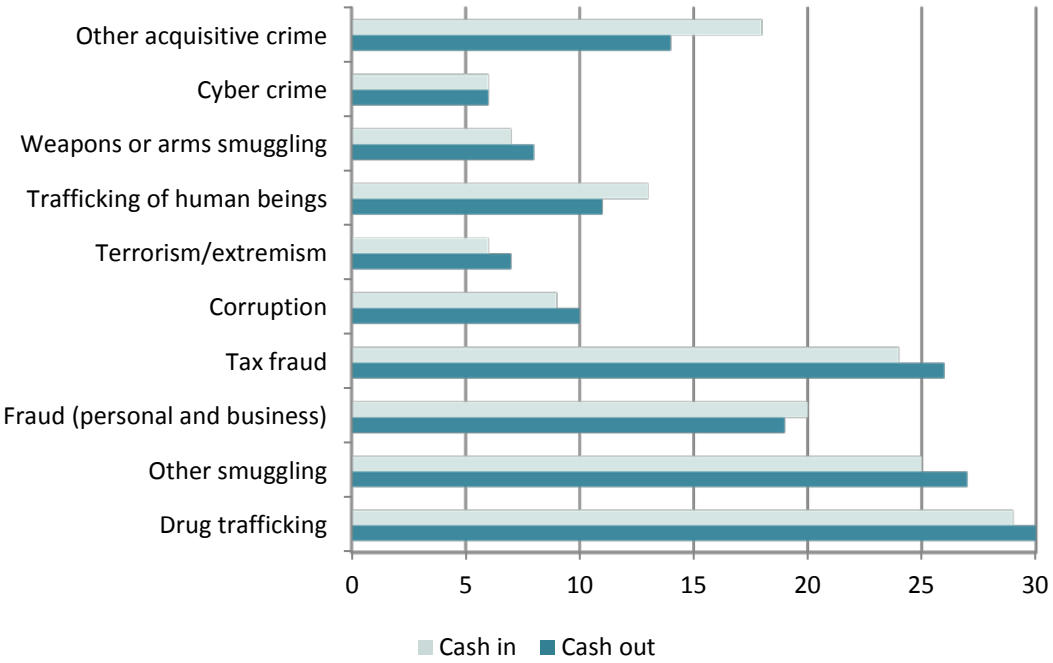
Conversely, some countries remarked that their perceptions of an increase in the problem were based on the results of an increase in the robustness of their border controls and an improvement in their detection capabilities. This raises the question of whether the problem of cross-border transportation of cash is actually increasing, or whether the countries concerned were simply getting better at detecting it.

1.8 PREDICATE OFFENCES GENERATING CASH PROCEEDS

It is clear from the completed questionnaires and case examples received in the course of the information gathering phase of this project that criminally derived cash physically transported across international borders originates from an extremely wide range of predicate offences. One of the questions in the questionnaire dealt specifically with this topic, and provided 12 options for types of offences, with an additional option of 'other' and a request to provide details of any offences not specified in the question. The question also asked countries to differentiate between cash smuggled into their jurisdiction, and cash smuggled out.

All of the predicate offences suggested were selected by at least six of the countries responding to the questionnaire. The responses were as follows:

Chart 4. **Predicate offences generating cash proceeds**



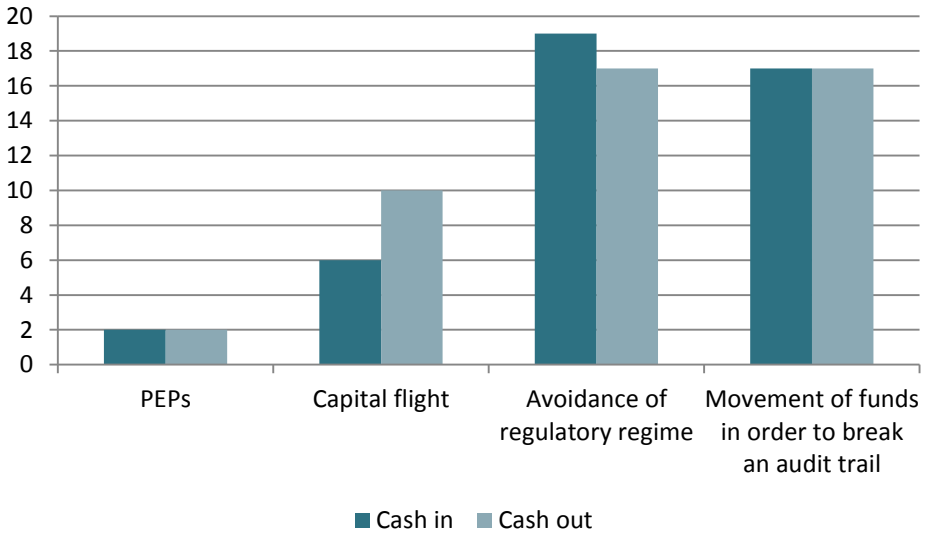
The responses show that the most frequently encountered predicate offence is drug trafficking, although smuggling of other goods (alcohol, tobacco etc.) and tax fraud also feature heavily. The above chart also shows that there is a broad correlation between the reasons behind the movement of cash into countries and those linked to movement in the opposite direction, although this does not necessarily mean the cash always follows the reverse routing of illicit goods.

Analysis of questionnaire responses indicates there are no predicate crimes that are more commonly associated with one method of cash smuggling than another. The method chosen to move the cash is influenced more by the intended use of the funds and the destination to which they are to be moved than by the nature of the crime itself. This issue is explored in more detail in Section 2 of this report.

OTHER FACTORS INFLUENCING CROSS-BORDER CASH TRANSPORTATION

The same question of the questionnaire also asked countries if movements of cash could be linked to factors other than just predicate offences. The graphic below illustrates the responses.

Chart 5. **Other factors link to movements of cash**



As can be seen all, of the options available were selected, with the desire to avoid the regulatory regime in a country, and the desire to break audit trails being major factors. Again, there was a broad correlation between reasons behind the movement of cash into countries and those linked to movement in the opposite direction. The sole exception to this is capital flight, with significantly more countries reporting this as a phenomenon linked to cash leaving their country than entering it. These issues will be covered in more detail in the next section.

1.9 ESTIMATING THE VALUE OF CROSS-BORDER TRANSPORTATIONS OF CRIMINALLY DERIVED CASH

Calculation of the size of something that is by its very nature designed to be concealed, is obviously a problematic exercise, and there are no reliable figures available for the amount of money laundered globally each year. In 1998, the International Monetary Fund (IMF) estimated the figure to be between 2 and 5% of gross domestic product (GDP), but made no attempt to subdivide this amount into money laundered through physical transportation of cash and that laundered by other methods.

In 1999, John Walker estimated this figure to be over USD 2.8 trillion,[43] and in 2005 Baker estimated that more than USD 1.1 trillion was transported across international borders through illicit cash flows globally.[44] In 2009, the United Nations Office on Drugs and Crime (UNODC) calculated from a meta-analysis of the results from various studies that it was likely that the extent of all criminal proceeds was about USD 2.1 trillion.[45] From this figure, cross-border money flows related to transnational organised crime activities were estimated to be around USD 0.87 trillion (USD 870 billion) in the same year.

In order to attempt to gain a 'ball park' understanding of the scale of the problem, the questionnaire included a request for the responding jurisdictions to detail how many ML-related cash detections they had made in the preceding three years, and the total amounts detected. Only about 60% of the countries who responded to the questionnaire answered this question, and not all of these provided a figure for the number of cases and the amount.

When converted into US dollars, the figures provided by those who responded to the questionnaire totalled just over 31 000 cases of ML-related cash detection, representing a little over USD 900 million in three years, This suggests a (very approximate) minimum figure of about USD 300 million detected globally each year[46].

Studies by the USA and the UK suggest that only a very small percentage of the total cash smuggled each year is intercepted. This being the case, it does not seem unreasonable to suggest that the total amount of cash physically transported for ML purposes globally is in the order of hundreds of billions of dollars, an order of magnitude broadly comparable with the academic studies referenced above.

Clearly, the abovementioned figures are only an indication of the amounts linked to transnational illicit financial flows; however they give an indication of just how big the scope of the problem is.

43 Baker, R.W. (2005).

44 Baker, R.W. (2005).

45 UNODC (2011).

46 In 2012 the UK assessed that over EUR 500 million in high denomination Euro notes was sold by currency exchange MSBs in the UK in a twelve month period, and that the overwhelming majority of this was purchased by criminals using them to reduce the bulk of the cash for smuggling purposes. In the same period less than 1% of this figure was intercepted outbound at UK ports.

2. WHY CRIMINALS USE CASH MOVEMENT

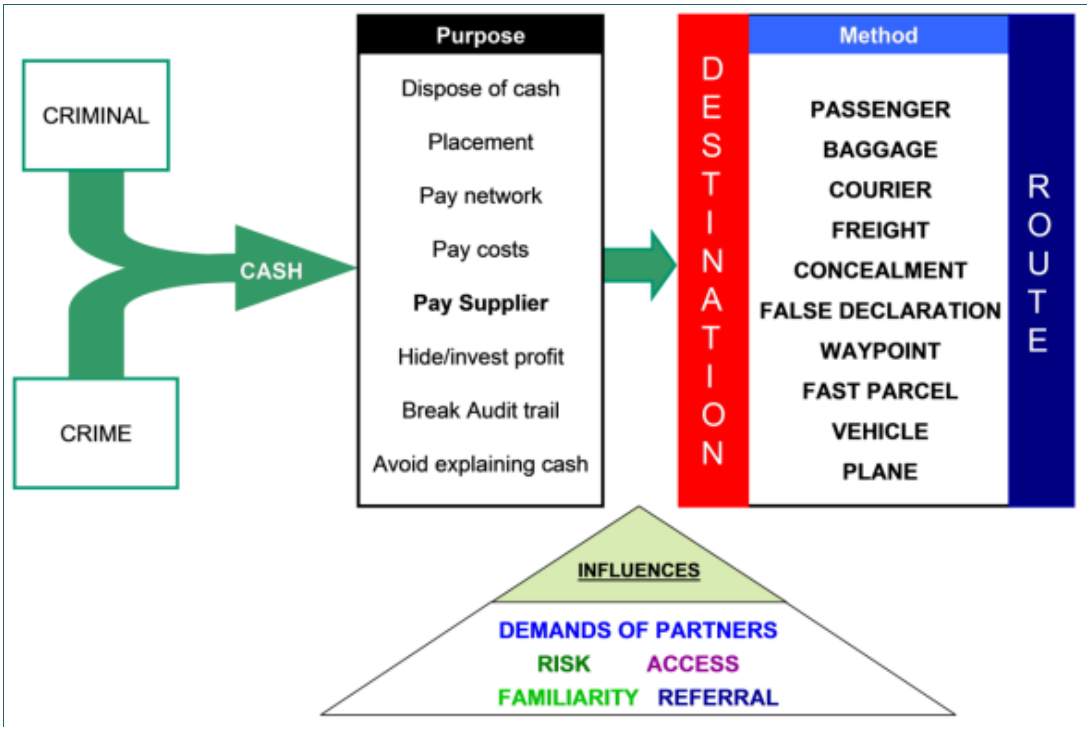
2.1 DRIVERS AND PUSH-PULL FACTORS INFLUENCING CRIMINAL CROSS-BORDER TRANSPORTATION OF CASH

Individuals move cash across borders for a range of reasons, both legitimate and illegitimate. This section seeks to explore in more detail why cash is moved for criminal purposes.

When considering why criminals seek to launder money by physically transporting it across borders, it is useful to consider what the criminal's primary objective is for doing so in the first instance. In general, these objectives can be summarised as RAISING, MOVING, STORING and USING[47] funds, and it is only after deciding on the primary objective or objectives (the 'Why') that a criminal will move on to the methods used to achieve the objectives (the 'How', and equally important, the 'Where'). These objectives are discussed more fully below.

There are numerous factors, which can be referred to as 'push factors' or 'pull factors', which will influence why criminally derived cash is moved from one jurisdiction to another and which go hand in hand with the criminal's requirement to raise, move, store and/or use the proceeds of his criminal activity. These factors are illustrated in the graphic below.

Graph 1. **Criminal decision making influences purpose and method of cash movement**



Source: UK authorities.

[47] 'Raise, Move, Store, Use' is an explanation developed by UK Law enforcement to describe processes in a number of financial crimes, including terrorism finance and money laundering.

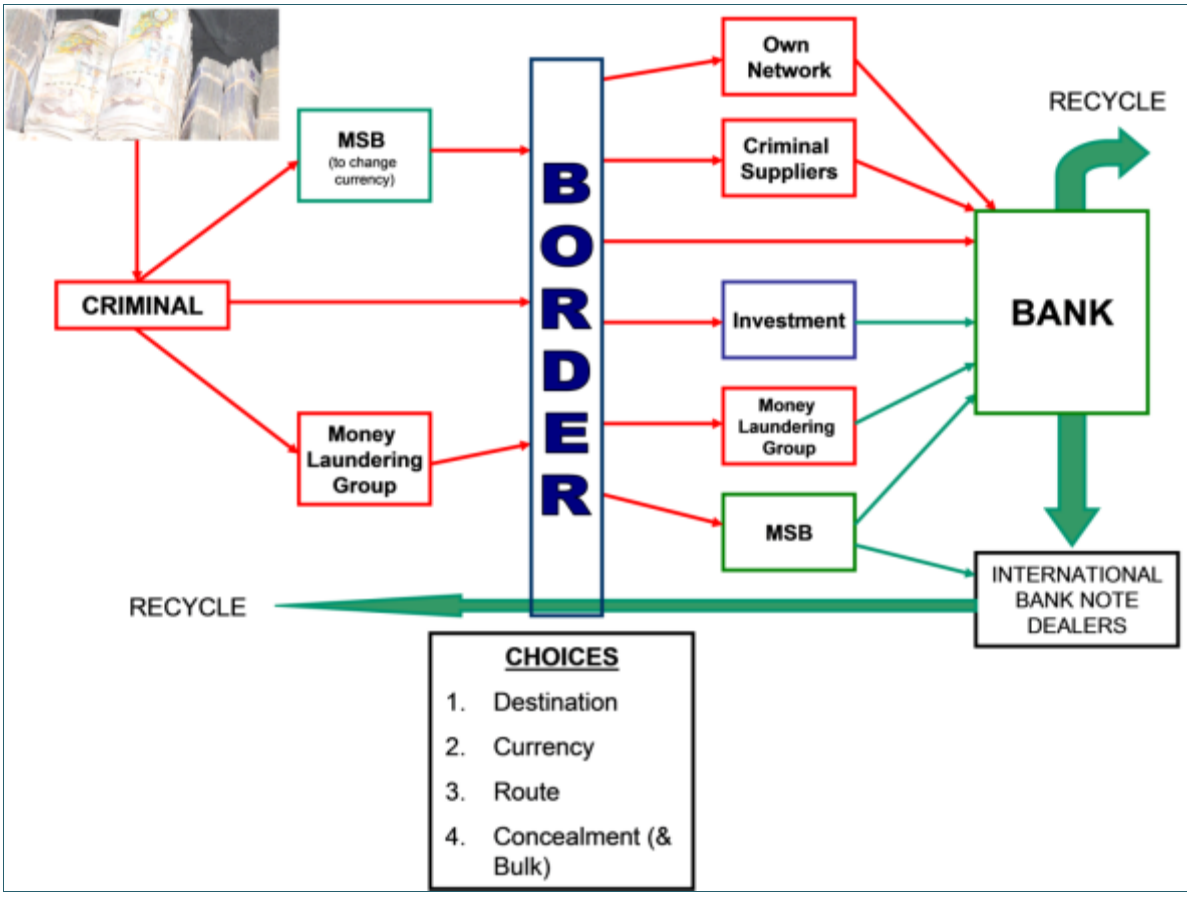
The process starts on the left hand side of the graphic, with the criminal committing the crime that generates the cash. The criminal must then decide what he wants to do with it (pay his costs, pay his supplier, invest the profits etc.)– this is the next step in the chain: the PURPOSE.

It is only once the purpose is decided that the DESTINATION will become apparent; this will be dictated by the purpose. The next step will be to decide how to get the cash to the destination; this will then lead to the next decision: the METHOD, (cash courier, concealment in a vehicle, use of freight etc.), and, closely associated and interrelated to the method and destination, the ROUTE chosen.

At all stages of the decision making process other factors will have an influence – these are shown at the bottom of the above graphic. These include: the risks of choosing one route and destination over another, the availability of (or access to) a particular method (such as a suitable vehicle), familiarity with a system that has worked before etc.

Throughout the process, the cash will follow a route dependant on the decisions of the criminal; however, ultimetely it will re-enter the legitimate fionancial system and will be 're-cycled'. The graphic below is an illustration of what can be termed the 'Cash Cycle'.

Graph 2. **The cash 'Cycle'**



Source: UK authorities.

Starting from the left, the criminal may take his cash to an MSB to exchange the cash into another currency; he may engage the services of a professional money laundering network, or he may use his own resources to move the cash across the border. These choices will depend on factors such as the destination chosen, the currency in which the cash is needed at the final destination, and the chosen routing (and whether any concealment is needed).

Once in the receiving jurisdiction, the cash may be used for a range of purposes – to pay the costs and expenses of the criminal's own network or to pay for further supplies of illicit goods, to invest in assets etc. It may also be passed to an MSB, or banked, as part of an exercise in breaking the audit trail of the money. At some point, possibly a considerable time later, the cash will re-enter the regular financial system, not necessarily due to any action taken by the criminal group. At this point, the bank will either recycle it for use within its own systems – for the purpose of stocking ATM machines, for example – or the cash will be traded on the international currency markets.

The push/pull factors impacting on criminal organisations often differ significantly from those that apply to the movement of legitimately acquired funds, and can therefore help in detailing indicators used to identify movements of criminal cash. In general terms, the main drivers of cash movement for legitimate purposes are business efficiency and cost considerations, coupled with imbalances in the supply and demand for cash (for example, tourism and business transactions, particularly in countries with cash-based economies). All businesses seek to reduce overheads and the financial sector is no different in that respect. Legitimate businesses will also endeavour to comply with local rules concerning anti money laundering (AML) and countering the financing of terrorism (CFT), (not least because failing to do so can result in significant fines, criminal prosecutions and public censure, all of which are bad for business).

Given the tendency of financial institutions to guard their reputation, it is highly unlikely that a developed financial institution or other business in the regulated sector would want to engage in any practices that might affect its 'bottom line' (at least, if it thought there was a risk of this type of activity being discovered). This being the case, it is unlikely that a bank would, for example, prefer to ship cash from a country with a high degree of regulatory oversight to one with less stringent controls for no other reason than to bank it there, or indeed to move cash anywhere without a strong business reason for so doing; as has been stated earlier, cash is heavy and bulky, and is expensive to process, ship and store securely.

Studies carried out by law enforcement agencies in the UK and elsewhere suggest that the most significant driver of cash movement for criminal purposes, in contrast, is safety (as described above, 'safety' in this context meaning in a manner calculated to avoid the scrutiny of law enforcement, or other criminal groups). Academic studies[48] suggest that criminals are more likely to be risk averse when contemplating making a gain, than when contemplating making a loss; in other words, they are likely to be more willing to take risks when seeking to hide their criminal profits from the authorities. Cost, although a factor, is a secondary consideration.

Thus, criminals are more likely to use complex series of transactions with no obvious business purpose, including withdrawing cash from a bank in one country and paying it into a bank in

[48] For example, Johnson and Payne (1996).

another.[49] Serious and organised criminals who often seek to launder large amounts of cash may see the risk of detection at air and sea ports as being lower than the risks associated with leaving an evidence trail, and having proceeds of crime reported officially when transactions are undertaken through the formal financial system.

2.2 RAISING CASH

'Raising' is the first stage of the process, and, in money laundering terms, refers to the actual generation of the criminal proceeds. In other words: committing the crime that results in the acquisition of the cash. This can be the sale of a consignment of drugs or some other illicit commodity, tax fraud, the acceptance of a bribe etc.

In the case of terrorism financing, 'Raising' has a different context. It is possible that funds used for terrorist purposes are derived from some other form of criminal activity, such as drug trafficking, fraud, kidnap for ransom etc. However, it is often the case that the funds have been derived from a legitimate source. For example, the terrorist may have some form of legitimate occupation from which he earns a salary, and he may use some of his salary to purchase components for an improvised explosive device, or to send overseas to make a donation to a terrorist cause.

Similarly, cash moved across a border may have a legitimate origin. As mentioned in Section 1.8, a number of countries identified capital flight as a reason for funds moving across their borders. Capital flight can be defined as 'a large scale exodus of financial assets and capital from a nation due to events such as political or economic instability, currency devaluation or the imposition of capital controls'[50]. The capital being moved does not necessarily have to be derived from criminal activity, although anecdotal evidence suggests that, at least in some cases, the capital being moved to a place of safety may be derived from tax fraud or other illicit activity.

The main driver for capital flight, as is suggested by the definition, is that the funds are perceived by the beneficial owner as being under threat for some reason, and the owner wants to move them to a place of safety. Reasons for the capital being moved in cash may include:

- the avoidance of strict exchange controls,
- the cash having an illicit source, or
- cultural considerations, such as the source country having a cash based economy where banks and other financial institutions are not trusted.

2.3 MOVING CASH

'Moving' refers to a criminal's desire to remove the proceeds of his criminal activity from the location where it was generated, or to move funds held in another location to a place where they are needed. The reason for moving criminally derived funds from the jurisdiction in which they were generated will vary from country to country depending on the economic and social factors there. The most prevalent drivers include;

[49] Source: based on research by UK authorities.

[50] Investopedia (nd).

2.3.1 DISTANCING THE PROCEEDS OF CRIME FROM THE PREDICATE OFFENCE.

One of the primary drivers for laundering money derived from criminal activity is to conceal its illegitimate origins, and one of the simplest methods of doing this is to remove it from the jurisdiction in which the predicate offence was committed. (In the context of this paper, this is viewed as being distinct from breaking the audit trail – see section 2.3.3).

The movement of funds in the form of cash from one country to another fulfils numerous requirements for a criminal. Primarily, it makes the tracing of the proceeds of a crime very difficult for the authorities. Police investigating a crime may never be able to identify the money generated from it if they have been unable to identify any evidence leading them to believe that the cash has been smuggled out of their jurisdiction. Even if the cash is detected in the destination country at some stage of the process, the legal and practical implications of information and intelligence exchange and evidence gathering between the countries of origin and destination can frustrate law enforcement efforts to prosecute offenders and seize the cash.

Long exposure to law enforcement techniques has led criminal groups to appreciate this situation, with the result that, in many cases, one of their first considerations is whether the benefits to be gained from distancing the cash from the crime by transporting it across an international boundary outweighs any other factors, such as the risk of detection at a border.

2.3.2 DEMAND

This is a driver closely related to the need to make use of the funds. Cash may be exported because it is needed somewhere else, perhaps to pay for further consignments of illicit goods. It may also be for some other reason, such as the desire to purchase an asset, or simply to ensure that anyone investigating the criminal's activities is unable to trace, and therefore confiscate, his ill-gotten gains. Similarly, funds may be imported because the criminal has completed a laundering process overseas and wishes to move the laundered funds to a location where they can be used, or perhaps because the country into which the cash is imported has less diligent regulatory oversight and it is easier to place the cash into the banking system there.

The reason for the movement of the cash to the second jurisdiction may also be that that is where the criminal needs it or wants it, regardless of any other factors, such as the controls in place. The local conditions in the destination country might mean that the cash can more easily be banked there. The criminal might intend to spend the money on an asset, such as a property or a vehicle, and needs the payment to come from a bank account, as a large cash payment would be considered suspicious. Similarly, a payment from an overseas bank account with no apparent connection to the purchaser might also be viewed with suspicion.

The person transporting the cash might also be doing so because he has no choice in the matter. He may not the beneficial owner of it, but that person has directed him to facilitate the transportation.

Box 3. **Bulk Cash Smuggling across the US/Mexico Border (and efforts to combat it)**

The United States and Mexico share a land border in excess of 2 000 miles in length, with 417 official Points of Entry, which poses significant problems for both countries in their efforts to combat organised crime. In recent years, the growth of Mexican groups involved in a wide variety of

organised criminal activity, including drug trafficking, organised immigration crime, corruption and weapons trafficking, has led to a significant growth in the volume of cash smuggling across the border with the US. Recent estimates as to the scale of the issue made by academics, accountancy and audit firms and the Mexican government range from USD 6 billion to USD 36 billion annually, with a generally accepted figure being around USD 25 billion. (The US and Mexico governments assess that, despite there being other methods available for moving criminal proceeds across the border, bulk cash smuggling is still used for the great majority of the proceeds generated).

In addition to the flow of drugs, illegal immigrants and firearms from Mexico into the US, there are numerous 'pull factors' within the Mexican criminal economy that contribute to the problem. Firstly, the Mexican Peso is seen by criminal organisations as being less stable than the US dollar, meaning that criminal groups prefer to have their proceeds in Dollars as there is less risk of it losing its value in the financial markets. Secondly, the Mexican criminal groups prefer to pay their bribes and operating expenses in US dollars; and finally the ultimate suppliers of the drugs that are smuggled into the US, the Cartels in Colombia and other South American countries, prefer to be paid in US dollars.

Exactly what proportion of the smuggled cash is used for the purchase of further shipments of cocaine from the suppliers in Colombia and other South American countries remains unclear; estimates range from half to 80%.

How the cash is moved

Cash derived from regional drug sales is generally taken to a central counting house in one of several US cities, including Atlanta, Boston, Chicago, and Los Angeles. The cash in its original form is usually in low denomination notes, and is converted to USD 100 or USD 50 bills, either at the consolidation points or in the original cities of sale. This is done primarily to reduce the bulk of the cash and make it easier to conceal.

Once the cash has been exchanged for larger denomination notes it is usually vacuum sealed to further reduce the bulk, and concealed in the structure of cars or articulated trucks that are hitherto unknown to law enforcement, meaning they have no reason to raise any suspicion if they are stopped. The crime groups often use the same trucks to transport cash south that have been used to transport drugs in the opposite direction.

The potential impact of any seizures is reduced by a variety of means, including regular rotation of transport vehicles and restricting the size of individual shipments to between USD 150 000 to USD 500 000, so that if any one vehicle is stopped the loss is not significant to the criminal organisation concerned and so does not significantly disrupt its operations. Typically multiple cars are sent, each carrying a relatively small percentage of any given cash shipment.

The Mexican criminal organisations constantly rotate drivers who drive the cash shipments from the consolidation centre to the designated border town close to the drug trafficking centre of the particular trafficking organisation. The cash is either aggregated and vacuum packed in a safe house on the US side of the border before being shipped into Mexico, or, increasingly frequently, the drivers continue directly into Mexico to deliver the money. This change is believed to be due to a number of factors, including a growing US law enforcement emphasis on monitoring the sales of particular equipment such as money counting machines and different types of packing equipment.

Efforts to combat the problem – The Merida Initiative.

In 2008, The US and Mexico signed the first letter of Agreement for the Merida Initiative, pledging to work together to counter the threat of drug related organised crime and the associated issue of Bulk Cash Smuggling on both sides of the US – Mexico Border. So far the US government has dedicated USD 2.3 billion to the programme, which has four 'pillars' encompassing a wide range of activities. The pillars are;

- disruption of the capacity for organised crime to operate;
- institutionalise capacity to sustain the rule of law;
- create a 21st century border structure, and
- build strong and resilient communities.

Examples of the activities put in place include;

- supply of specialised aircraft (fixed wing and helicopters) to the Mexican navy and police
- installation of a secure cross-border telecommunications system, providing a method of intelligence and information exchange between security forces;
- provision of specialised training and equipment for Mexican law enforcement and prison agencies, prosecutors and other justice sector personnel in cash detection and other matters
- provision of over 400 dogs trained to detect cash (and also drugs, weapons and explosives)
- supply of specialised non-intrusive scanning equipment enabling the detection of cash and other commodities concealed in vehicles
- supply of a sophisticated border control system providing expedited clearance for pre-approved low risk travellers
- creation and expansion of drug treatment centres and courts in Mexico.

Some countries will be net consumers of illicit goods. Criminal demand for controlled drugs in the UK, for example, is significant, which means that a large proportion of the proceeds of the sale of the drugs tends to be exported in order to facilitate more supply. However compared to the amount imported, a relatively small amount of drugs is exported from the UK to other jurisdictions. This means that inward payments for the supply of these drugs are less significant than the outwards flow, and accordingly cash smuggling outbound is more likely to be drug trafficking related than cash smuggling inbound.

The place of origin of the supply of the illicit goods will act as a push factor in deciding where cash will be smuggled to. In the case of the UK, a large proportion of the drugs consumed by users is

sourced from intermediaries in near Europe, particularly the Netherlands and Spain. Accordingly, cash smuggling related to payments for further supplies of goods are smuggled to these countries. Conversely, cash intended for use as a payment relating to the purchase of assets, such as property, is often smuggled from the UK to more distant destinations such as Dubai and Thailand.

2.3.3 BREAKING THE AUDIT TRAIL

There are clear indications from the questionnaires that a significant driver of the decision to move cash from one jurisdiction to another is to break the audit trail. In other words, it will make it difficult for anyone in the receiving country to establish that the cash is the proceeds of crime in the originating country, thus facilitating easier usage of the cash at the destination. (As referenced in section 2.3.1, breaking the audit trail in the context of this paper is distinct from the act of removing cash from the jurisdiction in which it was generated; instead, breaking an audit trail refers to the use of cash smuggling as a method of frustrating any attempt to trace the movement of funds from one place to another.)

In some cases, the transportation of the cash to another jurisdiction to facilitate placement into the regular financial system may be a precursor to its transfer by bank back to the country of origin. One of the most significant issues raised by contributors to the questionnaire was the problem of the exchange of information between different jurisdictions. This issue will be discussed at greater length later in this report (section 5.2), but the responses clearly suggest that one of the main reasons why cash is moved from one country to another is because it makes it considerably more difficult for law enforcement, and banks and financial institutions in the receiving jurisdiction to establish the provenance of the funds.

Box 4. **Physical transportation of cash to break the Audit Trail**

In November 2013 the Tunisian authorities received a suspicious activity report concerning the actions of a Tunisian national, who was resident in an overseas country but who maintained two personal bank accounts, in Euros and convertible Tunisian Dinar, in Tunisia. The report disclosed that between June and November 2013 the accounts had been credited with in excess of EUR 2.7 million, mostly in cash. The individual had no previous convictions and no business activities in Tunisia.

When questioned, the individual concerned stated that the funds were derived from the sale of property in his country of residence. Checks with customs authorities showed that the individual had declared cash when entering Tunisia from his country of residence on eight occasions between January and November 2013. The amount declared totalled EUR 2 662 000 (It was suspected that the sole reason for the cash declarations was to facilitate the banking of the cash in Tunisia – foreign exchange regulations in Tunisia dictate that cash in foreign currencies imported into Tunisia cannot be banked without being accompanied by a cash declaration form).

After the cash had been banked it was electronically transferred back to the individual's country of residence, to the accounts of corporate bodies (and on one occasion to an account held in the individual's own name). The reason given for the transfers were 'settlement of a loan' and, in the

case of the transfer to the personal account, 'sale of shares in a company'.

Enquiries carried out in the individual's country of residence revealed that he had been the subject of a suspicious activity report in May 2013 concerning a deposit of EUR 220 000 in cash to an account held by him there, which was then transferred to a family member in Tunisia. The reason given for the transfer was the purchase of machinery. The individual was also employed for a minimal wage by an agency organising temporary work placement, and had never owned or had title to any property. One of the companies that had been the beneficiary of some of the transfers from Tunisia was under investigation for tax irregularities.

The Tunisian authorities concluded that the cash was connected to tax fraud in the individual's country of residence.

2.3.4 AVOIDANCE OF REGULATORY OVERSIGHT

Many developed countries have a highly sophisticated financial sector with rigorous regulatory oversight. This is a 'push' factor, influencing the transportation of cash out of developed countries, as it is difficult to introduce large amounts of cash into the regulated sector without attracting law enforcement scrutiny. Hence, criminals will often seek to physically move the cash to a location where it can more easily be banked.

Similarly, a 'pull' factor may be that criminals perceive the destination jurisdiction to have weaker AML/CFT controls, and that the introduction of a significant amount of cash into the financial system there will attract less attention than it would in the originating country. In fact, this perception may be incorrect and the AML/CFT controls in place at the second jurisdiction may be just as robust as those in the first. This misperception may be down to other factors, such as the second jurisdiction having a largely cash based economy where large amounts of cash are viewed with less suspicion.

There may also be certain regulatory factors in the destination country that may influence the decision to move cash there. For example, the banking sector in the destination country may apply a higher degree of confidentiality to financial transactions. This can be advantageous to a criminal; if the difficulties of the initial placement can be overcome, there can be less chance of anyone being able to establish the true provenance of the funds.

The personal taxation regime in the jurisdiction in question may also be more lenient than that in the criminal's country of birth or primary residence. If the criminal has gone to significant trouble to conceal the criminal origin of his funds, and has been able to present them as legitimate income, it makes sense that he would wish to avoid additional expense by paying as little tax on them as possible.

In the questionnaire circulated as part of the project, countries were asked to consider whether one of the reasons criminally derived cash was brought into their country was that their country is known as a legitimate international financial centre. The purpose of this question was to establish if this could be a significant factor in criminal decision-making. Anecdotal evidence suggests that proceeds of 'white collar' crime such as tax fraud, fraud against the private sector, bribery,

corruption etc. tends to gravitate to major financial centres. Fifteen countries responded positively to this question; unsurprisingly, most were countries with highly developed economies and financial sectors, such as the UK, the USA and Australia.

Box 5. **Cash Placement facilitated by the absence of legislation regarding cash movements**

Lebanese Customs identified a group of travelers (eight in total) who had the same travel pattern, being multiple trips made from a European country (A). Some of them had made frequent travels in an eight month period. Customs officers intercepted the travelers and examined their baggage.

It was found that the travelers were carrying large amounts of cash, in mixed low denomination Euro banknotes and that the amounts ranged between EUR 135 000 and EUR 600 000. When questioned, they gave different justifications for the source of the cash. The preliminary investigation findings were forwarded to the relevant Law Enforcement Authority.

Investigations revealed that the travelers/couriers used to meet in a hotel room in country A, where they were given cash by a national of country B. They were told that the money was from the proceeds of stock market investments and contract business and were paid between USD 1 500 and USD 2 000 to transport the cash to Lebanon. Investigations also revealed that the travelers/couriers worked for two individuals based in Lebanon. In the absence of further information on the origin of funds transported into Lebanon, the cash was returned to the travelers. Based on an existing Memorandum of Understanding between the Lebanese Customs and the Financial Intelligence Unit of Lebanon (SIC), put in place to capture substantially the movement of funds pending the issuance of the cross-border transportation of funds Law (currently in the Lebanese parliament), the case was forwarded to the SIC.

The SIC initiated an investigation by circulating the names of the travelers/couriers and the two individuals that hired them for their services to all banks in Lebanon. Findings revealed the existence of several accounts. Analysis on the said accounts reflected multiple cash deposits. The SIC decided to freeze related bank accounts with a consolidated balance of approximately USD 1.6 million and forwarded its findings to the General Prosecutor.

Lebanon experienced difficulties in obtaining information on any investigations that took place in countries A and B. The decision to freeze the funds was taken by the Lebanese FIU based on suspicion and on media reports from country A, detailing a money laundering scheme. This information derived from the media coverage was provided by the Lebanese Embassy in country A rather than the authorities there. As a result, no judicial action was taken in Lebanon, although the freezing of the funds was maintained.

Source: Lebanese authorities.

Box 6. **Avoidance of regulatory oversight in originating country**

A South African national arrived at Auckland international airport from South Africa in May 2011. The passenger was already of interest to the authorities due to current investigation file relating to his company and undervaluation of goods exported to New Zealand. A baggage search located undeclared cash in a false bottom suitcase and the passenger's wallets, which equated to:

- ZAR 532 000 (South Africa rand)
- EUR 200 015
- NZD 10 215 (New Zealand dollar)
- AUD 20

Total NZD 436 030 equivalent

The passenger stated that at the airport on departure, a friend gave him the cash to take back to South Africa. The passenger then said the cash was going to buy his daughter a vehicle.

The New Zealand authorities concluded that this was an attempt to bypass South African exchange controls (by illicitly holding capital off shore and not returning it to South Africa as was required), and suppress company income for purposes of tax fraud in South Africa, linked to possible tax fraud by a New Zealand subsidiary.

The New Zealand authorities alerted the South African Revenue Service of possible tax offences and breaches of the exchange control regulations committed in South Africa.

Source: New Zealand authorities.

2.3.5 ACCESSING A SERVICE NOT AVAILABLE IN THE SOURCE COUNTRY

Some case examples and responses to the questionnaire indicate that a factor in deciding to move cash to a particular location is that the destination country might offer access to a service that is not available in the country of origin. This may be associated with the avoidance of regulatory oversight, but it may also be affected by other issues. For example, it may be that foreign exchange regulations in the originating country prohibit the exchange of cash into a particular currency, or that the currency required is not available in sufficient amounts without alerting the authorities.

2.3.6 FAMILIARITY

An often overlooked factor in the decision to physically transport cash from one country to another is that this is what the criminal has always done. All human beings, criminal or not, are creatures of habit, and there is a common adage in the English language which states that 'if it ain't broke, don't fix it', which in effect means that if something works or does the job it's supposed to, there is no reason to change or interfere with it. Thus, if a criminal involved in importing cannabis from country X to country Y has discovered that a reliable and low-risk method of transporting cash from country Y to country X to pay for further consignments is to exchange it for high denomination notes and then to give it to a trusted lorry driver who is involved in legitimate freight transportation between

the two countries, he is likely to carry on using this method unless some outside influence comes into play.

The advantages to the criminal of using a tried and tested method, apart from the fact that he knows that it works and can calculate the risks, include the fact that he will be more able to calculate and therefore control his costs, and he will also be able to establish what went wrong in the event that the cash is lost or seized.

2.3.7 REFERRAL

Another important, but often overlooked, factor in criminal decision-making is the influence of other criminal groups. Often, criminal networks involved in a similar activity exist in parallel to one another, and the individuals within those networks know each other and may even migrate from one network to another. As a result, methods and techniques used by one group become known to another, and may even be recommended by one group to another.

Using the above example, a criminal group involved in cocaine trafficking from country X to country Y may approach the group involved in importing cannabis, and ask that they use the same driver to export cash. They may also decide that the system is sound, but recruit someone else to move the cash on their behalf. Similarly, if the cocaine trafficking group needs to move cash to a third country they may decide to use a driver involved in legitimate freight transportation to that country. Likewise, if a criminal network has used the services of a specialist money laundering group to move money on its behalf, an associated criminal network may ask to be introduced to the money laundering groups to use its services.

2.4 STORING THE CASH

'Storing' refers to a criminal's desire or need to keep funds in a safe location ('safe' in this context meaning beyond the reach of law enforcement, or other criminal groups). This may be because the money is to be used as a 'contingency fund' in the event of a crisis, or simply because the relevant criminal enterprise has been so successful that the amount of cash held exceeds the criminal's laundering ability.

The decision to store funds in the form of cash may also affect the nature of the cash used for this purpose. The ECB has frequently stated[51] that one of the principal uses of the EUR 500 and EUR 200 banknote is for store of value purposes. A larger value can be concentrated in a smaller volume, which makes the cash easier to keep in a safe, for example (although research conducted as part of this project shows that the same high value/low volume advantage is frequently used by criminal groups for the purposes of moving large amounts of criminally derived cash across international borders in small concealments).

It is important to emphasise that the use of cash for store of value purposes, and the cross-border transportation of cash in order to facilitate this, is common and is not necessarily linked to any form of criminal activity. As stated in section 1.8, a common reason for cross-border transportation of

[51] Most recently in a speech by Yves Mench, Member of the Executive Board of the European Central Bank, in a speech at the Bargeldsyposium of the Deutsche Bundesbank, Frankfurt 19 May 2014.

cash is capital flight. Although there are occasions when the driver for this will be of an illicit nature, such as tax fraud, the funds may also have an entirely legitimate origin and its cross-border transportation is simply to avoid market events such as the devaluation of a currency.

Any type of currency can be used as a store of value, but the most common ones are the major international currencies such as the US dollar and the euro. These currencies are seen as more stable and less prone to currency speculation and significant variations in exchange rates. In addition, there are numerous countries in the world whose economies are significantly 'dollarised'[52] or 'euroised'[53] , or where the usage of these currencies for various purposes, including tourism, is widespread. As a matter of course, it is useful for stored cash to be useable in as many places as possible without the need for conversion into a less common currency, with the costs and difficulties that this would entail.

2.5 USING THE CASH

'Using' refers to the use of the criminally derived funds to purchase assets, or for normal, licit day-to-day transactions. It also refers to the use of criminally derived funds to generate further criminal proceeds, for example by using part of the proceeds of the sale of a shipment of drugs to pay for the next shipment. If the use of the cash at the destination is the primary objective, then there will be influencing factors that the criminal will need to consider when deciding how and where the money must be moved. There is little point in placing the cash in a financial institution, if the criminal's supplier in an overseas jurisdiction needs the payment in cash, or does not have access to an account into which it can be transferred.

For example, the cash may need to be declared on import into a jurisdiction in accordance with local laws and regulations, in order to give the appearance of a legitimate origin or to facilitate its introduction into the banking system. It may be held in low denomination notes, to make it easier to spend (retail outlets will usually not accept, or at least will question, very high denomination banknotes) and it may be kept or used in smaller amounts that are more easily explainable – by the sale of a vehicle, for example.

Likewise, if the reason for moving the cash is to pay a supplier for further consignments of goods, or to pay the expenses involved in the trafficking of a commodity, the supplier may need the cash in a different currency to the one in which it is currently held. If this is the case, then the criminal will need to have access to a currency exchange facility as well as a method of transportation.

This is the case in the UK due to the fact that, in contrast with most of the rest of Europe, it uses its own currency. This can be a complicating factor for criminals sourcing drugs and other illicit goods from near Europe as the European supply chain for such goods frequently requires payment in local currency. This impacts on the methods criminals in the UK use to transport cash as they will often need to exchange local currency into Euros as a precursor to smuggling it out of the UK. As a result, this has led to a significant and otherwise unexplainable demand for large quantities of high

52 Examples include Egypt, Somalia and several South American countries.

53 Examples include Kosovo and Montenegro – source as footnote 27.

denomination Euro banknotes in the UK, and a criminal market has developed to satisfy this demand.

The other major use for criminal proceeds in another jurisdiction is the purchase of assets. Assets can be used for a number of purposes, all of which are desirable for criminals. The first, and most obvious, is that the criminal wishes to enjoy the benefit of his criminal activities, by purchasing a large house in a desirable location, an expensive car, a gold Rolex watch or similar. Second, the criminal may wish to use an asset as a store of value. Property values in most major financial centres, such as London and New York, are either stable or rising steadily and purchasing a property, even if it is left vacant, can result in a healthy return on the criminal's investment in a relatively short space of time. Third, using cash to purchase a property, which is then sold soon afterwards, has the advantage of turning the cash into a balance in a bank account from an ostensibly legitimate source, thus aiding the laundering process, and finally, a title to a property (or any other high-value asset) can be exchanged between criminals as a way of settling a debt.

If the purchase of an asset is the intended use, then the cash will have to be imported into a jurisdiction in such a way that its introduction into the banking system arouses no suspicions. To this end, a criminal may choose to declare the cash on entry and try to use the cash declaration to deceive bank staff by presenting it as 'proof' that the cash must have a legitimate origin.[54] It may also be necessary to transport the cash into a jurisdiction with relatively lax regulatory oversight first, in order for it to be banked there, and then transferred electronically to the ultimate destination.

Box 7. **Cash smuggled to other jurisdictions for investment in property**

This case concerned a very large ML organisation from Colombia and the Netherlands, partly family, led by a woman of both Spanish and Colombian nationality. The group directed Ecuadorians, Colombians and Venezuelans who travelled the world with suitcases full of money. The money was taken to Spain and to various South American countries, where it was used for investments in property. The group probably worked for various clients. The main suspect was arrested at Schiphol airport in 1996 and sentenced to five years' imprisonment for drug trafficking. Her brother was arrested in 2003 carrying EUR 7 million.. The suspects alternately lived in Cali, Colombia and the Netherlands for ten years. The suspects were not (or no longer) engaged in cocaine trafficking themselves.

The investigation showed that the suspects organised money transports for more than EUR 50 million with profits of over EUR 5.5 million. A few money transports were intercepted. Several suspects also stood trial for drug trafficking preparations and possession of drugs and firearms. More than one million euros were found in the house of one of the suspects, which was hidden above a ceiling tile and in a vacuum cleaner bag.

The case also resulted in the seizure of: 38 premises in Cali, Colombia, money, money counting machines, passports, weapons and the contents of accounts.

[54] See also sections 3.5 and 5.1.

The technique used for smuggling the cash

Cash, probably originating from cocaine trafficking, was flown by the various suspects to South America. Money launderers organised money transports from the Netherlands in order to pay cocaine traffickers in Colombia.

For this purpose, couriers were used who were paid travel and subsistence expenses, and were put on a plane with prepared suitcases and backpacks. These were usually Colombian women who had little money and were given the chance to travel to their country of birth. Moreover, the women were paid well for their services as a courier.

In one case, a woman was intercepted carrying EUR 204 000 in the telescopic handles of her suitcase.

The suspects collected large amounts of money, preferably in convenient EUR 500 notes. They rolled the money, put carbon paper around it and hid it as a large roll inside the telescopic handles of the suitcases.

Source: Netherlands authorities.

A significant factor in a criminal's decision to transport cash to another country may be the ease with which he can use it to purchase high-value items in that country. Many countries consider the use of cash to purchase assets, such as cars, as a ML risk and/or a vehicle for tax fraud (although others disagree that this is the case) and have introduced legislation restricting the amount of cash that can be used in a single transaction. Within the EU, there is a wide variation of practices. Some countries place a limit on the amount of cash that may be used to purchase all goods, or certain types of goods (these limits vary between EUR 1 000 and EUR 15 000), whilst some countries impose no limits at all. Other countries do not impose a limit, but instead require businesses accepting large amounts of cash to implement procedures designed to identify (and discourage) the use of cash by criminals to purchase high-value goods.

3. METHODS AND TECHNIQUES

3.1 ROUTES AND ROUTE SELECTION

The choice of the route to move the cash between jurisdictions will depend on a number of influencing factors and will be determined only after the purpose, destination and method of transportation have been decided. Thus, the decision-making process for a criminal wishing to move EUR 100 000 from the Netherlands to Spain to pay a supplier will be different to that used by another criminal wishing to move the same amount of money from the UK to Spain. The criminal in the Netherlands already has the cash in the form of euros, and may simply decide to put it in a holdall in its existing form, in low-denomination notes, put it in the boot of a car and drive it across Belgium and France land borders into Spain. This choice is more likely than transporting it by air, as EUR 100 000 in low-denomination banknotes is quite heavy and bulky and would be easily detected during baggage scans at an airport. In theory, the cash could be exchanged for high-denomination banknotes, but this would bring with it the risk of being questioned at a bank or financial institution and/or reported to the authorities and inevitably would attract additional costs.

In this case, the choice of route will therefore be influenced by the fact that air transport is a less viable option. Also, under the Schengen agreement, there are no restrictions on movements within the EU, and there are therefore no risky manned border crossings that have to be negotiated during the journey. Millions of vehicles make similar journeys every day and there is very little chance that a customs or police official will select the wrong car for inspection, especially if obvious red flags are avoided, such as ensuring that the car is in good condition and speed limits are adhered to.

For the criminal in the UK, a number of other factors apply. The amount of cash, the purpose and destination are the same, but the method, and therefore the route, will be different. The UK is also an EU member state, but being an island and using its own currency are factors that come into play. The cash will be in the form of low denomination British pounds and so will need to be exchanged for euros in the UK first. Given that this has to be done anyway, the criminal may choose to obtain the euros in high-denomination notes from a 'friendly' MSB at the same time, to facilitate concealment. All of the UK's borders are manned at least some of the time so there is a much greater risk that the cash may be detected by law enforcement at the UK's borders. Concealment of the cash is therefore much more important. Once the cash is in the form of high-denomination notes, and is now much reduced in bulk and weight and more easily concealed, the criminal may choose to give the cash to an air passenger on a tourist flight to Spain. Alternatively, if the risks of discovery by customs officials at the airport were considered to be too high, the criminal might choose to drive it to Spain instead via the channel tunnel and through France (however this would take much longer and would have no cost advantage).

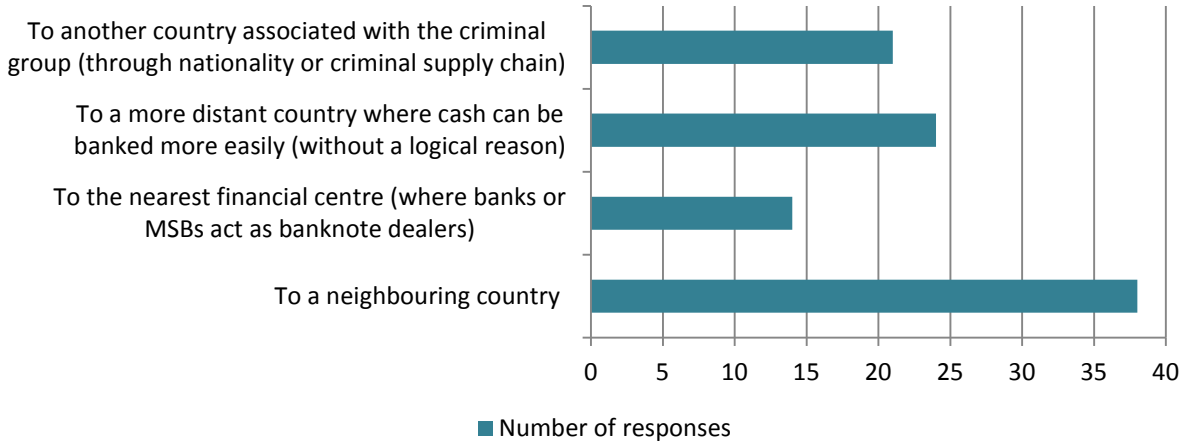
In the same way, any change in the currency and nature of the cash, the intended purpose, destination and method will have an effect on the route the criminal chooses. This being the case it is by no means guaranteed that criminals in the same country, and shipping the same amount of cash to the same destination will use the same routes and methods. Likewise, there is no guarantee that cash derived from the same type of predicate offence will always be transported in the same

manner to the same place. It is not possible to state with certainty that, for example, because cash has been detected in the false bottom of a suitcase destined for Spain, it is derived from drug trafficking, or that all proceeds of cigarette smuggling will go to a particular country.

3.1.1 OUTBOUND TRANSPORTATIONS OF CASH

Two questions on the questionnaire dealt with the issue of the destination and purpose of outbound criminal cash and the purpose and origin of inbound criminal cash. In respect of cash exported, the intention of the question was to establish if it was more common for the cash to be transported only as far as a neighbouring country rather than further afield, and if this was the case, what the reasons might be. The graphic below illustrates the responses.

Graph 3. **Where cash is exported and ML is suspected, where does the cash go?**



All of the choices offered received a significant positive response, and many countries selected more than one option.

The data suggests that the most popular option for criminals (38 responses) is to move the cash to the nearest country; more countries selected this option than those indicating the purpose was to make it easier to bank the cash or related to the ethnic make up of the crime group. As discussed in section 2.3.1, a possible explanation for moving the cash is the desire to distance it from the place where it was generated, rather than the desire to avoid regulatory scrutiny or to make a payment related to the criminal supply chain.

This being the case, it seems likely that the principal desire of a criminal group is that, having made a large amount of money by commiting an acquisitive crime in one country, they wish to take steps to prevent the authorities in that country from detecting their ill-gotten gains by making it harder to locate them. Transporting the cash to the nearest available country is the easiest, and presumably cheapest way of achieving this aim.

The significant number of responses for these other options, however, does demonstrate that the ability to place the cash in the legitimate financial system, and the necessity to pay for further illicit goods, or to pay the expenses incurred in transporting them, are significant influencing factors in route selection.

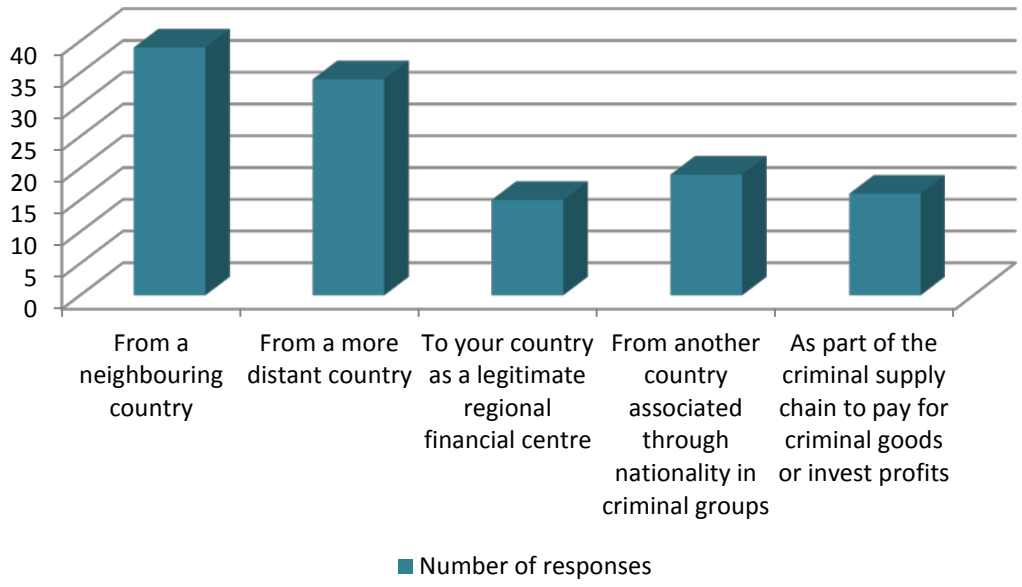
Fourteen countries believed that cash was sent to the nearest financial centre. This closely correlates with the number of countries (15) who believed that their country is a legitimate regional financial centre, and that cash was brough into their country because of this. Respondents to this question included France, Italy, the Netherlands, Panama, South Africa, the UK, and the USA, suggesting the major financial centres do act as a 'pull factor' for cash derived from criminality. This is understandable, as regional financial centres tend to be politically and economically stable, and have a greater number and greater range of small, medium and large businesses located there. Correspondingly, they have a larger concentration of banks and other financial institutions, meaning that the criminal would enjoy more opportunities for disposing of large amounts of cash without drawing attention to himself.

Regional financial centres are usually major cities such as Dubai, London, and New York. These cities are often seen as places of opportunity for the less well-off from many countries. This tends to make them more ethnically diverse, meaning that criminal groups that are ethnically homogenous are more likely to 'fit in' without attracting attention.

3.1.2 INBOUND TRANSPORTATIONS OF CASH

The most commonly selected options in respect of origin and purpose of inbound movements of criminal cash broadly correlated with those for outbound cash (see graphic below). In particular, the most commonly encountered point of origin for inbound cash was a neighboring country.This lends more weight to the theory that the primary driver behind the cross-border transportation of criminal cash is to distance it from the place where it was generated. Moving it the shortest distance possible whilst achieving that aim is the preferred option. However, the fact that nearly as many countries believe that cash is also imported from more distant jurisdictions may indicate that cost and convenience can be less important than the actual distancing process.

Graph 4. **Where cash is imported and ML is suspected, where does the cash come from?**

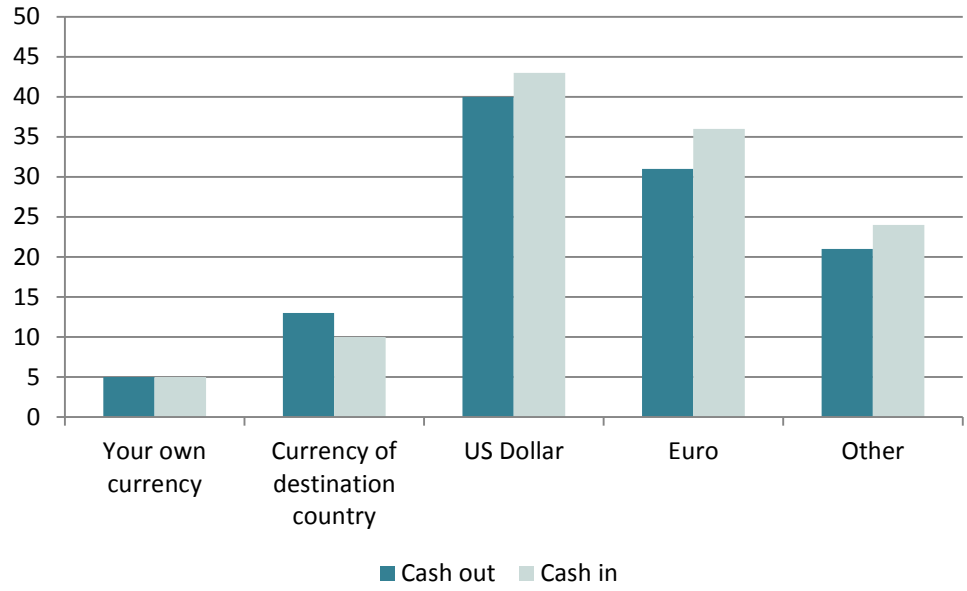


Less significant than the removal of the cash from the jurisdiction where it was generatedThe questionnaire responses illustrated in the above graphic indicate thatan association between a destination country and the ethnicity of a crime group (an ethnically homogenous crime group operating overseas but importing cash into their country of origin, for example), or the need to pay suppliers or expenses, are important considerations.

3.2 CURRENCIES

Countries were asked to identify the currencies most often encountered in consignments of suspected criminal cash transported out of and into their jurisdiction. The graphic below summarises the results.

Graph 5. **Currencies most often encountered in suspected criminal cash transport**



Perhaps unsurprisingly, overwhelmingly the most frequently encountered currencies were the US dollar and the euro. A large number of currencies were identified in the 'Other' category, of which the most frequently encountered were, in order of frequency, the British pound, the Swiss franc and the Chinese yuan, the Canadian dollar, then the Hong Kong dollar, Japanese yen and Russian ruble. All of these currencies were identified in jurisdictions other than where they are used as the main currency, indicating that the cash concerned had either been smuggled into that jurisdiction, or that it had been exchanged into this currency before the transportation took place.

Two features that nearly all of the most frequently encountered currencies have in common are that they are either noted for their long-term stability[55], or are widely used and traded, or both. Clearly, it makes sense for persons wishing to hold money in the form of cash for a prolonged period of time to choose a currency that is going to hold its value on international currency markets and is useable in the widest range of countries. The above currencies are those that best fit those requirements.

[55] The 'top six' are often acknowledged to be the US dollar, the euro, the Japanese yen, the British pound, the Swiss franc and the Canadian dollar (Lee, R., 2013).

Altogether, a total of 34 currencies, other than the US dollar and the euro, were identified in consignments of suspected criminal cash. One of the most striking features of the currencies identified was their regional variation - currencies such as the Saudi riyal and the Qatari riyal were only seen in the Middle East, for example. Moreover, the 'other' currencies identified were very often those of the country immediately adjacent to the country discovering them. Again, this gives weight to the theory that, in many cases, criminally derived cash is simply transported to the nearest possible foreign jurisdiction as a method of separating it from the crime that generated it.

3.2.1 CASH REPATRIATION

Where a country uses its own unique currency, it has the opportunity to gather data concerning the jurisdictions from which its currency is repatriated. This in turn has the potential to tell where its cash is exported to, and by extension, why. Cash in a currency that cannot be used in a jurisdiction, perhaps received in the course of a currency exchange transaction, is generally repatriated to the issuing country by being traded, often as part of a basket of currency, on international currency markets.

The British pound, for example, is only used as currency in the countries that make up the United Kingdom (England, Scotland, Wales and Northern Ireland) and various overseas territories with British ties such as the Channel Islands, the Isle of Man, Saint Helena, Tristan de Cunha etc. Therefore, with very few exceptions, any British pounds found in an overseas jurisdiction must have been transported there or, possibly, hoarded, or traded in the course of currency speculation (the British pound is the fourth most traded currency on international markets and, in terms of value, the third most held in reserves).

In 2008, the UK authorities conducted an in-depth exercise to study the repatriation of the British pound from overseas, drawing on information from customs data and banks and other financial institutions involved in trading on currency markets. Notwithstanding the popularity of the currency as a store of value and on international currency markets, and the distorting influence of regional cash consolidation centres such as Austria and Dubai, studying the phenomenon revealed a lot about where cash was transported to illicitly.

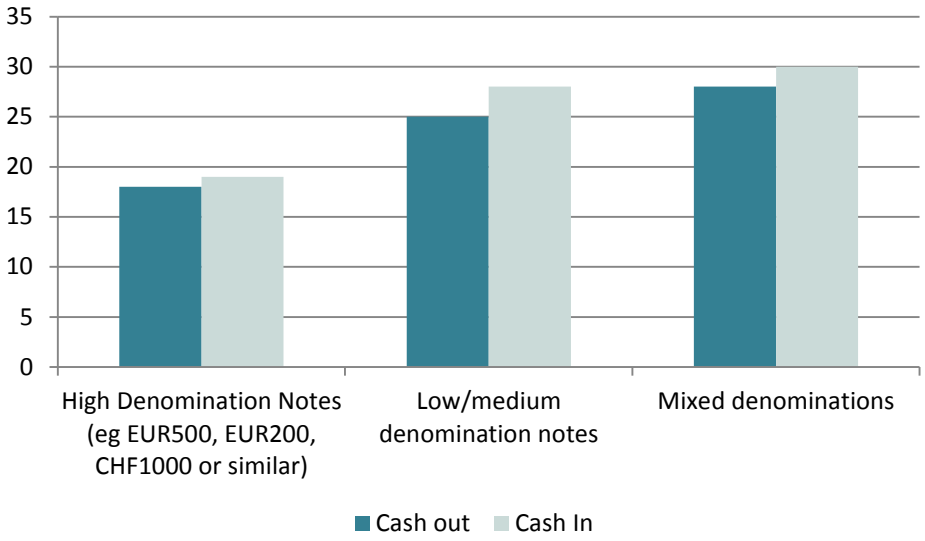
For example, the exercise showed that the amount of British pounds being repatriated from southern Spain was far in excess of what could be justified by international cash trading or the tourist trade. It was also far in excess of what was being repatriated from similar sized countries with similar economies (such as France and Germany). After further study to rule out other factors, the conclusion was that southern Spain was a popular destination for criminally derived cash smuggled out of the UK.

Similarly, in-depth study of data provided by a financial institution involved in international currency trading identified that a large amount of British pounds was being repatriated to the UK from northern Belgium. Law enforcement bodies requested further information from the financial institution who, from their internal paperwork (such as packing lists) were able to identify three branches of a particular bank where the cash had entered the Belgian financial system. When the locations of these branches were plotted on a map it showed that they were in close proximity to an industrial estate known as a consolidation and distribution point for smuggled cigarettes, indicating that the cash could have been linked to excise duty evasion.

3.3 DENOMINATIONS

One of the questions in the questionnaire asked countries to specify what denominations of notes they encountered in consignments of suspected crime-linked cash. The question covered cash both exported and imported, and the options offered were high denominations (E.g. EUR 500, EUR 200, CHF 1000 or similar), low/medium denominations, or a mixture of both. The answers are summarised in the graphic below.

Graph 6. **Denominations encountered in consignments of suspected crime-linked cash**



As can be seen from the data, high-denomination notes are frequently, but not always, encountered. Low/medium denominations or a mixture of both high and low denominations are more frequently seen. There is also a significant disparity between countries which might otherwise be expected to show similar results. For example, the UK reports that far more high-denomination euro and US dollar banknotes are sold by MSBs in the UK than can be explained by legitimate demand, and that there have been many convictions for money laundering of MSBs knowingly selling these notes to criminal groups whose main reason for purchasing them was to reduce the bulk and weight of criminal cash to a minimum to facilitate cash smuggling. A similar preference by criminals of EUR 500 and EUR 200 banknotes is noted by the authorities in the Netherlands.

Box 8. **The sale of high-denomination banknotes to criminals to facilitate cash smuggling**

In the UK in recent years, there have been numerous money laundering prosecutions of Money Service Businesses (MSBs) selling high-denomination euro and US dollar banknotes to persons they knew or suspected to be involved in criminal activity (usually drug trafficking). The evidence in these cases shows that the banknotes purchased were smuggled out of the UK and the reason high-denomination banknotes were used was to reduce the bulk and weight of the cash to a minimum to facilitate concealment.

A significant case concerned a person, K, who between 1994 and 1996 had operated an MSB in the UK which had sold a total of GBP 70 million worth of high-denomination banknotes to criminal customers (in pre-euro days, these were Dutch guilders, Austrian schillings, Deutschmarks etc.).

Almost none of the purchases of these banknotes from currency suppliers, and the onward sale to the criminal customers, were declared in the records of his business. K was prosecuted for money laundering, convicted, and sentenced to 14 years imprisonment (the highest sentence available for money laundering in a UK court).

K appealed to the UK High Court and in 2007 his conviction was quashed on the basis of a technicality. In the meantime he had been released from prison, and whilst he was waiting for the result of his appeal, he set up another MSB, in the names of his wife and son, and almost immediately re-commenced purchasing high-denomination foreign banknotes and selling them to criminal customers.

Law enforcement officers in the UK investigating the criminal activities of a separate MSB involved in similar activity chanced upon evidence indicating that K had re-commenced his previous activities. A separate criminal investigation was launched, and evidence was gathered of known drug traffickers visiting K's MSB and purchasing large amounts of high denomination euro and US dollar banknotes. K was arrested and his business was searched. The new investigation revealed that, once again, almost none of the purchases of the high-denomination banknotes from currency suppliers and the onward sale to customers were detailed in K's records. This time, the total value of the banknotes sold to criminal customers over an 18-month period was approximately GBP 190 million.

Faced with overwhelming evidence, K pleaded guilty to money laundering charges and was sentenced to 11 years imprisonment. His wife and son pleaded guilty to charges in respect of breaches of the regulations for running an MSB.

Source: UK authorities.

In Germany, however, the most common ocurrence is for seizures of low to medium denominations in the context of ML linked to drug proceeds generated within the EU, in particular when Spain, France, Italy, the Netherlands and Germany are involved. The German authorities have evidence that cash of this nature is seized in its 'raw state', apparently because criminals are deterred from changing small to high-denomination notes, due to the risk of being detected and reported by the financial sector in accordance with AML/CFT rules. Furthermore, during these AML operations, the cash is not found hidden in the car, apparently due to the fact that there are regular controls, for example, on the transit motorways from Spain to Germany via France. In the context of such controls, cash smugglers learned very quickly that if money is hidden in a car in the same way that drugs would be hidden, the smugglers could not credibly refer to any legal business as the source. Hiding the cash and the use of high-denomination notes therefore no longer play a signficant role in their plan. This identified modus operandi therefore contributes to the absence of high-denomination notes in cash payments of thousands of euros as an indicator of money laundering in cases as described in this paragraph.

Box 9. **Physical transportation of cash to break the Audit Trail**

Case review and analyses on investigation in ML through cash couriers associated with export of second hand cars.

Funds originating from drug trafficking operations in Europe are gathered and temporarily stored in different European countries. Money laundering groups/ organisations arrange the collection of those funds by cash couriers. The funds are physically transported from one European country to another (e.g. from Spain or the Netherlands to Germany). The transportation of funds is conducted by car on a weekly basis, the funds are not specially concealed (for example, packed in plastic bags and stored under the front seats). The value of the transported sums varies between EUR 40 000 and EUR 500 000; less frequently it goes up to EUR 1 million. The majority of the detected funds are regularly in small denomination of EUR 10, EUR 20 or EUR 50 notes, which is a clear indicator of drug sales on retail level. When running into a cash control the cash couriers regularly try to explain the transportation of the funds with an intended purchase of used cars or building machines.

Once in Germany, the cash couriers distribute the money to different small companies, mostly operating in the second-hand car market. All those companies are managed by the cash couriers, or other persons, with the same ethnic background. Being very cash-intensive, the companies are used as a simple legitimation for their legal income in Germany as well as cover up for their ML-activities. There is always an intermingling of legal and illegal businesses (e.g. integration of drug-related money as well as tax fraud)

Investigation showed that the funds carried by the cash couriers were up to ten times higher than the annual turnover declared to the German Tax Authorities.

The cash is used for purchase of building machines and cars on the second hand marked (grey market) in Germany which are then legally exported to the Middle East. The settlement for the exported goods is carried out over foreign accounts which belong to the car companies mainly located in the financial centers in the Middle East. If cash is needed, couriers will bring the money back into Germany with a proper declaration to the customs authorities. The customs declaration forms are used to legitimise the drug funds transported from various European countries to Germany later on.

The predicate offences for this typological scheme have been trafficking of heroin as well as cocaine.

Source: German Authorities.

The answer to these apparent discrepancies lies in the fact that, once again, other factors influence what denominations will be used when contemplating money laundering through the physical transportation of cash; these are the purpose, destination and method. An in-depth study of the questionnaire reponses and the case examples reveals that high-denomination notes are most likely to be encountered when there is an element of concealment involved in the transportation of the cash.

The reason for this is self evident and has already been discussed in this report. Taking the British pound as an example, measurements of the size and weight of the relevant banknotes shows that GBP 250 000 in 'street cash', a mixture of GBP 10 and GBP 20 notes, weighs between 15-20 kg and is bulky enough to fill an average size sports holdall. The same value in EUR 500 notes would weigh about 0.6 kg and would fit in a fat envelope. High-denomination notes therefore facilitate concealment of large values of cash; by the same token, if the concealment is already available (such

as a specially constructed 'hide' in a vehicle, for example), the use of high-denomination notes means that it is possible to transport a far higher value at a time.

Box 10. **Examples of the size and weight of the relevant banknotes**

3.4 METHODS OF PHYSICAL TRANSPORTATION OF CASH - PASSENGERS AND NATURAL PERSONS

As has already been stated, it is clear from the responses to the questionnaire most countries directed the bulk of the resources dedicated to tackling money laundering through physical transportation of cash towards natural persons. This may be as a reflection of the wording in Recommendation 32, which is titled 'cash couriers'.

FATF Recommendation 32. Cash couriers *

Countries should have measures in place to detect the physical cross-border transportation of currency and bearer negotiable instruments, including through a declaration system and/or disclosure system.

Countries should ensure that their competent authorities have the legal authority to stop or restrain currency or bearer negotiable instruments that are suspected to be related to terrorist financing, money laundering or predicate offences, or that are falsely declared or disclosed.

Countries should ensure that effective, proportionate and dissuasive sanctions are available to deal with persons who make false declaration(s) or disclosure(s). In cases where the currency or bearer negotiable instruments are related to terrorist financing, money laundering or predicate offences, countries should also adopt measures, including legislative ones consistent with Recommendation 4, which would enable the confiscation of such currency or instruments.

However, the "Glossary of specific terms used in this Recommendation" in the Interpretive Note to Recommendation 32 confirms that the scope includes shipment through containerised cargo and mailing:

Glossary of specific terms used in this Recommendation

Physical cross-border transportation

refers to any in-bound or out-bound physical transportation of currency or BNIs from one country to another country. The term includes the following modes of transportation:

(1) physical transportation by a natural person, or in that person's accompanying luggage or vehicle;

(2) shipment of currency or BNIs through containerised cargo or

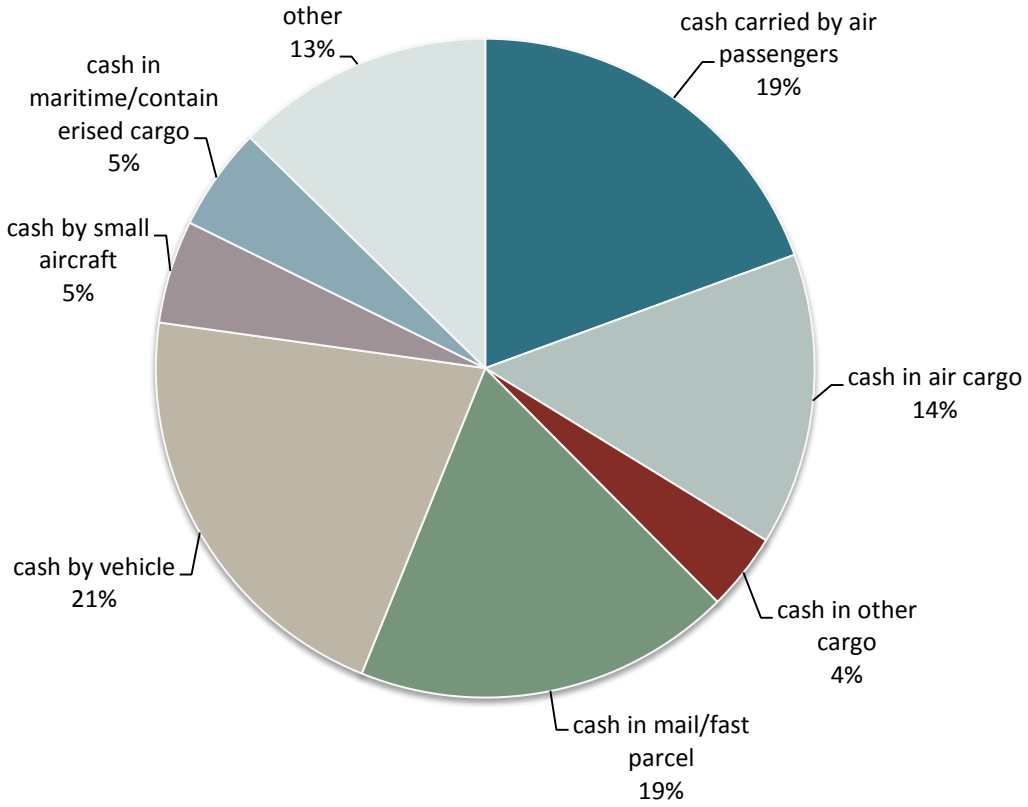
(3) the mailing of currency or BNIs by a natural or legal person.

While the FATF Recommendations cover cash transported by natural persons, mail and cargo, there is a focus on 'cash couriers' both in the title of Recommendation 32 and in its correlating interpretative note.

This focus on 'natural persons' may help to explain why from the questionnaires it appears that many jurisdictions seem to consider that their obligations under Recommendation 32 are limited to have in place a disclosure or a declaration system for transportation of cash by natural persons.

The questionnaire asked countries to rank the methods of cross-border transportation of cash they encountered most frequently in descending order. The graphic below illustrates the results.

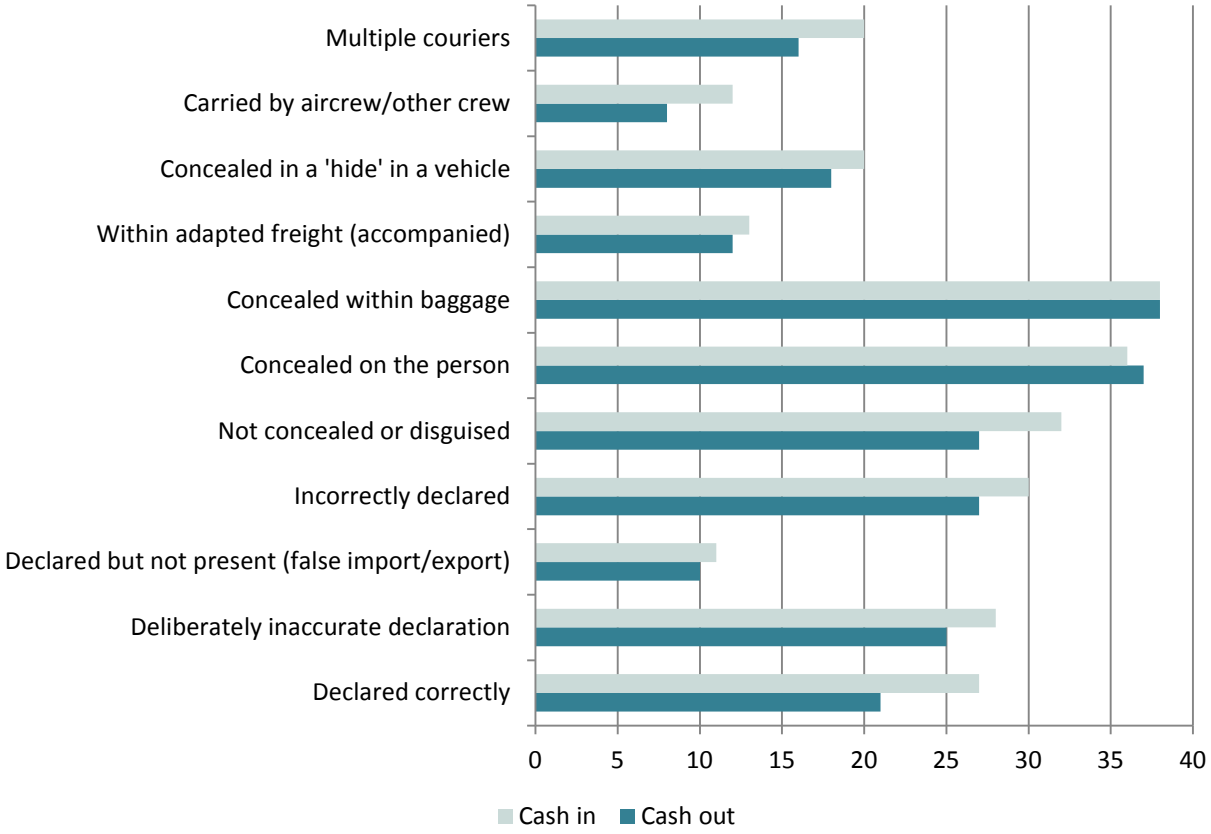
Graph 7. **Most frequently encountered methods of cross-border transportation of cash**



These results show that, in actual fact, many countries do encounter cash movements in air & other cargo and mail (37%). This would imply that countries are choosing to direct their resources against natural persons despite them knowing that cash is moved in other ways. This may indicate an incomplete awareness of the risks involved.

Countries were also asked to detail what, in their experience, were the most common techniques used by criminals when physically transporting cash. The data in respect of natural persons is expressed in the graphic below; it shows that the techniques encountered are broadly similar for cash detected both inbound and outbound.

Graph 8. **Most common techniques used by criminals physically transporting cash**



The techniques can be broadly split into the following categories; criminal cash being declared in some fashion; no attempt being made to conceal criminal cash; concealment on the person (internally, 'body packed' or within items of clothing); concealment in a passenger's baggage; and concealment within vehicles and adapted freight, these techniques are discussed in more detail below.

3.5 CASH DECLARATION REQUIREMENTS

As set out above, it is a requirement of FATF Recommendation 32 that 'countries should have measures in place to detect the physical cross-border transportation of currency and bearer negotiable instruments, including through a declaration system and/or a disclosure system' and most countries that are committed to the FATF Recommendations have introduced such a system. The wording of Recommendation 32 makes the purpose of these systems clear; it is to assist in the detection of both licit and illicit cross-border transportation of cash and BNIs, and the wording of the recommendation makes it clear that countries should also have effective and proportionate sanctions in place for breaches of the declaration requirements.

It is, however, clear from both the responses to the questionnaire, the case examples submitted and the discussions during the typology meetings in Qatar in November 2013 and December 2014 that criminal groups are finding ways of turning cash declaration and/or disclosure systems to their

advantage. One issue appears to be that in some countries, passengers completing a cash declaration do not routinely have the declaration checked by the authorities to see if what is written on the declaration form matches with reality (in some countries this is hardly ever done). There is also very little control exercised over the 'customer copies' of the cash declarations (most are completed in at least duplicate, with at least one of the copies being retained by the declarant), meaning that there is nothing to stop the same form being re-used (see bullet 3 below).

There are numerous ways in which a criminal can use a cash declaration requirement to his advantage. These are all real examples of techniques that have been encountered by countries responding to the questionnaire, or taking part in discussions at meetings of the project group;

- **Cash declarations used to lend a veneer of legitimacy to criminal cash.** Countries which acknowledge that they rarely check cash declarations report numerous examples of persons regularly importing large amounts of cash from jurisdictions linked to drug trafficking, who complete a cash declaration on entry into a country, then take the cash to a bank and pay it into an account. When challenged by bank staff, they produce the cash declaration, which the bank staff accept as 'proof' that the cash must have a legitimate origin as it was declared to the authorities and not seized. Cash derived from other criminality may also be accurately declared in order to circumvent local requirements in respect of banking the cash (see earlier case example from the Tunisian authorities).
- **Cash declarations used to create a false record of import or export.** A cash declaration form is completed and submitted, but not checked, when a passenger enters a country, but no cash was actually imported or exported. Instead, the criminal goes to a bank or other financial institution and pays in the cash derived from crime in the destination country to the value of the false declaration, which is accepted as legitimate in the same manner as the previous example (examples have been reported where a passenger declares cash in, say, three currencies but only two are actually present, the absent third currency is then 'made up' from criminal cash in the destination country).
- **Cash declarations re-used.** Cash is genuinely imported or exported and is declared accurately and correctly. The criminal then takes possession of additional cash derived from criminality in the destination country and goes from bank to bank with the same declaration, using the declaration multiple times to lend a veneer of legitimacy to the additional tranches of criminal cash. The bank staff examine the cash declaration form but do not retain it or make a note of the details, so no-one is able to detect that it has been re-used. A variation on this theme is an adaptation of the example above, where a completely fictitious declaration is used multiple times.
- **Cash declarations that are incomplete.** The criminal declares a large amount of cash at a border control and is challenged by the authorities to

produce the cash. The correct amount of cash is produced, it is counted and the authorities are satisfied with the declaration and the subject is allowed to proceed. Had the authorities searched the subject and his effects, however, they would have discovered that he had additional cash in his possession that he had not declared. The subject is later challenged by the authorities away from the border and can truthfully and verifiably state that he made a cash declaration which was verified satisfactorily by the authorities.

- **Cash declared at one end of a journey but not the other.** In this situation the subject may correctly declare the cash on leaving a jurisdiction, for example at an airport, where the authorities do not routinely check declarations. He has no intention of declaring it inbound at his destination as the cash has a criminal origin and he intends to put it to criminal use. However he is intercepted at the destination and the cash is discovered. The subject then claims the failure to declare the cash was an oversight and uses the declaration made at the beginning of the journey as 'insurance', effectively giving the cash a veneer of legitimacy as in the first example (see case reported by Israeli authorities below).

Box 11. **Example of a deliberately incomplete cash declaration**

In October 2013, a Jordanian person arrived at Amman airport coming from Turkey and he declared an amount of JOD 153 000 (Jordanian dinar) (approximately USD 215 000)

After checking the amount and counting the money, it was found that the person was actually in possession of the following, in total equivalent to about USD 290 000:

- AED 384 125 (Emirates dirham)
- SAR 74 300 (Saudi riyal)
- JOD 85 486
- QAR 113 238 (Qatari riyal)
- ILS 31 460 (Israeli shekel)
- EGP 11 091 (Egyptian pound)
- BHD 169 (Bahrain dinar)
- KWD 710 (Kuwaiti dinar) and
- LBP 747 000 Lebanese pound

The money was seized and the Jordanian court levied a penalty of 3% of the cash seized.

Source: Jordanian authorities.

Box 12. **Declaration at one end of a journey but not the other**

The authorities in Israel were alerted by customs officials in another jurisdiction about an Israeli citizen, a diamond dealer, who had made cash declarations on at least 20 occasions, totalling about USD 2.2 million whilst leaving that country to travel to Israel. The Israeli authorities discovered that the individual had not declared any of the cash when entering Israel. An investigation was commenced.

The subject refused to co-operate with the investigation, claiming that the money was from a legitimate source, using the fact that he had declared the money whilst leaving the other jurisdiction to support his claim. The subject was aware of the money laundering laws in Israel.

The cash was suspected to be linked to tax fraud.

At the conclusion of the investigation the subject was fined ILS 400 000.

Source: Israeli authorities.

3.6 NO ATTEMPT TO CONCEAL

As the graphic in section 3.4 shows, in some circumstances no attempt is made to conceal cash when it is transported from one country to another. This can be the case when the transportation is across a land border which is either only manned occasionally or not manned at all (as is the case with all land borders within the EU, see case reported by the German authorities, Box 9).

Box 13. **No attempt to conceal cash**

In 2008, Slovenian customs officials at a land border intercepted a person leaving Slovenia for Croatia by car. Customs noticed a bag on the rear seat of the vehicle and checked the contents. They found a huge amount of low-denomination banknotes. The cash was seized and counted. In total, there were more than 400 EUR 20 notes, more than 400 EUR 100 notes and more than 8 000 EUR 50 notes, totalling in excess of EUR 500 000. The cash was related to drug trafficking.

Customs had stopped the vehicle because the driver was of Serbian nationality, using a Portuguese passport and driving a car owned by a third party with Italian number plates.

In this case, the Slovenian authorities experienced significant difficulties evidencing the criminal conduct of the subject in another jurisdiction. Eventually they had to use information in a newspaper from the overseas jurisdiction (which reported the drug trafficking activities of the subject) to produce enough evidence to convince the Slovenian authorities to forfeit the cash.

Source: Slovenian authorities.

In the above case, as with the previous example from Germany (box 9), the cash was in its 'raw state': low-denomination euro notes derived from sales of controlled drugs in Slovenia. The euro is accepted unofficially by many businesses in Croatia, so there was no real imperative to exchange the

cash before removing it from Slovenia. At the time of this event, Croatia was not part of the EU. As a result of Slovenia's accession to the EU Schengen agreement, controls at the Slovenia/Croatia border were increased in 2007 as this was now an external EU border (and the cash should have been declared under EU regulations). However, as with most land borders in Europe large numbers of vehicles travel between the two countries on a daily basis and the chances of being intercepted were low.

3.7 CONCEALMENT ON THE PERSON

As shown in Graph 8, concealment of cash on (or in) the body, or within the luggage of a person travelling between two jurisdictions, was overwhelmingly the most common technique encountered by countries that responded to the questionnaire. It is important to note, however, that the resources of the customs authorities to check natural persons of most countries are concentrated more at air, sea and land boundaries than anywhere else, so there is an argument to say that the reason these techniques are most commonly encountered is because those are the ones that most countries look for.

Countries were asked to provide case examples, and well in excess of 100 examples were submitted from a wide variety of countries all over the world. There are too many to list individually but the following are examples:

Box 14. **Cash concealed on a person intended for Islamic State (ISIS/ISIL) in Syria**

In April 2014, a female traveller, M, was intercepted at outbound customs controls at London Heathrow airport on her way to Turkey. She was asked if she was carrying any cash. She produced 40 EUR 500 notes (EUR 20 000) from her underwear. She was also in possession of an additional EUR 1 000 made up of four EUR 200 notes and two EUR 100 notes.

M admitted she had been given the cash by a close friend, W, and asked to take the cash to Turkey, where she would hand it to W's husband or one of his associates. W had offered her EUR 1 000 to undertake the trip. W's husband had previous convictions for drug trafficking and firearms offences, but had recently converted to Islam and had travelled to Syria to fight for Islamic State. M claimed she had been told by W that the money was for the deposit on a house, and she did not know W's husband had joined Islamic State.

W was also arrested and evidence, including messages, photographs and videos, were recovered from her mobile phone showing her husband involved in jihadist activities. It was believed that W was preparing to travel to Syria with her two young children to join her husband.

At their trial, M was acquitted of funding terrorism, but W was convicted and sentenced to 28 months imprisonment.

Source: UK authorities.

Box 15. **Cash transported by aircrew**

A money laundering syndicate was suspected of using airline pilots and crew to smuggle millions of dollars' worth of cash out of Australia to Vietnam. Authorities suspect that the money was the proceeds of drug sales in Australia and payments for drugs imported into Australia.

The cash was given to the pilots by owners of several remittance service businesses, and authorities suspect the money laundering network used pilots to smuggle more than AUD 10 million from Australia to Vietnam over an 18-month period.

Searches of AUSTRAC's information database identified that one of the suspect Vietnamese pilots had previously declared AUD 19 000 on an international currency transfer report (ICTR). Since that declaration, the pilot had made no further reports of currency being carried into or out of Australia.

The suspect pilot was arrested after attempting to smuggle AUD 500 000 out of Australia without declaring it. He pleaded guilty to charges of money laundering under the *Criminal Code Act 1995* and was subsequently jailed for four-and-a-half years for smuggling a total of AUD 6.5 million out of Australia.

Box 16. **Outbound cash seizure destined for the USA**

In October 2013, at the Bermuda airport, a 46-year old Bermudian male presented himself at the US border control to travel to Atlanta. Officers were suspicious of his demeanour and appearance. When questioned, he admitted he had made a false declaration as to the amount of cash in his possession; whilst he had stated he had USD 1 800 he changed that to USD 8 000.

An initial search resulted in the seizure of USD 10 750 from his wallet and pockets.

The man was detained, he and his luggage searched. Officers body searched him and found he had a home made money belt containing USD 29 900. On searching his carry-on luggage officers seized USD 10 556 hidden in a Worldview Travel cardboard pouch.

When questioned, he stated that local gang members had forced him to carry the USD 50 000 because a drug deal had gone wrong. They had ordered him to take the cash to Atlanta where he would be met. He added that USD 1 206 was his cash from work. He had originally been given all the money in the money belt, but had split it up as it was too bulky under his shirt.

An investigation by the FIU showed that the subject had limited finances and was living within his means. He pleaded guilty to an offence of possession of the proceeds of criminal conduct and received a suspended sentence. The cash was confiscated.

Source; Bermuda Authorities.

3.8 CONCEALMENT IN PASSENGER'S BAGGAGE

As the above example from Bermuda shows, one of the influencing factors regarding whether cash is carried on the person or in their luggage is its physical bulk and weight. In the UK example (box 14),

the courier was able to hide the cash in her underwear as is was made up of high-denomination euro banknotes that reduced its physical size to the minimum possible. However there will be occasions when even the use of high-denomination banknotes will make it impossible for the cash to be concealed about a courier's person. If there is no other transportation option available, the cash will have to be placed in the courier's baggage instead, either simply hidden within the clothing, within the fabric of the luggage itself, or hidden within other items inside the suitcase.

Box 17. **Cash concealed inside items in a passenger's luggage**

On 7 January 2011 , at the international airport of Mexico City, customs officers performed a routine luggage inspection of passengers on flight number bound for Lima, Peru. A cash detector dog made a positive indication on a suitcase, which was sent to the mobile X-ray unit to be inspected.

The inspection showed irregular images that did not match the usual baggage of a passenger. Subsequently, customs staff opened the baggage in the presence of the passenger who owned the suitcase, for a thorough inspection of its interior and contents. Hidden inside a bag of candy and cigarettes packages they found a total of USD 151 000 in USD 100 banknotes .

Source: Mexico authorities.

Box 18. **Cash concealed in the structure of luggage**

On 4 October 2005, customs officials at the Ministro Pistarini (Ezeiza) international airport, Argentina, inspected the luggage of A, just arrived on a flight from Mexico. The luggage consisted of one bag with a backpack inside it. During the inspection the officials assessed that the backpack felt too thick. Both bags were emptied of their contents and X-rayed. The images displayed were suspicious. The customs officials cut the bags open and found that both had a double bottom containing US dollars wrapped in plastic wrap. Nine packs were found inside the two bags. The backpack contained four packs, three containing USD 25 000 and one containing US 23 000. The bag contained five packs, two with USD 50 000, two with USD 60 000 and one with USD 30 000, a total of USD 348 000.

On the same day, customs officials also inspected the luggage of R, who had also arrived from Mexico on the same flight. His luggage was a garment bag. The officials detected excessive rigidness while searching the garment bag. Agents emptied the contents and X-rayed the bag, and again, identified suspicious items. The agents cut the bag open and found a double bottom containing US dollars wrapped in plastic wrap. Eight packs were found, six containing USD 40 000 each and two containing USD 15 000 each, totalling USD 270 000.

The defendants were charged on the basis of "having entered the Argentinean National territory on 4 October 2005, from México DF in the MX 1691 flight, with USD 618 000, and having declared on the customs forms that they were entering with less than USD 10 000. The money was hidden in the luggage… (and) they reported receiving, as profit, that money from criminal source in order to give

it the appearance of a lawful source". The subjects received a penalty of imprisonment in abeyance, special disqualification for six months for the exercise of trade, total disqualification for six years to serve as public officers and the seizure of the money (USD 618 000).

Source: Argentinian authorities.

3.9 CONCEALMENTS IN VEHICLES AND ACCOMPANIED FREIGHT

Many countries share land borders, and where this is the case, a common method of cash smuggling is to conceal it within the structure of a vehicle or within freight carried on the vehicle. The advantage of doing this is that, in general, more cash can be concealed than would be the case with a foot passenger, and the concealment is generally more difficult to identify. As the graphic in section 3.4 shows, a significant number of countries identify this technique.

Of course, the method of transport does not have to be a wheeled vehicle; some countries also report the use of others, such as boats and light aircraft.

Box 19. **Cash concealed in adapted accompanied freight**

On 19 September 2013, at the San Emeterio tactical inspection station, located near Sonoyta, Sonora, an articulated truck with a trailer loaded with 2 058 boxes of fresh apples entered the station to clear customs formalities. After reviewing the cargo documentation, the vehicle and its cargo were sent for customs inspection. The inspection was performed by a non-intrusive scanning system in order to search the vehicle and its trailer for undeclared goods. The scan showed up irregularities in the backside of the trailer just before the rear axles. As a result, officials carried out a physical verification of the goods. Inside the boxes they found a total of USD 1 310 010 in various denominations.

Source: Mexico Authorities.

Box 20. **Cash concealed in a specially constructed 'hide' on a Yacht.**

On 5 April 2008 several law enforcement agencies in St. Vincent and the Grenadines conducted a joint operation. These agencies included the Coast Guard, Rapid Response Unit, Narcotics and the Financial Intelligence Unit. The aim of the operation was to board, and conduct searches on, two yachts suspected to be owned by defendant A. Prior to the operation, the St. Vincent and the Grenadines Financial Intelligence Unit (SVG-FIU) and the Royal St. Vincent and the Grenadines Police Force (RSVGPF) received intelligence from the law enforcement authorities in Bermuda indicating that defendant A had a large cache of money on the island of Bermuda and wanted to smuggle same into St. Vincent and the Grenadines.

During the operation on 5 April 2008, law enforcement officials boarded two yachts, yacht A and yacht B, which were anchored in the territorial waters of St. Vincent and the Grenadines. The main conspirator defendant A was present on yacht B with his children and other minors. Defendants B and C of Trinidad and Tobago and Bermuda respectively were on yacht A. The officers conducted preliminary searches of both vessels and nothing illegal was found. However, all mobile phones were seized and kept as evidence. The yachts and the occupants were taken to the main coast guard base where a more thorough search was conducted on the yachts.

The search of yacht B revealed nothing illegal, and defendant A was released from custody. Yacht A, which intelligence revealed had sailed from Bermuda to St. Vincent and the Grenadines, despite defendant C, the captain of that yacht, informing Bermuda customs that he was sailing to the Azores, was also searched. The search of Yacht A lasted for approximately seven hours before Officers decided to remove some liquid foam insulation that had hardened from around the water tank in one of the cabins of the yacht. Having removed the foam, the officer discovered US dollars in vacuum-sealed bags. Defendant C was questioned and informed the officer that other monies were around the water tank in the other cabin. Officers removed the foam from around this water tank and found US dollars in vacuum-sealed bags.

The SVG-FIU seized the monies and secured it as evidence. Forensic testing was conducted on the monies however no material evidence was recovered. Defendants B and C were charged with money laundering offences and defendant A was also subsequently arrested and charged with money laundering offences. The US dollars recovered from the yacht amounted to USD 1.76 million.

Defendants A and C were found guilty of the offences for which they were charged. Defendant B was acquitted.

3.10 RE-USE OF CONCEALMENTS OF ILLICIT GOODS

Countries report numerous examples of cash being transported in the same concealments that originally contained illicit goods, such as drugs. This is a sensible option for the criminal as it means that only one method of transportation is needed and if the concealment was secure enough to successfully ship an illicit commodity it is likely that it will be secure enough to ship cash. However as stated previously it will by no means always be the case that cash and drugs will be shipped this way. It will only be done if it suits the persons at both ends of the criminal transaction; if the supplier of the goods has shipped them from country A but wants the payment at Country B, for example, this technique will not be suitable and another will be used.

Box 21. **Cash transported in re-used concealments previously used for transporting drugs**

Police investigations and FIU analysis identified an organised group that was laundering money from drug trafficking from South America.

One of the techniques that the group used to import drugs from South America was to import boats fenders. They would hide the drugs inside the boat fenders, and after opening them and taking the drugs out, they would place cash in high-denomination notes in the same concealment. The boat fenders were sent back to the country of origin as defective goods.

Police made several cash seizures. It was also established that there were links between the money seized and drug trafficking organisations.

The investigations revealed that the criminal organisation used several money laundering systems at the same time; cash was also transported by air passengers.

A total of EUR 7.2 million in cash was seized, 11 people were arrested and 2 000 kg cocaine was seized.

Source: Spanish authorities.

3.11 ABUSE OF LEGAL BUSINESS STRUCTURES

Several of the case examples submitted, such as the one from the Spanish authorities above, demonstrate that criminals often use 'front companies' or other legal business structures to lend a veneer of legitimacy to their activities. In many jurisdictions it is very easy to establish a limited company, which is a legal entity in its own right, and can be controlled by members of the criminal group. Once a business has been established it can open a bank account which can be used to deposit cash derived from illicit activities (especially if the business claims to be cash intensive, such as a bar, a night club or similar).

In addition, as was the case in the Spanish example, a business can be set up which claims to legitimately trade with businesses in other jurisdictions. This can then be used as 'cover' for the transport of goods between the two countries, which then can be used to conceal cash. If the goods are sufficiently large and the trade generates sufficient volume then large amounts of cash can be concealed in unaccompanied cargo.

3.12 METHODS OF PHYSICAL TRANSPORTATION OF CASH - CARGO AND MAIL

The questionnaire asked countries about their perception of the extent of the illegitimate cash movements into, transiting and out of their country. Countries were asked how many cash smuggling cases (cash couriers, cargo and mail) they had had in the last 3 years and what the amounts involved were. Countries could also mention their experience with the methods used for the physical movement of cash for suspected criminal or money laundering purposes – countries could tell if criminal cash has been transported by passengers, in (different forms of) cargo or in mail/fast parcels.

Box 22. **USD 89 000 criminal cash in postal packages**

Based on a routine check by customs, an investigation by the joint financial investigation group of police and customs forces in Berlin lead to the discovery of USD 89 000 which were forwarded from the US to Berlin.

Perpetrators, which were unknown to this time, had sent five packages containing electric devices to various beneficiaries in Berlin by post. The money (solely USD 100 bills) was hidden in these devices.

After an information exchange with US authorities it was possible to assign the funds to a group of criminals, which had acquired at least USD 4 200 000 000 through criminal activities (mainly fraud and cybercrime). The money was seized.

Source: German authorities.

Two countries stated that they did not believe that cross-border flows of criminally-derived cash take place in their countries. Twenty-two countries stated that they did not have experience in how cross-border flows of criminally-derived cash take place[56]. However, most of the countries reported the amount of the cash smuggling cases they had the last three years and/or the amount of cash involved.

Only one country, however, made a clear division between cases regarding passengers and cases regarding criminal cash in cargo and mail. However, by combining the answers of both questions mentioned above, the project group was able to determine that 27 countries[57], or almost one-third of all responding countries, in the last 3 years had cases of cross-border transportations of criminal

[56] Nevertheless, some of these countries answered the questions in section 1 of the questionnaire reporting some cases of cross-border flows of criminally derived cash.

[57] Countries explicitly reporting in answering the first question of the questionnaire they had no cases the last 3 years but mentioning experience with cases in cargo and mail in the second question have not been counted in this number.

cash in cargo and/or mail. In total 19 of these 27 countries reported that they have dealt with cash smuggling cases in cargo and 19 countries had cases in mail.

Analyses of these 27 countries based on cross connections between different questions/answers in the questionnaire did not reveal a clear picture of why some countries were able to submit information on cash smuggling cases in cargo and mail and how they were able to detect these cases, while other countries were not able to do this. It might be expected, for instance, that the presence of specific regulations on anti-money laundering and terrorism financing regarding cash in cargo and mail would be a decisive factor, but this could not be concluded from the questionnaires. For instance, 13 of the 27 countries did not have a prohibition and/or a license requirement for cash in cargo and mail, and only 7 of the 27 countries have a specific declaration form for cash in cargo and/or mail. Of the 19 countries that have such a declaration form only 6 reported cases.

Precise figures for the number of cash smuggling cases relating to cargo and mail, and the amounts involved, could not be retrieved from the questionnaires, because the reported cases and amounts were not divided into cash carried by passengers, cargo or mail by any of the participating countries (except one). It was possible to conclude, however, that the actual number of cash smuggling cases[58] identified in cargo and mail was very limited, in total not more than hundred cases world-wide in the last three years. In the questionnaire responses, countries made it clear that almost all the cases detailed related to cash in the possession of passengers. This is no surprise as almost all countries appear to have strictly implemented comprehensive legislation on cash carried by passengers. This was also reflected in the answers on the question to indicate, in descending order, the most frequently encountered methods of cross-border transportations of criminal cash: cash couriers were the most numerous in all except one country[59].

It is worth noting that, while several countries reported cash smuggling cases in cargo and mail, many countries pay no attention to this phenomenon as there is no need to do so in the absence of relevant legislation. One country which reported several cases in mail, for instance, states that customs does not give priority to inspecting mail items containing cash because customs lacks the legal authority to do so regarding anti-money laundering and terrorism financing. Consequently, all findings in this country are 'chance hits'. Customs only makes these discoveries within the context of selection and inspection of other goods and risks. This description will most probably fit all other countries without specific cash and/or anti money laundering and terrorism financing legislation.

The occurrence of cash smuggling cases is remarkable also for another reason. In the circumstances described above, it would seem that criminals do not need to smuggle cash. Instead, they could make a rational choice to simply declare all cash transported. As long as criminal cash is transported the same way legal cash is, customs are not able to identify any difference between criminal and legal money – "the best way to hide a tree is in the forest". On the other hand, when customs, by chance, find a concealed amount of money, it is immediately clear that this is criminal money. Absence of regulation and effective enforcement through appropriate allocation of authority is an encouragement for criminals to use this easy way of transporting criminal or terrorist money.

[58] The terms "smuggling cases" and "illegitimate cases" used in the text have the same meaning.

[59] An other reason for being the number one in that ranking is that cash couriers are only able to transport a limited amount of cash. Multiple couriers have to be used in order to get a reasonable amount of cash across the border. In contrast to a container that could transport the big amount at once.

Recent research underlines this conclusion[60]. There is such a thing as 'ingenuity fallacy', which means that money laundering often takes place in a much easier way then one would think based on theory. If criminals can do it the easy way they won't do it the hard way.

3.13 NO ATTEMPT TO CONCEAL

Information from some counties indicates that criminal groups may have found a way of infiltrating cash into the outwardly legitimate bank-to-bank shipment system, such that it can be 'hidden in plain sight'.

Box 23. **Criminal cash infiltrated into the legitimate bank to bank cash shipment process**

The cash (total value: several million euros) was detected at an EU airport in transit from a bank in North America to a bank in the EU. Customs checks identified several clear money laundering indicators;

- Large amounts of EUR 500 notes
- The secure carrier had never before transported cash to the destination country; this country was a customer-country of another well-known carrier

A criminal investigation was started as customs of the transiting EU country reported a suspicion of money laundering to the FIU and the Police. The subsequent criminal investigation examined the background to the cash shipment, and also the bank concerned in North America in order to establish the suspected criminal origin of the money.

The case involved cooperation between the Police and Public Prosecution Service in the North American country involved and the Police in the EU country.

The investigation revealed that the case was the subject of a global investigation. The results so far are large confiscations, arrests and forfeitures.

Source: Netherlands authorities.

3.14 TECHNIQUES OF CONCEALMENTS OF CASH IN CARGO

As has been discussed earlier in this report, potentially far more cash can be concealed in cargo than can be carried by passengers, or concealed in a vehicle. Yet, the questionnaire responses indicate that in most countries the resources dedicated to detecting cash transported in cargo are a fraction of those dedicated to controlling air passengers. As explained in section. 5.3, this may be related to the absence AML and CTF regulation for cash in cargo in the majority of the countries. This, in turn, may be related to the current wording of FATF Recommendation 32 (see section 3.4).

[60] Soudijn (2015).

Box 24. **Bulk cash smuggling in cargo at Mexican border**

On 9 September 2009, Mexican customs officials on duty at Manzanillo seaport, carried out an inspection of two 40 ft shipping containers. The containers both contained 20 x 1 000 kg super-bags filled with ammonium sulfate, making a total of 40 super-bags. A physical examination of the super-bags and their contents revealed six concealed block shape packages. When opening the blocks, officials found USD 11 054 695, mostly in USD 100 banknotes. The goods were manifested for export to Colombia.

Comment: Although the predicate offence linked to the seizure of the cash is not known, it is highly likely that the cash is related to the trafficking of cocaine. The cargo was manifested to Colombia, which is a major cocaine source country.

Also of note is the fact that only 6 of the 40 super bags of chemicals contained blocks of cash. Clearly, much more cash could have been concealed, had the criminals behind the shipment felt it necessary to do so.

Source: Mexican authorities.

Box 25. **Cash concealed in a shipment of vehicles for export**

This case began due to a random customs control on an export shipment of a large quantity of vehicles consigned to Mexico. In the gear box of one of the vehicles (a pickup truck) customs discovered EUR 825 000 (the gear box was a spare part). This was clearly smuggling: the money was hidden and not declared.

Source: Netherlands Authorities.

Box 26. **Suspicious bank to bank shipment of cash transiting Schiphol Airport**

This case started with a customs control at Schiphol Airport on an international cash transport (transit) of EUR 425 000. It was a bank-to-bank consignment (South America – Schiphol Airport - Germany) that, at that time, took place several times each week. This was remarkable, not only because of the regularity of the transports, but also because in air cargo this is a relatively small amount.

The name of the sending bank changed officially several times. The top managers too, changed rather often, and these managers were known to be managers in dozens of trusts in the region as well. Final consignee and other parties concerned were hidden. The consignment consisted of:

- 780 notes of EUR 500
- 75 notes of EUR 200
- 100 notes of EUR 100
- 200 notes of EUR 50

In total EUR 425 000

The transportation route ceased to be used after Netherlands customs started examining the shipments.

Source: Netherlands authorities.

Box 27. **Operation Pacific Rim – US Homeland Security Investigations (HSI)**

Bulk cash smuggling is one of HSI's primary investigative priorities. As part of the effort to combat bulk cash smuggling, HSI established the Bulk Cash Smuggling Center in 2009. Between fiscal years 2003 and 2013, HSI bulk cash smuggling investigations led to the arrest of more than 2 300 individuals and seizures of more than USD 547 million. The center is an operational, intelligence-driven investigative unit that combats bulk cash smuggling from both national and international perspectives. It disrupts pipelines used to move currency derived from illicit activity including drugs, weapons, human trafficking, foreign political corruption and contraband.

In Operation Pacific Rim, HSI, working closely with the Colombian national police and Mexican authorities, dismantled a major drug trafficking organisation - an industrial and transportation empire with a profit margin measuring USD billions. Drug smugglers - responsible for 42 percent of Colombian cocaine entering the United States from 2003 to 2009 - brought tons of cocaine into the United States on yachts and semi-submersibles along the Mexico/United States maritime border. HSI began Operation Pacific Rim in September 2009 after scoring a previous victory in an investigation where they seized USD 41 million in Colombia and Mexico.

From FY 2009 to date, HSI's international partners continue to play a central role in Operation Pacific Rim. HSI works closely with the Colombian national police, Mexican authorities, and partners in Ecuador, Argentina, the Netherlands, Spain, Morocco and Panama, as well as the US Drug Enforcement Administration. This HSI-led investigation spanned the globe and effectively disrupted one of the most powerful and sophisticated bulk cash smuggling and drug trafficking organisations in the world.

Bundles of shrink-wrapped bulk cash concealed within containerised (conex containers) shipments of fertilizer were intercepted at seaports in Colombia and Mexico and also in armoured vehicles. The ports of Buenaventura and Manzanillo are key points of a well-known route used for smuggling cocaine northward to Mexico and then on to the United States, and for sending cash back into Colombia.

This transnational drug trafficking organisation that was generating the cash was a prolific cocaine source of supply, responsible for nearly half of the cocaine smuggled from Colombia into the United States between 2003 and 2009 – approximately 900 tons with an estimated street value of USD 24 billion.

The 'kingpins' of the Colombian drug trafficking organisation created a double problem for themselves in that they made so much money from their illegal narcotics trafficking that they couldn't launder it all. In addition, the huge scale of the drug trafficking and money laundering operations made concealing it from the authorities almost impossible.

Source: US Authorities.

3.15 TECHNIQUES OF CONCEALMENT OF CASH IN MAIL

Few countries report seizures of cash in post and mail, in all probability because most are not looking, some lack the required legislation, and some appear to think that Universal Postal Union (UPU) guidelines prohibit the practice when in fact they do not. It is clear from the cases that have been submitted that the practice does take place, although the amounts are relatively small when

compared the amounts of cash detected in cargo, for the simple reason that mail items are usually much smaller.

Box 28. **Cash in postal items**

At the customs offices in Hamburg and Hanover, the German postal administration detected nine packages, all part of the same shipment, which had been sent from the US to Germany

According to the declaration of content the parcels contained documents (without a declared value), books, videos and CDs. One parcel was declared as a present.

However, a closer inspection of the parcels revealed approximately USD 158 000 in cash.

Based on these detections, money laundering investigations were initiated against German senders and receivers of the parcels.

The funds were seized by order of the public prosecutor, because there was reason to assume that the money originated out of ML activities.

Proof was obtained that the funds originated from a theft in the US in which approximately USD 3.4 million was stolen.

Source: German authorities.

Box 29. **Cash concealed in priority mail**

HSI Honolulu and HSI Seattle were proactively investigating a criminal organisation responsible for the movement of illicit bulk cash currency as it relates to the distribution and sale of methamphetamines. In December 2013, a priority mail parcel was selected for examination at the Honolulu international mail branch, following a positive indication from a cash detection dog. The parcel was shipped from Guam to the state of Washington. Examination of the priority mail parcel revealed USD 42 000.

Source: US Authorities.

Box 30. **Cash in courier parcels associated to trafficking synthetic drugs**

Over a period of time, 23 courier packages and 29 envelopes were found containing cash. The 23 courier packages contained a total of EUR 92 430. The 29 envelopes contained a total of EUR 1 800 and BRL 14 500 (Brazilian real) (equivalent to approx. EUR 3 100). One parcel, contained a CD-cover, concealing two so-called confidence travel cards by VISA. The amount these cards represent is unknown.

Customs received information from courier company TNT Post regarding 37 EMS/ parcels that had been delivered to the suspect in the period 27 November 2008 to 4 February 2010. It is unknown whether these parcels contained cash.

As a result of the above, in the period between 24 August 2012 and 16 November 2012, a total of another 106 letters (envelopes) containing pills, shipped by PostNL and addressed to PO boxes in

Brazil were identified. The 114 envelopes concerned contained a total of 28 555 pills containing MDMA (popularly known as Ecstasy).

A total of five parcels were intercepted which had been shipped by UPS from Brazil. In each of these parcels a plastic Confidence Travel Card was found, mentioning, among other things, the words " Euro". These cards are so-called prepaid debit cards.

It is suspected that the amounts in euros credited to the five Confidence Travel Cards concerned were the proceeds of the delivery of XTC pills by the suspect to buyers in Brazil.

An associated seizure, revealed envelopes containing cardboard strips impregnated with LSD.

On 14 July 2011 the district court in the Netherlands sentenced the suspect in this case to a non-suspended prison sentence of 24 months and on 13 February 2012 he was released on parole.

Source: Netherlands authorities.

Box 31. **Examples of criminal money transported in mail and fast parcels**

2013. Cash concealed in the sides of the cardboard box of a mail parcel.

Total: EUR 4 200.

2013. Cash concealed in kitchen rolls. (Note – the concealment involves paper hidden in paper,

so the banknotes were not visible using X-ray equipment).

Total: EUR 182 000.

2013. Cash concealed in a box of children's nappies/diapers.

Total: EUR 28 500.

Source: Netherlands authorities.

4. CONTROLLING CROSS BORDER TRANSPORTATION OF CASH

4.1 CONTROLS AT BORDERS – ROLES AND RESPONSIBILITIES
