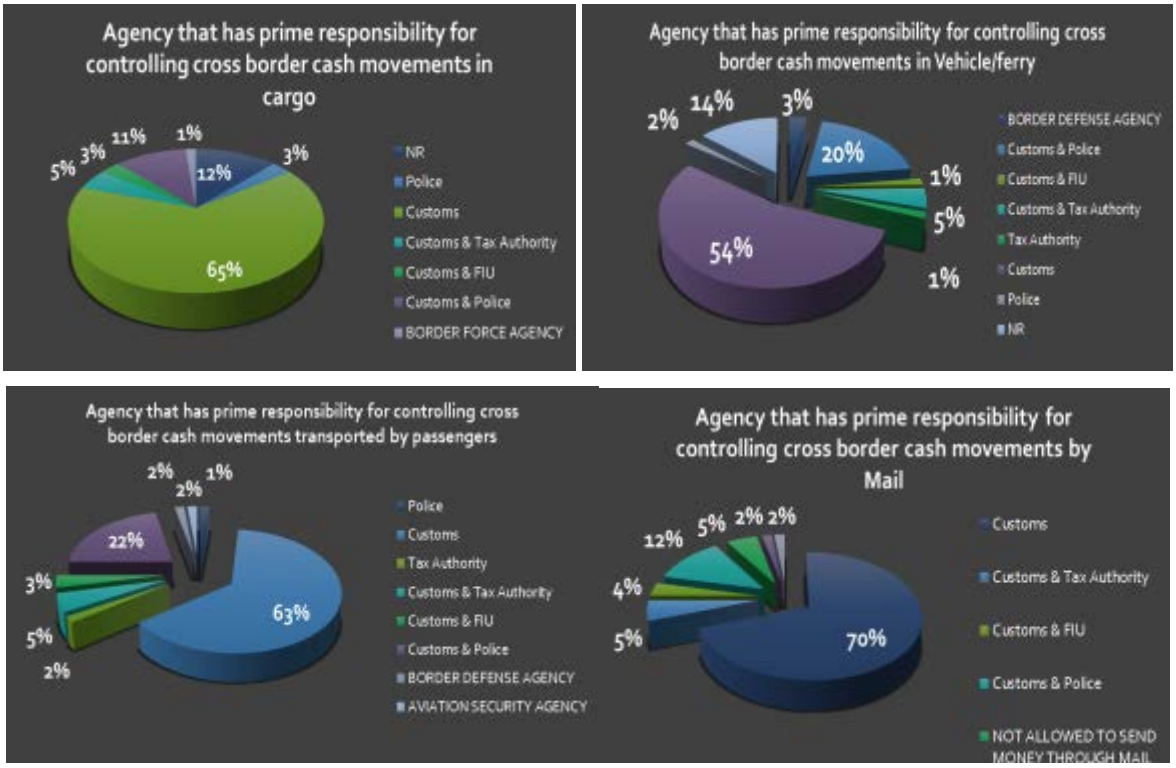
The questionnaire asked countries to specify which agency had prime responsibility for controlling cross-border transportations of cash in cargo, vehicles/ferry, passengers and mail. For all of these different methods of transportation, the most common answer was the customs authorities. However, it was notable that, for all four methods a significant number of countries responded that it was the responsibility of both customs and the police, as shown in the graphics below.



Source: Tunisian authorities, based on questionnaire analysis

Customs and other similar border authorities clearly have a significant role to play in combatting money laundering through the physical transportation of cash, a role that is highlighted and promoted by the WCO. However, customs authorities can only play an effective role when national legislation provides them with sufficient authority to act.

The important role of the police in controlling cross-border transportation of cash is not surprising. In many countries, the customs officials have an administrative role, and the responsibility for conducting criminal investigations rests only with the police. In these situations, a detection of cash thought to be of criminal origin will likely be referred to the police for investigation. Similarly, the police often have other, non-customs related responsibilities (such as crime and national security) at a border, in the course of undertaking which they may encounter consignments of criminally derived cash.

In addition, countries were asked if the responsibility for recording, examining and investigating cash movements was split between different agencies. Thirty-four countries said it was, whilst 19 said it was not. They were also asked if one agency had to, or needed to, work with other agencies to effectively examine, investigate or seize cash. Forty-four countries answered that this was the case, whilst 11 said no. Clearly, these results show that effective co-operation between the agencies concerned is of vital importance to maintaining an effective deterrent to cash smuggling.

Natural persons

Countries were also asked a series of questions relating to the legal authorities held by the agencies controlling the borders in certain circumstances. The first of these was whether agencies routinely examined passengers to identify suspected criminal cash. Fifty countries said yes and only four said no. This is not surprising, given that, as mentioned earlier, the data clearly shows that the bulk of the resources of most countries is dedicated to controlling natural persons, in accordance with those requirements of Recommendation 32 for which detailed guidance is included in the Interpretive Note.

Most countries (44 out of the 52 that answered this question) stated that the level of proof required to detain cash for further investigation was 'reasonable suspicion', although in order to forfeit cash, more countries needed to prove that it was criminally derived to a level beyond reasonable doubt (19 out of 48 countries). This coincides with the cases of criminal cash in cargo that have been submitted. In almost all the cases, the starting point was a suspicion of money laundering from an investigative agency upon which customs acted. This means, in practice, that hardly any customs control on cash shipments from an AML or CTF point of view will be and can be exercised, as the information available from a customs declaration is so limited (see below) that the level of proof needed to detain the cash and to exercise further inspection will seldom be reached.

Another issue arising from the questionnaire regarding Recommendation 32 is the definition of "currency and bearer negotiable instruments". Some 33% of the responding countries felt the definition is too narrow (whereas 23% of the countries did not answer this question).

The case examples submitted by a number of jurisdictions demonstrated that money laundering and terrorism financing also takes place with other valuables, comparable to currency and bearer negotiable instruments. A number of countries, suggested broadening the definition of "currency and bearer negotiable instruments" with commodities such as:

- Precious metals / Diamonds/ Gold/ Gemstones;
- Jewellery/ Watches;
- Prepaid cards;
- Cash cards/ Stored value cards;
- Casino chips;
- E-money (electronic types of money like electronic wallets or Bitcoins);

- Other commodities/instruments that can easily be transferred into cash/Each transmissible instrument in such form that the property of the title can be transferred to one or more persons.

Cargo and Mail

Countries were then asked if these border control agencies had the power to routinely search consignments of cash in cargo and mail from an AML perspective. The answers were overwhelmingly affirmative; 43 said yes and only 8 said no. Once again, this is not surprising as most countries have granted their customs (and police) the legal powers that they believe are required for the effective management of money laundering risks in respect of natural persons. However, further research suggests that in many cases the agencies concerned in fact do not have the power to conduct searches routinely, i.e. without a suspicion of money laundering.

The Harmonised System tariff code for banknotes attracts no VAT or customs duty, and the only details required on the customs documentation is the weight of the consignment and a proper description of the goods. Thus, the description on such a consignment need only say 'banknotes 1 000 kg' to comply with these requirements. There is no need, for example, to record the beneficial owner of the banknotes, the details of the financial institution where they started the journey, or the details of the recipient. Because specialized CVIT companies with depots in the origin and destination locations usually carry out the shipment and the customs declaration, it is frequently the case that the names and addresses of the dispatching and receiving depot of the CVIT company will be shown on the documentation as the addresses of the sender and receiver of the cash.

This, coupled with the fact that research has shown that the cash may be entered under the wrong tariff code (such as the ones for waste paper or printed matter, for example), means that customs authorities will often have almost no information at their disposal to assess whether the cash is a legitimate bank-to-bank shipment, or a consignment of criminal cash hiding in plain sight.

This issue goes to the heart of how customs authorities exercise their authority. No customs authority in the world is resourced sufficiently to examine every single consignment that crosses the borders they control. Nearly all will have to make some sort of reasoned judgment about which consignment to select for examination – in other words they will carry out some kind of profiling exercise. But in this circumstance, there is almost no information on which to base that kind of decision. As long as the customs documentation states that the shipment contains banknotes and their correct weight, the goods have been entered correctly and there is no objective reason for customs to suspect there might be anything suspicious about the cash. In other words, their powers to carry out further investigations and to demand the provision of further information are limited.

However, information gathered in the course of this project has shown definitively that criminal groups have been able to infiltrate very large volumes of cash into the bank-to-bank cash shipment system. It is therefore important that customs are able to inspect shipments and require the disclosure of additional information to enable them to address this risk effectively. The question that has arisen is whether, in the absence of any objective reason for suspicion, they have the legal power to do so (see also section 4.1 for an in-depth analysis of the (lack) of legislation/legal power). One country has examined this issue in detail and has concluded that their customs authority does not have the legal power. They are currently in the process of amending their national legislation to correct this situation.

This being the case, the next three questions in the questionnaire were carefully worded and designed to establish whether agencies tasked with controlling cash in cargo and mail had the legal authority to interfere with a consignment, or require the disclosure of additional information about it, if there were no obvious reasons for suspecting that it was connected to criminal activity.

- The first question was 'Where cash movements are superficially part of normal business, can the relevant agency inspect consignments and make further investigations to determine whether the movement is suspect?' Forty-seven countries answered yes to this, whilst only eight said no.
- The second question was 'Do these agencies have the power to routinely search consignments of cash in cargo and mail from an AML perspective?' Thirty-six countries answered 'yes' and eight said 'no'.
- The third question was 'If there is no apparent violation of customs regulations or banking rules, does the relevant agency have the power to detain a consignment of cash in cargo or mail for further inspection and/or investigation?' Thirty-three countries answered 'yes' and twenty-one said 'no'.

Overall, most countries believed that there were few restrictions on what their customs and other agencies had the legal authority to do, and it is possible that this is the case. However, the experience of one of the countries contributing to the project suggests that some countries may not have given the matter enough serious thought and studied their domestic legislation in enough detail to spot any loopholes that may exist. The effect of this is that most countries will continue to find it extremely difficult to detect any cross-border transportations of criminally derived cash in cargo and mail, and accordingly the matter will continue to be a considerable threat until these issues are addressed.

If countries do not pay greater attention to the issue of cash in cargo & mail, including gaining a better understanding of the legitimate trading of cash on international markets and the way that it is transported around the globe in consequence, they will be unable to use profiling and targeting tools effectively. Therefore, they will not be able to develop an effective response to the problem of criminal ability to infiltrate criminal cash into the legitimate systems used by banks and other financial institutions.

Box 32. **Establishing the nature and frequency of cross-border cash movements – Operation HANNIBAL**

In mid-2014, in response to the close involvement of CTAF, the Tunisian FIU, in the typology working group studying money laundering through the physical transportation of cash, and inspired by a similar exercise conducted by the Netherlands authorities in 2008, the Tunisian authorities conducted a 60-day project in which all transportations of cash into and out of Tunisia were monitored and recorded.

The exercise was supervised by CTAF, and conducted jointly by Tunisian customs and the Ministry of the Interior, in conjunction with all Tunisian banks. The objectives of the operation were;

- To identify different methods of money laundering and terrorism finance through the physical transportation of cash in order to enhance international community efforts in tackling these issues
- To detect, at a national level, the trends of legal importation and smuggling of cash as well as the methods used and its final destination.
- To use the outcomes of the exercise in the preparation of Tunisia's National Risk Assessment and make recommendations on ways of tackling organised crime (money laundering, financing of terrorism , smuggling etc.).
- To make practical recommendations for the best use and sharing of human and logistical resources on a risk-based approach.

The operation was wide ranging, and encompassed;

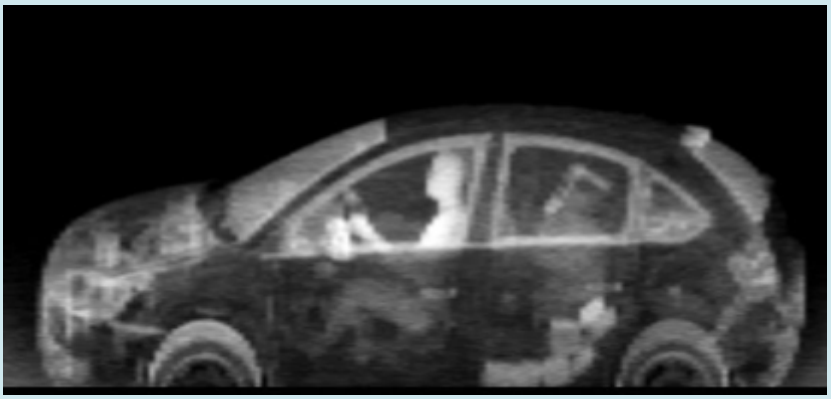
- The monitoring of physical transportation of currency across all Tunisian land, sea and air borders for a two-month time period . The targeted transactions were:
  - Smuggling of cash across the border during imports and/or exports.
  - Currency transactions reports (declared) at import, export and transit levels.
- Tracking the destination of reported currency through post-monitoring mechanisms carried out by national customs, banks, and Interior Ministry (Department of Foreign and Borders).
- Estimating the value of imported foreign currencies not regularised pursuant to Exchange Control Regulations.
- Attempting to determine the final destination of these funds and their potential links to money laundering and terrorism financing.

Information was exchanged using a specially commissioned secure area of the website of the Central Bank of Tunisia and monitored on a daily basis by CTAF. Over 17 000 reports were received, including 2 575 from banks and 14 983 from customs. Of the reports from customs, 28% were received from land borders, 9% from sea ports and 63% from airports.

Of the foreign currency detected, 94% was made up of US dollars, euros and British pounds, with only 6% in currencies of Arab states. Of the reports of movements of foreign currency, 2 935 originated from land border points, 1 348 from sea ports and 9 349 from airports.

As well as gathering a huge amount of valuable data concerning the value, nature and scope of foreign currency crossing their border, the Tunisian authorities detected a number of crimes including;

- A seizure of EUR 1 447 000 from a concealment in a car at a land border crossing; the seizure is believed to relate to the financing of terrorism



X-ray image of the car from which EUR 1.447 million was seized. Note blocks of money hidden under rear seat

- A seizure of USD 2 300 000 from a failed attempt at smuggling at an airport
- A seizure of USD 2 850 000 at an airport, which was being exported using a forged banking license.

In addition, further crimes, including importing and exporting currency without the required notice and the necessary license, cash smuggling, counterfeit currency and breaches of money laundering and terrorism financing laws were identified.

Source: Tunisian authorities.

4.2 METHODS USED TO DETECT AND PREVENT CRIMINAL CASH SHIPMENTS

4.2.1 CASH DETECTION DOGS

A number of the cases reported by respondents to the questionnaire have highlighted the importance and usefulness of cash detection dogs (see box 17 and box 29). Many countries now report that they are routinely using them to facilitate selection of passengers for inspection at ports and airports. One of the features of the Merida Initiative, the programme established to tackle bulk cash smuggling across the US-Mexico border, is that well over 400 dogs have been trained and deployed to detect not only drugs and firearms but cash as well. However they almost certainly also have a very important role to play in detecting illicit cash shipments in concealed in cargo and mail. The sheer size and volume of mail at mail depots, and cargo at ports and airports, makes profiling and control extremely difficult. Especially, as most countries pay little attention, and devote few

resources to the phenomenon. The use of cash detector dogs at container depots and other cargo consolidation points is a valuable asset too in selecting cargo and mail for examination.

4.2.2 X RAYS

As is the case with cash detection dogs, many countries are now using x-ray machines to identify cash concealed in a whole range of vehicles and goods, and a number of cases detailed in this report have resulted from x-ray scans (see box 19). The particular value of x-rays is that they can detect cash shipments even in the most cleverly constructed concealments that otherwise would be missed altogether by the human eye. They also facilitate much faster and more efficient screening of vehicles and persons, meaning more can be controlled and limited resources better utilised.

4.2.3 CONTROLLED DELIVERIES

The technique of controlled delivery is one that has been used for a number of years in many jurisdictions as a way of identifying and arresting persons involved in the trafficking of illicit substances such as drugs, counterfeit cigarettes, stolen goods etc. However, the case examples submitted suggest that the technique is under-used when it comes to large consignments of cash; only one such case was recorded.

The reason for this may be that, in respect of illicit substances such as controlled drugs, it is relatively easy to replace the drugs with a similar low-value substance, thus ensuring that, if anything goes wrong, the authorities have not suffered the embarrassment of losing a high-value consignment of illegal goods. Clearly, this is much more difficult with cash, as it is difficult to find anything that has the same look and feel of a large bundle of banknotes, and the value of the consignment often precludes any risk of loss. In the example below, the US authorities mitigated the risk of losing the subject, vehicle and cash en-route to the handover location by flying them from Mississippi to Colorado in a military transport aircraft, a facility that is not going to be readily available in most cases. Nonetheless, as can be seen from the result, the technique can be put to effective use if the risks can be mitigated.

Box 33. **Successful controlled delivery**

In April 2012, US Homeland Security Investigations (HSI) Resident Agent in Charge (RAC) St. Louis was contacted by the St. Louis County Police Department to adopt a USD 264 925 bulk currency seizure resulting from a probable cause traffic stop. HSI St. Louis special agents responded to adopt the seizure and conduct a post-seizure investigation, during which the subject agreed to co-operate and conduct a controlled delivery of the currency. In support of the controlled delivery, the National Bulk Cash Smuggling Center coordinated with the US Air Force Reserve to obtain a C-130 cargo aircraft to transport the HSI St. Louis agents, suspect, and vehicle to Greeley, CO. Additionally, HSI St. Louis co-ordinated efforts with HSI RAC Greeley and ultimately executed the controlled delivery, which resulted in additional seizures including USD 232 530 in US currency, 3 691 kilograms of cocaine, two vehicles, and one handgun. An additional suspect who was also arrested, agreed to co-operate and set up a meeting with a US-based cocaine distributor for the criminal organisation.

HSI Greeley and the Weld County Drug Task Force were subsequently successful in organising a

meeting with the co-operating defendant and the suspected US-based cocaine distributor for the organisation. The suspected cocaine distributor was apprehended and an additional USD 125 000 was discovered and seized. Furthermore, a fourth subject was arrested while trying to deliver 3.4 kg of cocaine to the co-operating defendant. The co-operating defendants successfully arranged a meeting with the suspected leader of the Mexican-based criminal organisation who travelled from Mexico to Greeley, CO where he was eventually arrested by HSI agents.

Source: US Authorities.

4.2.4 STATISTICAL ANALYSIS OF DATA

As has been discussed, most countries do keep some sort of record of the cash declarations made by passengers at their borders. This is a valuable source of information and can be exploited by conducting statistical analysis alongside other datasets, such as records of criminal convictions, police intelligence databases, suspicious activity reports and taxpayer information. This analysis, identifies criminal trends in legitimate and non-legitimate cash movement, which can assist in the targeting and deployment of resources. In addition the information can also assist in identifying other criminality, such as drug trafficking and tax fraud.

4.2.5 RESTRICTION ON PROVISION OF HD NOTES

Analysis of information resulting from money laundering convictions in the UK over a three-year period from 2008 to 2011 identified numerous cases where criminals were purchasing huge volumes of high-denomination euro banknotes from criminally complicit currency exchange MSBs in the London area. The UK does not use the euro as its currency and extensive research could not identify any substantial legitimate demand for high-denomination euro notes in the UK. It was clear from the evidence obtained during the money laundering prosecutions that the high-denomination banknotes were being used by criminals to facilitate the concealment of cash as an aid to smuggling it out of the UK.

Box 34. **UK Project QUAVER**

As a result of a research project, the UK's Serious Organised Crime Agency (SOCA) had been able to demonstrate, to the satisfaction of banks and other financial institutions in the UK, that the overwhelming demand for the EUR 500 note in the UK was from criminals wishing to use it to facilitate cash smuggling. As a result, banks and other financial institutions voluntarily ceased supplying the EUR 500 note in the UK with effect from the end of April 2010.

SOCA Project QUAVER (which has continued seamlessly in the transition from SOCA to the National Crime Agency, or NCA) was established as a recognition that the traditional approach to tackling the problem of complicit MSBs - arrests & prosecutions – was resulting in criminal convictions but was not having any effect in reducing the scale of the problem. MSBs who had previously sold nothing other than EUR 500 notes before April 2010 shifted smoothly to supplying nothing other than the same value of EUR 200 notes instead. Criminal groups were quickly able to identify replacements for prosecuted MSB owners as MSBs had discovered that they could charge criminals large amounts

of money for their services which the criminals were happy to pay.

Project QUAVER sought to address the problem by concentrating on 'influence activity' – delivering briefings on the problem and how to identify the risks to banks involved in currency supplies to wholesale MSBs. Wholesale MSBs involved in currency supply to the smaller complicit MSBs, and MSB trade forums. The messaging was that banks and wholesale MSBs were now in a position to identify and report suspicious activity in the currency exchange sector to the authorities, and to avoid becoming involved in it; and that if they failed to report it, and simply carried on regardless, then they would be prosecuted for money laundering themselves as they were now in possession of enough information to form a reasonable suspicion.

The verbal briefings were followed up with a series of documents detailing exactly how criminals obtained and made use of high -denomination banknotes, and the results of the study on the criminal and legitimate uses of high-denomination banknotes in the UK (which clearly showed there was no appreciable legitimate use of such banknotes in the UK and that the purchase of large amounts of them was a clear indication of money laundering).

As a direct result of Project QUAVER, the sale of high-denomination banknotes in the UK has now fallen to a small proportion of its previous magnitude (at least GBP 500 million of high-denomination euro banknotes were being sold in the UK per year), the bank that sold the bulk of the high-denomination notes to wholesale MSBs sold its foreign banknote trading division to a rival business, and intelligence from law enforcement agencies shows that criminals now find it far harder to source high-denomination euro banknotes in the UK, meaning that they have to smuggle low denomination notes instead, which is obviously more problematical due to the increase in size and weight of shipments.

Source: UK authorities.

4.3 INDICATORS

The following can all be considered to be potential indicators of money laundering through the physical transportation of cash in respect of natural persons, cargo and mail. They are intended for use by all agencies who need to work together and exchange information and intelligence to control borders effectively, including customs, police and other law enforcement bodies. They include information that can be gathered in respect of natural persons or cargo shipments by researching their available details on law enforcement intelligence databases.

It is very important to note that these are indicators only, and are intended to be an aid to profiling and a prompt for further investigations and enquiries, rather than as definitive descriptors of criminal activity warranting immediate action. Applicability of multiple indicators may be a grounds for suspicion that the funds concerned are from an illegal source, especially when the courier is not able to answer questions adequately. These indicators are drawn from numerous sources, including questionnaire responses and other FATF and FSRB papers (including 'International Best Practices: Detecting and Preventing the illicit cross-border transportation of cash and bearer negotiable instruments', 19th February 2010).

4.3.1 NATURAL PERSONS

- Requests to purchase, or possession of, large amounts of foreign currency without a plausible explanation. Studies carried out by the UK authorities in the course of project QUAVER established that the average amount of foreign currency exchanged by someone legitimately intending to use it as holiday money was in the range of GBP 350 – GBP 450.
- Possession of large amounts of money without an adequate explanation.
- Possession of money supposedly for business reasons while travelling to countries where cash payments are restricted
- Cash is only declared when passenger is intercepted, especially if the passenger first denied having money with him or declares that he carries the money for third parties.
- Requests to purchase, or possession of, large volumes of high denomination banknotes. Very few retail businesses in the EU will accept anything higher than a EUR 50 note for a routine purchase.
- Cash deposits in bank account (possibly indicating previous transportations of cash)
- Illogical travel patterns. For example less than 24 hours between inbound and outbound travel bookings, travelling to non-tourist destinations, convoluted routes for no apparent reason; vague or contradictory details of destinations or reason for travel.
- Little or no luggage
- Repeated short notice travel to the same destination
- Tickets bought for cash at very short notice at higher than normal prices
- Tickets purchased by someone other than the traveller
- Multiple individual travellers who appear to be involved in similar unusual movements or show similar travel patterns;
- Contradictory stories of apparently associated passengers
- Travel patterns that mirror smuggling patterns of illegal goods (i.e. drugs) and human being trafficking routes;
- Demeanour of passengers. Nervous, aggressive, evasive – clothes and baggage inconsistent with 'cover story', overreacts to the presence of detection animals and/or refuses to be in the vicinity of detection animals and/or other detection equipment (i.e. x-ray machines)
- Passenger has a connection (nationality, destination, origin, previous travel etc.) with a risk area or jurisdiction. E.g. those with specific crime issues; jurisdictions with non-functioning state institutions etc.

- Traveller has a criminal record indicating connection with Predicate offences (e.g. drug trafficking, OIC, etc.);
- Traveller has a history of lost or stolen travel documents;
- ID documents appear to have been falsified
- ID documents appear to be brand new
- Passenger has dual nationality
- Passenger's suitcase is 'sealed' (e.g. by wrapping in cling film etc.)
- Has refused to consume food and drinks offered on vessel, indicating that currency might be hidden in body;
- Uneasy movement or unusual body shape due to bulk cash hidden on body;
- Passenger has an iron in his luggage. Banknotes are sometimes ironed to make them easier to pack into small spaces.
- Passenger is a politically exposed person or otherwise a person of interest;
- Passenger leaves baggage at border/(air)port;
- Passenger aborts attempt to cross border;
- Last-minute check-in or boarding
- Previous use of cash declaration forms to legitimise banking large amounts of cash. As per previous discussion in this report; this can potentially be identified by FIU analysis of suspicious transaction reports
- Consignments of British Pounds contain large volumes of Scottish and/or Northern Irish banknotes. Widely acknowledged in the UK to be a reliable indicator of criminal origin of cash (but only if the traveller is not coming from Scotland or Northern Ireland)[61]
- Implausible explanations regarding the potential use or origin of the cash. For example 'I took EUR 20 000 overseas to purchase a car but couldn't find one I liked so I brought the cash back with me'.
- Volume of the currency in possession of the traveller exceeds currency/monetary control threshold of country of issuance;
- Cash is carried in several currencies;
- Currency withdrawn close to the border;
- Possession of large amounts of currency from jurisdictions unrelated to the traveller;
- small denomination, damaged and/or dirty banknotes;

[61] Further information on this issue is available on request from the UK National Crime Agency Expert Laundering Evidence team , contactable using the email address expert.laundering@nca.x.gsi.gov.uk.

- Banknotes carried in concealed form (more than necessary to prevent against theft);
- Possession of illegal goods (i.e. narcotics, endangered species, counterfeit goods);
- Traveller is in the possession of a (new) (pre-paid) mobile phone with unknown and/or few number(s) saved in the phone book;
- Possession of stored value cards that cannot be endorsed in destination country.
- Passenger appears to have detailed knowledge of and/or shows interest in the declaration/disclosure system and/or procedure;
- Passenger leaves jurisdictions with more currency than when the traveller entered the jurisdiction;
- Passenger failed to comply with declaration requirements at origin
- Travel document pages appear to be damaged to conceal past travel;
- (suspected) use of different travel documents to conceal past travel;
- Nationality stated on the travel document does not match the traveller.
- Amounts declared/disclosed do not match the actual amounts carried;
- Traveller does not object when presented with the possibility that the currency/BNI will be seized by the authorities.
- Possession of numerous cash declaration forms
- Cash is only declared when passenger is intercepted
- Cash is concealed even though it has been declared

4.3.2 CARGO AND MAIL

- Method of packing in respect of bank to bank cash shipments. Most banks prefer new notes which are usually bank banded in blocks of 100 notes, and each block banded with others to make a bigger block of 1 000. All should be a single currency and denomination and heat sealed. Banknotes are commonly transported in strong hessian or plastic sacks and each sack should only contain one currency. The seal on the bag should match the paperwork. There may be a packing list in the sack and this should match with the contents. International cash trading is based on very small margins of exchange rates so messy packaging, multiple currencies per sack, bundles of different sizes of different denominations, bundles wrapped with elastic

bands etc. are much more expensive to count and process and can be viewed as a potential indicator of criminal origin of the cash.[62]

- Cash transport is presented as a bank-to-bank transaction, but is not carried out by a Cash / Valuables in Transit Company.
- Uneconomic cash shipments. Shipment is of a very small amount of cash, why was it not simply banked and wired?
- Odd or illogical routing
- Cash is claimed by someone using fake documents - to identify himself or making fake claims concerning ownership of the money
- A frequently used shipment route stops after interference of the authorities / there is a decrease in the apparently legal activities after a criminal investigation
- No contact from the shipper or beneficial owner after a consignment has been inspected
- The owner or carrier of the cash in cargo changes their story concerning the origin and destination of the money
- The owners and carriers of the cash in cargo have different stories concerning the origin and destination of the money
- Cash is transported in high denomination banknotes
- The nature or volume of the currency does not match the point of origin
- Business sense – Why are the goods being shipped if they are readily and cheaply available in the destination country
- No economic justification for the goods or the routing.
- Goods appear to be re-used. The same goods appear to be being shipped to the same destination multiple times.
- Companies do not exist or appear not to trade
- Goods shipped or posted from high risk jurisdictions
- Paperwork is very basic, or appears to have been altered. It may also contain material errors such as spelling mistakes in names of companies, countries etc. The paperwork is not consistent with the goods.
- Beneficial owner of the cash is unclear or appears to have been disguised
- Different qualities of banknotes (some new, others old, worn and torn)
- False customs declaration

[62] Based on interview with major well known international financial institution involved in trading on international currency markets.

- Value of declaration too low for content
- Parcel shipped from/to drugs source country
- Name and address details on parcel are unclear, vague and/or falsified
- Signatures and handwriting inconsistent

4.3.3 VEHICLES

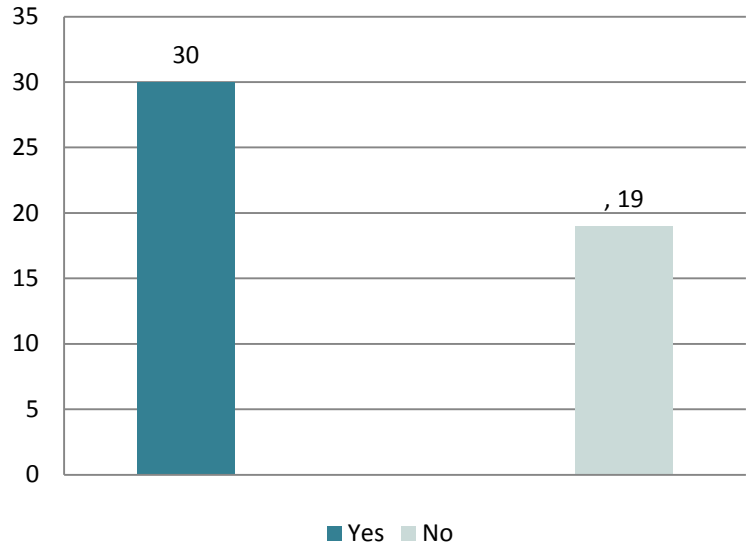
- Driver of the vehicle is not the owner
- Nationality of the driver and the nationality of the vehicle do not match
- Demeanour of driver – nervous, sweating, excessive smoking etc.
- Older vehicle
- Vehicle not insured, or insured in the name of someone who is not the driver
- Vehicle recently purchased
- Vehicle purchased for cash
- Signs of tampering – scratches or fingerprints on wheel rims or around panels, stray sealant, new screws, smell of chemicals etc.
- Inaccessible parts of the vehicle – parts of the boot/trunk, beneath seats etc.
- New wiring or electrical items (possibly electronically operated access to concealment)
- Goods carried by vehicle are uneconomic to ship
- Goods don't match paperwork
- Driver and passengers give contradictory stories
- Driver displays any of the traits detailed given for natural persons above
- Use of rental cars

5. CHALLENGES TO THE DETECTION AND CONTROL OF CROSS-BORDER TRANSPORTATION OF CASH

5.1 AT BORDERS – NATIONAL CO-OPERATION

Perhaps one of the most telling responses to the questionnaire was that to the question of whether customs officers received specific training to identify money laundering through the physical transportation of cash. Again, not all countries answered this question, but the responses of those that did are illustrated in the graphic below;

Graph 9. **Are customs officers specifically trained to identify money laundering through physical transportation of cash?**

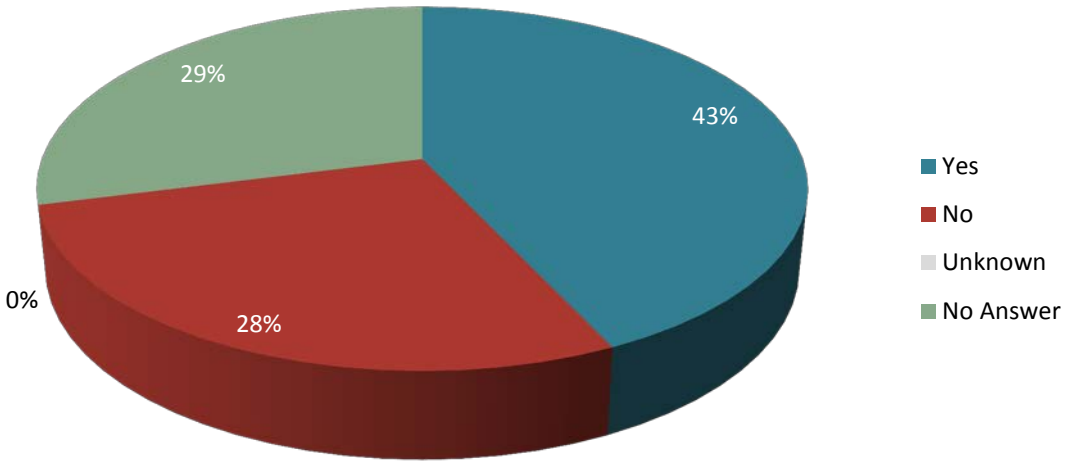


Nearly 40% of respondents do not give their customs officers specific training in how to identify cash based money laundering. This is somewhat surprising, given that cross-border transportation of cash is one of the most basic and widespread methods of money laundering. Most countries who do deliver such training agree that it is a special skill.

A second issue is that, for the majority of respondents, customs and other agencies (mainly the police) need to work together to control borders. This may be for a number of reasons, such as the policies are set by one agency but enforced by another, or because customs do not have the authority to conduct criminal investigations. Whatever the reason, effective internal co-operation is essential in order to effectively control the problem.

Analysis of the questionnaire responses highlights that, for a number of countries, their FIU have an important role to play in collating and analysing records of cash declarations and cash seizures. At least 43% of the countries that have a customs database or some other system that records the import and export of banknotes in cargo and mail, grant their FIU access to these databases.

Graph 10. **Does your FIU have access to this database?**



The figures and statistics for cash declaration and importation in cargo and mail are available to the FIU in approximately 58% of the countries. When the information is not available to the FIU (24% of the countries), it is generally because the information is not shared on a standard basis. In that case, the custom declaration system could generate the figures and statistics concerning cargo and mail for the FIU when needed. 17% of the countries did not know if figures and statistics for cash movement in cargo and mail were available to their FIU.

Resources are another issue. No country has the manpower to police all of its border crossings, all of the time (and within the EU there is a specific agreement that all EU citizens have freedom of movement across between all EU member states). Therefore, countries have to make decisions on where to place their limited resources, which has to be done on the basis of risk profiling. However the questionnaire responses suggest that some countries do not have a full appreciation of the risks, especially in respect of the effective control of cargo and mail, and so may not be in a position to make fully informed judgements.

Some countries do not yet have access to, or make use of, some of the tools mentioned in this paper, such as X-ray facilities, body scanners and cash detection dogs. These are worthwhile investments for any country as they are proven to be effective in detecting illicit movements of cash when targeting or profiling cannot always be relied upon to deliver results.

It seems clear from the number of respondents that highlighted the issue that cash declaration systems, whilst acting as an important tool in the drive to cut cash smuggling, and a valuable source of information about such things as values of cash being moved and the routes that it takes, can also be turned to the advantage of criminals. The principal way in which this may happen is the use of cash declaration paperwork to lend a false veneer of legitimacy to criminally derived cash introduced into the legitimate financial system..

Bank staff appear to have too little understanding of the systems in place and an insufficient appreciation on how cash can be made to appear legitimate by the use of a cash declaration form. In fact, there are indications that bank staff are actively encouraging people to produce cash declaration forms as an indication as bona fides, without checking to see if a declaration was checked at the border or even if it was actually made (rather than just filling out a form). Moreover, the presence of a cash declaration in some cases appears to 'blind' bank staff to obvious questions as regards the source of the funds in the overseas jurisdiction, and why the cash was imported as cash rather than being banked overseas and sent by electronic transfer.

5.2 INTERNATIONAL CO-OPERATION

During discussions of this typology, and in responses to the questionnaire and case examples submitted, the single most common challenge raised by countries was that in international co-operation. Clearly, all cash smuggling attempts have two ends, in two different jurisdictions. However, with a few notable exceptions, such as the Merida Initiative between the US and Mexico, the level of co-operation between countries at all levels appears to leave ample room for improvement.

5.2.1 INTELLIGENCE EXCHANGE

There are obvious benefits to the free and open sharing of intelligence between jurisdictions, assuming that legal issues can be overcome. Intelligence sharing makes countries aware of issues like similarities and differences between their legal arrangements, cultural and diversity issues (such as trends within ethnic groups) and current trends in typologies and methods. It can also raise awareness of features unique to a particular jurisdiction, for example the fact that large amounts of Scottish and Northern Ireland banknotes in a consignment of British pounds is a reliable indicator of criminal origin of cash.[63]

At present, there is no global framework for co-operation and exchange of data. Most countries are member of the Egmont Group of Financial Intelligence Units. However, unless data on cash seizures, cash declarations and customs information in respect of cash movements in cargo and mail (legitimate or otherwise) is routinely shared with the FIU (which again emphasises the need for national as well an international co-operation) this information will not be available, or at least not readily accessible, for sharing with another jurisdiction. In this respect, it is worth mentioning that in case of suspicion of money laundering or terrorism financing 39 countries share information on cash movements in cargo and mail with the country of origin or destination and 3 countries even share this information if there is no suspicion (spontaneous information sharing).

The WCO maintains a comprehensive database (the Customs Enforcement Network, or CEN), a valuable tool which holds large amounts of information about customs seizures and offences, acts as a website containing enforcement-related publications, and provides a separate secure system (CENcomm) to facilitate communication between users at an international level and to hold operational data in respect of criminal cases. The system can be used for a wide range of analytical

[63] See footnote 41.

purposes and can highlight new and emerging trends and methods, as well as providing statistical data that would be invaluable to most countries.

The problem is that usage of CEN and CENcomm is patchy at best. Some countries regularly input large amounts of data into the system, whereas some countries appear not to use it at all. Clearly, this has the effect of diminishing the usefulness of the data and any analysis of it that is carried out. It is not possible to state with certainty that the reason that one smuggling route appears to be prevalent is because it actually is, or because a country has decided to take special interest in it. Other countries may experience cash smuggling on a much larger scale through other routes but if they do not enter information into the system no-one will be able to benefit from their experience.[64]

It seems clear that efforts to tackle money laundering through the physical transportation of cash would be more effective if countries were more willing, or more readily able to exchange intelligence, either through CEN, the Egmont system or by any other means, for example by Memoranda of Understanding.

5.2.2 EVIDENCE GATHERING AND SHARING

A closely related issue is that of the exchange of evidence between countries. It is of paramount importance that this matter is properly handled by countries since, as has already been made clear in this paper, one of the main drivers of money laundering through the physical transportation of cash is the separation of the cash from the crime that generated it, by the simple expedient of moving it to another country. As has also been discussed, each cash movement involves at least two countries and if any criminal prosecution is to succeed, it is vital that one country is able to obtain evidence to support its case from the other. The project team has been made aware of numerous cases where requests for legal assistance have not been serviced in an appropriate timeframe (or indeed at all) by the counterpart country.

Most countries will deal with requests for mutual legal assistance from another country by preparing and submitting an International Letter of Request, or ILOR, unless the matter is covered by other statutes or conventions to which both are signatories. Discussion of the practical implications of these processes is not relevant to this paper, however the general principle is that a court in one country requests a court in another country to obtain evidence on its behalf.

One of the main challenges faced by this procedure is that countries sometimes have no appreciation of the legislative processes in the country from which they are seeking to gather evidence, or are unable to understand if the request is actually practical or even possible to comply with in that country. This will have a direct impact on the ability, and willingness, of the receiving country to service the request in an appropriate timeframe. It may be that the information requested is not centrally collated or recorded, for example, and obtaining what is sought might involve the receiving country in a marathon country-wide paper chase and the interviews of dozens of witnesses. It may also be that there is a legal impediment in the receiving country which prohibits the disclosure of the information requested, or that the information provided in the ILOR is insufficient to convince a court that coercive powers should be used to obtain the information.

64 Source – WCO presentation at Joint Expert's Meeting , Qatar December 2013.

Alternatively, the ILOR might not make it clear to whom the request for assistance would best be directed; to police or to customs authorities, for example.

Another issue is the fact that some jurisdictions receive a great many ILORs and do not have the resources to deal with them all in a timely manner. It is a natural desire of an investigating authority that the receiving country should deal with the ILOR without delay, but if the ILOR is only the most recent of twenty that have been received that week, it is unlikely that the delay will be looked on patiently by the requesting jurisdiction. Furthermore, if the request is vague, would involve a huge amount of resource to service, or is simply not legally possible, it is likely to be relegated to the bottom of the pile. An additional problem with this is that any future requests from the same country in a similar case are likely to be given similarly low priority.

At least part of the answer to these issues is better intelligence and information sharing. Countries need to have good relations with the countries from whom they are most likely to request legal assistance. They need to be able to call someone in the receiving country who will be able to advise them on the sort of information that might be available (and what will not be), how to word the request, who to send it to, and what the likelihood is of it being serviced in an acceptable timeframe. This is a matter not only for the central authorities but for the agencies themselves. Sharing information and closer co-operation are the key to ensuring an effective response to the problem.

5.3 LEGISLATIVE ISSUES

As has already been discussed, there is an issue for some countries in that, although they have a comprehensive legal framework in place to address cash smuggling by natural persons through ports and airports, they may not (without realising it) have the necessary legal tools to properly address issues in respect of cash in cargo and mail. In particular, where a shipment is (reportedly) between two financial institutions and the (sparse) customs paperwork contains all of the information legally required under customs regulations. They may not have the legal authority to detain shipments for further information or to require the disclosure of further information. If this is the case, they may also lack the legislative tools needed to investigate appropriately. In addition, there may be issues when dealing with cash that passes through a country in transit from one destination to another.

The detection of the physical transportation of cash itself is usually insufficient for establishing a well-grounded suspicion of a money laundering offence, needed in order to initiate an investigation by law enforcement agencies. At the same time in some countries, Customs would not have the authority to conduct its own research/inspection, even though the circumstances would raise questions. The latter appears primarily to be an issue of lack of legislation.

In addition, the law in some countries requires that, in order to prove a money laundering offence, investigators also need to prove the predicate offence that generated the money being laundered. This can be a significant difficulty, particularly where the predicate offence took place in another country. This again highlights the vital importance of effective international co-operation in tackling money laundering through the physical transportation of cash.

5.3.1 PROHIBITION AND/OR LICENSING OF CASH IN CARGO AND MAIL

Some countries have enacted other legislation on cash in cargo and mail in addition to their national legislation relating to specific cash declarations. In 16 countries, it is prohibited to transport cash in cargo and mail without a license. For one country, the response to the questionnaire appears to suggest a total prohibition, as this country did not mention the possibility of applying for a license. Five countries mention in their questionnaire response that they do not have a prohibition, but a license is required for cash to be transported in cargo and mail.

In conclusion, 21 countries forbid cash transportation in cargo and mail without a license. In 10 of these countries, a specific cash declaration (in addition to the normal customs declaration) is also required. Eight countries have no licensing system in place, but do require a specific cash declaration, meaning that in total 29 countries have specific legislation in place on cash in cargo and mail.

The legislation varies considerably between the countries. Countries provided the following details in their questionnaire responses:

- the threshold for applying for a license is the equivalent of USD 10 000 or USD 5 000;
- only banks authorised by the central bank have the right to conduct cross-border transportation of cash in cargo and mail;
- The central bank issues a license to permit the export of currency in cargo or mail and applies a threshold which is subject to exchange control restrictions;
- transfer of funds has to be subject to prior approval issued by the central bank for commercial institutions, and non-profit organisations require prior approval for this from the Ministry of Social Affairs;
- courier services need to be registered with the Chamber of Commerce and hold the necessary licenses;
- exporting the national currency above a threshold requires a license from the central bank;
- the licensee is required to comply with money laundering legislation;
- transporters have to comply with reporting requirements.

It is important to note that a substantial part[65] of the legislation of the 29 countries is of a monetary nature. Only some of the 29 countries actually have legislation regarding money laundering and terrorism financing in place. Also, only in some cases do customs or other authorities have the legal power to check cash in cargo and mail in respect of money laundering and terrorism financing. (This also highlights the importance of international cooperation, when addressing transnational transportation of criminal cash).

65 From the questionnaires it was not possible to find out exactly how many countries have just monetary legislation.

5.3.2 CASH IN TRANSIT

Due to customs legislation, some form of customs declaration is obligatory in all cases of cash transiting a country in cargo and mail, and customs has the legal power to check these consignments. The formalities to check transit movements of cash in cargo and mail, however, are even less extensive than in case of import and export. A brief declaration and description of goods is sufficient. That means, for example, that a transit declaration for a parcel containing second-hand books will look exactly the same as that for a box with a large amount of cash in it (assuming the cash is not declared). If there are no grounds for suspicion, and when there are no specific legal obligations relating to the transportation of cash, such as a specific cash declaration or a prohibition on transporting cash without a license, these transiting cash movements are not checked in relation to money laundering and terrorism financing. Checks only take place within the domain of customs regulation (e.g. correct declaration), but following the current risk-based approach (no tax on cash and no other legislative burdens) no consignment containing concealed cash will be selected for customs inspection. When there is a reasonable suspicion, transiting cash movements are selectively examined for money laundering and terrorism financing purposes.

Nevertheless, 39% of the responding countries indicate that legitimate cash movements *transiting* their country in cargo and mail, are *not* subject to any form of control, declaration or examination. Almost a third of the responding countries do not know if these movements are subject to any form of control. It can thus be assumed that in most countries there is no control on the transit of cash.

In responding to the questionnaire, some European Union member states mentioned a EU-wide problem regarding the limited scope of Regulation (EC) No 1889/2005 of the European Parliament and of the Council of 26 October 2005 on controls of cash entering or leaving the Community. This Regulation is directly applicable in all EU member states. The barrier here is that this EU law only sets rules for cash transported by passengers (natural persons) and to cash (bearer-negotiable instruments including monetary instruments in bearer form such as travellers' cheques).

The EC is currently conducting a review of the implementation and scope of this regulation, and has sent a separate questionnaire of this issue to all member states. In the light of the responses received as well as additional analysis by the EC, this process could result in changes to the regulation.

5.4 TYPOLOGIES AND GUIDANCE

Some countries, when asked about challenges they faced in developing an effective response to the problem of money laundering through physical transportation of cash, mentioned the following issues;

- There is a perceived lack of clear and usable typologies and best practises; both from an international and national perspective. Research, including a literature review, in the course of the preparation of this report did identify that, although many individual countries and FSRBs had studied the issue, there has been no single paper that comprehensively pulled together all of this experience. Hopefully this paper will go some way to addressing this issue.

- There are no profiles available that target packages and cargo that may contain undeclared (and/or criminal) cash (essential for the risk-based approach of customs). Again, this paper is designed to address this issue.
- There is a lack of relevant information available to judge whether cash being transported across borders may possibly be connected to money laundering. As described above, this could be addressed by greater international co-operation and data sharing, and potentially by closer co-operation with the WCO.
- Once cash has been discovered in cargo or mail, barriers exist regarding the rapid and timely exchange of information between countries regarding the origin/ source of the cash. It would appear that closer co-operation between countries (particularly those who share land boundaries or ties such as ethnicity or frequency of travel by citizens between them) would be an advantage, such that the countries become more aware of the unique circumstances in each other jurisdictions, and the barriers that they need to address to enable the necessary information sharing.

MONEY LAUNDERING THROUGH THE PHYSICAL TRANSPORTATION OF CASH

In order to break the audit trail, criminals often choose to remove their illicit assets from their bank account and transport these funds to another country to spend it or reintroduce it into the banking system. This report identifies the methods and techniques that criminals use to transport funds across the border and highlights the main challenges that relevant border control agencies face to detect and disrupt these transports.

This report provides a series of case studies and other information for use by all agencies, who need to work together and exchange information to control their borders.

FATF Report

Money Laundering through the Football Sector

July 2009

THE FINANCIAL ACTION TASK FORCE (FATF)

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering and terrorist financing. Recommendations issued by the FATF define criminal justice and regulatory measures that should be implemented to counter this problem. These Recommendations also include international co-operation and preventive measures to be taken by financial institutions and others such as casinos, real estate dealers, lawyers and accountants. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit the website:

WWW.FATF-GAFI.ORG

TABLE OF CONTENTS

EXECUTIVE SUMMARY

1. Criminals have shown adaptability in finding new channels to launder the proceeds of their illegal activities and sports is one of the many sectors that are at risk of being inflicted with criminal money.

2. With the growing economic importance of sports during the last two decades, especially football, money gradually started to exert a strong influence on the world of sports. This influx of money has positive effects, but also negative consequences.

3. In order to get a better understanding, this study identifies vulnerabilities which make the football sector attractive to criminals. These are mainly related to the structure, the financing and the culture of this sector.

4. The study analyses several cases that illustrate the use of the football sector as a vehicle for laundering the proceeds of criminal activities. After this analysis, money laundering (ML) through the football sector is revealed to be deeper and more complex than previously understood. Indeed, this analysis appears to show that there is more than anecdotal evidence indicating that a variety of money flows and / or financial transactions may increase the risk of ML through football. These are related to the ownership of football clubs or players, the transfer market, betting activities, image rights and sponsorship or advertising arrangements. Other cases show that the football sector is also used as a vehicle for perpetrating various other criminal activities such as trafficking in human beings, corruption, drugs trafficking (doping) and tax offences.

5. The ML techniques used vary from basic to complex techniques, including the use of cash, cross border transfers, tax havens, front companies, non-financial professionals and PEPs.

6. In many cases, connections with other well-known ML typologies were identified such as trade-based ML, the use of non-financial professionals and NPOs for ML purposes, ML through the security sector, the real estate sector and the gaming sector.

7. Various initiatives are taken by international and national actors in order to combat threats to the integrity of football, including ML. Looking ahead, there appear to be a number of areas that could be considered to improve the capacity to cope with the ML risks associated with the football sector.

INTRODUCTION

8. In reaction to the increasing compliance of financial institutions all over the world with the Financial Action Task Force (FATF) anti-money laundering and counter-terrorist financing standards, criminals have shown adaptability in finding new channels to launder the proceeds of their illegal activities. Simultaneously, the globalisation of financial markets and the development of information technology have gradually boosted the criminal economy and have expanded the possibilities for economic crime. In this context, there are growing concerns that various legitimate sectors are at danger of being infected with criminal money.

9. The sporting industry is one of the many sectors that could be attractive for criminals for money laundering purposes and merits closer consideration given the large scope of monetary transactions and the increase in the number of individuals involved.

10. In order to get a better understanding of the process of money laundering, of ways in which criminality can be connected with legal economic activities, and how criminal money finds its way into legitimate businesses, the FATF decided in June 2008 to study on money laundering through the football sector.

11. The following countries joined the project team and contributed to the study: Argentina, Belgium (as project co-leader), Brazil, France, Ireland (as project co-leader), Italy, the Netherlands (as project co-leader), Norway, Sweden, Switzerland and the United Kingdom. The report was written with support from the OECD sub-group on tax crimes and money laundering.

Scope

12. The aim of this project is to study one specific sport which could reveal money laundering schemes that may also be occurring in other sports. As one of the largest sports in the world, football[1] was chosen. Both professional and amateur football were to be examined. Although the scale of vulnerabilities to money laundering is potentially different, risks in both areas were considered likely to be similar.

13. On the other hand, the title of the project was broadened from 'clubs' to 'sector' because focussing on clubs was too narrow. Vulnerabilities not only occur within clubs but concern also other important stakeholders within the football industry. For these reasons, the original scope of the project 'money laundering through sporting clubs' consequently has turned into 'money laundering through the football sector'.

[1] The term *football* is used in different ways in different parts of the English-speaking world. The name *soccer* (or *soccer football*) was originally a slang abbreviation of the word *association* from *association football* and is now the prevailing term in the United States, Canada, Ireland, Australia and New Zealand. Of the 45 national FIFA affiliates in which English is an official or primary language, only three (Canada, Samoa and the United States) actually use *soccer* in their organisations' official names, while the rest use *football*.

Methodology

14. This report is based on four main sources: an extensive literature review, the analysis of the answers to a questionnaire sent to FATF and FSRB members; the results of a typology workshop and subsequent consultation with the football sector.

15. Results to the questionnaire[2] were obtained in October 2008 from 25 countries, mostly European, seven South-American countries, two from Asia and Australia.[3] The responding countries differ widely in size, role and organisation of football in society (ranging from large countries with big football leagues to smaller nations or nations with only non-professional football). Differences in information, position and interest in the person or organisation that provided the answers (national football association, government representatives, national FIUs, the police or judicial authorities) needed to be taken into consideration as well.

16. Following the analysis of questionnaires, a workshop on money laundering and the football sector was held in Monaco in November 2008 as part of the 2008 FATF/MONEYVAL Typologies meeting. This workshop was very well supported by members of the FATF, MONEYVAL and representatives of other countries. The following participants were involved in the 2-day breakout session which considered issues in depth: Belgium, Brazil, Cyprus, Egmont Group, France, International Olympic Committee (IOC), Ireland, Italy, Monaco, Norway, Russia, Slovenia, South Africa, Switzerland, the Netherlands and the United Kingdom.

17. The study has also relied on the experience and cooperation of the private sector. A representative of the IOC attended the Monaco workshop in November 2008. Consultation with representatives of the Fédération Internationale de Football Association (FIFA) and of the Union of European Football Associations (UEFA) also took place in January and April 2009. Those representatives received a copy of the report and were given the opportunity to comment. All the comments of the private sector were taken into account when considered relevant.

18. The project team would like to acknowledge the input of all the participants.

[2] The questionnaire is attached as an annex.

[3] Completed questionnaires were received from: Argentina, Australia, Belgium, Brazil, Canada, Chile, Colombia, Ecuador, France, Italy, Japan, Latvia, Lithuania, Luxembourg, Mexico, Netherlands, Portugal, Romania, Singapore, Sweden, Switzerland and the United Kingdom.

CHAPTER 1: MONEY LAUNDERING AND SPORTS

19. Since ancient times, societies throughout the world have devoted considerable resources to sports, as well as offering praise to the exploits of sportsmen. What is new today is the surge of commercialisation of sport, the unprecedented internationalisation of the sports labour market, the considerable sums of money flowing in from broadcasters and sponsors, and massive cross-border investments by sponsors, including the sporting industry itself and sometimes "super rich" private investors.

20. It is difficult to ascertain the overall economic value of sports. According to some recent estimates in Europe, the sporting industry accounts for from 0,5 to 3,7 of overall EU-GDP, depending on the definition of sporting industry.[4] Big matches in large stadiums are undoubtedly important to local economies. In addition, sport has an important social and psychological function at all levels of the society.

21. With the growing economic and social importance of sports and increasing profits that can be made out of sports, money now exerts a strong influence on the world of sports. The influx of big money has positive effects such as an increase of sport facilities and their availability to a larger number of people, yet this money also brings negative consequences. There is a higher risk of fraud and corruption given the amount of money at stake. Sport also can be used as a channel to launder dirty money.

22. Sports governing bodies as well as national and international authorities recently expressed their concerns on the inflow of dirty money into the sporting industry. The EU White Paper on Sport – the first EU Community document to recognise the importance of sport in European society – which was published in 2007 – stated, "Sport is confronted with new threats and challenges, such as commercial pressure, exploitation of young players, doping, corruption, racism, illegal gambling, violence, money laundering and other activities detrimental to the sport."[5]

Which sports?

23. Based on a literature review and the results of the FATF-questionnaire, several sports can be identified as being vulnerable to money laundering. Sports that are regularly indicated as being vulnerable

[4] Sound and comparable macro-economic data are generally lacking, due to, among others, problems of definition. For example, according to a paper presented to the EU in 2006 the sporting industry in Europe should be responsible for 0.5% (sport defined in a narrow sense) to 3.7% (according to the widest definition including tourism, insurance and for example better health) of overall European GDP (See: Dimitrov, D., Helmenstein, C., Kleissner, A., Moser, B., Schindler, J. (2006)). However, the vast majority of sporting activities still take place in non-profit structures, many of which depend on public support. At the same time a large part of the growing economic value of sports is linked to intellectual property rights (such as copyright, commercial communications, trademarks and image and media rights).

[5] Commission of the European Communities (2007).

to criminal money are football, cricket, rugby, horse racing[6], motor racing, car racing, ice hockey[7], basketball and volleyball.

24. Just like any other business, sport can be used by criminals to launder the proceeds of crime or to perpetrate illegal activities for financial gain. Unlike other businesses, it is not always the profitability as such that make sport attractive to criminals. Connections that criminals seek to make with sport are not only motivated by the desire to gain money. Social prestige is another important factor. Popular sport can be a route for criminals to become 'celebrities' by associating with famous people and moving upwards to powerful circles within established society.

25. Sports that could be vulnerable to money laundering problems are either big sports (worldwide like football or on a national basis like cricket, basketball or ice hockey), sports like boxing, kick boxing and wrestling (sports that have traditionally links with the criminal milieu because of the relationship between crime and violence), high value sports (such as horse and car racing where there are ample opportunities to launder big sums of money), sports using (high value) transfer of players, sports where there is much cash around, which give criminals opportunities to turn cash into non-cash assets or to convert small into large bills. This fact means that virtually all sports could be targeted by criminals, although for different reasons.

26. A topic that deserves separate attention is betting on sporting activities. This touches upon a broad range of sports. Money laundering through legal and illegal betting, especially on the internet, is considered as a huge and increasing problem that should be explored separately in more detail. For the purposes of this study, betting on sporting activities falls outside the scope of this work and has therefore not been studied in detail.

Why football?

27. If we want to examine money laundering through sport, football is an obvious candidate. Football is by far the biggest sport in the world. There are 38 million registered players and 5 million referees and officials. Football is played all over the world and is the most popular sport in many countries. Football can count on a broad base of support, ranging from loyal fans attending weekly matches of their club, to

[6] The FATF in earlier research has already pointed out that gambling on horse races provides ample opportunities for money laundering. Circuits have been set up to organise systematic buy-back of winning tickets from their legitimate holders. Furthermore, persons can also gamble money in order to have it laundered. If their chips are repaid at the end of their gambling session in the form of a cheque from the gambling or betting agency, apparently verifiable "winnings" are obtained. The New York Police discovered an underground operation involving the large-scale conversion of small bills into large ones with a Jamaican gang acting as a front for the Gambino crime family (New York Times 2001). This is according to the New York Police a typical form of money laundering designed to facilitate the smuggling of cash out of the country by reducing the bulk (Office of the New York State Attorney, 2001). Other ways by which money laundering can be laundered through horse racing are the acquisition of horses and the organisation of illegal races.

[7] The National Hockey League (NHL) has 30 teams in the US and in Canada, almost 1 million registered players and is one of the largest money making sports leagues in the world generating billions of dollars in revenue. It is also popular in Russia, Scandinavian countries and central European countries such as the Czech Republic. The Russian mafia is reportedly attracted to hockey, both in the former Soviet Union and abroad (Hill, D. (2008)). There are various famous cases of extortion by Russian mobsters against Russians playing in the NHL. There are examples of infiltration in hockey franchises, not only by criminals from Russia. Internet gambling on hockey, connected with match fixing, is another way by which criminals can launder millions of dollars without any suspicion.

passive spectators at home in front of their television screens. The FIFA World Cup Final in 2006 attracted just over 1 billion viewers or 15 percent of the world population.

Table 1. Key Statistics Football Around the World (2006)

Total players	265 million
Female players as % of male world population	8%
Registered players	38 million
Referees and officials	5 million
Number of clubs	301.000
Top-20 countries with most registered players in 2006:	Germany (> 6 million), USA (> 4 million), Brazil (> 2 million), France, Italy, England, South-Africa, Netherlands, Japan (> 1 million), Canada, Russian Federation, People's Republic of China, Ukraine, Czech Republic, Poland, Spain, Austria, Sweden, Chile and Iran (> 0,4 million)

Source: FIFA 2007.

28. The professional football market has undergone an accentuated growth due to a process of commercialisation since the beginning of the 1990's. Money invested in football surged mainly as result from increases in television rights and corporate sponsorship. Simultaneously, the labour market for professional football players had experienced unprecedented globalisation – with more and more football players contracted by teams outside their country and transfer payments of astounding dimensions. Transfers are carried out all over the world. The cross border money flows that are involved may largely fall outside the control of national and supranational football organisations, giving opportunities to move and launder money. At the same time money from private investors is pouring into football clubs to keep them operating and can give the investor long term returns in terms of media rights, ticket sales, proceeds of sales of players and merchandising.

29. Betting on sports offers another means of allowing substantial money flows to move beyond the control of governing bodies. Due to its particular structure, as well as the considerable need to finance the system at short sight, notably at club level, football offers an interesting platform for irregular betting activities.

30. Football has changed from a popular sport into a global industry with an increasing economic impact at the top and important social functions at lower levels. Football can serve not only as a source of income for many people, but also as a tool for local economic development, social cohesion, education, personal development and the transmission of human and cultural values. Partly due to the industry's growth, football seems to be confronted with various forms of crime and corruption - including money laundering.

31. The multiple relations between crime and football have been described and analysed in several books[8], and some 'headline-grabbing' money laundering cases have been revealed by the international media. There are connections between criminal organisations and the world of football – ranging from internationally operating organised crime infiltrating top football to locally operating criminals with connections in local lower leagues or even amateur football.

[8] See for example Hill, D. (2008) and Johnson, G. (2006) on the influence of organised crime on football in the UK. Or Robert, D. (2006), who states that "*le football est devenue un formidable machine à blanchir l'argent*". Also interesting in this respect is Glenny, M. (2008) on the modern spread of transnational crime after the break-up of the Soviet Union and the simultaneous deregulation of global markets. Glenny also touches upon connections between Eastern European criminals and the world of football.

CHAPTER 2: STRUCTURE OF THE FOOTBALL SECTOR

Football governance

32. The international governing body of the football industry is the Fédération Internationale de Football Association (FIFA). FIFA's purpose is to promote and develop football throughout the world. FIFA also is the guardian of the regulations of the game. FIFA consists of six confederations (AFC, CAF, CONCACAF, CONMEBOL, OFC and UEFA)[9] which are the umbrella organisations for the national football associations. Professional and amateur football clubs are members of their national football associations. National associations must be members of both FIFA and the confederation in which their nation is geographically resident for their teams to qualify for entry to FIFA's competitions. FIFA has in total 208 member associations (one per country). The whole industry is built on two main pillars: club football and national team football.

33. UEFA is one of the biggest of the six confederations of FIFA. It is by far the strongest in terms of wealth and influence over the global game. Virtually all of the world's top players play in European leagues. This is in part due to the salaries available from the world's wealthiest football clubs, particularly in England, Germany, Italy and Spain. Two of the top seven teams in the FIFA World Rankings are nevertheless CONMEBOL members (Brazil and Argentina).

34. At a lower level, the FIFA confederations like UEFA consist of national associations, of which the English Football Association, founded in 1863, is the oldest. The national associations of each country operate league systems, normally comprising several divisions. The national associations are the supreme regulatory and disciplinary body of the sport within national boundaries. Their autonomy however is restricted to the fact that they have to abide by the rules of FIFA and the six confederations like UEFA and CONMEBOL. In some countries the football sector is organised in regional associations on a lower level. The individual clubs - according to FIFA - are the basic cell at the foundation of the pyramid.

[9] AFC - *Asian Football Confederation* in Asia and Australia, CAF - *Confédération Africaine de Football* in Africa CONCACAF - *Confederation of North, Central American and Caribbean Association Football* in North America and Central America, CONMEBOL - *Confederación Sudamericana de Fútbol* in South America, *OFC - Oceania Football Confederation* in Oceania and UEFA - *Union of European Football Associations* in Europe.

35. Traditionally sporting associations have defined the rules of the game, including financial rules, at an international level. FIFA was established in 1904 in response to the need for a single body to oversee the game worldwide. One of objectives of FIFA is prevention of practices that might jeopardise integrity of the sport. It is for this reason that FIFA insists it is necessary to have global football regulations that apply to everyone everywhere.

36. National governments still adhere to some degree to the policy that the specific nature of sport, its important social, educational and cultural functions, sets it apart from any other field of business activity. In Europe for example the European Council officially endorsed in the Nice declaration of 2000 the need to protect independence, autonomy, self-regulation and self-organisation of sports according to the principle that *'sports and politics don't mix'*, however also while respecting individual EU and national legislations.[10] Regulatory functions for the sports sectors are performed by private organisations – sports governing bodies – rather than by governments. For historical and cultural reasons, all EU member states have, to various degrees and to a large extent, left the regulation of sport to the sports bodies. It is believed that this has helped to remove (or at least reduce) the risk of political influence being brought to bear on sports matters. The European Council believes that this principle should be preserved for the future.[11] Sport also has very specific economic characteristics – for example the necessarily joint-production of 'the product' (football matches, football competitions) by competitors.

Football finances

37. There are no comprehensive figures of the overall size of the football sector in the world. However, according to the Deloitte Annual Review of Football Finance (which is the leading yearly overview on the finances of football in Europe) the total size of the European football market has grown to an estimated at 13.8 billion EUR in 2007 (which is 0.1 percent of EU GDP). Behind these numbers, football sector revenue can be represented as a reversed pyramid. The big five European leagues – the premier League in England, Bundesliga in Germany, la Liga in Spain, Serie A in Italy and Ligue 1 in France - attracted more than half of these revenues (see table).

Table 2. Revenue distribution in the professional European football market, 2007

	%	billion EUR
'Big five' European leagues	52	7.2
'Big five' other leagues	16	2.2
Non 'big five' top leagues (other 48 UEFA countries)	15	2.1
Non 'big five' other leagues	3	0.4
FIFA, UEFA and National Associations	14	1.9
Total	100	13.8

Source: Deloitte 2008, chart 1.2.

38. It is in these five leagues that the richest football clubs in the world can be found. To be more specific, all but one of the Forbes' list of 25 most valuable football clubs in the world belong to these 'big

[10] Point 7 of the Nice Declaration reads as follows: "*The European Council stresses its support for the independence of sports organisations and their right to organise themselves through appropriate associative structures. It recognises that, with due regard for national and Community legislation and on the basis of a democratic and transparent method of operation, it is the task of sporting organisations to organise and promote their particular sports, particularly as regards the specifically sporting rules applicable and the make-up of national teams, in the way which they think best reflects their objectives."*

[11] Arnaut, J.L. (2006).

five' European leagues (the exception being Celtic in Scotland). The other half of the total European football sector is divided between the other top and lower leagues in Europe and FIFA and UEFA.

39. Professional football in Western Europe relies on four main revenue sources: match day revenues (gate receipts and all-season tickets), television rights, sponsorship (brand name placing on shirts and around stadiums), and other commercial revenues (licensed merchandise, conference and catering services). As table 3 shows, the relevance of television money is especially big for top-division clubs in the big five European leagues, depending on the size of the television market (35 to over 60 percent of total revenues). Clubs in countries with less developed economies rely for the biggest part on financial support from owners and in some cases also local or national government.

Table 3. Revenue breakdown for the ten biggest European leagues , 2006-07

	Total (in million EUR)	Matchday %	Broadcast %	Sponsorship %	Other %
England*	2 273	35	39	26	-
Germany	1 379	22	35	26	17

40. On the spending side, roughly more than half of the budgets of professional football organisations is spent on salaries and related costs – which means players' salaries plus net transfer payments. Other payments include salaries paid to other staff, business costs, image rights, signing-on fees and transfer fees, including fees to players' agents. In smaller countries and lower divisions, players may be part-timers with a second job, or amateurs.

41. Within the big five European leagues, over half of the revenues is spent on salaries and related costs for players – these amounts paid to a very select group of top players, agents, managers, coaches. The industry is thus characterised by a very uneven distribution of income - ranging from amateur players at the lowest level, to half professionals, full professionals, and a select group of world star players.

42. To give an idea of the recent growth of professional football in Europe, total revenues in the big five European football leagues rose from EUR 2.5 billion in 1996-97 to EUR 7.9 billion in 2007-2008. Most of this increase came from broadcasting, of which a large part was channelled to increasing wage costs as the top European leagues attract most of the world's best players. Wage costs increased to over EUR 4.2 billion, compared with 1.2 ten years ago.

43. As already mentioned, the total size of the European football market is estimated at EUR 13.8 billion EUR, of which EUR 4.2 billion is spent on salaries in the big five European leagues, comprising only 98 clubs in total. This means one third of the football money flowing into the hands of a

select group of just a few thousand star players and their managers. There are thousands and thousands of clubs – professional, semi-professional and amateur – scattered all over the world that fall outside the national and international elite of top clubs. The top clubs are able to attract young talent and best players from less wealthy clubs, including clubs in Africa and South America.

44. Considering these money flows, several important financial actors in the football industry can be identified: the clubs (basic cell of the industry), football players (most valuable assets of the industry), corporate sponsors (in most levels most important investor), media (especially powerful in top-league football), individual investors ('club patrons'), local business clubs or talent pools (investing in a club or in the acquisition of individual players), football agents (acting in the interest of the player or as an intermediary on the transfer market), (local) governments (subsidising clubs, acting as a lender of the last resort, sometimes owner of the stadium complex), tax authorities (in some cases a failing club will delay meeting its tax obligations in the hope of avoiding liquidation), real estate proprietors (stadiums are not always owned by the clubs or local government). In addition associations or leagues can act as regulators as well and sometimes operate financial clearinghouses for transfer payments. In some countries, supporters provide large amounts of cash and have an influence over club owners, the management and supplying businesses as well as, in a small number of cases being allegedly linked with organised crime. If there is fraud, corruption, tax evasion or money laundering it takes place within the complex network of relations between these actors.

CHAPTER 3: VULNERABILITIES OF THE FOOTBALL SECTOR

45. What makes the football sector specifically vulnerable to money laundering? A long list of possible vulnerabilities can be compiled based on responses to the questionnaires.[12] These vulnerabilities are not unique to football or even sport in general, and they vary depending on the specific size and structure of the football sector on an international, national or even local level. Most vulnerabilities apply to professional football; a smaller set occur also in amateur football.

46. Several factors combine to make football one of the many sectors that is attractive to criminals. Based on our analysis, three areas of vulnerabilities were identified, which relate to the structure of the sector, the sector's finance and the sector's culture.

Vulnerabilities related to the sector's structure

47. ***The market is easy to penetrate***: This is mainly due to the low or absent entry barriers of the sector. Football fans from all areas of society meet at the football stadium. Meetings between government and corporate officials, and the legitimate and criminal world present opportunities for collusion.

48. ***Complicated networks of stakeholders****:* The sector is complex and characterised by opaque networks of stakeholders and interdependence between the different actors. With the growth in the number of international transfers and the skyrocketing sums of television and sponsorship money that is spent on sales and purchase of players, more and more people are involved in the sector such as managers, intermediaries, sponsors and companies who own players. This large number and range of stakeholders and the money flows facilitates the concealment of fraudulent activity, in particular as many of the transactions and the criminal activities are carried out abroad.

49. ***Management lacks professionalism***: Except for the major professional leagues, which have been managed professionally for a number of decades, the management of the football sector has only recently begun moving from a style appropriate to the sport of amateurs to one of professionals. The real sports business is fairly new. It really started only twenty years ago. Even today, management can still be volunteer and inexperienced. However, in many cases there is indeed development towards levels of professional management that is more in line with the current management standards – both in amateur and in professional football.

50. ***Diversity of legal structures***: the legal structures of football clubs vary from private limited companies to foundations. Often the stadium activities are managed through different companies. In some cases players' funds (talent pools) are separate legal entities. The lack of regulation or control over legal structures and the ownership or control of football clubs means that they are easy to acquire.

[12] Less than half of respondents answered 'yes' to the first question of the FATF questionnaire ("Do you consider the football sector in your country vulnerable to money laundering?"). Mainly smaller countries, countries without a professional league or where football is not the biggest sport answered 'no'. Football seems to be more vulnerable when the football sector is big and deeply rooted in society.

Vulnerabilities related to the sector's finance

51. ***Considerable sums are involved***: The sector deals with considerable cash flows and large financial interests. Many of the transactions within the sector involve large amounts of money, for instance on the transfer market. Competition is stiff, both nationally and internationally, and the performance of a club on the field also determines its financial position. Financial circuits are multiple and global, and the international money flows that are involved risk falling outside the control of national and football organisations. Often these money flows move in and out of tax havens or involving many countries. It was not unusual for clubs that had a large proportion of their revenues from stadium entry tickets to receive nearly all their revenues in cash.

52. ***Irrational character of the sums involved and unpredictability over future results:*** Prices for players can appear irrational and are hard to control. As well with the discovery and subsequent training of young talent, massive but uncontrollable profits can be made. Transfers are carried out all over the world, providing ample opportunities to launder money. In addition, sport is essentially characterised by a high level of unpredictability over future results. This 'culture of unpredictability', might lead to an increased tolerance towards seemingly irrational payments. There is a wide variety of different accounting methods applied. Finally, the intangible nature of player values has led to some strange practices – for example, in some countries there was historically a practice of reciprocal over-valuation of players between two clubs in a deal where players were exchanged allowing inflation of asset values/the balance sheet.

53. ***Financial needs of football clubs:*** Despite the tremendous growth of the industry as a whole, many football clubs are financially in bad shape and their financial trouble could urge football clubs to accept funds from dubious parties. The financial fragility is partly the result of the nature of the game. Big clubs need large sums to have success and to be able to buy players. Sport is a typical 'winner-take-all market'.[13] Winner-takes-all markets do not pay according to absolute performances but according to performance relative to others. Losing just one game can have massive financial consequences (decline of income from sponsors, television rights, relegation to a lower division). Financial vulnerabilities can make football clubs an easy target for dirty money. Clubs that face relegation or are in financial trouble could be in need of 'financial doping'. The inherent financial fragility could be exaggerated by the recent global financial crisis, which has made it harder to find sponsors. There is a risk that clubs that are in debt will not ask many questions when a new investor appears. Moreover, a very high proportion of the sector's cost base is composed of tax, meaning in some cases a culture of seeking to circumvent tax and closer proximity to underground activities.

[13] In certain jobs, the market pays individuals not according to their absolute performance but according to their performance relative to others. The income of window cleaners depends upon how many windows they clean, but sportsperson's pay may depend upon their performance ranking (and window cleaners are easily substitutable unlike top sports talent) (see Rosen, S. (1981) for example). Slightly more talented window cleaners will make only a small difference to the transparency of their customers' windows, but in sports that slight edge can mean everything to their clubs' status and financial position. Rewards at the top are therefore disproportionately high, and rewards below the top are disproportionately low. People in these professions are often willing to work for very little just to have the chance to compete for the top job and the jackpot that comes with it. In a normal market, sumptuous superstar incomes would attract competition from more applicants to do the jobs that pay them. This would then bring salaries down to less exotic levels. In a winner-takes-all market, this does not happen. This sort of economics has long been prevalent in celebrity-dominated businesses such as entertainment and sport. Globalisation has expanded the market for skills, increasing the opportunities for the rich to become even richer. Source: *The Economist*, www.economist.com, research tools, economics a-z.

Vulnerabilities related to the sector's culture

54. ***Social vulnerability of some players:*** (This is especially the case with younger players.) If they are badly advised, players could easily be subject to shady businesses. This could make it easy to manipulate some market's key players.

55. ***Societal role of football***: People are reluctant to shatter sports' illusion of innocence. Therefore, illegal activities may not often be reported. Furthermore, the image of sports is very important, particularly to the sponsors. Sponsors try to buy a good image by supporting a particular sport. A rumour about money laundering will likely result in the withdrawal of the sponsor and his funds and loss of fans and the revenue they bring. This makes it less likely that money laundering or other crimes are reported by the management of football clubs.

56. ***Non-material rewards:*** Football has a status with which many people would like to be associated. Criminals often seek a status outside the criminal world and football can offer the opportunity for acquiring such a patron status ('sugar daddy') thanks to supporting a club no matter where the money comes from. An investment in a football club can provide the criminal the favoured status. In most cases investments in football clubs are characterised by a high degree of uncertainty over future results. However there are strong non-material rewards for wealthy individuals who invest in football clubs or players. Football clubs are deeply rooted in (local) societies. This makes football clubs an attractive way to gain social status in the local community and get entry to the establishment. By investing in football, criminal organisations might also gain control of associated activities such as betting, real estate businesses and contracts with the local government (in some countries, many club owners have come from the construction industry). This complex set of financial and non-financial motives could make football attractive to criminals seeking legitimate social status. What is happening is that the laundered money is being 'integrated' and being used to buy celebrity and influence which have a value of their own and provide opportunities for further legal and illegal gains. The criminal is buying an entrance ticket to a social milieu. Football has indeed a long history of investments by private wealthy individuals or companies who have achieved success in other businesses. There are also instances of individuals with more dubious background investing in football – both on the highest levels of the football pyramid and on local amateur levels – and gaining legitimate status in society might be a motivator for this.

CHAPTER 4: CASES AND TYPOLOGIES

57. Based on our analysis of the use of the football sector as a vehicle for laundering the proceeds of criminal activities, a variety of money flows involving various financial transactions increase the risk of money laundering. These are related to:

- Ownership of football clubs
- The transfer market and ownership of players
- Betting activities
- Image rights, sponsorship and advertising arrangements

58. What evidence do we have about these risk areas? Over twenty cases of money laundering through the football sector, ranging from simple cases of smuggling large amounts of cash that seem to be derived from illegal transactions, to complex international money laundering cases, have been collected from the responses to the FATF questionnaire, cases presented at the 2008 FATF/MONEYVAL Typologies exercise and a literature survey. Some of the most interesting cases along with fictional typologies, constructed to highlight the vulnerabilities in the sector, are presented below. Most cases identify pure money laundering. Some cases that are presented below also focus on other predicate offences in connection to football. In these cases, money laundering appears as a potential risk or as the inevitable consequence of the predicate offence.

Ownership of clubs

59. Investments in football clubs can be used to integrate money of illegal origin into the financial system, akin to investment of proceeds crime in real estate. Football clubs are indeed seen by criminals as the perfect vehicles for money laundering.

Case 1: Funding of a non professional football club

Following the receipt of a STR made by an accountant, a European FIU investigated a case regarding the funding of an amateur football club. It appeared that the accounts of the club were regularly in deficit and were balanced at the end of the season by exceptional payments from a businessman through a number of his companies. This businessman was the president of the club; however, his investments appeared suspicious for the following reasons: (1) the funding was provided without any negotiated compensation, neither financial nor sportive, (2) the funding was provided through the companies of the businessman to their prejudice: the amounts invested in the football club were extremely disproportionate to the companies' financial possibilities.
Further investigation by the FIU revealed that the accounting information of some of the companies had not been correctly registered as required by the law. So it was not possible to verify the exact financial capacities of those companies. Finally the financial analysis revealed gaps between the accounting documents showing the breakout of the various payments for funding the club and financial flows observed on the bank accounts of the various companies of the businessman, the president of the club. By excessive withdrawal of funds from the treasury of its companies without economic justification and in a way which compromises the financial balance of those companies, the businessman was misusing company assets, which is a criminal offence. The funds derived from this offence are illegal and their use to fund the football club constituted a ML offence. The case was transmitted to the public prosecutor on the basis of a presumption of misuse of company assets and laundering of proceeds from the misuse of company assets.

Source: France.

60. Investments in football clubs are a risk area for money laundering due to a lack of transparency regarding the source of funding. Indeed, investments may be unclear and obscure, making it difficult to verify the origin of the invested funds. This situation is in fact not different from the acquisition of any private company in the industrial or commercial sector. The preventive measure foreseen in the FATF Recommendations and in the AML legislation of FATF members is indeed the customer due diligence measures that financial institutions and non-financial professions would apply in this kind of transactions. However, suspicions of the influx of dirty money into football through these "sugar daddy" investments are hard to prove. If private investments in football clubs occur from the lowest amateur levels up until the world's top clubs, the targets are frequently clubs in financial trouble looking for "lifesaving" sponsors.

Case 2: Investing in a club in financial difficulties

The FIU of country B received a disclosure from a bank with regard to suspicious transactions concerning club A. This club, which was in financial difficulties, was looking for funds (several million EUR) in order to avoid bankruptcy. A financing proposal was put forward by a financial group established in South America. It was linked to an individual that had already invested funds in various foreign clubs. These funds were suspected to be of illegal origin. After the bank inquired into the origin of the funds the financial group withdrew from the negotiations. A second financing proposal was then put forward by Mr. COX, a European investor through his company located in a tax haven. Suspicions were aroused because this individual, unfamiliar to the world of sports, had suddenly suggested investing money of unknown origin in club A. Additional information showed that Mr. COX was known to the police and FIU for various cases of fraud. In this case the different possibilities for investing in club A can be considered to be attempts to launder money of illegal origin.

Source: Belgium.

61. Football has a long history of private persons investing in clubs, with investments often being made by individuals who have made profit in other businesses including politically exposed persons (PEPs) and individuals with a suspected or even known criminal background. As football clubs may not always be very profitable and future returns on investments are highly unpredictable, investments may not essentially be made for purely economic reasons. An investment in a football club can provide the criminal a favoured status. By investing in football, criminal organisations get entry to the local or even national establishment.

Case 3: Drug trafficking and investment in a football club

Mr Heep, a person of humble origins living in a small town in the interior of the country migrated overseas, returning 5 years later with a lot of money and ownership of various companies in the border area (businesses that require investments of large amounts of money which obviously were not in his purchasing power). Later Mr Heep acquired a football team which was at that point languishing in the third division. The team was not an attractive investment. One advantage was its location in a major city in the country; however, Mr Heep moved the team to a small town of barely 30,000 inhabitants, where it could expect lower profitability because of the smaller numbers of followers. This activity showed all the indicators of a non-profitable business; however, the salaries and infrastructure paid under this new administration were well above the average of other teams in the same category, and the sponsoring companies were known for their low financial solvency. It is presumed that the payment of high salaries, infrastructure and the alleged sponsorship were aimed at increasing the value of the franchise in order to legitimise its investors as recognised entrepreneurs and important people in sports sector. The team rose from third to second division in a year. Later, the investor was identified as the leader of a drug trafficking network.

Source: Mexico.

62. It has been observed in several countries that some owners and / or investors in football clubs are often awarded contracts for public works.

Case 4: Corruption and PEPs

A pseudo-businessman linked to local government officials acquired a profitable team in the professional football league and used this as a means to attract politicians and officials of various levels of government. Thanks to his team and football matches, he had access to local officials with decision-making power over the state's public works, and he used these contacts to ensure that major public works were assigned to him.

Source: Mexico.

63. The following are examples of the way in which a football club could become a vehicle for money laundering, through the investment in or purchase of a club[14]. It is not vital to the mechanism that the business at the centre of it is a sporting club, merely that the business can be bought easily and that high value transactions are part of its normal business model. Any business with a significant cash turnover would be as vulnerable to manipulation in this way.

Case 5 (fictional): Securities based money laundering

A is a well known international figure who has substantial available funds from business enterprises (Sound Co) in loosely regulated jurisdictions. A buys football club X and recapitalises the club partly by a loan to the club and partly by the sale of new share equity. The value of the club (and the share equity) rises because of the involvement of A. He retains a majority shareholding and the club repays the loan from the new share equity.

A enters into negotiations through agents on both sides to buy players from a number of other clubs. A's agent is an offshore corporate entity based in a low tax jurisdiction. The transaction involves secret pay back fees paid by the selling club to A's agent which are built into the price of the players paid by A. The commission paid to A's agent is paid onwards to a third party, which is an offshore entity controlled by A, and this commission equals A's original investment. A now owns the majority shareholding in a high value football club at no net cost to himself he has also laundered the original purchase price of the club.

In this example the sum of USD 1 million which circulates through a series of transactions may represent the proceeds of crime introduced into Sound Co. Equally it may represent the remuneration due from Sound Co to A and the transactions may simply be an effort to evade tax from foreign earnings.

Case 6 (fictional): returns from investment

A is a business man who owns a successful scrap metal business as well as a number of other business enterprises. A is involved in the purchase of stolen metal. A uses the money from his legitimate businesses to buy a lower league football club in his home town and introduces GBP 5 million of new capital. The club (controlled by A) expends GBP 4 million on improvements to its ground, new canteen facilities and new kit. Each of these are provided by companies controlled by A and are paid at an inflated price. Funds are channelled from these companies to an intermediary management company based offshore controlled by A.

A vests his shares in the club in the intermediary management company and moves that offshore. A channels cash from his criminal dealings in stolen scrap into the club through gate receipts and the canteen. This cash injection and the general revival in the clubs fortune causes a significant increase in the clubs profits which are then paid in dividends to the shareholders. The majority of the dividend payments go to the intermediary management company owned by A.

In this example A has recovered most of his original investment through the sale of services to the club, he retains a majority shareholding in a now profitable business and he has laundered the proceeds of his illegal scrap metal dealings through the club.

64. Cash received from ticket sales for football matches may be open to manipulation in order to launder funds by falsifying the books of a football club. A football club would however not be different from other cash-generating businesses outside the football area, such as restaurants, bars etc. Also in this case, the vulnerability may be higher for amateur clubs than for major league clubs. In major leagues, clubs

[14] Fictional cases are constructed to highlight the vulnerabilities in the sector and to provide guidance to law enforcement agencies, FIUs and the private sector.

have been required to implement, also for safety reasons, strict controls (through machines) on the number persons entering the stadiums. In some countries, the local federations agree to supply a very large number of tickets. Even though clubs state these are all sold, the federation does not check this. In reality there can be as many as 500 spectators less than full capacity, and money is laundered by buying the remaining seats. The increased presence of large denominations in the takings for the day may be an indicator of this practice as medium value notes are commonly used by the public when purchasing tickets.

65. It is important to obtain properly documented and corroborated information as to the identity, background, business and sources of wealth and funds of each club and its owners. It is therefore vital to understand who the real beneficial owners and controllers of a club are. This requirement is needed to preserve the independence of clubs but will also assist in the fight against money laundering.[15]

Case 7: Ownership of a football club

Italy has experienced an attempt to launder money through the purchase of a famous Italian football team. The investigations[16] to detect the case started from judicial proceedings in 2006. The *Procura della Repubblica* suspected that financial crimes were occurring, such as, money laundering, insider trading and misuse of market information..

Initially, a lot of rumours spread concerning a well-known Italian football team and intentions to purchase its shares on the capital market. Almost immediately after the purchase, the shares increased in value rapidly and strongly. At the same time, the judicial authorities started to investigate suspected threats made to the President of the concerned football team in order to convince him to sell the shares. Meanwhile, rumours around the purchase continued, including a public announcement by a European pharmaceuticals firm of a EUR 24 million investment, a purchase offer that was later denied.

Investigations uncovered evidence that the money used to buy the shares was supplied by a criminal association operating in Central Italy.

Further, a part of that money, supposedly offered to the football team as sponsorship, was then diverted to another company to purchase real estate, which was subsequently seized by Italian judicial authorities. Investigators identified that the criminal association was strongly interested in purchasing the football team with funds obtained from several offences.

As a result of these investigations, the criminal attempt to get hold of the football company failed. Proceedings for money laundering, insider trading, extortion, unfair competition and other offences are ongoing.

Source: Italy.

The transfer market and ownership of players

66. The increasing internationalisation of the market for football players has added to the vulnerability to money laundering.[17] At the Wold Cup of 2006 for the first time in history over half of the players in the best national teams of the world were playing in foreign football clubs.[18]

15 Arnaut, José Luis (2006), p.82

16 These investigations involved collaboration amongst several Italian public authorities: Guardia di Finanza, Digos, Consob (National Commission over listed companies and stock market), the Italian FIU, the Procura della Repubblica and other judicial authorities.

17 Internationalisation started in the 1930s when national teams were taking on players of other nationalities in order to reinforce their squads (*e.g.* Italy with Argentinian players for the World Cup in 1934), a practice which continued after that. At club level, there were also several examples of foreign players in major leagues: for instance, the Real Madrid in the 1950/60s had several foreign players (Santamaría from Uruguay, Puskas from Hungary, Di Stefano and Rial from Argentina, Kopa from France), and it was not the only club in this situation (for instance, Luis Suárez moved from Spain to Internazionale Milano in the 1960s). Cruijff and Neskeens (Netherlands) were playing in 1975 for Barcelona (Spain), which in the 1970s had already recruited Krankl (Austria) or Simonssen (Denmark); Real Madrid recruited the 1974 German world champions Breitner and Netzer

67. The worlds' best players, both from within and outside the EU, are contracted by the richest European leagues. On the supply side, Brazil has long been a big exporter of footballers not only to Europe but also to Asia. In the course of the last few years, Africa has emerged as a less expensive source of new talent. Talented players from the former European East Bloc also gravitate towards rich clubs elsewhere in the world.

68. The liberalisation of the TV markets and the expansion of private TV chains in Europe greatly contributed to the increase of budgets of clubs, the salaries of players and, consequently, the internationalisation of the market for football players. Tax factors played a role as well. In recent years, for a top club in the UK or Spain a foreign player (i.e. not resident in the UK or Spain at the moment of being recruited) was/still is in some cases less costly because of the different tax treatment for "temporary" residents.

69. The internationalisation of the labour market for football players was further helped by the Bosman ruling of 1995 when the European court of Justice decided on the free movement of players between member states. This revolutionised the rights of footballers and has contributed to the vast increase of salaries of top-players.

70. The transfer market is vulnerable to various forms of misuse, such as tax evasion, insider fraud and also money laundering.[19] Vulnerabilities are connected with lack of transparency in relation to the funding for certain transfer transactions and the opportunity for funds to be paid offshore with limited disclosure requirements regarding beneficial ownership of destination accounts.

71. Estimating the transaction price for a player is often unfeasible, since large amounts are involved, often carried out in one transaction or transferred abroad, making it difficult to verify their final destination. The over-evaluation of a player corresponds to a money laundering technique similar to the over-invoicing of goods and services seen in trade-based money laundering. The key element of this technique is the misrepresentation of the price of the good or service in order to transfer additional value.[20]

72. The football specificity is that the transfer of a football player (it would be more correct to say the termination of a contract with a previous employer – unless such contract has expired – and the subsequent signing up of a contract with a new employer) implies a compensation from the second employer to the

in the 1970s and later on Jensen (Denmark) and Stielike (Germany); Brasilians Leivinha and Luiz Pereira were playing for Atlético Madrid in the 1970s. British clubs started to recruit top foreign players only from 1978 onwards.

[18] Compared to 11.4% of the players of the participating national teams during the world tournament of 1978, 27.1% in 1990, 33.0% in 1994, 42.6% in 1998, 48.2% in 2002 and 53.1% in 2006. *Source*: Frick, B. (2009).

[19] For instance, in Spain (one of the four major leagues) the legal form of top football clubs is either an "association" (such as Barcelona or Real Madrid) or Sport limited liability company (such as Valencia or Sevilla). In both cases, profits/dividends may not be distributed by law. This means that if those controlling the club want to extract value from it, they need to do it through related-party transactions. The easiest way to divert funds for the direct benefit of directors would be through the transfer market.

[20] FATF (2006), p. 4.

first employer. Compensations may be high and largely increase the costs of transfers, therefore increasing the attractiveness of these transfers for illegal activities such as money laundering.[21]

Case 8: Acquisition of players

A football club with high debts in Latin American country Z signed a management contract with a collective investment fund, constituted in a tax haven, under which the investment fund pledges to allocate funds in order to cancel the society's debts and to share the results.
The club then acquired the player "Ito" from another local football club (Argentina) for USD 20 000 000. The football club based in country Z transferred the funds to an account that the selling club has in a third country. The funds never entered Argentina. Thus, little was known about the origin of the funds or the account into which they were deposited in the third country.

This typology was characterised by the following stages:

- Unknown (anonymous) investors willing to allocate funds.
- Collective Investment Funds constituted in tax heavens.
- Acquisition by collective investment funds of the management of football clubs with debts or in an irregular situation, in need of attracting investors.
- Allocation of funds for the acquisition of football players.
- Money transfers to the football club that acquires the football player, to accounts located abroad.

Warning Signs:

- Investor groups constituted in tax havens.
- Acquisition of management quotas of societies with large liabilities, compromising to cancel them and to share results.
- Football club based in developing countries that have offers of football players prized in millionaire sums.
- Football clubs receiving contributions through companies constituted in tax havens, where the real investors of such funds remain unknown.

Source: Argentina.

73. When ML occurs in the transfer market, football agents are often a focal point of these illegal transactions. In an increasingly complex legal environment, players (but also sport clubs) increasingly ask for the services of agents to negotiate and sign contracts. The international transfer market consists of over 4 000 football agents with an official FIFA registration. There are no limits to the role of agents. They manage their players but could also be managing the customer's funds (asset management consultancy), giving tax advice (tax consultant), offering an image contract or taking care of their publicity (advertising agents). Their position is crucial because they often determine whether a transfer happens or not (through their influence over a player and relationship with a club).

74. There are rules that cover this activity, yet some countries are more rigorous in applying them than others. For instance, to combat the non-transparency of the football agent sector, FIFA, as a private entity, has set strict guidelines for players' agents. According to these new regulations, which are private laws, players' agents should respect and adhere to the regulations, directives and decisions of the

[21] The current football transfer system is the result of historical development and contractual practice. The transfer system is not a necessary condition for the organisation of high level/good quality sport competitions, as shown by examples in other countries/sectors (see for instance the system in the USA concerning professional basketball, in particular the competition organised by the NBA). Therefore, one could imagine that, alongside monitoring the transfer system for possible abuses, structural measures could be put into place to reduce the attractiveness of this type of transfer for money laundering purposes.

competent bodies of FIFA, the federations and the associations, as well as the laws governing job placement applicable in the territory of the association (see also chapter 5).[22]

75. However, many agents still operate without license (players can for example also choose close relatives or lawyers as their agent) and are thus not controlled by the FIFA or any other continental or national football association. Agents (licensed and non-licensed) form a closed community, which makes it difficult to screen the transactions that are conducted by them. The stricter FIFA regulations can therefore not prevent money laundering or other irregular activities completely.[23]

Case 9: Unlicensed agent and money laundering

Following the receipt of STRs from banks, a European FIU studied the financial activity of an individual X and his company A which specialised in consulting and advising sports people. The apparent activity of the company, along with the particularly high amounts of various international wire transfers crediting the bank account of company A, individual X and his wife, all confirmed that X was clearly a players' agent, at the European level. Neither X nor his company A held the FIFA license required to negotiate players transfers, however. The financial flows observed on X's account and on his wife's and company's accounts actually characterise the illegal exercise of player's agent, which is punishable by one year imprisonment and a fine of EUR 15 000 by the law in the country in question. The players and clubs who used the services of this unlicensed agent had also breached the FIFA regulation.

Further analysis revealed that many international wire transfers crediting the bank account of company A originated from company B and from an individual Y. Y was a licensed agent from an Eastern European country and was known to be closely linked to the organised crime in his country. The wire transfers he ordered in favour of company A and of X may characterise money laundering operations. The organisation and the identity of the associates of company B were vague. Information collected by the FIU revealed that X and Y were managers of company B and were using it as a vehicle for laundering proceeds of crime. Regarding the ML aspects, first the proceeds derived from the illegal exercise of a regulated profession are themselves illegal and the use of them constitutes a ML offence. Second, many international wire transfers ordered by individual X may be considered as ML transactions, as X was known in his country to be closely linked to organised crime. There were also suspicions of corruption regarding player transfer activity in another European country. As X was involved in the management of company B which was also the origin of international wire transfers, this company may have been used as a way to disguise the origin of the transferred funds. The case was transmitted to the public prosecutor on the basis of a presumption of illegal exercise of the profession of players' agent and money laundering of illegal proceeds.

Source: France.

76. Another problem is raised by the multiple financial transactions that occur during the transfer process. Besides the transfer sum which is stated in the contract, there are transfer bounties and the additional costs that are made to attract a football player (house, car, financial arrangements for the family etcetera). All of these items can be used for the benefit of players but also by clubs, managers and agents. There are no fixed rules on how these transactions should be accounted for. The overall settlement of the transfer could therefore remain non-transparent and provide opportunities for money laundering.

77. A relatively recent development is the possibility of ownership of players (or rights in players) by individuals or entities that are not football clubs. These persons fall outside the direct jurisdiction of the football organisations. The ownership structures often involve companies in offshore jurisdictions with

[22] See: The Football Association 2008).

[23] Concerning the problems related to the activities of agents, an independent study on players' agents is currently being carried out on behalf of the European Commission by external contractors. The objective of this study is to analyse the situation regarding sports agents in the European Union and to identify the problems posed by their activities, as well as the solutions already provided by public and/or private stakeholders, in order to enable the European Commission to assess whether intervention is required. The study will address issues such as financial transparency and ethics in the conduit of players' agents. The results of the study should be made available by October 2009.

complex and often impenetrable ownership structures. A significant amount of money is generated as a result of player transactions that have resulted in significant sums being paid to such entities where they hold the ownership rights to certain players. Due to the limitations of the football organisations jurisdiction, the basis of the acquisition of these rights and the trading, funding and ownership position of the entities through which such transactions are managed is opaque and often impossible for the football organisations to establish.

78. Full legal ownership of players is particularly a South-American phenomenon. In Europe private investors sometimes collect funds through a closed talent pool. These talent pools are however no legal owners of a player, giving them only the right to (part of) the revenues when a player is sold to another club. Talent pools are often better options to actually get a return than through the investment in a football club as such. Talent pools could be misused for money laundering.

Case 10 (fictional): Talent pools

A club purchases a player for EUR 10 million but states in the official documents that it has purchased the player for EUR 5 million. The total amount of EUR 10 million is provided by the investors. These investors invest EUR 5 million in the talent pool and provide the club another EUR 5 million of the books which could be 'dirty' money. The player needs to improve himself and will later be sold to another club for a transfer sum of say EUR 15 million. Everyone who is involved in the deal will gain by the acquisition and sale of the player. The club can by the extra donation of EUR 5 million buy a better player. The investors can launder EUR 5 million and get a return on their investment. And the players' agent gains a good commission since his player is bought for EUR 10 million instead of EUR 5 million and is later on sold for EUR 15 million.

Betting activities

79. There is an ambiguous relationship between betting and sport. On the one hand, betting has historically been an important revenue source for sport in many countries. On the other hand, betting has also been associated with attempts to fix matches and alter the results of sporting competitions. Betting can be used both for the generation of illegal proceeds from game fixing and for pure money laundering purposes.

80. The FIFA Task Force "for the Good of the Game" has observed that "due to its particular structure, as well as the considerable need to finance the system at short notice, football offers a tempting platform for irregular betting activities. As the media and the public eye focus on fixtures in top competitions and top leagues, irregular betting activities can frequently be observed in less important fixtures (including lower divisions of domestic championships), where the environment can be manipulated more easily. Recent scandals in which betting has resulted in the manipulation of matches have brought the game into serious disrepute".

81. While problems linked to betting are not new, it appears that betting in sport has reached new levels of sophistication with various operators involved across several countries and continents and new offshore betting companies being established. Moreover, the use of the Internet for online betting further increases the risk of money laundering.

Case 11: SOGA I and II

Illegal soccer gambling is a serious problem in Asia. A recent Interpol operation, SOGA II, provides an idea of the scale of illegal soccer gambling in that region. Interpol announced that 1 300 people were arrested on the suspect of illegal soccer gambling and USD 16 million in cash were found during the operation (Interpol, 2008). 1 088 gambling dens were identified of which most were associated with organised crime. It is estimated that these dens handled bets which were worth nearly USD 1.5 billion. This is however not the first time Interpol has taken action in this area. In 2007 SOGA I resulted in 400 arrests, 272 illegal gambling dens and confiscation of USD 680 million worth of bets (Interpol, 2008). It is of course not said that the gambling sites are only used for money laundering. However, illegal soccer gambling is according to Interpol often related to money laundering.

Source: Interpol.

82. UEFA has called on the police organisation Europol to investigate possible match-fixing by Asian betting syndicates in top-flight European football. Meanwhile, Europol has recognised the danger emanating from corruption in sports. "The phenomenon of game fixing in organised sport is one of the areas that Europol has on the radar as a crime on the increase"[24].

83. However, illegal football gambling does not necessarily only involve Asian criminals. On the contrary, most of the Asian bookmakers are professional and well organised companies with a lot of expertise in the field. They do not deal with the gamblers directly, but only by means of a network of intermediaries. In other words, they do not know the individuals or organisations that are placing the bets. The problem is often situated elsewhere. International organisations or syndicates in Europe, for example, are trying to secure their investments in the Asian betting market by manipulating games through clubs, players or referees. Other parts of the world are also associated with match-fixing gambling scams. According to UEFA, there is an international network of organised crime behind certain European matches believed to have been fixed for betting reasons. Money traded on a single website can surpass EUR 100 000 for a third division football match. The UEFA however reports even higher stakes of EUR 1 million to EUR 2 million per match and stakes that can even increase for large tournaments.

84. Due to the fact that most countries have different gambling regulations, the gambling market is non-transparent and is a heterogeneous market with a mix of private and state companies acting both nationally and internationally. Providers are often established in countries which allow the organisation of gambling activities or in countries that do not regulate or supervise gambling. It is however not easy to take legal action against providers who offer their services online and are established abroad. This in combination with the non-transparency of the gambling market makes betting an interesting money laundering vehicle for criminals.

Case 12: Irregular betting

Several individuals regularly went to casinos in European country A to purchase chips for a substantial total amount. Analysis revealed that one of the individuals involved was a foreigner without any link to country A. The other individuals involved are either directly (players or coaches) or indirectly (relatives of players or coaches) linked to the world of football. There was no economic justification for the large amount of money used to purchase the chips. Police sources showed that the individuals were known in an investigation into rigged matches. The foreigner was suspected of bribing players before certain matches with money originating from betting activities linked to fixed matches. An online betting company established in a foreign country recorded exceptionally high bets for these matches. His aim was to invest in different clubs to control and corrupt them to play matches that were rigged beforehand. He mainly focused on clubs in financial trouble that were looking for "lifesaving" sponsors. The extraordinary scale of the betting or the unusual result of some matches (8-0) pointed to fraud. The money used to bribe players and to buy the chips could have originated from criminal activities of which the individuals were suspected.

Source: Belgium.

[24] World Sports Law Report (2007).

Image rights, sponsorship and advertising arrangements

85. Players with an excellent reputation and sometimes others as well get the chance of concluding so-called "image contracts" with companies that generally have their registered office abroad. These contracts take advantage of the "rights to the player's image" and are a tool to exploit personal appearances by the player as part of broad publicity campaigns but could represent vulnerabilities in respect to tax evasion and money laundering activities, even if the research for this report was unable to turn up any examples of proven cases.

86. The money due as stipulated in the contract is transferred to the company's account, often in a tax haven. This implies various risks: risk of fraud for the players with a very powerful image as they may be tempted to not declare part of the money received or be used as a "gatekeeper" for financial transactions in favour of a third party, and risk of money laundering for the players with an image that is not so powerful, they are used to launder money that is not related to their image. The player needs to be an accomplice in order to successfully complete these transactions.[25] Another scheme may be set up internally. When the club needs to "release" cash for some dubious use it will "officialise" this release under the pretext of paying for an image contract and then recover part of it.

87. Another possibility could be the use of fictitious image rights. In this scheme, payments for fictitious image rights are not remuneration for the use of the image rights of the player. In fact the payment is part of the football salary. The club pays a sum which does not make any connection with the actual value of the image rights or with the income to be earned. The players involved often have high football qualities, but a poor, even minimal exposure. Therefore afterwards, it emerges that the club has not or hardly made any commercial use of the rights. By disguising a part of the football salary as a payment for image rights the club and the player try to postpone or entirely cancel taxation in the same way as described above for the real proceeds of image rights.

88. Another risk area involves large money flows stemming from sponsorship and advertising arrangements. Part of professional football clubs' income depends on sponsors who invest in football for marketing reasons. If no check is done on sponsors' backgrounds, organised crime can use sponsoring as a gateway to legitimate business. By acquiring a certain dominant position within a professional sporting organisation the sponsor gains access to a corporate network.

89. Similarly issues concerning the relationship between the sports sector and sports media (television in particular) have become crucial as television rights are the primary source of income for professional sports in the large Western European countries. Conversely, sports media rights are a decisive source of content for many media operators. Sport has been a driving force behind the emergence of new media and interactive television services. There are no proven cases of dirty money going into football through media contracts however this remains an area of concern for football governing bodies.

Related illegal activities

90. Several cases show that the football sector is used as a vehicle for perpetrating criminal activities. Those criminal activities mainly refer to illicit trafficking in human beings, corruption, drugs trafficking (doping) and tax crime.

[25] SCPC (2003).

Illicit trafficking in human beings

91. Several cases linked to trafficking in human beings involve individuals directly or indirectly linked to the world of football. The problem of trafficking young players became apparent in many European countries at the beginning of the 1990s. Currently, population movements, mainly from African and Latin America, are becoming ever more significant and the circumstances surrounding the players' recruitment and accommodation are sometimes unclear. Dishonest agents set up networks that have led to a series of irregularities and have been involved in trafficking in human beings. Nowadays the football competition boasts many foreign players from African and Latin American countries but there are clear signs that this phenomenon is spreading to Eastern Europe and some Asian countries.

Case 13: Trafficking of players

Mr. LAN, an African citizen residing in his country of origin, had opened an account with a bank in Europe. An international transfer took place from this account. Part of the money had been transferred to an account of Mr. SMO, a European citizen. The latter immediately withdrew two thirds of the amount in cash. Mr. LAN's account also regularly received cash deposits. Analysis revealed that Mr. LAN acted as agent for international transfers of football players. Mr. LAN was not mentioned on any official list as a registered manager though. One of the individuals who held power of attorney on his account was a former football coach. Police sources showed that Mr. LAN was known to be involved in illicit trafficking of football players to which Mr. SMO was an accomplice. The transactions performed were probably linked to the commissions received for this trafficking. There was an amount of EUR 160 000 involved.

Source: Belgium.

Corruption

92. According to *Play the Game*, an organisation devoted to ethical values in sport, the rising incidence of corruption is due to the changing role of sport: its increasing commercialisation and the resultant increase in media coverage, advertising revenue and corporate sponsorship. Star athletes earn salaries comparable to top CEOs or stars in the entertainment industry, and major sport clubs deal in sums that rival many corporations. The mere presence of such money makes illicit behaviour attractive. Gambling encourages unethical conduct such as bribery of referees, officials or players to fix matches or influence league positions. The construction of sports facilities and the purchase of large amounts of equipment provide fertile fields for corruption in procurement. Where money flows, corruption often follows. Often seen are cases of match fixing to profit from betting or to affect league positions.

Case 14: Corruption and match fixing

The FIU of European country A sent information to the FIU of European country B regarding possible corruption related to football which was being investigated in country B. This information concerned Mr. PINO and Mr. FLY. Mr. PINO's assets of around EUR 1 million were divided over various accounts with a bank in this country. In a period of a few months, the account received several hundred thousand euros. Mr. FLY had also opened an account with this same bank. This account regularly received cash deposits. Analysis revealed that Mr. PINO was the chairman of a football club and was the subject of an investigation into corruption with respect to fixed matches. Mr. FLY was the lawyer of this football club. Mr. PINO and Mr. FLY held several accounts in country B and held power of attorney on accounts opened in the names of several companies. They carried out numerous cash deposits on various accounts totalling to several hundred thousand euros. Transfers between different company accounts were also performed, often involving use of transit accounts. The transactions carried out in country B and the assets abroad have been linked to offences that are currently under investigation.

Source: Belgium.

Drug trafficking – Doping

93. The issue of doping was very prominent in recent years due to several cases of doping products used by sportsmen. A broad range of products is available and, it is now extremely easy to buy forbidden

substances over the Internet. Organised crime has a clear influence on this type of trafficking. Indeed, it involves schemes akin to those used for drug trafficking.

Case 15: Doping

The company DIET, selling food supplements, had an account over which Mr. LATE held power of attorney. Following several changes to the articles of association, the activity on the company's account increased considerably. In a few months' time the credit transactions amounted to almost EUR 2 000 000. International transfers also began to take place on this account. Analysis revealed that the transactions were linked to a vet, Mr. HONY and represented invoice payments. The official activities of the company DIET did not justify why a vet was one of its customers. Mr. LATE and Mr. HONY were known to the police for trafficking of hormonal substances as part of a doping investigation in cycling and football. The transactions on the company DIET's account were linked to hormone trafficking.

Source: Belgium.

Tax evasion

94. Tax evasion and money laundering often use the same mechanisms. For example the money launderer may seek to conceal the proceeds of crime in corporate entities registered in regimes which have light financial regulation or strict banking secrecy laws. The tax evader will seek out the same secrecy jurisdictions. For a football club the channelling of money in a transfer deal through companies resident in low tax jurisdictions may be a method of laundering money, equally it may be tax evasion. And it is also likely that both offences may be present.[26]

95. The financial investigator faced with a complex series of transactions will have at some point to distinguish between money laundering and tax evasion as the objective. It follows also that co-operation, between financial investigators and tax authorities, is an essential part of the fight against both money laundering and tax evasion. Whilst tax evasion may be the predicate offence behind money laundering it is also likely that the objective of the suspicious activity is tax evasion. In the latter case recovering the proceeds of crime may be better effected by the application of tax powers and the recovery of tax, interest and civil penalties.

Case 16: Tax evasion through football agents

A disclosure was made by a player, revealing that his signing on fee was disguised as part of a fee to a foreign agent. He confirmed that the agent then paid him GBP 300 000 abroad and did not previously disclose this to the UK tax authorities. It is likely that the club concerned was fully aware that the payment to the agent included a signing-on fee for the player and the benefit to the club in such an arrangement is that it avoided Social Security contributions of GBP 38 000.

Source: United Kingdom.

96. The use of image rights is also used increasingly as a way of disguising remuneration. Image rights agreements have been used to disguise payments to agents. The amount of the image rights payment is inflated to account for payment made by the club to the agent. Once the image rights payment has been made to the offshore company, the agent will receive his entitlement, but without declaring the income for his services.

[26] There may be reasons other than money laundering or tax evasion for maintaining funds in "regimes which have light financial regulation or strict banking secrecy rules". Sometimes, it may be a problem of lack of confidence in the financial system of one's country, in the thoroughness of the country's supervisory systems or in the value of the currency (*e.g.* capital flight).

Case 17: Tax evasion through the use of image rights

A player (non-UK national) entered into an image rights agreement with a club. The player had transferred the rights to exploit his image exclusively on a world-wide basis to a company registered in a known tax haven in return for shares of that company. Unlike all the other players at the club, he was the only individual not to have either a signing on fee or a loyalty bonus and appearance fees. The club had not exploited the player's image in any way and after 2 years had sought professional advice, only to be advised that the image had no commercially exploitable value. Nonetheless, the club renegotiated both the playing and image rights contracts after 3 years, increasing the level of payments in both. The club concerned conceded that the image rights agreement was part of the employment terms and paid over additional duties of GBP 938 688. Additional duties of GBP 404 480 were also to be paid over the future life of the image rights contract.

Source: United Kingdom.

97. In the examples above, the common feature is the payment of money outside the "home" jurisdiction, the effect being to conceal the ultimate destination of payments. Image rights are used to disguise the true character of the payments.

CHAPTER 5: OVERVIEW OF ANTI-MONEY LAUNDERING INITIATIVES

98. The fight against money laundering became one of the priorities of public policies about 20 years ago, when the States realised that the significant development of circuits reinvesting dirty money constitutes a real threat to social and economic framework of the world. More recently, various international and national actors started to express concerns on the integrity of the football sector, including money laundering.

International and national public authorities

European Union

99. The EU recently produced several documents in which economic and social values of sports in general including football are praised, connected with statements about action that has to be undertaken to combat crime including the fight against money laundering.

100. In 2006, a European independent football review launched by the UK presidency resulted in a report to the EU Commission.[27] The objective of this Independent Review was to consider certain concrete issues facing sport and to adopt a series of recommendations on how the EU institutions, the EU member states and the European football organisations could provide a comprehensive and robust legal framework for European sport in general and football in particular.

101. The European Parliament adopted in March 2007 a resolution on the future of professional football in Europe. In this resolution the Parliament asked the Council of the European Union to develop and adopt measures for the fight against the criminal activities that haunt professional football, including money laundering, illegal betting, doping and match fixing, and enforced prostitution on the sidelines of major football events.

102. In July 2007, the European Commission published the White Paper on Sport.[28] For the first time the Commission addressed sport-related issues in a comprehensive manner. Its overall objective is to give strategic orientation on the role of sport in Europe, to encourage debate on specific problems, to enhance the visibility of sport in EU policy-making and to raise public awareness of the needs and specificities of the sector. The White Paper recognises that corruption, money laundering and other forms of financial crime affect sport at the local, national and international levels. The White Paper proposes to tackle cross-border corruption problems at the European level and to monitor the implementation of the EU anti-money laundering legislation with regard to the sport sector. As part of the implementation of the Pierre de Coubertin Action Plan, a number of studies have been launched or are in preparation concerning the issues covered by this report. A study on sports agents should be completed by the end of 2009. The study will address problems posed by the activities of sports agents in Europe. Another study on internal market barriers to the financing of sport will be carried out in 2010. It will address, among other things, the issue of sports betting.

---

27 Arnaut (2006).

28 Commission of the European Communities (2007).

National public authorities

103. Some national authorities undertake their own initiatives to support greater financial transparency including the prevention of money laundering and tax evasion through football.

104. France has set up a Direction Nationale du Contrôle de Gestion (DNCG) controlling the finances of professional and amateur sporting clubs. DNCG is a voluntary body within the French federation of football consisting mainly of accountants and lawyers that warrants the "fairness in sports". It ensures the books are balanced for the sporting season. Even though DNCG ascertains the solvency of investors, by asking for guarantees on their personal assets, it has not the mandate to check the legal origin of funds. However, its members in their quality of professionals subject to the AML/CFT regime (accountants, lawyers) do have the legal obligation to report suspicious transactions to the French FIU. In addition, according to the financial and monetary code, the French FIU has the power to obtain information from the DNCG. It is worth to note that the French code of sports provides for each sport federation with a professional league to set up a DNCG, competent for both professional and amateur sector. As a result, there is a DNCG for the rugby, basketball, handball, etc.

105. Initiatives have also been undertaken by Italy which has set up COVISOC which is a surveillance commission responsible for the financial control of professional football clubs and depends on the Italian Football Federation. In Brazil, there is a voluntary working group on football clubs involving football organisations, the central bank, FIU, the police and judiciary authorities. This working group has to assess vulnerabilities to ML, propose solutions to the problem and obtain operational results. Since the mid-1990s, the Dutch tax authority has followed the policy of dealing with sports by way of concentration and co-ordination. All professional football clubs are handled by one unit: the National Specialist Unit of Professional Sports. Club management often consult about fiscal matters with the Unit.

Sports organisations

FIFA

106. According to FIFA, their organisation bears a special responsibility to safeguard the integrity and reputation of football worldwide. FIFA is striving to protect the image of football, and its own image, from harm as a result of immoral or unethical methods and practices. In this connection, the Code of Ethics was developed in 2004 and revised in 2006. This revision was prompted by a decision of the FIFA Congress made in Munich in June 2006, requiring the creation of a new and independent Ethics Committee to constitute FIFA's third judicial body.

107. In November 2005, FIFA established a special task force "For the Good of The Game", aimed to investigate and combat threats to integrity of football. The task force consisted of three separate working groups, one on Competitions, one on Political Matters and one on Financial Matters. This financial working group had to "discuss and propose possible solutions to problems involving corruption, ownership of more than one football club by a single individual or organisation, betting on football, money-laundering and the flow of money during player transfers, developments in the transfer market and players' agents".

108. It was the first time that FIFA officially referred to money laundering. As part of its efforts to safeguard the integrity of the game of football, FIFA set up the following measures based on the proposals from the Task Force.

Player transfer matching system

109. The transfer matching system is a web based system for data exchange operated by a legal entity owned by FIFA. Applicable to international transfers of professionals, the system is firstly a contract

matching system to ensure that all parties agree on the details of the transfer, secondly a contract validation system to ensure that the terms of a transfer are correct and thirdly a payment recording (settlement) system. The advantages are twofold: it facilitates transfers and shows where the money is coming from and going to, with the aim of making transfers more transparent[29]. The system will become the source for all international transfer certificates for professional players by September 2010[30], and in future it will become a clearing house (timeline to be determined).

FIFA Club Licensing Regulations

110. After UEFA had a positive experience with club licensing regulations, FIFA sought to implement a global licensing system, in collaboration with national associations and confederations. FIFA Club Licensing Regulations were thus drafted based on the *UEFA Club Licensing manual*. The principles were approved by the 57th FIFA Congress in May 2007.

111. The club licensing system has the following overall objectives: safeguarding the credibility and integrity of club competitions; improving the level of professionalism within the football family; ensuring sporting values in accordance with the principles of fair-play; ensuring safe and secure match environments and ensuring transparency in the finances, in the ownership and in the control of clubs.

Players' Agents Regulations

112. The most recent FIFA Players' Agents Regulations were approved by the FIFA Executive Committee on 30 October 2007 and came into force on 1 January 2008. The new features include licences for players' agents being renewable as opposed to having lifetime validity, with the aim of making sure that agents are up to date with the rulings that are in force. Disciplinary measures against agents with dishonest intentions have also been significantly strengthened, and players will also have to pay their agents themselves in order to increase the transparency of the various transactions. In concrete terms, agents will receive payment exclusively from the client who engages them.

Early warning system on betting activities (EWS)

113. The early warning system is an independent subsidiary of FIFA aimed at protecting football from match-fixing derived from sports betting by highlighting any irregularities which occur in betting on football at a sufficiently early stage. This preventative alert system was tested during the 2006 FIFA World Cup Germany™. It monitored all 302 events of the 2008 Olympic Games in Beijing on behalf of the IOC. The FIFA Congress decided at the end of May 2007 to institutionalise the system and will use it to monitor gambling activities related to qualifying and tournament matches for South Africa 2010.

---

[29] As part of a valid transfer, clubs will have to provide the following combination of details: counter club information; counter clubs association (ITC management); player name; type of transfer (permanent, loan); total transfer amount (plus solidarity and/or training compensation if any); transfer type (single-payments, instalments); club agent and commissions if any; player agent if any; payment details of source bank (from club) and destination bank (to club), amount and value date.

[30] From May 2008 to April 2009, 47 countries began the implementation of the system. Phase 1 (since May 2008): Belarus, Belgium, Brazil, Chile, China, Côte d'Ivoire, Greece, Hungary, Kenya, Mexico, the Netherlands, Norway, Paraguay, Poland, Portugal, Spain. Phase 2 (since November 2008): Argentina, Australia, Austria, Bulgaria, Cameroon, Canada, Colombia, Croatia, Czech Republic, Congo, France, Germany, Japan, Lithuania, Morocco, New Zealand, Nigeria, Peru, Puerto Rico, Romania, Russia, Slovakia, South Africa, South Korea, Switzerland, Trinidad & Tobago, Turkey, Ukraine, Uruguay and the United States.

114. The EWS has signed contracts with more than 400 bookmakers worldwide. These bookmakers report any suspicious betting behaviour to EWS. In the event of suspicious betting patterns, FIFA is immediately informed, in accordance with the established emergency plan. EWS offers its infrastructure and its know-how to FIFA member associations and is establishing a common database for all relevant information in relation to match-fixing.

Other measures

115. Concerning the protection of minors, FIFA increased training compensation for 12-15 year old players and introduced the control of academies. In addition FIFA Transfer Matching System will also have an effect on the protection of minors. Concerning the anti-doping policy, in January 2009, a new world anti-doping code and FIFA anti-doping regulations came into force. This includes individual case management, flexibility in sanctions and possible whereabouts for teams.

International Olympic Committee (IOC)

116. The IOC Ethics Commission, created in 1999, is charged with defining and updating a framework of ethical principles, including a Code of Ethics, based upon the values and principles enshrined in the Olympic Charter of which the Code forms an integral part. In addition, it investigates complaints raised in relation to the non-respect of such ethical principles, including breaches of the Code of Ethics and, if necessary, proposes sanctions to the IOC Executive Board.

117. On the question of resources, the IOC Code of Ethics provides that the use of the Olympic resources, namely the financial support given by the IOC, must be only for Olympic purposes, and that this must be clearly demonstrated in the accounts. Regarding the question of the risk to the integrity of the Olympic Games posed by irregular betting activities, the IOC decided to monitor all the betting activity on the 28 sports during the Olympic Games in Beijing. Furthermore, the IOC was in contact with Interpol during this period. Fortunately, during the Olympic Games in Beijing, no irregular activity was noticed. However, the IOC has decided to continue such monitoring of betting activities during future Olympic Games.

Union of European Football Associations (UEFA)

118. UEFA has become remarkably explicit in its concerns on money laundering through football and expressed its concerns that money laundered from various criminal activities is moving into football. In 2005 UEFA has asked the European Union to investigate the origins of some of the hundreds of millions of pounds coming into football due to growing fears that criminals may be using clubs as a vehicle for money laundering. UEFA also urged MEPs from the European parliament known as the "Friends of football" to ask the FATF to examine suspicious investments in the sport.

119. In June 2006 William Gaillard, UEFA's director of communications, stated that "there is no doubt European and Latin American football could be a channel for dirty money to be laundered in major economies. […] Dirty money hurts the game".

120. In a presentation given to Transparency International's conference in November 2006, Henri Roemer, an advisor to UEFA's Executive Committee, explained in more detail what makes football so vulnerable to organised criminal organisations, who amongst other things, use clubs to launder their money. Roemer also outlined a number of steps that football bodies can take with partners outside sport to

combat the problems. Roemer mentioned FATF as the first most appropriate institution to collaborate with.[31]

121. Concerning the betting and match-fixing issues, UEFA stated during a UEFA disciplinary workshop in January 2009 that "an increasing challenge for football comes from betting and possible match manipulation – an area endangering football's integrity". UEFA's determined response to the challenge posed is, among other things, the reinforcement of UEFA's disciplinary services by improving the UEFA fraud detection system, through the recruitment of additional staff, in particular with specific experience in criminal investigation and sports betting. UEFA is also co-operating with a number of specialist partners in monitoring betting on UEFA matches, and the systematic collection of live official data from UEFA matches will help the monitoring process in the future. UEFA's fraud detection policy provides for comprehensive investigation of any alleged cases, and disciplinary action will follow against offenders. An UEFA delegation met recently with the largest bookmakers in Asia to find a way of efficient reporting of irregular betting patterns related to European matches.

122. From the season 2009-2010, UEFA will run a Europe-wide Fraud Detection System including the monitoring of all European domestic top 2 division matches and national cup fixtures of all 53 national associations affiliated to UEFA. These national associations will be informed about irregular betting patterns for their matches and guided in the subsequent disciplinary proceedings.

123. A recent example of UEFA's initiative can be illustrated by the decision taken by the UEFA in April 2009 regarding a club from the former Yugoslav Republic of Macedonia. This club was banned from UEFA competitions for eight years for match-fixing. The UEFA Control and Disciplinary Body added that the club president and a player have also been banned for life as a result of the investigation. Charges were brought against the club due to reports of irregular betting patterns and statements from a number of witnesses.

Football Associations

124. In December 2007 English Football Association came up with an extensive guidance for football clubs "Money Laundering and The Proceeds of Crime Act"[32]. This document was prepared in response to requests from professional and semi-professional clubs for more guidance in this area. The document sought to provide clubs with an overview of the main UK legislation concerning money laundering and the proceeds of crime on legislation; to set out steps a club might take in the event of a suspicious transaction; and to summarise some preventative measures that clubs might take to protect themselves.

125. According to this guidance, there are many transactions that take place within football clubs which have the potential to involve money laundering, no matter how reputable the other party may be in the transaction. Consequently, clubs should ask themselves various questions when carrying out transactions, for example: "Do you know exactly whom you are dealing with?", "Have you properly identified and verified the persons that you are doing business with?", "Do you know how the purchaser/investor/trader/agent has found the funds to pay you?"

126. The guidance also highlights that the repressive anti-money laundering legislation is applicable to sporting clubs. At a preventive level, even though clubs are not directly subject to AML legislation, some of their activities fall within the scope of the law which applies to "relevant businesses" defined in the Regulations such as accountants, banks and solicitors, as well as other that carry out activities that clubs may be involved in such as accepting deposits, dealing in investments and dealing in goods of any

[31] Roemer, H. (2006).

[32] The Football Association (2008).

description (including for example player transactions) by way of business whenever a transaction involves accepting total payments of EUR 15 000 or more.

127. If a club has a "nominated officer", any disclosure should be made to him or her in the first instance. The nominated officer should in turn report to the FIU. If there is no "nominated officer" the disclosure should be made direct by to FIU by the person who has the information or by a member of the club's senior management (assuming that the information is passed onto them).

128. To guard against the risks associated with potential money laundering or the handling of the proceeds of crime, clubs should review their existing systems and procedures and, where appropriate, consider implementing various measures. These measures include:

- Appointing somebody within the club's senior management to be responsible for money laundering issues.
- Making staff aware of the money laundering legislation and training staff that may be involved in transactions that could involve money laundering.
- Ensuring that there are internal controls on your business transactions so that only employees with the appropriate authority can bind the club.
- Ensuring that up to date and accurate records are kept of all business transactions, especially those that may involve money laundering.
- Ensuring that the identity is known of those that the club is dealing with and carry out appropriate enquiries before entering into transactions with them.
- Monitoring customer activity so that if it changes you can evaluate why it may have changed (for example, a customer with a history of making payment through the electronic banking system suddenly starts paying in large sums of cash); and reporting any suspicious activity.

129. The FA works closely with law enforcement authorities. Since 2007, the FA has also set in place a monitoring team which oversees and scrutinises the player transfer market and payments to football agents. One of the mechanisms that allows the FA to undertake this work is the "clearing house" function that the FA operates, whereby all monies paid by English clubs to overseas clubs in respect of player transfers and all monies paid by English clubs to agents must be processed through the FA's dedicated bank account.

CHAPTER 6: POLICY IMPLICATIONS

130. This study of typologies aims to help identify the weaknesses or loopholes in the prevention systems currently in place and may lead to the setting up or development of measures to protect the sector from money laundering linked to criminal activities, thus avoiding its becoming an attractive destination for money obtained from criminal sources.

Key findings

131. Criminals have shown adaptability in finding new channels to launder the proceeds of their illegal activities and there are concerns that various legitimate sectors are at danger of being misused for money laundering.

132. With the growing economic importance of sports during the last two decades, including the increasing profits that can be made out of sports, money gradually started to exert a strong influence on the world of sports. The influx of big money into sports has positive effects, but there are negative consequences. There is a higher risk of fraud and corruption given the amount of money at stake. Sport also can be used as a channel to launder dirty money.

133. As the biggest, truly global, high value sport, football seems to be confronted with various forms of crime and corruption - including money laundering. Football has undergone an accentuated growth and commercialisation since the early 1990's. The influx of big money, in combination with some specific factors has made football one of the many sectors that can be attractive for criminals to launder proceeds of crime.

134. The report identifies three areas of vulnerabilities.

135. The first area relates to the structure of the sector: the market is easy to penetrate, there is a multitude of stakeholders and money flows, different types of legal entities are at stake and management of clubs often lacks professionalism.

136. The second area of vulnerabilities regards the sector's finance. Clubs have large financial needs and considerable sums are often involved, especially in the international transfer market, often with an apparently irrational character, whereas control of origins or destination of payments is weak or even absent.

137. The third area relates to the sector's culture: a certain social vulnerability of some players (in particular younger players) making them vulnerable, the societal role of football making people reluctant to shatter sports' illusion of innocence and finally the opportunity for acquiring social status in the local community and gain entry to the establishment. A complex of financial and non-financial motives could make investments in football attractive for criminals seeking legitimate social status.

138. After analysis, money laundering through the football sector is revealed to be more complex than originally understood.

139. There are cases that illustrate the use of the football sector as a vehicle for laundering the proceeds of criminal activities. A variety of money flows involving various financial transactions increase the risk of money laundering through football. These are related to the ownership of football clubs or players, the transfer market and betting activities. Other cases show that the football sector is used as a vehicle for perpetrating criminal activities, and thus creating dirty money. Those criminal activities mainly refer to illicit trafficking in human beings, corruption, drug trafficking (doping) and tax crime.

140. The money laundering techniques used vary from very basic to complex and sophisticated techniques, including the use of cash, cross border transfers, tax havens, front companies, PEP's and the misuse of non-financial professionals.

141. Connections with other well-known money laundering typologies were identified such as trade-based money laundering, the use of non-financial professionals and NPOs for money laundering purposes, money laundering through the security sector, the real estate sector and the gaming sector.

142. Concerning this last point, it appears that betting in sport has reached new levels of sophistication with various operators involved across several countries and continents and new offshore betting companies being established. The use of the Internet for online betting further also increases the risk of money laundering.

143. Various initiatives are taken by international and national actors in order to combat threats to the integrity of football, including money laundering, in particular with the aim to control the ownership of clubs; to obtain information related to player transfers; to improve the situation surrounding players' agents and to combat illicit betting activities.

Issues for consideration

144. Looking ahead, there appear to be a number of areas that could be considered to improve the capacity to cope with the money laundering risks associated to the football sector.

145. **Building a better awareness**: while criminals use creative schemes to exploit the football sector, lack of awareness of money laundering risks associated to football could contribute to the problem. Very often there is a lack of awareness amongst some key players about their responsibility in the process of fighting illicit activities. Creating an understanding of the money laundering risks associated to the football sector amongst government bodies and the private sector, including financial institutions, is critical. Awareness-raising may prove to be very useful. This would require resources for outreach, training or other cooperative activities, but may result in enhanced information exchange.

146. **Imposing good governance and improving financial transparency:** With the growth in the number of international transfers and the increase in the sums of money paid per transfer, there are more managers and more intermediaries involved, including new parties of dubious background. Promoting healthy financial management is therefore crucial. One could imagine that, alongside monitoring the transfer system for possible abuses, structural measures could be taken to reduce the attractiveness of the transfer system to money laundering.

147. **Exploring industry best practices**: Some countries mentioned reporting obligations of money laundering to the national FIUs. In most cases there are no such obligations for football clubs. The adoption by the football sector of a code of best practices, such as the British football association guidance, could be helpful.

148. **Cooperation with the private sector**: various initiatives are taken by sports organisations (FIFA, UEFA, IOC) in order to safeguard the integrity of football and achieve the greatest possible degree

of transparency. To be successful, these measures could be developed further in cooperation with the FATF.

149. **Imposing similar regulations**: Given the international character of football, it is important to impose similar regulations to avoid choosing countries with the poorest regulations. In this context, there is a need to recognise the sporting industry as a robust industry (requiring financial transparency, proper external accounts, adequate financial management, and an effective regulatory framework).

150. **International co-operation is a key factor**: Difficulties in international exchange of information and the use of tax havens are a major stumbling block in the detection and prosecution of money laundering through the football sector. International co-operation and information sharing are key factors in the fight against money laundering given the international dimension of the football sector. Countries need to work cooperatively to identify and combat the use of the football sector for money laundering purposes.

151. **Internet gambling.** There is a risk associated with internet gambling related to sports in general. This issue could be investigated in a separate FATF typology study.

ANNEX – FATF QUESTIONNAIRE

1. Do you consider the football sector in your country to be vulnerable to money laundering? If yes, please describe the vulnerabilities?

2. Do you have cases of the misuse of football clubs and their networks to launder the proceeds of crime (such as money laundering through player transfers, investment of illegal funds in clubs, gambling on football competition, through sponsorship, talent pools, business clubs)? If yes, describe these cases in as much detail as possible and provide information on the persons or networks involved.

3. Football clubs and their networks can also serve as a vehicle for perpetrating illegal activities such as fraud, corruption, bribery, illegal gambling. Sporting clubs can therefore also be seen as a source of 'dirty money'. Do you have any cases illustrating this kind of illegal activity? If yes, please describe the schemes used.

4. By which means money laundering cases through football clubs have been detected (*i.e.* STRs, police investigations, newspapers)? If any, please provide the number of STRs relating to football and sporting clubs.

5. Please provide an estimate of the amount of money laundering in each of the case you have described. Do you consider the cases illustrative (common) or exceptional (uncommon) for laundering the proceeds of crime through football?

6. Please give a substantiated estimate of the overall size of money laundering through football in your country (in absolute numbers or related to the overall money laundering problem or compared to other money laundering schemes)?

7. Do individual clubs, football associations, federations or public authorities take measures to prevent money laundering and other illegal activities (see question 3) through football, including on the basis of international measures? If yes, describe these measures and if possible, provide the text of these measures. What kind of measures could be useful to prevent money laundering through football?

8. Which other sporting activities are notably vulnerable to money laundering in your country? Please describe some typical money laundering schemes through sporting activities other than football. Give a substantiated estimate of the overall size of these money laundering schemes.

FATF, *Proliferation on Financing Report* (Paris: FATF, 2008).

Financial Action Task Force

Groupe d'action financière

PROLIFERATION FINANCING REPORT

18 June 2008

TABLE OF CONTENTS

INTRODUCTION

1. The Proliferation Finance Typology Project develops an understanding of the issues surrounding proliferation financing and provides information that can be used by the FATF to assess the need for policy measures to counter proliferation financing.

2. Pursuant to the FATF's Guidance of 29 June 2007, "Further study of broad-based measures to combat WMD proliferation finance under United Nations Security Council Resolution 1540 (2004) "S/RES/1540 (2004)", the project identifies and analyses the existing threat of proliferation financing; examines existing measures used to counter this threat; and outlines a series of options that could be considered by the FATF to counter proliferation financing, within the framework of existing S/RES/1540 (2004) and S/RES/1673 (2006).

There are financial provisions within paragraphs 2 and 3(d) of S/RES/1540 (2004)'s mandatory Chapter VII obligations that merit further examination by the FATF.

> *2. Decides also that all States, in accordance with their national procedures, shall adopt and enforce appropriate effective laws which prohibit any non-State actor to manufacture, acquire, possess, develop, transport, transfer or use nuclear, chemical or biological weapons and their means of delivery, in particular for terrorist purposes, as well as attempts to engage in any of the foregoing activities, participate in them as an accomplice, assist or finance them;*
>
> *3. Decides also that all States shall take and enforce effective measures to establish domestic controls to prevent the proliferation of nuclear, chemical, or biological weapons and their means of delivery, including by establishing appropriate controls over related materials and to this end shall:*
>
> *(d) Establish, develop, review and maintain appropriate effective national export and trans-shipment controls over such items, including appropriate laws and regulations to control export, transit, trans-shipment and re-export and controls on providing funds and services relate to such export and trans-shipment such as financing, and transporting that would contribute to proliferation, as well as establishing end-user controls; and establishing and enforcing appropriate criminal or civil penalties for violations of such export control laws and regulations;*

S/RES/1540 (2004) defines a non-state actor as an "*individual or entity, not acting under the lawful authority of any State in conducting activities which come within the scope of this resolution.*"

S/RES/1673 (2006) reiterates the requirements of S/RES/1540 (2004) and emphasizes the importance for all jurisdictions to implement fully that resolution, including provisions regarding the financing of WMD proliferation.

The FATF, while taking into consideration the work of the United Nations 1540 Committee, will conduct further study to:
(a) identify the threat of the financing of WMD proliferation;
(b) analyse the effectiveness of existing measures to counter the threat of the financing of WMD proliferation, and
(c) identify measures (*e.g.* criminalisation measures, broader sanctions, activity-based financial prohibitions or controls or examining the use of financial intelligence) that could be considered in combating WMD proliferation finance within the framework of existing UNSCRs, such as S/RES/1540 (2004).

3. This report has incorporated, *inter alia*, the following into its analysis: 1) jurisdictions' responses to the Proliferation Financing Questionnaire; and 2) the findings of the November 2007 Joint FATF / APG Experts' Meeting on Money Laundering and Terrorist Financing Typologies. The report has also benefited from the discussions that took place at the May (Ottawa) and September (Rome) 2007 WGTM Intersessional Meetings. The Project Team[1] has had opportunities to discuss proliferation financing issues with some representatives of the private sector. Private sector representatives participated at the November 2007 Joint FATF / APG Experts' Proliferation Financing Workshop. The issue of proliferation financing was also discussed at the December 2007 FATF – Private Sector Expert's Meeting on Typologies.

1. ASSESSING THE THREAT OF PROLIFERATION FINANCING

4. The threat of proliferation is significant and the consequences are severe. Proliferation has many guises but ultimately involves the transfer and export of technology, goods, software, services or expertise that could be used in nuclear, chemical or biological weapon-related programmes, including delivery systems; it poses a significant threat to global security. If appropriate safeguards are not established, maintained and enforced for sensitive materials, technology, services and expertise, they can become accessible to individuals and entities seeking to profit from the acquisition and resale, or for intended use in WMD programmes.

5. They can also find their way into the hands of terrorists willing to employ WMD in acts of terrorism. There is evidence that terrorist organisations continue to pursue chemical, biological, radiological or nuclear (CBRN) capabilities, and it is worrying that their efforts are increasing.[2] In such circumstances, terrorism financing as it relates to providing financial support to terrorist organisations that endeavour to acquire and/or deploy CBRN weapons is then by its nature also contributing to proliferation.

6. Proliferation financing is an element for the movement of proliferation-sensitive items and as such, contributes to global instability and potential catastrophic loss of life if WMD are developed and deployed. Similar to international criminal networks, proliferation support networks are using the international financial system to carry out transactions and business deals.

7. This paper does not seek to define proliferation or proliferation financing. In considering the challenges posed by proliferation financing, this report has looked at issues wider than those set out in S/RES/1540 (2004), strictly defined. The following is a broad working definition of proliferation and proliferation financing for this report only.

> *Proliferation is the transfer and export of nuclear, chemical or biological weapons; their means of delivery and related materials.*
> *This could include, inter alia, technology, goods, software, services or expertise.*
>
> S/RES/1540 (2004) further defines the following:
>
> *Means of delivery: missiles, rockets and other unmanned systems capable of delivering nuclear, chemical, or biological weapons that are specially designed for such use.*
>
> *Related materials: materials, equipment and technology covered by relevant multilateral treaties and arrangements, or included on national control lists, which could be used for*

[1] The following FATF delegations participated as members of the Project Team: Belgium; Canada; Denmark; France; Germany; Hong Kong, China; Italy; The Netherlands; Switzerland; United Kingdom; United Nations and United States.

[2] *www.cia.gov/library/reports/general-reports-1/CBRN_threat_wo.pdf*
www.csis-scrs.gc.ca/pblctns/prspctvs/200110-eng.asp

the design, development, production or use of nuclear, chemical and biological weapons and their means of delivery.
Proliferation financing is providing financial services for the transfer and export of nuclear, chemical or biological weapons; their means of delivery and related materials.

It involves, in particular, the financing of trade in proliferation sensitive goods, but could also include other financial support to individuals or entities engaged in proliferation.

For the purpose of this report, no distinction is made between witting and unwitting actors.

8. The proliferation challenge faced by governments includes the direct technology transfers by governments through nuclear, chemical, biological and missile cooperation or espionage into clandestine efforts to build and acquire WMD capabilities. While there can be legal or other restrictions on information sharing given the sensitive nature of proliferation investigations and intelligence gathering, the report does identify a number of proliferation financing cases. Determining, for example, that a high, medium or low number or value of international financial transactions are facilitating proliferation may be impractical, however, the cases identified in the report show several instances where the international financial system has been used to facilitate proliferation. While it is fact that financial institutions were involved in these transactions it does not per se indicate that they should have been in a position to detect the true nature of the transaction and prevent it.

9. Governments have established numerous multilateral arrangements to detect and prohibit proliferation including the Nuclear Non-Proliferation Treaty[3]; however, as indicated later on in the report, traditional arrangements have not focused on proliferation financing. The detection of even a few proliferation related cases should raise concern, in particular, given the consequences that the use of or threat of using a biological, chemical, radiological or nuclear weapon can have on the international community, including the international financial system.

10. Governments have worked to establish and maintain extensive export controls and safeguards to prevent the acquisition of the required goods, services, technology and expertise by proliferators or their supporters. These controls, including safeguards such as the registration, licensing and pre-approvals for the manufacture and export of a broad range of designated goods, are fundamental in preventing proliferators from acquiring important goods, services, technologies and expertise. However, these controls are not uniform across jurisdictions, and some jurisdictions have yet to implement the requirements mentioned in several international treaties to detect and restrict trade in proliferation sensitive goods and items.

11. In addition, trade globalisation and steady advances in technology are providing fresh challenges for the maintenance of effective export controls. Trade volumes continue to rise and trade patterns are less discernable. Further, there is a growing range of goods and technology that have commercial applications as well as applications for WMD and WMD delivery systems (*i.e.* "dual-use" goods), and while proliferators previously attempted to buy or sell whole manufactured systems with the effective control systems, there is a growing trend to purchase or sell more elementary components. Proliferation networks continuously seek out and exploit weaknesses in the global export control system and international financial system.

12. Export controls are used to *inter alia* prevent dual-use and other sensitive goods (listed and unlisted) from being exported to known individuals and entities that are involved in WMD proliferation-related activities. However, it is challenging for authorities to designate and monitor trade in all relevant "dual-use" goods.

[3] The full range of multilateral arrangements is described in some detail in Annex 4.

13. Governments are continuously working to further develop these controls while proliferation networks, individuals, entities and countries of concern continue to adapt, using front companies, illicit brokers and illicit means to obtain goods, services, technology and expertise.

14. The multilateral financial prohibitions contained in S/RES/1540 (2004)[4] introduce an additional tool that complement existing counter-proliferation regimes. The diagrams in Annex 2 demonstrate the growing complexity of the procurement process. One or two decades ago financial institutions were in a better position to collect and scrutinise information regarding the ultimate end–use of potentially sensitive proliferation items. However, procurement networks have become more complex over time, increasing: *i)* the number of actors involved; *ii)* the trade in sub-components; and *iii)* the indisputable probability that the true end-users of proliferation sensitive goods will avoid detection. This implies, *inter alia*, the acquisition of technology with the aim of shifting the production capacity to their own country or to generally unwitting production facilities in other countries.

15. With changes to the procurement process and a significant increase in the number of normally innocuous items that now have potential proliferation sensitive applications, it has become far more difficult to assess with a sufficient degree of certainty whether an item will truly be used for civilian purposes. While information that is potentially held by intelligence services has not changed significantly, information held by other entities, including suppliers and financial institutions is greatly diminished. For example, it is common today for suppliers to only have information on intermediary players in the procurement chain. Suppliers deliver dual use products and other critical items that are often not subject to export controls, to traders, brokers and other entities responsible for forwarding on the items as inputs to other facilities where proliferation sensitive goods are then produced.

16. Today, financial institutions have far less information about end-users and ultimate end-uses of items underlying financial transactions. Apart from information that is collected concerning their clients, information in transactions that describe items is generally too vague and/or would require a significant amount of technical knowledge to determine if they were sensitive or not.

17. The following diagram shows the information that is usually available to financial institutions.[5]

5 See Annex 2 for further detail.

The scope of proliferation financing

18. Defining the scope of proliferation and proliferation financing for the purposes of this report is both critical and challenging. The report seeks to present the types of proliferation activities that often involve proliferation financing.

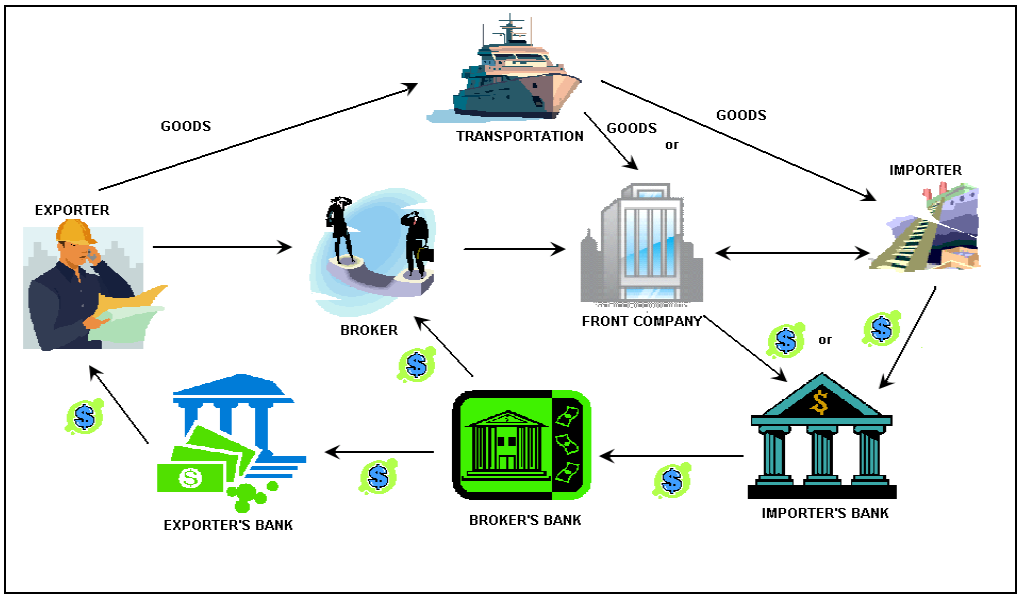
19. Proliferation networks operate globally. Advances in economic integration and in the volume and speed of international travel and trade, facilitate the global transfer of sensitive items by proliferators. Proliferators mask their acquisitions as legitimate trade. They exploit global commerce *e.g.* by operating in countries with high volumes of international trade or utilising free-trade zones, where their illicit procurements and shipments are more likely to escape scrutiny. However, in reaction to this phenomenon, jurisdictions with a highly developed and efficient export control system make enhanced efforts to control these transactions.

20. The following diagram illustrates a basic foreign trade pattern which is routinely used in export financing. Proliferators may abuse this typical trade pattern to disguise their real intentions. It is a starting point for subsequent illustrations and cases that provide a more dynamic snapshot of individuals, entities, products, and documents proliferators may use and exploit, as well as the financing mechanisms they use to facilitate their trade.

OVERVIEW OF A FOREIGN TRADE PATTERN ABUSED FOR PROLIFERATION

An importer may arrange for the shipment of goods directly with an exporter or could use a front company, broker or both a front company and a broker.

Similarly, payments may be settled with a manufacturer's bank either: directly; using a Front Company; using a Broker; or the manufacturer may arrange for payment using Letter of Credit or other payment method.



Source: Canada.

21. Proliferators rely on support structures[6] that exploit a number of channels to facilitate the purchase, sale, export or import of sensitive goods. As with most illicit trafficking, proliferation networks work to conceal the end-user of traded goods, the goods themselves as well as the entities involved and associated financial transactions.

6 More information provided in the section "Witting and Unwitting Actors".

22. To ensure that authorities do not detect the real end-use of sensitive goods being exported, networks may use intermediaries and front companies to arrange for the trade and export of goods by witting or unwitting companies. However, the use of intermediaries is not in itself an indication for proliferation financing. Exporters employ intermediaries for legitimate purposes. When exporting out of or through jurisdictions with well-developed export control regimes, intermediaries and front companies may use fraudulent documents, such as false end-use certificates, forged export and re-export certificates. Couriers or other facilitators may be used to ensure that the transfer of goods, in particular at main transit points, avoids inspection to ensure safe entry of the goods by land, sea, or air.

Activities relevant to this report

23. Weapons of mass destruction proliferation, including the transfer of complete systems or the transfer of components; dual-use goods, services, technology, expertise and training, that could be used to develop weapons or delivery capability is the primary focus of this report. The theft of high value materials from authorised storage facilities with the intention of resale should also be considered a proliferation-relevant activity.

Dual-use goods

24. Proliferators purchase dual-use items, many of which are controlled under international export control regimes. In contrast to trafficking in nuclear or radiological material, these purchases are mostly settled using a range of financial transactions, normally through the formal financial sector.

25. Dual-use goods are items that have both commercial and military or proliferation applications. This can include goods that are components of a weapon, or those that would be used in the manufacture of a weapon (*e.g.* certain machine tools that are used for repairing automobiles can also be used to manufacture certain component parts of missiles).

26. Export control systems are continuously updated and expanded to incorporate new goods and technologies. This has forced proliferators in some cases to adopt a different strategy to select, where feasible, elementary components rather than complete subassemblies[7] to elude authorities. However, a high level of technical expertise is often required to integrate various elementary goods into a full assembly, and as such, proliferation networks may continue to attempt to illegally purchase subassemblies or complete systems. They may even attempt to acquire the manufacturing company.

27. Dual-use goods destined for proliferation use are difficult to identify even when detailed information on a particular good is available. Regardless of the amount of information provided for a particular good, highly specialised knowledge and experience is often needed to determine if a good may be used for proliferation. The table below includes a small subset of the kinds of items – with only minimal information – that are often classified as dual-use by jurisdictions, it is by no means an exhaustive list of dual-use items, as national dual-use goods lists often contain hundreds of items, as well as the technology used to design, manufacture or use such items. Dual-use items can be described in common terms with many uses – such as "scrubbers" – or in very specific terms with more specific proliferation uses – such as metals with certain characteristics. Further, many of the goods listed in this table are only regarded as dual-use if they measure-up to very precise performance specifications.

[7] A subassembly is defined as a major subdivision of an assembly consisting of a package of parts, elements, and circuits that perform a specific function.

Table 1. Select examples of general dual-use items

Nuclear	*Chemical*	*Biological*	*Missile and delivery*
Centrifuges	Scrubbers	Bacterial strains	Accelerometers
High-speed cameras	Mixing vessels	Fermenters	Aluminium alloys
Composites	Centrifuges	Filters	Aluminium powders
Maraging steel	Elevators	Mills	Gyroscopes
Mass spectrometers	Condensers	Presses	Isostatic presses
Pulse generators	Connectors	Pumps	Composites
X-ray flash apparatus	Coolers	Spray dryers	Maraging steel
Pressure gauges	Precursors	Tanks	Homing devices
Ignition	Pumps	Growth media	Oxidants
Vacuum pumps	Reactors		Machine tools
	Heat exchanges

Transhipment and diversion

28. Transhipment centres, commonly known as 'hubs' are cargo-sorting and redistribution destinations through which much international trade is routed. Examples of major international hubs include the Netherlands (Rotterdam), the UK (Felixstowe), Hong Kong, Singapore, and Malaysia (Port Klang). Free trade zones are destinations where goods pass through on route to their final destination. Free trade zones, while not always transhipment hubs, are sometimes used by exporters as the landing post for goods destined for end-users in nearby jurisdictions. Examples include the United Arab Emirates (Jebel Ali free port), Malta and Cyprus.

29. Routing goods through transhipment hubs offers a number of advantages to those seeking to facilitate international trade. It is common practice amongst cargo shippers and helps lower shipping costs by reducing the number of ship movements required. Although transhipment routes are often highly complex, with goods travelling through many hubs, they provide the opportunity to link up with other vessels going directly to the end-user destination and do not require specially charted ships to be commissioned or to travel empty – cutting the cost to the importer. Goods travelling through a hub may be small volume – single packages or containers. Many hubs, like free trade zones, have the additional advantage of being close to their eventual cargo destination.

30. For the procurer of illicit goods seeking to avoid detection, the advantages of Free Trade Zones and Transhipment Hubs are that less stringent export controls are often applied by states to goods being transhipped or routed through free trade zones than to goods entering their territory through other means. As goods do not officially enter the economy in question they may be beyond effective customs and police control. The final journey may be by smaller cargo vessel or it may be completed by land or air. Although certain destinations maintain accurate data for cargo passing through their ports for commercial reasons the constant rerouting of goods can make effective tracking of cargo difficult.

31. Diversion occurs when the supplier, broker or end-user deliberately tries to conceal the eventual destination of a particular shipment. For instance, when diverted goods pass through a third country, an individual in that country who is aware of the true destination of the goods seeks to establish himself as a false end-user. Entities or persons seeking to conceal the true end-user have the best chance of doing so by diverting or routing goods through third countries with weak (or non-existent) controls. Diversion points used by proliferators will often be ports where national shipping carriers call and where goods can be passed on to other cargo shippers on route to their final destination.

32. While transhipment and diversion make traditional counter-proliferation controls harder to enforce it can result in a financial intelligence trail for investigators and customs authorities to follow breaches of export control law. Financial flows required to move goods from one place to the next could provide authorities with supplementary information to link up entities of concern with transport routes and ultimate end-users.

Proliferators' use of the formal financial sector

33. Some elements of proliferation support networks may operate for financial gain and the formal financial sector can be abused by networks to carry out transactions and business dealings worldwide. Apart from transaction and business activities in the informal financial sector, proliferation financing can involve traditional trade finance products and transactions.

34. There have been incidences where proliferation-related transactions are settled through opaque cash or "barter-like" settlements involving goods such as oil, sensitive military goods or other proliferation sensitive goods. Cash may be used by proliferators to avoid detection by financial monitoring systems. Further, the cash used in payments may have been obtained through illegal activity. Cash payments for goods do not create financial (paper or electronic) trails and therefore do not contribute financial information that may be useful in identifying and combating proliferation activity.

35. However, it is important for proliferators to have access to the international financial system under most circumstances. Purchases must appear to be legitimate if proliferators are to elude suspicions and they often exploit commercial companies with legitimate businesses.

36. While there are cases where proliferators have exchanged suitcases of cash, this is not cost effective or efficient and is certainly suspicious. Companies being used unwittingly are aware of the sensitivities surrounding their products and are often required to exercise due diligence with purchasing parties. It would be quite suspicious, for example, if an individual tried to purchase a piece of machining equipment with cash.

37. International trade has well established instruments to facilitate imports and exports while mitigating business risks, including the general level of trust between parties engaged in a transaction. Trust is exploited by proliferators to ensure the minimum amount of scrutiny. Traditional trade financing contracts clearly define the specific terms of trade and ensure each party that the other will follow through on their end of the arrangement. The most common payment methods include open account payment, pre-payment, documents against payment and letters of credit. Trade can also be financed through more direct means via credit. These are discussed in more detail below.

38. Proliferation networks also use financial flows to pay intermediaries and suppliers outside the network. Similar to actors that supply proliferation networks, financial institutions are usually unwitting facilitators of proliferation, as a consequence of the complexity of dual-use goods, the involvement of illicit intermediaries, front companies and illegal trade brokers.

Survey results on disrupting and deterring proliferation and proliferation financing[8]

39. Some jurisdictions raised the following general risk factors which might make a jurisdiction vulnerable to proliferation financing, in response to the Proliferation Financing Questionnaire (the survey). The most significant risk factors include: laws or enforcement capacity, its size, openness, industrial make-up and volume of trade with respect to the economy and/or geography. Specific factors raised in the survey responses include:

[8] A survey was sent to all jurisdictions on 1 October 2007 and this report reflects the responses of 20 jurisdictions.

- Weak AML/CFT controls and/or weak regulation of the financial sector.
- Weak or non-existent export control regime and/or weak enforcement of existing export control regime.
- Non-party to relevant international conventions and treaties regarding the non-proliferation of weapons of mass destruction.
- Lack of implementation of relevant UNSCRs.
- The presence of industry that produces WMD components or dual-use goods.
- A relatively well-developed financial system or an open economy.
- The nature of the jurisdiction's export trade (volumes and geographical end-users).
- A financial sector that provides a high number of financial services in support of international trade.
- Geographic proximity, significant trade facilitation capacity (*e.g.* trade hub or free trade zone), or other factors causing a jurisdiction to be used frequently as a transshipment point from countries that manufacture dual-use goods to countries of proliferation concern.
- Movement of people and funds to or from high-risk countries can provide a convenient cover for activities related to proliferation financing.
- Lack of working coordination between the customs authority and the export licensing authority of a specific jurisdiction.
- A jurisdiction that has secondary markets for technology.

40. Most jurisdictions responded that any financial services related to international trade, including through products such as letters of credit, could be abused to finance trade in proliferation-sensitive goods. Financial institutions providing trade finance services are at risk of being abused for proliferation financing with financial services and products such as letters of credit (or documentary credits), loans and electronic funds transfers. It was noted that *hawala* and money remittance services and the insurance sector were at risk for proliferation financing and identified that proliferation networks may use cash couriers to finance proliferation.

41. A number of jurisdictions indicated that general risks, such as having a highly developed industry and financial sector, will increase vulnerabilities should no efficient export control system exist. When asked to assess the effectiveness of export controls in their own jurisdiction, respondents generally considered their system to be adequate.

2. WITTING AND UNWITTING ACTORS

42. Proliferators abuse typical trade structures to facilitate their activities, which include supporters, financiers, logistical support, front companies, assets, shippers and facilitators. Entities that are knowingly engaged in proliferation, such as a front company, may also be involved in legitimate business. Other actors used by a network may knowingly support proliferation, be "wilfully blind" that they are being used for illicit purposes, or are truly unwitting actors. When an entity is engaged in both legitimate and illicit trade it may be less likely for financial institutions to suspect illegal activity.

Front and Other Companies

43. In individual cases, proliferation networks have employed companies to conceal the true end-use or end-user of traded goods. Most front companies are sensitive to public exposure and disruption of legitimate activities.

44. Front companies established by proliferators conduct transactions similar to those of companies engaged in legitimate business. Front companies used by proliferators may be similar to those established by money launderers. As is the practice of other criminal organisations, proliferators create companies for a seemingly legitimate commercial purpose and commingle illegal funds with funds generated by legal commercial activity. In some cases, front companies established by proliferators do not engage in any legal activity at all. Front companies may use fraudulent accounting practices and establish various offshore entities in jurisdictions with lax controls to disguise illegal operations.[9] Proliferators are also known to change the names of front companies, or to use multiple names for the same front company, to prevent the detection of the companies' association with proliferation – or other illicit activity.

45. Front companies used by proliferators are often located in a major trading hub of a foreign jurisdiction with lax export controls but may also be found in jurisdictions with more established controls. They can be shell corporations with a fictitious business and physical location or can have normal commercial and industrial operations.

46. Front companies can arrange shipping services, routing or re-routing goods acquired by the importer or its intermediary. The same and/or additional companies can also be located in jurisdictions with weak financial controls, enabling related financial transactions to settle the underlying trade without detection.

47. In exceptional cases, front companies may seek complicity within a particular jurisdiction's government for signoff by national authorities, by production of false cargo manifests to misdirect customs, law enforcement, and intelligence as to the true nature of the goods being exported and their end-use.

Brokers

48. Brokers are involved in the negotiation or arrangement of transactions that may involve the transfer of items (often between 3rd countries) or who buy, sell or arrange the transfer of such items that are in their ownership. In addition they may also become involved in ancillary activities that facilitate the movement of items such as, but not limited to: *i)* providing insurance; *ii)* marketing; *iii)* financing; and *iv)* transportation / logistics. Illicit brokers illegally participate in proliferation by circumventing existing controls and obfuscating trade activities.

49. Brokers used by proliferation networks are often individuals relying on simple commercial structures, who are very mobile (financially and geographically) so that they can operate from any jurisdiction.

Other Intermediaries

50. Intermediaries may include companies and individuals that purchase or sell sensitive goods for further manufacture or redistribution. Intermediaries may have a particular knowledge of a jurisdiction's commercial infrastructure. Intermediaries that are knowingly engaged in proliferation will use this knowledge to exploit vulnerabilities in export control systems to the advantage of the proliferator.

Financial Institutions

51. Proliferation networks may use financial institutions to hold and transfer funds, settle trade and pay for services. Proliferation networks may use both private and public financial institutions for international transactions. States seeking to acquire WMDs may also use foreign branches and subsidiaries of state-owned banks for proliferation finance-related activities, giving these institutions

[9] FATF (2003), FATF (2006).

the responsibility of managing funds and making and receiving payments associated with proliferation-related procurement or other transactions. These subsidiaries may be engaged in both legitimate and illegitimate transactions.

Financial institution settlement of international trade transactions[10]

52. Financial institutions support international trade in three main ways:

- A financial institution's products and services are used to settle international trade transactions. These products and services range from payment transfers[11] from the importer to the exporter to more sophisticated financial products, such as a letters of credit[12], documentary collections and guarantees.
- The financial sector provides export finance to bridge the time between the need of funds for production, transportation etc. and the payment for such products by the importer. Banks and other export credit agencies provide loans and credit to traders to enable them to purchase and resale goods or equipment.
- The financial sector may provide insurance against certain risks involved in the trading process. Insurance instruments can protect exporters against the non-payment of buyers and insure against non-compliance by the seller and risks arising from government policy changes (*i.e.* political risk).

53. The role of financial institutions in trade finance is not limited to the provision of financial products. In addition, financial institutions provide valuable information to investors and traders depending on the financial service they provide to their client. They may inform their clients about present and future money and capital market conditions. And they operate through established international banking relationships with correspondents, which give their clients greater assurance about the legitimacy of their trading partners. While correspondent banks are used to facilitate trade transactions, the use of these banks does not provide legitimacy to the commercial parties to a transaction. Depending on the trade finance process used, it may provide a greater assurance of payment, however, it does not account for the legitimacy of a trading partner. This role feeds directly into the provision of the three groups of products and it will not be discussed separately.

Trade Settlement

54. In all business transactions, there is some commercial risk. However, in the international context, this risk can be magnified, as information about foreign companies (*e.g.* importers, foreign banks, economic conditions and foreign laws) would likely be less familiar to the exporter and his bank, than in respect of domestic clients. This applies equally to both exporters and importers.

55. For the exporter, commercial risks include the importer not accepting the merchandise or not paying for it once it is accepted. The importer risks that the exporter does not deliver the products at the agreed quality and time. In both cases, the capital invested in the purchase or sale – be it out of companies' own funds or through a credit facility – is at risk.

56. A key consideration in mitigating commercial risk is the choice of trade financing instrument. Traders typically choose from three main methods for settling trade transactions, depending on the extent of commercial risk: *i)* Clean Payments (open account and payment in advance), *ii)* Documentary Collections, and *iii)* Letters of Credit.

---

10 This section significantly relies on information by Hinkelman, E. G., (2002b)

11 This would include wire payments.

12 The term letter of credit is a broad term that includes both Commercial Letters of Credit (typically used for the purchase and sale of goods and services) and Standby Letters of Credit (used for various purposes to guarantee a payment and commonly used to guarantee the purchase and sale of goods and services).

57. It is estimated that about 80% of global trade is conducted not using the traditional process of letters of credit and collections and may be simply clean payments processed through financial institutions. Of the remaining 20% of global trade it is estimated that as much as ten percent may be transacted completely outside the traditional financial system.[13]

58. The following is a description of the three main methods of settling trade transactions.

(i) Clean Payments

59. Clean Payments are typically limited to transactions between well-established, ongoing trading partners or other partnerships where significant trust exists between the importer and exporter. In clean payment transactions, the role of the financial institutions is limited to the transfer of funds. Documents, such as title documents and invoices, are transferred between trading parties without a financial institution acting as the intermediary. Clean payments may be used for any purpose and are not specific to transactions between an importer and exporter.

60. As mentioned, the use of open account transactions by entities engaged in international trade is most commonly used. The decline in use of letters of credit or other trade finance vehicles is in relation to the overall growth in world trade. The actual transaction volume for letters of credit has remained relatively stable over time while the volume of world trade has grown.

61. A significant advantage of clean payments is that the administrative costs, including the time required to settle the transaction and the fee paid to a financial institution, are minimal.

62. The two most common types of clean payments are open account and payment in advance.

(i)(a) Open Account

63. An open account transaction involves the exporter shipping the goods and sending the trade documents directly to the importer. Once the goods are received, the importer arranges through its financial institution to forward payment to the exporter. In this arrangement, the exporter bears all risk and, in the absence of other financial arrangements, cannot access the funds until payment is received from the importer.

(i)(b) Payment in Advance (full or partial)

64. A payment in advance transaction reverses the order of an open account transaction. The first step involves the importer providing payment to the exporter as agreed. Once the exporter receives payment, the goods are shipped and the documents sent to the importer. In this arrangement, the importer bears all risk. In addition, there is an opportunity cost to the importer of using the funds prior to the goods being received.

65. Financial institutions participating in open account transactions will monitor transactions in accordance with domestic anti-money laundering and counter-terrorist financing regulations. This typically involves undertaking the appropriate customer due diligence (CDD) and record keeping as outlined in FATF recommendations and local regulatory requirements.

66. The level of scrutiny and information available on the underlying transaction will depend on the financial institution's exposure to credit and reputation risk associated with the nature of the customer relationship or its participation in the transaction. For example, because an institution's risk exposure when participating in an open account transaction is low, it would not likely scrutinise (or even see) the documents supporting the transaction (*e.g.* bills of lading or invoices).

[13] International Chamber of Commerce

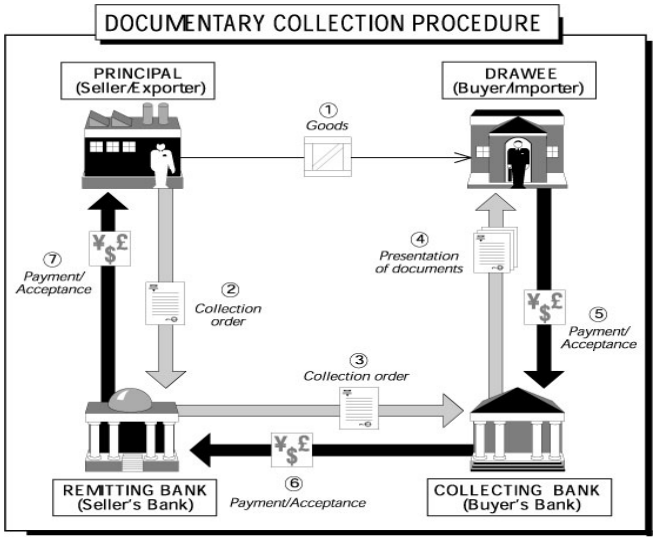
(ii) Documentary Collections

67. Documentary Collections involve the exporter transferring documents (such as an invoice and transportation documents) through exporter's bank to the bank designated by the importer. The importer is able to retrieve the documents once it has made payment or accepted drafts for future payment and obtain release of the goods. In simple terms, banks act as intermediaries to collect payment from the buyer in exchange for the transfer of documents that enable the holder to take possession of the goods. In a typical collections transaction, the bank does not have title or control over the goods.

68. As in the case of an open account transaction, there is a risk of non-payment by the importer, because financial institutions involved in the transaction do not guarantee payment or assume credit risk. The role of financial institutions is to act as an intermediary to forward documents from the exporter to the importer upon receipt of payment (Documents against Payment) or the importer's promise of payment at a later date (Documents against Acceptance). The banks are under no obligation to authenticate documents.

Documentary Collection Process

69. The documentary collection procedure involves the step-by-step exchange of documents giving title to goods for either cash or a contracted promise to pay at a later time. The diagram following the description below illustrates by way of example only each numbered step.



Contract for the purchase and sale of goods – The Buyer and Seller agree on the terms of sale of goods: (a) specifying a documentary collection as the means of payment, (b) naming a Collecting Bank (usually the buyer's bank), and (c) listing required documents.

(1) Seller ships the goods – The Seller ships the goods to the Buyer and obtains a transport document from the shipping firm/agent. Various types of transport documents (which may or may not be negotiable) are used in international trade and only where required by the underlying transaction is a negotiable document used.

(2) Seller presents documents to Remitting Bank – The Seller prepares and presents a document package to his bank (the Remitting Bank) consisting of: (a) a collection order specifying the terms and conditions under which the bank is to hand over documents to the Buyer and receive payment, and (b) other documents (*e.g.* transport document, insurance document, certificate of origin, inspection certificate, etc.) as required by the buyer.

(3) Remitting Bank sends documents to Collecting Bank – The Remitting Bank sends the documentation package by mail or by courier to the Collecting Bank in the Buyer's country[14] with instructions to present them to the Buyer and collect payment.

(4) The Collecting Bank reviews and provides documents to Buyer – The Collecting Bank (a) reviews the documents making sure they appear to be as described in the collection order, (b) notifies the Buyer about the terms and conditions of the collection order, and (c) releases the documents once the

[14] While a collecting bank may be in the buyer's country it need not be.

payment or acceptance conditions have been met. Acceptances under documentary collections are known as "Trade Acceptances" which, when accepted (by the Buyer), only carry the obligation of the buyer as opposed to a "Bankers Acceptance' commonly used under a letter of credit which carries the obligation of a bank.

(5) Buyer provides payment to Collecting Bank – The Buyer (a) makes a cash payment, or if the collection order allows, signs an acceptance (promise of the Buyer to pay at a future date) and (b) receives the documents and takes possession of the shipment.

(6) Collecting Bank provides payment to Remitting Bank – The Collecting Bank pays the Remitting Bank either with an immediate payment or, at the maturity date of the accepted bill of exchange if it receives payment from the Buyer.

(7) The Remitting Bank pays the Seller.

70. See Annex 7 for a description of the document that accompany a Documentary Collection transaction.

(iii) Letters of Credit

71. A letter of credit (also known widely as a documentary credit) is the written and almost always irrevocable[15] promise of a bank to pay a seller the amount specified in the credit, subject to compliance with the stated terms. The fact the seller is relying on the promise of a bank rather than the buyer for payment is the biggest distinction between a letter of credit and a documentary collection transaction.

72. Documentary credits provide a high level of protection and security to both buyers and sellers engaged in international trade. The seller is assured that payment will be made by a bank so long as the terms and conditions of the credit are met. The buyer is assured that payment will be released to the seller only after the bank has received the documents called for in the credit and those documents comply with the terms and conditions of the credit.

73. Although documentary credits provide good protection and are the preferred means of payment in many international transactions, they do have limitations. They do not, for example, ensure that the goods actually shipped are as ordered. It is up to the parties to settle questions of this nature between themselves. Documentary credits will also have higher transaction costs than other settlement methods. A letter of credit is an international established practice offering the best level of legal / contractual certainty, and therefore constitutes one of the most reliable payment methods for international transactions. A core element of the letter of credit is the concept that banks deal with documents and not with goods, services or performance to which the documents may relate[16] and banks examine documents presented under letters of credit "on their face"[17] in compliance with international standards banking practice.[18]

74. While this covers the traditional commercial letter of credit, standby letters of credit and bank guarantees are often frequently used for the purchase of goods and services internationally.

---

15 Revocable credits are rarely used today and are no longer included in international rules such as the International Chamber of Commerce Unified Customs and Practise (UCP).

16 UCP 600 Article 5.

17 UCP for Documentary Credit, Article 14(a).

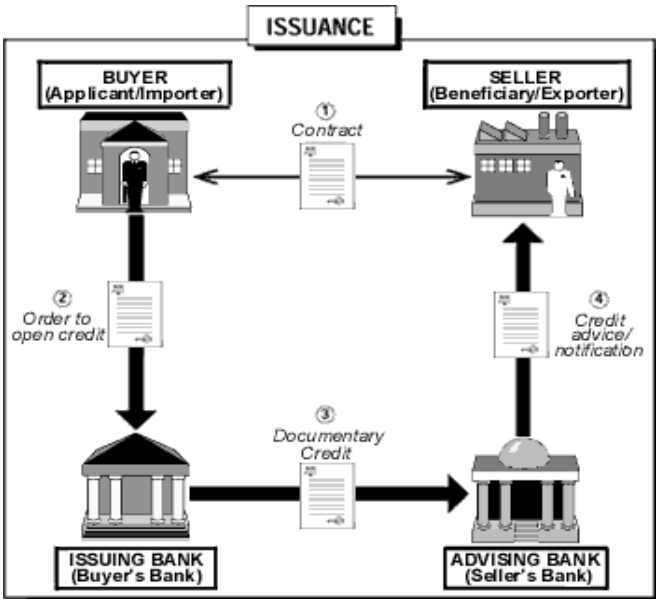
18 UCP Article 14 (d).

Basic Documentary Credit Procedure

75. The documentary credit procedure involves the step-by-step exchange of documents required by the credit[19] for either cash or a contracted promise to pay at a later time. There are four basic groupings of steps in the procedure: (a) Issuance; (b) Amendment, if any; (c) Utilisation; and (d) Settlement. A simplified example follows:

(a) Issuance

76. Issuance describes the process of the buyer's applying for and the issuing bank opening a documentary credit and the issuing bank's formal notification of the seller either directly or through an advising bank.



(1) Contract – The Buyer and Seller agree on the terms of sale: (a) specifying a documentary credit as the means of payment, (b) naming an advising bank (usually the Seller's bank), and (c) listing required documents. The naming of an Advising Bank may be done by the buyer or may be chosen by the issuing bank based on its correspondent network

(2) Issue Credit – The Buyer applies to his bank (Issuing Bank) and the issuing bank opens a documentary credit naming the Seller as beneficiary based on specific terms and conditions that are listed in the credit.

(3) Documentary Credit – The Issuing Bank sends the documentary credit either directly or through an advising bank named in the credit. An advising bank may act as a bank nominated to pay or negotiate (nominated bank) under the credit or act as a confirming bank where it adds its undertaking to the credit in addition to that of the issuing bank. Only in those cases where an advising bank is not nominated to negotiate or confirm the credit is the role of that bank simply an advising bank.

(4) Credit Advice - The advising, nominating or confirming bank informs (advises) the seller of the documentary credit.

(b) Amendment

77. Amendment describes the process whereby the terms and conditions of a documentary credit may be modified after the credit has been issued.

78. When the seller receives the documentary credit, it may disagree with the terms and conditions (*e.g.* the transaction price listed in the credit may be lower than the originally agreed upon price) or may be unable to meet specific requirements of the credit (*e.g.* the time may be too short to effect shipment).

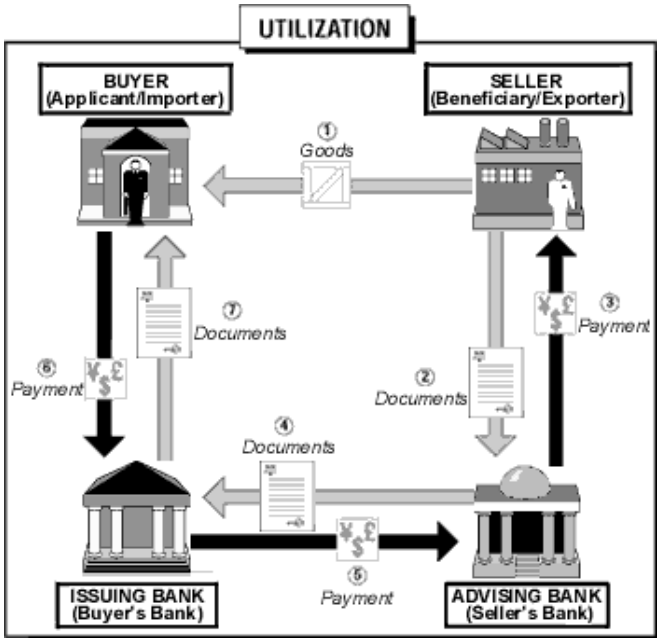
79. If the seller wants to amend the terms prior to transacting, the seller can request these from the buyer. It is at the discretion of the buyer to adopt the proposed amendments and request an amendment to be issued by the issuing bank. An amended letter of credit would be issued by the issuing bank to the seller through the same channel as the original documentary letter of credit.

[19] Title only transfers if a document of title is required under the credit.

Amendments to a letter of credit require the agreement of the issuing bank, confirming bank (if any), and the beneficiary to become effective.

(c) Utilisation

80. Utilisation describes the procedure for the seller's shipping of the goods, the transfer of documents from the seller to the buyer through the banks (presentation), and the transfer of the payment from the buyer to the seller through the banks (settlement). For example:



(1) Seller ships goods – The seller (beneficiary) ships the goods to the buyer and obtains the documents required by the letter of credit.

(2) Seller presents documents to Advising or Confirming Bank or directly to the Issuing Bank – The seller prepares and presents a document package to his bank (the advising or confirming bank) consisting of (a) the transport document if required by the credit, and (b) other documents (*e.g.* commercial invoice, insurance document, certificate of origin, inspection certificate, etc.) as required by the documentary credit.

(3) Nominated or Confirming Bank reviews documents and pays Seller - The nominating or confirming bank (a) reviews the documents making certain the documents are in conformity with the terms of the credit and (b) pays the seller (based upon the terms of the credit) which may mean that payment does not occur until after (5). An advising bank does not normally examine the documents, but simply forwards them on to the confirming or issuing bank for their examination.

(4) Advising, Nominated or Confirming Bank transfers documents to Issuing Bank – The Advising, Nominated or Confirming bank sends the documentation by mail or by courier to the issuing bank.

(5) Issuing Bank reviews documents and reimburses the Nominated or Confirming Bank or makes payment to the beneficiary through the Advising Bank – The Issuing Bank (a) reviews the documents making certain the documents are in conformity with the terms of the credit, under advice to the Buyer that the documents have arrived, and (b) pays the beneficiary through the advising bank or reimburses the nominated or confirming bank (based upon the terms of the credit) and,

(6) Buyer reimburses the Issuing Bank – The Buyer immediately reimburses the amount paid by the issuing bank or is granted a credit by the issuing bank allowing it to reimburse the issuing bank at a later date.

(7) Buyer receives documents and access to goods – The Issuing Bank sends the documents by mail or courier to the buyer who then takes possession of the shipment.

(d) Settlement

81. Settlement describes the different ways in which payment may be effected to the seller from the buyer through the banks. The form of payment is specified in the original credit, and must therefore be accepted by the seller. The following are common settlement methods:

- The Sight Credit (Settlement by Payment) – In a sight credit, the value of the credit is available to the exporter as soon as the terms and conditions of the credit have been met (as soon as the prescribed document package has been presented to and checked by the issuing, nominated or confirming bank and found to be conforming to the terms and conditions of the credit) or once the advising bank has received the funds from the issuing bank (unconfirmed). Payment may be affected directly by the nominated bank or confirming bank upon their examination of the documents and they are reimbursed for that payment by the issuing bank.
- The Usance Credit (Settlement by Acceptance) – In a Usance Credit, the beneficiary presents the required document package to the bank along with a time draft drawn on the issuing, nominated or confirming bank, or a third bank for the value of the credit. Once the documents have been found to be in order, the draft is accepted by the bank upon which it is drawn (the draft is now called an acceptance) and it may be returned to the seller who holds it until maturity.
- The Deferred Payment Credit - In a deferred payment credit the issuing bank and/or the nominated or confirming bank accepts the documents and pays the beneficiary after a set period of time. The issuing, nominated or confirming bank makes the payment at the specified time, when the terms and conditions of the credit have been met.
- Negotiation is the term used where a bank other than the issuing bank agrees to advance funds or discount drafts to the exporter before the issuing bank has paid. Discounting an accepted draft has the same effect.

82. A letter of credit will normally require the presentation of several documents including a Draft[20], Commercial Invoice, Transport Document, Insurance Document, Certificates of Origin and Inspection, Packing and Weight Lists. Annex 7 provides some detail on the kinds of information that may be contained in each of these documents.

Export Financing

83. Through a variety of sources and structures, exporters can obtain financing (working capital) to facilitate their trading activities and bridge the time from which they spend money on an export activity (for example, securing an export order) until the moment of payment. Working capital financing can be applied to the manufacture and development of goods prior to shipment, or be applied to business activities following shipment but prior to receipt of payment.

84. The following section briefly describes the following types of trade finance:

(a) Direct Loans or general credit facility.
(b) Note Purchases (also known as forfaiting).
(c) Factoring.
(d) Guarantees.

(a) Direct Loans

85. Acting independently or as part of a syndicate, financial institutions and other entities offer loans to facilitate export transactions. There are two basic types of loans. Buyer credit involves an arrangement to finance exports generally related to a specific contract. Supplier credit transactions are structured to provide the exporter with the ability to provide its buyer with extended payment terms. These loans may also be backed by export or buyer credit guarantees provided by the governments of the countries involved.

[20] Drafts are not always required by a credit.

(b) Note Purchases / Forfaiting

86. Financial entities can purchase promissory notes or bills of exchange issued by foreign buyers to exporters for the purchase of goods and services, freeing up cash for the exporter.

(c) Factoring

87. In international trade, factoring is the purchase or discounting of a foreign account receivable for cash at a discount from the face value. While factoring is primarily undertaken by non-bank financial entities, banks may participate in factoring if the exporter has obtained accounts receivable insurance that guarantees the liquidity of the accounts.

(d) Guarantees

88. Guarantees are provided to or by financial institutions on behalf of exporters. Two popular types of export guarantees are pre-shipment and performance guarantees.

- *Pre-shipment Guarantees* encourage other financial institutions to advance pre-shipment loans to fund the upfront costs associated with an export contract.
- *Performance Guarantees* providing contract performance cover to buyers on behalf of the exporter.

89. It should be noted that both guarantees and standby letters of credit may be used in various ways to generate the purchase or sale of goods or services. In those cases many of the documents outlined in the steps above may or may not be utilised as part of the transaction.

Transaction risks for importers vs. exporters

90. The graphic below shows the different types of core trade finance products available, and positions each in terms of transaction risk, from the importer's and from the exporter's perspective. Importers and exporters consider these transactional risks in conducting legitimate trade transactions. The product choice will depend on the level of trust between the buyer and seller. Proliferators will also consider transactional risks when deciding how to sell/purchase and receive payment for/send payment for goods.

Risk Management and Customer Due Diligence (CDD)

91. All financial institutions involved in trade finance, no matter what their business line, have both commercial incentives and legal obligations to conduct CDD and potentially account monitoring. But the nature and depth of CDD undertaken, and how it is organised, can vary significantly between financial institutions, from transaction to transaction and based on the regulations in the local jurisdiction.

92. Some elements of CDD are universal: CDD processes include the identification and, in a risk-based manner, the verification of the identity of customers and reasonable measures to identify and verify the identity of beneficial owners, obtaining information on the purposes and intended nature of the business relationships and conducting ongoing due diligence. Of these components, the identification and verification of identity of customers are requirements that need to be completed in all situations.

93. The implementation of other components of CDD is variable, depending on the risks associated with the transaction and the legal requirements in the jurisdictions involved. A reasonably implemented risk-based approach may allow for a determination of the extent and quantity of information required, and the mechanism used to meet these standards.[21] The CDD process that a financial institution will perform before they act or an international trade transaction will be dependent upon a number of factors, these include:

- Specific regulatory requirements or guidance to which it is subject.
- The role which it will be required to perform in the transaction.[22]
- The institution's own exposure to financial or reputational risk through the transaction.
- Its assessment of the risk posed by the country in which the instructing party is based or operates.
- Its assessment of the risk nature of the underlying trade business (*i.e.* the goods, products or services being traded.).
- Whether any other higher risk parties appear to be involved as owners or intermediaries.

94. Appropriate CDD measures, relying in particular the factors above, are a critical first step for a financial institution to mitigate the risk of proliferation financing.[23]

95. Where the financial institution is granting any form of credit to the party from whom instructions are expected, then more extensive information would be requested as part of the CDD process, focused particularly on the client's financial standing, credit risk, and ability to repay. Equally where the financial institution assesses a customer to be higher risk then it may well employ "enhanced CDD" to the extent that a risk-based approach is allowed by the relevant regulatory authority.

---

21 FATF (2007)

22 In a letter of credit transaction, for example, financial institutions view different parties in the transaction as their customers for CDD purposes. As an issuing bank the applicant of the credit will be their customer, as an advising, nominating or confirming bank the issuing bank will be their customer. In some cases the beneficiary of a credit may be the customer of the advising, nominated or confirming bank and they may have done CDD on that beneficiary, however in most transactions the banks look to the issuing bank as their customer.

23 Customer Due Diligence is, depending on the type of internal organisation, conducted at the relationship management area rather than in the trade operations. This area may be a specific relationship manager, a relationship management group, a client coverage area, a compliance group or other area designated by the bank. Depending on the bank's internal policies and procedures the actual point of review, investigation, notification, determination, decision or reporting may vary.

96. Each financial institution has its own organisational structure for conducting CDD, an element of which may include outsourcing to employees that are located in different countries and undertake transactions that are not local to them. The same obligations for CDD apply no matter what arrangements are in place for implementing them.

Correspondent Banks

97. In the context of trade finance it is important to note that no one financial institution will undertake all aspects of CDD related to a specific transaction; and as discussed, different financial institutions will be responsible for individual elements depending on their role.

98. Since financial institutions in foreign countries do not necessarily have a presence in all countries or a relationship with all financial institutions, financial institutions are sometimes used as correspondents in the payment chain. Payment transactions are ordered in a foreign country, transit through one or more financial institutions and finally are received by the beneficiary located in a second foreign country. Such transactions may also occur when designated financial institutions in a country are prohibited from conducting financial transactions with institutions from another country, and therefore a correspondent financial institution in a third country is used as an intermediary.

99. With banks undertaking international financial transactions for themselves and for their customers in jurisdictions where they have no physical presence, correspondent banks must rely on the respondent bank's due diligence and monitoring controls. However, a financial institution would not normally initiate a transaction on behalf of a party it does not know.

100. A primary objective for any financial institution when agreeing to accept instructions from a correspondent will be to ensure that the correspondent conducts satisfactory CDD on its own customers. Establishing a correspondent relationship might involve an understanding of the customer and documenting that the associated CDD obligations are undertaken.

101. As part of due diligence which is performed on a potential correspondent it is critical for the financial institution to agree and establish the types of accounts, if any, they will operate and the means of exchanging authenticated (bank to bank) messages. These mechanics are necessary for the handling of international trade transactions.

102. Although many financial institutions have procedures to ensure that the respondent institution's controls are adequate to mitigate the risk of money laundering and terrorist financing,[24] most do not specifically assess whether a respondent institution has adequate controls to detect and prevent proliferation financing. Such assessments may rely on information that is not currently reviewed as part of correspondent banking procedures[25], such as information related to a respondent financial institution's trade finance controls or its association with a state proliferator.

103. For more information in the risks related to money laundering and terrorist financing by correspondent banking, see the FATF Report on Money Laundering Typologies 2001-02.

Reviewing and monitoring transactions

104. Financial institutions manage a wide range of risks in the processing of international trade business. In practice risk management will normally include credit risk, including cross border or country risk, and the operational risk. Exposure to money laundering and terrorist financing form part

[24] For more information in the risks related to money laundering and terrorist financing by correspondent banking, see FATF (2002).

[25] Customer Due Diligence for correspondent banks is usually conducted in a centralised relationship management area within financial institutions. This area may be a specific relationship manager, a relationship management group, a client coverage area, a compliance group or other area designated by the bank.

of the overall risk management process. Such risk management processes will influence what arrangements are in place for reviewing documents and monitoring transactions.

105. If there is potential exposure to proliferation financing, financial institutions consider whether parties involved in payments are named in UN or relevant local sanctions lists or are considered to pose other risks. For example, if the transaction is subject to any export licensing requirements or trade embargoes.

106. All financial institutions are expected to have a form of financial transaction monitoring in place. The form of monitoring varies between (and within) institutions, including automated or manual checking, or a mixture of both, in order to monitor the transactions handled. This may involve reviewing customers' accounts or patterns of activity.

107. The information presented to a financial institution will vary according to the nature and complexity of the transaction. The extent to which this information needs to be verified will also vary. In general a financial institution will normally examine trade instructions received to establish whether:

- They have CDD on the instructing party;
- The instruction is consistent with what would normally be expected from the instructing party.

108. Financial institutions will also check the documents presented to them in accordance with relevant International Chamber of Commerce (ICC) rules and accepted banking practice. Furthermore, where letters of credit are concerned, the vast majority of transactions will be subject to commercial expectations and ICC standards which determine the time allowed for processing the various stages during the lifespan of the letter of credit.

109. It should be noted that in processing trade finance transactions, financial institutions deal with documents, not the physical goods to which they relate. Any physical inspection of goods will only occur in exceptional circumstances and would tend to relate to wider credit issues where the underlying goods are pledged as security. However, commercial parties to the underlying transaction may use other agencies to independently verify a particular shipment. Consequently inspection and verification measures in relation to physical goods are relatively rare as the vast majority of trade transactions are conducted legally between parties who willingly disclose all the information needed to conclude such transactions.

110. However, some existing transaction monitoring controls currently employed by financial institutions may result in the detection of proliferation finance. Financial institutions may currently detect transactions associated with proliferation activity by screening transactions against proliferation-related United Nations sanctions lists, such as the list of individuals and entities designated pursuant to S/RES/1737 (2006), or other local proliferation sanctions lists, to detect the presence of an individual or entity involved in proliferation in the transaction. In some cases, financial institutions may also attempt to verify whether a transaction is subject to any export licensing requirements or trade embargoes by requesting additional verification or documentation, such as export control licenses.

Identifying Suspicious Activity

111. There are several points in the trade finance cycle at which financial institutions could potentially detect suspicious activity if provided sufficient information by their customer and/ or relevant government authorities. For example, CDD processes can establish risks: whether a customer is a producer or buyer of goods or services which the institution regards as high risk, including ongoing monitoring of transactions, as described above, can also identify activity which may be intended to obscure the ultimate counterparties to the transaction or the eventual destination of goods.

If suspicious activity is suspected, the role of financial institutions is not to determine the underlying criminal activity; but to report suspicious activity in line with their domestic legal framework and relevant local regulations (including data privacy laws).

112. Financial institutions rely on export control regimes and customs authorities to police the activities of exporters which are its customers, in part as financial institutions are unlikely to have staff technically qualified to understand whether an apparently legitimate or innocent trade transaction is subject to such a control or whether in any event it is actually part of a proliferation finance scheme.

113. The ability of financial institutions to detect suspicious activity in their trade finance operations is constrained by several factors:

- The description of goods may be too vague and/or technical for a financial institution to determine if it is proliferation-sensitive or not.
- The fragmented nature of the trade cycle and the involvement of different financial institutions in a single transaction.
- The systems used to monitor transactions and volume of transactions will also influence the ability to review information and identify potential suspicious activity. Even where only a single financial institution is involved in a transaction, the organisational complexity of the institution may mean that no one individual examines all elements of CDD and monitoring associated with a transaction. This can make it difficult to identify complex or large-scale patterns which might indicate suspicious activity.
- The detection of fraud or money laundering by financial institutions is based on well-understood indicators and profiles, developed from a substantial case history. Proliferation financing has only recently garnered attention and consequently has not been incorporated into financial institutions' due diligence processes – whether through profiles or staff training programmes - to the same degree. Indicators or "red flags" invariably only become evident after the event when a transaction has already been completed.
- The availability of specific information regarding suspicious or high-risk entities is critical, as the factors noted above limit financial institutions' capacity to detect generic patterns associated with proliferation financing. Therefore, the ability of a financial institution to detect and identify potential proliferation financing is dependent on clear guidance or specific intelligence provided by authorities.

Money Services Businesses

114. Apart from supervised payment services, illegal, informal or registered money services businesses or alternative remittance systems (*e.g.* Hawalas) can also be used to transfer funds. Entities involved in proliferation financing activity may also use this sector if there is strong detection or monitoring measures in place for financial institutions in the formal sector.

Authorities relevant for export control

115. A jurisdiction's export control policy is usually implemented by a number of agencies that have varying responsibilities. The main authorities, which contribute to the implementation of the export control policy, are as follows:

- Licensing authorities
- Law enforcement and customs authorities
- Intelligence services (as a part of their general duties)

116. In accordance with their specific responsibilities, licensing authorities, law enforcement and customs authorities and intelligence services each play a major role in the prevention of proliferation. Licensing authorities decide whether the export of an item is subject to licensing or is exempt. They are also responsible for making licensing decisions – and for informing exporters of the decisions they have made. Normally, in adherence to their international obligations under relevant multilateral arrangements, jurisdictions will require an export licence application for controlled goods.

117. Items covered by national and international lists usually range from weapons, ammunition and related production facilities via material, plants and equipment for nuclear, biological and chemical purposes, high-grade materials, specific machine tools, electronic equipment, computers, telecommunications up to specific chemical units and chemicals. In addition to the licensing requirements for listed items, there are often licensing requirements for non-listed items depending on the use they may be put to. Experience shows that unlisted items are playing an increasing role in proliferation activities. Export control systems may incorporate "catch-all" clauses, to restrict trade in such items that in circumstances could be used for proliferation purposes. However, these catch-all clauses are usually only triggered when the destination and end-user is known to be of proliferation concern, unless there is evidence that the destination / end-user has established front companies elsewhere to try and circumvent controls. In cases concerning sensitive jurisdictions, technical assistance as well as the trafficking and brokering of items particularly from 3rd countries to those destinations may also be subject to additional controls.

118. National export control regimes usually provide that the exporter is liable for compliance with the restrictions and licensing requirements in force. Therefore, licensing authorities often reach out to industry in order to make them aware of their responsibilities. Ideally, licensing authorities and exporters work together to ensure compliance with this legislation.

119. Law enforcement and customs authorities monitor and control trade in order to detect deliberate offenders who illegally export or divert strategic proliferation-sensitive goods, software and technology. Law enforcement and customs authorities decide whether the exporter or importer wishing to export, import or transit their jurisdiction respects national and international regulations. Focus is most often placed on the verification of exports through selective risk-based examination. In the case of exports to jurisdictions of concern, efficient systems will often require all exports to be examined in this way. Surveillance procedures are used in the first instance to identify targets using documentation provided prior to export. The assessment of this information may lead to the targeting of particular shipments for physical examination. In some instances customs authorities may regularly decide to subject all cargo being shipped from a particular port or airport to such a destination to a physical examination.

120. Law enforcement and customs authorities are in a position to examine whether the description of the items in the export license match the items actually being exported. Customs authorities have the ability to physically inspect the goods, use their expertise and that of others within government with specialist knowledge of dual-use and other proliferation sensitive goods, to decide if export control requirements have been met.

121. If available, an intelligence service will provide specific information to enhance the monitoring by licensing and customs authorities. The intelligence function is a critical component for collecting, evaluating, collating, analysing and disseminating information on actual, suspected and potential export violations and trends. Intelligence is crucial in identifying suspected or known violators and ultimately unravelling complex networks. Intelligence is important in uncovering illegal procurement tactics such as diversion through false description of goods or the use of front companies. Intelligence is also used to detain and seize goods and may in certain circumstances be used by prosecutorial authorities. Provision of information on proliferation activities by intelligence is therefore a key element to prevent proliferation.

122. The exchange of information between customs and the wider export control enforcement community such as law enforcement, defense and export licensing authorities is imperative for an effective export control system. Licensing and customs authorities are in the best position to detect non-compliance with export control requirements, including criminal acts such as forgery of export documents and other related materials. However, financial information may provide another intelligence stream to supplement or reinforce existing channels in the fight against proliferation.

3. CASE STUDIES

123. The following 18 case studies illustrate some common techniques used by proliferators to transfer and export technology, goods, services or expertise that contribute to the proliferation of weapons of mass destruction.

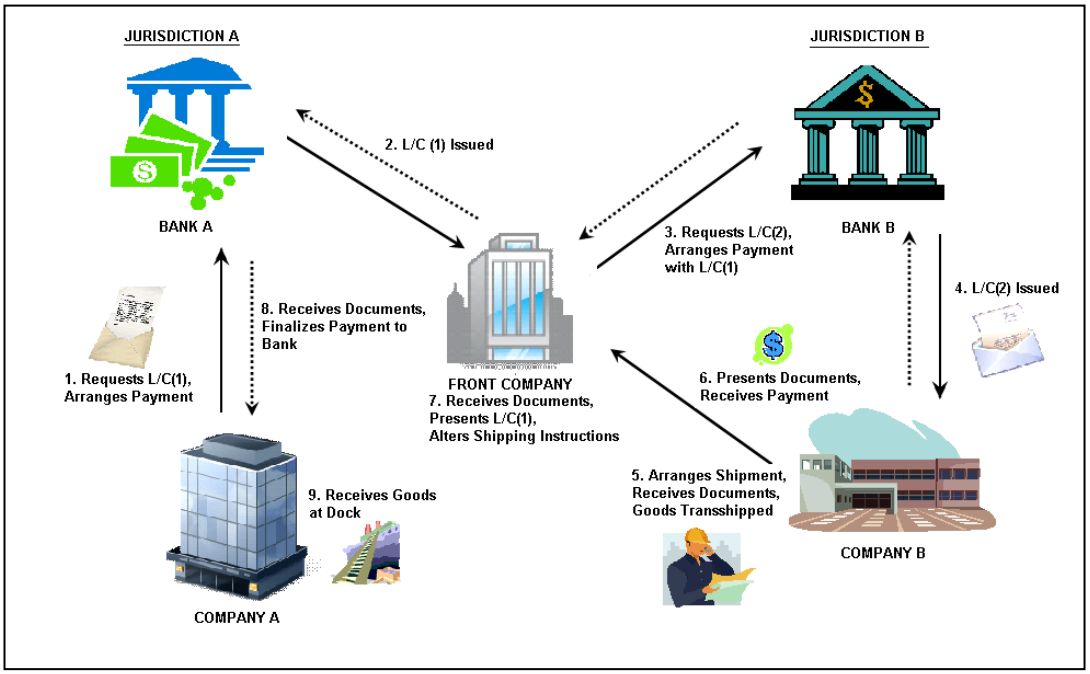
124. The cases also indicate that the international financial system is being used to facilitate proliferation. In many of these cases proliferators use letters of credit to settle trade in sensitive goods. In some there are more simple examples of wire transfers and large cash transactions that are used to move funds in efforts to facilitate proliferation. Annex 3 contains additional cases with no proven link to the financial sector, but that provide useful context.

125. While the majority of the cases mentioned in the report illustrate traditional means of trade financing such as letters of credit, there is no evidence that suggests that these financial instruments are more susceptible to potential abuse by proliferators. It would have been very difficult for the financial institution to detect proliferation financing based on evidence provided in the cases that illustrate links to the international financial system.

126. It is likely that proliferation background is more difficult to detect if other financial instruments, such as clean payments, are used. These cases studies describe features of the transactions, which were discovered through subsequent investigation, which would not at the time have provided a meaningful basis for financial institutions to report suspicions. They nevertheless can illuminate the financial features associated with the underlying acts of proliferation.

Cases involving letters of credit

Case 1: Letters of credit and front company



1. In **Jurisdiction A**, **Company A** requests that Bank A draw up Letter of Credit (1) and arranges payment for goods from a **Front Company**.
2. **Bank A** issues Line of Credit (1) to the **Front Company**.
3. The **Front company** then requests Letter of Credit (2) from Bank B in Jurisdiction B and arranges payment using Letter of Credit (1).
4. **Bank B** issues Letter of Credit (2) to Company B located in Jurisdiction B.
5. **Company B** arranges for shipment of goods to Front Company, arranges documents and transhipps goods.
6. **Company B** presents documents to **Bank B** and receives payment.
7. Front Company receives documents from **Bank B**, presents for Letter of Credit (1) and alters shipping instructions.
8. **Front Company** gets documents and finalizes payment to **Bank A**.
9. **Company A** receives goods at port.

Source: United States.

Case 2: Purchase of magnets through front companies and intermediaries

A proliferator set up front companies and used other intermediaries to purchase magnets that could be used for manufacturing centrifuge bearings.

False declaration
Front Company 1 signed documents with the foreign jurisdiction's manufacturing company concerning the manufacturing and trade of magnets, however, it was not declared in these documents, nor was it detected by authorities, that these components could be used to develop WMD.

Diversion
The magnets were transhipped through a neighbouring third jurisdiction to Front Company 2. This jurisdiction was typically used as a "turntable" for goods *i.e.* goods are imported and re-exported. The proliferator used an intermediary to arrange for the import and export of the magnets in this third jurisdiction. The intermediary had a sound understanding of the jurisdiction's export and commercial controls and used this knowledge to conceal the nature of the goods.

Using banks with poor AML/CFT controls
The intermediary also conducted financial transactions to settle trades. The intermediary had accounts with several banks in the third jurisdiction and used these banks to both finance the acquisition of goods and launder the illegal funds used for these transactions. A combination of cash and letters of credit were used to pay for the trade of the magnets, which totalled over 4 million USD.

Case 3: The Thyratron case in Halmstad

In the spring of 1999 the Swedish Customs found out that a person (P) in Halmstad, via a pizzeria, had exported a thyratron to Iran that was classified as a strategic product and therefore was subject to export control. After an audit and interview with P, suspicions grew that it was a question of smuggling.
A search was made in the apartment of P and a seizure of a thyratron was made at Arlanda Airport. It was on its way to a jurisdiction of proliferation concern. Earlier another thyratron was already exported.
P stated that he had been contacted by his cousin in the jurisdiction of proliferation concern in the spring of 1998 who worked at a university in that jurisdiction. The cousin wanted P to get a thyratron to the university. The producer in the United States directed P to the branch in Sweden. P stated he would use it as a degree project at a Swedish university. He forged an end user statement in order to buy the thyratron.

P paid the company 22 000 SEK and delivered the product to Halmstad. P contacted a forwarding company in order for them to export the thyratron to a university in the jurisdiction of proliferation concern. P wrote a pro forma invoice in the name of the pizzeria. The buyer was the university in the jurisdiction of concern. The thyratron was then exported.

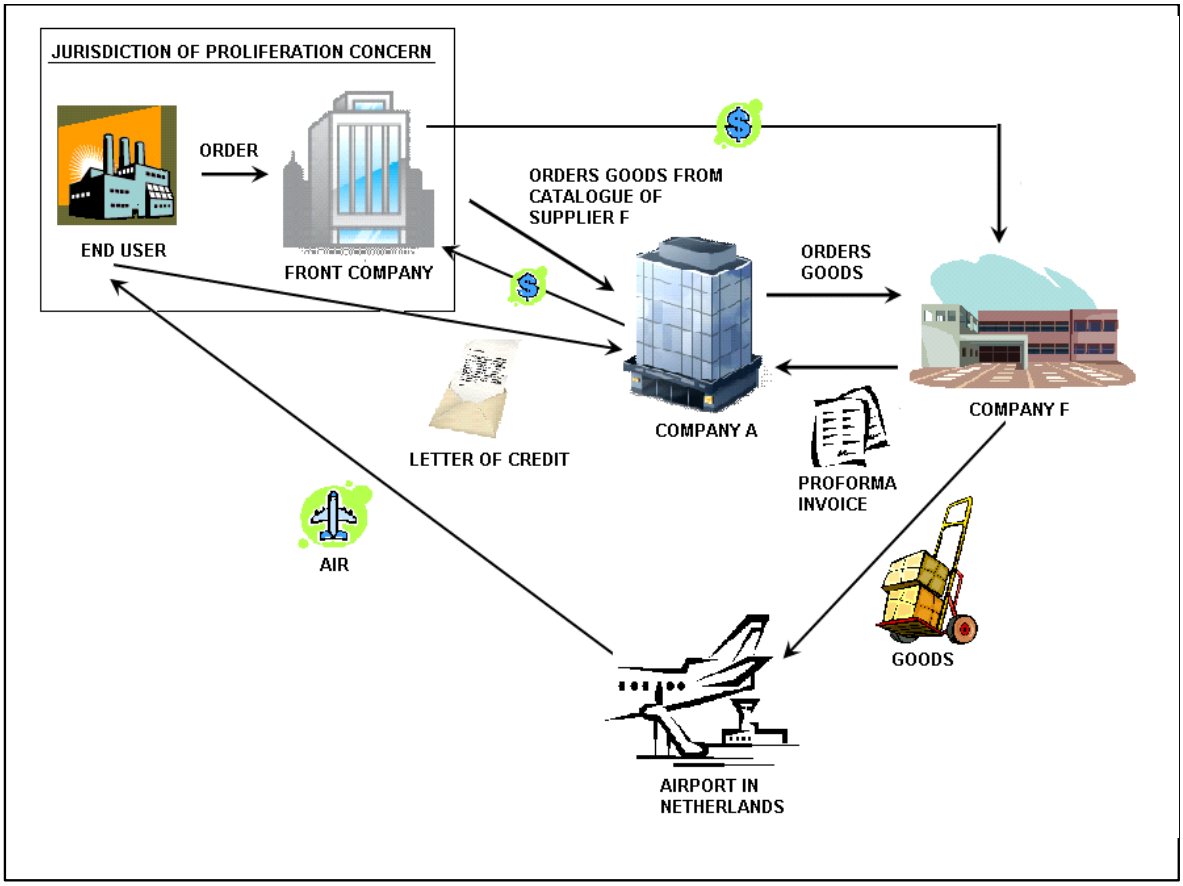
In November 1998 P ordered one more thyratron after an order from another university in the jurisdiction of concern. P paid the delivery and in 27 May 1999 the thyratron was delivered to P in Halmstad.

The forwarding company got an assignment to send it to the jurisdiction of concern. The product was not exported because P had not paid the forwarding company for the cost of the freight terminal. P had the impression that Iran Air would once again be responsible for all expenses like last time.

During the preliminary investigation the Swedish Customs found documents like dispatch notes for payment from abroad, inter alia, from the jurisdiction of proliferation concern.

Source: Sweden.

Case 4: Letter of credit and front company



A **Front Company** in a Middle-Eastern jurisdiction of proliferation concern, used the following method in order to obtain goods. The **Front Company** represents several large companies located in the jurisdiction of concern that are also established in Europe and other Western countries. The **Front Company** stands surety for the delivery of the needed goods to the companies in the jurisdiction of concern and executes eventual after sales services. The **Front Company** has the first contact with the true **End User** in the jurisdiction of concern.

The **End Users** order the needed goods from the **Front Company**. The **Front Company** orders the goods of the different Western companies from " **A**", that is to say, only on the basis of the article numbers in the catalogue and informs "**A**" about the supplier the goods have to be bought from. At request a L/C is opened in favour of "**A**". It also happens that "**A**" itself has to look for a supplier on the basis of an article number or article description. This happened worldwide. "**A**" orders the goods after having received the order (pro-forma invoice) from **F** and the L/C from the Middle Eastern client or end user. The goods that were bought outside the Netherlands came in transit to the airport of Schiphol and were delivered at a forwarding agent. The goods were sent from Schiphol airport to the jurisdiction of concern. "**A**" did not see the goods itself.

"**A**" placed the payment received from the end users through the L/C at the disposal of **the Front Company** by means of a bank account with a Dutch bank and after deduction of a commission. The suppliers were paid by the **Front Company**.

Source: The Netherlands.

Cases 5 to 8: State-owned entities

Three known instances of procurement for WMD programmes routed through state-owned banks whose overseas branches and correspondent banking partners facilitate business with foreign suppliers:

Case 5: Company A, a well-known front company for one of the entities responsible for country Z's ballistic missile programme, in order to buy 'special items' from country X, opened a Letter of Credit at a branch of a state-owned bank in Z's capital. The London branch of the same state-owned bank was named as the Advising Bank and in due course transferred payment to the supplier of the 'special items'.

Case 6: A branch of the same state-owned bank in another European capital was instructed to transfer over $100,000 to the account of a company in country U, a near neighbour of Z and a known diversionary destination. The company is owned by a well-known procurement agent who asked for the money to be transferred to a specific UK bank in order to cover the purchase of goods associated with a Letter of Credit opened with a branch of the same state-owned bank in Z's capital.

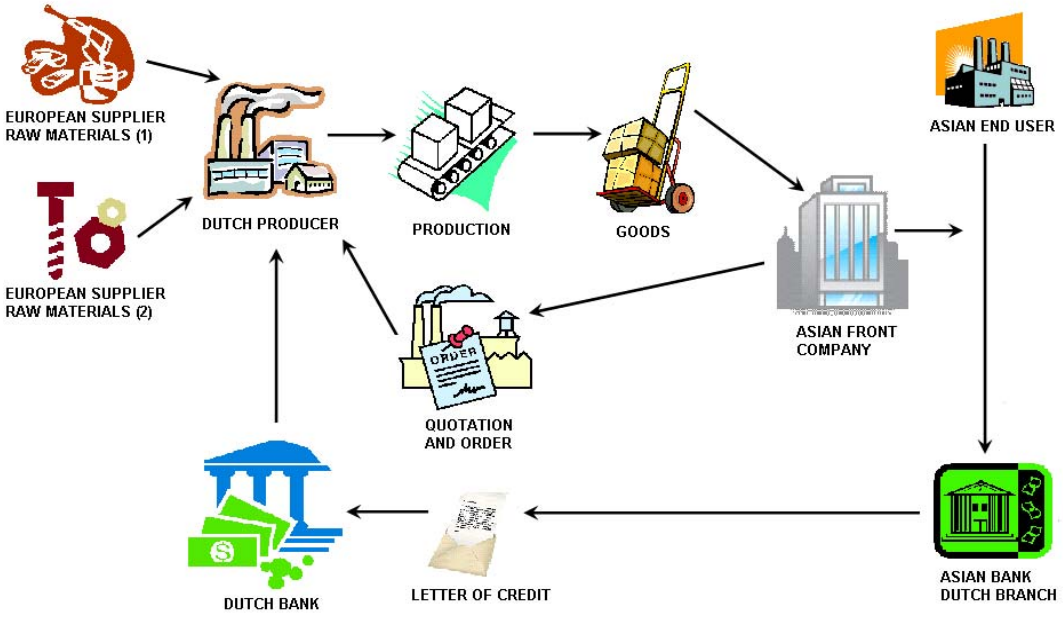
Case 7: In country Y, a state-owned bank known as the X Commercial Bank is known to have close relations with country Y's main arms exporters. In the past it has routed transactions through European banks. Recently it has sought correspondent bank relationships with several banks in a large Asian country, seeking to open Euro and US dollar accounts.

Use of a UK bank in a Diversionary Destination

Case 8: Trading company B in country Z deals in laboratory test-equipment for university and research centres and also for the energy sector. It is known to have procured dual-use items for country Z's WMD programmes.
Company B has bank accounts in a number of countries and has a UK account with a UK bank in country U, a known diversionary destination.

Source: United Kingdom.

Case 9: Infringement of export controls and Letter of Credit



This case concerns the infringement of export controls. Strategic goods were exported without the obligatory authorization. The Dutch producer was contacted by a Front Company, in an Asian jurisdiction of proliferation concern, to provide certain strategic goods, carbon fiber with special characteristics. The Dutch producer ordered the materials from two suppliers in other European countries. Payment took place through a Letter of Credit. The bank of the true Asian end user actually issued the letter of credit to the Dutch bank of the producer.

Finally the prosecutor decided to no longer pursue this suspect, since during the pre-trial the testimony of the expert stated that after the specific production performed by the Dutch producer, the end result of the carbon fibre no longer contained the characteristics for which it qualifies as a strategic good.

Source: The Netherlands.

Case 10: ASHER KARNI

Overview
Asher Karni was the principal in an import/export business known as Top-Cape Technology. In July 2003, agents from the U.S. Commerce Department (Commerce) and the Department of Homeland Security (DHS), U.S. Immigration and Customs Enforcement learned that Karni was in the process of acquiring 200 triggered spark gaps from a company in Massachusetts and that he planned to have the triggered spark gaps sent to Top-Cape in South Africa, from where the items, at his instruction, would be re-exported to Pakistan. Triggered spark gaps are high-speed electrical switches that are capable of sending synchronized electronic pulses. They can be used as detonators of a nuclear device.

Investigation and outcome
U.S. export laws and regulations require the issuance of a license for the export of triggered spark gaps to Pakistan. At the request of investigating agents, the manufacturer agreed to disable the triggered spark gaps before they were shipped to Karni's company in South Africa through a broker.

In October 2003, Karni's company illegally sent the triggered spark gaps to Islamabad, Pakistan via Dubai, UAE. Karni was arrested on Jan. 1, 2004, in Denver, CO, when he arrived for a ski vacation. He was detained pending trial. In September 2004, Karni pled guilty and cooperated. Karni acted as a middle man for Khan, a Pakistani, in illegally shipping both triggered spark gaps and oscilloscopes to Pakistan. Khan was indicted in April 2005. Karni received credit for his cooperation and was sentenced to 36 months in prison in August 2005.

Financial elements
The triggered spark gaps shipment was financed via letter of credit opened by Khan at the National Bank of Pakistan with the Standard Bank of South Africa.

Source: United States.

Case 11: Thiodiglycol

US Immigration and Customs Enforcement, Office of Investigations, through its predecessor agency the United States Customs Service, conducted an investigation into the illegal export of thiodiglycol, which is a precursor for sulfur-containing blister agents found in Mustard Gas. Thiodiglycol is a Chemical Weapons Convention schedule 2 chemical used in the production of sulfur-based blister agents such as mustard gas.
http://en.wikipedia.org/wiki/List_of_Schedule_2_substances_%28CWC%29

The investigation had revealed that Alcolac International, a United States based company, was shipping large amounts of thiodiglycol out of the Baltimore Port of Entry to several transshipment countries with a final destination to Iran. During the investigation, agents encountered a large shipment of thiodiglycol with a declared final destination to a "Far East country." Agents substituted the chemical with water and tracked the shipment from the United States through two transshipment countries and ultimately to Iran.

The investigation led the agents to multiple bills of lading for shipments to other companies with one marked "Transshipping is allowed." A review of the financial documents and related bank records revealed multiple Alcolac Letters of Credit noting preference for immediate payment in cash. Agents also discovered that subjects attempted to open new accounts under shell companies in the US to facilitate the exportation through a letter of credit.

Alcolac International pled guilty to two counts related to the illegal export of thiodyglycol. As a result the company was fined $437,594. Several additional individuals who took part in the illegal exportation of thiodyglycol were also found guilty.

Source: United States.

Cases involving other payment methods such as wire transfers and cash transactions

127. The following cases show how proliferators use wire transfers and cash transactions to support their activities. Case 13 also provides an example where a proliferator under-valued shipment in efforts to disguise the true nature of the goods being transferred.

Case 12: Sponsoring of students by a known WMD procurement entity

Voluntary information received from a Canadian intelligence agency indicated that **Individual 1**'s education in Canada was sponsored by a known WMD procurement entity located in **Country X** and that **Individual 1** was possibly a procurement agent.

Analysis of FINTRAC's information revealed that **Company A**, located in **Country X**, sent Electronic Funds Transfers (EFTs) to **Individual 1** and three other individuals (**Individuals 2, 3 & 4**). For some of the EFTs, the transaction was noted to be for "cost of study". All EFTs were sent to personal bank accounts and totalled about $140,000 US.

Other than all receiving funds from **Company A**, no apparent connections between the four individuals were identified. **Individuals 1 & 2** were found to be located in two different Canadian provinces, while no address was found for either **Individual 3** or **Individual 4**.

During the same period, a Large Cash Transaction Report (LCTR) received from a depository financial institution indicated that **Individual 2** also deposited about $10,000 US into his/her personal account. The LCTR further indicated that **Individual 2** was a student.

It is unknown why **Company A** would be funding the education of these four individuals. However, the research field in which **Company A** was involved indicated a possible association to a WMD program. In addition, at the time, **Country X** was known to sponsor students who agreed to study overseas in science and engineering programs. It was suspected that **Country X**'s objectives were to gain knowledge and expertise in some areas that could be useful for its WMD program.

Source: Canada.

Case 13: AMLINK

Overview

R. David Hughes was the president of an Olympia, Washington-based company, AMLINK. AMLINK was a medical supply company, but was involved in export of commodities that did not match its business profile.

In June 1996, the U.S. Customs Service began an investigation of the exportation of nuclear power plant equipment by Hughes and AMLINK from the Port of Seattle to Cyprus. According to a confidential source, the nuclear power plan equipment was to be shipped from Cyprus to Iran via Bulgaria, in violation of the U.S. embargo on Iran.

Investigation details

The equipment in question was nuclear power plant equipment that had been purchased in an auction by a Washington company, LUCON. The origin of the equipment was a Washington-based power company that led a consortium in the 1970s to develop a nuclear power station in Burlington, Washington. The power plant was cancelled in 1983, and the equipment was sold. Hughes worked with another individual, a Lebanese national with permanent U.S. resident status, Habib T. Abi-Saad to purchase the equipment from LUCON, export it to Cyprus and attempt to find buyers for the equipment. Hughes used a freight-forwarding company to assist in arranging the shipment.

The equipment was transported in three shipments from Seattle in 1995, which transited Rotterdam, before arriving in Cyprus. Although the documentation regarding the shipment did not indicate it included nuclear equipment, Cypriot authorities who inspected the cargo determined that it was nuclear-related equipment. The equipment was controlled by the Nuclear Regulatory Commission and required a license to export. Hughes did not request or receive such a license. Further, documentation/bills of lading were marked “for re-export only,” but there was no end destination or consignee was provided and the exporter provided vague/incomplete information to the freight forwarder on commodities involved.

Hughes was indicted and convicted of export of nuclear equipment without a license.

Financial elements

Payment was made via wire transfer from Abi-Saad into Hughes U.S. bank account; Hughes then paid for the equipment with a cashier’s check. The declared value of the shipment was under-valued with ten containers being exported with a declared value at $20,000, even though it would cost $2,000 to ship an empty container out of the country.

Source: United States.

Case 14: Use of financial information in a case of an attempted procurement

Information sent to the Canadian FIU identified individuals and entities that were suspected of being involved in the procurement of technology that could be possibly used for WMD programs.

It was alleged that **Company 1**, located in Country Z, received a request from Foreign **Individual X** for price information regarding a magnetostrictive sensor instrument for guided wave research, and declared Foreign **Company X** as the end user. **Company 1** informed Foreign **Individual X** that it could not sell the equipment due to Country Z's export restrictions. The equipment utilizes wave propagation and acoustic emissions to detect defects in piping systems. It is not specifically export-controlled, however, according to its design engineers it could have both nuclear and military applications. The following day, **Company 1** received a similar request for the same equipment from **Individual A** as a representative of **Company A**, located in Canada.

Company 1 noticed that **Company A** was copying Foreign **Individual X** on a series of e-mail exchanges.

Foreign **Individual Y**, the head of Foreign **Company X**, had created **Company A** and was listed as its General Director, while other Foreign **Company X** personnel occupied other executive positions within **Company A**.

Financial Elements
Analysis of the Canadian FIU's information revealed that a short time after that inquiry by **Individual A**, Foreign **Company X** ordered EFTs totalling over $100,000 US for the benefit of **Company A** over a period of about two months. The total amount appeared to cover the controlled item price plus an additional amount, possibly a commission for **Company A**'s services.

A few weeks later, **Company A** ordered one EFT, which appeared to have been an initial deposit, for the benefit of **Company 1**. One month later, **Company A** ordered another EFT for the benefit of **Company 1**, which covered the balance of the guided wave equipment price.

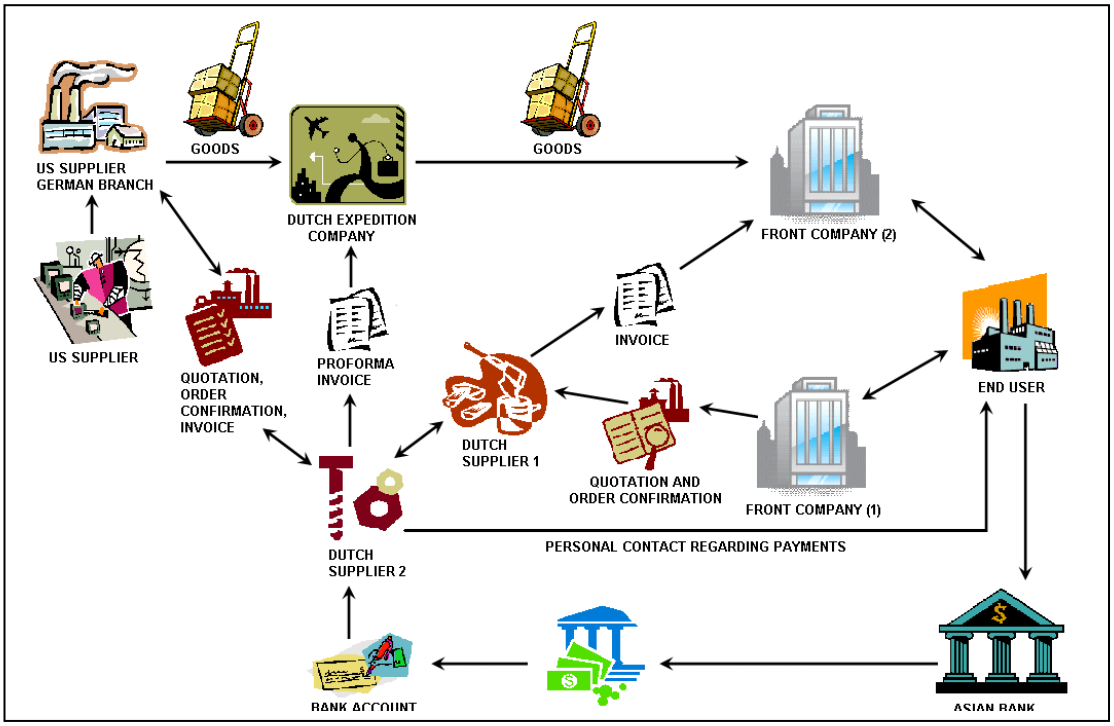
Investigation
An investigation revealed that Canadian **Company A** had been established by Foreign **Individual Y** specifically to market foundry software developed by Foreign **Company X.** Foreign **Individual X** is a member of the Research and Development department of Foreign **Company X** and was directing the purchase of the equipment through Canadian **Individual A**. Foreign **Company X** is a private research center and independent testing laboratory in the field of materials engineering, and is also involved in the development of materials engineering software for the foundry industry.

Individual A was described as "Management Executive", and operated **Company A** on behalf of Foreign **Individual Y**. This made it possible to distribute Foreign **Company X**'s foundry software to customers in Country Z as a means of circumventing its regulations.

Individual A and Foreign **Individual Y**, together with a third representative of Foreign **Company X**, were arrested while traveling to Country Z to receive training on the guided wave sensor.

Source: Canada.

Case 15: BANK BRANCHES



The case study clearly shows the difficulties in discerning the true purpose of trade when an authorization request is separated from the actual delivery of the goods.

The Dutch **Supplier 1** was contacted by two separate front companies, both located in an Asian jurisdiction of proliferation concern. The invoice was sent to one **Front Company A** in the jurisdiction of proliferation concern but the Dutch **Supplier 1** received the quotation and the actual confirmation of the order from another front company, **Front Company 2** (**Front company 1** and Dutch **Supplier 2** had personal contact with the **End User** in the jurisdiction of concern about the orders and payments.
This could be deducted from administrative information (emails and other documents) found at a research investigation at Dutch **Supplier 2**.

Dutch **Supplier 2** also contacted and confirmed that it could acquire goods form an additional supplier, **Supplier 3**, a branch located in Europe. The goods were then shipped directly by a regular Dutch expedition company to **Front Company 2**. The Dutch expedition company was unaware of the order confirmation and the invoice that was sent to the **US Supplier**, since it received a proforma invoice of Dutch **Supplier 2** directly.

The payments were received via wire transfers form the **End User's Bank** in the jurisdiction of concern, through a separate branch on the bank account of **Dutch Supplier 2**.

By using different companies (both in The Netherlands as in the jurisdiction of concern) that acted separately in different phases of the process, parties tried to disguise the actual circumstances of the trade transaction.

Source: The Netherlands.

Case 16: FRENCH CUSTOMS (EXAMPLE 1)

A French businessman is contacted by Pakistani nationals for the supply of dedicated electronic equipment for missile and/or drone tracking and guidance. He will acquire this equipment from an American intermediary, who will in turn order the components from an American manufacturer. Exportation of this sensitive equipment from the United States to France is authorised, provided that the latter country is the final destination. This operation is therefore subject to a prohibition on re-exportation from France.

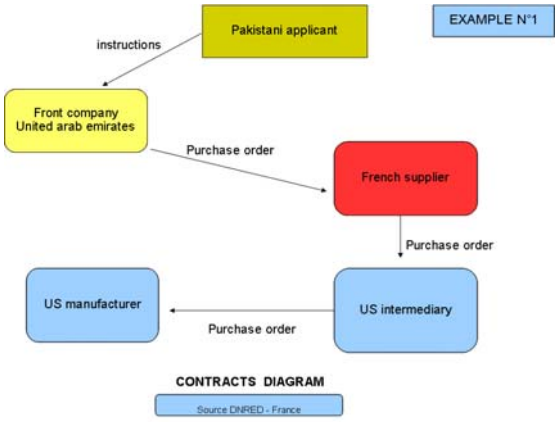
The equipment will not even be cleared from customs on arrival in France but remain in transit until immediate re-exportation to the United Arab Emirates, destined for a local front company acting on behalf of the Pakistani principal, which is affiliated with the Department of Defence (DoD) in Islamabad.

Contracts

A Pakistani purchasing network operating on European territory contacts a French industrialist to acquire electronic components that could be incorporated into tracking – ballistic control equipment for missiles or drones.

The French industrialist, who does not carry such equipment, contacts an American intermediary, which in turn places an order with an American electronic equipment manufacturer. On receipt, the intermediary decides to export the equipment to France, taking advantage of an export authorisation subjected to a restrictive condition prohibiting re-exportation from France.

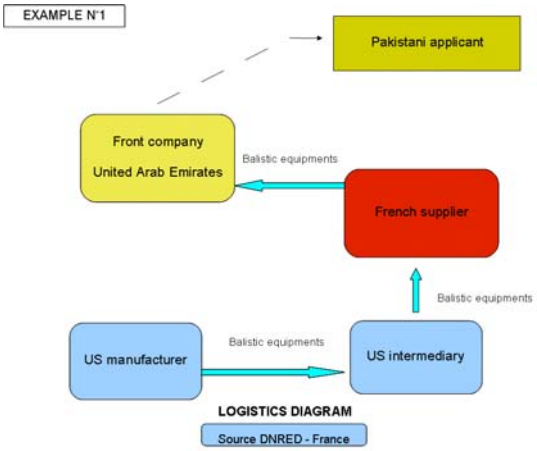
Meanwhile, a front company based in the United Arab Emirates, acting on behalf of the Pakistani principal linked with the Department of Defence, officially places an order with the French supplier.



Logistics

The equipment leaves the U.S. for France by express air freight.

It will not be cleared through customs in France. While in transit in Marseille, it is immediately re-exported to the front company in the United Arab Emirates, which assumedly then delivers the equipment to Pakistan.



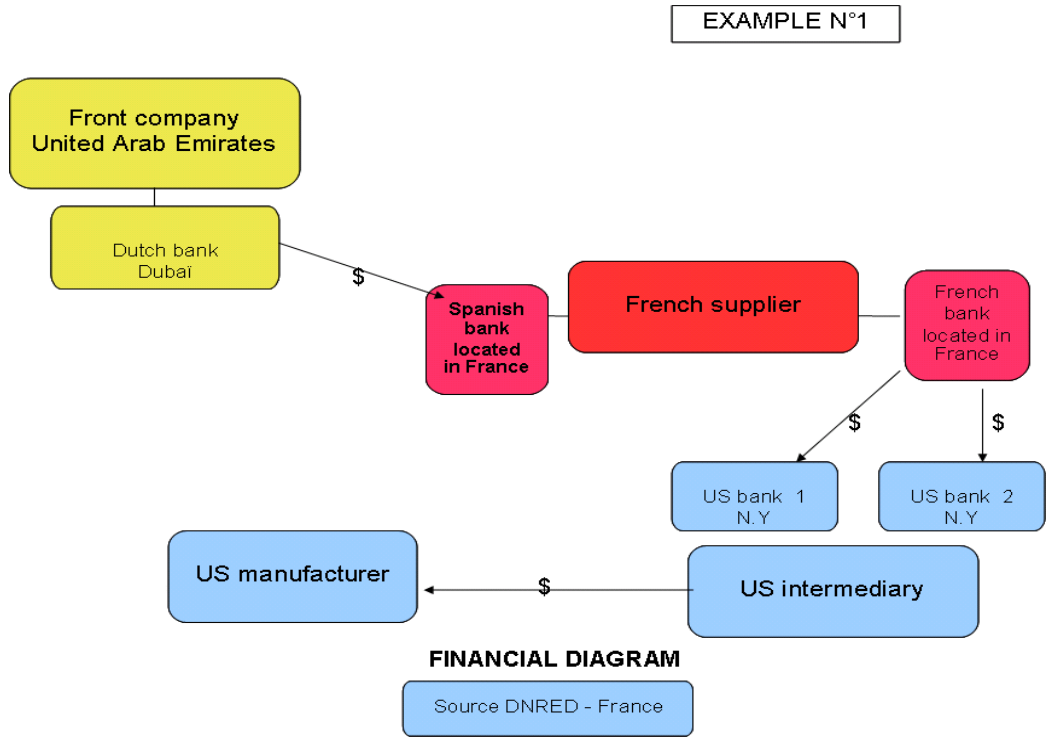
Case 16: (Cont'd)

Financial elements

This involves a direct financial transfer from Dubai (branch of a Dutch bank) to one of the French company's two banks (French branch of a Spanish banking group + branch of a French banking group).

One bank (branch of the Spanish bank) receives the money from Dubai and the other pays the American supplier, which itself has two banks, both domiciled in New York.

The transactions are split, both in France and in the U.S., between two banking institutions, seemingly unrelated because they belong to separate groups.



Source: France.

Case 17: FRENCH CUSTOMS (EXAMPLE 2)

Further to the action described in example 1, the Pakistani intermediaries acting on European territory established contact with a company specialised in designing and selling ballistic testing and programming equipment for missiles and drones.

This firm, very small (3 employees) yet capable of designing and producing high technology customised to satisfy its customers' needs, bought components from a Norwegian manufacturer specialising in the space industry (in which the firm had acquired financial interests) to then incorporate them into equipment exported to Pakistan. The shipments were split up to prevent inspection services from getting a comprehensive picture of the equipment (declared to Customs as electrical testing equipment), its characteristics and its sensitivity.

The equipment was exported without authorisation:

- either directly to Pakistan, destined for an import-export company fronting for the Department of Defence (DoD);
- or via an intermediary company based in the United Arab Emirates.

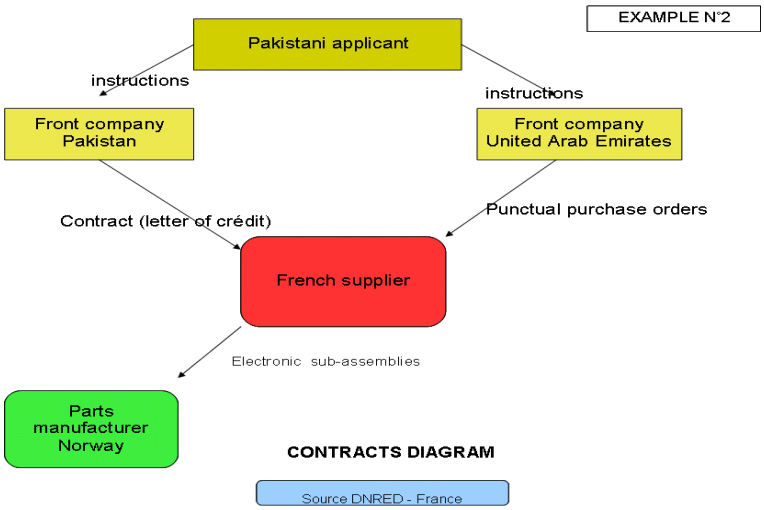
Searches were launched by French Customs at the firm's main office and at its employees' homes after an attempt to export one of the batches of equipment destined for Pakistan was intercepted at Roissy airport. These investigations confirmed the extreme sensitivity of all of the equipment (classified war materiel by the French Ministry of Defence) and the substantial involvement of the French company's director in the operations of the Pakistani military-industrial complex. The French company was declared dormant by its director. A claim was lodged by French Customs with French judicial authorities.

Contracts

The same Pakistani purchasing network (as in example 1), probably hoping to diversify and secure its supply sources in Europe, contacts a French businessman at the head of a small technological innovation firm (three employees) specialising in tracking and fire control equipment (missiles, drones). A contract is concluded concerning a complete calibration and guidance system for drones.

This project is divided into two separate but complementary orders. A first order is placed by a company based in Pakistan (55% of the system). A contract and letter of credit are drawn up for this order. The other part of the contract (45%) will be fulfilled through a succession of single orders by a front company based in the United Arab Emirates.

The two companies (Pakistan and UAE) both act on behalf of the same principal, i.e. Pakistan's Department of Defence (DoD). Down the line, the French integrator will procure part of the components required to develop the system from a Norwegian manufacturer which specialises in aeronautics and space and supplies the Norwegian army. The French integrator secures this procurement by taking a share in the Norwegian supplier's capital.

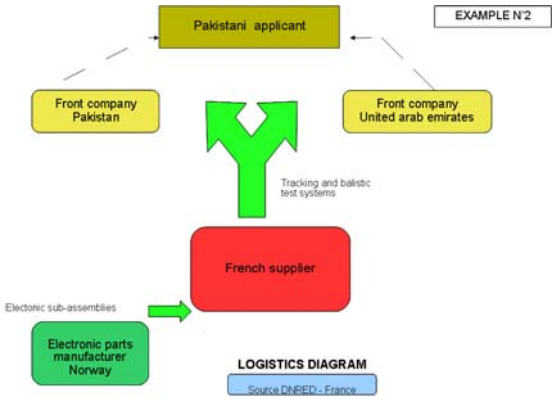


Case 17: (Cont'd)

Logistics

Upstream, the Norwegian manufacturer delivers its electronic subsystems to its French customer, which exports them directly in its name, one part to Pakistan and the other to the United Arab Emirates.

It is worth pointing out that, as is generally the case in such affairs, the real nature of the goods and their sensitivity were obscured by the innocuous-looking commercial wording of the customs declaration (e.g. electrical equipment).

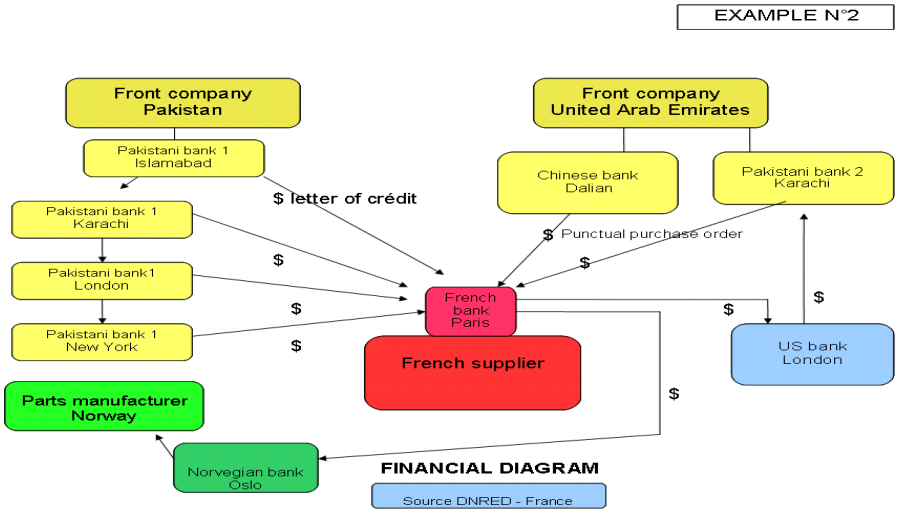


Financial elements

The financial diagram is highly instructive, because it shows the range of financing possibilities behind an act of organised proliferation. The Pakistani principal will go through two separate financing networks: 1) (right-hand side of the diagram) One network will put money into its front company in the United Arab Emirates and funnel the payments for single orders through a Chinese or Pakistani bank. Interestingly, the Pakistani customer indicates to the French seller that an American bank in London is to receive the kickback payments; and 2) (left-hand side of the diagram) The Pakistani buyer will use the letters of credit destined for a single French bank, where the French seller has domiciled its accounts.

These letters of credit will transit through four branches of the same Pakistani banking group (other that the one used by the front company in the United Arab Emirates) located in Islamabad, Karachi, London and New York, respectively.

The advantage of this scheme divided into two distinct parts is that the left hand doesn't know what the right hand is doing. However, all of the operations (left hand and right hand) were linked to a single French bank, a linkage that facilitated the French Customs' investigations. In addition, this French bank effected the payment of the electronic component orders placed with the Norwegian manufacturer via a Norwegian bank in Oslo.



Source: France.

Case 18: FRENCH CUSTOMS (EXAMPLE 3)

Information passed on by a French intelligence service reported visits by interns of country A to the main office of a French company based near Paris. This extremely dynamic company was headed by an independent industrialist, also the director of another firm. The two companies specialised in designing and manufacturing very high-tech dedicated products for ballistic applications. Concerned here were calibration tables for missile guidance systems that only found their equivalent at a Swiss supplier and an American supplier. In other words, the French industrialist headed one of the three specialists world-wide in that area.

The following facts also attracted the service's attention:

- This equipment was systematically declared free for export (neither licence nor authorisation for war materiel exports) under such surprising customs descriptions as electrical cabinets or kinaesthetic apparatuses.
- The buyers of this equipment were located in Pakistan, in country A and in country B.

French customs officers conducted an "in the act" (*flagrant délit*) interception at Paris' Orly Airport, with the support of their specialised counter-proliferation intelligence and investigation service. A machine was seized for examination at the time of the attempted export. The examination immediately confirmed at a minimum the dual civil and military nature of the equipment, whose destination was a ballistics research institute located in country A.

The searches conducted on the company's premises revealed that:

- Several machines had been exported illegally to those sensitive countries, either directly by one of the two French industrialist's companies or through the intermediary of a front company that received a commission for appearing to be the official seller of certain machines destined for various institutes of country A. The front company was also mentioned on the contracts, the letters of credit and the customs export declarations, whereas everything had been negotiated and organised by the French industrialist.
- Analysis of the equipment's technical characteristics found that it classified either as war materiel (therefore subject to a war materiel export authorisation) or as a product on the list of dual-use items (export licence - category 2B1 of the European Union's Community regime regulation).
- Hearings of the implicated companies' executives underlined the French industrialist's deliberate intention of circumventing existing export restrictions for his sensitive goods, whose strategic and military nature he knew perfectly well. In view of the potential buyers of the equipment, the industrialist knew that he could not obtain the necessary authorisations from French authorities. That was why the equipment was falsely declared in customs at exportation and why a front company in France was used in order to mask the real seller.
- As for the financial side of these sales, apart from the country A or Pakistani buyers' direct payments to the industrialist's companies by conventional letter of credit, most of the transactions were effected via the front company, the intermediary through whose accounts the money merely passed before the total, after an average 3% commission was skimmed off, was paid into the industrialist's companies' various accounts and then finally transferred to a financial structure belonging to the industrialist.

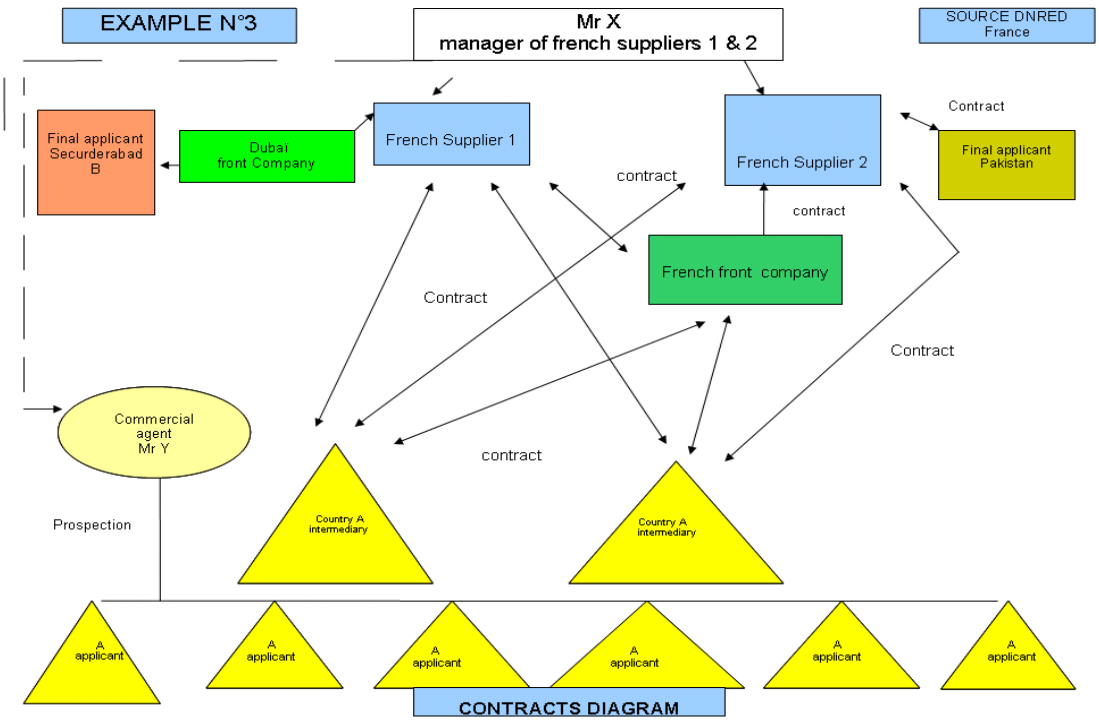
Case 18: (Cont'd)

Contracts

A French industrialist decides to set up business in at-risk countries – Iran, Pakistan, country A and country B – for which he knew he could not obtain the French authorities' authorisation to export sensitive equipment.

The investigation uncovered two kinds of commercial relations: 1) sales contracts entered into directly, with no intermediary (diagram upper right: Pakistani contract); or 2) contracts via various types of intermediaries:

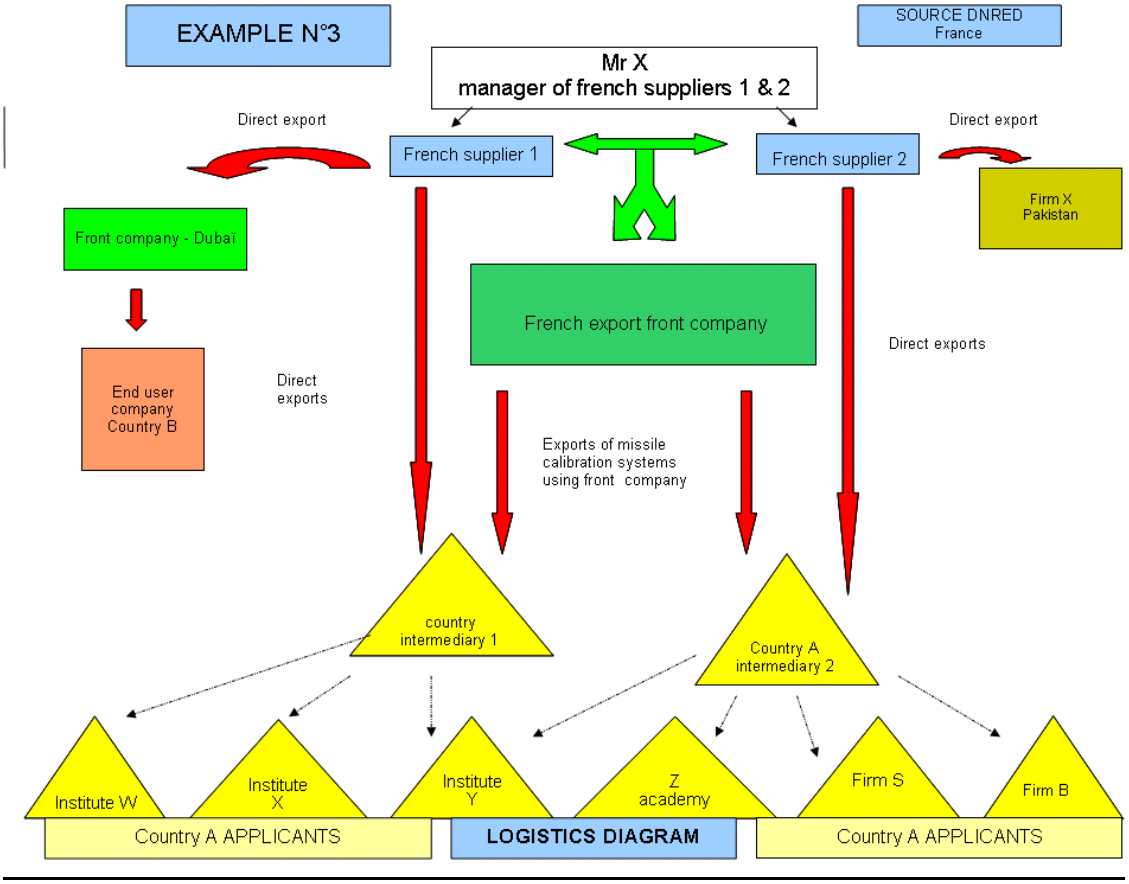
- Contracts via a commercial agent of country A canvassing the end users.
- Contracts via intermediary companies of country A disguising the real end customer (country A intermediaries diagram).
- Lastly, the most complex variant: use of a buffer company in France (French chain company diagram) to substitute for the industrialist and his company as the declared exporter of the sensitive goods.
- Another interesting point: a one-shot circuit for a B customer via a front company in the United Arab Emirates (diagram upper left).



Case 18: (Cont'd)

Logistics

The logistics diagram mirrors the contracts diagram. Direct exports by the companies controlled by the French industrialist to Pakistan and the United Arab Emirates, as well as to two A trading groups (intermediaries), responsible for forwarding the equipment to the final customers. The main exportation scheme used passes through a French front company mentioned on the customs declarations as the official exporter.



Case 18: (Cont'd)

Financial elements

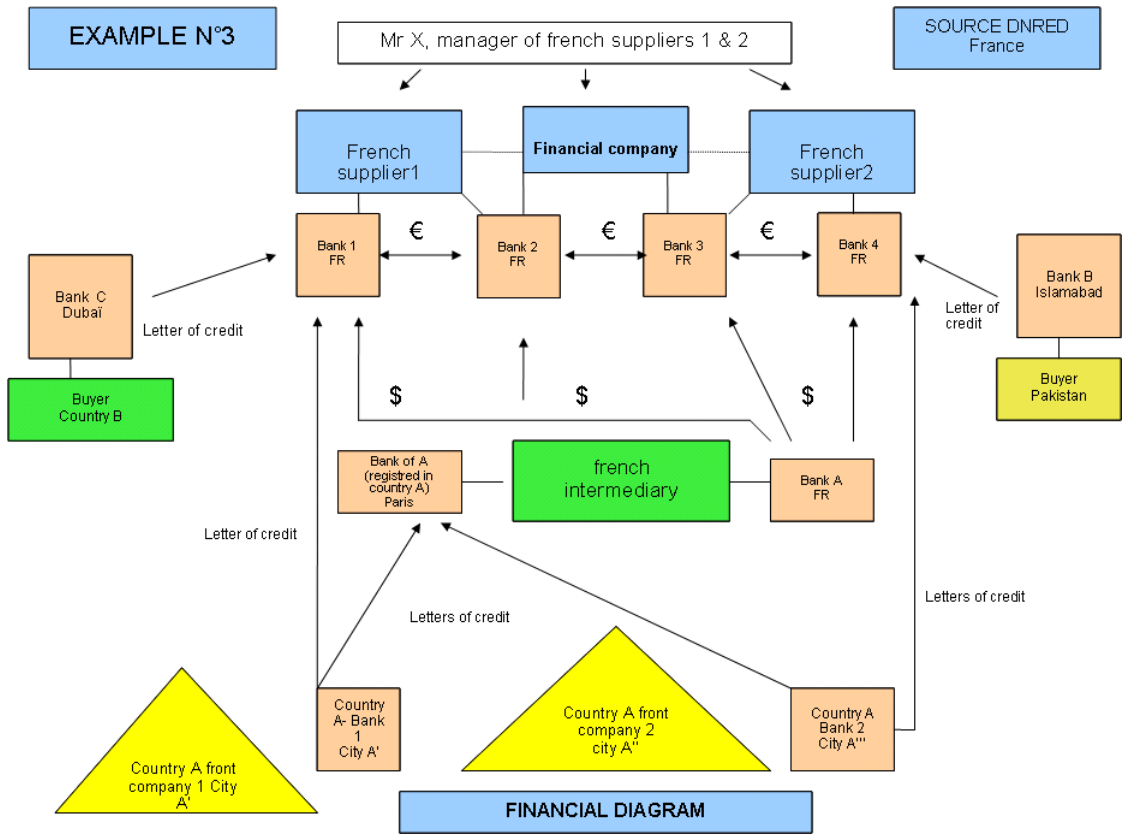
The financial diagram is highly enlightening as to the "left hand/right hand" model, in which the left hand doesn't know what the right hand is doing.

In general, it operates by letters of credit opened:

- Either directly by the foreign customer – Pakistani via an Islamabad bank or B using a Dubai bank – in the French companies' favour (suppliers 1 & 2).
- Or by A intermediaries in favour of the French front company (French chain company).

For the A operations, all of the letters of credit for the French front company are opened by two A banks at the Bank of A in Paris. This establishment then has those sums transit through a merchant bank in Paris, after skimming off an average 3% commission. The merchant bank, following instructions from the industrialist who organised the fraud, then transfers the sums to one or the other of his firms (suppliers 1 & 2), through one of their banks (four in all).

Even more interesting, the French industrialist had set up a financial structure (company) in the Paris area, totally independent of his companies, through which he could recycle that money as he wished, to his personal benefit.



Source: France.

4. COUNTER PROLIFERATION PURSUANT TO S/RES/1540 (2004)

128. S/RES/1540 (2004) was adopted unanimously on April 28, 2004 under Chapter VII of the UN Charter, with its objectives reiterated in S/RES/1673 (2006).

129. The resolution is the first international instrument to deal with the non-proliferation of all classes of WMD, their means of delivery and related materials in an integrated manner, and is the first international instrument to prohibit facilitating proliferation via financing. Operative Paragraph (OP) 5 of S/RES/1540 (2004) states that none of its obligations shall be interpreted to conflict with existing treaties. Annex 4 has a description of the most important conventions and other initiatives.

The key requirements of S/RES/1540 (2004)

130. S/RES/1540 (2004) represents the first time that the Security Council adopted a Resolution that broadly addresses the issue of WMD proliferation.

131. S/RES/1540 (2004) obligates States to take a wide range of actions to prevent and counter the proliferation of WMD. The main requirements of S/RES/1540 (2004) are found in OPs 1 to 3.[26] While those paragraphs set out multiple broad obligations, they are not prescriptive in nature, States are required to determine how best to implement the requirements of the Resolution, in accordance with their domestic laws and regulations and consistent with international law.

132. OP 1 prohibits States from providing any form of support to non-State actors that attempt to develop, acquire, manufacture, possess, transport, transfer or use nuclear, chemical or biological weapons and their means of delivery.

133. OP 2 requires States to "adopt and enforce appropriate effective laws which prohibit any non-State actor to manufacture, acquire, possess, develop, transport, transfer or use nuclear, chemical or biological weapons and their means of delivery, in particular for terrorist purposes, as well as attempts to engage in any of the foregoing activities, participate in them as an accomplice, assist or finance them". Of particular importance for the FATF's consideration, States must have in place prohibitions which address WMD proliferation financing activity.

134. OP 3 requires that States establish and enforce effective domestic controls to prevent WMD proliferation, including accountancy and physical protection over related materials, border controls, brokering controls, measures to prevent illicit trafficking, and export controls (including controls over transshipment and re-export, as well as end-user verification). In terms of proliferation financing, it is important to note that OP3 also requires that States put in place controls on providing funds and services related to the export of WMD-related materials, such as financing.

135. OP 8(d). asks jurisdictions to work with industry and the public on their legal obligations under laws implementing S/RES/1540 (2004). This requirement enhances the effectiveness of measures that have been adopted.

---

[26] *Non-State actor*: individual or entity, not acting under the lawful authority of any State in conducting activities which come within the scope of this resolution.

Means of delivery: missiles, rockets and other unmanned systems capable of delivering nuclear, chemical, or biological weapons that are specially designed for such use.

Related materials: materials, equipment and technology covered by relevant multilateral treaties and arrangements, or included on national control lists, which could be used for the design, development, production or use of nuclear, chemical and biological weapons and their means of delivery.

5. KEY FINDINGS ON THE IMPLEMENTATION OF S/RES/1540 (2004)

136. Based on the survey[27] results and the findings of the 1540 Committee[28], the following information is useful in considering how jurisdictions are implementing their obligations pursuant to S/RES/1540 (2004).

Export controls

137. Export controls are a key feature of, and effective implementation is an essential first step to, countering proliferation. However, the 1540 Committee reported that only 80 jurisdictions had any export controls related to WMD-related items, and only 69 had associated penalty provisions, among nearly 130 States. However, every jurisdiction responded to the FATF survey as having an export control system and most reported as having specific dual-use legislation covering dual-use items and catch-all provisions covering goods known or suspected for WMD end-use but not listed as dual-use items under their export control system. Some jurisdictions have prohibited any support for the development of WMD, including prohibition on financing activities related to it. Annex 5 provides information on some elements that traditionally contribute to effective export controls. In general it does not appear from survey responses that any jurisdiction's export control regime imposes special obligations on financial institutions to detect proliferation financing, a conclusion that is supported by the findings of the 1540 Committee.

138. Reports to the 1540 Committee show that a number of jurisdictions worldwide have not yet implemented lists of controlled goods and end-user controls. A limited number of jurisdictions control the transit, trans-shipment, or re-export of WMD-related items; efficient control may be more difficult in free trade zones. Jurisdictions that responded to the survey indicated the importance of end-user controls, including the examination and verification of end-users by authorities using Embassy assistance, assurances by foreign governments, end-user certificates, international import certificates and pre-shipment audits. Most jurisdictions that responded to the survey use a coding system for controlled goods, including dual-use goods; however, the use of this system presupposes detailed technical knowledge which financial institutions do not poses.

Sanctioning proliferation activities

139. The survey results indicate that one jurisdiction has legislation containing provisions that specifically criminalise proliferation and financial assistance related to proliferation, and that most have taken significant action to implement specific proliferation legislation and controls. Most jurisdictions have not implemented legal provisions that criminalise proliferation financing, indicating in the survey response that specifically criminalisation of the activity of proliferation financing is already covered by complicity provisions in connection with provisions criminalising specific activities related to proliferation. Depending on the breadth of complicity provisions in a particular jurisdiction counter proliferation legal framework, additional legal provisions may be superfluous.

140. No jurisdiction reported any convictions or charges related to proliferation financing. All jurisdictions reported to have asset freeze requirements related to S/RES/1718 (2006) on North Korea and S/RES/1737/1747 (2006/07) on Iran. In addition, some reported having an ability to impose asset freezes for known proliferators beyond their implementation of these resolutions.

---

[27] A survey was sent to all jurisdictions on 1 October 2007 and this report reflects the responses of 20 jurisdictions.

[28] Countries must report on their implementation of S/RES/1540(2004) to the 1540 Committee. The 1540 Committee's report to the Security Council was based on answers from 129 States (136 by August 2007) and the EU. This report, along with country reports are published on the 1540 Committee's website *http://disarmament2.un.org/Committee1540*. A forthcoming report of the 1540 Committee is due by 31 July 2008.

141. While some jurisdictions consider anti-terrorism laws to be sufficient in satisfying their obligations to prohibit proliferation by non-state actors, it should be considered if such legislation is applicable in all cases. For example, the 1540 Committee identified that non-state actors may not necessarily proliferate for terrorist purposes, or their activities may not lead to facilitating a terrorist act[29].

142. The could also be issues concerning the applicability of money laundering legislation when proliferation financing is derived from legitimate sources and is not connected to the proceeds of crime. Terrorism financing legislation may not be applicable if the financing does not ultimately result in contributing to a terrorist act. Again, the 1540 Committee has expressed to the Security Council its concerns with regards to the use of AML/CFT legislation, that it may not be sufficient to fully implement OP 2 requirements[30].

143. The FATF survey indicated that few countries have taken measures to monitor the activities of trade intermediaries, for example trading companies, freight forwarders, etc. One jurisdiction reported having legislative measures against proliferation through brokering and transport. In this example, a broker must obtain a permit for the trade with goods that are or might be destined entirely or in part for the purpose of WMD. One jurisdiction reported that it requires customs brokers, depot and warehouse operators to be licensed by customs authorities. One jurisdiction reported that freight forwarders are subject to a license/registration system.

Enforcement

144. Effective implementation of S/RES/1540 (2004) requires a significant amount of public resources, and it appears that jurisdictions are implementing a legal framework to deter and detect proliferation. However, the effectiveness of enforcement measures may differ from jurisdiction to jurisdiction. In its report, the 1540 Committee identifies a number of issues, and provides its recommendations concerning effectively maintaining and enforcing: border controls; export controls; licensing; controls related to items and controls related to transactions.[31] Annex 6 provides a chart from the 1540 Committee report that indicates that while a number of jurisdictions are enacting the necessary legislation for border and export controls, fewer have implemented appropriate enforcement measures.

145. Survey responses varied concerning the methods used by authorities to address the risks of proliferators diverting goods to circumvent export controls. The most elaborate responses noted the following as key elements used by the responsible authorities for detecting/preventing diversion:

1) Risk assessment.
2) Intelligence and information sharing.
3) Follow-up procedures to ensure products arrived at declared destination.
4) Legislative authority to ask for additional verification measures from an exporter, *e.g.* the proof of delivery through providing documentary evidence.
5) Ad-hoc verification after delivery by competent authorities, *e.g.* to check if goods are used for the intended purpose.
6) Authorisation for export of dual-use goods is followed by a letter informing company about the obligation to immediately notify the competent authority if conditions for the authorisation change, including if the company receives new information about the end-use of the goods, the end-user or re-export of the product.

30 United Nations (2006), Paragraph 41
31 United Nations (2006), Paragraphs 85 to 105

Exchange of information and outreach to private sector

146. Jurisdictions reported that information on proliferation is generally shared among competent authorities both domestically and internationally but on a case-by-base basis. Little mention was given to proliferation financing. Confidential information (names etc.) is exchanged domestically between limited authorities dealing with counter-proliferation and internationally in counter-proliferation forums. Some information is only exchanged between intelligence services. The EU has a system which requires Member States to provide all other Member States with information on denials of export licenses for dual-use goods. As a rule, the private sector is not privy to this information.

147. The survey results indicate that many jurisdictions are disseminating information about export controls publicly. In general, red flag indicators and typologies for manufacturers and/or export control and customs authorities as well as official targets etc, if existent, may be publicly available. This may, in some jurisdictions, include "countries of concern". Some information concerning critical countries, end-users, intermediaries and brokers may be shared with export control authorities (and part of this may be shared with the private sector on a case by case basis) while some of it will only be known by intelligence services.

148. Several jurisdictions indicated that they issue guidance concerning UNSCR-targeted persons and entities and other general information (see publicly available information under export controls) and AML/CFT indicators relevant to proliferation financing, while one jurisdiction doubted in general whether AML/CFT indicators could help detect proliferation financing. One jurisdiction reported that it provides a programme of outreach awareness-raising exercises with the financial sector on issues relating to proliferation more generally. These include seminars that highlight the importance of export controls and the relevance of these to financial institutions.

149. Some jurisdictions also mentioned that transport documents could help detect diversion, including the implementation of a safeguard provision covering competent authorities to receive documentation for goods arriving at the stated place of end-use. Some indicated that information on controlled goods held by international control regimes could be useful information for financial institutions to screen transactions for possible proliferation financing.

Financial measures in more detail[32]

150. Many survey responses suggest that CDD requirements may be the most useful AML/CFT requirements in countering proliferation financing. Some mentioned suspicious transaction reporting systems could be useful, and others referred in addition to the following requirements:

1) Record-keeping requirements.
2) Correspondent banking controls.
3) Prohibition on shell banks.
4) Reporting of large cash transactions.
5) Reporting of electronic fund transfers.

151. One jurisdiction reported that its financial sector would need consolidated information on companies that were denied export licenses. Guidance could help the financial sector in identifying industries deemed high risk that are not self-evident in addition to considering where goods and financial transactions are destined. Additional information concerning high risk individuals, entities and jurisdictions can be very useful for financial institutions.

152. Screening customer databases against lists of names, knowledge of customers' trading activities and knowledge of products, if available, are trade finance controls that could be most useful

[32] The following relies solely on information derived from survey responses.

in detecting and deterring proliferation financing. A financial institution that has some knowledge of the controlled goods lists and export restrictions may be in a better position to request additional information such as export licences, and provide guidance to clients on more complex transactions of trade financing.

153. Under normal circumstances financial institutions do not have a detailed knowledge of the underlying commercial transaction associated with a financial transaction undertaken for a client, in particular where there is no detailed documentary evidence used in the transaction, such as a letter of credit.

154. No jurisdiction reported to have any specific proliferation financing reporting for financial institutions, but several jurisdictions mentioned that reporting is encouraged[33]. However, in addition to electronic fund transfer and large cash transaction reporting, several jurisdictions mentioned that information may be reported under the suspicious transaction reporting system.

155. Jurisdictions generally reported that financial information could help counter proliferation and proliferation financing and provide useful information to ongoing investigations. There was some indication that information on financial aspects has proven to be useful in investigations on the infringement of export controls, and in one example the investigating authority will focus on financial aspects of trade to verify end-use and the true nature of the good. There was some indication of reports having been received by a financial intelligence unit (FIU) concerning entities and/or individuals suspected of being involved in proliferation financing activities. There was some indication that a financial audit had assisted in determining the extent of procurement of non-WMD controlled items and the involvement of others in the supply of dual-use goods.

156. Jurisdictions indicated that, in general, the following types of financial information could be useful to help detect diversion:

1) Information in any associated letter of credit.
2) All information on type of payment (letter of credit, wire transfers).
3) Information on financial transfers associated with commercial transactions, including specific information on parties to the transaction.

6. ISSUES FOR CONSIDERATION

157. The following section addresses the third objective, of the report: to identify measures (*e.g.* criminalisation measures, broader sanctions, activity-based financial prohibitions or controls or examining the use of financial intelligence) that could be considered in combating WMD proliferation finance within the framework of existing UNSCRs, such as S/RES/1540 (2004).

158. This study explains that proliferation financing poses a real and ongoing threat to the international financial system. Proliferators are using trade finance and other bank products to finance trade in proliferation sensitive items. However, proliferators use a variety of techniques, which are described in the report, to hide their true identities and their involvement in proliferation, as well as the true end-use of an item or an item's true end-user. Jurisdictions and financial institutions may remain vulnerable if these risks are not adequately considered.

159. The issues for further consideration by the FATF are presented along four broad categories: *i)* legal systems; *ii)* preventative measures; *iii)* awareness raising; and *iv)* investigations.

160. The analysis and observations contained in previous sections of this report suggests that financial measures could help in overall counter proliferation efforts, but the benefit of these measures

[33] Jurisdictions do require financial institutions to report on targeted financial sanctions pursuant to S/RES/1718(2006), S/RES/1737(2006) and S/RES/1747(2007).

will be very limited if more traditional counter proliferation measures are not effectively implemented and enforced. Effective proliferation financing prohibitions is one of several important elements that contribute to a jurisdiction's effective and comprehensive counter proliferation regime.

161. However, it is important to note that without a thorough implementation of controls to prevent the transfer and export of technology, goods, services or expertise, proliferation financing will be difficult to prevent and financial measures would not be useful.

Legal systems

162. S/RES/1540 requires jurisdictions to prohibit proliferation financing.

- There is limited evidence that jurisdictions have taken additional measures to criminalise proliferation and proliferation financing since the adoption of S/RES/1540 (2004).
- Most jurisdictions rely on complicity provisions and other provisions, such as terrorism financing provisions, to prohibit proliferation financing.
- There may be value in explicit criminalisation, including to:
  - Clarify the obligations on firms and financial institutions to be vigilant to proliferation and proliferation financing.
  - Enhance enforcement against proliferation and proliferation financing, including by establishing appropriate penalties.
  - Address financial activities not otherwise covered by export controls.
  - Provide a basis for financial institutions to report, when necessary, financial information related to proliferation financing to an appropriate competent authority within the domestic legal framework.
  - Provide a basis for competent authorities to receive, analyse and share financial information related to proliferation financing.
  - Properly cover intermediary activities, *i.e.* brokers.

163. Some jurisdictions are using targeted financial sanctions to prohibit proliferation financing, however most do not. There may be value to measures that create a domestic legal authority and capacity to implement targeted financial sanctions against individuals, entities and jurisdictions involved in proliferation financing. Such measures can serve to:

- Deprive proliferators of their assets and limit their access to the global financial system.
- Disrupt proliferation networks by publicly exposing designated individuals and entities.
- Provide detailed identifier information on designated proliferators, front companies and other associates, which could be used by financial institutions to effectively detect and prevent proliferation financing.

164. However, the use of targeted financial sanctions against proliferation financing has limitations. Automatic and manual screening through name based designation requires adequate and up-to-date identifier information for designated individuals and entities. This can be challenging for jurisdictions, which can result in false positives and failure to capture individuals and entities working on behalf of designated entities, or designated entities who have changed their names or other identifying information.

Awareness

165. While proliferation networks, including financing arrangements, use creative schemes to exploit unwitting actors, lack of awareness of proliferation and proliferation financing could contribute to the problem.

166. The majority of private sector entities do not knowingly engage in proliferation, want to be good corporate citizens and do not want to be involved in illicit activities. They avoid risks to their reputation and avoid having their assets unknowingly involved in proliferation.

167. Outreach by government to producers, sellers, transporters etc. on proliferation risks is critical, and already takes place to a high degree in many countries.

168. Outreach to the financial sector on proliferation financing risks does not take place to the same degree. When considering if and to what extent measures should be taken the nature of the services provided by the financial sector and the ability to detect proliferation finance must be taken into account.

169. Awareness-raising with authorities and persons/companies/financial institutions etc. may prove to be very useful. This would require a reasonable amount of resources for outreach, training or other cooperative activities, but may result in enhanced information exchange.

170. It may also be beneficial to outreach to those (*e.g.* lawyers, notaries, accountants, auditors) involved in the establishment, incorporation, purchase and audit of companies to make them aware of the use of front companies in proliferation networks.

171. Generally, there are limited educational, licensing, registration or oversight requirements for brokers. Flexibility of business operations enables illicit brokers to avoid restrictions by locating in a jurisdiction with little or no regulation of brokering services.

Preventative measures

172. Effective implementation of existing AML/CFT requirements, in particular CDD, record keeping, transaction monitoring, and due diligence with respect to correspondent banking relationships, are relevant measures for a financial institution to mitigate proliferation financing risk.

173. Given that the sources of funding for WMD proliferation can be legal or illegal, well-known indicators or “red flags” for money laundering may be relevant in cases where the source of funds is illegal. However, the risk of proliferation financing is more likely to be present in cases where the source of funds is legal but the end-user or type of goods involved is intended to be obscured. The structural differences between money laundering on the one hand and proliferation financing on the other hand should therefore be taken into account when considering the applicability of AML/CTF requirements.

174. Using existing AML/CFT controls against the threat of proliferation financing has the benefit to financial institutions of allowing them to rely on familiar concepts, processes and procedures to protect against a newly understood risk There may be value in:

- Considering adjustments to AML/CFT controls to adequately detect and prevent proliferation financing.
- Financial institutions applying AML/CFT controls in a risk based manner across all product lines, particularly trade finance.

- Effective use of CDD information by global trade services representatives engaged in trade finance activities, which may require additional training of these representatives in AML/CFT measures.
- Using any information contained in trade finance documentation to verify the goods that are being traded, the final destination, and the parties involved in the trade.

175. Information sharing is critical in enabling a financial institution to address proliferation financing risks. Government may consider providing additional information on threats and risks to allow financial institutions to assess the risks they face from proliferation financing and, where appropriate, to amend CDD and monitoring systems to mitigate the risk.

- Detailed information on entities designated through targeted financial sanctions can be particularly useful to financial institutions.
- Diversion of trade and financial payments through third parties and/or third jurisdictions.
- Jurisdictions with substandard export and financial controls.
- There may be useful public information for financial institutions that is currently made available by export control authorities.
- Information on high risk persons and entities, including front companies.

Investigation

176. Financial information can be useful in proliferation related investigations and prosecutions and relevant authorities should consider its use as a matter of routine in these cases. In particular, financial information is useful for:

- Contributing to uncovering proliferation activities when complemented by information held by competent authorities and other sources.
- Linking entities of concern together, especially given the increasing use of front companies and transhipment points by the proliferation networks in their attempts to evade export controls.
- Demonstrating diversion or infringement of export controls.

177. There are significant amounts of data that are received by financial intelligence units currently in relation to money laundering, terrorist financing and other illicit activity that could contribute to proliferation investigations.

178. There may be some value in reporting suspicions of proliferation financing or other reporting mechanisms.

179. Domestic information sharing mechanisms between government agencies are critical to combating proliferation financing. Given the international dimension of proliferation financing, effective mechanisms to share information between governments is also crucial.

ANNEX 1: ELEMENTS THAT MAY INDICATE PROLIFERATION FINANCING

The investigative indicators below serve as a starting point to assist financial institutions in understanding the risk that customers, transactions or other account activity may be associated with WMD proliferation. They are not provided as definitive indicators that WMD proliferation is occurring, as a basis for automated screening, further work would be needed to develop such indicators.

Identifying characteristics that are useful to financial institutions as indicators for possible proliferation financing-related activity poses several challenges, for example:

- Given that the sources of funding for WMD proliferation can be legal or illegal, well-known indicators or "red flags" for money laundering may be relevant in cases where the source of funds is illegal. However, the risk of proliferation financing is more likely to be present in cases where the source of funds is legal but the end-user or type of goods involved is intended to be obscured. The structural differences between money laundering and proliferation financing should therefore be taken into account when considering how indicators could be used.
- Specific information on the risk posed by the end-user or counter-party involved, or technical expertise to evaluate the possible WMD use of goods involved, will generally be needed to fully understand the risk of proliferation financing for a transaction or a customer.[34]
- Proliferators use a range of sophisticated schemes to obfuscate their activities. For example the case studies show that proliferators have used layered letters of credit, front companies, intermediaries, brokers etc. However, existing case studies do not enable us to identify any single financial pattern uniquely associated with proliferation financing, though indicators, if available, may help to identify some of the methodologies used by proliferators.

Nonetheless, the typologies working group has endeavoured, as part of its study of this issue to identify, or adapt, possible indicators of proliferation financing.

It should be stressed that in trade individual financial institutions rarely deal with all counterparties involved, and may not be aware of the activities highlighted below. Some of the indicators also presuppose access to information, *e.g.* on customers of concern, which may not be routinely available to financial institutions, or which financial institutions lack the capacity to use. The list includes both indicators which could provoke initial suspicion of a transaction or customer, and also indicators which would be useful to remove "false positives" through further investigation, but which are not themselves a basis for suspicion. Finally, specific indicators might only be useful at particular stages of the transaction process *i.e.* during initial CDD, during transaction processing ("real time screening"), and after the transaction monitoring post transaction review in investigation of already-suspect activity. The opportunities and capacity to use indicators will therefore vary according to when they can be practically used.

[34] Where particular individuals, organisations or countries are the subject of WMD proliferation-finance sanctions programmes or export controls, the obligations on institutions to comply with those sanctions and export controls are determined by countries and are not a function of identifying potential risk. Violations of such sanctions may result in a criminal offence or sanctions in some jurisdictions if funds or financial services are made available to a target, directly or indirectly.

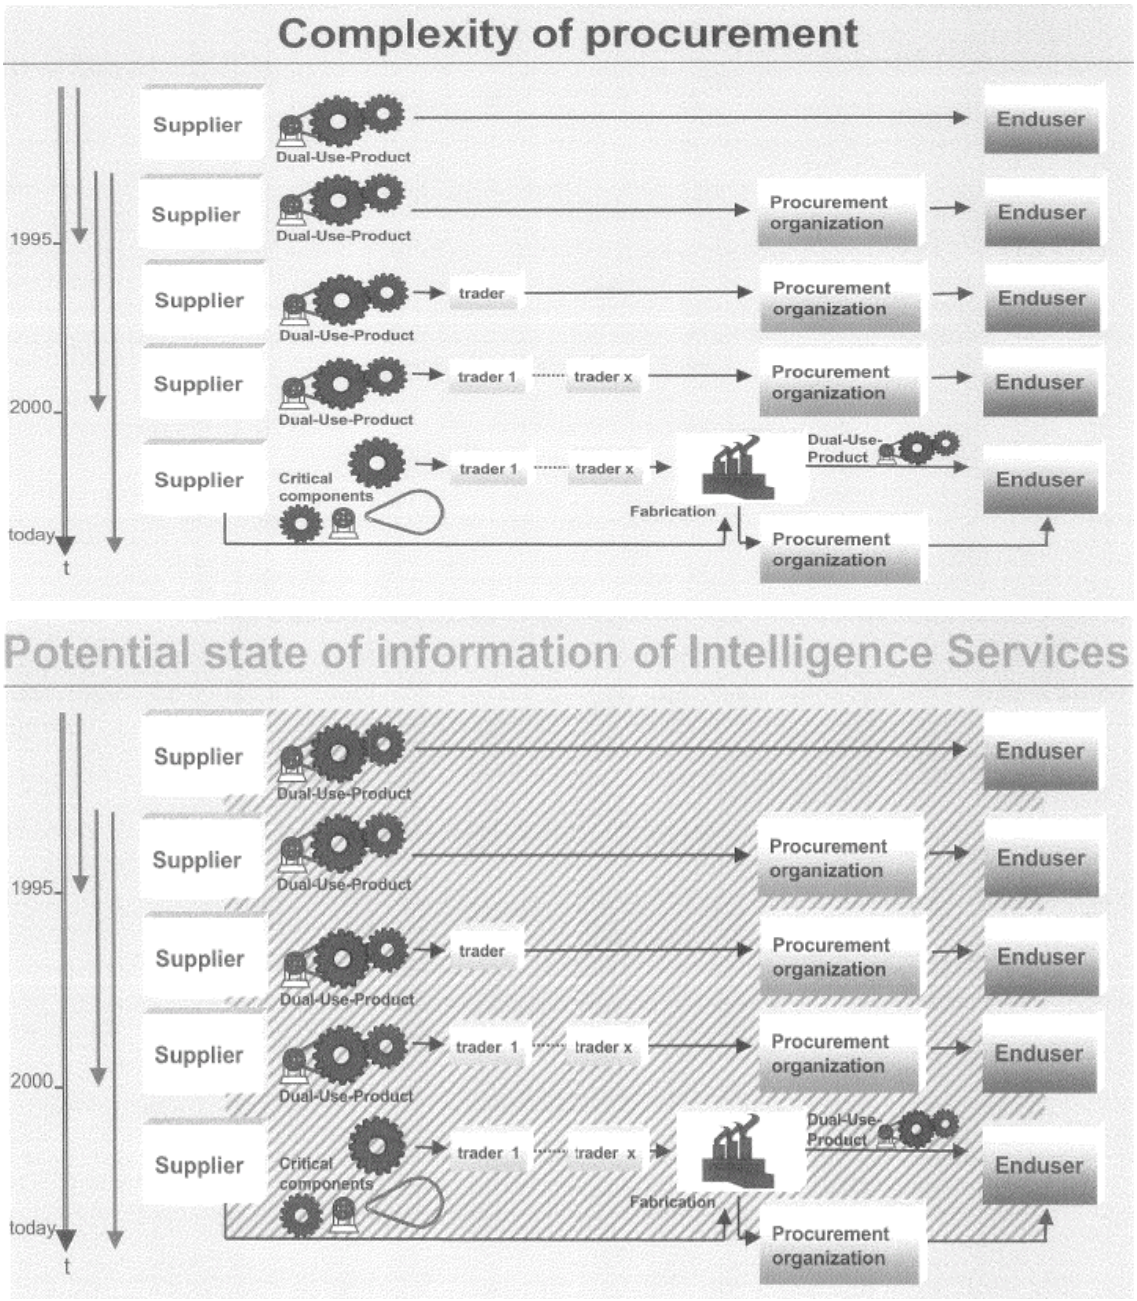
Indicators of possible proliferation financing

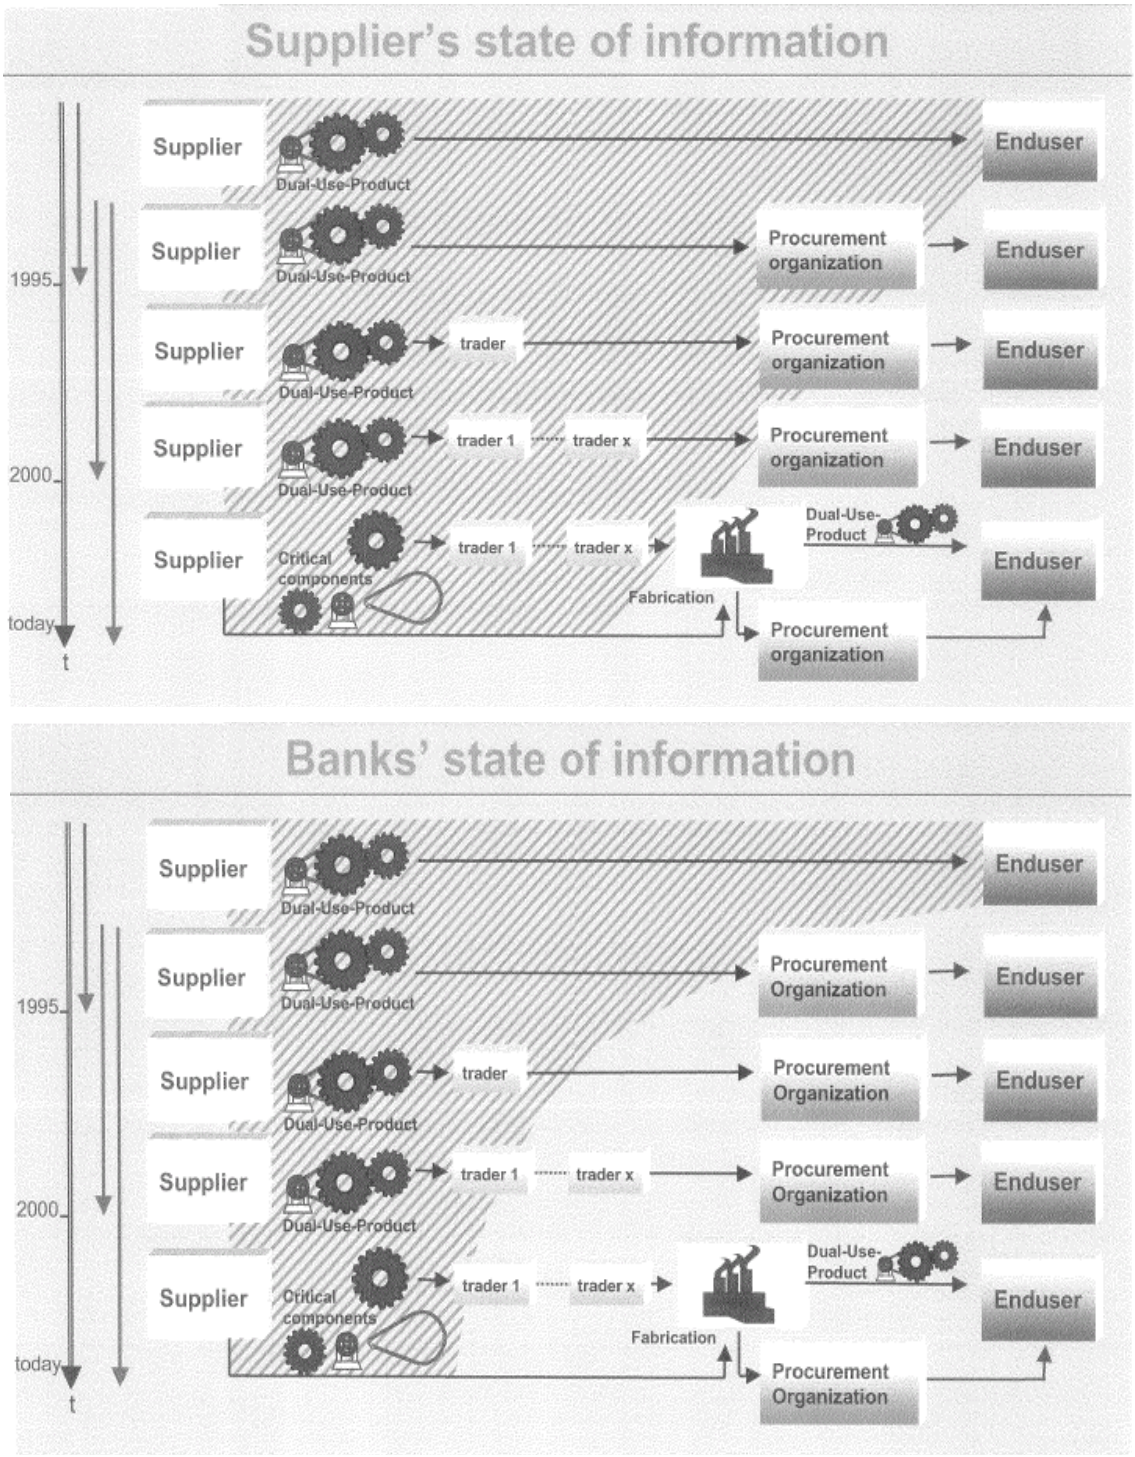
- Transaction involves individual or entity in foreign country of proliferation concern.
- Transaction involves individual or entity in foreign country of diversion concern.
- Trade finance transaction involves shipment route (if available) through country with weak export control laws or weak enforcement of export control laws.
- Transaction involves individuals or companies (particularly trading companies) located in countries with weak export control laws or weak enforcement of export control laws.
- Transaction involves shipment of goods inconsistent with normal geographic trade patterns (*e.g.* does the country involved normally export/import good involved?).
- Transaction involves shipment of goods incompatible with the technical level of the country to which it is being shipped, (*e.g.* semiconductor manufacturing equipment being shipped to a country that has no electronics industry).
- Transaction involves financial institutions with known deficiencies in AML/CFT controls and/or domiciled in countries with weak export control laws or weak enforcement of export control laws.
- Based on the documentation obtained in the transaction, the declared value of the shipment was obviously under-valued vis-à-vis the shipping cost.
- Inconsistencies in information contained in trade documents and financial flows, such as names, companies, addresses, final destination etc.
- Customer activity does not match business profile, or end-user information does not match end-user's business profile.[35]
- Order for goods is placed by firms or individuals from foreign countries other than the country of the stated end-user.[36]
- Customer vague/incomplete on information it provides, resistant to providing additional information when queried.
- New customer requests letter of credit transaction awaiting approval of new account.
- The customer or counter-party or its address is similar to one of the parties found on publicly available lists of "denied persons" or has a history of export control contraventions.
- Circuitous route of shipment (if available) and/or circuitous route of financial transaction.
- Transaction demonstrates links between representatives of companies exchanging goods *i.e.* same owners or management.
- Transaction involves possible shell companies (*e.g.* companies do not have a high level of capitalisation or displays other shell company indicators).
- A freight forwarding firm is listed as the product's final destination.
- Wire instructions or payment from or due to parties not identified on the original letter of credit or other documentation.
- Pattern of wire transfer activity that shows unusual patterns or has no apparent purpose.

[35] This indicator may also be apparent through credit-risk or other know-your-customer assessments, particularly if a customer is moving into a new line of business. At the transactional level, a transaction involving a product whose capabilities do not fit the buyer's line of business, such as an order for sophisticated computers for a small bakery, should raise concerns.

[36] In many cases, end-users may not be identified in documentation supporting a transaction. Additionally, wholesale companies routinely have this type of activity as a business model. In cases involving wholesalers, geographic or other factors should be considered in identifying risk.

ANNEX 2: THE COMPLEXITY OF PROCUREMENT NETWORKS OVER TIME





Source: Germany.

ANNEX 3: ADDITIONAL CASES OF PROLIFERATION

While the following cases do not provide any proven direct link of proliferation to the financial sector, they do provide some additional context as to the complexity of the detection of proliferation activity in general. For example, case 16 discusses how financial information may have been useful in investigating illicit activities that were disguised by proliferators through the use of cover names, front companies, false end-users and diversion etc.

Case 19: Customs authorities.

A suspected procurement network operating in Canada attempts to supply targeted entities in **Jurisdiction 1** with goods controlled under Canadian export laws. **Jurisdiction 1** is a jurisdiction of proliferation concern. A shipment of "industrial equipment" was presented for export at a major Canadian port by an exporter that was subject to a Canadian Border Services Agency (CBSA) national security/export control lookout due to suspected proliferation activity. Shipping documents were presented to CBSA indicating that the consignee of the equipment was an import/export trading company. Customs officials formally detain the shipment at the Canadian port for examination and export permit verification. The following documents are analysed:

- Export Declaration Form detailing the exporter, the consignee, the commodity, transportation details (routing, carrier) and the value. The exporter had listed the consignee as an Import/Export Trading Company located in **Jurisdiction 2**, a known transhipment hub. The goods are described as "industrial equipment" without further elaboration.
- Bill of Lading provides cargo shipping information.
- Invoice indicates the value of the "industrial equipment" is $500,000.
- Certificate of Origin indicates the goods originate from **Jurisdiction 3**.
- Export Permit is not presented for the goods (*Note*: Depending on the commodity, its origin and its destination, exporters may be required to indicate a General Export Permit number on their export declaration or they may be required to obtain an Individual Export Permit from competent authorities.

The exporter was the subject of a customs authority lookout (targeted shipment) for procurement activity and has a history of export control contraventions. The consignee was a trading company in a known transhipment country.

The description of the goods as "industrial equipment" was not specific enough to ascertain what the goods actually are or what their intended use might be. The value of the goods is high, which may indicate specialized use or high technological content.

Customs officials at the Canadian port are instructed to contact the exporter and obtain technical specifications for the goods and an end-use certificate from the consignee. The technical specifications reveal that the goods are a "five-axis milling machine", which, depending on their cutting capabilities, are controlled nuclear dual-use goods and subject to Canadian export control laws. The end-use certificate states that the goods are to be used in **Jurisdiction 2** at a wood working plant. Furthermore, a trading company is probably not the true end-user since it is likely the goods will be sold or re-exported. Open source searches indicate that the trading company in **Jurisdiction 2** is state-owned by **Jurisdiction 1**. At this stage, customs authorities have concerns that the milling machine is a controlled commodity and that it will be diverted or transhipped to the nuclear industry in **Jurisdiction 1**.

Canadian Customs officials ask export permit authorities what required export permits are required. Goods originating from **Jurisdiction 3** require a general export permit when destined to **Jurisdiction 2**. Since the exporter did not declare that the goods were being re-exported through Canada, customs authorities issue an administrative monetary penalty to the exporter for failing to properly declare this. There was not sufficient evidence to prove that the goods were destined for jurisdiction 2 and therefore the goods were not seized and were released for export despite suspicions on the part of customs officials.

Case 19 *(Cont'd)*

Numerous indicators maintain the concerns of customs authorities as to the true end-use and destination of the goods. Authorities continue to develop an intelligence file on the exporter and consignee. The intelligence file work-up includes reviewing various intelligence, enforcement, and commercial databases (including both open and classified sources). A review of the Canadian exporting company's previous exports revealed that it had already exported 8 five-axis milling machines with a combined value exceeding $4 million. As such, in addition to the current shipment, CBSA would now expand the intelligence probe to better understand the circumstances (*i.e.* end-users, routing, destination, etc.) surrounding all the shipments of five-axis milling machines (possible controlled nuclear dual-use goods).

Customs officials intercepted the Canadian exporter two weeks later at an airport returning from a trip to **Jurisdiction 2**. A secondary examination of his luggage is conducted under the authority of the customs laws and a bill of lading is discovered in his carry-on baggage, which describes the movement of a milling machine from **Jurisdiction 2** to an electronics company in **Jurisdiction 1**. Classified intelligence indicates that the electronics company is a known front company for **Jurisdiction 1**'s nuclear and missile industries.

In this example, CBSA was unable to seize the five axis milling machine, without proof of the true end-use and ultimate consignee in **Jurisdiction 1**. Proof for transhipment to **Jurisdiction 1** might include:

- Letters of credit from Jurisdiction 1's nuclear industry to the Canadian exporter;
- Financial transactions between the Canadian exporter, the trading company in Jurisdiction 2, the front company in Jurisdiction 1, and Jurisdiction 1's nuclear industry.
- Financial intelligence analysing complete financial proliferation networks linking all the various entities involved.

Source: Canada.

Case 20: Accelerometers

The United States Immigration and Customs Enforcement, Office of Investigations, in conjunction with the Defense Criminal Investigative Service (DCIS), conducted an investigation in which led to a federal indictment against a foreign national. The indictment was for conspiracy to commit offenses against the United States in connection to exporting Endevco 7270A-200K accelerometers, which are designated as a defense article on the United States Munitions List and cannot be exported from the United States without permission from the United States Department of State. The Endevco 7270A-200K accelerometer has many military applications including use in "smart" bombs, missile development and the measurement of nuclear and chemical explosives.

From April 2007 through October 2007, ICE agents conducted undercover operations, in which an identified foreign national conspired with agents to export the Endevco 7270A-200K accelerometers in violation of United States Export laws. Undercover agents were advised that if the items were delivered overseas in proper working order, larger orders would follow. Undercover agents along with identified suspects negotiated price, payment, and delivery terms of the accelerometers in furtherance of the conspiracy. Undercover discussions included the delivery of the accelerometers to either a third party country or the country of final destination. Financial terms were discussed between the Undercover agents and the violator utilising the formal financial sector through either an escrow account for payment or making payments through bank wire transfers.

The defendant has been charged under Title 18, of the United States Codes, Section 371, with conspiracy to Commit offenses Against the United States and faces a maximum penalty of five (5) years in prison and a $250,000.00 fine.

Source: United States.

Case 21: Shipping of electronics to a number of countries

Canadian **Individual A** is the sole owner of Canadian **Company A**, whose business includes the shipping of electronics to a number of countries. Canadian **Individual A** contacted Canadian **Company B** to purchase a number of computer chips (power amplifiers) designed for use in radar and satellite communication systems. These goods are dual use with potential military applications and are subject to export controls. **Individual A** reported the end-user as Canadian **Company C** and refused to allow Canadian **Company B** to meet with representatives of Canadian **Company C**. Canadian **Individual A** ultimately cancelled the order entirely.

Significant suspicions were raised on the part of Canadian **Company B** once Canadian **Individual A** refused to coordinate a meeting with Canadian **Company C**. The addresses given by Canadian **Individual A** on the US Traffic in Arms Regulations (ITAR) form for both the purchaser (Canadian **Company A**) and the purported end-user (Canadian **Company C**) were the same.

Further investigation revealed that Canadian **Company C** is actually based overseas, and is also run by Canadian **Individual A** and another person. Had the purchase of computer chips from Canadian **Company B** gone through, the items would have been shipped through Canada overseas.

The following year, an intermediary for the military of a foreign country requested a purchase of US-origin military-grade night-vision cameras from the same Canadian **Individual A**. The cameras have potential dual-use WMD applications in addition to regular military use and are subject to export-controls. Canadian **Company A** placed an order for one camera with US **Company 1**. US **Company 1** notified US authorities, who confirmed that the camera, after arriving in Canada, was then re-exported overseas and is currently located near an important nuclear site in a country of proliferation concern.

In addition, Canadian **Individual A** has been involved in other procurement deals designed to circumvent US export restrictions using Canadian **Company A**. For instance, Canadian **Company A** is now believed to be in the midst of procuring F-5 fighter aircraft spare parts from US **Company 2**, also on behalf of Foreign **Company X**, purportedly for a foreign Air Force. Canadian **Company A** has also attempted to re-label a US-origin airplane propeller as originating in another country in order to avoid prohibitions regarding shipment and re-export of US-origin goods. Although this particular shipment was stopped by Canadian authorities, other similar orders have been carried out. Canadian **Company B** has also fielded requests for other military-related goods, such as helicopter parts and jet fuel, although it is not known if these particular orders have been completed.

Source: Canada.

Case 22: Use of intermediaries to circumvent export restrictions

Canadian **Company A** deals in medical products and laboratory equipment and was in contact with Foreign **Company X** regarding the sale of multiplexers and potentiograph laboratory equipment. Foreign **Company X** is a procurement entity associated with a foreign nuclear programme of proliferation concern. Inquiries revealed that Canadian **Company A** has ongoing business dealings providing potential dual-use goods to a number of foreign enterprises, including Foreign **Company Y**. Foreign **Company X** is known to utilize Foreign **Company Y** as an intermediary, as part of its deceptive practices to avoid revealing the foreign nuclear programme as the end-user of purchased equipment. Goods are instead described as being for "educational purposes".

Further investigation revealed that the proprietor of Canadian **Company A**, Canadian **Individual A** regularly engaged in deceptive practices to conceal the end-user of dual-use equipment. Some deceptive techniques used in this particular case include the following:

- **Individual A** frequently provided the name of a Canadian University as the end-user for US-origin and other goods, despite having no actual connection with the university. The products would then be re-shipped to various foreign countries via commercial courier, with the description "laboratory equipment" or "medical instruments" given on the customs declaration, regardless of the true nature of the product being exported.
- Canadian **Company A** falsified documents in order to hide US-origin goods, re-labelling them as Canadian products manufactured in a south-east Asian country in order to permit export to embargoed countries.
- Canadian **Company A** exploits the fact that a country's export authorities generally do not inspect exported items as rigorously as imported items.
- Canadian **Company A** exploits a loophole in export reporting requirements for goods valued at less than $2,000.00 dollars, by re-invoicing products at a far lower value to avoid having to complete a paper export declaration.
- Canadian **Company A** is also involved as part-owner of Foreign **Company Z**, which it uses as the principal point of transit for goods going from Canada to overseas.

In addition to a number of potential nuclear/WMD dual-use exports to the companies noted above, Canadian **Company A** also conducts business with several other entities of procurement concern. These entities have been connected to procurement activities on behalf of various nuclear/WMD programmes in different countries of proliferation concern. Canadian **Company A** is currently the subject of a joint investigative effort by Canadian agencies aimed at uncovering the nature and extent of its procurement activities on behalf of the nuclear/WMD programmes of several high-interest countries.

Source: Canada.

Case 23: Illicit Brokering

A suspected procurement network operating in Canada aimed to supply entities in a jurisdiction of proliferation concern with controlled and strategic goods.

While executing a search warrant related to an offence of the *Customs Act* and the *Export and Import Permits Act* at the business address of the Canadian exporter, Customs authorities uncover shipping documents and commercial invoices related to a shipment of titanium-stabilized stainless steel tubes with an outer diameter of 750mm and a wall thickness of 2.5mm (controlled under 6-6.C.9 of the ECL). This shipment was not related to the offence being investigated. The documents related to this shipment indicate the tubes were manufactured in a European country; purchased by the Canadian company; moved by rail to a second European country; loaded into a maritime shipping container; shipped to a Free Trade Zone and once there, re-manifested and shipped to the jurisdiction of proliferation concern.

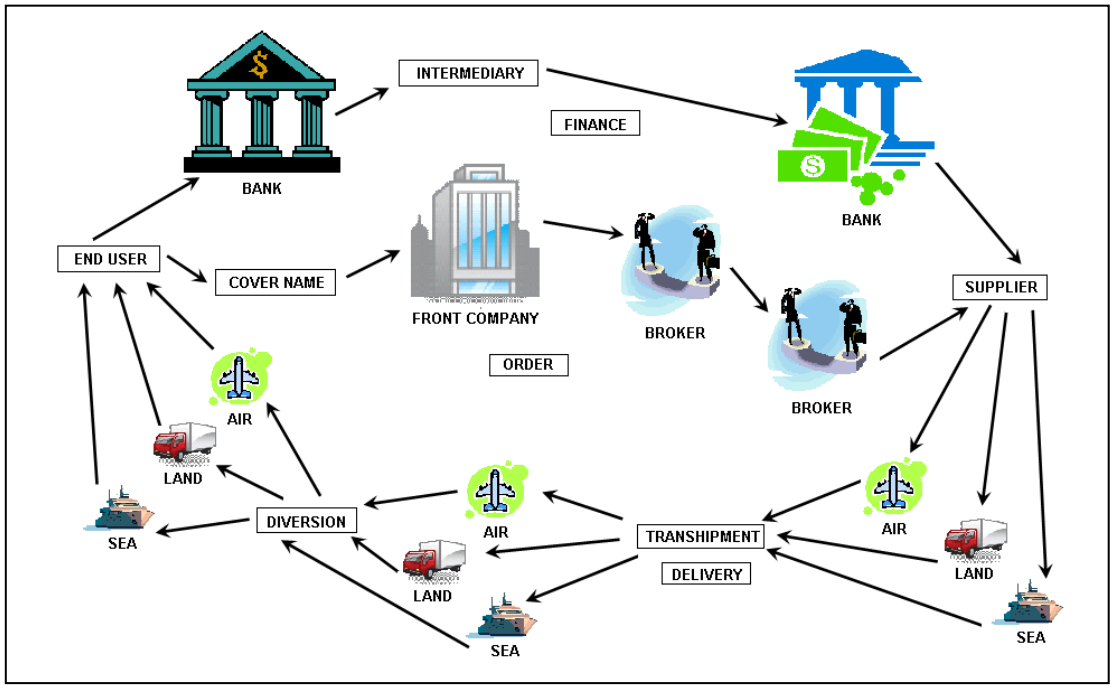
CBSA did not have enough evidence to enable it to act upon this illicit brokering activity. Furthermore, the above example is based on the fact that CBSA authorities had obtained a search warrant on an unrelated matter. If CBSA had not been searching the business records, this infraction would have gone undetected. However, financial information could have formed the basis for an initial investigation.

Source: Canada.

Case 24: Traditional counter proliferation making use of financial information

This diagram represents the procurement process and the start point for an analysis of proliferation networks. Counter proliferation has traditionally focussed on the bottom two aspects of the process.

This model can be used to describe purchases made on the open market and transfers between proliferators.



When purchases are made on the open market only a few entities within the diagram will be aware of what they are doing. In some cases only one entity will know. It is unlikely entities within the delivery or finance part will have sight of what is occurring. For example, it may be that only the end-users and the representative of the front company that are aware of the true destination and end-use for the goods.

When the transfer is between proliferators more of the entities involved will be aware that they are engaged in illicit activity. However these transactions still utilize commercial practises and routes some entities involved in the procurement and transportation may be unaware of that occurring. For example while the entities representing the supplier and end-user – the middle part of the chain would be aware the transfer is associated with a WMD or BM programme. They may choose to transport the goods by commercial carrier who would be unaware of the nature of the transfer.

Source: United Kingdom.

Case 25: Kahn

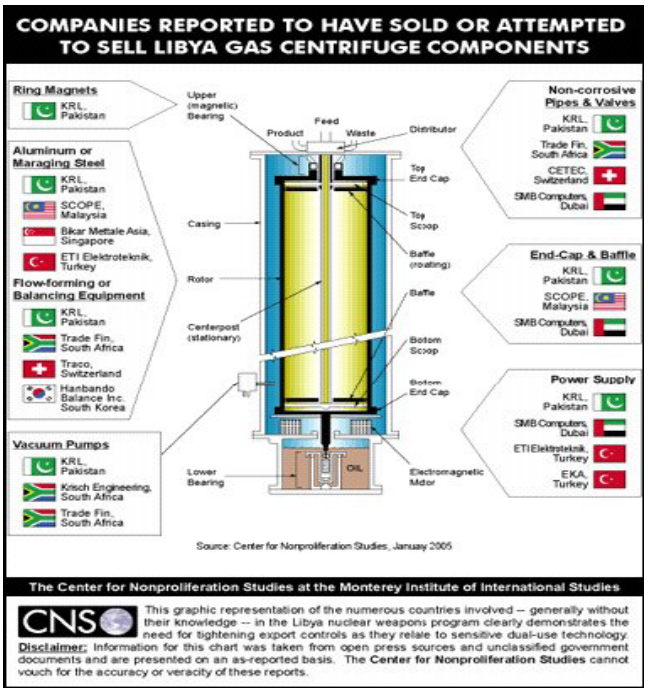
The Khan-case (which consists of several different proliferation cases over a long period) concerned nuclear weapon programs in several jurisdictions of proliferation concern. The process of proliferation for each item to be constructed consisted of many steps in order to disguise the activities of the network and the true nature and end-use of the goods. Many individuals, companies and countries were – knowingly or in good faith – involved. There is not much published concerning the financing in the Khan proliferation networks, but at least the following is mentioned in "Proliferation Networks and Financing" by Bruno Gruselle (Fondation pour la Recherche Stratégique, March 2007):

"Although some operations appear to have been settled in cash, others were settled through international transfers within the framework of duly established contracts. For example, this is the case for the contract made between the *Gulf Technical Industries* (GTI) company and SCOPE, for an amount of 13 million dollars."

"In terms of the financial organization, the few data available highlight two types of transaction:

- Inter bank: for remuneration of agents or suppliers outside the network. In other words, transfers between suppliers, intermediaries and/or front companies. Thus, the contract between SMB and SCOPE appears to have been financed conventionally, probably through letters of credit or bills of exchange.
- Cash transactions within the network and with customers. The amounts thus obtained (possibly in several payments) could then have been deposited in bank accounts of emerging or offshore countries before transactions were made between banks for final beneficiaries. Even if payments were made in cash, some operations could have been made through written contracts between Khan (and/or Tahir) and the intermediary concerned."

An illustration from the Centre for Non-proliferation Studies concerning gas centrifuge components to Libya illustrates the puzzle of proliferation of WMD – and also illustrates why detection is so difficult:



Many centrifuges are needed and a numerous components are required for each centrifuge. Several entities will be involved in the different networks used to acquire the components – including in payments and financing – but if someone sells e.g. 10 vacuum pumps to a country which is not a country of special concern one may not have WMD as the first thought.

ANNEX 4: RELEVANT CONVENTIONS AND INITIATIVES

1. Nuclear Non-Proliferation

1.1 INTERNATIONAL TREATIES

Treaty on the Non-Proliferation of Nuclear Weapons (NPT)

The NPT aims at preventing the spread of nuclear weapons outside the five States which are recognised by the NPT as nuclear weapon States (NWS): France, the People's Republic of China, Russia, the United Kingdom, and the United States. These NWS have agreed not to transfer nuclear weapons or other nuclear explosive devices and not in any way to assist, encourage, or induce a non-nuclear weapon state (NNWS) to acquire nuclear weapons.

NNWS which are party to the NPT agree not to receive, manufacture or acquire nuclear weapons or to seek or receive any assistance in the manufacture of nuclear weapons. They also agree to accept safeguards by the International Atomic Energy Agency (IAEA) to verify that they are not diverting nuclear technology from peaceful uses to nuclear weapons. In return, NNWS are granted the inalienable right to use nuclear energy for peaceful purposes.

190 States are party to the NPT.

1.2 INTERNATIONAL ORGANISATIONS

The International Atomic Energy Agency (IAEA)

The IAEA is an independent intergovernmental organisation under the aegis of the United Nations and is the world´s centre of cooperation in the nuclear field. The Agency works with its Member States and multiple partners worldwide to promote safe, secure and peaceful nuclear technologies. Three main pillars – or areas of work – underpin the IAEA´s mission: Safety and Security; Science and Technology; and Safeguards and Verification. The IAEA reports annually to the UN General Assembly and, when appropriate, to the UN Security Council. It also works closely with the World Customs Organisation on security and trade issues, the Universal Postal Union on mail security issues, and Interpol and Europol in combating illicit nuclear trafficking.

The IAEA conducts inspections in countries that have safeguards agreements with a view to verifying that those countries are using nuclear material peacefully and providing recommendations on ways to improve the accountability and control of nuclear material. It also provides training at the international, regional and national levels concerning the security of nuclear and radioactive materials. In addition, the IAEA helps countries to obtain the necessary equipment for physically protecting nuclear and radioactive materials, including equipment that assists in the detection of cross-border smuggling of such materials.

In 1997, a model Additional Protocol to the NPT was produced by the IAEA. The adoption of the Additional Protocol is a voluntary measure for non-nuclear weapons states parties, designed to strengthen and expand existing IAEA safeguards for verifying that they only use nuclear materials and facilities for peaceful purposes.

1.3 EXPORT CONTROL REGIMES

The Nuclear Suppliers Group (NSG)

The NSG is one of four informal and voluntary export control regimes. It consists of a group of nuclear supplier countries which create Guidelines for exports of nuclear goods and nuclear related dual-use goods. The NSG Guidelines aim to ensure that nuclear trade for peaceful purposes does not contribute to the proliferation of nuclear weapons or other nuclear explosive devices, and to mitigate the risk of acts of nuclear terrorism. Participants seek to coordinate national export licensing efforts to prevent nuclear proliferation.

The NSG has 45 participants. The European Commission participates as an observer.

The Zangger Committee

The Zangger Committee, also known as the "NPT Exporters Committee", contributes to the interpretation of article III, paragraph 2, of the Nuclear Non-Proliferation Treaty (NPT) and thereby offers guidance to all parties to the Treaty. The main significance of this paragraph is that parties to the Treaty should not export, directly or indirectly, nuclear material and equipment to non-nuclear-weapon States unless the export is subject to International Atomic Energy Agency (IAEA) safeguards. By helping to establish and update control lists of nuclear equipment, the Zangger Committee helps to prevent the diversion of exported nuclear items from peaceful purposes to nuclear weapons or other nuclear explosive devices.

2. Missiles

2.1 EXPORT CONTROL REGIMES

The Missile Technology Control Regime (MTCR)

The MTCR is one of four informal and voluntary export control regimes. It aims to ensure the non-proliferation of ballistic missiles, cruise missiles and other unmanned delivery systems capable of delivering weapons of mass destruction. Partners of the MTCR seek to coordinate national export licensing efforts aimed at preventing the proliferation of these means of delivery by defining Guidelines for the export of relevant systems and related dual-use goods.
The MTCR has 44 partners.

3. Chemical Weapons

3.1 INTERNATIONAL TREATIES

The Chemical Weapons Convention (CWC)

The CWC prohibits all development, production, acquisition, stockpiling, transfer, and use of chemical weapons. It requires each State Party to destroy chemical weapons and chemical weapons production facilities it possesses, as well as any chemical weapons it may have abandoned on the territory of another State Party. The CWC does not prohibit production, processing, consumption, or trade of related chemicals for peaceful purposes, but it does establish a verification regime to ensure such activities are consistent with the object and purpose of the treaty.

The verification provisions of the CWC not only affect the military sector but also the civilian chemical industry, world-wide, through certain restrictions and obligations regarding the production,

processing and consumption of chemicals that are considered relevant to the objectives of the Convention. The most important part of the verification regime, however, are regular inspections which are conducted by the Organisation for the Prohibition of Chemical Weapons (OPCW). The CWC maintains only controls on chemicals, but does not control production technology.

183 States are party to the CWC.

3.2 International Organisations

The Organisation for the Prohibition of Chemical Weapons (OPCW)

The Organisation for the Prohibition of Chemical Weapons (OPCW) is responsible for the implementation of the Convention. The OPCW is mandated to ensure the implementation of its provisions, including those for international verification of compliance with the Chemical Weapons Convention. It also performs monitoring and conducts inspections to verify that declared chemical weapons production facilities have been deactivated and declared weapons stockpiles destroyed. Inspectors also verify the consistency of industrial chemical declarations and monitor the non-diversion of chemicals for activities prohibited under the Chemical Weapons Convention.
To address the threat of chemical terrorism (*i.e.* the use of chemical weapons by terrorists to threaten, injure, or kill people), the OPCW works towards chemical disarmament and to ensure that chemicals which are produced for peaceful purposes are not misused.

3.3 Export Control Regimes

The Australia Group

The AG is one of four informal and voluntary export control regimes which controls chemical and biological substances, as well as production equipment. The Group meets annually to discuss ways of increasing the effectiveness of participating countries' national export licensing measures to prevent would-be proliferators from obtaining materials for CBW programmes.

The AG has 41 participants including the European Commission.

4. Biological Weapons

4.1 International Treaties

The Biological and Toxin Weapons Convention (BTWC)

The Convention bans the development, production, stockpiling, acquisition and retention of microbial or other biological agents or toxins, in types and in quantities that have no justification for prophylactic, protective or other peaceful purposes. It also bans weapons, equipment or means of delivery designed to use such agents or toxins for hostile purposes or in armed conflict.

156 States are party to the BWC.

4.2 Export Control Regimes

The Australia Group (see section 3.3)

5. Conventional Weapons

5.1 EXPORT CONTROL REGIMES

The Wassenaar Arrangement (WA)

The WA is one of four voluntary and informal control regimes and concentrates on export controls for conventional arms as well as related dual-use goods and technologies. The WA contributes to regional and international security and stability and aims at preventing destabilising accumulations of conventional arms. The WA follows agreed Guidelines and Procedures, including the Initial Elements, the founding document of the WA. The 40 WA participating States implement export controls on the basis of WA control lists, agreed guidelines and best practices via national legislation and report transfers and/or denials of specified controlled items (arms and dual-use gods).

The WA has 40 participating States.

6. Other non-binding Measures

The Proliferation Security Initiative (PSI)

The Proliferation Security Initiative (PSI) is an informal network of cooperating nations that are committed to stopping the trafficking of weapons of mass destruction, their delivery systems, and related items to and from states and non-state actors of proliferation concern. The PSI was created in 2003 as an innovative complement to more formal non-proliferation regimes. More than 85 countries have endorsed the PSI Statement of Interdiction Principles (4 September 2003). PSI participating states develop a broad range of legal, diplomatic, economic, law enforcement, and other tools to assist in interdicting shipments of proliferation concern consistent with national legal authorities and relevant international law and frameworks. To date, PSI partner states have conducted over 30 interdiction training exercises involving more than 70 nations. These exercises increase the interoperability of PSI participants, improve interdiction decision-making processes, and enhance the interdiction capacities of participating states.

ANNEX 5: ELEMENTS OF EXPORT CONTROL SYSTEMS

Export control systems can vary from jurisdiction to jurisdiction, including each jurisdictions lists and due diligence for controlled goods. At a minimum, jurisdictions that implement export controls tend to licence the exports of certain goods, as identified by the four export control regimes. A truly comprehensive regime may require catch-all clauses. Many jurisdictions may consider the following elements in their export control systems:

Preventive export control

- International information sharing.
- National open source information (websites, conferences, seminars, etc.).
- Outreach activities to the private sector:
    - Legal basis
    - International sanctions and UN-resolutions
    - Procurement methodology
    - Countries/entities/organisations/persons of concern
    - Red flags
    - End-user/purchaser check

Export control

- Export authorisation.
- Special authorisation for certain products, *e.g.* weapons, chemicals or CBRN-material.
- Customs control – screening:
    - Licenses
    - Certificates
    - Shipping documents
    - Other documents
- Technical assessment of exported items
- Customs control – border:
    - Spot checks
    - Front companies
    - Diversion
    - Trans-shipment and transit cargo

Investigative export control authorities

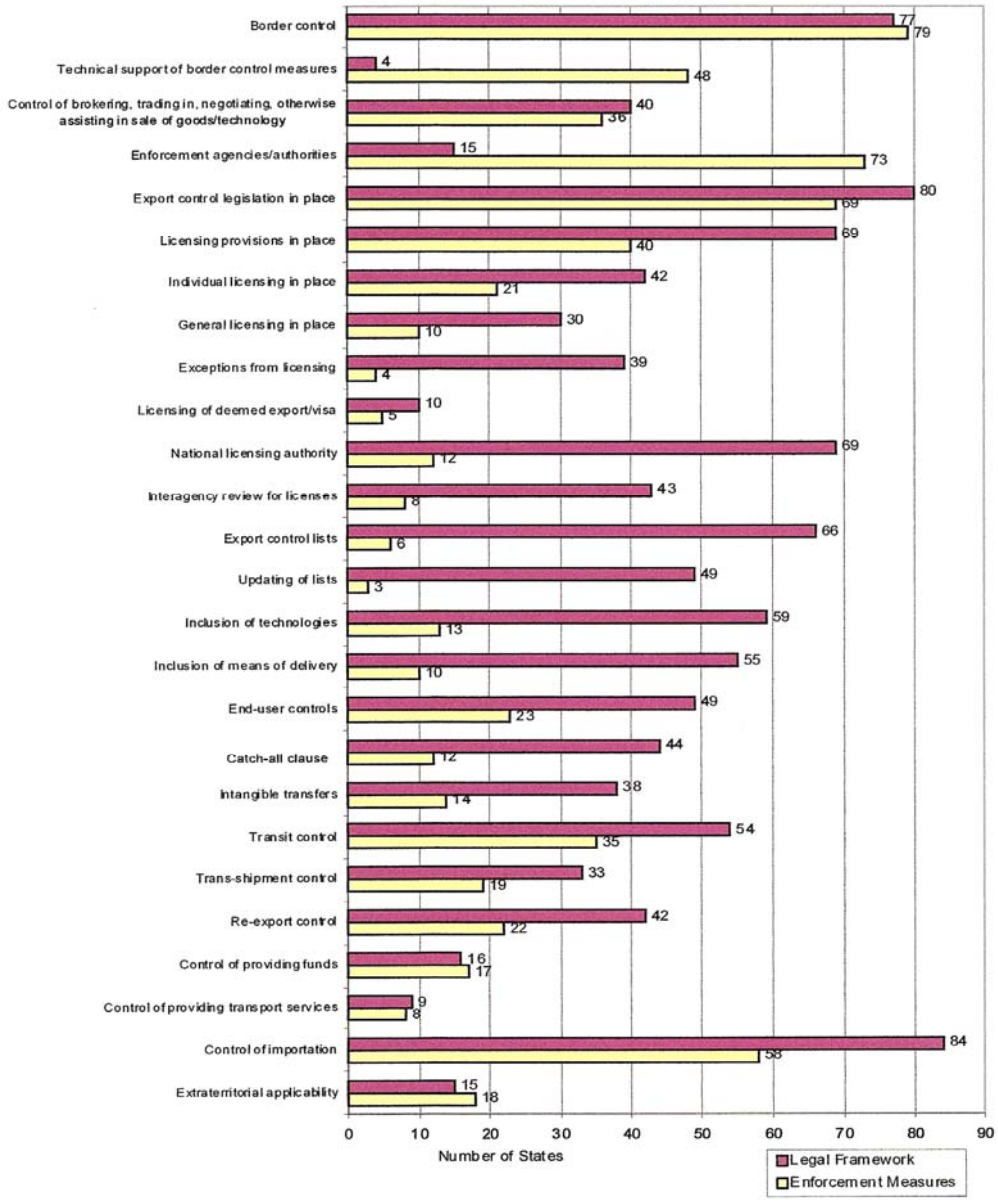
- Licensing authorities:
    - Applications
    - Denials
- Customs:
    - Authorisations
    - Surveillance
- Intelligence
- Security
- Police authorities
- Other public authorities

ANNEX 6: EFFECTIVE BORDER AND EXPORT ENFORCEMENT

Annex IX

States reporting on national legal framework and enforcement measures under paragraph 3 (c) and (d)

Border and export controls



ANNEX 7: INFORMATION IN DOCUMENTS WHICH MIGHT BE CALLED FOR AND PRESENTED UNDER A LETTER OF CREDIT PRESENTED AS PART OF A DOCUMENTARY COLLECTION

Note. Similar documents to those described below may be presented as part of documentary collection order, but unlike the L/C scenario *i)* without any reference to a letter of credit *ii)* the draft should not be drawn on the bank and *iii)* the bank will not be examining the documents for the same detailed consistencies.

The *Draft* or Bill of Exchange (not always required) provides formal evidence of debt under a letter of credit and is presented with all other documents unless stipulated otherwise. A Draft may contain information on:

- Value of Draft, date of payment and payment terms *e.g.* "at sight", "30 days after sight", "60 days after Bill of Lading Date".
- Date Exporter presents documents to the "available with" Bank (not normally required).
- Letter of credit reference number assigned by the Issuing Bank (if required by credit).
- Date the letter of credit was issued (not normally found on a draft).
- Name and address of the Issuing Bank (if the drafts are drawn on the issuing bank).
- Name and address of the bank on which the Drafts are to be drawn.
- Signature of an authorised signing officer of the Company and the Beneficiary's name as shown on the letter of credit.

The *Commercial Invoice* is the accounting document through which the exporter charges the importer for goods and services purchased. The Invoice gives details about:

- Merchandise weight, quantity and price and currency.
- The name and address of Exporter and the Importer.
- The number of copies presented and signed if required.
- The trade term listed, *e.g.* C.I.F., F.O.B etc.

The *Transport Document* (or Bill of Lading, Airway Bill, Railway Consignment Note) is a document issued by the carrier that describes the goods that have been accepted for carriage. In some forms, the Bill of Lading may also act as a document of title to the goods and should include information that is consistent with the letter of credit:

- Information on the merchandise (usually a general description).
- The points of loading and discharge.
- To whom the Bill of Lading is consigned.
- The date of shipment.

The *Insurance Document* is a guarantee in part or in whole (depending on the terms and conditions) by an insurance company, specifying the goods shipped on a named vessel, indicating the applicable coverage, and showing to whom loss is payable.

The *Certificate of Origin* notes the country where the goods were produced. The *Certificate of Inspection* offers an opinion that the specified quality and quantity related conditions have been met. These documents should be dated on or before the Bill of Lading date.

A *Packing List* is usually supplied by the exporting shipper in cases where a diversified shipment is packed in several packages or containers. The list will show the contents of each box or case identified by a specific number. A *Weight Certificate* is supplied by the Exporter, at the request of the Importer. It certifies the weight of each large unit in a shipment or the net and gross weights of packages containing smaller units. It is of particular value when the price of the goods is based on weight and, also, is often used by the carrier in arriving at the weight to be recorded on the Bill of Lading as a basis for the freight charges.

- The quantity of units/weights should match the Commercial Invoice (this may or may not agree based on how the weights are calculated by the various parties involved).
- The breakdown of merchandise/weight per carton, package or container should be shown if requested in the letter of credit.

Appendix OO:

FATF, *Money Laundering & Terrorist Financing Vulnerabilities of Commercial Websites and Internet Payment Systems* (Paris: FATF, 2008)

Financial Action Task Force

Groupe d'action financière

MONEY LAUNDERING & TERRORIST FINANCING VULNERABILITIES OF COMMERCIAL WEBSITES AND INTERNET PAYMENT SYSTEMS

18 June 2008

TABLE OF CONTENTS

EXECUTIVE SUMMARY

1. Criminals have shown adaptability and opportunism in finding new channels to launder the proceeds of their illegal activities and to finance terrorism. As the Internet becomes more and more a worldwide phenomenon, commercial websites and Internet payment systems are potentially subject to a wide range of risks and vulnerabilities that can be exploited by criminal organizations and terrorist groups.

2. The present study analyses money laundering and terrorist financing (ML/TF) risks associated with commercial websites and Internet payment systems with the focus on mediated customer-to-customer websites as the most vulnerable to abuse because of their popularity, accessibility (to the public), and high volume of cross border trade transactions. The analysis also provides a number of case studies that illustrate how mediated customer-to-customer websites can be exploited for ML/TF purposes.

3. The study highlights the following vulnerabilities of commercial websites and Internet payment systems: non face-to-face registration, possible anonymity of the users, speed of transactions, limited human intervention, high number of transactions, international presence, limited jurisdictional competences, difficulties for traditional financial institutions to monitor and detect suspicious financial transactions with the consequence that their abilities in the detection of suspicious financial transactions, when an Internet payment service provider is used, could be affected.

4. The study indicates that some of the ML/TF risks associated with trade-based money laundering[1] and non face-to-face business and financial transactions also apply to commercial websites and Internet payment systems. The financial transactions that are initiated from a bank account or a credit card (which is the majority of online payments) already involve a customer identification process as well as transaction record keeping and reporting obligations. While low value transactions do not necessarily equate to low risk, these transactions are subject to the regulatory controls already applicable to the financial sector and may be consequently less risky. Regarding the risks associated with the non-face-to-face registration and the possible anonymity of the users, the study highlights the need for online identity verification solutions (the electronic identity card used in certain countries for instance) to help commercial websites and Internet payment service providers mitigate the risk of criminal activity. The report also indicates that if Internet payment service providers adequately monitor the financial transactions of their customers, monitoring for and acting on deviations from the customer transaction profile, the lack of face-to-face contact at the beginning of the relationship with the commercial website and Internet payment service provider may not constitute a problem. Online and offline retail merchants and payment services should have comparable AML/CFT obligations.

5. It is also important that efforts to fight ML/TF by commercial websites and Internet payment service providers in different countries not be hampered by divergent privacy legislation, potentially interfering with the amount of customer information that service providers could exchange regarding suspected ML/TF.

[1] FATF (2006b).

6. Although the challenges to identifying terrorist financing apply equally to Internet payment systems (the suspicions being mostly based on name matching with the names provided by the competent authorities), it is not always necessary for Internet payment service providers to identify TF in their suspicious transactions reports (STRs) in order to help counter terrorist financing. Any suspicious activity is important to report regardless of the type of activity. Some Internet payment service providers have put in place systems to detect, monitor and analyse suspicious transactions - even for small amounts.

7. Concerning the risk-based approach to combat ML/TF, we can refer to the June 2007 FATF Guidance which states that : "By adopting a risk-based approach, competent authorities and financial institutions are able to ensure that measures to prevent or mitigate money laundering and terrorist financing are commensurate to the risks identified. This will allow resources to be allocated in the most efficient ways. The principle is that resources should be directed in accordance with priorities so that the greatest risks receive the highest attention." Applying this principle to online transactions, the private sector may be allowed to consider low value consumer payments initiated from a financial institution or credit card account (which require customer identification and verification procedures, as well as transaction record-keeping and reporting policies) to be of lower risk than transactions initiated through service providers without anti-money laundering and counter-terrorist financing (AML/CFT) obligations.

8. The risk of fraud and the sale of illegal goods are among the concerns of commercial websites and Internet payment systems. These concerns are among the motives for commercial websites and Internet payment systems to secure their communications, websites and payment systems. In some jurisdictions, online commercial websites are not as such required to detect or fight against ML/TF, but have a market incentive to detect fraud.

9. Some commercial websites and Internet payment service providers, aware of the risk of being used for illegal activity, have set up departments to screen and monitor the transactions of their customers, using a risk-based approach. In addition to monitoring for fraud, some Internet payment service providers have also set up AML/CFT mechanisms. Best practices in the sector, including customer due diligence, monitoring transactions, not accepting anonymous forms of payment (cash for instance) imposing transactions limits, maintaining transactions records, and reporting large or suspicious transactions to the competent authorities, could be helpful for other parties of the private sector.

10. The collaboration between commercial websites and Internet payment service providers to exchange information on commercial transactions underlying financial transactions is a factor which mitigates ML/TF risks, as well as risk of fraud. Legal dispositions encouraging such exchange of information could be very useful.

11. The report concludes that, as long as the sector and the relevant competent authorities understand the potential vulnerabilities associated with commercial websites and Internet payment systems and appropriate risk-based measures with regard to customer identification, record keeping and transaction reporting are taken, the mentioned issues may not necessarily constitute a higher risk for the online sector than for the offline sector.

12. The project team believes that even though awareness of ML/TF amongst major players in the online sector is increasing, due to efforts made by regulators and trade associations, efforts need to be made to increase this awareness, particularly regarding the mechanisms of ML/TF.

13. Looking ahead, the study identifies areas which could be the focus of future efforts in order to improve the capacity to cope with the identified ML/TF risks: *i)* building a better understanding amongst governmental bodies and the private sector of online ML and TF risks and related typologies and developing guidance for implementing mechanisms to detect suspicious transactions, *ii)* making traditional financial institutions aware that they still have an important role to play in the detection and

the monitoring of suspicious financial transactions, even when the payment is made via an Internet payment service provider, *iii)* given the international character of commercial websites and Internet payment systems, international cooperation is a key factor in the fight against ML and TF, *iv)* explore further ways Financial Intelligence Units (FIUs) can enhance the exchange of information and data pertaining to the criminal misuse of commercial websites and Internet payment systems. Finally, given the international character and presence of Internet, it is difficult to determine which jurisdiction has regulatory authority over an Internet payment service provider, and how enforcement action can be applied if there are violations. World based Internet payment service providers have locations and licences in different countries and regions. It is consequently important that governments impose similar regulations, requiring customer identification, due diligence, record keeping and transaction reporting, to avoid certain Internet payment service providers choosing the country with the poorest regulations or one that is not at all regulated.

INTRODUCTION

14. Criminals use a wide variety of mechanisms to launder the proceeds of their criminal activities and to finance terrorism, including using the formal financial system, the physical movement of cash by couriers and the movement of value through trade.

15. Over the years, the Financial Action Task Force (FATF) has focused considerable attention on these mechanisms and their related typologies. Hopefully, this effort is increasing the vigilance and experience of both the private and public sectors, making it harder for criminals to launder the proceeds of their criminal activities and to finance terrorism, using identified methods.

16. However, criminals have shown adaptability and opportunism in finding new channels to launder the proceeds of their illegal activities and to finance terrorism. In this context, commercial websites and Internet payment systems appear to be subject to a wide range of vulnerabilities that can be exploited by criminal organizations and terrorist financiers.

17. Faced with the risk that this sector can be used to launder money or finance terrorism, government officials have been called on to start regulating electronic commerce and in particular Internet payment systems.

18. For the purpose of this study, commercial websites and Internet payment systems constitute the areas of study, with a focus on mediated customer-to-customer commercial websites. The overriding objective of this study is to increase public and private sector understanding of ML/TF risks associated with commercial websites and Internet payment systems and to raise global awareness of the methods used to launder the proceeds of crime or finance terrorism using these conduits. Largely based on case studies, an analysis of ML/TF risks associated with commercial websites and Internet payment systems constitutes a large part of the research.

19. The study does not want to replace or duplicate the FATF study on the New Payment Methods, but could be used within the framework of supplementing that report.

20. Ten countries have joined the project team and have contributed to the study: Australia, Belgium (as project leader), China, Hong Kong China, Finland, France, Luxembourg, the Netherlands, the United States and the United Kingdom. Several countries made presentations during the workshop held in Bangkok, Thailand from 28 November 2007 until 30 November 2007 in the framework of the typology exercise of the FATF. A questionnaire has been circulated to the members of the project team. The following other countries participated in the workshop and also contributed to the study: Bangladesh, Chinese Taipei, the Fiji Islands, Germany, India, Japan, New Zealand, the Philippines, South Africa, Russia, Spain, Sweden, Switzerland and Thailand. Various elements of the presentations and replies to the questionnaire have been incorporated into the report.

21. The study has also relied on the experience and cooperation of the private sector. Representatives of eBay and PayPal attended the workshop and participated to the study. The UK based company PrePay Technologies as well as the Electronic Money Association (EMA), a European trade association based in London representing a group of 33 e-money issuers and payment service providers, also participated to the project and contributed to the study.

22. The private sector has also been consulted on the report and the conclusions of the study. A meeting was organised by the project leaders with some members of the project team and the above mentioned members of the private sector, on 4 April 2008 in Brussels. The private sector which contributed to the study received a copy of the report and has been given the opportunity to comment. The comments of the private sector have been taken into account when considered relevant.

23. Finally, the risks and vulnerabilities identified by the study will be useful to the FATF study on Money Laundering Threat Analysis Strategies.

NATURE OF COMMERCIAL WEBSITES AND INTERNET PAYMENT SYSTEMS

Definitions

24. This section provides a functional definition of the different classes/types of commercial websites. Commercial websites can be divided into five categories[2]:

- Mediated customer-to-customer, sites that allow private individuals to sell to one another via an online marketplace.
- Mediated business-to-customer, sites that allow multiple merchants to sell to consumers via an online marketplace.
- Non-mediated customer-to-customer (*i.e.* Bulletin board services and online classifieds), sites that only allow customers to advertise goods they want to sell.
- Direct business-to-customer, merchants that sell goods to consumers via their own websites.
- Direct business-to-business websites, merchants selling to merchants.

25. The present study focuses on the first category of commercial websites. Mediated customer-to-customer sites are popular, easy to access, open to the public, and facilitate a high volume of cross border trade transactions. As such these sites are easily susceptible to criminal misuse. This type of commercial website facilitates transactions between private parties as opposed to simply providing seller contact information with any transactions occurring off-line.

26. Online classified-advertising sites, bulletin boards and social networking sites often allow sellers to post items for sale with the transaction taking place offline. While these businesses facilitate the introduction and communication of buyers and sellers, they do not play a significant role in the final sale nor financial settlement. This type of "non-mediated" person-to-person website is therefore not often in a position to see any aspect of the transaction process after the introduction of buyer and seller.

27. "Mediated" websites, on the other hand, play an active role in the completion of underlying transactions, such as by setting the selling price through an online auction, providing some form of verification process for buyers and sellers (including aggregating feedback from other customers), or facilitating financial settlement of transactions (such as providing escrow, or similar intermediary, services). While non-mediated websites may be abused for illegal purposes such as fraud, this paper focuses on mediated businesses that play an active role in facilitating transactions that could be abused specifically for ML or TF.

28. Mediated business-to-customer websites are also subject to AML/CFT risks. A website can sell clothing much of the day, and appears legitimate to its Internet payment service provider, but the website address (URL) may in fact be used to sell child pornography material for several hours each night. In some cases, businesses may allow 3rd party merchants to sell their own goods and services through the business's online portal.

[2] It is worth mentioning that certain commercial websites belong to more than one category.

29. Commercial websites and Internet payment service providers can be used for illegal transactions, including the sale of illegal drugs, weapons, firearms, counterfeit products and child pornography, or to facilitate fraud. Internet payment service providers can be used afterwards to launder the proceeds of these illegal activities.

30. For purposes of this report, the term Internet payment system is used to broadly describe an Internet-based company that provides financial transaction services to consumers. Furthermore, in most instances, Internet payment systems consist of non-bank financial institutions that may or may not be subject to regulatory oversight depending upon the legal jurisdictions of where such systems provide services to consumers. Consumers are attracted to Internet payment systems because such systems often are convenient, and serve as an alternative to making payments via a bank account or credit card which may not be available to everyone.

31. Considering the risks affecting commercial websites and Internet payment service providers, the project team considers that a clear distinction must be made between the business activities of commercial websites and the payment associated with these commercial activities (Internet payment services), even if some commercial websites are apparently providing both commercial activities and the associated financial service.

Main characteristics

32. This section lists the main characteristics of the type of commercial websites studied and the Internet payment systems linked to these websites.

Commercial websites

33. Commercial websites usually have some if not all of the following characteristics[3]:

- A simple Internet connection is sufficient to open an Internet account with a commercial website and to buy and sell items on the Internet.
- Websites can potentially be accessed from any location in the world.
- A customer can gain access from his own Internet connection or from the Internet connection of a third party (*e.g.* cyber cafes or phone shops that provide Internet access) or another access point that is not registered to the customer.
- A customer can register in one country and connect from another country.
- Registration is very easy and very rapid (only a few minutes are necessary to register).
- Registration is non face-to-face.
- A limited amount of information is required to register.
- No procedure to verify customer identification in certain cases.
- Anonymous e-mail addresses may be used as customer contact information.
- Commercial transactions are performed very rapidly. E-mail messages are used to inform the seller that the item he put on sale has been sold.
- Customers have access to a wide range of items (from small value items to high value items) on sale on a wide range of commercial websites located all over the world.
- Goods can be sold for either a fixed or variable price. For example, on auction sites, the price may be set by the seller or by different buyers, creating uncertainty over the true market value of the goods being sold.

[3] Some of these characteristics are characteristics of the Internet and also apply to Internet payment service providers

- Commercial websites may facilitate sale and financial settlement but leave delivery arrangement to buyers and sellers. Often, the only indication of non-delivery of goods will be if the buyer complains.

34. Some commercial websites and Internet payment service providers apply a risk-based approach when identifying customers. If the risk profile of the customer and transaction are high, additional verification methods are applied (simplified Customer Due Diligence (CDD) vs. enhanced Customer Due Diligence (CDD). The mechanisms of verification can be adapted to the country of registration and changed as necessary to adapt to criminal techniques to bypass identification and verification processes. The private sector representatives who participated in the study indicated that criminals do attempt to circumvent these processes and although none of the methods had a zero-failure rate, they were effective on a risk-weighted basis. In certain countries, online customer identification mechanisms using an electronic identity card are used and reduce the risk of identity theft.

Internet payment systems

35. As with any type of online business, the structure and operations of a given Internet payment system may vary drastically. However, in most cases such systems usually require a consumer, or user, to register with the Internet payment system before any transactions can be effected by the system. This registration process typically involves the collection and verification of some identification and/or contact information. For example, an Internet payment system may require a user to input his or her email address, telephone number, street address, and information needed to create a password and user identification (User ID) that will be required for the user to log into the Internet payment system.[4] Other information may be required based upon the business practices of the Internet payment system largely depending upon the type of services provided and the risk management processes required by jurisdictional authorities. The information collected is then verified using a variety of methods, ranging from the examination of paper copies of identity documentation to the use of online identity verification solutions provided by third parties.

36. Before a user of an Internet payment system can effect a transfer of funds through the system he generally must first fund the transfer. Funding a transfer through an Internet payment system may involve funding an "account" from which funds will be drawn for subsequent transactions or transfers, or providing the Internet payment system with the equivalent amount of funds the user wishes to transfer. Depending upon the operations of a given Internet payment system, the user may have several options for funding a transaction, and may not be limited to the use of the user's credit card or personal bank account. To avoid fraud or any form of criminal misuse, the Internet payment service provider may attempt to verify that the customer has control over and is authorised to use certain funding methods, such as a credit card or bank account. Once the user has successfully been verified, the user is free to conduct transactions through the Internet payment system.

37. It is important to note that in order for an Internet payment system to provide transaction services for their users, they oftentimes must intersect with traditional banking and settlement systems. For example, an Internet payment system that accepts major credit cards as a funding source from its users usually is required to maintain a merchant account at a financial institution. Through this merchant account the Internet payment system can receive funds from its users, via major credit card networks. Such funds can then be applied to a transaction instruction that has been initiated by a user within the Internet payment system. A similar type of relationship typically exists with an Internet payment system that accepts funds from its users via the user's personal bank account. Once again, the Internet payment system is typically required to maintain an operating account at a bank where the

[4] Note that at the time of registration an Internet payment system may not require a user to input their personal identification number (*e.g.* social security number, passport number, etc.) or date of birth. Based upon the best practices of a given Internet payment system such information may not ever be collected from a user.

transfer of funds from a user's personal banking account can be received. Typically these types of transfers are effected through clearing systems.

38. Internet payment systems may support various types of payment methods for consumers purchasing goods and/or services online from a business website (commonly referred to as Consumer-to-Business transaction or C2B transaction) and businesses purchasing goods and/or services online from another business (a Business-to-Business or B2B transaction)[5]. However, the type of transaction that is of concern for potential ML and TF vulnerability is a person-to-person (P2P) transaction, involving a transaction between two consumers, as when buyers and sellers interact via a mediated website.

39. Other types of funding could be provided directly by certain commercial websites (transactions not powered by an Internet payment provider) or requested by consumers selling items on P2P commercial websites:

- Credit cards.
- Prepaid scheme-branded cards[6] (anonymous in certain countries).
- Wire transfers (in favour of the bank account of the commercial website for further transfer to the seller).
- Wire transfers to the seller bank account (with a message accompanying the transfer and referring to a sale on the Internet).
- Gift cards or gift cheques (anonymous and transferable).
- Cheques (sent to the commercial website in certain countries, to the customers in other countries).
- Bank cheques.
- Postal orders/money orders in favour of the seller[7].
- Money transfers in favour of the seller.
- Cash is accepted on certain commercial websites.

Payment in cash can be made directly between buyer and seller, but this mechanism is not believed to be regularly used.

40. With Internet payment systems, the transaction takes place electronically very rapidly.

41. For global stakeholders (commercial websites and Internet payment systems available in different countries), the policies, practices, facilities (commercial and payments) made available to customers, may be different depending on the location of the parent company, local branch, or local website.

---

5 Some commercial websites and Internet payment service providers offer their customers the opportunity to use a more secured method of payment called the "third party of confidence". Using this facility (against the payment of a commission), the buyer knows that the funds for his purchases on Internet will be made available to the seller only if the goods purchased have been delivered and if he is satisfied that the goods correspond to the description on the commercial website.

6 Banks in certain countries offer prepaid scheme-branded cards (preloaded cards) to customers for whom banks do not want to open a credit limit (unemployed or persons without a regular income).

7 Certain commercial websites advise their users to be cautious when accepting money orders as payment facilities when purchasing items on the Internet, as experience has shown that money orders are often used by criminals who commit fraud (selling items they do not deliver for instance).

MONEY LAUNDERING AND TERRORIST FINANCING CASE STUDIES

42. The following section gives an overview of case studies involving the use of commercial websites and Internet payment systems. This section is divided into two subsections *i)* actual case studies and *ii)* potential vulnerabilities. Potential vulnerabilities are given to provide guidance to law enforcement agencies, financial intelligence units and the private sector.

Actual case studies

43. This subsection provides a number of case studies that illustrate various ways that commercial websites and Internet payment systems have been exploited for ML/TF purposes.

44. Commercial websites and Internet payment systems can be used to sell/purchase illegal products, like drugs or counterfeit goods. Sometimes, the sold/purchased dual-use or precursor products are not *per se* illegal but correspond to dual use goods such as products used to make explosive, weapons or other controlled goods. Postal and express freight are frequently used to distribute these goods.

45. Commercial websites and Internet payment systems can be used for committing illegal transactions, fraudulent transactions or illegal activities, activities outside of the FATF's remit. Nevertheless, various case studies indicate that commercial websites and Internet payment systems are also used to collect the proceeds of these illegal activities, and further to facilitate ML and TF transactions (by making the funds disappear: transferring the funds on a bank account in the country of the criminals or abroad, using them for other purchases on commercial websites,…).

Case study: The use of commercial websites and Internet payment systems to sell drugs

In one file, the bank account in Belgium of an individual was credited by wire transfers from an Internet payment service provider (small amounts for a total of EUR 4 700). The subject was under investigation in another European country for the sale of drug starters. Information from law enforcement confirmed that the subject was selling drug starters via a commercial website.

Source: Belgium.

46. In the above-mentioned case, the Internet payment service provider was used to collect the proceeds of the illegal activities and may afterwards be used to perpetrate the illegal activities and operations. The criminal could use the proceeds of his illegal activities to buy new drug starters and continue to carry out his illegal activities via the commercial website.

Case study: The use of commercial websites and Internet payment systems to sell counterfeit goods

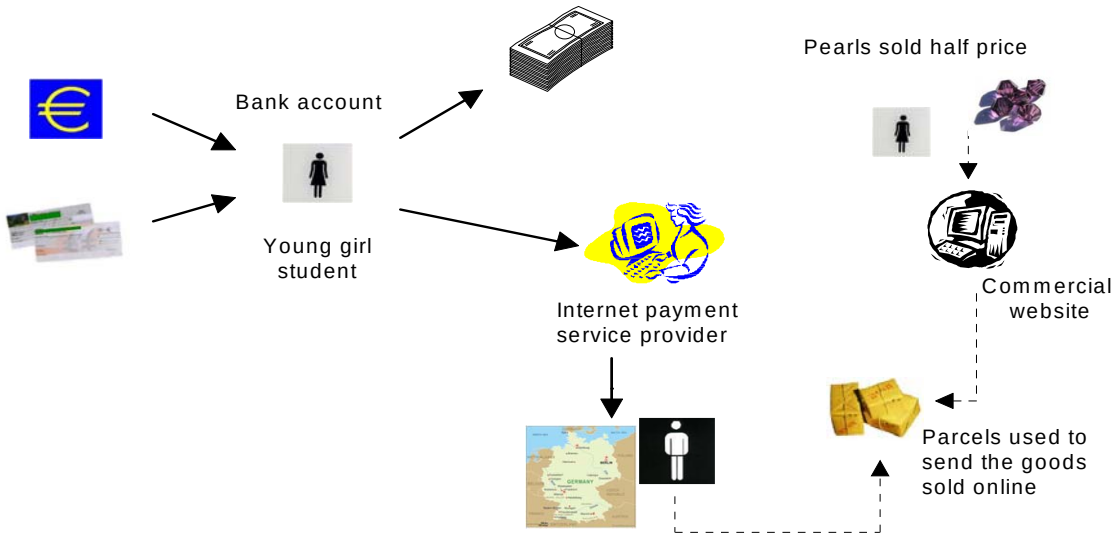
A bank reports the suspicious transactions of a young girl. From January 2005 to August 2005 (eight months), the bank account of the young girl, student, was credited by wire transfers and cheques written out by individuals located all over France. The amount of each cheque was rather small (EUR 20 to 40). Regarding the debiting operations, the girl made cash withdrawals and wire transfers bearing the mention “Internet payment provider bills”. The purchases amounted to a total of EUR 6 340 split into 43 operations.

In September 2005, she began to use a credit card so that it became more difficult for the bank to understand and analyse her transactions. Only a global amount of payments is registered monthly on her bank account.

Investigations showed that, from September 2005 to March 2006 (eight months), she made 63 purchases online for a total amount of EUR 39 282.24.

The young lady was selling counterfeit pearls of a famous brand at half price. She was using a provider in another European country which sold her parcels used to send the goods she had sold online.

Over 16 months, she earned more than EUR 43 000, roughly more than EUR 2 800 a month.



Source: France

Case study: The use of commercial websites and Internet payment systems to sell explosive precursor products

A foreign FIU communicated/disclosed to the Belgian FIU that they received a STR from an Internet payment service provider concerning a national from a European country selling the following items on an associated commercial website: potassium, chlorate, barium nitrate, strontium nitrate, ammonium nitrate. These items are considered as dual-use goods, because, put together, they can be used to make explosives. The goods were sold to customers in Eastern Europe.

The criminals planned to collect the proceeds of their “illegal” sales on the Internet through the Internet payment service provider and consequently to launder these proceeds, also using the Internet payment service provider.

Source: Belgium.

Case study: The use of commercial websites and Internet payment systems related to weapons trafficking

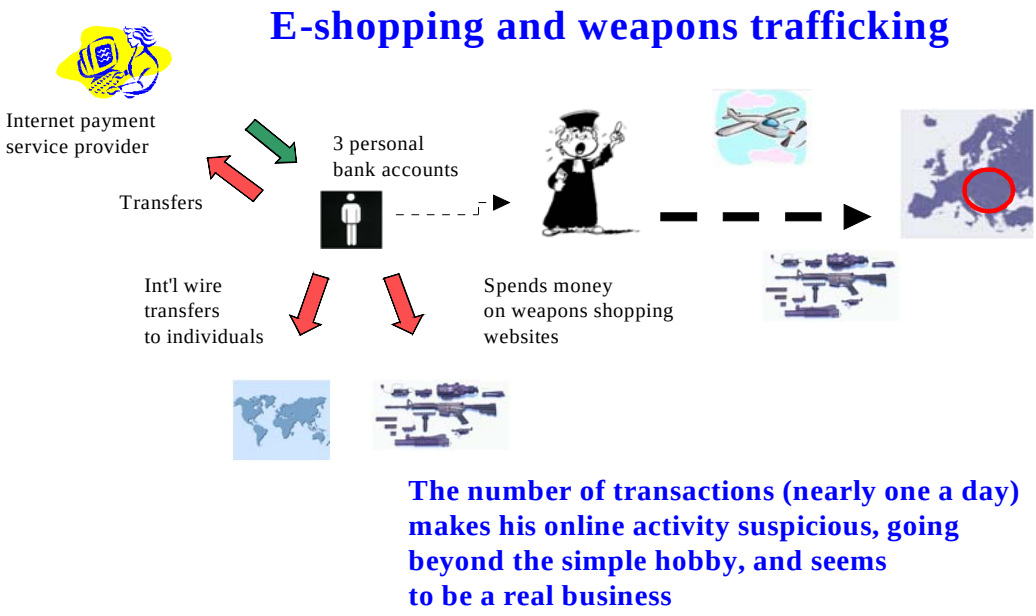
A case reported by a bank involves a lawyer receiving and initiating a lot of Internet payments on and from his three personal bank accounts, ordering international wire transfers to individuals, receiving cheques and making cash deposits with no apparent economic rationale.

From the message on his bank account accompanying the financial transactions with the Internet payment service provider (payment "gun X", payment "pistol Y") and the analysis of the wire transfers, it was possible to identify his online activity as related to weapons and elements of weapons sales transactions.

FIU's investigations revealed further that:

- over 4 years he made more than 1 600 selling operations, the frequency of this online activity revealing a potential illegal business activity related to the use of weapons commercial websites;
- he regularly travelled to countries from Central and Eastern Europe which are vulnerable to weapons trafficking and often stayed more than one week there, so that he might have smuggled weapons.

The case was transmitted to the judicial authorities for weapons trafficking.



Source: France.

47. Commercial websites and Internet payment systems can also be used for commercial activities performed without VAT registration and without paying taxes.

Case study: The use of commercial websites and Internet payment systems to sell goods illegally (avoiding tax obligations)

The persons on investigation were directors of a company involved in purchasing large quantities of duty free cigarettes and alcohol to sell on the domestic market contrary to their export-duty free status, thus avoiding tax obligations. Due to not paying any tax on the goods the company was able to markedly increase profits. The syndicate also generated false receipts that purported to come from an export company detailing their alleged cigarette exports. Investigations with the purported company confirmed that no such exports had ever been made. On arrival of the cigarettes, payment was made to the delivery driver on a cash-on-delivery basis.

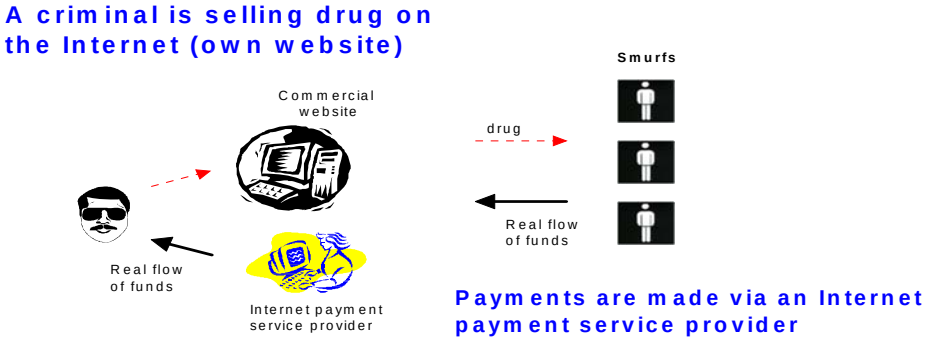
A large number of the company's sales occurred over the Internet from customers paying via credit card. A majority of the sales on the Internet were illegitimate and came from three different email addresses. Payments for these orders were made from one of two credit cards linked to Belize bank accounts. One of these cards was held in the company's name. The money in the Belize bank account was sent there by one of the directors using several false names from not only Australia but Belize, Hong Kong, and Vietnam. The director conducted structured wire transfers under false names and front company accounts. The funds were purchased at well known banks with multiple transactions occurring on the same day at different bank locations and all of the cash transfers conducted in amounts of just under AUD 10,000 to avoid the reporting threshold.

Source: Australia.

48. Criminals can develop their own commercial website to sell illegal products or perform illegal activities and use Internet payment service providers to collect the proceeds of these activities.

Case study: Criminals using their own commercial website to sell drugs and the use of an Internet payment service provider to collect the proceeds of their activities

An Internet payment system user owns a commercial website where he is selling cannabis, cannabis seeds and narcotics utensils. As he wishes to be paid via an Internet payment system, the buyers are using this payment system.



Source: Luxembourg.

Case study: The use of an Internet payment service provider account to collect proceeds of procurement on the Internet

The user of an Internet payment service provider receives payments from a website offering escort services or prostitution. This user is the registrant of the website and he gets the funds on an account from buyers. On the website, the use of the Internet payment system is indicated. The website is explicit, contains several prostitutes to be chosen by the client and is professionally set up. The commercial website and the IP logins are detected by the Internet payment service provider and the file transmitted to the FIU.

Source: Luxembourg.

49. As already mentioned in the FATF report on New Payment Methods, digital precious metals are a new online payment system that involves the exchange of options or the right to purchase an amount of precious metals at a specific price. These derivatives can be exchanged, like traditional commodity or securities derivatives, between account holders in a digital precious metal service. Consumers purchase a quantity of virtual precious metal holdings based on the current price of the metal on the world commodity exchanges. Once a purchaser has acquired a quantity of the virtual

precious metal, those holdings or a portion of them can be transferred either to another individual or a merchant in exchange for goods and services, also online. As a result, digital precious metal exchanges allow for the transfer of fixed "value" between unrelated 3rd parties, functioning as a money and value transmission business.

Case study: the use of e-gold as payment method

On 27 April 2007, a federal grand jury in Washington, D.C., indicted two companies operating a digital currency business and their owners. The indictment charges E-Gold Ltd., Gold and Silver Reserve, Inc., and their owners with one count each of conspiracy to launder monetary instruments, conspiracy to operate an unlicensed money transmitting business, operating an unlicensed money transmitting business under federal law, and one count of money transmission without a license under D.C. law. According to the indictment, persons seeking to use the alternative payment system E-Gold were only required to provide a valid e-mail address to open an E-Gold account – no other contact information was verified. The indictment is the result of a 2½-year investigation by the U.S. Secret Service with cooperation among investigators, including the Internal Revenue Service (IRS), the Federal Bureau of Investigation (FBI), and other state and local law enforcement agencies. According to Jeffrey A. Taylor, U.S. Attorney for the District of Columbia, "The defendants operated a sophisticated and widespread international money remitting business, unsupervised and unregulated by any entity in the world, which allowed for anonymous transfers of value at a click of a mouse. Not surprisingly, criminals of every stripe gravitated to E-Gold as a place to move their money with impunity."

Source: U.S. Department of Justice.

50. During the workshop, case studies were also presented where commercial websites and Internet payment services providers are used to facilitate the commitment of the underlying criminality (fraud in most of the cases) but not for the money laundering. These cases, even if they are not directly relevant in the framework of the present study, are given as they could be useful to traditional financial institutions for fighting against money laundering.

51. Commercial websites and Internet payment systems can be used by criminals to commit fraud. One of the mechanisms used is the sale of fictitious items which the seller will not deliver to the buyer after receiving the payment. If commercial websites are used to attract buyers (in this case the victims of the fraud), Internet payment systems are not necessarily used to collect the funds (the proceeds of these activities). Criminals frequently use bank accounts in traditional financial institutions or money transfers and postal orders to be paid for the goods they do not deliver. The same channels are thereafter used to launder the proceeds of these illegal activities by making the funds disappear.

Case studies: Transfers related to fraudulent sales on commercial websites (items never delivered)

The Belgian FIU received several STRs from banks in Belgium concerning bank accounts credited by wire transfers, apparently related to/justified by sales on commercial websites, and followed by cash withdrawals.

The majority of the wire transfers are of small amounts (maximum EUR 800), originate from various senders and, following the message accompanying the payment, should be related to sales on a commercial website, sometimes the sales of luxury goods. Payments are not made through an Internet payment service provider but originate from the bank account of the buyer and are credited on the bank account of the seller. The wire transfers are followed by instant withdrawals in cash.

The goods are never delivered to the buyer (victim of a non-delivery fraud).

In some reports the wire transfers are not followed by cash withdrawals but by transfers in a country known for producing counterfeit products (in cases related to the sale of counterfeit goods).

The fraudulent bank account is used only during a short period (because of buyer's complaints).

Investigation showed that false names are used on the commercial website (the name used by the seller on the commercial website (certainly a fictitious name) and the name of the bank account holder where the payment is made are different). In one file, information received from law enforcement indicated that the subject was known for using different names on the commercial website. In another file, the subject was using two different passports and different names.

Source: Belgium.

Case study: Sale of fictitious goods on commercial websites and the use of Western Union to collect the proceeds of these fictitious sales

The National Bureau of Investigation Money Laundering Clearing House investigates an aggravated fraud and money laundering case. The two main suspects in Finland were acting as Western Union agents in Finland. The offices of the agents were closed on 27 March 2007, and the suspects were taken into custody.

People from other countries than Finland were fooled into buying fictitious goods (in this case; cars or other vehicles) on commercial websites[8] and sending the payment to fictitious persons in Finland via Western Union.

The two Western Union agents in Finland picked up the money with the identities of the fictitious persons. Furthermore, the agents forwarded, again with fictitious identities, the money as Western Union transactions outside of Finland.

The two suspects in Finland received text messages from two persons (money flow managers) using mobile phone numbers including:

- information about the victims abroad (their name, the expected receiver of the money, the amount sent and the MTCN) as well as
- instructions for forwarding the money abroad (the name of the receiver, the amount and the country to which send the money).

The money flow managers are living in European countries.

The total number of victims is over 300 and the total loss for the victims is about EUR 1.07 million. The main source countries for the assets were the USA and the UK, but there were also a number of other source countries (about 25 countries).

The two Western Union agents in Finland say that they received 10 per cent of the money picked up by them. They also say that both the money flow managers visited Finland during the activity and took with them a significant amount in cash.

Based on the investigations, at least one of the money flow managers seems to have similar arrangements with local Western Union agents in a number of other European countries.

Searches at the Western Union offices and the homes of the agents and arrests were made on 27 March 2007.

The investigation of the phones, SIM cards and PCs gave good evidence. Hundreds of text messages as well as a few e-mail messages were found in which instructions were given to the Western Union agents concerning the fraud cases and the money transactions.

To support the investigation and the case in court, information is needed about as many predicate offences abroad as possible. Therefore, requests (FIU, Interpol or MLA) have been sent to 24 countries.
At the moment information was received about 181 fraud cases from 19 different countries.

[8] It is worth mentioning that on certain commercial websites, a seller cannot request potential buyers to pay by money orders. To avoid problem with fraud, these commercial websites do not allow their users to propose payments by money orders (this option is not available and a seller cannot request a payment by money orders when exchanging mails via the mail system of the commercial website).

Source: Finland.

52. It is worth mentioning that certain commercial websites propose mechanisms to their customers to avoid their site being used to commit such type of fraudulent activities: organizing rating systems to evaluate users' (buyers and sellers) reliability based on their previous transactions with the commercial website, advising their customers not to use money orders, encouraging the use of an Internet payment service provider associated with the commercial website because this is more secure, tracking and banning fraudsters.

Potential vulnerabilities

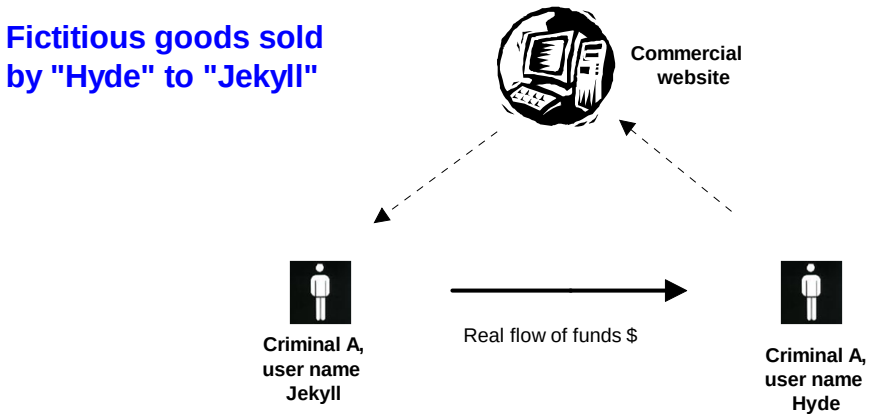
53. Potential vulnerabilities presented in this section are given to help the private sector stakeholders, not yet aware of possible ML or TF mechanisms, to detect possibly suspicious transactions. Some potential case studies present similarities with case studies analysed by FIUs and presented in the first subsection.

54. These potential vulnerabilities are considered feasible in reality by the private sector consulted during the study. However certain commercial websites and Internet payment services providers have developed monitoring and detection systems and mechanisms (cf. section "Risk management measures taken by the sector") in such a way that these transactions may be better detected and provide additional deterrence to criminals attempting to use these systems.

55. Criminals may use fictitious commercial transactions on commercial websites to justify movements of funds using traditional financial institutions or Internet payment systems. This typology shares many similarities with trade-based money laundering, where the transfer of funds for a transaction is disproportionate to the value of the goods delivered.

Potential case study: Fictitious sales on commercial websites followed by real payments

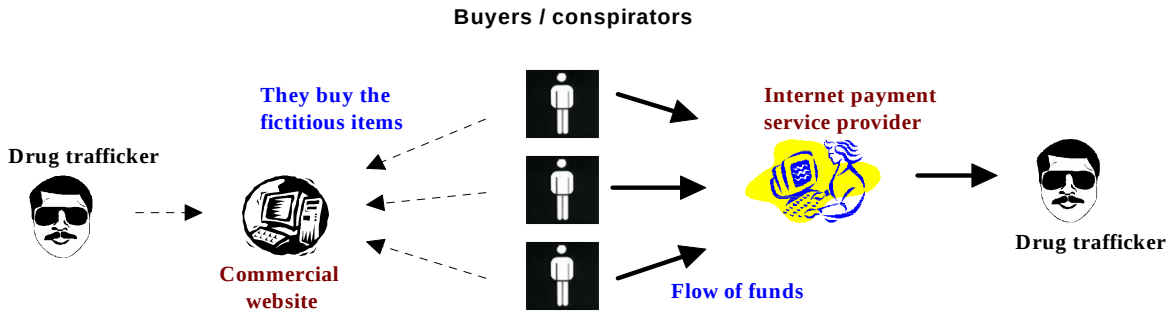
Buyer and seller know each other and may live in different countries or continents. No goods are delivered. Certain commercial websites between private individuals only put buyers and sellers in touch. They are not liable for the delivery, for checking the quality and/or the reality/existence of the goods offered for sale. The buyer will never complain for the non-delivery because seller and buyer are in league with each other. The buyer will pay the seller who will receive the funds on his bank account abroad. The beneficiary will have no difficulties justifying the origin of the funds received because the funds apparently come from sales on the Internet[9]. The buyer can also easily explain that he uses his credit card to buy something on the Internet. Commercial websites between private individuals allow the sale of goods of relatively high value, which will allow criminals to launder considerable amounts.



Source: Belgium.

Potential case study: The use of a commercial website to launder the proceeds of drug trafficking

A drug trafficker can use commercial websites to receive the payment of his illicit sales. Instead of raising his bank's suspicion with unjustified cash deposits, he publishes an announcement for whatever fictitious products. His drug clients then proceeds with an online immediate purchase. Once the drug trafficker receives the payment, he can deliver the drugs as well as justifying the credit operations on his bank account with "online sales operations". This implies that there is coordination between "seller" and "buyer".



Source: France.

[9] As also mentioned in the section "Considerations on second level of controls versus third level of controls", a statement or a printout of a screen of the commercial website showing an item on sale for instance must not immediately and unconditionally considered as an invoice or justifying a financial transaction on the bank account of the customer. Conversely, the presentation of such justification document could be used as a red flag or indicator for the financial institution.

56. If the item sold by criminals exists, it can happen that the price of the item sold is overrated by buyers and sellers who know each other and can consequently justify relatively bigger movements of funds. This is essentially the same typology used in trade-based money laundering.

Potential case study: The sale of goods at an overrated price

The mechanism is the same as in the above-mentioned example, except that the goods sold do exist and are sold at an overrated price through several fictive buyers. The net difference between the nominal sale price and the actual value of the goods delivered equals the value of money laundered. This type of transaction provides additional security for the launderers by creating a record trail of actual delivered goods, requiring law enforcement to prove that the value of the sale is grossly out of proportion with the actual market value of the goods.

Alternatively, value can be laundered in the reverse direction by having the buyer buy significantly less than the market value of the goods and then reselling the goods for a profit. The buyer would then be able to claim the difference in value was a profitable arbitrage deal while the seller would be to write off the difference as a market loss.

Many online businesses, particularly auction sites, sell goods that do not have a readily available market price. Also, overbidding is not unusual and could reflect legitimate transactions. In addition, since the items being sold remain in the possession of the seller throughout the auction process, the online auction company has little ability to ascertain the true market value of the item.

Source: Belgium.

57. As already mentioned above counterfeit products or stolen products could be sold on commercial websites, aka a "virtual fence". Internet Payment systems could be used to move and launder the proceeds of these sales.

Potential case study: The sale of counterfeit or stolen products using multiple identities and user names

A criminal sells via a Customer to Customer website stolen and counterfeit goods. By multiplying identities and user names, he reduces the risk of being identified by the monitoring unit of the shopping website. He can either use the proceeds generated by his illegal sales to buy other goods or services online or transfer it to his personal bank account, the crediting operations being justified by "online sales operations".

Source: France.

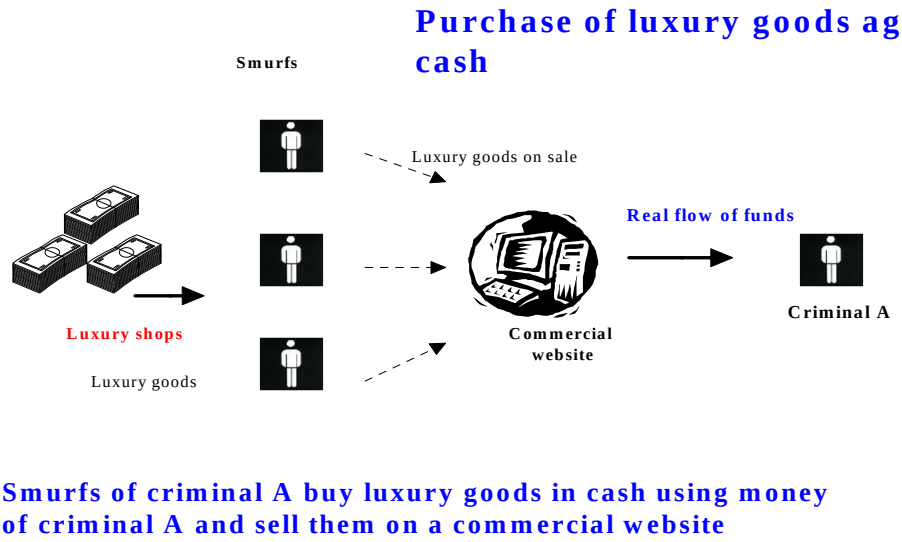
58. Not only counterfeit luxury goods could be sold on commercial websites, but also real luxury goods purchased with cash by smurfs recruited by criminals to launder the proceeds of their illegal activities.

Potential case study: The use of commercial websites to sell at a reduced price, of goods (not counterfeit) purchased by smurfs in luxury goods shops with cash

Criminals send smurfs to luxury goods shops to buy articles of relatively high value (handbags…) that they pay in cash. This first stage of the money laundering process allows criminals to inject cash, possibly in small denominations into the financial system. This stage takes place in luxury good shops, which are less aware of money laundering[10].

[10] The 3rd EU AML/CFT directive applies to natural or legal persons trading in goods, to the extent that payments are made in cash in an amount of EUR 15 000 or more, whether the transaction is executed in a single operation or in several operations which appear to be linked. Merchants of high value goods accepting cash above EUR 15 000 are submitted the AML/CFT obligations (KYC, record keeping, cooperation with the FIU, adequate internal organisation). In certain countries, merchants in high value goods are not authorized to accept payments in cash if the value of the purchased goods exceeds a certain threshold (in Belgium: EUR 15 000).

The luxury goods are subsequently sold on commercial websites, at a lower price. Criminals accept to lose a lot of money to launder the proceeds of their illegal activities. The proceeds of the sale arrive on the bank account of the seller abroad.



Source: Belgium.

59. ML transactions not only take place in the first stage of the money laundering process (placement), but happen also during the two other ML stages (layering and integration). Criminals usually try to make the financial transactions more sophisticated for law enforcement authorities and investigators, using a combination of the different ML stages. Commercial websites and Internet payment services providers could be used at various stages of the ML process. Traditional financial institutions could be used during the placement stage and commercial websites and Internet payment services providers at later stages such as during the layering stage (the above mentioned potential case study) and the integration (the purchase of goods or items with illegal funds already injected in the financial systems). The two following case studies explained below provide examples of the use of the ML process at the integration stage.

Potential case study: The use of an electronic purse in conjunction with other ML methods

- An individual residing at the country border regularly imports tobacco and alcohol products exceeding the duty-free quantities from the neighbouring country.
- He sells them to individuals. The cash collected is used to credit a savings account opened in the name of one of his underage children. The justification given can be cash donations from the family to the child.
- The funds crediting the savings account of the child are regularly transferred to the bank account of the individual held in another bank. The origin of the funds appears to be legal – it comes from the savings account of one of his children; the justification for the transfers can be temporary financial difficulties, expenses made for the child like buying a scooter or paying driving lessons, etc.
- The funds transferred on the bank account of the individual can then credit an electronic purse to buy goods and services online.

Source: France.

60. Commercial websites and Internet payment systems can potentially be used to finance terrorism, taking into consideration the fact that terrorism financing may involve small amounts of money.

61. As already mentioned, commercial websites and Internet payment service providers depend on information they obtain from law enforcement and other authorities to facilitate the detection of suspicious transactions related to terrorist financing and it is not always necessary for Internet payment service providers to identify TF in their STRs in order to help counter terrorist financing.

Potential case study: The use of a commercial website and Internet payment service provider to finance terrorist activities also in conjunction with other ML methods

- Y, a well-known terrorist, under close watch of the intelligence services, residing in Germany, wants to send funds to Z, residing in France so that Z can buy cell phones or other items necessary to make explosive devices.

- Afraid of being detected if he uses funds transfer systems like Western Union or MoneyGram, he decides to use an alternative way to make his funds available.

- He asks a student to register on a C to C website and to open an Internet payment provider account. Y gives the student a prepaid card of EUR 799 to credit his Internet account.

- The student can then order a transfer from his Internet account to the Internet account of another student located in France.

- The student located in France can then credit his bank account with the funds received on his Internet account and buy prepaid cards to be handed over to Z.

- Z can use the prepaid cards directly or credit his bank account with them.

Source: France.

62. Front individuals or intermediaries such as the "students" in the example above are even recruited on the Internet, lured by the payment of a commission amounting from 5% to 10% of the funds to be transferred. Massive spams are sent, proposing to become the associate of a "financial company", the job consisting of receiving and transferring funds. These mules are used for ML/TF.

63. Other potential case studies :

Other potential case studies

- A criminal or a third party used by the criminal purchases goods on the Internet, using prepaid cards (anonymous).

- The purchase of prepaid cards against cash (from points of sales or third parties).

- The purchase from a third party (against cash) of assets/value held by the third party on an account opened on the Internet (Internet payment service provider).

- A money launder justifies movement of funds by a fictitious turnover from e-commerce activities.

- A criminal or money launderer detains assets on accounts opened on the Internet (Internet payment service provider).

Source: The Netherlands

64. If the above mentioned case study is feasible in reality, high standards of due diligence and computer software to detect suspicious transactions should detect such patterns as they are carried out on a multiple basis (multiple transactions is a prerequisite for criminals if they want their ML/TF transactions to be economically viable)[11]. On commercial websites and Internet payment service providers applying such due diligence mechanisms, a user multiplying transactions will be the subject of a "client verifying process", implying that the commercial websites will obtain more information on the seller (Memorandum of Association, VAT registration…). Commercial websites also work with companies selling luxury goods to identify individuals selling counterfeit luxury items.

Red flags – Indicators

65. This section, which resulted from the typological analysis, provides an overview of potential indicators of ML/TF. These red flags – indicators must call the attention of the Internet payment services providers when analysing suspicious transactions. An indicator is itself not sufficient to

[11] The commercial websites and Internet payment service providers consulted during the study apply these types of due diligence mechanisms and use monitoring software.

conclude that a transaction is suspicious and must be reported to the FIU. The Internet payment service provider has to collect additional information to analyse the suspicious transactions.

66. Certain Internet payment service providers already use these red flags – indicators to detect suspicious transactions/activities using risk models and computer software (cf. section "Risk management measures taken by the sector"). However, they are provided for Internet payment service providers which are not yet aware of the ML/TF risks and not yet familiar with such indicators.

67. This section is also provided for the private sector stakeholders to be added to their own developed indicators.

68. As mentioned below in the section "mechanisms used to mitigate ML/TF risks", Internet payment service providers have access to a range of information, inclusive information on the underlying commercial transactions, to analyse suspicious financial transactions.

69. Following red flags-indicators have been identified:

- The customer opens his individual Internet account with the payment service provider in one country but logs in regularly on the website from a single or multiple third countries.
- The account opened by the customer is loaded with funds transferred from a third country, which could indicate that the customer does not live in the country from which he registered but in another country where he cannot register (not accepted by the website for security reasons) or that he registered in one country but commits illegal activities in a third country, or that he concealed the results of his illegal activities in a third country.
- The customer starts to purchase items on the Internet for amounts not in line with his previous transactions profile.
- The customer loads his Internet account with cash[12], if the Internet payment services provider allows loading with cash[13].
- The customer account with payment service provider is loaded with funds transferred by a third party apparently not related to the customer.
- The transactions of the customer suddenly deviate from its previous transactions profile after his customer account had been loaded with money from a third party.
- The customer purchases items of high value[14] or purchases middle high value items on a regular basis with a prepaid debit card, an anonymous prepaid credit card[15] or a gift card where the origin of the funds is difficult to retrace[16].

---

12 It is worth mentioning that the loading of an account or a card with cash is not sufficient in itself to give rise to a suspicion of ML/TF. Cash could have a legal origin. Confronted with cash, the Internet payment service provider needs to apply higher standards of control or due diligence (monitoring of transactions, limits and restrictions…).

13 It is worth mentioning that systems which do not accept cash may be less risky.

14 According to the private sector consulted during the study, on commercial websites and Internet payment services provider, the average value of a commercial transaction and the subsequent payment are very low. Consequently money launderers wanting to use commercial websites and Internet payment service providers for their criminal activities and the ML may need to carry out several consecutive small transactions if they want to avoid being detected. In case they carry out a large transaction they will be detected by commercial websites and Internet payment service providers using sophisticated computer software.

15 It is sometimes difficult for Internet payment service providers to distinguish between a normal credit card and a prepaid credit card as credit card companies use similar credit card numbers for both credit cards.

16 It is worth mentioning that Gift cards have generally low face values. Criminals need to purchase several gift cards to make their ML transactions economically viable. Issuers of gift cards have also internal control

- The customer apparently resells goods purchased beforehand, without any economic reasons, or with a significant discount or increase on the price (monitoring feasible if the Internet payment service provider cooperates with the commercial website involved when analysing suspicious financial transactions);
- The buyer requests that the goods be delivered to a post office box or to a different address from the one registered to the account (facilities depending on the country of destination).
- A customer uses an account with an Internet payment service provider not to purchase items on Internet but to hide a sum of money obtained illegally. A customer opens an account with an Internet payment service provider, loads the account with important amounts of money, leaves the funds on the account during a certain period of time and requests the redemption of the funds later on[17].
- A customer requesting the balance from his Internet account to be transferred to a third party without apparent relation with him.
- The use of credit cards, particularly prepaid, issued in a foreign country.
- A customer sells illegal items or the goods appear on a list of forbidden items.
- Abnormality with the proposed price on an auction site or during an auction sale indicating a possible complicity between buyer and seller (a customer offers to purchase an item at a price largely higher than the requested price). Additional factors could include multiple transactions between the same buyers and sellers.
- The purchased goods are regularly shipped to a foreign country.
- The customer uses a credit card issued by a bank in an offshore centre or in a FAFT non-cooperative country[18].
- The funds originate from a non-cooperative country.
- The country of origin of the customer is known by the FATF as a non-cooperative country in the fight against money laundering or terrorism financing.
- An unexpected turnover for a recently established commercial website or an unexpected increase in the value of the commercial website after a few sales.

Suspicious behaviour or transaction may result from one indicator or a set of indicators.

70. The private sector participating in the study confirmed, based on their experience, the accuracy and pertinence of this list of red flag – indicators.

---

mechanisms to follow the issuance of gift card at local shops or supermarket, which reduce but do not eliminate anonymity.

17 Some e-money devices are limited in time.

18 All the non-cooperative countries identified by FATF have been delisted. Certain countries are still under monitoring.

MONEY LAUNDERING AND TERRORIST FINANCING RISKS

71. The AML/CFT risks of trade-based money laundering and non face-to-face transactions apply also to commercial websites and Internet payment systems. The AML/CFT regulations of commercial websites could be comparable to the ones existing for traditional commerce (those regulations only apply to merchants accepting cash over a predefined threshold) and the ones of Internet payment systems to the common payments systems, even if the relationship is non face-to-face, because risk-based CDD and monitoring measures are taken to reduce and mitigate the ML/TF risks.

72. These risks can be classified according to the ML phases:

Placement:

- **Anonymity[19] of customers on certain commercial websites and Internet payment services providers.** Both the registration and transactions could in certain circumstances be performed anonymously (on certain websites an anonymous e-mail address is enough for registration).
- **The relationship with customers is a non face-to-face relationship**. Transactions are non face-to-face transactions, which makes it more difficult for the commercial websites and Internet payment services providers to be sure that they are working with the customer who has been identified at registration.
- **The possibility to use multiple registrations.** The use of multiple (anonymous) registrations to purchase and sell items could create problems when screening, monitoring and reconstructing transactions and flow of funds.
- **Remote access to commercial websites and Internet payment systems.** Connection to commercial websites and Internet payment systems is available everywhere in world. A criminal can connect himself to the Internet from web terminals not affiliated or registered to his or her identity, which makes more difficult for law enforcement to locate and to pursue criminals and money launderers.
- **Relative "anonymity" associated with certain methods of payment.** With prepaid credit cards, gift cards/gift cheques[20] and when cash is used, the origin of the funds cannot be (easily) retraced[21].

Layering:

- **The speed of movement**. Transactions via commercial websites and Internet payment systems can be done very rapidly as transactions between sellers and buyers are performed electronically.

---

19 A good identification is a prerequisite for detecting a suspicion related to an individual/company but also for a serious and effective investigation of a suspicious operation.

20 Even if anonymous gift cards are generally issued for relatively small amounts.

21 Even if measures of internal control exist to monitor and to supervise the issuance of gift cards at local shops or supermarkets and the purchase of prepaid cards and avoid or survey sudden increases in the number of gift cards issued and amounts loaded (analysis of purchase details, pattern of purchases and spending locations, IP addresses, physical monitoring of premises), anonymity can be reduced but cannot be totally avoided.

- **The international character and the jurisdictional issue of where the transaction takes place.** Transactions on commercial websites and Internet payment systems can be performed across international borders and the jurisdiction where the Internet payment service provider is located may not be competent to investigate and prosecute ML or TF. Likewise, no single jurisdiction has clear responsibility for regulating and monitoring activity.

The speed of movement, the international character of the transaction and the jurisdictional issue related to the use of the commercial websites and Internet payment systems may impact on FIUs and law enforcement who investigate cases of money laundering or terrorism financing.

- **Volume - high number of transactions and amounts per transaction**[22]. The high number of transactions and consequently amounts per transactions make it more difficult for Internet Payment services providers to define criteria to monitor and screen transactions (which types of transactions should be regarded as suspicious?)[23];
- **The limited human intervention**. As less human intervention is associated with transactions via commercial websites and Internet payment systems, traditional first level detection mechanisms which rely heavily on the face-to-face relationship with the customer, are no longer available and must be replaced by sophisticated second level detection mechanisms[24].
- **The lack or inadequacy of audit trails, record keeping or suspicious transactions reporting by certain Internet payment services providers.**

Integration:

- **The possibility to buy high value items.** Buying (high value) goods, precious metals, real estate or securities on commercial websites using an Internet payment system.

[22] By limiting the use of an account, the Internet payment service provider should be able to limit the potential risk.

[23] It is worth mentioning that it is also difficult for traditional financial institutions to define criteria to monitor the transactions of their customers using computer software.

[24] If Internet payment service providers adequately monitor the financial transactions of their customers by detecting deviations from their customer's known profile of transactions, the face-to-face contact at the beginning of the relationship with the commercial website and Internet payment service provider may not constitute a problem.

OVERVIEW OF REGULATIONS IMPOSED ON THE SECTOR

73. For the above-mentioned reasons, Government officials have been called on to start regulating the commercial websites and Internet payment systems fearing that criminals and terrorists could use them to launder money or finance terrorism.

General introduction

74. In general regulations are imposed to commercial websites mainly in the field of the protection of the consumer (better inform their users on their rights and duties, general terms of use and the use of electronic contracts, identification of the commercial website, advertising…), the prohibition to sell certain goods and the possibility to cancel a purchase made online.

75. For instance Electronic Commerce is regulated by means of several European Directives. The goal of the regulation is mainly to create transparency for consumers and thus give them the necessary protection. The main regulations stem from the E-Commerce Directive (2000/31/EC) and the Distance Selling Directive (1997/7/EC). The first Directive imposes several rules for transparency of the E-commerce company by obliging transparency about the nature and general information on the E-commerce company as well as transparency about the process of buying a product. The second directive states rules on revoking purchases (within certain time limits). Finally the European Regulation (2006/2004/EC) for coordination of cross-border requests for mutual assistance concerning consumer protection.

76. In the US, the Bureau of Consumer Protection of the U.S. Federal Trade Commission (FTC) works to protect consumers against unfair, deceptive, or fraudulent practices in the marketplace. The Bureau conducts investigations, sues companies and people who violate the law, develops rules to protect consumers, and educates consumers and businesses about their rights and responsibilities. The Bureau also collects complaints about consumer fraud and identity theft and makes them available to law enforcement agencies across the country.[25] The FTC's Division of Enforcement litigates civil contempt and civil penalty actions to enforce federal court injunctions and administrative orders in FTC consumer protection cases; coordinates FTC actions with criminal law enforcement agencies through its Criminal Liaison Unit; develops, reviews, and enforces a variety of consumer protection rules; coordinates multi-pronged initiatives to address current consumer protection issues; and administers the Bureau of Consumer Protection's bankruptcy programme.[26]

77. In most cases, there is no identification or STR-obligations in place for commercial websites. In The Netherlands, in case a commercial website provides payment services as well these obligations will be applicable.

78. This is consistent with the international AML/CFT standards which apply in the same manner to traditional commerce and do not require merchants to apply AML/CFT measures (CDD, cooperation with the FIU, adequate internal organization) if they do not accept cash over a preset threshold.

79. The AML/CFT obligation (among others the obligation to monitor and detect suspicious transactions) is an obligation imposed on financial institutions and e-money providers.

---

25 Federal Trade Commission (2007a).

26 Federal Trade Commission (2007b).

80. In the European Union, e-money issuers are required to be licensed, they are regulated in the country in which e-money is issued. With the European passport mechanism, an e-money issuer licensed in one European country is allowed to operate across the EU. E-money issued in one European country can be spent on a commercial website in another European country. E-money issuers are mainly located in the UK, Luxembourg, and Germany. In the US, Internet payment service providers are licensed as a money services business (MSB). Licences are also granted to Internet payment services providers in other countries such as Australia. There are apparently no regulations imposed to Internet payment services providers in China. The issuer can only issue the e-money and target customers of the country of issuance (the country where he gets the licence).

81. In the European Union, the prudential supervision of the business of e-money institutions is regulated by the EU Directive 2000/46/EC ("E-money Directive"). The directive introduces a legal framework that harmonises the prudential supervision of electronic money institutions for ensuring their sound and prudent operation and their financial integrity. The legal framework includes among others measures like the obligation to have an initial capital and requirements to own funds sufficient to cover their financial liabilities related to outstanding electronic money, limitations of investments, sound and prudent management, administrative and accounting procedures and adequate internal control mechanisms. For the purpose of the prudential supervision of electronic money institutions, the issuance of electronic money is not considered as a deposit-taking activity and subject to the supervisory regime applying to credit institutions if the received funds are immediately exchange for electronic money.

82. The EU AML/CFT Directives apply to electronic money institutions. Directive 2005/60/EC foresees simplified customer due diligence (CDD) where, if the device cannot be recharged, the maximum amount stored in the device is no more than EUR 150, or where, if the device can be recharged, a limit of EUR 2 500 is imposed on the total amount transacted in a calendar year, except when an amount of EUR 1 000 or more is redeemed in that same calendar year by the bearer as referred to in Article 3 of Directive 2000/46/EC.

83. In regulated sectors like the sector of the Internet payment service providers, efforts have been made by regulators and by trade associations to develop guidance to the sector for the application of AML/CFT regulations and with fraud and ML/TF typologies exercises.

Overview by country

United Kingdom

84. The UK does not have a specific regulatory regime for electronic commerce, although the Financial Services Authority does regulate electronic money in the UK, as well as the sale of financial services by electronic means by firms in the UK.

85. E-money is defined in UK law as monetary value as represented by a claim on the issuer which is stored on an electronic device, issued on receipt of funds and accepted as a means of payment by persons other than the issuer. E-money is considered as an electronic surrogate for coins and banknotes, intended to effect payments of limited amounts.

86. The FSA's approach to regulating e-money is based on requirements of the EU's E-money Directive. E-money issuers also have obligations under the Money Laundering Regulations 2007 to, for example, apply customer due diligence measures and to undertake ongoing monitoring of their business relationships. In the event that potentially suspicious activity is detected, the firm has a legal obligation to report this to the authorities. The FSA would expect e-money issuers to be able to demonstrate that they deploy an adequate range of controls for the type of risks that they encounter. Discussion of steps that can be taken by e-money issuers to meet their legal obligations is provided by Guidance issued by the Joint Money Laundering Steering Group (JMLSG).

Luxembourg

87. The relevant Luxembourg legislation transposes the E-Money Directive and the EU AML/CFT Directives. Since July 2007 one Internet payment provider has established its EU Headquarters in Luxembourg. This entity is licensed as a bank by the Luxembourg financial sector supervisory authority, the *Commission de Surveillance du Secteur Financier* (hereafter the "CSSF"). Thus this Internet payment provider is submitted to the same AML/TF legislation and guidelines of the CSSF as any bank operating in Luxembourg. In particular it has the following obligations: costumer identification (CDD (simplified/enhanced) -on a risk based approach-), records keeping, adequate internal AML/CFT procedures, cooperation with the Luxembourg authorities (in particular with the FIU). The regime of administrative sanctions in case of breach of those AML/CFT obligations and the criminal offence in case of intentional breach of those obligations also apply.

The Netherlands

88. In the Netherlands the E-Money Directive (2000/46/EC) and Third Anti Money-Laundering Directive (2005/60/EC) apply. Payment methods on the Internet need an E-money license and a special regime will be applicable in that case. The regulatory response consists of: registration/licensing, (prudential) supervision, record keeping, suspicious transaction reporting, other specific AML policies & procedures (CDD-regulation). The providers who have a waiver have a less burdensome regime. The regulatory response consists of: record keeping, no suspicious transaction reporting, no other specific AML policies & procedures. Explicit waivers have been given for prudential purpose to five E-money institutions. Furthermore payment providers often have developed a self regulatory approach to a certain extent. The main goals for this approach are to protect the good name of the company, judicial liability issues and credit risks.

United States

89. Banking organizations that provide payment methods used for electronic commerce in the United States are subject to a full range of AML/CFT requirements, including among other things, requirements to: detect and report suspicious transactions; maintain records of funds transfers, and to implement AML compliance and customer identification programs. The cornerstone to this strong AML compliance program is the adoption and implementation of comprehensive customer due diligence policies, procedures, and processes for all customers. These processes assist U.S. banking organizations in determining when transactions are potentially suspicious.

90. When a banking organization within the United States determines a transaction is suspicious, it is required to file a Suspicious Activity Report (SAR) with the U.S. financial intelligence unit, known as the Financial Crimes Enforcement Network (FinCEN). Banking organizations within the United States are required to report transactions involving or aggregating to at least USD 5 000 that are attempted or conducted by, at, or through the institution in which the organization "knows, suspects, or has reason to suspect" the transaction: *i)* involves funds derived from illegal activities or is conducted to disguise funds derived from illegal activities, *ii)* is designed to evade the reporting or record keeping requirements of the Bank Secrecy Act (BSA) (*e.g.* structuring transactions to avoid currency transaction reporting), or *iii)* "has no business or apparent lawful purpose or is not the sort in which the particular customer would normally be expected to engage, and the banking organization knows of no reasonable explanation for the transaction after examining the available facts, including the background and possible purpose of the transaction."

91. The Federal banking agencies and the U.S. Department of the Treasury's Financial Crimes Enforcement Network (FinCEN) are the primary government agencies responsible for enforcing compliance with the relevant AML/CFT regulations.

92. The U.S. Federal banking agencies have been charged (under U.S. Federal banking laws 12 USC 1818(s) and 12 USC 1786(q) for banks and saving banks) with ensuring that banking organizations, subject to their respective jurisdictions, maintain effective Bank Secrecy Act/Anti Money Laundering compliance programs.

93. Several other regulations apply to electronic funds transfer activities. They concern the rights, liabilities, and responsibilities of parties in electronic fund transfers (EFT) and protect consumers using EFT systems, such as ATMs and debit cards.

Singapore

94. E-money is broadly referred as Stored Value Facility (SVF) in Singapore. Under Singapore law, a SVF is a form of prepaid electronic cash or card that can be used within the system of the SVF issuer. The SVF issuer is also known as the holder of the SVF.

95. The issuance and management of SVFs are governed by the Payment Systems (Oversight) Act 2006 (PS(O)A) and its related regulations[27]. Any entity can issue a SVF and hold the stored value. However, SVF with total outstanding stored value exceeding SGS 30 million will require approval from the Monetary Authority of Singapore (MAS) and a bank licensed by the MAS to be fully liable for the stored value. SVFs whose aggregated stored value falls below the prescribed SGD 30 million do not require MAS' approval to operate but are required to provide disclosure to advise potential users that such SVFs are not subject to MAS' approval.

96. In addition to the PS(O)A regulatory requirements, any holder SVF which issues a SVF that has a load limit of more than SGD 1 000 has to adhere to and apply the MAS AML/CFT Notice to holders of SVF on the prevention of money laundering and countering the financing of terrorism[28].

97. The Notice imposes preventive measures to holders to limit the risk of SVFs being used for illegitimate purposes. The Notice sets out obligations which require holders to take measures to mitigate money laundering and financing of terrorism risk in the following fields; *i.e.* due diligence measures (simplified, enhanced), identification of users (customers), verification of identification of users, identification and verification of identities of Beneficial Owners, non face-to-face verification, review of relevant transactions, record keeping, suspicious transactions reporting, internal policies, audit and training.

98. Any holder of SVF which fails or refuses to comply with the requirements under the Notice shall be liable on conviction to a fine not exceeding SGD 1 000 000 and, in case of a continuing offence, to a further fine of SGD 100 000 for every day during which the offence continues after conviction (under section 27B of the MAS Act[29]).

99. The MAS has also issued SVF Guidelines[30] which recommend sound principles and risk mitigating factors for all holders of SVFs. These principle-based recommendations address issues such as transparency, disclosure, public confidence, stored value protection, prevention of money laundering and countering the financing of terrorism.

China

100. There are no regulations in place addressing Electronic Commerce or Internet payment systems in China. Nevertheless, on 13.12.2007, the Chinese Ministry of Commerce issued an opinion on Enhancing the regularised Development of Electronic Commerce. The objectives of the guidance are to help the third-party electronic payment service providers to improve the reputation of the industry, operate in a prudent and stable manner, prevent blind business expansion and out-of-order competition, and ensure the safety of users' funds. The guidance encourages measures like standardised operation and management, overseeing business flow, secure electronic payment, keeping transaction data, and prevents online illegal financial transactions …

Hong Kong, China

101. Hong Kong, China does not have licensing systems for e-money and Internet payment service providers. In Hong Kong, China, 'e-money' is very much represented by Multi-purpose stored value cards. Institutions in Hong Kong China issuing or facilitating the issuance of Multi-purpose stored value cards must be authorised by the Hong Kong Monetary Authority (HKMA) under the Banking Ordinance, Cap. 155 (BO)[31]. These institutions are called authorised institutions (AIs) and are subject to supervision of the HKMA.

102. Internet payment service providers, in Hong Kong, China, only provide a platform for the users to settle various types of payment through transferring money from their designated bank accounts to that of the vendor of goods or services. Nevertheless, when such service providers carry on a business of taking deposits and cash, they have to get a licence from HKMA to conduct business as an AI.

103. The HKMA has set out various supervisory policies and requirements to be observed by AIs in the form of supervisory guidelines. The supervisory guidelines issued by the HKMA with respect to AML/CFT are the "Guideline on Prevention of Money Laundering" and the "Supplement to the Guideline on Prevention of Money Laundering". These guidelines are issued in the form of a statutory guideline pursuant to section 7(3) of the BO. These guidelines impose obligations on AIs to put in place effective systems and procedures for combating money laundering and terrorist financing and are developed based on the latest international standards including the current 40 Recommendations on anti-money laundering and 9 Special Recommendations on countering the financing of terrorism of the FATF. The requirements in these guidelines apply to AIs which issue Multi-purpose stored value cards.

104. Under the AML/CFT guidelines, AIs are required to *i)* conduct the customer due diligence process to identify and verify the identity of their customers and the beneficial owners of their customers using reliable, independent source information, *ii)* obtain information on the purpose and intended nature of the business relationship, and *iii)* conduct on-going due diligence and scrutiny of transactions throughout the business relationship. AIs are required to adopt a risk-based approach in their CDD process. AIs should develop customer acceptance policies and procedures that aim to identify the types of customers that are likely to pose a higher money laundering/terrorist financing risk. For those customers identified with higher ML/TF risk, AIs should adopt a more extensive customer due diligence process and subject them to close monitoring. In undertaking the CDD

[31] A Multi-purpose stored value card is defined in the BO as a card on which data may be stored in electronic, magnetic or optical form and for or in relation to which a person pays a sum of money to the issuer of the card (directly or indirectly) in exchange for *i)* the storage of the value of that money, in whole or in part on the card; and *ii)* an undertaking by the issuer (express or implied) that the issuer or a third party will, on production of the card, supply goods and services (which may include money). There is currently only one issuer of Multipurpose stored value cards (*i.e.* Octopus Cards Limited) in Hong Kong, China. The Octopus Cards Limited is authorised as a deposit-taking company under the BO. Octopus cards are designated for small amount retail payments and there is a maximum storage limit of HKD1 000 per card.

process, AIs should, whenever possible, conduct a face-to-face interview with a new customer to ascertain the customer's identity and background. In cases where a face-to-face interview is not conducted, they should apply equally effective customer identification procedures and on-going monitoring standards to mitigate the risk. The AML/CFT guidelines also require AIs to keep proper account and transaction records.

105. Section 25A of the Organised and Serious Crimes Ordinance, CAP 455, (and similar provisions under Hong Kong's anti-terrorist financing legislation) provides requirements for reporting of suspicious transactions by all persons in Hong Kong to Hong Kong's Joint Financial Intelligence Unit, (JFIU). Failure to report a suspicious transaction is a criminal offence. All parties engaged in financial transactions of any kind must have systems in place to detect suspicious transactions to comply with this law, but the exact methods used are the responsibility of each company. Moreover, under the HKMA's AML/CFT guidelines, AIs should put in place effective management information systems to enable them to identify and report suspicious transactions. The Organised and Serious Crime Ordinance and Drug Trafficking (Recovery of Proceeds) Ordinance, (and similar provisions under Hong Kong's anti-terrorist financing legislation) makes provision for reporting of STRs to the JFIU. The reporting obligations apply to any person who knows or suspects that any property represents any person's proceeds of an indictable offence, or the property was used in connection with or is intended to be used in connection with an indictable offence, he shall disclose that knowledge or suspicion to an authorised officer (*i.e.* JFIU officer) as soon as practicable.

106. The HKMA ensures compliance of AIs with its AML/CFT guidelines through its on-going supervisory process. If an AI fails to comply with a requirement under the AML/CFT guidelines, the HKMA will require the AI to take appropriate remedial actions to rectify the situation. The HKMA will follow up with the AI to ensure that the deficiency has been satisfactorily addressed. Where the non-compliance is considered to be serious, the HKMA will impose supervisory measures against the AI[32].

Australia

107. Payment methods are regulated largely by a combination of the Payments System (Regulation) Act 1998, the Payment Systems and Netting Act 1998, and the Electronic Funds Transfer (EFT) Code. The Reserve Bank of Australia (RBA) administers the Payments System (Regulation) Act 1998, and the *Payment Systems and Netting Act 1998* with the goal of achieving efficiency, competition and stability. The Australian Securities and Investments Commission administers the EFT Code with the goal of providing consumer protection.

108. Australia's primary anti-money laundering and counter-terrorism financing (AML/CTF) legislative package includes the Anti-Money Laundering and Counter-Terrorism Financing Act 2006 (AML/CTF Act) and Anti-Money Laundering and Counter Terrorism Financing Rules. The AML/CTF Act sets out general AML/CTF principles and obligations. With the details of how these obligations are to be carried out being set out in subordinate legislative instruments known as the AML/CTF Rules.

109. The AML/CTF Act covers the financial sector, gambling sector and bullion dealing and any other professionals or businesses that provide particular designated services. Being activities-based,

[32] There is a broad range of supervisory measures available to the HKMA. They include for example issuing a statement of warning to the senior management of the AI, imposing restriction on the AI's business, downgrading the supervisory ratings of the AI and commissioning an external auditor to review the AML/CFT system of the AI. In the event that the AI fails to take appropriate remedial actions, the HKMA will consider exercising its formal powers under the BO, which include withdrawing the consent given to the responsible directors and chief executives, attaching conditions to the AI's authorisation, requiring the AI to seek advice from an Advisor appointed by the HKMA and suspending or revoking the authorisation of the AI. The supervisory measures to be taken in each case will depend on the seriousness of the deficiencies identified in the AI and are considered to be effective, proportionate and dissuasive.

under the AML/CTF, it does not matter how designated services are provided (*i.e.* electronic, paper or face to face).

110. The AML/CTF Act imposes a number of obligations on businesses (called reporting entities) when they provide these designated services. These obligations include: customer due diligence (identification, verification of identity and ongoing monitoring of transactions); reporting (suspicious matters, threshold transactions and international funds transfer instructions); record keeping, and establishing and maintaining AML/CTF program.

111. The AML/CTF Act implements a risk-based approach to regulation. Businesses are able to determine the way in which they meet their obligations based on their assessment of the risk of whether providing a designated service to a customer may facilitate money laundering or terrorism financing. The AML/CTF Rules specify how the obligations may be complied with by a reporting entity putting in place appropriate risk-based systems and controls. When determining and putting in place appropriate risk-based systems and controls, the reporting entity must have regard to the nature, size and complexity of its business and the type of ML/TF risk that it might reasonably face. In identifying its ML/TF risk a reporting entity must also consider the risk posed by the following factors: its customer types, including any politically exposed persons, the types of designated services it provides, the methods by which it delivers designated services; and the foreign jurisdictions with which it deals.[33]

112. The Australian Prudential Regulation Authority (APRA) authorises certain e-commerce payment mechanisms to be a Purchased Payment Facility (PPF). PPFs, such as smart cards and electronic cash, are facilities which consumers pay for in advance and use to make various types of payments. Consumers rely on the holder of the stored value redeeming that value on demand.

113. APRA's prudential standard regarding PPF's seeks to ensure that those who provide PPF facilities are subject to prudential requirements commensurate with their risk profile. A PPF provider is not authorised to conduct general banking business. Under the prudential standard, a PPF provider is required to comply with AML/CTF requirements as administered by AUSTRAC (under the Anti-Money Laundering and Counter-Terrorist Financing Act 2006).

114. APRA also authorises those who carry on a credit card issuing and/or acquiring business in Australia as a "specialist credit card institution" (SCCI). SCCIs are a special class of authorised deposit-taking institutions (ADIs) that are authorised to perform a limited range of banking activities. SCCIs may only perform credit card issuing and/or acquiring business and any other services related to credit card issuing and/or acquiring. SCCIs are not permitted to accept deposits (other than incidental credit balances on credit card accounts).

[33] [Australian] Attorney-General's Department (2007).

RISK MANAGEMENT MEASURES TAKEN BY THE SECTOR

Introduction

115. As with any type of business, commercial websites and Internet payment systems are confronted with various types of risks ranging from the technical safeguards of their websites from computer hackers and viruses to the outright criminal misuse of their systems by criminals for purposes of facilitating fraud, and Internet payment systems for money laundering and other financial crimes. Risk management is therefore an ongoing process that may be developed by commercial websites and Internet payment systems to minimise their exposure to various risks. This may include the establishment of customer user agreements and policies by a company that set strict rules and policies for the use of their respective system by a user. In addition, commercial websites and Internet payment systems may also establish "best practices" designed to set internal standards for how a company may safely operate while at the same time providing effective services to their users. Risk management may also encompass Anti-Fraud and Anti-Money Laundering/Terrorist Financing (AML/TF) programs that may have been implemented by commercial websites and Internet payment systems. Finally, a risk-based approach may also integrate other initiatives that are undertaken by a commercial websites and Internet payment systems that are required under the regulatory regime of a specific country or jurisdiction where a commercial websites and Internet payment systems may provide services, *e.g.* reporting requirements (for Internet payment systems), etc. Other stakeholders (such as the tax authorities and authorities supervising payments) are or must be involved in the fight against ML or TF and the mitigation of ML or TF risks. If commercial websites have no reporting obligations they are controlled by these stakeholders.

AML/CFT mechanisms used to mitigate fraud, money laundering and terrorism financing risks

116. Internet Payment service providers, subject to regulations from a supervision authority, mitigate the above mentioned ML/TF risks by applying different mechanisms. During the study the project team obtained confirmation on the use of such mechanisms by consulting, as mentioned in the introduction, one of the most important mediated customer-to-customer commercial websites and Internet payment service provider as well as a smaller electronic money issuer and the Electronic Money Association representing a range of e-money issuers and payment service providers. The project team also obtained confirmation that AML/CFT regulations imposing similar mechanisms apply to Internet payment service providers in the most industrialised countries.

117. A non-exhaustive list of these mechanisms is provided in this section:

- Implementing important worldwide security teams patrolling sites to detect fraud and misuse.
- Applying risk-based Customer Due Diligence (simplified CDD vs. enhanced CDD).
- Scoring customer risk at opening of account.
- Risk-based verification of information entered by customers (e-mail address/IP address, identity of credit card holder, stolen credit cards …).
- Automated call, random charges to verify identities of customers.
- Sending a letter to verify customers address.
- Credit cards address verification.

- Consulting commercial databases to confirm information received from customers;
- Phone calls by staff to obtain additional information from customers.
- Activity limits, sending and withdrawals limits.
- Verification of funding source.
- Real time screening of customers, their activities and items sold.
- Monitor, using risk models built to detect bad activities, information:
  - obtained from customers (identity, address, e-mail and IP addresses used, About Me page, …)
  - collected from customers (phone call to sellers, …)
  - obtained internally (previous transactions, item country location, customer location, shipping methods used, behaviour of customers during auction processes, accepted payments, …)
  - obtained from external sources (countries at risk for certain forms of criminalities, check listings of presumed terrorists or terrorist groups, …)
- Risk models to detect abnormal (with regards to previous transactions) or high volume activity.
- Models/software to detect suspicious activities (based on various red flags and indicators).
- Manual review of abnormal transactions and of higher use accounts.
- Detect abnormal and suspicious activities in withdrawals.
- Refuse transactions on prohibited items (drugs, firearms, counterfeit products…).
- Remove offending items from the website.
- Cooperate with commercial company to detect counterfeit products and remove them from sales.
- Analyse the physical and electronic evidence left by criminals on the net.
- Delay a transaction.
- Display message to customers on regulation applying to certain countries and transactions.
- Encourages the reporting of suspicious items on sale, suspicious auctions or suspicious behaviour of customers (sellers or buyers) – scoring of customers (buyers and sellers by each other).
- Does not accept or distribute cash.
- Maintain full audit trails of commercial transactions and payments.

118. The most organised Internet payment service providers collect a range of data and information about movements of funds between buyers and sellers, located in different countries all over the world but customers of the same Internet payment service provider, commercial transactions between buyers and sellers, data and information accumulated over a long period of time and available centrally.

119. Consequently, they have a global view of the movements of funds and the commercial transactions between buyers and sellers internationally, information that the banks of buyers and sellers do not have. They can easily reconstruct commercial transactions and movements funds between different countries and persons in the world.

120. Certain Internet payment service providers have the opportunity to access data and information on the commercial transaction underlying a financial movement of funds because they provide payment facilities to commercial websites belonging to the same financial group. Nevertheless, certain Internet payment service providers providing payment facilities to commercial websites not belonging to the same financial group can also obtain but in a more limited way information on underlying commercial transactions.

121. An easy data sharing of information with commercial websites reduces the risks of misuse and the risks of ML/TF.

122. If Internet payment service providers adequately monitor the financial transactions of their customers by detecting deviations from their customer's known profile of transactions, the non face-to-face contact at the beginning of the relationship with the commercial website and Internet payment service provider may not constitute a problem.

123. Nevertheless, it is worth mentioning that an Internet payment service provider will be able to build a better and much accurate customer's profile of transactions if the number of transactions performed by a customer is significant.

124. Exchange of information between commercial websites and Internet payment services providers possibly located in different countries is sometimes not easy because of the differences in the privacy legislation.

125. As already mentioned in the subsection regarding regulations, AML/CFT reporting obligations are applicable to Internet payment service providers in the country in which they are physically located. Certain commercial websites and Internet payment service providers work closely with law enforcement. They encourage regulators and law enforcement to play an active role in the fight against the use of commercial websites and Internet payment service providers for criminal activities.

CONSIDERATIONS ON "SECOND LEVEL OF CONTROLS VERSUS THIRD LEVEL CONTROLS"

126. Internet payment service providers, licensed as e-money providers or as a bank, have several obligations in the field of identification of customers, detection, monitoring and reporting of suspicious financial transactions. As explained in the section above, they have access to a wide range of information for monitoring the transactions of their customers and certain Internet payment service providers have implemented ongoing due diligence mechanisms which include: scrutiny of transactions undertaken throughout the course of the relationship to ensure the transactions conducted are consistent with their customer's known profile. In many cases, the profile of a customer can only be deducted from previous transactions with the payment service provider.

127. When services of Internet payment services providers are used, banks of buyers and sellers do not have a global view of the flow of funds between buyers and sellers, as this information is only known by the Internet services provider itself. A customer of a bank may order his bank to transfer funds from his bank account to his account with an Internet payment service provider. Afterwards the customer will request the Internet payment service provider to transfer funds for a purchase on a commercial website. The bank can be totally unaware of this purchase and the reasons for funding the account with the Internet payment service provider. In the United States, similar cases have been identified with payments requested by customers of banks in favour of Internet payment service providers and used thereafter by these customers on gambling websites, without the bank knowing the funds were used for this illegal activity in the United States.

128. But banks still have an important role to play in the monitoring and detection of suspicious transactions, even if the funds are transferred to or originate from an Internet payment service provider. For instance, a transaction with an Internet payment service provider can be abnormal or disproportionate to the bank with regards to the known profile (professional activities, professional revenues, customer bank transactions profile) of its customers.

129. It is also important that financial institutions, such as the banks, do not exonerate themselves from their AML/CFT responsibilities, in particular the detection of suspicious financial transactions, when the funds originate from an Internet payment service provider, and even if the transactions concern relatively small amounts. A statement or a printout of a screen of the commercial website showing an item on sale must not immediately and unconditionally considered as an invoice or justifying a financial transaction on the bank account of the customer. Conversely, the presentation of such justification document could be used as a red flag or indicator for the financial institution.

POLICY IMPLICATIONS

130. ML/TF risks associated with commercial websites and Internet payment systems have been analysed and the focus has been put on the type of electronic commerce identified for various reasons (increasing popularity, easy access, available to private individuals, high volume of cross border trade transactions …) as the most susceptible to be used by criminals for ML/TF: mediated customer-to-customer. The work of the project team has led to the following key findings with respect to ML/TF vulnerabilities of commercial websites and Internet payment systems.

Key findings

131. Criminals have shown adaptability and opportunism in finding new channels to launder the proceeds of their illegal activities and to finance terrorism. As the Internet becomes more and more a worldwide phenomenon, commercial websites and Internet payment systems appear to be subject to a wide range of risks and vulnerabilities that can be exploited by criminal organizations and terrorist groups.

132. Various vulnerabilities of commercial websites and internet payment systems have been highlighted: the non face-to-face registration which may lead to identification problems; the speed of transactions, the limited human intervention and the high number of transactions, which may cause problems concerning audit trails, monitoring and detection of transactions; the international character, which is inherent to the Internet, which may create issues concerning jurisdictional competences; difficulties for traditional financial institutions to monitor and detect suspicious financial transactions with the consequence that their abilities in the detection of suspicious financial transactions, when an Internet payment service provider is used, could be affected.

133. Some of the ML/TF risks associated with trade-based money laundering and non face-to-face business and financial transactions apply also to commercial websites and Internet payment systems. The financial transactions that are initiated from a bank account or a credit card (which is the majority of online payments) already involve a customer identification process as well as transaction record keeping and reporting obligations. While low value transactions do not equate to low risk, these transactions are subject to the regulatory controls already applicable to the financial sector and may be consequently less risky. Regarding the risks associated with the non-face-to-face registration and the possible anonymity of the users the study highlights the need for online identity verification solutions (the electronic identity card used in certain countries for instance) to help commercial websites and Internet payment service providers mitigate the risks of criminal activity. The report also indicates that if Internet payment service providers adequately monitor the financial transactions of their customers, monitoring for and acting on deviations from the customer transaction profile, the lack of face-to-face contact at the beginning of the relationship with the commercial website and Internet payment service provider may not constitute a problem. Online and offline retail merchants and payment services should have comparable AML/CFT obligations.

134. It is also important that efforts to fight against fraud and ML/TF by commercial websites and Internet payment service providers in different countries not be hampered by divergent privacy legislation, potentially interfering with the amount of customer information that service providers could exchange regarding suspected ML/TF.

135. Although the challenges to identifying TF apply equally to Internet payment systems (the suspicions being mostly based on name matching with the names provided by the competent authorities), it is not always necessary for Internet payment service providers to identify TF in their

STRs in order to help counter terrorist financing. Any suspicious activity is important to report regardless of the type of activity. Some Internet payment service providers have put in place systems to detect, monitor and analyse suspicious transactions - even for small amounts.

136. Concerning the risk-based approach to combat ML/TF we can refer to the June 2007 FATF Guidance which states that : "By adopting a risk-based approach, competent authorities and financial institutions are able to ensure that measures to prevent or mitigate money laundering and terrorist financing are commensurate to the risks identified. This will allow resources to be allocated in the most efficient ways. The principle is that resources should be directed in accordance with priorities so that the greatest risks receive the highest attention." Applying this principle to online transactions, the private sector may be allowed to consider low value consumer payments initiated from financial institutions or credit card account (which require customer identification and verification procedures, as well as transaction record-keeping and reporting policies), to be of lower risk than transactions initiated through services providers without AML/CFT obligations.

137. The risk of fraud and the sale of illegal goods are among the concerns of commercial websites and Internet payment systems. These concerns are among the motives for commercial websites and Internet payment systems to secure their communications, websites and payment systems. In some jurisdictions online commercial websites are not as such required to detect or fight against ML/TF, but have a market incentive to detect fraud.

138. Some commercial websites and Internet payment service providers, aware of the risk of being used for illegal activity, have set up departments to screen and monitor the transactions of their customers, using a risk-based approach. In addition to monitoring for fraud, some commercial websites and Internet payment service providers have also set up AML/CFT mechanisms. Best practices in the sector, including customer due diligence, monitoring transactions, not accepting anonymous forms of payment (cash for instance) imposing transactions limits, maintaining transactions records, and reporting large or suspicious transactions to the competent authorities, could be helpful for other parties of the private sector.

139. The collaboration between commercial websites and Internet payment service providers to exchange information on commercial transactions underlying financial transactions is a factor which mitigates money laundering and terrorism financing risks, as well as risk of fraud. Legal dispositions encouraging such exchange of information could be very useful.

140. The report concludes that, as long as the sector, and the relevant competent authorities, understand the potential vulnerabilities associated with commercial websites and Internet payment systems and appropriate risk-based measures with regard to customer identification, record keeping and transaction reporting are taken, the mentioned issues may not necessarily constitute a higher risk for the online sector than for the offline sector.

141. The project team believes that even though awareness of ML/TF amongst major players in the online sector is increasing, due to efforts made by regulators and trade associations, efforts need to be made to increase this awareness, particularly regarding the mechanisms of ML/TF.

142. Given the international character of commercial websites, international cooperation is a key factor. Cooperation between, for example, FIUs, law enforcement and other parties involved is therefore important. Internet payment service providers report in the country where they are established (got a license) and not in the country of residence of the individuals involved in the suspicious financial transactions, which for FIUs and law enforcement may lead to identification and follow-up problems (it is difficult to confirm the true identity of the parties involved in the transactions in the country of the disclosure given that the individuals do not live in the country and the transactions are difficult to explain / justify as they does not take place in the country where the Internet service provider is located and reports.

Issues for consideration

143. Looking ahead, there appear to be a number of areas that could be considered to improve the capacity to cope with ML/TF risks associated to commercial websites and Internet payment systems.

144. **Building a better awareness:** Creating an understanding of the ML or TF risks amongst governmental bodies and the private sector is critical. Making the traditional financial institutions aware of their role in the detection and the monitoring of suspicious financial transactions. Therefore it is necessary to raise awareness by identifying red flags and typologies. Awareness could also be raised by training programs and outreach sessions to the private sector. The regulators and trade associations which have already contributed to the issuance of AML/CFT guidance to the sector and the development and issuance of ML/TF typologies could be of great help.

145. **Imposing similar regulations**: Given the international character and presence of Internet, it is difficult to determine which jurisdiction has regulatory authority over an Internet payment service provider, and how enforcement action can be applied if there are violations. World based Internet payment service providers have locations and licences in different countries and regions. It is consequently important that governments impose similar regulations, requiring customer identification, CDD, record keeping and transaction reporting, to Internet payment service providers all around the world, to avoid certain Internet payment service provider choosing the country with the poorest regulations or not at all regulated.

146. **Exploring industry best practices**: The high standard for customer due diligences and the sector best practices (monitoring of transactions, non-acceptance of certain forms of payment (cash for instance) considered as high risk for ML/TF, limits imposed to transactions, …) identified during the workshop and presented in the report could be helpful for other players in the private sector and could be an important part of the training programs and outreach sessions to the private sector.

147. **Bearing in mind that international cooperation is a key factor**: International cooperation is a key factor in the fight against ML and TF given the international character of the Internet and commercial websites activities. Countries need to work cooperatively to identify and combat the use of commercial websites and Internet payment systems for ML/TF purposes. International cooperation to ensure that entities operating in multiple jurisdictions are being properly regulated and monitored somewhere is also important.

148. Approaching the Egmont group in order to discuss the awareness raising amongst FIUs in view of combating ML/TF via commercial websites and Internet payment systems: There is a need to explore ways FIUs can enhance the exchange of information and data pertaining to the criminal misuse of commercial websites and Internet payment systems.

FATF REPORT

Money laundering and terrorist financing related to counterfeiting of currency

June 2013

FINANCIAL ACTION TASK FORCE

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

DEFINITIONS

Currency:

The CCC 1929 defines currency in Article 2 as "paper money (including banknotes) and metallic money, the circulation of which is legally authorized".

Currency counterfeiting:

Article 3 of the CCC 1929 refers to "fraudulent making or altering of currency, whatever means are employed".

League of Nations' Currency Counterfeiting Convention (CCC) 1929:

League of Nations International Convention for the Suppression of Counterfeiting Currency of 1929.

Money laundering:

The definition is provided in the Article 6 of the *UN Palermo Convention 2000*:

> *The conversion or transfer of property, knowing that such property is the proceeds of crime, for the purpose of concealing or disguising the illicit origin of the property or of helping any person who is involved in the commission of the predicate offence to evade the legal consequences of his or her action; The concealment or disguise of the true nature, source, location, disposition, movement or ownership of or rights with respect to property, knowing that such property is the proceeds of crime; Subject to the basic concepts of its legal system: The acquisition, possession or use of property, knowing, at the time of receipt, that such property is the proceeds of crime; Participation in, association with or conspiracy to commit, attempts to commit and aiding, abetting, facilitating and counselling the commission of any of the offences established in accordance with this article.*

Money laundering offence:

"[R]efers not only to the primary offence or offences, but also to ancillary offences" (FATF, 2013: 119).

Organised criminal group:

Article 2 of the *UN Palermo Convention 2000* defines *organised criminal group* as being "a structured group of three or more persons, existing for a period of time and acting in concert with the aim of committing one or more serious crimes or offences established in accordance with this Convention, in order to obtain, directly or indirectly, a financial or other material benefit".

UN Palermo Convention 2000

The United Nations Convention against Transnational Organized Crime 2000

Terrorist:

"Any natural person who: (i) commits, or attempts to commit, terrorist acts by any means, directly or indirectly, unlawfully and wilfully; (ii) participates as an accomplice in terrorist acts; (iii) organises or directs others to commit terrorist acts ; or (iv) contributes to the commission of

terrorist acts by a group of persons acting with a common purpose where the contribution is made intentionally and with the aim of furthering the terrorist act or with the knowledge of the intention of the group to commit a terrorist act".[1]

Terrorist act:

The FATF standards define terrorist act according to the *International Convention for the Suppression of the Financing of Terrorism* (1999). A terrorist act therefore includes:

> (a) an act which constitutes an offence within the scope of, and as defined in one of the following treaties:
>
> *(i) Convention for the Suppression of Unlawful Seizure of Aircraft (1970);*
>
> *(ii) Convention for the Suppression of Unlawful Acts against the Safety of Civil Aviation (1971);*
>
> *(iii) Convention on the Prevention and Punishment of Crimes against Internationally Protected Persons, including Diplomatic Agents (1973);*
>
> *(iv) International Convention against the Taking of Hostages (1979);*
>
> *(v) Convention on the Physical Protection of Nuclear Material (1980);*
>
> *(vi) Protocol for the Suppression of Unlawful Acts of Violence at Airports Serving International Civil Aviation, supplementary to the Convention for the Suppression of Unlawful Acts against the Safety of Civil Aviation (1988);*
>
> *(vii) Convention for the Suppression of Unlawful Acts against the Safety of Maritime Navigation (2005);*
>
> *(viii) Protocol for the Suppression of Unlawful Acts against the Safety of Fixed Platforms located on the Continental Shelf (2005);*
>
> *(ix) International Convention for the Suppression of Terrorist Bombings (1997); and*
>
> *(x) International Convention for the Suppression of the Financing of Terrorism (1999).*
>
> (b) any other act intended to cause death or serious bodily injury to a civilian, or to any other person not taking an active part in the hostilities in a situation of armed conflict, when the purpose of such act, by its nature or context, is to intimidate a population, or to compel a Government or an international organisation to do or to abstain from doing any act[1].

Terrorist financing:

Refers to the financing of terrorist acts, and of terrorists and terrorist organisations (FATF glossary)[1].

Terrorist financing offence:

Refers not only to the primary offence or offences, but also to ancillary offences[1].

---

1 FATF (2012), *p.* 122.

Terrorist organisation:

"Any group of terrorists that: (i) commits, or attempts to commit, terrorist acts by any means, directly or indirectly, unlawfully and wilfully; (ii) participates as an accomplice in terrorist acts; (iii) organises or directs others to commit terrorist acts; or (iv) contributes to the commission of terrorist acts by a group of persons acting with a common purpose where the contribution is made intentionally and with the aim of furthering the terrorist act or with the knowledge of the intention of the group to commit a terrorist act".[2]

[2] FATF (2012), *pp*. 122-123.

EXECUTIVE SUMMARY

The counterfeiting of currency emerged as a violation of law at the same time that "money" became a standardised unit of exchange. From Sumerian coin shell money to metallic coins and finally the introduction of paper money, it has always been a high profit-generating crime for individuals and criminal groups alike. With the increased demand and its acceptance beyond local markets, ample opportunities arose for counterfeiters. Over time it has evolved into more serious forms and has been, and continues to be, used as a means of economic warfare.

FATF Recommendation 3 designates counterfeiting currency as a predicate offence for money laundering (ML). However, specific aspects linked with the offence of currency counterfeiting such as the production of counterfeit currency, its smuggling and placement into the financial system, and laundering of proceeds, have not been considered directly in typologies research to better understand the differences and similarities between counterfeiting as predicate offence and the related methods of laundering these proceeds. This research project provides an overview of these different aspects of counterfeiting of currency and focuses on its relation with organised crime (OC), ML and terrorist financing (TF). It identifies and describes ML and TF aspects associated with counterfeit currency. The findings of the report are based on general research in Open Sources, on expert knowledge, and were supported by the input from 25 countries (see Annex 1) who responded to a survey developed by the research team.

The counterfeiting of currency is a widespread phenomenon. While it should be relatively easy to detect counterfeit banknotes with the “feel-look-tilt” features that many physical currency notes possess, it has become increasingly difficult for some counterfeits to be identified, especially those printed by offset printing method and with innovative techniques used to imitate some of the security features. The seizure of “high quality” counterfeit currency notes (CCN) in multiple jurisdictions throughout the world appears to indicate the involvement of criminal groups operating internationally. Organised Criminal Groups (OCGs) based in one country have been found to be smuggling counterfeit currency of other countries. These criminal groups use their already existing infrastructure in terms of a covert network of smugglers and ML businesses to introduce counterfeit currency into the financial system to multiply their profits.

Research on the involvement of OC networks in the production and distribution of counterfeit money is readily available. However, reliable and public available information on TF by means of counterfeit money is comparatively rather scarce. Six of the countries responding to the survey reported the linkage of counterfeit currency with OC and TF: India, Kyrgyzstan, Nepal, Russia, Tajikistan and the United States. They also refer to links between OCG and terrorism, including TF and the use of counterfeit money as a means of economic warfare.

Counterfeiting has become attractive to terrorists and their sympathisers, as it is very profitable, particularly when comparing the associated risks to those of other forms of criminal activity such as trafficking in drugs. While OCGs carry out currency counterfeiting throughout the world as one of many criminal activities, currency counterfeiting for the purpose of financing terrorism is seen only in certain regions. Academic research suggests that terrorist organisations active in Europe, Asia, and Latin America, rely on common criminal activities such as extortion, kidnapping, narcotics

trafficking, counterfeiting and fraud, to finance their operations and even forge relationships with OCGs. The survey responses indicate that the nature, intensity and character of the nexus between currency counterfeiting and TF have not been a subject of serious scrutiny.

Counterfeiting has evolved from a mere criminal activity generating proceeds that are then also used to fund terrorism, into an activity intended to replace real currency. In certain instances, particularly during wartime, the infiltration of high-quality counterfeit notes has been used to attack the economy of a country in an effort to erode the faith in its currency.

Since the counterfeiting of currency has an international dimension, it also becomes imperative to move the proceeds across international borders. Furthermore, the very activity of trafficking counterfeit notes results in their introduction into the regular financial stream. In this respect, the methods for introduction of counterfeit notes into a financial system are very similar to those used for "placement" of illicitly generated proceeds by other types of criminal activity. This means that a large scale currency counterfeiting operation can only be called effective when the laundering of the criminal proceeds is effective too.

The survey indicates that the most frequently used method to move the proceeds of crime is the use of cash couriers. For layering and integration of proceeds of crime related to counterfeit currency, the most frequently used techniques are intermingling in cash-intensive business, movement through multiple jurisdictions, movement through multiple accounts and false or misleading declaration of goods and services.

This study sets out a series of red flag indicators, which will help identify ML techniques related to currency counterfeiting crimes. It also highlights areas for improvement in the co-operation between Law Enforcement Agencies (LEAs) and Financial Intelligence Units (FIUs).

Governments around the world periodically review the security features of their currencies to protect against the threat of counterfeiting. Financial institutions and Designated Non-Financial Businesses and Professions (DNFBPs) by virtue of handling large volumes of physical currency have to be particularly alert in ensuring action against counterfeiting within the financial system. To do this, they need to develop and implement preventive measures for the detection and reporting of counterfeit currency notes (CCN), as well as carry out training and awareness-raising.

Legal provisions criminalising the act of counterfeiting currency as well as laundering its illegal proceeds have been established in most jurisdictions. However, the responses to the survey appear to indicate that national legislation generally focuses more on the ML and/or TF activities – with currency counterfeiting by default as one of the predicate offences – rather than foreseeing specific ML/TF activity in counterfeit currency related provisions.

The legal provisions criminalising the act of counterfeiting currency focus on this activity per se, although counterfeiting currency remains a predicate offence to ML in the legislations of many countries. The responses to the survey indicate that there is generally very low focus on the ML and/or TF activities associated with this crime.

Armed with legal provisions, police and customs authorities play a very important role, especially in the conduct of intelligence-led operations and the seizure of counterfeit currency. Data from past

operations are collated to study emerging trends. Trends and intelligence gathered are used in profiling offenders and routes and in identifying possible *modi operandi*[3].

The survey reveals that the national legislation in many countries permits special investigation techniques such as undercover/sting operations, intercepting communications, controlled delivery, tracing and recovery of assets, confidence buys to be used in counterfeiting investigations. However, the extent of the use of these techniques by LEAs is sometimes limited due to resources and restrictive laws, which consequently hinders effective cross-border co-operation.

Relevant international co-operation practices were also analysed as part of the study. In most countries, this international co-operation is dealt with by LEAs, very often in co-operation with central banks.

The first international legal instrument dealing with counterfeit currency is the *International Convention for the Suppression of Counterfeiting Currency* signed at Geneva on 20 April 1929 (CCC 1929). This convention is a specific, legal, international and binding instrument for fighting against currency counterfeiting. The *UN Convention against Transnational Organized Crime* which was adopted by General Assembly on 15 November 2000 is one of the main international legally binding instruments in the fight against cross-border OC.

INTERPOL provides technical and forensic support, and operational assistance to support member countries in addressing the problem of counterfeit currency. Of particular interest is the S-Print Project[4], an international monitoring system on the security printing industry and suppliers, including the verification of second-hand *intaglio* machines, security printing equipment and suspicious purchase orders.

With regard to international co-operation, various impediments have been identified such as late or no responses to requests, or complicated and time-consuming procedures. The survey indicates that there is room for enhanced international co-operation.

The European Union's legal framework on the protection of the euro against counterfeiting can be seen as a "best practice" example with regard to co-operation at the regional level. EUROPOL acts as the *European Central Office* for combating euro counterfeiting within the meaning of Article 12 of the CCC 1929. Even before the euro was physically introduced as physical currency in (initially) 12 European Union (EU) member states in 2002, provisions had been made to protect it gainst counterfeiting. Those provisions have since been further developed and are complemented by a number of institutions responsible for the exchange of strategic, technical and operational information to support efficient cross-border co-operation. The European Commission's funding programme Pericles[5], managed by its Anti-Fraud Office OLAF, has been established to take into account the international and multidisciplinary aspects of combating counterfeiting of the euro.

I. INTRODUCTION

The menace of counterfeit currency is a global phenomenon. Related criminal activity has the capability to generate high profits and is often linked to other types of criminal activities such as trafficking in drugs and racketeering. Currency counterfeiters continue to improvise and take advantage of new technologies to keep pace with regular periodical changes in currency design and security features.

The 2003 FATF Recommendations on ML and TF designated "counterfeiting currency" as one of the 20 predicate offences for ML. Although today counterfeiting currency is among the designated categories of offences as per FATF standards, the FATF has not yet considered it directly in a typology study in order to determine its nature, the scale of the problem, and the methods of laundering these proceeds. It is also unclear how, if at all, the techniques of placing counterfeit currency into the legal financial system differ from those used to launder non-counterfeit illicit cash proceeds. Furthermore, it is little understood how the counterfeiting of currency generates illicit (non-counterfeit) proceeds that must then be laundered.

1. SCOPE OF THE STUDY

Currency counterfeiting has various manifestations:

- Individuals producing counterfeit currency to be used for personal use.
- Criminal groups producing counterfeit currency as a profit-making activity in order to sell or resell it for illegal gain.
- The use of CCN for financing terrorist activities.
- States and/or terrorist groups using counterfeit currency as a means of economic warfare.

This project provides a short overview of these different manifestations but focuses on the second and third one, since it is these activities that are the determining factors related to ML and TF.

The study reflects the situation on counterfeit banknotes only.

2. AIMS OF THE STUDY

The goals of the FATF typologies research on counterfeiting of currency are:

- To identify and describe ML and TF methods associated with counterfeit currency;
- To compare the methods of placement of counterfeit currency with those of other criminal proceeds;
- To study the links of counterfeiting of currency to organised crime, TF and other criminal activity;

- To identify AML/CFT measures that are potentially useful in detection of counterfeiting of currency and associated to ML and/or TF;
- To identify red flag indicators for detection of suspicious transactions relating to counterfeit currency;
- To identify gaps in the legal framework and/or mismatches in the operational interaction of LEAs, customs and FIUs preventing successful investigation and prosecution of ML/TF arising from counterfeit currency.

3. METHODOLOGY

This study is based on two main types of sources of information. Primary information was gathered by means of: (1) survey questionnaires sent to FATF members and FATF-Style Regional Bodies (FSRBs); (2) several workshops run by the project team;, and (3) opinions, experience and knowledge of experts related to subject matters such as currency counterfeiting, ML and TF. This primary information assisted the research team in establishing the general parameters of its work and in focusing its requests for further information. The views of experts were particularly helpful to uncover shortcomings in a highly specific field of this activity.

Secondary information was systematically developed, mainly from academic articles, and used to complement the survey responses received.

Due to the limited number of survey responses received (25 in total), the report does not present a complete picture for all countries of the world. Nevertheless the information collection process and the literature review suggest that while OC and TF related to counterfeiting of currency have, to a certain degree, attracted the attention of scholars, the ML aspect of counterfeiting of currency has not been a serious subject of research up to now. Information related to currency counterfeiting has often been treated under the more general offence of fraud or incorporated into articles related to other forms of criminal activity.

4. SCALE OF THE PROBLEM

Currency counterfeiting crimes can have a high impact on the political and economic system of one country as they are able to challenge the foundation of sovereignty. The involvement of OC and terrorist groups can pose a serious threat to national economies and global security.

Estimates for the proceeds generated by currency counterfeiting are rare, and the survey does not provide comprehensive figures. According to statistical data provided by LEAs and regional institutions of the Bank of Russia, the number of counterfeit notes detected in recent years has decreased[6]. Haken suggests that the amount of counterfeit US dollars and euros is not large in the general context of all currency in circulation and cites a US Secret Service (USSS) 2005 estimate of one counterfeit USD for every USD 12 400 out of USD 760 billion in circulation[7]. European Central Bank (ECB) statistics from 2010 indicate that more than 97% of counterfeit banknotes withdrawn

6 Krylov, O.V. (2012).

7 Haken, J (2011), *p.* 18.

from circulation in the second half of that year were in countries of the "Euro area"[8]. Seizures of counterfeit euro notes in EU countries outside the Euro area amounted to 1.5% with a similar seizure amount for countries outside the EU[9]. These figures need to be seen from the perspective that countries outside the EU are not obliged to report euro counterfeiting seizures to the ECB. The statistics[10] also do not include counterfeit banknotes that were seized before they were put into circulation, *e.g.,* counterfeits seized in dismantled print-shops. On the other hand, in India there has been an increase in the recovery and seizures of counterfeit Indian currency by about 210% in 2011 as compared to 2009.

Another factor that makes estimates of proceeds of crime difficult is "dark figures". The 2006 final report to the US Congress by the Secretary of the Treasury refers to the unlikelihood of large amounts of counterfeit US dollars circulating for a very long time before being detected, due to the way that US currency is used and moved. Collected data, input from currency dealers, information on currency flows and analysis of economic data, appear to indicate that US banknotes "are exchanged sufficiently often that they regularly move through financial institutions and exchange houses"[11]. Counterfeit banknotes are thus more likely to be detected.

INTERPOL publishes yearly statistics for all counterfeit currency seizures that take place in 190 countries. Data from 100 Interpol members (see Annex 2) reveal that 3.27 million pieces of CCN representing115 different currencies were detected in 2011:

- 98 countries out of the 100 countries reported that they detected/seized counterfeit national currency.
- On average, each country reported detection/seizure of 4.35 different types of currencies other than the national currency.
- Switzerland, followed by the United Kingdom; Hong Kong, China; and the Netherlands, were the top four countries in terms of different types of counterfeit currencies detected/seized in their jurisdiction.
- The US dollar, euro, pound sterling and Yuan renminbi were the top four currencies reported as counterfeited by other countries (see Chart 1);

---

8 The "Euro area" includes those the EU members whose currency is the euro and in which a single monetary policy is conducted under the responsibility of the Governing Council of the ECB. In 2013, it comprised Belgium, Germany, Greece, Spain, Estonia, Ireland, France, Italy, Cyprus, Luxembourg, Malta, the Netherlands, Austria, Portugal, Slovenia, Slovakia and Finland.

Chart 1. **Top 10 currencies reported as counterfeit by different countries**

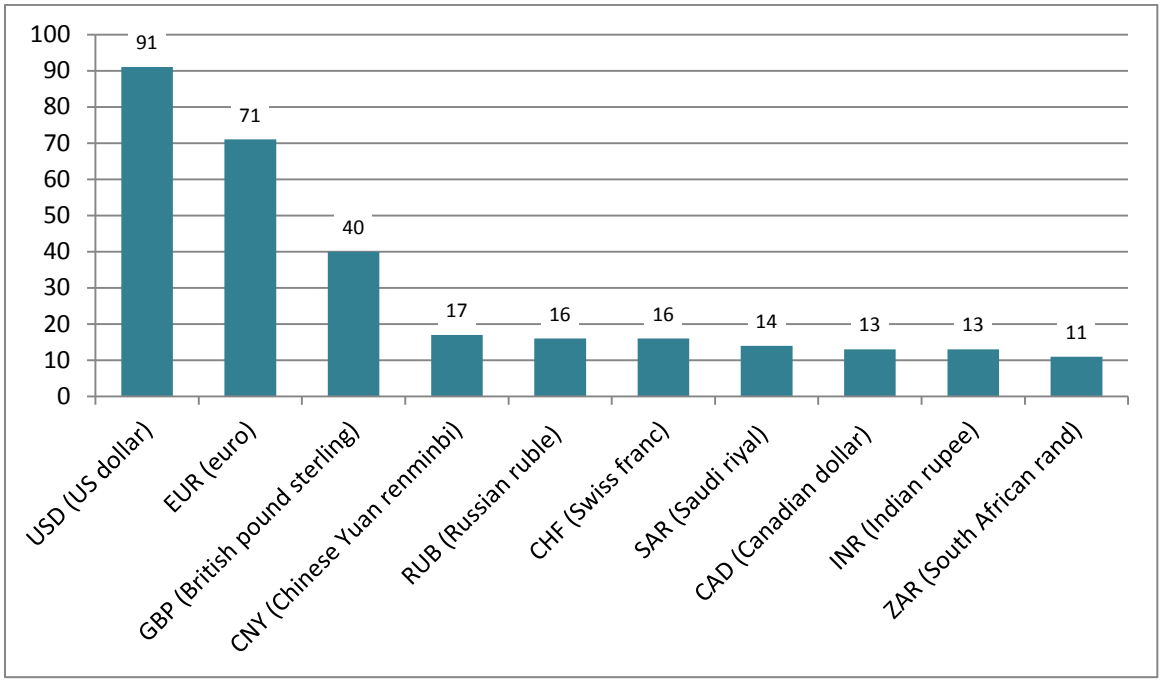

Chart 2. **Top 10 currencies in terms of number of notes reported as counterfeit by different countries**

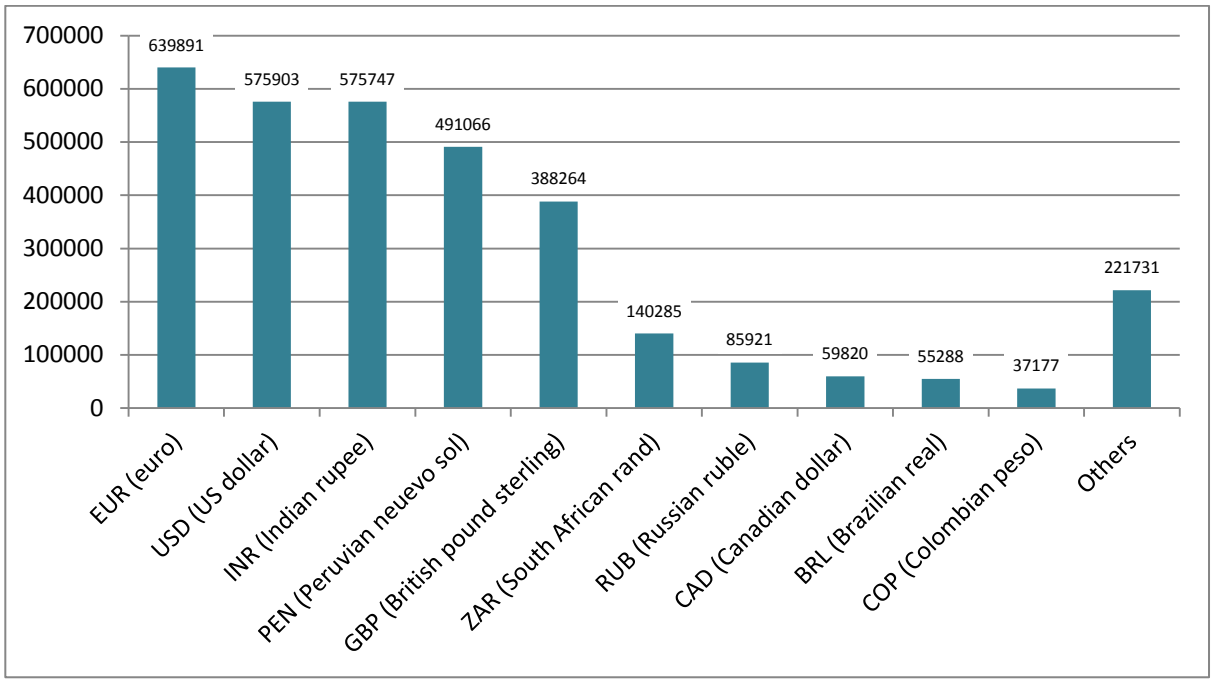
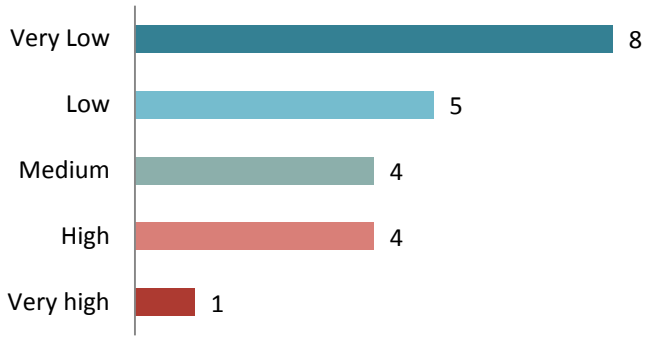


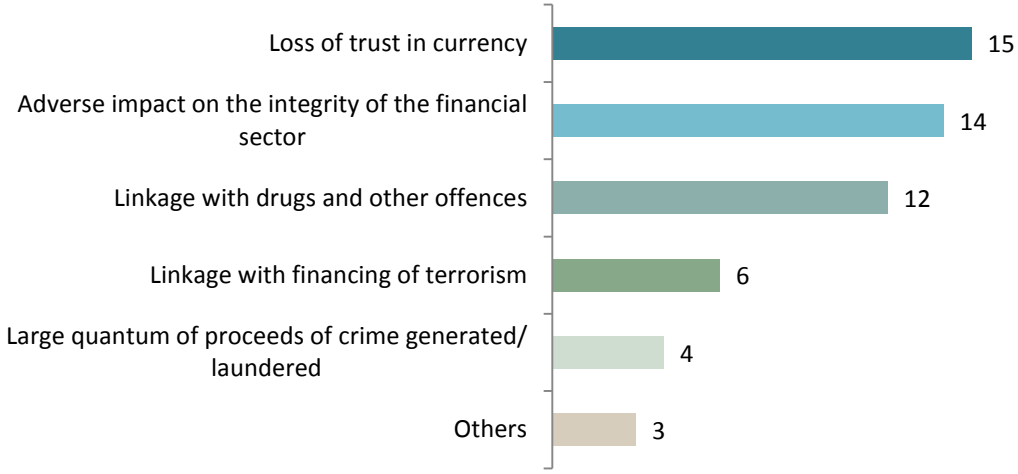
The threat from counterfeiting of currency was assessed by the responding countries on a range from “very high” to “very low”. Thirteen countries evaluated the threat from currency counterfeiting as "low" to "very low". Five countries responded the threat as "high" to "very high" while four countries claimed the threat is "medium".

Chart 3. **Threat rating for counterfeiting of currency**
Option selected by number of countries



When asked to identify the factors underlying the threat from currency counterfeiting, respondents referred to the "loss of trust in the currency system" followed by the "adverse impact on the integrity of the financial sector" rather than the "financial loss" one faces by "accepting" a counterfeit or the actual financial damage which is in fact compared to other forms of criminal activity quite small (for more information see Chart 4).

Chart 4. **Factors underlying the threat assessment of counterfeiting of currency**



The technology revolution in the cyberspace-age makes equipment necessary for the production of counterfeit money cheap, easy to purchase and to operate. "The advent of desktop publishing, colour printers, and photocopiers means that currency counterfeiting is no longer the exclusive domain of lithograph experts with expensive offset printers. As such, a greater number of amateurs can produce larger numbers of bogus bills"[12]. Essentially, everyone with basic computer skills, access to a PC, a scanner and a printer has the potential to become a counterfeiter. However, the success of introducing counterfeit notes into legal circulation very much depends on the quality of the product. Public awareness sessions by the private banking sector in co-operation with LEAs and

12 Schneider, S. (2002), *p.* 21.

central banks increased the public's attention and contributed to a reduction in counterfeit products.

Regarding the preferred currency for counterfeiting, the above mentioned report from the US Treasury Department concludes, "as much as 60 percent of genuine [US] currency is likely held abroad" [13]. Nevertheless, since the introduction of the physical euro as official means of payment in 2002, this new currency has rapidly become the second-most-traded currency in the world and in certain cases may even eventually displace the US dollar.[14] Furthermore, the Euro area is expected to continue to grow in the future. The 2011 Europol Organised Crime Threat Assessment (OCTA) suggests that OCGs both inside and outside Europe will continue to target the euro for its counterfeiting activities[15]. With the internationalisation and broad acceptance of the euro, citizens of the Euro area have come to realise that they can exchange the euro as easily as they did before with the US dollar and might even find it more convenient[16]. The Inter-Governmental Action Group against Money Laundering in West Africa (GIABA) suggests that when the full convertibility to one of the major global currencies is guaranteed, this factor contributes to the motivation of OCGs to produce counterfeits in those currencies[17].

II. THE COUNTERFEITING OF CURRENCY AND ITS RELATION TO OC, ML, AND TF

1. TECHNIQUES USED IN THE PROCESS OF PRINTING AND CIRCULATION OF CCN

Counterfeiters can be classified into three categories: (1) amateurs; (2) semi-professionals; and (3) professionals. Amateur counterfeiters are people who have no or poor knowledge of graphic arts and who utilise commercially available means. Semi-professional counterfeiters have some knowledge in graphic arts and use commercially available means. Professional counterfeiters are individuals with expert knowledge in printing and who use professional printing equipment to make CCN. Counterfeiters can act alone or as part of a group.

The number of perpetrators who act alone seems to be high, but the damage they cause is marginal since the area of distribution is mostly local. One of the reasons lies in the motives for carrying out such activity. For example, the individual acting alone may be short of money due to unemployment. The counterfeiting activity serves to generate funds that can be used to replace loss of income and thus to purchase needed or luxurious goods. Such individuals are both producer and distributor. They do not have to share their knowledge with others and they do not run the risk of getting compromised by infiltrated informants or undercover agents. On the other hand, they normally do not have access to a large distribution network. Their profits are thus relatively small, although they may still run the risk to attract attention from law enforcement.

Intensive currency counterfeiting activity is mostly carried out by OCGs. These OCGs range from small, domestic groups to substantial, international groups of criminals involved in the printing and/or the circulation of CCN as a profit-making activity.

The two main techniques of production of CCN used by counterfeiters are (1) printing by offset and by (2) digital graphic chain. The traditional method of the offset production is similar to the one used for the printing of newspapers, tax labels or stamps. To use an offset press, specific know-how is needed and these machines are not easy to find on the (second-hand) market. On the other hand, the digital graphic chain production simply requires a basic hardware consisting of a computer, a scanner, a laser/inkjet printer or a colour copying machine, an image processing software and some commercial paper. The offset and the digital graphic chain techniques relate to the visual of the counterfeit banknotes. Others diversified techniques are complementary used to counterfeit the security features of the banknotes.

In the chain of CCN (from the printing to circulation), there are several different operators especially when it comes to the involvement of OCGs:

- the printer(s),
- the distributors,
- the retailers, and
- the "mules" who are the last ones in the distribution chain causing the actual financial damage.

Each of them has a specific role to play. It is difficult to estimate the proceeds of crime generated by each of them, because there is a shortage of comprehensive information available on the complete working of various layers of the OCG. Currency counterfeiting occurs more often at times when new currencies are issued, taking advantage of the usually poor knowledge amongst the public about the look and feel of new banknotes. The crime of counterfeiting of currency has become international in character. The perception that working in groups decreases the risk and increases global reach motivates these OCGs which are driven by profit, to work very efficiently. The diversity in background or ethnicity of the individual group members does not seem to affect the group's efficiency.

2. COUNTERFEIT CURRENCY AND OC

A. THE INTERNATIONAL/GLOBAL DIMENSION OF OC CURRENCY COUNTERFEITING

The connection between currency counterfeiting and transnational organised criminal groups is also reflected by the fact that the majority of high-quality counterfeit US dollars appear to be produced by counterfeiters with origins in Colombia, Peru, Israel, the Russian Caucasus region and the western Africa region: the regions known to have the presence of such organised criminal groups. Similarly, the euro is also counterfeited outside Europe.

The majority of survey responses indicate that there are no domestic OCGs involved in printing and/or circulation of counterfeit currency as a profit-making activity. The main problem is caused by international OCGs operating in their respective national/territorial jurisdiction. Members of an OCG that is running an illegal print-shop usually avoid distributing their “products” in the same country where the print-shop is located. OCGs that operate in countries with a currency as legal tender that is only accepted in that jurisdiction often turn to the production of foreign currencies with an international distribution dimension such as the US dollar or the euro to dissimulate that they are distributing CCN within the target country and for the purpose of widening the scope of distribution to other countries in order to gain more profits. In the survey eight countries replied that there is counterfeit foreign currency in circulation in their jurisdiction while five stated that counterfeit national currency is printed abroad. This is supported by INTERPOL statistics and case studies such as the one reported by Hong Kong, China, about a seizure in February 2012 of counterfeit Indian Rupees found concealed in a shipping consignment from Pakistan via Hong Kong, China, to Nepal[18].

Europol's OCTA states that within Europe, Italy and Bulgaria "are among the foremost countries for counterfeit currency production sites"[19]. With regard to the counterfeiting of USD "Bulgaria was a country of concern because of the growth of organised crime in south-eastern Europe"[20]. This picture began to change in 2002 when the euro was introduced. Since then "both production and trafficking of counterfeit U.S. banknotes have declined sharply"[21]. Indeed the introduction of the

18 Retrieved from the response of Hong Kong to the questionnaire.

19 Europol, 2011a, *p*. 34.

20 US Treasury Department, 2006, *p.* 60.

21 US Treasury Department, 2006, *p*. 60.

Euro was consecutively followed by numerous print-shops dismantled in Bulgaria. A 2012 report of the European Commission claims that "structures of organised crime were disrupted, with a positive impact curbing prostitution, human trafficking and counterfeiting"[22]. "Bulgarian producers cooperate mainly with Bulgarian, Lithuanian, Turkish, Romanian and Albanian criminal groups to circulate banknotes"[23].

Belgium reported in their responses to the questionnaire that Italian nationals and those of West African origin living in certain Belgian cities are exclusively distributing counterfeits coming from Italy[24].

The war in the area of former Yugoslavia with economic blockades, the presence of weak states in the post-war context, the sometimes legal vacuum, and the coexistence of several OCGs, provided a favourable environment for OC. These preconditions mixed with the geographical location (being the link between Asia and the Mediterranean Sea for the trafficking of illicit commodities to and from the EU), allowed the Western Balkans to become a hub for international OC inter alia involved in currency counterfeiting crimes. Illegal euro print-shops dismantled in Bosnia and Herzegovina and Serbia with existing networks to and in EU member states reflect their specialisation and sophistication in this activity.

Chechen militants have been identified as the primary distributors of counterfeit US dollars and Russian ruble in Russia. Russian OCGs are reported to have consolidated their presence among Albanian, Chinese and Nigerian OCGs in northern and central Italy. By means of laundering the criminal proceeds Russian OCGs have acquired property in tourism and leisure industries and spread their activities in other serious crimes such as , trafficking of arms or synthetic narcotics and trafficking in human beings. [25]

Counterfeit currency and the profit derived therefrom have been used to finance extremist and terrorist activities in North Caucasus[26]. Russian ruble, US dollar and euro are also imported by the OCGs into Russia from Georgia, Kazakhstan, Israel, Eastern Europe and some countries of the EU[27]. The Russian LEAs are reported to have actively suppressed the activity of OCGs associated with the production and distribution of counterfeit money.

Turkish/Kurdish OCGs, apart from being involved in currency counterfeiting, are also involved in drug and human trafficking, production of illegal documents, smuggling, blackmail and extortion; and also in ML by investing the proceeds of the crime in legal businesses[28].

Similarly, Chinese OCGs, commonly known as "Black Society Groups" are involved in migrant smuggling, drug trafficking, smuggling, including arms smuggling, apart from counterfeiting of

28 Shanty, F. (2008), *p.* 467.

currency[29]. Europol's OCTA also suggests that for the production of counterfeit euro Eastern Asia "plays an increasing role in the supply of raw material and equipment"[30].

In India, the problem of counterfeit currency has domestic as well as international dimensions. The high-quality counterfeit Indian currency notes, however, invariably have strong international linkages. The involvement of OCGs based in the neighbouring countries is clearly seen by the Indian LEAs. Evidence with Indian LEAs indicate that high-quality counterfeit Indian notes are printed in Pakistan and then smuggled into India through transit points at Dhaka, Bangladesh, Sri Lanka, UAE and Bangkok. The other route to smuggle and pump the counterfeit Indian rupees is by smuggling through the India-Pakistan border and India-Nepal borders.

OC and OC networks of transnational character have also seriously affected Western-African countries by criminal activities such as drugs and human trafficking, smuggling, ML, terrorism and currency counterfeiting with the scale of their activities posing a serious threat to institutional development in this area. GIABA claims that "[c]ounterfeiting in the region has the capacity to generate very large quantities of illicit funds, and in its most extreme forms, to de-stabilise and weaken local currency"[31]. Between June 2008 and June 2009 the total value of counterfeit notes seized in Nigeria was 1.3 billion principally in US dollars, but also in other currencies such as the euro, Pound sterling, Canadian dollar and Nigerian naira[32].

In Canada, the OCGs "have adapted their structure to facilitate the production and distribution of counterfeit currency"[33]. According to the RCMP[34], these groups operate both domestically and internationally. The major cities, where they are generally based, provide them with anonymity and the market for their product. They are also involved in forged payment cards, weapons, drugs, stolen vehicles and forged identity documents.

In the US counterfeit currency is one of the crimes in which a number of OCGs are involved. Some of these OCGs are also involved in other illegal activities such as gambling, extortion, robbery, drug trafficking, trafficking in human beings and ML. During the Financial Year 2011 the USSS "recovered USD 154.7 million in passed and seized counterfeit currency, arresting 2 471 individuals domestically and 386 suspects in foreign countries for counterfeiting offenses"[35].

Europol's OCTA suggests that "the euro continues to be a target for organised crime groups active in the forgery of money, not only in Europe but also in other regions of the world such as South America"[36]. Colombia "has historically been one of the largest producers of counterfeit [US] currency"[37] and "has been the chief supplier of counterfeit notes to the [US] market"[38]. In Financial

Year 2011 "more than $ [USD]4.1 million Colombian-originated counterfeit was passed within the United States. This accounts for five percent of the total dollar amount of counterfeit passed domestically"[39].

Apart from the global market, the so called "temporary criminal markets" are of special interest. They work on the fact that counterfeit currency distributors often circulate their products in tourist areas and during special events (*e.g.,* in major sports events like the Olympic Games or World Championships). Experience has shown that the distribution of certain kinds of counterfeits is linked to an event where the suspected country of production is represented by a sport team. Distributors of counterfeits find favourable conditions, such as unfamiliarity with the design and security features of foreign banknotes, fast handling of cash transaction because of long queues of spectators, etc.

In the process of the enlargement of the Euro area it has also been seen in some instances that OCGs took the opportunity to produce and introduce counterfeit euro banknotes in the transition period when the level of confusion is high.

B. STRUCTURE WITHIN OCGS INVOLVED IN CURRENCY COUNTERFEITING

Generally, the OCGs that are involved in currency counterfeiting "are characterised by their rigid organisation, with a strict distribution of tasks to cells operating independently in order to minimise risk"[40] to the persons at the upper echelons of the criminal organisation and the production source. Evidence suggests that these OCGs strictly separate the production from the distribution site. The hierarchy within the organisation is commonly referred to as a "pyramid-like structure".

The pyramid-like construction makes it inherently difficult for LEAs to tackle the criminal organisation and to locate the illegal production facilities. The ones most likely to be caught by the police are those that actually cause the damage by distributing counterfeit currency to ordinary and unsuspecting citizens. Low-level distributors are recruited in a random way, most of them young people looking for quick profits (especially when compared to their national salary). In addition, this field of criminal activity usually has only low priority for LEAs compared to higher priority activity such as trafficking in human beings, drugs trafficking or cybercrime.

It seems that only very few OCGs exclusively deal with currency counterfeiting. These groups attempt to work independently; however, they must exist alongside and compete with other well-established OCGs. These independent OCGs try to establish their own criminal networks, which are usually operated by low profile and inexperienced criminals. The structure of these groups is normally not characterised by rigorous internal rules which make the whole network porous, weak and susceptible to infiltration. The weakness of these OCGs reflects their overall resources and skills not only in negotiating and distribution of CCN but also in producing them. The CCNs of such groups are often of poor quality, and their members are constantly running out of money and thus become easily susceptible to disloyalty.

38 US Treasury Department (2006), *p.* 60.

39 USSS (2011), *p.* 35.

40 Europol (2011a), *p.*34

Typically, the evolution of a criminal group into a criminal network, where independent groups are brought together by so-called facilitators, results when the criminal co-operation is based on mutual benefits to all of the groups involved. OCGs use their illegal print shops not only for the purpose of counterfeiting money but also for gaining other profits, *e.g.,* forging tax stamps or tax labels, forging payment cards, or by facilitating their criminal activities with the production of forged documents. The operations of OCGs also cross ethnic dividing lines. They co-operate without regard to nationality; their main incentive is profit.

The real threat comes from criminal groups sponsored or financed by well-established OCGs. Though there is very little information regarding the top level of these organisations, it can be stated that it involves powerful criminals who are in control of large "mafia-style" organisations for whom counterfeiting is only one of the activities which contributes to the overall profit. "In Italy, the production and transnational distribution of counterfeit money is often tolerated, and in some cases orchestrated, by mafia-type organisations such as the Camorra in the Neapolitan region"[41].

Frequently OCGs involved in currency counterfeiting activity are a branch of criminal activity or part of bigger criminal networks engaging in all kinds of illicit activities. Those groups and all branches within can rely on long-existing, reliable and well working facilitating networks. It is also seen that groups overlap; for example, drugs traffickers use currency counterfeiting channels and vice versa. A significant characteristic of these groups is their ability to adapt: if one branch is disrupted, another branch takes over the activity within a very short period of time. The fact that most of the criminals arrested have criminal records for a wide variety of criminal activities supports the theory that counterfeiting activities are only part of the entire criminal business of these organisations.

As for the links of currency counterfeiting to other forms of criminal activity, the majority of survey responses from FATF members refer to illicit trafficking in narcotic drugs and psychotropic substances (11), followed by participation in an OCG and racketeering (9), smuggling (4), trafficking in human beings and migrant smuggling (4), small-scale and street-level deception cases committed by individual criminals (1), and illicit arms trafficking (1). The fact that currency counterfeiting activity comes almost always along with other criminal activity is also strongly supported by the various case studies received.

Box 1. **Seizure of counterfeit currency with arms and drugs**

The Border Guarding Force along with the Police intercepted five individuals on the border, from whom following were seized, 11 kilograms of heroin, one Beretta pistol along with eight live cartridges, and high-quality counterfeit Indian currency notes having face value of INR 500 000. Investigation has revealed that these persons are smugglers with international connections and had received these contraband goods from their accomplice from across India's western border. The accused have been charged under various provisions of Narcotics Drugs and Psychotropic Substances Act, Arms Act and Indian Penal Code.

41 Europol (2011a°), *p*. 35

Box 2. **Seizure of Counterfeit printing facility with counterfeit US dollars and drugs**

On 17 February 2012, the Dominican Republic National Drug Control Agency (NDCA) contacted the Secret Service San Juan Resident Office requesting assistance regarding a counterfeit US currency investigation. The investigation was initiated based on information provided by a reliable confidential informant.

The NDCA gathered additional intelligence through surveillance operations and other investigative techniques identifying that a residence in Mata San Juan, Dominican Republic, possibly contained 500 kilos of cocaine. The NDCA executed a search warrant revealing two suspects and an offset printing press. A search disclosed negatives containing images of USD 100 currency, paper similar to genuine money, jars of ink and USD 2.6 million in counterfeit currency. San Juan agents conducted a check of the Secret Service Counterfeit Tracking Application identifying the notes as being of record under Circular - 24806. Based on the passing history of this circular, agents believe that C-24806 is manufactured in the Dominican Republic. On 17 February 2012, two suspects were arrested under Dominican Republic law for fraud and distribution of counterfeit currency. This case is continued pending further investigation and judicial action

Source: USSS (2012).

C. TECHNOLOGY, SPECIALISATION AND THE USE OF LEGITIMATE BUSINESS STRUCTURES

The activities of some OCGs involved in printing, circulating, smuggling and distributing of CCN have a high level of sophistication which cannot be attained by ordinary criminals, such as comprehensive and covert distribution channels, transnational operations, high volumes of CCN and the use of logistics of highly sophisticated ML networks.

The production of CCN is not only restricted to illegal laboratories. The owners and employees of legitimate printing firms have also been detected in this illicit activity[42]. Legal print shops have been, and certainly continue to be, used to counterfeit currency. In some cases, the owner was aware of this, while in others, employees were on the payroll of a criminal organisation without the knowledge of the owner.

Box 3. **Euro counterfeiting case**

Spanish authorities, working with Europol, dismantled a criminal group responsible for drug trafficking and distributing more than two million counterfeit euros in 20 EU countries. In total 25 people from the criminal group were arrested. This criminal group had been under investigation by the Spanish National Police since 2010, for drug trafficking and euro counterfeiting. In June 2011, Spanish authorities dismantled the first part of the criminal network when they seized 1 018 tonnes of cannabis and arrested 11 suspects. The investigations nevertheless continued, and focused on euro counterfeiting. Europol played an important role in

42 Europol (2011a), *p.*34

the operation, as the European central office for the protection of the euro, by coordinating investigations among the countries affected by the activities of the counterfeiters. The main counterfeiter was the owner of a canned food distribution company, where the clandestine print shop was found. He used the company as a cover for the illicit print shop, where 50 EUR notes were printed. The criminal group also imported fake 20, 50 and 100 EUR notes from criminal counterparts in Italy for further distribution around Europe.

In this part of the operation, 9 search warrants were carried out in different Spanish cities, 14 suspects were arrested and EUR 1.5 million in counterfeit banknotes were seized, as well as materials for the mass production of more counterfeit euro notes. Machinery and tools to counterfeit Spanish identification documents were also found.

Source: Europol (2011b)

Typically, in a counterfeit currency operation, the printing facility is centralised in one location, often in a country other than the country to which the counterfeited currency belongs for reasons related to risk perception. Although a certain degree of job rotation is seen, it is rather unlikely to have printing operations at numerous locations because of the levels of technological sophistication and investments involved. It normally tends to be a high-volume operation because once the printing facilities and capabilities are in place the marginal cost of printing additional notes is very low as compared to the profits they fetch.

Production on demand avoids the exposure to LEA attention and minimises the risk of losses when depots are raided. Furthermore, the producer of CCN needs specific skills and knowledge in all different stages of the production process. The skills of those people are so sophisticated that OCGs tend to "employ" the same printer again even after serving prison sentences. Computers are increasingly used, either alone or in combination with the traditional printing method of offset for the production of counterfeits, though several preventive measures have been taken to inhibit high-tech reproduction of counterfeit banknotes. However, most of the CCN in circulation throughout the world is of such quality that it is difficult for a non-expert to distinguish the counterfeits from genuine currency.

Incorporation of such sophisticated level of security features, which require not only technologically advanced production processes but also access to restricted material, entails high levels of capital expenditure and investment. Such advanced level of production capability suggests that there may sometimes be close links between OCGs and the state apparatus.

It is no longer necessary to physically hide films and printing plates. A rapid and growing problem is the use of web-based platforms where criminals share their knowledge and deposit files and images for the production of counterfeits. Moreover, web-based companies offer counterfeit currencies of all kind. Furthermore, the jurisdictional ambiguities tend to discourage the authorities from taking up the investigations.

Operations related to ultimate infiltration of counterfeit currency in the regular financial stream must be spread over a large area, not only in the country to which the currency belongs, but also in the countries where there is a high demand for the currency. The trafficking operations from the

stage of printing to the stage of infiltration therefore require a well-organised covert distribution network, which also takes care of cross-border smuggling of CCN.

In a typical operation, several layers of intermediaries might be involved, each one dealing with one or more of the following intermediate processes:

- Procurement of CCN from printing facility.
- Distribution to a stocking facility.
- Stocking of CCN (often located in a neighbouring country and close to the borders/ports/airports for ease of smuggling to the country to which the counterfeit currency belongs).
- Smuggling of CCN to the country in which it is to be circulated.
- Distribution and integration of the CCN into the financial system of the target country.
- Ensuring collection and repatriation of the proceeds generated to all stakeholders in the chain.
- Laundering the proceeds of crime.

3. COUNTERFEIT CURRENCY AND ML

There are many factors affecting the printing, distribution and circulation of CCN across jurisdictions. The first such factor is that of "jurisdictional arbitrage". Many countries do not consider counterfeiting activity involving non-national currency as a significant problem, as such activity does not have a direct impact on them. Ultimately, the foreign financial system suffers the loss, but the “blame” goes to the jurisdiction whose currency is being counterfeited, as well as the country where OCGs are operating. Moreover, the capabilities for detection of counterfeiting foreign currencies may sometimes be lower in foreign jurisdictions simply because the financial institutions and the population in general are not familiar with security features on these currencies. As already explained, the risks associated with operations like printing and stocking of CCN are therefore much less if carried out in other countries, thus making overseas operations attractive. In addition, there is a demand for foreign currencies in cash form in every jurisdiction generated by demand factors such as the payment of wages to illegal foreign migrant workers, payments for procuring goods for smuggling, requirements of international travellers etc.

Large scale trafficking in counterfeit currency is closely and inextricably linked with ML. The increasingly global nature of the counterfeiting activity results in the requirement to move CCN and subsequent proceeds of crime across national borders. This will be illustrated in the cases in this chapter.

While illegal transactions in any product that generates proceeds or profits would entail the need for ML, the linkage of ML with illicit trafficking in counterfeit currency operates at two distinct levels. Firstly, like any other criminal activity, illicit trafficking in counterfeit currency generates proceeds of crime which need to be laundered for their integration into the regular financial stream. Secondly, the very activity involved in illicit trafficking in counterfeit currency is placement of

currency notes, albeit fake, into the same regular financial stream. This can only be done through an effective laundering process, which not only conceals and camouflages the origin of the fake currency, but also the fact that they are counterfeits.

The following sections are based on the survey responses from countries regarding the ML techniques that are used to place counterfeit currency into the regular financial network, to transfer proceeds of crime and ultimately to integrate proceeds of crime into that network.

A. PLACEMENT OF CCN

In the process of distributing CCN, each intermediary stage in the process has its share of profits or remuneration which may be given in the form of a commission or a discount on the face value of the currency. For example, counterfeit currency would be sold from the printing facilities at a discount ranging from 75% to 80%, *i.e.,* counterfeit currency equivalent to USD 100 would be sold to the first stage distributor at USD 20 to USD 25 depending upon the quality of counterfeiting. Thereafter each stage will have its margin of profit/commission depending on the risk perception associated with each stage. For example, the courier smuggling counterfeit notes across a border would demand a higher commission as compared to a courier transporting it within the country. Finally, at the end-user level the counterfeit currency sells at a discount ranging from 25% to 35%, *i.e.,* counterfeit currency equivalent to USD 100 would be sold at the end user stage at USD 65 to USD 75. The actual commission or discount given would vary from case to case, given the various factors and nuances of the activity.

As explained earlier there are only a few people on top level and numerous low level distributors. While in sum all the low level distributors generate huge profits, the profit for a single perpetrator is quite small. Hence, those profits for a single perpetrator might not raise any suspicion at all and do not necessarily need to be laundered. Considering that every stage in the process of distribution has its profits and that the higher you go up in the hierarchy of the organisation the fewer people there are, there is a stage where profits no longer go undetected and illicit profits need to be laundered.

The methods used for the placement of counterfeit currency note are numerous and vary. Chart 5 identifies the most commonly used methods reported by the responding countries:

Chart 5. **Methods used for placement of counterfeit currency**

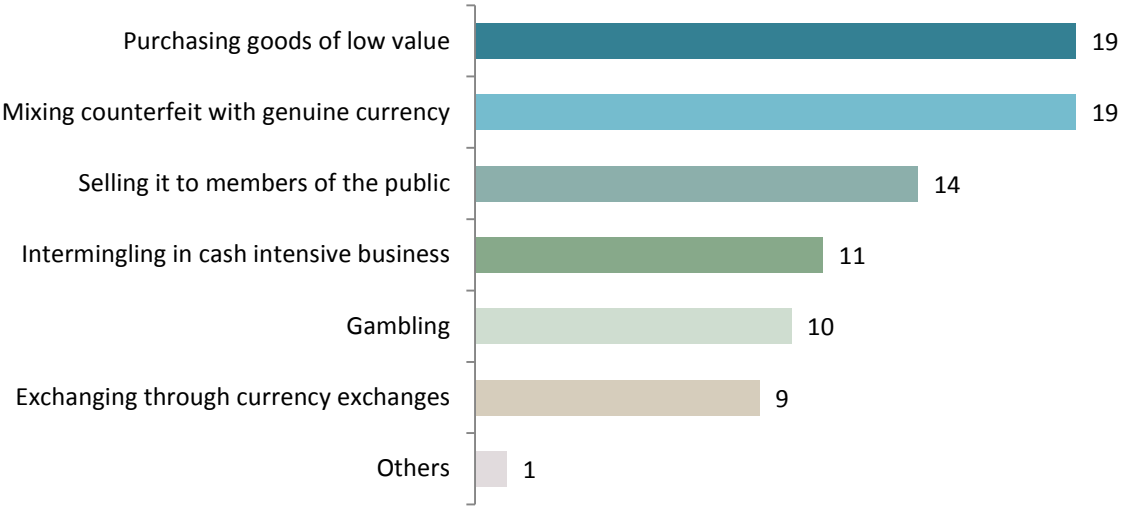

Chart 5 indicates that the most common method used for placement are mixing of counterfeit notes with genuine currency and/or purchasing of goods of low value. The risk of detection in these methods is low and hence preferred by the criminals. Selling it to children considerably lowers the risk in getting caught, while children might not be punished because they are minors.

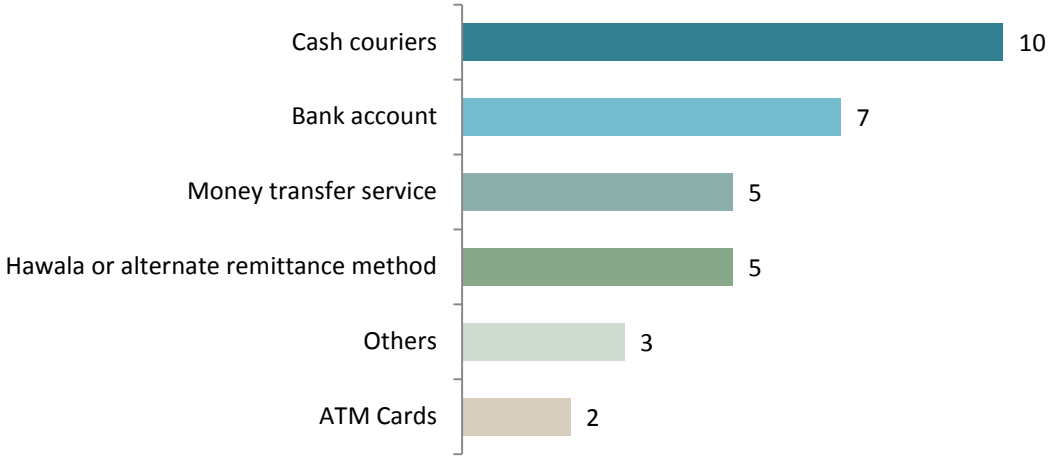
B. TRANSFER OF PROCEEDS OF CRIME

Chart 6 identifies these methods used for the transfer of proceeds of crime related to counterfeit currency.

Chart 6. **Methods used for transfer of proceeds of crime related to counterfeit currency**



It should be noted that all techniques identified are similar to the ones associated to any other types of criminal activities. The most used method is the system of the cash couriers. The term “cash

couriers" refers to the natural persons who physically transport currency and bearer negotiable instruments on their person or accompanying luggage from one jurisdiction to another[43].

Box 4: **Selling of Counterfeit currency of third country smuggled by a foreigner through use of money exchange**

The police in India have registered a case against two Omani nationals and counterfeit Indian currency notes having face value of INR 25 000 from their possession. It was revealed that the accused had exchanged an amount of INR 40 000 from Asia Express Exchange, Khaboura, Oman on 29 January 2013 and came to India on 30 January 2013. The case is under investigation.

Another case was registered against an Omani national by the police in India for possessing eight counterfeit Indian currency notes of INR 1 000 denomination. As per the statement of the accused, he had exchanged his Oman currency to Indian currency from an exchange centre situated at Oman airport. The accused came to India on 7 February 2013. The case is under investigation.

The police in India have also registered a case on against one Indian National who remitted an amount of counterfeit Indian currency notes for INR 17 000 for treatment of her daughter at a hospital in India. According to the statement of the suspected accused she exchanged UAE Dirhams into Indian currency of INR 20 000 from AI Fala Plaza situated at Lulu Centre, Sharjah and she got 20 notes of INR 1 000 denomination.

According to the statements of the suspected accused in the above three cases, the counterfeit notes possessed by them were received from the currency exchange centre in foreign countries, *i.e.,* two offences from Oman and one offence from Sharjah.

An investigation by the Royal Oman police identified a Pakistani national for involvement in the circulation of counterfeit Indian currency notes in Oman, possession of which led to the detention of the Omani nationals in India. An arrest warrant has been issued in Oman against the Pakistani suspect, who is understood to have left Oman. Omani authorities have obtained confirmation that the Pakistani national was also involved in circulation of counterfeit Indian currency notes in other countries.

C. LAYERING AND INTEGRATION

Concerning the methods for layering and integration of proceeds of crime related to counterfeit currency, the following techniques are currently seen:

[43] FATF (2005).

Chart 7. **Methods used for layering and integration of proceeds of crime related to counterfeit currency**

The survey indicates that vulnerabilities of the financial system for the purpose of ML are being misused by adopting different methods. In a given case, there may be more than one method used for placement and integration of illegal proceeds, usually also associated with cash-intensive businesses. The other methods are general in nature. All techniques identified are similar to the ones associated to many other types of criminal activities too. Intermingling in cash intensive business, not surprisingly, leads the chart because it comprises two actions at one time:

(1) introducing the counterfeit currency into the legal financial flow by exchanging it with genuine currency, generating the profit; and

(2) integrating the proceeds of crime.

There are various types of techniques used for ML. It is important to highlight some of them in order to understand the nature of techniques for integration of not only the proceeds of crime relating to counterfeit currency but also the integration of counterfeit notes in the regular financial stream. Some of the techniques used for laundering of money related to currency counterfeiting activity are highlighted in the following chapters.

Use of bank accounts, multiple bank accounts, different type of bank accounts, debit cards, credit cards, etc.

This technique is used to escape detection of the proceeds of crime by the reporting entities, because the deposits may not match with the profile of the account holder: the beneficiary of the proceeds of crime. The criminals, therefore, are known to use multiple bank accounts into which to deposit the proceeds of crime. These multiple bank accounts are also opened and operated by the sellers of counterfeit currency in the name of other gullible individuals. A common typology that has been seen is that the seller of the counterfeit currency asks his buyers to deposit the proceeds of crime in different bank accounts, which are established outside the geographical area in which the seller operates. The seller in turn withdraws the proceeds of crime by use of ATM cards. In this manner, the seller evades the reporting entities by keeping the deposits below the threshold, in each of the multiple bank accounts.

Box 5: **Transfer of proceeds using bank accounts and ATM cards**

On the basis of information received, the Police searched four persons and found counterfeit Indian currency having face value of INR 40 000 (Indian rupees). Subsequent search of the residential premises of one of these four apprehended persons led to the recovery of counterfeit currency having face value of INR 110 000. The verification of the backgrounds of the arrested persons revealed that two of them were dedicated members of a banned terrorist organisation. In fact, one of them was involved in raising and collecting funds for the banned terrorist organisation. The CCN were to be used to finance terrorist activities and for providing to terrorists and their sympathisers. Later, another person who provided the counterfeit currency to these arrested persons and in return accepted the proceeds of the counterfeit currency was also arrested.

The investigations revealed that the counterfeit currency was brought in from a neighbouring country into a border town by one counterfeit currency dealer. One of the accused procured the CCN from this dealer and provided it to activists of terrorist groups. His standard *modus operandi* to collect the proceeds of the counterfeit currency was use of ATM cards of the recipients of the counterfeit currency to withdraw payments in the border town, which was deposited by the recipients of counterfeit currency in bank accounts located at various places. The other *modus operandi* was the use of bank accounts held in the name of other persons (not directly connected with the underlying activity) to receive and withdraw the payments deposited by the recipients of counterfeit currency at different places.

Source: India

Another practice involving the use of bank accounts is the use of accounts maintained by the bank for individuals who are residing in a foreign country. Such accounts are maintained in convertible foreign exchange and can be accessed from anywhere in the world. Hence, the dealer of counterfeit currency, who is located in a foreign country, deposits his proceeds of crime in this account and then transfers it to different (normal) domestic bank accounts. The domestic reporting entities do not suspect any wrongdoing on the part of the account holder based abroad, as they feel that the deposits are coming through banking channels and that the requisite due diligence has been performed by the bank in which the deposits were made initially. The criminals take advantage of the fact that the domestic banks are not aware of the activities of the sellers abroad and the banks abroad are not aware of the various nuances of trade in counterfeit currency of a different country. This is accentuated by the lack of international co-operation amongst LEAs and also lack of exchange of information on risk between financial regulators and banks.

The beneficiary of such bank accounts also resort to use of credit cards, linked to these particular bank accounts, to access these funds. The use of ATM/ debit cards and credit cards are typical of non-face-to-face transactions. It effectively circumvents the effect of CDD measures by the banks.

Smuggling of cash

Smuggling of cash involves physical movement of cash from one country to another in a clandestine manner. This method avoids the banking system, so that the proceeds of crime go undetected by the

reporting entities. One simple *modus operandi*, where the borders between countries are fenced, is to throw the purchase price in genuine currency of the counterfeit currency over the fence and similarly the counterfeit is thrown over the fence from the other side of the border. In such cases, the seller uses the proceeds of crime to convert it in the currency of the native country of the seller, using money changers, including those operating underground. On the other hand, the buyer of the counterfeit sells the same to lower rung of operators who use it or sell it further. These persons get their proceeds of crime, either by collecting the cost of the counterfeit currency directly or by use of bank accounts, as explained above.

The other *modus operandi* used is to smuggle physical cash in genuine currency to a foreign country, in which the criminal syndicate is located, to buy the counterfeit currency. The counterfeit currency is also smuggled either in baggage or on the person into the country where it is to be circulated. The cash so smuggled is then either deposited in the bank in the recipient country or laundered through other techniques in the recipient country.

Box 6: **Smuggling of proceeds in cash**

The customs authorities seized an amount of about INR 7 million at the airport from baggage checked in for a Middle East bound flight. The investigations revealed that this represented the proceeds derived from selling CCN and was meant for the top level players of the syndicate abroad. In another case, the customs authorities, similarly intercepted and examined baggage of a Middle East airline and recovered Indian currency of approximately INR 10 million. The said amount was the proceeds derived from selling CCN and was meant for the top-level players of the syndicate abroad.

Source: India

Box 7: **Conversion of proceeds in foreign exchange and smuggling**

At times, the proceeds of crime derived in genuine currency are converted into foreign currency from underground money changers which is smuggled to the foreign-based criminal syndicates. The foreign currency chosen is one which has very high exchange rate compared to Indian rupee, as this reduces the volume of the currency to be smuggled and facilitates further conversion in the local currency of the country in which the syndicate is based. The use of this *modus operandi* has come to the notice of LEAs. In one case, the LEA seized assorted foreign currency, equivalent to about INR 3 million, from a South East Asia bound passenger at an Indian airport. On another occasion, the LEA seized USD 79 200 (equivalent to about INR 3.4 million) from two passengers at an Indian airport.

Source: India

False Description of Goods

In this method, the cargo containing the CCN is generally falsely declared on the invoices, bill of lading and other shipping documents, including the letter of credit for settling the transaction of the imported consignment that contains the counterfeit currency.

Box 8: **False Description of Goods**

In this case, an importer from a company based in a foreign country attempted to import a container full of waste paper. The importer was under the control of criminal syndicates who concealed a huge quantity of fake Indian currency in the container. The importer was the subject of an intelligence-led operation and an intense search of the cargo led to the discovery of the counterfeit Indian currency. The payment to the foreign syndicate (both for junk cargo as well as for fake Indian currency) was to be paid through banking channels by opening the letter of credit, based on false declaration of the goods contained in the cargo and by over-invoicing the falsely declared goods on the documents.

Source: India

Use of bank for placement and deriving the proceeds of crime

The use of banks to place counterfeit currency in the system, its circulation and replacing the counterfeit currency with genuine currency notes, thereby generating the proceeds of crime, is an extremely rare phenomenon.

Box 9: **Use of bank for placement and deriving the proceeds of crime**

The police intercepted a person with counterfeit Indian currency notes with a face value of about INR 500 000. Interrogation of this person revealed that he used to receive the CCN from two persons, who in turn smuggled the counterfeit currency from a neighbouring country, for delivery to the cashier at a bank. Investigations at the currency chest of the bank revealed the presence of fake Indian currency notes with a face value of about INR 40 million in the currency chest. There was also a shortage of genuine currency of about INR 7 million in the currency chest. It is understood that the counterfeits were used to replace the genuine notes in the currency chest and the counterfeits were circulated through ATMs.

Source: India

Use of Alternate Remittance System

The most common method to remit the proceeds of crime (cost of counterfeit currency) to a foreign country from where the counterfeit currency is to be purchased is by use of an alternate remittance system. The buyer pays the cost of the counterfeit currency to a *hawala* dealer, and the seller receives the same in his country of residence or any other country of choice, in the currency of that country. The CCN is then smuggled or sent to the buyer concealed in cargo. The buyer sells the

counterfeit currency to other criminals and the proceeds of crime generated at each stage are brought into the system by various techniques.

Box 10: **Transfer of proceeds through informal channel**

In one case, the proceeds of crime were transferred from a foreign jurisdiction by a criminal syndicate through informal channels. The proceeds of crime received in cash were put into the bank account of another person, who then transferred it out of his account by cheque, which was used as legitimate money by the criminal syndicate. In an another case, the cash amount which was in fact the proceeds of crime (genuine money) was used to purchase the bank draft to make payment towards a life insurance policy.

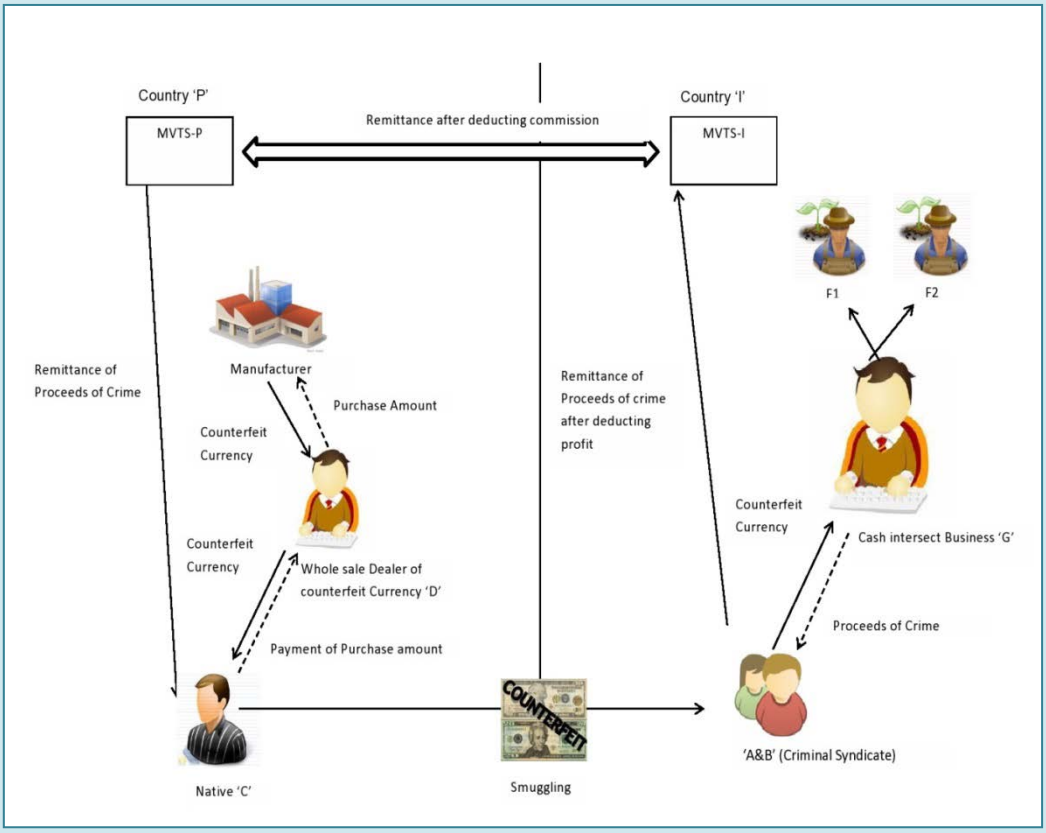
Source: India

Box 11: **Use of MVTs**

Person 'A' was intercepted by the Customs authorities of Country 'I'. Search of the said person resulted in the recovery and seizure of CCN of country 'I' with face value equivalent to USD 4 000. The search at his residence resulted in the recovery and seizure of more CCN of country 'I' with face value equivalent to USD 27 500 as well as the arrest of 'B', an accomplice of 'A'. During interrogation 'A' revealed that he had received the consignment of counterfeit currency equivalent to USD 135 000 from his uncle/associate 'C' a resident of a neighbouring country. The consignment of counterfeit currency was handed over to 'A' and 'B' by a person who had smuggled the currency from the neighbouring country 'P' on the directions of 'C'. Investigation further revealed that the remaining consignment of counterfeit currency equivalent to USD 103 500 had shifted to another safe place. Domestic co-operation between the different LEAs led to further recovery of counterfeit currency of face value equivalent to USD 68 500.The matrix of the case that has been constructed based on the facts revealed during investigations is as follows:

The investigations revealed that 'D' is the main counterfeit currency operator in Country 'P' who deals in the counterfeit currency of Country 'I'. 'C', also a resident of country 'P', procures counterfeit currency valued at USD 135 000 at a discount of 60% *i.e.,* currency worth USD 100 is purchased for USD 40. 'C' contacts criminal syndicate/relative in country 'I' and enters into a contract with them to distribute counterfeit currency in country 'I' for a commission of 10% *i.e.,* USD 10 for every distribution equivalent to USD 100. These natives of country 'I' sell the currency notes at a discount of 30% to cash intensive businesses in Country 'I' like sugar manufacturers ('G') who have to pay the farmers ('F1' &'F2') they procure sugar from in cash. 'G' mixes CCN with genuine currency notes while making payment to the farmers. This is the ML activity taking place in the course of placement of CCN in the regular financial stream. The proceeds of crime or the proceeds of sale of CCN are to be remitted to 'C' in country 'P'. After retaining a commission of 10%, for counterfeit currency equivalent to USD 100 distributed in country 'I' USD 50 has to be remitted back. 'A' gets in touch with *hawala* or 'money or value Transfer service or, 'MVTS-I'. 'MVTS –I along with *hawala* operator 'MVTS-P' in country 'P' runs

an MVTS or a *hawala* operation wherein for a commission of 1.5% they transfer money between countries 'I' and 'P'.



Source: India

Use of high denomination banknotes

The Annual Report 2010 on the "Suspicious Activity Report Regime" of the United Kingdom Serious Organised Crime Agency (SOCA) states that the United Kingdom banned the use of the EUR 500 banknote from retail foreign exchange within the country, based on evidence of significant use by criminals[44]. The report indicates that over 90% of the UK demand for EUR 500 banknotes came from criminals. UK authorities developed evidence of this usage by criminals through analysis of suspicious activity reports (SARs) filed by financial institutions and through information obtained from successful investigations. The SAR analysis indicated that individuals were regularly exchanging in single transactions lower denomination banknotes for the EUR 500 notes. Often these individuals requesting such transactions offered reasons for needing such large volumes of cash. Because of the ban on exchanging small denominations for the EUR 500 notes, the smuggling of funds in cash out of the country has become a bulkier process and thus more susceptible to detection. This experience of the UK reinforces the evidence that the demand in large volumes for

44 SOCA (2010), *p.*35.

high-denomination banknotes, when not justified by clear legitimate economic reasons, can serve as a potential indicator of criminal activity[45].

The fact that EUR 500 and EUR 200 banknotes have been, and are still, counterfeited, attracts particular interest to this phenomenon on the use of high denomination banknotes and would seem to justify further consideration as an indicator for counterfeiting activity.

4. COUNTERFEIT CURRENCY AND FINANCING OF TERRORISM

Most jurisdictions have not reported TF patterns involving CCN. However, Nepal and Kyrgyzstan have instances of currency counterfeiting as a method used for financing of terrorist act and/or terrorists. India, Bangladesh and the United States, have seen a similar development. The United States and India have both reported that individual terrorists use counterfeit currency and distribute it through terrorist networks. The proceeds are invested to strengthen a terrorist support infrastructure and to finance individual attacks.

Box 12: **Use of counterfeit currency in Mumbai terrorist attack by Lashkar- e-Taiba, a proscribed organisation in India**

Person X who was involved in the 26/11 attacks in Mumbai, said that for doing the reconnaissance of Mumbai before 26/11 attacks, an agency of a neighbouring country provided him INR 40 000 (approx. USD 1 000) of high quality Fake Indian currency notes for his expenses by his handlers based in a neighbouring country, which includes the top rung of Lashkar-e-Taiba a terrorist organisation. Person X has been charged, and non-bailable warrants have been issued against him.

Source: India

The United States, India and Tajikistan have reported that counterfeit currency is also used as a method of economic warfare and is used to liaison with OCGs. In addition, India has reported that counterfeit currency is produced in liaison with sovereign states. The role of state actors is apparent, based on forensic examination of the counterfeit currencies seized by the LEAs. Russia, has reported that according to its intelligence agencies, the counterfeit currency manufactured in Dagestan was used to finance extremist groups, purchase arms and in settlements for terrorist activities conducted.

Box 13: **Use of CCN of different countries by terrorists in Russia**

On 15 May 2011, two residents of Dagestan engaged in the distribution of fake Ukrainian hryvnias (UAH) and Russian rubbles (RUB), were detained in Rostov region. Four lots of RUB 1000 banknotes, eleven lots of UAH 200 bills and 12 lots of USD 100 bills were seized. Searches of their premises in Dagestan yielded printing equipment, along with 30 and 100 lots of

45 SOCA (2010), *p.*35.

RUB 1000 and UAH 200 notes respectively. The maker of the fake bills escaped. During a special operation conducted 1 December 2012 in the city of Makhachkala, law enforcement units eliminated a group of militants, including a maker of fake banknotes, and seized Makarov pistols, improvised explosive devices, RUB 734 000 in fake roubles, UAH 580 200 and USD 1 200. Operative intelligence showed that one of the militants killed was linked to the explosion in Kaspisk in 2009.

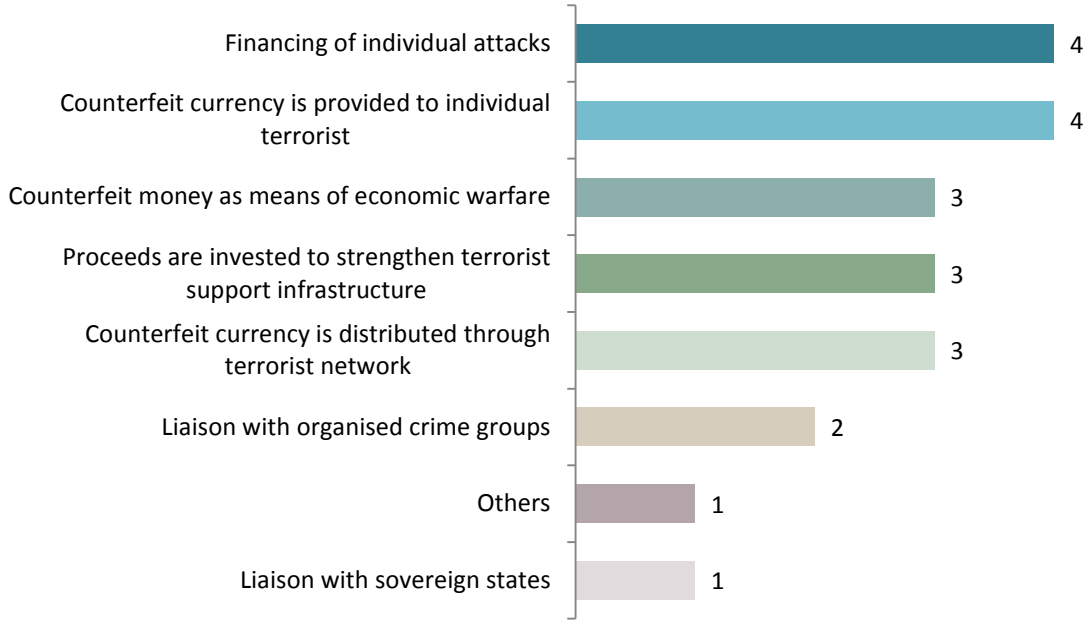
Source: Russia

Before looking more closely at the link between TF and counterfeiting, it makes sense to consider the motives that terrorist groups might have for getting involved in such activity, a realm that is far away from their ideological principles and dominated by medium to large-scale OCGs.

A starting point to explain this – at first glance – strange relationship could be chapter "Crime-Terrorism Toolbox" in Rollins, Wyler, and Rosen's report *International Terrorism and Transnational Crime* from 2010[46]. They split criminal activities associated with terrorist groups in three main categories:

- Fundraising through criminal activities;
- Materials and logistics support; and
- Exploitation of corruption and gaps in the rule of law.

Chart 8. **Methods used for resourcing/financing of terrorism from counterfeit currency**



46 Rollins, J. Wyler, L.S. & Rosen, S. (2010), *p.* 8.

Fundraising by different means is an important factor for terrorist organisations to ensure their continued existence and for the purpose of achieving their goals. Experience of LEAs has clearly shown that terrorists need relatively small amounts of funding for the actual execution of the terror attack. However, the architecture of the entire activity, which includes: recruitment, training, motivation, planning, etc., requires a big amount of funding. They need large sums of funds to recruit, train and maintain their infrastructure. Terrorist organisations are open to accepting funds from any source and therefore, raise funds from a variety of sources ranging from extortion to arms and drug trafficking to counterfeit currency, smuggling, human trafficking, kidnapping for ransom and other criminal activities. They are also known to accept donations from charities and use non-profit organisations, front companies and state sponsorship to meet their funding requirements. It is believed that it was the proceeds from drug trafficking that helped Taliban to support and protect Osama bin Laden and the Al Qaida network[47].

The terrorist organisations have the propensity to be attracted to any 'enterprise' provided that it is lucrative and comparatively unnoticed by the LEAs. The reason for the close association between the terrorists and OCGs is the high profit that organised crime yields and this profit is too attractive for the terrorist organisation to ignore. "Terrorist groups find trading in counterfeit or pirated goods as an easy way to finance their operations with low-entry costs and high-profit margins"[48]. It is widely believed that the IRA was the first terrorist organisation that took to use the profit from counterfeiting of currency as a major source to generate funds. The Hezbollah has also used counterfeiting of currency to generate funds.

Box 14: **Use of Counterfeit currency by terrorists of Hizb-ul-Mujahideen, a proscribed organisation in India**

A network of overground workers were used to collect counterfeit Indian currency notes from Bangladesh and transfer it to Jammu, India (1 500 km away) to be further handed over to the terrorists of the Hizb-ul-Mujahideen. (Proscribed terrorist organisation in India and EU.)

Source: India

While criminal activity as a means of financing terrorism is found in terrorist groups throughout the world, counterfeiting as a mode of terrorist financing appears to occur only in certain regions. There is a wealth of academic literature that suggests terrorist organisations, such as those in Europe, East Asia, and Latin America, rely on common criminal activities, such as extortion, kidnapping, narcotics trafficking, counterfeiting and fraud, to support their operations.[49]

47 Wright, A. (2006), *p.* 87.

49 Wesley, A.J.L. (2007), *p.* 15.

Box 15: **Conspiring to Provide Material Support to Terrorist Organisation Hezbollah**

In a complaint brought before the US District Court for the Eastern District of Pennsylvania, the jury detailed efforts by defendants X, Y, and Z to sell the co-operating witness (CW) counterfeit United States currency for the purpose of raising funds for terrorist organisation A. In total, the conspirators provided the CW with approximately USD 9 800 in counterfeit US currency. From around July 2008 through to around November 2009, in the Eastern District of Pennsylvania and elsewhere, the accused conspired and agreed with others known and unknown to the grand jury to commit offences against the United States, that is, to provide "material support or resources," including false documentation, false identification, currency, monetary instruments and financial securities, to a designated foreign terrorist organisation.

This conspiracy led the accused and others known and unknown to the grand jury to commit the following overt acts, among others, in the Eastern District of Pennsylvania and elsewhere:

Around 18 September 2008, X met with CW and stated that the Country P manufactured high-quality counterfeit US currency for the benefit of terrorist organisation A and that, consequently, representatives of A would need to approve the sale of this type of counterfeit currency.

Around 25 November 2008, Y met with the CW in Philadelphia to discuss the sale of counterfeit United States currency.

Around 24 February 2009, Z caused his assistant ("Individual A") to deliver a sample of counterfeit EUR 200 and USD 100 notes to the CW.

Around 25 April 2009, defendant X met with the CW in Florida and told the CW, among other things, that Hezbollah's representatives worked 18 to 20 hours a day counterfeiting many currencies, including those of the United States, Kuwait, Saudi Arabia and the European Union.

Around 3 September 2009, X confirmed to the CW via telephone that he had mailed a package that the CW received in Philadelphia that same day containing approximately USD 9 200 counterfeit US currency hidden inside a photo album.

Source: Charges brought before the United States District Court for the Eastern District of Pennsylvania, United States of America v. Hassan Hodroj & Others, Date filed: November 24, 2009.

The counterfeiting rackets run by Hezbollah and Hamas are active in different parts of the world and they have apparently co-located with a variety of other OCGs in the tri-border region of Argentina, Brazil and Paraguay[50]. Tamil networks are also believed to be involved in wide range of criminal activities including currency counterfeiting[51]. The Al Qaida's training manual *"Declaration of Jihad against the Country's Tyrants*", seized by the Manchester Metropolitan Police in May 2000 declares currency counterfeiting a requirement "to assist in confrontation and endurance"[52].

A. THE TERRORISM – ORGANISED CRIME NEXUS

LEAs around the globe have come across a close nexus between the OCGs and terrorist organisations. One of the characteristics of terrorism is that this relationship between OCGs and the terrorist organisations is growing. The sleeper cells and OCGs conspire in fundraising as well as the organisation of crimes to raise funds for their activities. As the LEAs focus on state sponsored terrorism, the sleeper cells use the lack of focus on them to conduct their nefarious activities.

The terrorist organisations have drawn on the structure and activities of OCGs as models to structure their organisations and to finance their operations, although for different purposes; OCGs focus on profiteering while the terrorist organisations use it to accomplish their 'ideological' goals. Crimes such as drug or arms trafficking, trafficking in human beings, counterfeiting, and credit card fraud, etc. have proved to be profitable to both the OCGs and the terrorist organisations. Apart from sharing their profits with terrorist groups in certain cases, OCGs also assist the terrorist organisations by providing fake identity documents, arms, illicit border crossing for men and material.

"The newly emerging hybrid group of 'organised criminal terrorists' would be the group of individuals to sponsor, support, and actively engage in terrorist activity, and thus to try to promote their own personal interests or strive to acquire more power and wealth from their organised crime-linked activities"[53]. However, Galeotti in his study of OC in light of the financial crises says that connections between OC and terrorists "have tended to be essentially short-lived and low level"[54].

There are specific instances, *e.g,.* in India, which show the close nexus between terrorist financing and the use of hawala for routing the funds to terrorists. The *hawala* networks, in many a case, are controlled by OCGs or have close operational linkages with them. The close nexus between the OCGs and terrorist organisations is best exemplified by the use of counterfeit Indian currency notes by terrorists to fund their activities, which is printed, distributed and circulated by the OCGs.

The report of the Asia/Pacific Group on ML on "Timor-Leste" summarises AML and counter TF measures in place. Its "Key Findings" say that the country "is vulnerable as a target for organised crime smuggling and potentially terrorist activities, particularly given that the economy is 'dollarised' and cash-based, providing an attractive environment for the placement and layering of funds. The risk are intensified given controls at the land border with Indonesia are weak as are the maritime border controls in respect to the cross border movement of currency, goods and/or persons. In this environment, assessments suggest that the majority of proceeds of crime could stem from corruption, tax avoidance, smuggling, human trafficking, counterfeiting of currency, illegal gambling and prostitution".[55]

It is not necessary that the link between counterfeiting and terrorism should always be direct. Such nexus between the two is also indirect where the terrorist sympathizers involved in counterfeiting

53 Bovenkerk, F. & Chakra, B.A. (2007), *p.* 39.

54 Galeotti, M. (2009), *p.* 6.

55 Asia/Pacific Group on Money Laundering (2012), *p.* 2.

transfer part of the proceeds of counterfeiting to the terrorists or terrorist organisations through third parties, by way of donations (Zakat).

B. ECONOMIC WARFARE

Currency counterfeiting and ML have the potential to destabilise national economies and threaten global security as they are key ways in which terrorists and other criminals finance their activities and conceal their profits[56]. However, the character of counterfeiting has undergone transformation over time. It has transitioned from a mere criminal activity, into an activity to replace real currency. In certain instances, particularly during wartime, it has become the 'act' in itself, where the infusion of high quality counterfeit currency has been used to attack the economy of a country by eroding faith in its currency. The most prominent and commonly known cases are Operation Bernhard in World War II when Germany tried to destroy the British economy by counterfeiting huge amounts of British pounds; and the Hungarian plot to destabilise the economy in France as an act of revenge after having lost huge parts of their territories in the Peace Treaty of Versailles in 1919 after World War I. The plot and the level of political involvement in Hungary were of such a magnitude that it triggered the international community to establish the CCC 1929.

In recent times, India has also reported large scale use of counterfeit currency, by both State and non-State actors, to assist/fund terrorist acts. The case studies in this regard furnished by India, expose the scale and intensity of the problem. In particular, there is evidence of multiple bases being used to flood the country with counterfeit notes, thereby attempting to attack the 'economic security' of the country, besides, using it to fund/ assist specific terrorist acts. This in turn, constitutes a new dimension to the phenomenon of criminal activity related to currency counterfeiting. It is in this light that India has taken measures to amend laws relating to terrorism, to include within its ambit, trafficking of high quality counterfeit currency, as a 'terrorist act' (PRS Legislative Research India, 2013). The amendments redefine "raising funds" to mean, raising, collecting, and providing funds through the production, smuggling, and circulation of counterfeit currency.

The involvement of some state actors in counterfeiting of currency also in other parts of the world has been suspected; e.g., there have been reports of North Korea being involved in production and smuggling abroad of counterfeit US currency, as well as other contraband items[57].

India's experience shows that counterfeit Indian currency notes have been known to be a source of terrorist financing in India. Apart from the trade being a profitable business venture, the protracted involvement of agencies located abroad in the manufacture and supply of counterfeit Indian currency notes has revealed its usage in terror financing activities in India. These instances uncovered the TF element of counterfeit Indian currency notes for terrorist groups such as:

- Lashkar-e- Taiba LeT
- Al-Badr
- Harkat-ul–Jehad–E–Islami/*Harkatul Jihad al Islami (* HuJI)

56 UNODC (2012).

57 Hesterman, J.L. (2004) and US Government (2011).

- Jamait-ul-Mujahidden Bangladesh (JMB), and
- Specially designated global terrorist Dawood Ibrahim and his associates.

Box 16: **Seizure of Counterfeit Currency with Explosives from Terrorists in Bangladesh and linkage with terror outfit**

On 30 March 2013, Dhaka Metropolitan police arrested four Pakistani and 7 Bangladeshi nationals from Mirpur, Dhaka on charges of conspiring to carry out subversive activities in Bangladesh and illegal possession of counterfeit Indian currency notes. The seizure included counterfeit Indian currency notes with a face value of INR 12.9 million, USD 4 000 in cash, a small amount of Pakistani currency and some explosive materials. The arrested Pakistani nationals were professional counterfeit Indian currency notes carriers and had visited Bangladesh on several occasions in the past. Two of the arrested persons also functioned as Hawala operators besides engaging in counterfeit currency notes trafficking. One of the arrested Bangladesh nationals had figured in several cases in the past and frequently travelled to Pakistan, Singapore, Thailand and India in connection with counterfeit currency notes business. Two of the arrested were in possession of both Pakistani and Bangladesh citizenship documents.

Source: India

In conclusion, and by answering the question raised at the beginning of this chapter it can be said that although terrorists may not be directly involved in the production of counterfeit currency, they are known to circulate it and benefit from the proceeds of currency counterfeiting. The combination of high profits stemming from currency counterfeiting crimes, coupled with comparatively low priority assigned to it by the LEAs, has attracted both terrorists and their sympathisers.

III. PREVENTING AND COMBATING COUNTERFEITING OF CURRENCY AND RELATED CRIMINAL ACTIVITY

The success of any counterfeit currency trafficking operation depends on several factors. Foremost amongst them is the quality of the counterfeit currency. The more security features a banknote has, the more difficult it is to be counterfeited. Governments around the world continually review the security features of their currency to protect it against the threat of counterfeiting. Regular assessment of the usefulness and public acceptance as well as upgrading of visible and machine-readable security features are found to be very effective preventive measures in most jurisdictions.

Useful security features for banknotes include *inter alia* security paper and embedded features such as fibres and security threads, different types of watermarks, the use of optical variable inks (OVI), micro and macro lettering, the use of *intaglio* printing techniques and hologram patches. Currently, it is very difficult for criminals to produce counterfeits by incorporating imitated security features in a manner that will go undetected. Nevertheless, their level of sophistication and innovation is getting better by the day.

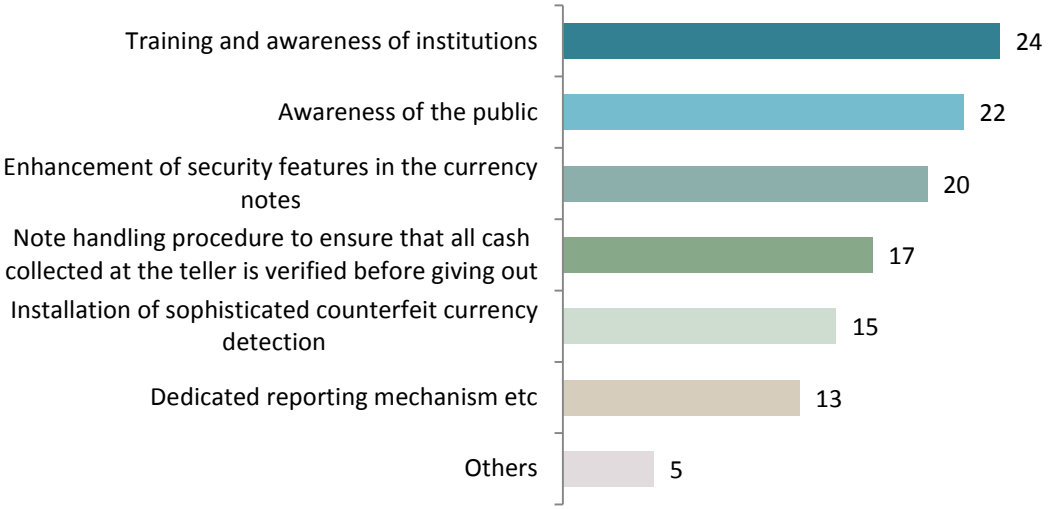
Other factors that help prevent easy introduction of counterfeit currency into the financial system include an alert and knowledgeable public that is familiar with the features of the genuine currency, and the availability of cheap and user-friendly technology capable of aiding identification of counterfeits.

Preventive measures therefore need to encompass all measures mentioned above and need a multidisciplinary approach involving close co-operation between banknote issuing authorities, LEAs, financial institutions and DNFBPs. Such measures need to be applied in several ways including measures to, design banknotes to make them difficult to replicate, train the public and raise their awareness, and monitor currency in circulation to detect counterfeits.

Financial institutions and DNFBPs by virtue of handling large volumes of physical currency have to be particularly alert in ensuring that counterfeit currency does not enter the legal money flow. The survey responses revealed that banks, MVTS, foreign exchange agencies, post offices, dealers in precious metals and stones, insurance companies and real estate agents are some of the key actors dealing with large volumes of currency. The preventive measures taken by the financial institutions and DNFBPs therefore mainly involve detection, reporting, training and awareness.

All currency notes generally have machine-readable features which can be used for detection of counterfeit notes. Ultraviolet light is an easy and common method used in the detection of counterfeit notes. Financial institutions dealing in large amounts of currency notes therefore generally use high precision and sophisticated note sorting machines and/or desktop sorters through which all currency notes tendered are passed. ATMs frequently also have inbuilt features that ensure detection of CCN and consequently do not disburse them in ATMs. The 'Cassette Swap System' which enables tamper proof transportation of cash to the ATMs and other destinations could be more widely used while transporting currency notes through cash transport companies to avoid possibility of substitution en route. Further, on detection, the counterfeit notes should be impounded and defaced/stamped as counterfeit and should under no circumstances be allowed to re-enter the financial system.

Chart 9. **Preventive measures employed to combat to counterfeit currency**



After detection of the CCN, the next logical step is reporting to the police as well as a central agency for investigation and/or feeding of a database for later cross-referencing abilities. Most of the jurisdictions which responded to the survey have a system of reporting to the police as well as to a central agency, generally the central bank or finance ministry. The detections are reported to the police for investigation and prosecution depending on the legal system in each jurisdiction.

A joint Europol/Dutch National Bank study indicates that the reporting can be quite influential in whether prosecuting a counterfeiting case is mandatory following the principle of legality opposed to the mere principle of opportunity.

Training and awareness are crucial to the success of the preventive measures adopted for all parties involved in dealing with the recognition of genuine and counterfeit currencies. The best way the public can protect itself from counterfeit currency is to be familiar with security features. A large number of countries have reported lack of awareness amongst the population as the main impediment to the effective detection of CCN. Almost all countries responding to the survey reported the use of one or several awareness-raising programmes, such as using posters, pamphlets, and brochures. Some countries also reported using short documentary films and web pages having audio visual contents on genuine and counterfeit notes. Interactive games are another media used for that purpose. Seminars, exhibitions, and press conferences by LEAs; direct enquiry hot line, student ambassadors, workshops and display of signage at traffic signals have also been used to spread awareness among members of the public. The impediments in effective detection of counterfeit currency are shown in the following chart.

Chart 10. **Impediments to effective detection of counterfeit currency by the financial institutions and DNFBPs**

1. ROLE OF REGULATORS AND FIUS

According to information collected from the questionnaires, FIUs are currently not involved in combating currency counterfeiting but nevertheless have an important role to play in its prevention in association with ML.

Financial sector regulators, such as central banks, play a major role in detecting and reporting CCN. Based on the reports received, regulators can assess the requirement and need for training and awareness programmes as well as for increased or more widespread use of devices for detection of counterfeit notes. The assessment and feedback is used for taking policy decisions and issuing necessary instructions to the financial institutions regarding detection, impounding, defacing and reporting of the CCN. Most regulators also put a proper oversight mechanism in place in all financial institutions, particularly where large amounts of currency notes are handled, to ensure that effective measures are in place for detection and reporting of the counterfeit notes.

FIUs can use the reports of detections of CCN for trend analysis (temporal as well as geographical/spatial) and to identify scenarios and possible red flag indicators from a ML and TF perspectives. From the analysis of the reports and information received from the financial institutions and with the help of possible red flag indicators (see below), important inferences can be drawn about the locations, accounts and suspected persons that might be involved in dealing with CCNs. This analysis can be further exploited with supporting information from LEAs that undertake enforcement functions in respect of the CCN, to identify suspects engaged in currency counterfeiting. The results of analysis can then be used either to collect more intelligence, if necessary, or for the LEA to undertake investigations against the suspected persons. The information that the financial institutions have about these suspects may also be obtained to help identify their assets. This information could then be used as justification for the use of provisional

measures (for example, the attachment of properties) in the event that a ML and/or TF case is established.

A. RED FLAG INDICATORS

In general, red flag indicators that apply to counterfeiting also apply to most of the predicate offences. Red flag indicators for detection of suspicious transactions relating, *inter alia*, also to counterfeit currency have been identified as follows ('e' and 'h' relate specifically to counterfeit currency):

a) Activity inconsistent with customer profile;

b) Multiple deposits below a certain threshold;

c) Same day transactions conducted at different bank branches;

d) Deposit from different counters under the designated threshold;

e) Cash deposits made to one account at the same place by multiple individuals;

f) Splitting large currency deposits among several accounts.

g) Customer makes frequent deposits or withdrawals of large amounts of currencies for no apparent business reason or for a business that generally does not generate large amounts of cash;

h) Small value cash deposits in multiple locations followed by immediate cash withdrawals in locations where counterfeit currency groups are active;

i) Subjects wanted by the authority for currency counterfeiting offences;

j) Cash deposits with small denomination banknotes, to perform wire transfers;

k) The banknotes brought by customers; being small denominated and dirty, existence of stains demonstrating that it has been carried concealing in various elements and giving off smell, packaged carelessly and precipitately, lacking or exceeding substantially than the declaration of customer when counted, coming across with counterfeit banknotes in the bankroll;

l) The involvement of high denomination banknotes – this is by virtue of the fact that high denomination bank notes carry larger intrinsic value (see SOCA, 2010).

2. ROLE OF LEA AND OTHER INVESTIGATIVE AUTHORITIES

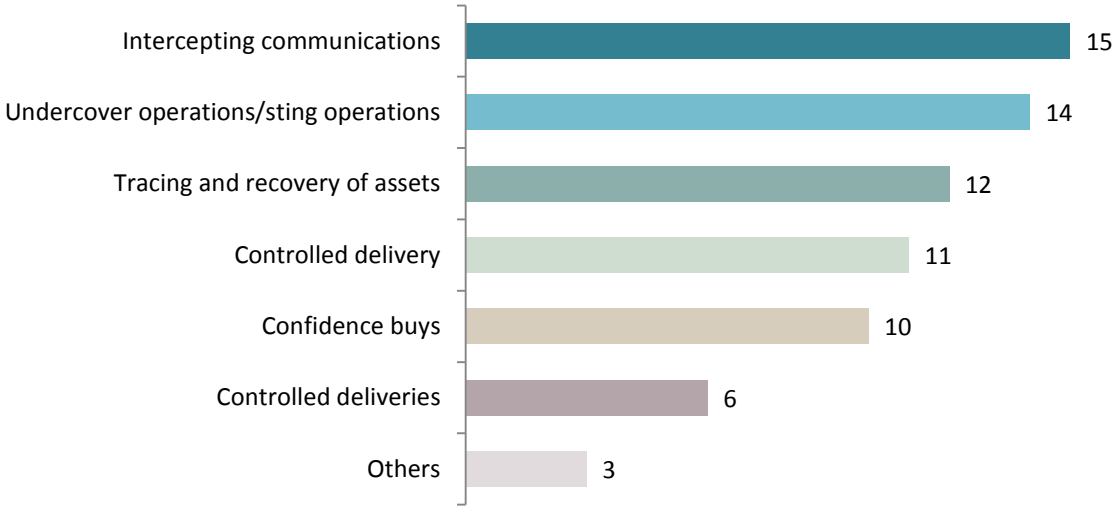
LEAs play a very important role. Firstly, by preventing physical entry of CCNs into the jurisdictions in case of cross-border movements and into the economy in case of domestically CCN. Secondly, by taking effective action against the offenders involved in currency counterfeiting. Such LEAs that are established as a national contact point for other branches within and across one jurisdiction are often associated to the National Central Office with regard to Article 12 of the CCC 1929. Those LEAs collect and produce information and intelligence, co-operate with other key institutions and with counterparts across borders. The data obtained is analysed to study trends, profile persons and routes, to identify possible *modus operandi*, and to identify possible weaknesses and risk areas for

further suitable preventive measures and, although rarely seen, socio-economic reports on the phenomenon.

Effective prosecution ensuring timely and commensurate punishment, including financial sanctions and attachment of properties, can serve as a major deterrent to the offenders.

The situation regarding the possibility of using 'special investigative techniques' to combat counterfeit currency: namely undercover/sting operations, intercepting communications, controlled deliveries, tracing and recovery of assets, confidence buys or fictitious purchases, varies from jurisdiction to jurisdiction. However, it seems that the most important of those techniques are – if not widely used – at least allowed by the legislation in many countries. The Survey responses provide some detail on the frequency of usage of these techniques by countries as shown in the chart below.

Chart 11. **Special investigative techniques used to combat counterfeit currency**



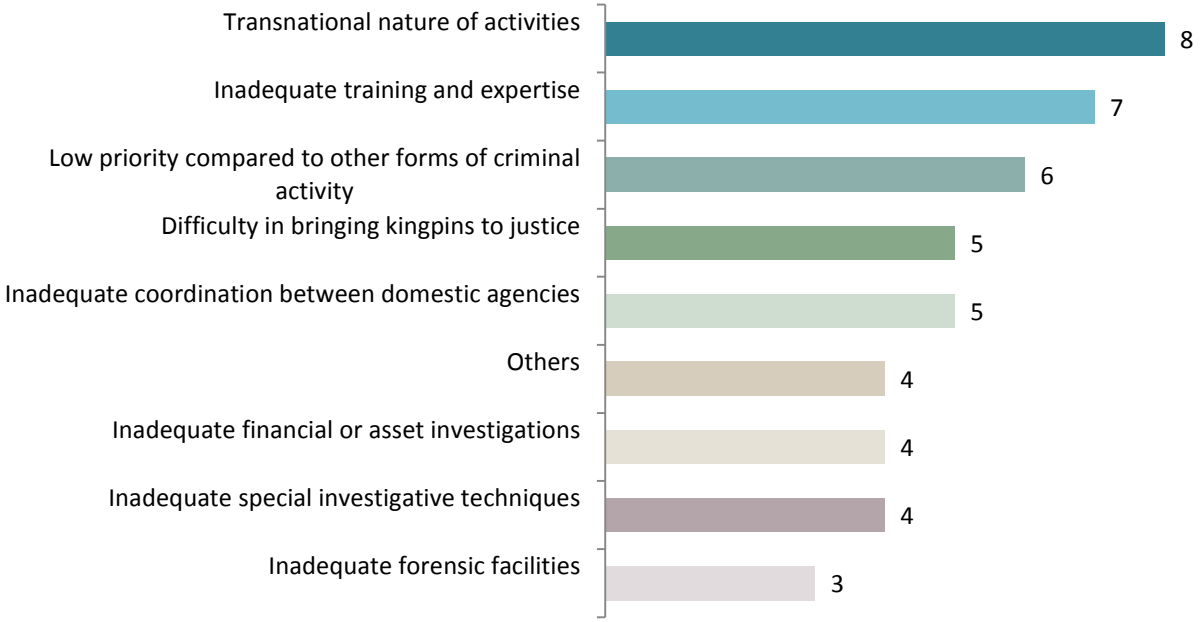
The survey responses also provided some indication of the obstacles facing countries in investigations which need to be considered in assessing the effectiveness of the domestic legal regime.

LEAs and other key institutions in the fight against currency counterfeiting such as central banks, and finance or treasury ministries also develop tailor-made strategic analysis products to combat currency counterfeiting such as:

- Trends over time in detection of counterfeit currency in terms of face value and number of notes of each denomination;
- Geographical distribution in detection of counterfeit currency in terms of face value and number of notes of each denomination;
- Statistics showing sudden increase in detection of counterfeit currency in terms of face value and number of notes of each denomination in a particular geographical area;

- Periodic identification of reports related to currency counterfeiting, and trends of information contained in said reports;

Chart 12. **Impediments encountered when conducting investigations related to counterfeiting of currency**



Having efficient reporting mechanisms in place is the primary basis for analysis of any kind of criminal phenomenon. At national and international level, obligations regarding the reporting of counterfeit money and the establishment of a specific chain of reporting should exist. Another critical aspect is the legal obligation to withdraw counterfeits from circulation. In most jurisdictions, unsurprisingly, both obligations are in place. It is also seen that the reporting obligation is widely used with few exceptions. For example, EU member states have the obligation to report to Europol in its role as being European Central Office for combating euro counterfeiting[58].

There are shortcomings in LEAs and their preventive measures, the following have been identified: the lack of reinforced controls at strategic advantageous locations such as airports, train and bus stations or border crossing points, specialised research and studies (e.g. socio-economic reports on the phenomenon), forecasting and scenario planning, training including the education of money sniffing dogs, and in the light of advanced technology and digital offset also enhanced co-operation with manufacturers such as the Japan Business Machine and Information System Industries Association (JBMIA) or the Central Banks Counterfeit Deterrence Group (CBCDG).

3. ROLE OF CUSTOMS AUTHORITIES

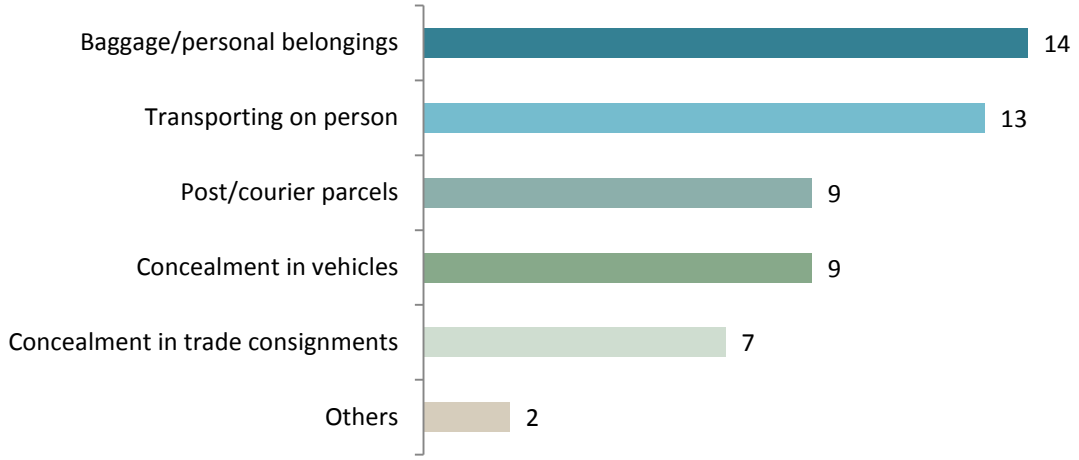
Customs authorities have a primary responsibility in preventing the entry of CCN into the country. Pre-entry measures include developing intelligence about routes, criminals, and criminal gangs

[58] See Council Decision 2005/511/JHA of 12 July 2005 on protecting the euro against counterfeiting, by designating Europol as the Central Office for combating euro counterfeiting.

involved in production, movement or distribution of CCN and *modus operandi* adopted. This may be done through risk-based screening of goods and persons entering into their jurisdiction, border management and patrolling. As part of the strategy, sea, land or air routes susceptible to misuse need to be identified on a dynamic basis. Proper co-ordination with other LEAs and necessary domestic as well as international cooperation is the key to any effective preventive strategy.

The transnational character of currency counterfeiting implies the use of techniques for cross border smuggling. Those techniques are diversified but are in principal comparable to the techniques used to smuggle genuine money:

Chart 13. **Modes used for cross border smuggling of counterfeit currency**



However, the first two techniques, that is to say transporting CNN on person and baggage/personal belongings, are by far the most used by smugglers of CCN. The nature of the methods used for the transport also depends on the geography of the country concerned.

The role of customs in investigations is similar to that of other LEAs as discussed in the previous section. Since the seizures by customs of CCNs are essentially transnational in nature, international co-operation and mutual assistance amongst various customs formations become imperative in combating counterfeiting. Various international conventions such as the Nairobi Convention of 1977 and the Johannesburg Convention of 2003 emphasise the need for bilateral co-operation on enforcement of customs laws. Mutual assistance between customs authorities can significantly mitigate risk and limitations of jurisdiction thereby leading to improvement in detection, interdiction and prosecution of such activity.

In any case, all the provisions of FATF Recommendation 32, which requires jurisdictions to implement measures to detect and prevent the physical cross-border transportation of currency and bearer negotiable instruments, cover both incoming and outgoing cross-border transportations of currency (and bearer negotiable instruments) by any of the following three methods of transportation: (1) by cash couriers, (2) through the post or (3) by containerised cargo. Based on the experience of jurisdictions with the implementation of Recommendation 32, the FATF published a revised best practices paper on the subject in 2010 (replacing an older paper from 2005[59]).

[59] FATF (2005).

IV. LEGAL FRAMEWORK AND INTERNATIONAL COOPERATION

The study has so far shown that currency counterfeiting activities carried out by OCGs and to a certain degree by terrorist groups have an international dimension.

Box 17: **Smuggling of counterfeit Algerian dinars printed on stolen fiduciary paper, disruption of offset illegal print shop**

In September 2008, two Turkish citizens were inspected by the French customs at the airport of Marignane as they were about to fly back to Turkey. They were in possession of 51 103 counterfeit DZD 1 000 (Algerian dinars) banknotes with a face value of EUR 520 000.

The individuals denied knowing the counterfeit aspects of those dinar banknotes. They argued that the money represented the payment of an invoice by an Algerian client having bought some possessions in Turkey and having given mandate to one of the two Turkish citizens arrested for the recovering in France of his claim.

The first parallels tend to draw a link between this case and the armed robbery, committed in November 2006 in Marseille (South East of France) by a commando of 3 armed men. They robbed a road convoy transporting 22 tons of Algerian fiduciary paper.

Italian Central Office (UCIFM) informed the French police that an illegal print-shop of counterfeit dinar banknotes was broken up in January 2009 in the south of Italy by the Italian *Guardia di Finanza*. During this break-up operation, 345 000 counterfeit banknotes of DZD 1 000 were found with a roll (400 kg) of genuine Algerian fiduciary paper (including the watermark and the complete hologram of the Algerian State) produced in Germany.

It was established that the arrested Turkish citizen had a contact in Marseille who received Algerian counterfeit banknotes from an Italian citizen considered to be the supervisor of the production of counterfeit dinar banknotes within the Camorra's organisation.

In conclusion, after an armed robbery of dinar fiduciary paper rolls (for the Central bank of Algeria), two illegal print-shops manufacturing fake DZD 1 000 were discovered in Naples, Italy (in January 2009) and in Lyon, France (in October 2009). There were many arrests of "Naples group" members in Italy and organised crime gangs in France. The judgment of this case in France was delivered in December 2012 with sentences of 2 to 10 years of imprisonment.

Sources: France & Italy

In this scenario, special attention should be paid to two aspects which are key points in enhancing the efficiency and effectiveness of trans-border investigation, namely: (1) the legal framework - with particular attention to the available international instruments; and (2) the way the competent national authorities take advantage of those (international) tools by carrying out and putting in place international co-operation.

1. LEGAL FRAMEWORK

It would be impossible, or rather not that practical, to list all international and national rules and regulations established with regard to the legal provisions referring to counterfeiting of currency and/or aspects linked to ML and TF. Practical experience of the members of the project team and the information collected through the survey circulated prior to the drafting of this report, indicated that from the national point of view, the legal provisions about the way the (predicate) offence of counterfeit currency is tackled are generally adequate. This is in particular evident if one refers to the level of the penalties/punishments of criminal offences linked to counterfeit currency (including printing, circulation, smuggling, possession) or, in the case of ML and/or TF (related or not) to counterfeiting currency. The range of penalties - from three to more than 20 years of imprisonment can be in general terms considered as dissuasive and proportionate.

However, based on the survey responses, it seems that national legislation is more focussed on the ML and/or TF activity by itself and covers currency counterfeiting by default as one of the predicate offences rather than foreseeing specific ML/TF provisions relating to counterfeit currency.

For national provisions, the situation varies when it concerns the possibility of using the so-called special investigative techniques to combat counterfeit currency, namely: undercover operations/sting operations, intercepting communication, controlled delivery, tracing and recovery of assets, confidence buys, and controlled deliveries. Great prudence should be given to the fact that the number of survey response received cannot support a definitive conclusion. However, it seems that the most important of those techniques are - if not widely used - at least allowed by national legislation. This consideration also takes into account the practical experience of the experts of the project team. A different evaluation is possible when referring to the practical use of those special forms of investigation, but in this case, the questions did not request any figures on the use of those tools.

Investigations on counterfeit currency almost always require the need for establishing contacts with counterparts abroad, with the aim of making the investigation effective, researching evidence of an offence, apprehending fugitives, etc.

It is not by chance that the international community identified the need for establishing an international specific multilateral instrument: the CCC 1929, which is still “the” convention by definition in this field. Other instruments are of course in force at regional and/or bilateral level but it is still the most important reference in force worldwide. The Geneva Convention is a reference to look at with regards to the basic principle of co-operation, including binding measures (with some exceptions) that contribute to create a system and ensure important multidisciplinary tools, useful for enhancing the defence of national currencies.

The CCC 1929 actually includes important concepts for co-operation reflected in its articles enhancing identification, investigation, prosecution of counterfeit currency with a transnational dimension, the establishment of contacts between competent authorities, the provisions for the establishment and function of central offices to facilitate the exchange of information and or experience, etc.

Specific figures on the use of the CCC 1929 are not available. The last conference of the high contracting parties took place more than ten years ago, organised by INTERPOL. According to some

of the replies and the experience in the field, it seems that the concepts and tools offered by the CCC 1929 are in use in many contracting parties, next to other instruments at regional or bilateral level. Its ratification and use should be further supported and promoted, since it contributes to creating a system, and the multidisciplinary tools, for protecting currency and fighting against its counterfeiting at national and international co-operation level.

When referring to the issue of regional legal instruments in place that supplement the provisions of the CCC 1929, it is interesting to note the system in place within the EU, in particular for the protection of the euro (see Box 18). The EU legal instruments for the protection of the euro are in particular useful as one possible example of legal mechanism that national legislators could take into account when addressing the issue of administrative and criminal protection of their national currency, including by means of specific training programmes like the Pericles funding programme, managed by OLAF, the Anti-Fraud Office of the European Commission. Even if the EU legislation itself requires continuous updates to address new challenges and threats caused by the counterfeiters (and specific legislative initiatives in the field have been recently proposed by the European Commission), it represents today a valid basis for supplementing the provisions under the CCC 1929 and facilitates its application, without prejudice to the obligations under the CCC 1929 itself.

The legal instruments of the EU allow for co-operation and exchange of a wide range of information:

- exchange of technical and operational information
- harmonisation of laws,
- definitions
- co-operation between LEAs, judicial authorities and central banks, and
- technical expert analyses:,
    - EU expert analysis authorities (Counterfeit Analysis Centre for banknotes at the ECB and the coin analysis centre at the European Technical and Scientific Centre)
    - National analysis centres (National Analysis Centres for banknotes and Coin National Analysis Centres).

Box 18. **Examples provided by the EU instruments**

Council Framework Decision 2000/383/JHA of 29 May 2000 on increasing protection by establishing penal sanctions and other sanctions against money counterfeiting in connection with the introduction of the euro;

Council Framework Decision 2001/888/JHA of 6 December 2001 amending Framework Decision 2000/383/JHA on increasing protection by criminal penalties and other sanctions against counterfeiting in connection with the introduction of the euro;

Council Regulation (EC) 1338/2001 of 28 June 2001 laying down measures necessary for the protection of the euro against counterfeiting;

Council Regulation (EC) 1339/2001 of 28 June 2001 extending the effects of Regulation 1338/2001 laying down measures necessary for the protection of the euro against counterfeiting to those member states which have not adopted the euro as their single currency;

Council Regulation (EC) No 44/2009 of 18 December 2008 amending Regulation (EC) No 1338/2001 laying down measures necessary for the protection of the euro against counterfeiting;

Council Regulation (EC) No 45/2009 of 18 December 2008 amending Regulation (EC) No 1339/2001 extending the effects of Regulation (EC) No 1338/2001 laying down measures necessary for the protection of the euro against counterfeiting to those member states which have not adopted the euro as their single currency;

Council Decision 2001/887/JHA of 6 December 2001 on the protection of the euro against counterfeiting;

Council Decision 2001/923/EC of 17 December 2001 establishing an exchange, assistance and training programme for the protection of the euro against counterfeiting (the so called 'Pericles' funding programme, managed by the Anti-fraud Office of the European Commission/OLAF);

Council Decision 2001/924/EC of 17 December 2001 extending the effects of the Decision establishing the "Pericles" programme to the member states which have not adopted the euro as the single currency;

Council Decision 2005/511/JHA dated 12 July 2005 on protecting the euro against counterfeiting, by designating Europol as the Central Office for combating euro counterfeiting (based on which, Europol is also allowed to support - from a special budget – specific euro counterfeiting operations);

Commission Decision 2005/37/EC of 29 October 2004 establishing the ETSC and providing for coordination of technical actions to protect euro coins against counterfeiting;

Regulation (EU) No 1210/2010 of the European Parliament and of the Council of 15 December 2010 concerning authentication of euro coins and handling of euro coins unfit for circulation;

Council Regulation (EC) No 2182/2004 of 6 December 2004 concerning medals and tokens similar to euro coins;

Council Regulation (EC) No 46/2009 of 18 December 2008 amending Regulation (EC) No 2182/2004 concerning medals and tokens similar to euro coins;

Council Regulation (EC) No 2183/2004 of 6 December 2004 extending to the non-participating member states the application of Regulation (EC) No 2182/2004 concerning medals and tokens similar to euro coins;

Council Regulation (EC) No 47/2009 of 18 December 2008 amending Regulation (EC) No 2183/2004 extending to the non-participating member states the application of Regulation (EC) No 2182/2004 concerning medals and tokens similar to euro coins.

Additional instruments are also quite interesting in terms of judicial co-operation, namely the "European Arrest Warrant", applicable to counterfeiting and ML irrespectively of the dual criminality principle.

With respect to international instruments available for fighting the (possible) ML aspects linked to currency counterfeiting cases, it is appropriate to highlight that generally speaking – also according to the survey responses – the national legal frameworks do not address the ML or TF aspects of currency counterfeit *per se*, but rather by considering it in the framework of "predicate offences".

2. INTERNATIONAL CO-OPERATION

Given the trans-national characteristics of currency counterfeiting, it is important to address the issue of international cooperation. The UN Palermo Convention 2000, provides tools for international co-operation on prevention, investigation and prosecution, once a criminal offence is established and once the recognition of the requirements for making it applicable are satisfied

The survey in support of this research included specific questions not only on the role played by FIUs, LEA and customs, but also referred to some of the tools established through the international instruments mentioned in the previous section. Unfortunately, the picture is not complete, due to the limited number of replies received, including (for those who gave some feedback) with reference to possible comprehensive figures for example on the number of requests for co-operation or assistance sent or received.

Nevertheless, even in the absence of comprehensive replies, some conclusions can be drawn from the information obtained. With regard to the interaction between FIUs, customs and, LEA, the legal frameworks at national level are heterogeneous. If the view is limited to the analysis of currency counterfeiting and related ML or TF aspects, the majority of the cases appear to indicate either that there is no specific role played by one or more institution (FIU/customs), or that the role is not specifically recognised by the legislation but was undertaken as one of the core tasks of the agency, for example:

- ML provisions address any predicate offence, not exclusively currency counterfeiting.
- Cash controls at border lead to the detection of counterfeiting currency.
- Special forms of co-operation are used (also at international level) in the presence of certain types of criminal activity (for example when minimum thresholds enable the use of special investigative techniques, rather than specific provisions on currency counterfeiting).

In general terms, when it comes to international co-operation (to send/receive assistance), it seems the FIUs and customs play a limited role in purely counterfeit currency cases, since in the majority of the countries such cases fall under the competence of LEAs. The international LEA community is used to benefit from the opportunity offered by the contact with counterparts abroad.

However, the figures provided by those who replied are not enough to be considered as a representative sample of the actual situation. This is the reason why, for example, the project team could not focus more on the exchange of information, joint investigation, mutual legal assistance etc.

It is also true that there is a feeling that international co-operation resulting from informal, or not officially recorded, statistics is wider than what is said by official figures. This is an aspect of the international mutual assistance which is very well known to international law enforcement

"practitioners", whose networks of informal contacts are often used or based on personal relationships and thus are not reflected in official figures.

Box 19: **Counterfeiting of US dollars and euros**

On 19 December 2012, the Peruvian National Police (DIRINCRI - *Direccion de Investigacion Criminal*), in co-operation with the *Brigada de Investigación Del Banco de España* (BIBE), the US Secret Service and Europol, dismantled a counterfeit banknote print shop in Lima and arrested one suspect. A total amount of EUR 4 437 000 and USD 4 460 000 in counterfeit banknotes were seized, all 100 denomination notes. Printing equipment, including an offset press and materials for the production of banknotes, were also confiscated. The raid was the culmination of an extensive operation that has been ongoing for a number of months and has involved information sharing across a number of international law enforcement agencies. A Europol expert was on location to provide technical support to Peruvian authorities and to evaluate the counterfeit euro notes and machinery seized.

Source: Europol (2013)

Moreover, even if not addressing exclusively the currency counterfeiting sector, the experience made within some regions of the use of joint investigation teams or the network of liaison officers are evidence of a level of international co-operation that is most probably much higher than those expressed by available figures. Examples of structure and legal procedures for the establishment and conduct of such joint investigation actions or on the use of international liaison office/officers network are again offered also by the EU legislation/initiatives.[60]

On the other hand, the case studies collected by the project group about the use of special investigative techniques and/or the use of international co-operation testify of the significant cross-border aspects of currency counterfeiting and the benefits of international co-operation to the effectiveness of an investigation.

Box 20: **Organised crime syndicate involved in smuggling and distribution of counterfeit US dollars**

In September 2012, Secret Service agents in Lima, working closely with the Peruvian National Police (PNP) Dirincri "Estafas" unit, obtained investigative intelligence from a confidential informant regarding a transnational organised group distributing counterfeit US currency. The investigation identified "A" as the primary suspect, a former PNP officer and cousin of the "godfather" of the *Familia Nique* crime syndicate and creator of the Peruvian counterfeit note

[60] Examples involving joint investigation team structures and use of liaison officers:

family.

Through extensive surveillance and the use of other electronic investigative techniques, Lima agents and PNP investigators discovered a group of co-conspirators who distributed large quantities of counterfeit US currency through commercial ground transportation. The suspects concealed the counterfeit notes in boxes of pastries and shipped the contraband on buses that travelled from Peru to Ecuador, Colombia and Venezuela. Once in Venezuela, the suspects transported the counterfeit cash, through various smuggling methods, such as hiding the notes in false bottom luggage and children's toys and bibles on commercial flights, to locations in the United States, primarily New York and Miami. During surveillance in Lima, agents and PNP officers observed three suspects smuggle counterfeit currency onto a passenger bus. The investigative coalition force executed a search warrant on the vehicle and seized USD 600 000 in USD 100 Federal Reserve Notes and arrested "A". A query of the Secret Service Counterfeit Tracking Application identified the seized currency as a member of circular family C-23985. These notes first appeared in Detroit, Michigan in 2009, and are forensically linked to the Peruvian note family, with a total passing history in excess of USD 26 million. On 6 October 2012, Lima agents and the PNP arrested under Peruvian Criminal Code for possessing and distributing counterfeit currency.

Source: USSS (2012)

Most jurisdictions have identified impediments in respect of international co-operation. In the study questionnaire, the following six issues were identified:

- Different types, operating standards, and powers of individual FIUs/LEAs;
- Different priorities of the countries;
- Differing quality and credibility of information exchanged;
- Late or no responses to requests; insufficient/ low quality of responses; unduly rejected requests;
- Lengthy and complicated (time-consuming) procedures for implementation of MoUs and other agreements on international cooperation;
- Language barriers make communication more difficult (especially for non-English speaking jurisdictions).

Box 21: **Project Colombia**

Since 1996, the US Secret Service has had a significant presence in Colombia working in collaboration with Colombian law enforcement officials toward the suppression of counterfeit US currency. Success in the fight against criminal organisations dedicated to the manufacturing of counterfeit US currency is a direct result of the Secret Service's commitment to providing support and leadership within both the law enforcement and prosecutorial entities in Colombia. The Secret Service operates and maintains a "Vetted Anti-Counterfeiting Task Force" (VACF) in Colombia, comprised of Colombian law enforcement officials from both their federal and national police

forces. Members of the VACF Task force undergo background investigations and ultimately are required to pass a polygraph examination given by a certified US Secret Service polygrapher before he/she can become a certified member of the VACF. This vetting process ensures the integrity of the VACF unit, and allows members to receive specific training including wire tracking, counterfeit detection, firearms training and tactical strategies.

Since the inception of the VACF Task force, the Secret Service has not only provided continued financial support but has worked with Colombian Government Officials to change Colombian Federal Statutes, ensuring criminals and criminal organisations responsible for counterfeiting can be punished appropriately within their judicial system. This relationship between the Secret Service and the Colombian Law Enforcement has proven so successful it has served as a model for forming additional Secret Service led anti-counterfeiting task forces throughout the world.

Since the Bogota Resident Office opened in 1996 thru 2011, total counterfeit currency related to the Colombian Note, seized is USD 372 319 095. The establishment of the Secret Service Resident Office in Bogota, Colombia and formation of the VACF has had a significant impact on the production of counterfeit US currency in Colombia. These successes, coupled with the ability to cripple organisations manufacturing US counterfeit currency would not have been possible without the establishment of the VACF and the noted cooperation between the Secret Service and Colombian law enforcement officials.

Source: United States

INTERPOL provides forensic support, operational assistance, and technical databases, in order to assist member countries in addressing counterfeit currency. The agency seeks to provide partnerships between LEAs, financial institutions, and central banks, as well as with security printing industry and high grade suppliers. Interpol provides the following services[61]:

- Classifying, analysing and storing genuine currency specimens and counterfeit banknotes;
- Circulating analytical reports among INTERPOL member countries;
- Determining whether suspect specimens are genuine or counterfeit;
- Allocating international indicatives to newly discovered counterfeits;
- Publishing descriptions of new counterfeit banknotes;
- Preparing and circulating tables of statistics on worldwide counterfeit
- Organising best practices exchanges.

Of particular interest are the yearly statistics published by INTERPOL for all counterfeit currencies discovered in INTERPOL member countries.[62]

61 Interpol (2013).

62 For detailed analysis of trends in counterfeiting please see Annexes.

One INTERPOL project to counter counterfeiting is Project S-Print – an international monitoring system on the security printing industry and suppliers, including the verification of second-hand *intaglio* machines, security printing equipment and suspicious purchase orders. The objective of the project is to reduce currency counterfeiting and altered security documents by preventing the necessary production materials and supplies from reaching the counterfeiters. The project has also formulated a checklist to help suppliers of printing materials identify orders that could be related to the manufacture of banknotes or identity documents[63].

In the FATF AML/CFT regime, counterfeiting finds a place. The interpretative note to the FATF Recommendation 3 (which deals with ML), states that countries should include a range of offences within each of the 'designated categories of offences'. The offence of ML should extend to any type of property, regardless of its value, that directly or indirectly represents the proceeds of crime. When proving that property is the proceeds of crime, it should not be necessary that a person be convicted of a predicate offence[64]. 'Counterfeiting currency' is one of the designated categories of offences[65]. This is in addition to the regulations in respect of terror financing which find a place in Recommendation 5-8 of the FATF Recommendations and the International Convention for the Suppression of the Financing of Terrorism.

Europol plays an important role in the efforts of the EU in combatting euro counterfeiting. Europol acts as the Central Office for combating euro-counterfeiting within the meaning of Article 12 of the Geneva Convention[66]. Within the context of its mandate, Europol:

- Works closely together with key playing institutions such as the ECB, the European Commission/OLAF, Eurojust and Interpol.
- Centralises, processes and analyses all information of a nature to facilitate the investigation, prevention and combating of euro counterfeiting and shares this information with the National Central Offices of the EU member states.
- Corresponds through the EU Liaison Office network with the National Central Offices of third countries in accordance with the rules on the transmission of personal data.
- Forwards on requests, and in line with the provisions of the CCC 1929, to the National Central Offices of third countries a set of specimens of actual euros.

Where counterfeiting of all other currencies is concerned, the National Central Offices retain their respective competence. The EU seeks to step up co-operation among member states and between member states and Europol with a view to protecting the euro against counterfeiting at

63 Interpol (2013).

64 FATF (2012), *p.* 34.

65 FATF (2012), *p.* 112.

66 See Council Decision 2005/511/JHA of 12 July 2005 on protecting the euro against counterfeiting, by designating Europol as the central office for combating euro counterfeiting.

international level. Third countries need a central contact for information on counterfeit euros. All such information is to be brought together for purposes of analysis at Europol.

The purpose of the Pericles Programme is to strengthen the protection of the euro against counterfeiting, taking into consideration transnational and multidisciplinary aspects. It seeks to promote content-convergence of the measures taken at European level to combat the counterfeiting of the euro and to ensure equivalence and homogeneity of the protection while observing the distinct traditions of each EU member states.

The programme envisages a four pronged strategy- of

- strengthening co-operation,
- technical, scientific and operational assistance,
- providing training and
- raising awareness to combat euro counterfeiting.

The programme seeks to closely support the establishment and completion of relevant protection structures (for example, national central offices against counterfeiting) in "relevant" third countries, enhance co-operation between countries as well between enforcement/financial structures, establish homogeneous and effective frameworks (legislation, procedures, and offices), support intelligence gathering, training, studies etc.[67].

The nature and scale of counterfeiting makes it obvious that counterfeiting cannot be exclusively tackled at the domestic level but needs sustained and substantial international co-operation. This is more so in the case of TF through counterfeiting, where the actors are often based in multiple jurisdictions.

International co-operation amongst states to combat counterfeiting with AML/CFT dimensions is usually based on time tested legal instruments such as bilateral treaties and multilateral conventions. Co-operation in individual cases is mostly through the processes of mutual legal assistance and extradition. Specifically, Recommendations 36-40 of the FATF Recommendations provide mechanisms for international co-operation in ML and TF cases. Mutual legal assistance could encompass a range of activity, from freezing/ confiscation/ evidence collection/ aids to investigation to prosecution assistance, extradition etc. Domestically, the agencies seeking such co-operation could be FIUs/LEAs.

FIUs seek co-operation through the Egmont Group, as well as the FATF or FSRBs[68]. The police typically use the extensive Interpol system for mutual assistance.

---

67 See European Commission (2012a).

68 There are 8 FSRBs which include The Eurasian Group (EAG), Asia/Pacific Group on combating money laundering (APG), Caribbean Financial Action Task Force (CFATF), Committee of Experts on the Evaluation of Anti-Money Laundering Measures and the Financing of Terrorism of the Council of Europe (MONEYVAL), Eastern and Southern Africa Anti-Money Laundering Group (ESAAMLG), Financial Action Task Force on Money Laundering in South America (GAFISUD), Intergovernmental Action Group against Money-Laundering in West Africa (GIABA), Middle East and North Africa Financial Action Task Force (MENAFATF).

Import of counterfeit currency is also covered by customs laws in most jurisdictions, and international co-operation mechanism in respect of customs laws therefore also apply. Besides the World Customs Organisation, the International Convention on Mutual Administrative Assistance for the Prevention, Investigation and Repression of Customs Offences (Nairobi Convention 1977), and the International Convention on Mutual Administrative Assistance in Customs Matters (Johannesburg Convention 2003) provide a framework mechanism in this regard. This is in addition to bilateral and regional customs agreements, as well as regular informal channels of communication. Mutual legal assistance between customs administrations significantly mitigates risk and limitations of countries, thereby leading to an increase in detection, interdiction and prosecution of such activity.

In respect of the role of FIUs, these units have dealt with counterfeit currency queries in Australia, India, Spain, Tajikistan and the United States. No such queries had been dealt with in France, Mexico, Nepal and Turkey.

In respect of LEAs, all countries which responded to the survey have suggested that LEAs do send/ receive requests for international co-operation in counterfeit currency cases. Particularly, with regard to exchange of information, Belgium has substantial engagement, having sent 58, and received 96 requests. In respect of requests for conducting enquiries/ trials, France (1 sent, 12 received) and Belgium (3 sent, 75 received), have utilised this mode of co-operation. In respect of joint investigations, Turkey was the only country which reported use of this method.

Box 22: **International co-operation and exchange of information**

A planned operation was initiated in accordance with the analysis based on the information given by German liaison officers about the suspects of counterfeiting of currency who were arrested in Germany.

A meeting was held with German officials at the later stages of the investigation. Thanks to the international co-operation, many suspects were arrested in the operation and counterfeit Russian rubbles (valued at USD 994 500) were seized.

Source: Turkey

Italy in particular, stated that since it is a country known for producing counterfeit currency, there is a continuous flow of information from/to foreign countries both in and outside Europe. Furthermore, operational meetings between investigators are quite frequently organised and, in some cases, joint investigations conducted by Italian and foreign law enforcement agencies have been carried out, sometimes with the involvement of their respective judicial authorities. In this regard, the most active co-operation has been with France, Germany and Spain due to the importance of these countries from the standpoint of economy, finance, circulation of money as well as the statistical impact of currency counterfeiting within their national territories. Italy submitted 893 requests for information in 2012 and received 1554.

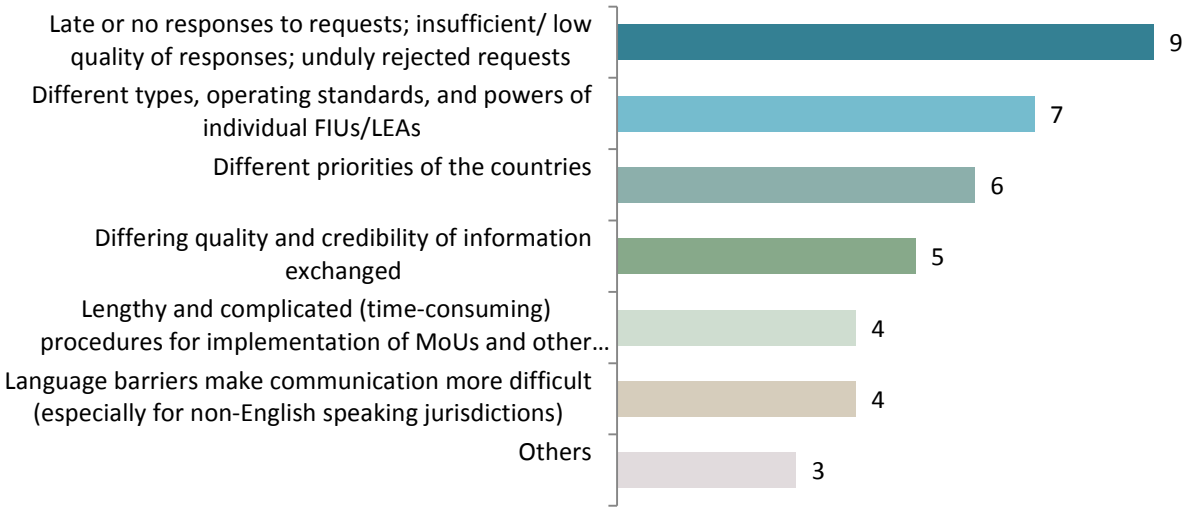
Box 23: **International co-operation (Printing of counterfeit US dollars)**

In October 2011, Italian law enforcement officials from the *Polizia di Stato* contacted the US Secret Service Rome Field Office requesting assistance with a counterfeit US currency investigation. The initial investigation identified a primary suspect. *Polizia di Stato* informed the Secret Service Rome Field Office of an investigation regarding an organised criminal group involved in a series of bank robberies throughout Italy. Utilising electronic investigative techniques and surveillance conducted during the investigation, *Polizia di Stato* identified an apartment located in La Spezia, Italy believed to contain counterfeit US currency. On 7 October 2011, members of the *Polizia di Stato* executed a search warrant revealing USD 1.78 million in counterfeit USD 100 banknotes, an offset printer, printing plates and negatives. On 7 October 2011, the primary suspect was arrested by Italian law enforcement and was charged with manufacturing counterfeit foreign currency. Criminal and MCI checks of the suspect revealed that suspect was of record with the Secret Service regarding previous counterfeit investigations dating back to 1986 and 1989.

Source: USSS (2012)

Survey responses to the question on the impediments encountered in providing or receiving international co-operation are indicated in the chart below.

Chart 14. **Impediments to international co-operation related to counterfeit currency**



The United States, in addition to the above, suggested that participation by inappropriate government officials as another matter of concern.

V. CONCLUSIONS

Currency counterfeiting is as old as money as a unit of exchange itself. With the internationalisation of money and its acceptance beyond local markets, currency became more attractive to counterfeiters. The US dollar, the euro or the British pound sterling are being circulated worldwide and trusted to hold their value. Favourable conditions such as inflation, political and economic instability, an underdeveloped banking sector, or a lack of convertibility of the domestic currency, prompt people to use such "hard currencies". As seen by the example of Bulgarian based OCGs, changing preferences for certain hard currencies has the potential to make counterfeiters switch to the production of other currencies.

The importance of currency as a symbol of sovereignty and main contributor to economic stability triggered the international community to establish the CCC 1929. Still today, currency counterfeiting presents a threat to national economies. It is not so much the financial damage, which in fact is quite low compared to other forms of criminal activity, but the impact it has on the "trustworthiness" of the currency. In contrast, and as the survey results show, it seems that governments, LEAs and FIUs give a relatively low priority to combating currency counterfeiting. The problem is further accentuated by the fact that hardly any scientific research has been undertaken on this subject and its relationship to other forms of criminal activity. Estimates of the related proceeds of crime are rare, incomplete (only 100 out of 190 Interpol members reported actual figures), difficult to calculate and mainly reflect circulated counterfeit banknotes that have been seized, while police seizures in print-shops dismantled are not taken into account for statistical purposes. For understandable reasons, regulatory bodies and central banks are not in favour of attracting big media attention to the issue of counterfeiting. There is an apparent underestimation of how much attention is needed to protect currencies and the way resources should be allocated to achieve an adequate level of protection against counterfeiting. Furthermore, that counterfeiting receives lower priority may in part be due to the fact that a number of jurisdictions have not yet felt the impact of this activity on their domestic economy.

Improvements in digital printing techniques play an increasing role in facilitating the business of counterfeiting. Today, in principle, anyone with basic computer skills has the tools at hand to become a counterfeiter. Cheap, but sophisticated, printers and software make counterfeiting a lucrative, easy and opportunistic activity.

Currency counterfeiting crimes generate high profits only when powerful mafia-style OCGs are involved. The research appears to indicate that internationally operating OCGs are heavily involved in the illegal business of currency counterfeiting on a global scale. The complexities involved in the large-scale printing, smuggling and distribution of counterfeit currency when produced by offset printing machines requires the involvement of organised criminal syndicates with international linkages. The study confirms the strong links between currency counterfeiting and other forms of criminal activity, such as drug trafficking and arms smuggling.

The involvement of international OCGs makes it extremely difficult for a single country to address counterfeiting on its own, and an urgent need for enhanced international co-operation appears to be necessary.

This report has focussed on the ML and TF aspects of this currency counterfeiting and concludes that there is a lack of awareness on this activity and its links to ML, and thus taking a closer look at the relationship between currency counterfeiting and ML appears to be justified. One important aspect is the fact that proceeds generated by currency counterfeiting are often "laundered" by investing them in other criminal enterprises, especially in relation to drugs trafficking and actual figures originating from the proceeds of counterfeiting are lost.

The survey responses indicate that various methods, such as intermingling counterfeit with genuine currency, purchasing goods of low value or use of cash-intensive business as a front for introducing counterfeit currency into the financial system are preferred *modus operandi*. Similarly, various methods such as, use of cash couriers; bank account; *hawala* or other types of alternate remittance methods are employed by criminal syndicates to move the proceeds of crime related to counterfeit currency. The proceeds of this activity are integrated by intermingling in cash intensive business, movement through multiple jurisdictions, movement through multiple accounts/entities, use of corporate structure and false declaration of goods and services. The study did not identify distinctive methods only used to transfer proceeds of crime generated by currency counterfeiting or their integration into the legal financial flow. More likely, methods associated with counterfeiting follow the same patterns as those for other forms of criminal activity. Among a number of red flag indicators, the use of high-denomination banknotes such as the EUR 200 and the EUR 500 banknotes raised some suspicion. The fact that they are object of counterfeiters in principle contradicts the finding that the commonly used denominations are also the most counterfeited ones.

The study concludes that terrorist organisations have resorted to the use of counterfeit currency for a variety of reasons. Training, recruitment, attacks and propaganda require large amount of funds; and terrorist groups have often resorted to the business of counterfeiting of currency as one of the means to fund such activities. While currency counterfeiting in relation to OCGs is a global phenomenon, its relation to TF is seen only in some regions around the globe and in isolated cases. There is growing evidence that some terrorist groups co-operate with OCG to produce counterfeit currency in order to fund their activities.

It has also been observed that in some instances, counterfeit currency has been used as a tool to destabilize the economy of a country. Huge quantities of high quality CCN are being infused into the financial system of a country which lowers the value of the currency, triggers inflation and thus does not only erode the faith of the people in their currency but might have the power – in its worst case scenario – to make the whole economic system collapse.

The survey responses indicate that international instruments of co-operation exist between countries for criminal matters in general. International co-operation is continuously evolving, and there are still substantial, unresolved challenges. Some of the responses indicate that there is still considerable room for improvement at international level with regard to co-operation, in order to ensure a wider awareness of the existence of specific legal tools, the use of such instruments and enhancement of mutual trust. To ensure wider acceptance and use of the international co-operation mechanisms indicated above, there is an urgent need for international funding programmes for training and staff exchanges. Significantly, there is also a need for better understanding of the fact that in international co-operation- “the more you give the more you receive”.

While many countries are dealing with the problem of counterfeit currency, some are still not signatories to the CCC 1929, and some of them are not even aware of the existence of such a convention. The responses also indicate that LEAs have so far, largely dealt with counterfeit currency as a distinct form of criminal activity but have rarely focussed on the ML and TF aspects associated with it.

All countries who responded to the survey indicated that they have their own internal reporting mechanisms in place regarding counterfeit currency; but there appears to be room for improvement here too. The need to report and compile all the information pertaining to counterfeit currency in each jurisdiction by a single authority, a national central office, is stipulated in Article 12 of the CCC 1929. The role of FIUs and customs in collecting and compiling this data needs to be explored. Countries also undertake training programmes for the LEAs, improving and upgrading security features and conduct public awareness programmes.

The laws pertaining to counterfeit currency seem to be in place and sufficient but need international/regional harmonisation to avoid the creation of "safe havens". The case studies and international examples show that special investigative techniques are very efficient tools in dealing with currency counterfeiting. Considering the involvement of OCGs and terrorist groups which operate in an inherently highly secret environment, it makes sense to encourage further use of these techniques in the context of currency counterfeiting investigations.

VI. POLICY IMPLICATIONS

The project has identified several policy implications for possible improvements:

There is an urgent need for enhanced international co-operation between all the actors involved, at different levels of responsibility such as: regulators, LEAs and judicial authorities, and other stakeholders in the field, including financial intermediaries. All jurisdictions need to consider ratifying and/or acceding to the CCC 1929 and consequently put in place all its required legal and organisational measures, in particular those on the establishment of a national central office as outlined in Article 12.

The findings of this study clearly indicate that counterfeiting currency and associated ML and TF risks are transnational in character. The activity is carried out by organized criminal syndicates with a transnational presence. The transnational nature of the risk could be further considered by the FATF and FSRB assessors during a country's assessment of compliance with the FATF Recommendations. This includes any information with respect to the use of that country for producing and/or smuggling of counterfeit currency of another country. This information would help to form an objective, authentic and comprehensive view for addressing transnational risk by the country under assessment.

For the purpose of getting a more complete picture of the subject matter, Interpol could be encouraged to expand its relevant questionnaire to include more on ML and TF issues.

At the national level, efficient reporting mechanisms and establishment of adequate institutional frameworks could also be further promoted. These mechanisms and institutions could help to achieve more effective co-operation amongst regulatory bodies, FIUs and LEAs. This could then also reinforce efforts to detect currency counterfeiting within entities dealing with large amount of cash (*i.e.,* financial institutions and DNFBPs).

Countries could focus on setting up national training programmes and multidisciplinary working groups. National authorities could also look at improving mechanisms for monitoring convicted "printers"/producers of counterfeit currency. Within such monitoring frameworks, authorities could also consider extending the length of time for data retention on currency counterfeiting activity to ensure that known criminals do not escape LEA and judicial attention. Within this framework, the possibility of launching regional or international funding programmes such as the European Commission's Pericles programme could be explored.

The continuous review and enhancement of security features of national currency as an effective preventive measure for combating counterfeiting seems to be an essential element of addressing the issue. The development of such security features should, to the extent possible, take advantage of the practical knowledge gained by LEAs.

LEAs – and in particular – customs authorities – need to pay greater attention to shipments of any material which can be used for printing counterfeit currency such as security inks, security paper and holograms. Manufacturers of key raw material used for printing money, such as security paper and security ink, could be encouraged to take more responsibility in ensuring that their products do

not fall in the hands of criminal enterprises. This could also facilitate investigations undertaken by the LEAs across the world. The Interpol S-PRINT project could help to reinforce this effort.

LEAs and other public authorities or initiatives, such as the Central Banks Counterfeit Deterrence Group (CBCDG), may wish to further develop co-operation with business machine manufacturers such as the Japan Business Machine and Information System Industries Association (JBMIA). It is necessary that the FIUs receive the information not only from the financial institutions where CCN is detected and impounded but also from the LEAs that intercept, seize and confiscate CCN and prosecute the offenders.

Due to the lack of knowledge and understanding on the subject matter, countries should consider undertaking multidisciplinary studies on the economic and social impact of counterfeiting by putting focus on ML and TF related issues. Scenario planning could also help to address possible unforeseen/unexpected new challenges.

Countries may also want to examine more closely the OCG pyramid-like structure and identify the level at which ML takes place. Finally, future studies of currency counterfeiting and associated money laundering could assist in better understanding how the use of high denomination banknotes is related to both activities.

ANNEX 3: RESEARCH SURVEY

FATF TYPOLOGIES PROJECT

MONEY LAUNDERING AND TERRORIST FINANCING RELATED TO COUNTERFEITING OF CURRENCY

Initial Questionnaire

The goals of the FATF typologies project on counterfeiting of currency are:

- To identify and describe money laundering and terrorist financing methods associated with counterfeit currency
- To contrast the methods of placement of counterfeit currency with those of other criminal proceeds
- To study the linkage of counterfeiting of currency with organised crime, terrorist financing and other types of criminal activity.
- To identify AML/CFT measures that are useful in detection of counterfeiting of currency and associated ML/TF
- To identify red flag indicators for detection of suspicious transactions relating to counterfeit currency
- To identify gaps in the legal framework and/or mismatch in the operational interaction of LEAs, customs and FIUs preventing successful investigation and prosecution of ML/TF arising from counterfeit currency

A questionnaire has been developed to solicit basic information from FATF members and other participants. The information obtained through this questionnaire will assist the Project Team in establishing the general parameters of its work and in focusing its requests for further information.

The typology project does not cover counterfeit coins.

The questionnaire is divided into following sections:

- Section A: About Counterfeiting of Currency in general
- Section B: Money Laundering
- Section C: Terrorist Financing
- Section D: Preventive Measures
- Section E: Financial Intelligence Unit
- Section F: Customs Authorities
- Section G: Law Enforcement and Investigative Authorities
- Section H: International Cooperation

■ Section I: Legal Framework

Respondents are requested to return their completed questionnaires by December 11, 2012 to the FATF Secretariat.

THANK YOU FOR PARTICIPATING IN THE PROJECT.

Q.3	What is the threat rating for counterfeiting of currency in your jurisdiction? Please check the relevant rating.	☐ Very High ☐ High ☐ Medium ☐ Low ☐ Very Low ☐ Others (Please use the space below to specify)
Q.4	What are the factors underlying the threat assessment of counterfeiting of currency in your jurisdiction? Please check all that apply.	☐ Adverse impact on the integrity of the financial sector ☐ Loss of trust in currency ☐ Large quantum of proceeds of crime generated/ laundered ☐ Linkage with financing of terrorism ☐ Linkage with drugs and other offences ☐ Others (Please use the space below to specify)
Q.5	Is there one currency production facility or multiple facilities that produce the currency notes?	
Q.6	Is there a methodology to estimate for the value of counterfeit currency in circulation in your jurisdiction? If yes, please provide the salient features of the methodology.	
Q.7	Is there an estimate as to how much of your domestic currency in circulation is counterfeit? If yes, please provide estimates of the value of such counterfeit currency in circulation in your jurisdiction?	
Q.8	Is there a national strategy to combat counterfeiting of currency? If yes, please provide the salient features of the strategy.	
Q.9	What is the competent authority for identifying and verifying that the suspected currency is counterfeit?	
Q.10	Name of the competent authority(ies) responsible for combating currency counterfeiting.	
Q.11	What is the name of the unit designated as the dedicated Nation Central Office (NCO) for combating currency counterfeiting according to Article 12 of the International Convention for the Suppression of Counterfeiting Currency of 1929?	

74 Counterfeit banknotes seized before they caused damage (financial loss), *e.g,.* seizures in confidence buys/sting operations, counterfeits seized in illegal print-shops or deposits.

75 The face value has been sought in USD and the rate of conversion for all three years should be taken at the exchange rate of the national currency vis-à-vis USD as at 1 July 2012.

Q.12	What equipment is utilized to examine the suspected counterfeit currency? (Microscopes, various light sources, magnetic detector, scanning electron microscope, RAMAN, GC/MS?)	
Q.13	Is there a certain special budget available for combating currency counterfeiting? Who provides this budget (police, national bank, international organisation or funding programmes, etc.?)	
Q.14	Are currency counterfeiting cases reported and administered at a central body?	
Q.15	Name of the competent authority(ies) responsible for combating money laundering related to counterfeit currency.	
Q.16	Name of the competent authority(ies) responsible for combating financing of terrorism related to counterfeit currency.	
Q.17	Is counterfeit currency linked with other predicate offences? Please check all that apply.	☐ Participation in an organised criminal group and racketeering ☐ Terrorism, including terrorist financing ☐ Trafficking in human beings and migrant smuggling ☐ Illicit trafficking in narcotic drugs and psychotropic substances ☐ Illicit arms trafficking ☐ Smuggling ☐ Others (Please use the space below to specify)
Q.18	Please provide case studies to show linkage of counterfeiting of currency with other predicate offences. (E.g. Cases in which counterfeit currency was seized along with drugs, illicit arms etc.)	
SECTION B: MONEY LAUNDERING		
Q.19	Are domestic organised criminal groups involved in printing and / or circulation of counterfeit currency as a profit-making activity? If yes, please provide percentage share of organised criminal groups in counterfeit currency.	
Q.20	Are international organised criminal groups involved in printing and / or circulation of counterfeit currency as a profit-making activity? If yes, please provide percentage share of organised criminal groups in counterfeit currency.	
Q.21	What methods are used for placement of counterfeit currency? Please check all that apply.	☐ Mixing counterfeit with genuine currency ☐ Intermingling in cash intensive business ☐ Gambling ☐ Purchasing goods of low value ☐ Selling it to people/kids ☐ Exchanging through currency exchanges ☐ Others (Please use the space below to specify)
Q.22	What methods are used for transfer of proceeds of crime related to counterfeit currency? Please check all that apply.	☐ Cash couriers ☐ Hawala or alternate remittance method ☐ Bank account ☐ Money transfer service ☐ ATM[76] Cards ☐ Others (Please use the space below to specify)
Q.23	What methods are used for layering and integration of proceeds of crime related to counterfeit currency? Please check all that apply.	☐ Movement through multiple accounts/entities ☐ Movement through multiple jurisdictions ☐ Mis-declaration of goods and services ☐ Intermingling in cash intensive business ☐ Use of corporate structures ☐ Others (Please use the space below to specify)

[76] ATM : Automated Teller Machine.

Q.24	Is there any estimate of proceeds of crime generated by the main operators in the chain of counterfeiting currency distribution chain (printer, distributor, retailer etc.)? (E.g. Distributors of counterfeit currency collect X% of the face value of the counterfeit currency from the retailer)		
Q.25	Please provide the quantum of counterfeit currency involved in top few (around five) cases (based on the number of counterfeit notes) that were investigated by your jurisdiction in last three years (2009, 2010 and 2011) and the quantum of counterfeit currency involved?		
	Year	No. of cases	Value of counterfeit currency involved (in USD)
	2009		
	2010		
	2011		
Q.26	How many cases of money laundering were investigated by your jurisdiction in last three years (2009, 2010 and 2011) and the quantum of counterfeit currency involved?		
	Year	No. of cases	Value of counterfeit currency involved (in USD)
	2009		
	2010		
	2011		
Q.27	Please provide case studies to show use of ML methods and techniques in counterfeit currency.		

SECTION C: TERRORIST FINANCING

Q.28	Is counterfeit currency used for resourcing/financing of terrorism?	
Q.29	What methods are used for resourcing/financing of terrorism from counterfeit currency? Please check all that apply.	☐ Counterfeit currency is provided to individual terrorist ☐ Counterfeit currency is distributed through terrorist network ☐ Proceeds are invested to strengthen terrorist support infrastructure ☐ Counterfeit money as means of economical warfare ☐ Financing of individual attacks ☐ Liaison with Organised Crime Groups ☐ Liaison with sovereign states ☐ Others (Please use the space below to specify)
Q.30	How many cases of terrorist financing related to counterfeit currency have been investigated by your jurisdiction in last three years (2009, 2010 and 2011)?	
	Year	No. of cases / Value of counterfeit currency involved (in USD)
	2009	
	2010	
	2011	
Q.31	Please provide case studies to show linkage of counterfeit currency with resourcing/ financing of terrorism.	

SECTION D: PREVENTIVE MEASURES		
Q.32	What preventive measures are employed by your jurisdiction to combat counterfeit currency? Please check all that apply.	☐ Enhancement of security features in the currency notes ☐ Installation of sophisticated counterfeit currency detection ☐ Note handling procedure to ensure that all cash collected at the teller is verified before giving out ☐ Dedicated reporting mechanism etc. ☐ Training and awareness of institutions ☐ Awareness of the public ☐ Others (Please use the space below to specify)
Q.33	Describe any education or awareness-raising provided to the public on genuine and/or counterfeit currency?	
Q.34	What type of financial institutions and DNFBPs deal with large amount of cash in your jurisdiction? Please check all that apply.	☐ Banks ☐ Insurance companies ☐ Money transfer service providers ☐ Foreign exchange agents ☐ Securities market intermediaries ☐ Post offices ☐ Real estate agents ☐ Dealers in precious metals and stones ☐ Others (Please use the space below to specify)
Q.35	What are the impediments in effective detection of counterfeit currency by the financial institutions and DNFBPs? Please check all that apply.	☐ Lack of awareness and training ☐ Gaps in currency handling procedures ☐ Inadequacy of mechanism to detect counterfeit currency ☐ Lack of expertise to detect counterfeit currency ☐ Compliance cost in handling/reporting seized counterfeit currency ☐ Fear of losing bona fide customers ☐ Apprehension of getting involved in legal proceedings ☐ Others (Please use the space below to specify)
Q.36	Is detection of counterfeit currency reported to the central authority such as Central Bank/ Ministry of Finance/Department of Treasury?	
Q.37	In the last two decades, how many times the security features of the national currency has been redesigned?	
Q.38	Are there machine readable components in your national currency?	
Q.39	Are law enforcement officials involved in the currency design and production process?	
Q.40	What happens to the counterfeits after examination (destruction, deposit, court, etc.)? Whether counterfeit currency is turned over to law enforcement officials?	
Q.41	Whether the counterfeit currency is subsequently collected and stored in a centralised location? If so, who maintains custody of the counterfeit specimens?	
SECTION E: FINANCIAL INTELLIGENCE UNIT (FIU)		
Q.42	Do financial institutions and DNFBPs report detection of counterfeit currency to the FIU in STRs[77]?	
Q.43	How many reports (including STR) related to counterfeit currency were received by the FIU in last three years (2009, 2010 and 2011) and the quantum of counterfeit currency involved?	

[77] STRs: Suspicious Transaction Reports.

	Year	No. of reports	Value of counterfeit currency involved (in USD)
	2009		
	2010		
	2011		
Q.44	Does FIU conduct outreach and training relating to counterfeit currency? If yes, please provide details.		
Q.45	What red flag indicators are used by the financial institutions/DNFBPs to detect proceeds of counterfeit currency? (E.g.: Small value cash deposits in multiple locations followed by immediate cash withdrawals in specific location, etc.)		
Q.46	What type of operational analysis is conducted by FIU to combat counterfeit currency? (E.g. Large value of counterfeit currency detected in one incident; Repeated incidents of counterfeit currency linked to the same person etc.)		
Q.47	What type of strategic analysis products are developed by the FIU to combat currency counterfeiting? (E.g. Identification of temporal and geographical trends and patterns in detection of counterfeit currency; Identification of localities showing sudden increase in detection of counterfeit currency for a period, etc.)		
SECTION F: CUSTOMS AUTHORITIES			
Q.48	Does Currency counterfeiting have a transnational character? Please check all that apply.	☐ Counterfeit national currency is printed abroad ☐ Counterfeit foreign currency is in circulation in the jurisdiction ☐ Others (Please use the space below to specify)	
Q.49	What are modes used for cross border smuggling of counterfeit currency? Please check all that apply.	☐ Carriage on person ☐ Baggage / Personal belongings ☐ Post/courier parcels ☐ Concealment in trade consignments ☐ Concealment in vehicles ☐ Others (Please use the space below to specify)	
Q.50	Do customs authorities give special attention to shipment of materials (e.g. security inks, security paper, printing-presses etc.) which can be used for printing counterfeit currency? If yes, please provide details.		
Q.51	Do customs authorities investigate cases of counterfeit currency?		
Q.52	Do customs authorities conduct the money laundering aspect of this investigation, or is it referred to a law enforcement agency?		
Q.53	Do customs authorities conduct the terrorist financing aspect of this investigation, or is it referred to a law enforcement agency?		
Q.54	Please provide case studies to show the role of customs authorities in combating counterfeit currency.		
SECTION G: LAW ENFORCEMENT AND INVESTIGATIVE AUTHORITIES			
Q.55	Are special investigative techniques used to combat counterfeit currency? Please check all that apply.	☐ Undercover operations/sting operations ☐ Intercepting communications ☐ Controlled delivery ☐ Tracing and recovery of assets ☐ Confidence buys ☐ Controlled deliveries ☐ Others (Please use the space below to specify)	
Q.56	Are permanent or temporary multi-disciplinary groups specialised in financial or asset investigations formed to combat currency counterfeiting.		
Q.57	Is there any evidence available to suggest that counterfeit currency production is being sponsored by a foreign government?		

Q.58	Is there an analytical procedure in place to determine how suspected counterfeit has been produced and where the components for production are located?	
Q.59	What are the penalties/punishments related to following activities? Please mention penalty and punishment for the following.	
	Printing of counterfeit currency	
	Circulation of counterfeit currency	
	Smuggling of counterfeit currency	
	Possession of counterfeit currency	
	Money laundering related to counterfeit currency	
	Financing of terrorism related to counterfeit currency	
	Possession of equipment and raw material to produce counterfeits	
	Others (please specify)	
Q.60	Please mention any impediments encountered when conducting investigations related to counterfeiting of currency? Please check all that apply.	☐ Inadequate special investigative techniques ☐ Inadequate financial or asset investigations ☐ Inadequate training and expertise ☐ Inadequate forensic facilities ☐ Inadequate coordination between domestic agencies ☐ Transnational nature of activities ☐ Difficulty in bringing kingpins to justice ☐ Low priority compared to other fields of crime ☐ Others (Please use the space below to specify)
Q.61	Please provide case studies to show use of special investigative technique, multi-disciplinary coordination for combating counterfeit currency.	

SECTION H: INTERNATIONAL COOPERATION

Q.62	Does the FIU send or receive requests for information with international counterparts related to counterfeit currency? If yes, please provide number of requests		
Q.63	Do Law enforcement authorities send or receive request for international cooperation with international counterparts related to counterfeit currency? Please mention whether request for following types of international cooperation was sent or received.		
	Type of international cooperation	Number of Requests sent	Number of Requests received
	Exchange of information		
	Conduct inquiries and obtain information		
	Joint investigation to conduct cooperative investigations		
	Establish bilateral or multilateral arrangements to enable joint investigations		
	Others (please specify)		

Q.64	What are the impediments encountered in providing or receiving international cooperation related to counterfeit currency? Please check all that apply.	☐ Different types, operating standards, and powers of individual FIUs/LEAs ☐ Different priorities of the countries ☐ Differing quality and credibility of information exchanged ☐ Late or no responses to requests; insufficient/ low quality of responses; unduly rejected requests ☐ Lengthy and complicated (time-consuming) procedures for implementation of MoUs and other agreements on international cooperation ☐ Language barriers make communication more difficult (especially for non-English speaking jurisdictions) ☐ Others (Please use the space below to specify)
Q.65	Please provide case studies to show use of international cooperation for combating counterfeit currency.	
SECTION I: LEGAL FRAMEWORK		
Q. 66	Did your country ratify the International Convention for the Suppression of Counterfeiting Currency of 1929 (commonly known by "Geneva Convention" of 1929)?	
Q. 67	On which basis (legal framework) does you country combat currency counterfeiting?	
Q. 68	Are there any obligations as regards the transmission of international law into you domestic law?	
Q. 69	Are there any obligations about the reporting of counterfeit money or is there a specific chain of reporting (e.g. to a superior office, institution, organisation)?	
Q. 70	Are there any legal obligations to withdraw counterfeits from circulation after detection?	

ANNEX 4: STATISTICAL ANALYSIS OF QUESTIONNAIRE

Q. No.	Question	Options	Selected	Total	Percentage
Q.3	**What is the threat rating for counterfeiting of currency in your jurisdiction? Please check the relevant rating.**	Very High	1	22	5%
		High	4		18%
		Medium	4		18%
		Low	5		23%
		Very Low	8		**36%**
		Others	0		0%
Q.4	**What are the factors underlying the threat assessment of counterfeiting of currency in your jurisdiction? Please check all that apply.**	Adverse impact on the integrity of the financial sector	14	25	56%
		Loss of trust in currency	15		**60%**
		Large quantum of proceeds of crime generated/ laundered	4		16%
		Linkage with financing of terrorism	5		20%
		Linkage with drugs and other offences	12		48%
		Others	3		12%
Q.17	**Is counterfeit currency linked with other predicate offences? Please check all that apply.**	Participation in an organised criminal group and racketeering	12	25	48%
		Terrorism, including terrorist financing	5		20%
		Trafficking in human beings and migrant smuggling	5		20%
		Illicit trafficking in narcotic drugs and psychotropic substances	13		**52%**
		Illicit arms trafficking	3		12%
		Smuggling	9		36%
		Others	3		12%
Q.21	**What methods are used for placement of counterfeit currency? Please check all that apply.**	Mixing counterfeit with genuine currency	19	25	**76%**
		Intermingling in cash intensive business	11		44%
		Gambling	10		40%
		Purchasing goods of low value	19		**76%**
		Selling it to people/kids	14		56%
		Exchanging through currency exchanges	9		36%
		Others	1		4%
Q.22	**What methods are used for transfer of proceeds of crime**	Cash couriers	10	25	**40%**
		Hawala or alternate remittance method	5		20%

Q. No.	Question	Options	Selected	Total	Percentage
	related to counterfeit currency? Please check all that apply.	Bank account	7		28%
		Money transfer service	5		20%
		ATM Cards	2		8%
		Others	3		12%
Q.23	**What methods are used for layering and integration of proceeds of crime related to counterfeit currency? Please check all that apply.**	Movement through multiple accounts/entities	5	25	20%
		Movement through multiple jurisdictions	6		24%
		Mis-declaration of goods and services	4		16%
		Intermingling in cash intensive business	11		**44%**
		Use of corporate structures	5		20%
		Others	6		24%
Q.29	**What methods are used for resourcing/financing of terrorism from counterfeit currency? Please check all that apply.**	Counterfeit currency is provided to individual terrorist	4	25	**16%**
		Counterfeit currency is distributed through terrorist network	3		12%
		Proceeds are invested to strengthen terrorist support infrastructure	3		12%
		Counterfeit money as means of economical warfare	3		12%
		Financing of individual attacks	4		**16%**
		Liaison with Organised Crime Groups	2		8%
		Liaison with sovereign states	1		4%
		Others	1		4%
Q.32	**What preventive measures are employed by your jurisdiction to combat counterfeit currency? Please check all that apply.**	Enhancement of security features in the currency notes	20	25	80%
		Installation of sophisticated counterfeit currency detection	15		60%
		Note handling procedure to ensure that all cash collected at the teller is verified before giving out	17		68%
		Dedicated reporting mechanism etc	13		52%
		Training and awareness of institutions	24		**96%**
		Awareness of the public	22		88%
		Others	5		20%
Q.34	**What type of financial institutions and DNFBPs deal with large amount of cash in your jurisdiction? Please check all that**	Banks	24	25	**96%**
		Insurance companies	7		28%
		Money transfer service providers	19		76%
		Foreign exchange agents	15		60%

Q. No.	Question	Options	Selected	Total	Percentage
	apply.	Securities market intermediaries	3		12%
		Post offices	12		48%
		Real estate agents	7		28%
		Dealers in precious metals and stones	9		36%
		Others	7		28%
Q.35	**What are the impediments in effective detection of counterfeit currency by the financial institutions and DNFBPs? Please check all that apply.**	Lack of awareness and training	14	25	56%
		Gaps in currency handling procedures	10		40%
		Inadequacy of mechanism to detect counterfeit currency	10		40%
		Lack of expertise to detect counterfeit currency	15		**60%**
		Compliance cost in handling/reporting seized counterfeit currency	4		16%
		Fear of losing bona fide customers	9		36%
		Apprehension of getting involved in legal proceedings	8		32%
		Others	2		8%
Q.48	**Does Currency counterfeiting have a transnational character? Please check all that apply.**	Counterfeit national currency is printed abroad	10	25	40%
		Counterfeit foreign currency is in circulation in the jurisdiction	13		**52%**
		Others	2		8%

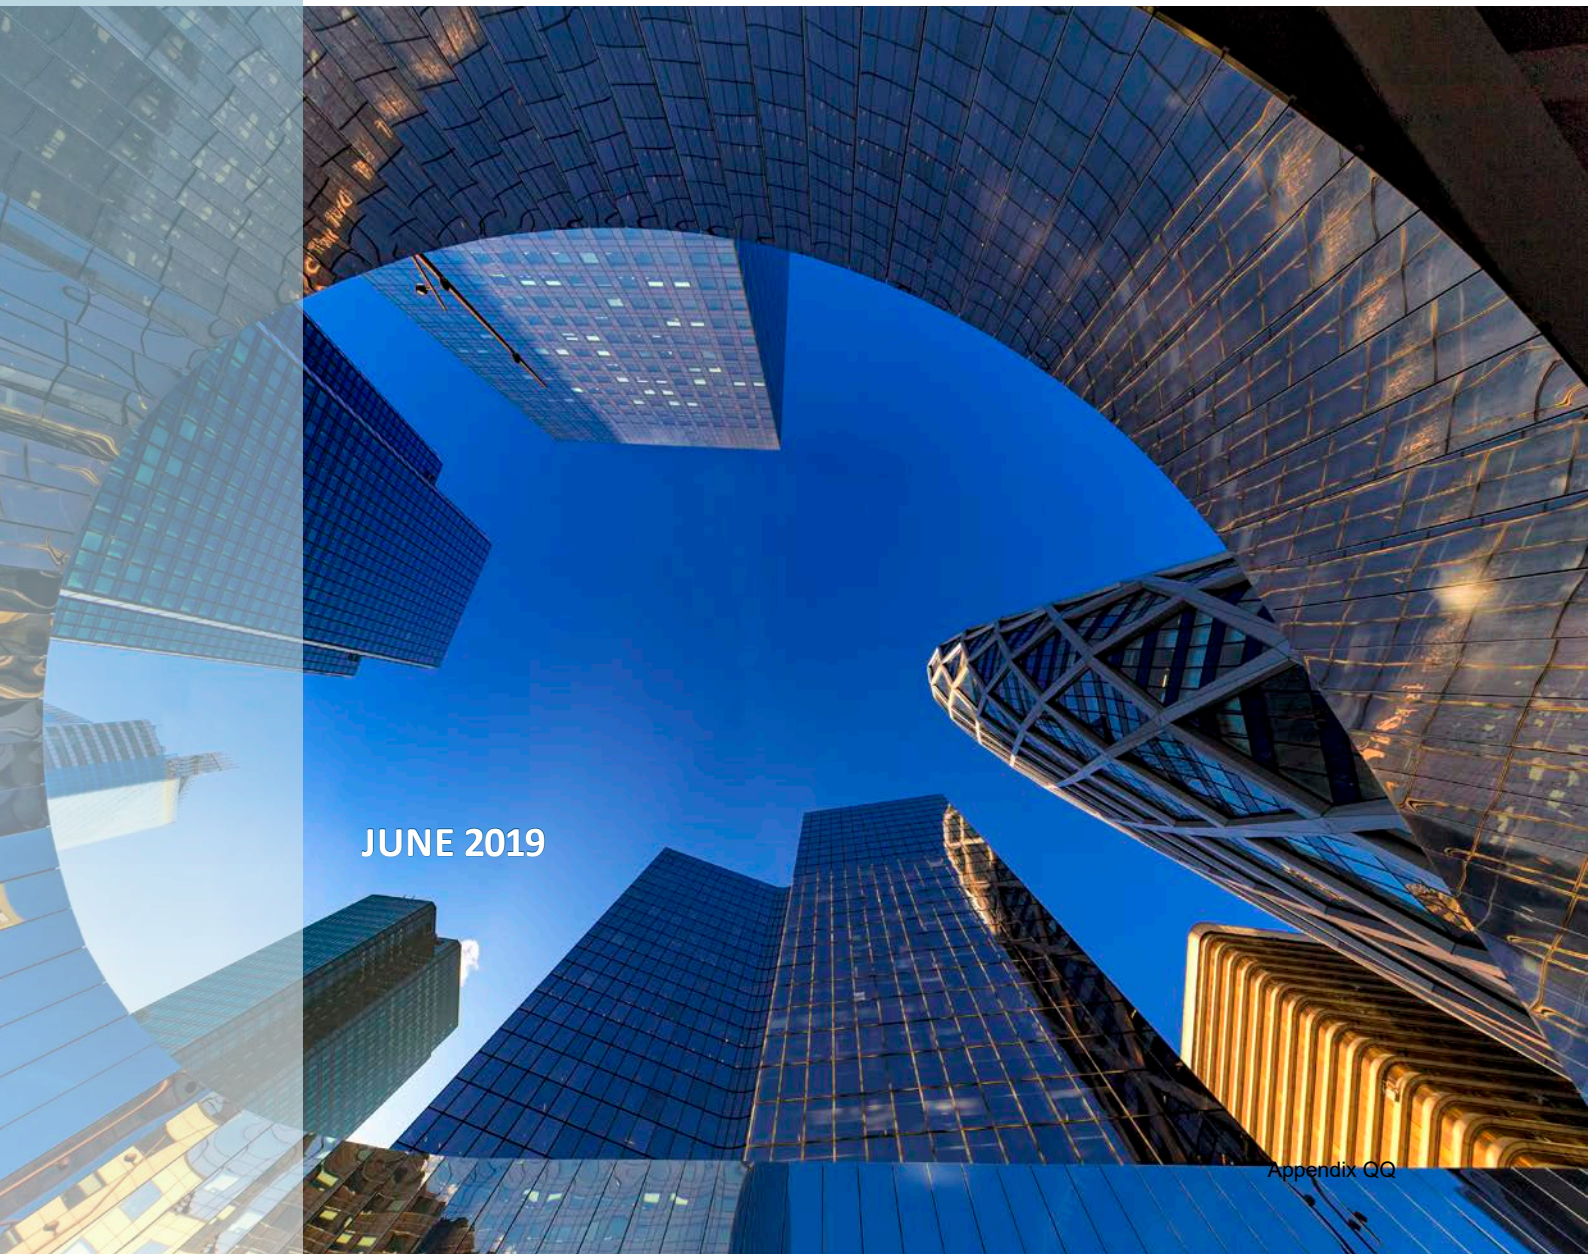
FATF

GUIDANCE FOR A RISK-BASED APPROACH

TRUST AND COMPANY SERVICE PROVIDERS



JUNE 2019

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

FATF (2019), *Guidance for a Risk-Based Approach for Trust & Company Service Providers (TSCPs),* FATF, Paris, www.fatf-gafi.org/publications/documents/rba-trust-company-service-providers.html

TABLE OF CONTENT

Table of acronyms

AML/CFT	Anti-money laundering/Countering the financing of terrorism
CDD	Client[1] due diligence
DNFBP	Designated non-financial businesses and professions
FIU	Financial intelligence unit
INR.	Interpretive Note to Recommendation
ML	Money laundering
PEP	Politically Exposed Person
R.	Recommendation
RBA	Risk-based approach
SRB	Self-regulatory body
STR	Suspicious transaction report
TCSP	Trust and company service providers
TF	Terrorist financing

[1] In some jurisdictions or professions, the term "customer" is used, which has the same meaning as "client" for the purposes of this document

Executive Summary

1. The risk-based approach (RBA) is central to the effective implementation of the FATF Recommendations. It means that supervisors, financial institutions, and trust and company service providers (TCSPs) identify, assess, and understand the money laundering and terrorist financing (ML/TF) risks to which they are exposed, and implement the most appropriate mitigation measures. This approach enables them to focus their resources where the risks are higher.

2. The FATF RBA Guidance aims to support the implementation of the RBA, taking into account national ML/TF risk assessments and AML/CFT legal and regulatory frameworks. It includes a general presentation of the RBA and provides specific guidance for the TCSP sector and for their supervisors. The Guidance was developed in partnership with the profession, to make sure it reflects expertise and good practices from within the industry.

3. The development of the ML/TF risk assessment is a key starting point for the application of the RBA. It should be commensurate with the nature, size and complexity of the business. The most commonly used risk criteria are country or geographic risk, client risk, service/transaction risk. The Guidance provides examples of risk factors under these risk categories.

4. The Guidance highlights that it is the responsibility of the senior management of TCSPs to foster and promote a culture of compliance as a core business value. They should ensure that TCSPs are committed to manage ML/TF risks when establishing or maintaining business relationships.

5. The Guidance highlights that TCSPs should design their policies and procedures so that the level of initial and ongoing client due diligence measures addresses the ML/TF risks they are exposed to. In this regard, the Guidance explains the obligations for TCSPs regarding identification and verification of beneficial ownership information and provides examples of standard, simplified and enhanced CDD measures based on ML/TF risk.

6. The Guidance has a section for supervisors of the TCSP sector and highlights the role of self-regulatory bodies (SRBs) in supervising and monitoring. It explains the risk-based approach to supervision as well as supervision of the risk-based approach by providing specific guidance on licensing or registration requirements for the TCSP sector, mechanisms for on-site and off-site supervision, enforcement, guidance, training and value of information-exchange between the public and private sector.

7. The Guidance also highlights the importance of supervision of beneficial ownership requirements and nominee arrangements. It underscores how supervisory frameworks can help ascertain whether accurate and up-to-date beneficial ownership information on legal persons and legal arrangements is maintained by TCSPs and made available in a timely manner to competent authorities when required.

Section I- Introduction and Key Concepts

This Guidance should be read in conjunction with the following, which are available on the FATF website: www.fatf-gafi.org:

a) The FATF Recommendations, especially Recommendations 1, 10, 11, 12, 17, 19, 20, 21, 22, 23, 24, 25 and 28 and their Interpretive Notes (INR), and the Glossary.

b) Other relevant FATF Guidance documents such as:

- The FATF Guidance on National Money Laundering and Terrorist Financing Risk Assessment (February 2013)
- FATF Guidance on the Risk-Based Approach for Accountants
- FATF Guidance on the Risk-Based Approach for Legal Professionals
- FATF Guidance on Transparency and Beneficial Ownership (October 2014)

c) Other relevant FATF Reports such as:

- Money Laundering Using Trust and Company Service Providers (October 2010)
- The Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership (July 2018)

Background and context

8. The risk-based approach (RBA) is central to the effective implementation of the revised FATF *International Standards on Combating Money Laundering and the Financing of Terrorism* and *Proliferation*, which were adopted in 2012[2]. The FATF has reviewed its 2009 RBA Guidance for trust and company service providers (TCSPs), in order to bring it in line with the new FATF requirements[3] and to reflect the experience gained by public authorities and the private sector over the years in applying the RBA. This revised version applies to the TCSP sector[4] as well as, accountant and legal professionals who provide TCSP services, and financial institutions who are engaged in TCSP activity (e.g. through subsidiaries that conduct TCSP activity).

9. Reference in this Guidance to TCSPs refers to trust and company service providers acting in the course of a business.

10. The RBA Guidance for the TCSP sector was drafted by a project group comprising FATF members, FATF observer member - the Group of International Finance Centre Supervisors and representatives of the private sector. The project group was co-led by the UK, the United States, the Institute of Chartered Accountants in England and Wales, the International Bar Association and the Society of Trust and Estate Practitioners. Membership of the project group is set out in Annex 4.

2 The FATF Standards are comprised of the FATF Recommendations, their Interpretive Notes and applicable definitions from the Glossary.

3 These services are included in the FATF Glossary under "Designated non-financial businesses and professions at (f)

4 Including both legal and natural persons, see definition of the term 'Designated Non-Financial Businesses and Professions' in the FATF Glossary

11. The FATF adopted this updated RBA Guidance for TCSP at its June 2019 Plenary.

Purpose of the Guidance

12. The purpose of this Guidance is to:

a) Support a common understanding of a RBA for TCSPs, financial institutions and designated non-financial businesses and professions (DNFBPs)[5] that maintain relationships with TCSPs, competent authorities and self-regulatory bodies (SRBs)[6] responsible for monitoring the compliance of TCSPs with their AML/CFT obligations;

b) Assist countries, competent authorities and TCSPs in the design and implementation of a RBA to AML/CFT by providing guidelines and examples of current practice, with a particular focus on providing advice to small firms;

c) Recognise the difference in the RBA for different TCSPs who are establishing trusts, companies or other legal entities for the benefit of clients or who are acting as trustees or directors (or providing persons to act as trustees or directors) of such trusts, companies or other legal entities as against TCSPs who are providing more limited services (e.g. registered office services);

d) Outline the key elements involved in applying a RBA to AML/CFT related to TCSPs;

e) Assist financial institutions and DNFBPs that have TCSPs as customers in their role as directors or trustees of a legal person or legal arrangement customer of the financial institution or DNFBP, in identifying, assessing and managing the ML/TF risk associated with TCSPs and their services;

f) Assist countries, competent authorities and SRBs in the implementation of the FATF Recommendations with respect to TCSPs, particularly Recommendations 22, 23 and 28;

g) Assist countries, SRBs and the private sector to meet the requirements expected of them, particularly under IO.3 and IO.4;

h) Support the effective implementation of action plans of NRAs conducted by countries; and

i) Support the effective implementation and supervision by countries of national AML/CFT measures, by focusing on risks as well as preventive and mitigating measures.

Target audience, status and content of the Guidance

13. This Guidance is aimed at the following audience:

a) Practitioners in the TCSP sector;

---

5 See definition of the term 'Designated Non-Financial Businesses and Professions' in the FATF Glossary

6 See definition of the term 'Self-regulatory body' in the FATF Glossary

b) Countries and their competent authorities, including AML/CFT supervisors of TCSPs, SRBs, AML/CFT supervisors of banks and other financial institutions that have TCSPs as customers, and Financial Intelligence Units (FIU); and

c) Practitioners in the banking sector and other financial services sectors and DNFBPs that have TCSPs as customers.

14. The Guidance consists of four sections. Section I sets out introduction and the key concepts. Section II contains key elements of the RBA and should be read in conjunction with specific Guidance to TCSPs (Section III) and guidance to supervisors of TCSPs on the effective implementation of a RBA (Section IV). There are four annexes:

a) Beneficial ownership information in relation to a company, trust or other legal arrangements to whom a TCSP provides services (Annex 1);

b) Glossary of Terminology (Annex 2);

c) Supervisory practices for implementation of the RBA (Annex 3); and

d) Members of the RBA Drafting Group (Annex 4).

15. This Guidance recognises that an effective RBA will take account of the national context, consider the legal and regulatory approach and relevant sector guidance in each country, and reflect the nature, diversity, maturity and risk profile of a country's TCSP sector and the risk profile of individual TCSPs operating in the sector. The Guidance sets out different elements that countries and TCSPs could consider when designing and implementing an effective RBA.

16. This Guidance is non-binding and does not overrule the purview of national authorities[7], including on their local assessment and categorisation of the TCSP sector based on the prevailing ML/TF risk situation and other contextual factors. It draws on the experiences of countries and of the private sector to assist competent authorities and TCSPs to implement applicable FATF Recommendations effectively. National authorities may take this Guidance into account while drawing up their own Guidance for the sector. DNFBPs should also refer to relevant legislation and sector guidance for the country in which a TCSP customer is based.

Scope of the Guidance: terminology, key features and business models

Terminology

17. Under the FATF definition, Trust and Company Service Providers refers to all persons[8] or businesses that are not covered elsewhere under the Recommendations, and which as a business, provide any of the following services to third parties:

- Acting as a formation agent of legal persons;

7 National authorities should however take the Guidance into account when carrying out their supervisory functions.

8 Including both legal and natural persons, see definition for Designated Non-Financial Businesses and Professions in the FATF Glossary

- Acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- Providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangement;
- Acting as (or arranging for another person to act as) a trustee of an express trust or performing the equivalent function for another form of legal arrangement;
- Acting as (or arranging for another person to act as) a nominee shareholder for another person.

18. The FATF definition of TCSP relates to providers of trust and company services that are not covered elsewhere by the FATF Recommendations, and therefore excludes financial institutions, lawyers, notaries, other independent legal professionals and accountants. Separate guidance has been issued for those sectors, and they should therefore apply that guidance when providing services covered by R.22. However, all those professions/entities engaged in TCSP activities should also refer to the TCSPs guidance, as it is more specifically tailored to TCSP services.

Key features

19. TCSPs can take different forms. In some countries, they may be predominantly legal professionals and accountants. In other countries – particularly in countries with a high concentration of non-resident business – TCSPs are independent trust companies which may be owned and operated by their directors/senior managers, or trust companies that are subsidiaries of financial institutions and DNFBPs. In some cases, these may form part of international non-bank financial groups which provide TCSP services from more than one jurisdiction, or who may be other professionals. In other countries, trust service providers (e.g. trust companies) and company service providers are separate and distinct categories of entities subject to separate regulatory requirements. As a result, not all persons and businesses active in the TCSP industries provide all of the services listed in the definition of a TCSP. Accordingly, risk should be identified and managed on a service-by-service basis.

20. The roles and therefore risks of the different DNFBP constituents, including TCSPs frequently differ. However, in some areas, there are inter-relationships between different DNFBP sectors, and between the DNFBPs and financial institutions. For example, in addition to specialised trust and company service providers, financial institutions, legal professionals, and accountants may also undertake the trust and company services covered by the FATF Recommendations.

Activities carried out by TCSPs

21. TCSPs provide a range of services and activities that differ vastly, e.g. in their methods of delivery, in the depth and duration of the relationships formed with customers, and the size of the operation. For example, some of these entities are single person operations. This Guidance is intended for all TCSPs and sets out a risk-based approach to ensure compliance with FATF's Recommendations.

Vulnerabilities of TCSP services

22. Criminals may seek the opportunity to retain control over criminally derived assets while frustrating the ability of law enforcement to trace the origin and ownership of the assets. Companies and often trusts and other similar legal arrangements are seen by criminals as potentially useful vehicles to achieve this outcome. While shell companies[9], which do not have any ongoing business activities or assets, may be used for legitimate purposes such as serving as a transaction vehicle, they may also be used to conceal beneficial ownership, or enhance the perception of legitimacy. Criminals may also seek to misuse shelf companies[10] formed by TCSPs by seeking access to companies that have been 'sitting on the shelf' for a long time. This may be in an attempt to create the impression that the company is reputable and trading in the ordinary course because it has been in existence for many years. Shelf companies can also add to the overall complexity of entity structures, further concealing the underlying beneficial ownership information.

23. Many aspects of this guidance on applying a RBA to AML/CFT may also apply in the context of predicate offences, particularly for other financial crimes such as tax crimes. The ability to apply the RBA effectively to relevant predicate offences will also reinforce the AML/CFT obligations. TCSPs may also have specific obligations in respect of identifying risks of predicate offences such as tax crimes, and supervisors may have a role to play in oversight and enforcement against those crimes. Therefore, in addition to this guidance, TCSPs and supervisors should have regard to other sources of guidance that may be relevant in managing the risks of predicate offences.

FATF Recommendations applicable to TCSPs

24. The basic intent behind the FATF Recommendations as it relates to TCSPs is to ensure that their operations and services are not abused for facilitating criminal activities and ML/TF. The requirements of R.22 regarding CDD, record-keeping, PEPs, new technologies and reliance on third parties set out in R.10, 11, 12, 15 and 17 should apply to TCSPs in certain circumstances.

25. R.22 applies to TCSPs when they prepare for or carry out transactions for a client concerning the activities set out in paragraph 17 above.

26. R.23 requires that R.18, 19, 20 and 21 should apply to TCSPs when on behalf of or for a client, they engage in a transaction in relation to the activities described to in R.22 above. These Recommendations relate to internal AML/CFT controls, measures to be taken for countries that do not or insufficiently comply with the FATF Recommendations, reporting of suspicious activity and associated prohibitions on tipping off and confidentiality provisions. Section III provides further guidance on the application of R.22 and R.23 obligations to TCSPs.

---

9 A shell company is an incorporated company with no independent operations, significant assets, ongoing business activities, or employees.

10 A shelf company is an incorporated company with inactive shareholders, directors, and secretary, which has been left dormant for a longer period even if a customer relationship has already been established.

27. Countries should establish the most appropriate regulatory regime, tailored to address relevant ML/TF risks, which takes into consideration the activities and applicable code of conduct for TCSPs.

Section II – The RBA to AML/CFT

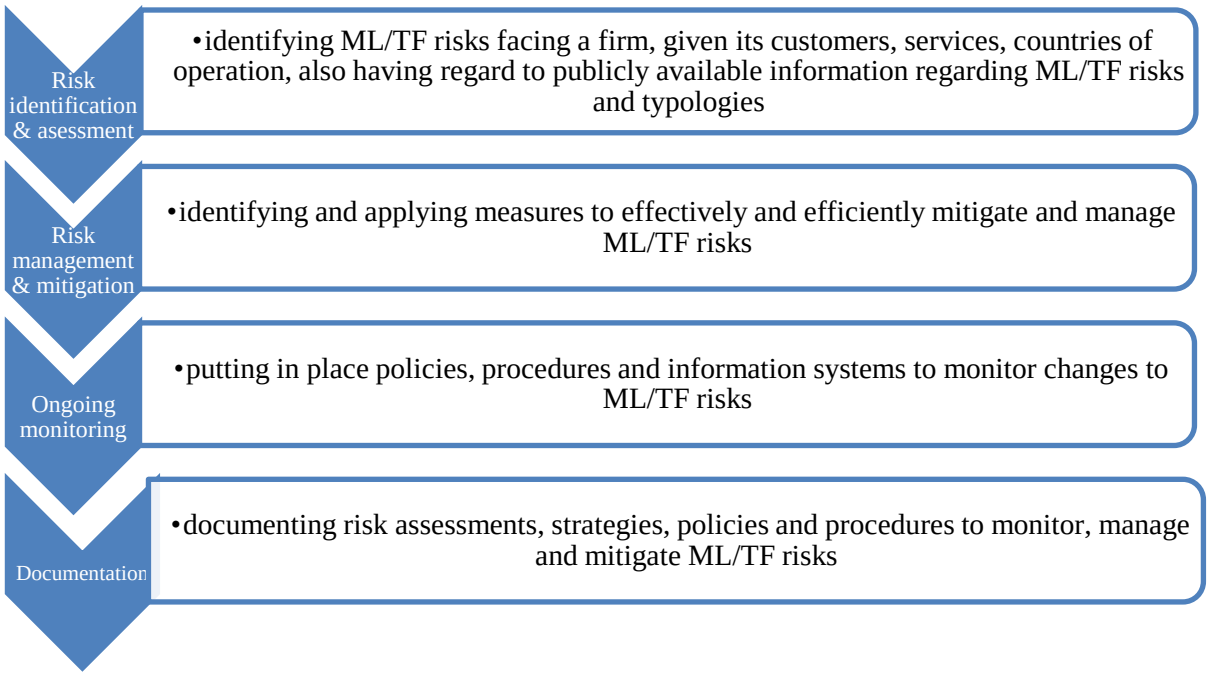
What is the risk-based approach?

28. The RBA to AML/CFT means that countries, competent authorities and DNFBPs, which include TCSPs should identify, assess and understand the ML/TF risks to which they are exposed and take the required AML/CFT measures to effectively and efficiently mitigate and manage the risks.

29. For TCSPs, identifying and maintaining an understanding of the ML/TF risk faced by the sector as well as specific to their services, client base, jurisdictions in which they operate and the effectiveness of actual and potential risk controls that are or can be put in place, will require the investment of resources and training. For supervisors, this will also require maintaining an understanding of the ML/TF risks specific to their area of supervision, and the degree to which AML/CFT measures can reasonably be expected to mitigate such risks.

30. The RBA is not a "zero failure" approach; there may be occasions where a TCSP has taken reasonable and proportionate AML/CFT measures to identify and mitigate risks, but is still used for ML or TF purposes in isolated instances. Although there are limits to any RBA, ML/TF is a real and serious problem that TCSPs must address so that they do not, unwittingly or otherwise, encourage or facilitate it.

31. Key elements of a RBA can be summarised as follows:



The rationale for the RBA

32. In 2012, the FATF updated its Recommendations to keep pace with evolving risk and strengthen global safeguards. Its purposes remain to protect the integrity of the financial system by providing governments with updated tools needed to take action against financial crime.

33. There was an increased emphasis on the RBA to AML/CFT, especially in preventive measures and supervision. Though the 2003 Recommendations provided for the application of a RBA in some areas, the 2012 Recommendations considered the RBA to be an essential foundation of a country's AML/CFT framework.[11]

34. The RBA allows countries, within the framework of the FATF Standards, to adopt a more tailored set of measures in order to target their resources more effectively and efficiently and apply preventive measures that are commensurate with the nature of risks.

35. The application of a RBA is therefore essential for the effective implementation of the FATF Standards by countries and TCSPs.[12]

Application of the risk-based approach

36. The FATF Recommendations do not predetermine any sector as higher risk. The standards identify sectors that may be vulnerable to ML/TF. The overall risk should be determined through an assessment of the sector at a national level. Different entities within a sector will pose higher or lower risk depending on a variety of factors including services, products, customers, geography, preventive measures and the strength of an entity's compliance program.

37. R.1 sets out the scope of application of the RBA as follows:

a) Who should be subject to a country's AML/CFT regime? In addition to the sectors and activities already included in the scope of the FATF Recommendations[13], countries should extend their regime to additional institutions, sectors or activities if they pose a higher risk of ML/TF. Countries could also consider exempting certain institutions, sectors or activities from some AML/CFT obligations where specified conditions are met, such as proven low risk of ML/TF and in strictly limited and justified circumstances.[14]

---

11 R.1.

12 The effectiveness of risk-based prevention and mitigation measures will be assessed as part of the mutual evaluation of the national AML/CFT regime. The effectiveness assessment will measure the extent to which a country achieves a defined set of outcomes that are central to a robust AML/CFT system and will analyse the extent to which a country's legal and institutional framework is producing the expected results. Assessors will need to take into account the risks and the flexibility allowed by the RBA, when determining whether there are deficiencies in a country's AML/CFT measures, and their importance *(FATF, 2013f).*

13 See Glossary, definitions of "Designated non-financial businesses and professions" and "Financial institutions".

14 See INR.1.

b) How should those subject to the AML/CFT regime be supervised or monitored for compliance with this regime? Supervisors should ensure that TCSPs are implementing their obligations under R.1. AML/CFT supervisors should consider a TCSP's own risk assessment and mitigation and acknowledge the degree of discretion allowed under the national RBA.

c) How should those subject to the AML/CFT regime be required to comply? The general principle of a RBA is that, where there are higher risks, enhanced measures should be taken to manage and mitigate those risks. The range, degree, frequency or intensity of preventive measures and controls conducted should be stronger in higher risk scenarios. TCSPs are required to apply each of the CDD measures under (a) to (d) below[15]: (a) identification and verification of the client's identity; (b) identification and taking reasonable measures to verify the identity of the beneficial owner and taking reasonable measures to verify the identity of beneficial owner; (c) understanding the purpose and nature of the business relationship; and (d) on-going due diligence on the relationship. However, where the ML/TF risk is assessed as lower, the degree, frequency and/or the intensity of the controls conducted will be relatively lighter. Where risk is assessed at a normal level, the standard AML/CFT controls should apply.

d) Consideration of the engagement in client relationships: TCSPs are not obliged to avoid risk entirely. Even if the services they provide to their clients are considered vulnerable to the risks of ML/TF based on risk assessment, it does not mean that all TCSPs and all their clients or services pose a higher risk when taking account of the risk mitigating measures that have been put in place.

e) Importance of TCSPs to the overall economy: TCSPs often play significant roles in the legal and economic life of a country. The role of TCSPs in supporting the business registration process, finalising documentation for that and providing professional advice is vital. The risks associated with any type of client group is not static and the expectation is that within a client group, based on a variety of factors, individual clients could also be classified into risk categories, such as low, medium-low, medium high or high risk (see section III below for a detailed description). Measures to mitigate risk should be applied accordingly.

Challenges

38. Implementing a RBA can present a number of challenges for TCSPs in identifying what necessary measures they need to take. A RBA requires resources and expertise, both at a country and institutional level, to gather and interpret information on risks, to develop and maintain effective procedures and systems, and to train personnel. A RBA is also reliant on individuals exercising sound and well-trained judgement when designing and implementing procedures and systems. It will also lead to a diversity in practice, although this can result in innovative solutions to address areas of higher risk. On the other hand, TCSPs may be uncertain as to how to comply with the regulatory framework itself and the TCSP sector may find it difficult to apply a uniform approach.

[15] See R.10

39. TCSPs need to have a good understanding of the risks and should be able to exercise sound judgement. This requires the profession, and the individuals within it, to build expertise through experience and training. If a TCSP attempts to adopt a RBA without sufficient expertise or understanding and knowledge of the risks faced by the sector, they may make flawed judgements. TCSPs may over-estimate risk, which could lead to wasteful use of resources, or they may under-estimate risk, and therefore deploy insufficient resources, thereby creating vulnerabilities.

40. TCSPs may find that some staff members are uncomfortable making risk-based judgements. This may lead to overly cautious decisions, or disproportionate time spent documenting the rationale behind a decision. It may also encourage a 'tick-box' approach to risk assessment.

41. Developing sound judgement is reliant on good information and intelligence sharing by designated competent authorities and SRBs. The existence of good practice guidance, training, industry studies and other available information and materials will also assist the TCSPs to make sound risk-based judgements. TCSPs must be able to access this information and guidance easily so that they have the best possible knowledge on which to base their judgements.

42. The services and products TCSPs provide to their clients vary and are not wholly of a financial nature. The FATF Recommendations apply equally to TCSPs when they are engaged in a specified activity, including obligations related to CDD, reporting of suspicious transactions and associated prohibitions on tipping-off, record-keeping, identification and risk management related to politically exposed persons or new technologies, and reliance on other third-party financial institutions and DNFBPs.

Box 1. Particular RBA Challenges for TCSPs

Culture of compliance and adequate resources. Implementing a RBA requires that TCSPs have a sound understanding of the risks and are able to exercise sound judgement. Above all, TCSP and their management should recognise the importance of a culture of compliance across the organisation and ensure sufficient resources are devoted to its implementation appropriate to the size, scale and activities of the organisation. This requires the building of expertise including for example, through training, recruitment, taking professional advice and 'learning by doing'. It also requires the allocation of necessary resources to gather and interpret information on risks, both at the country and institutional levels, and to develop procedures and systems, including ensuring effective decision-making. The process will benefit from information sharing by relevant competent authorities and SRBs. The provision of good practice guidance by competent authorities and SRBs is also valuable.

S***ignificant variation in services and clients.*** TCSPs may vary substantially in the breadth and nature of services provided and the clients they serve, as well as the size, focus, ownership profile and sophistication of the firm and its employees. In implementing the RBA, TCSPs should make

reasonable judgements for their particular services and activities. This may mean that no two TCSPs are likely to adopt the same detailed practices.

Appropriate mitigation measures will also depend on the nature and risks arising from the service provider's role and involvement. Circumstances may vary considerably between providers who represent clients directly as trustees or directors controlling the affairs of the legal arrangement or legal person to those that are engaged for distinct purposes such as provision of registered office only services and who have to rely on information on the company's activities from external directors.

Transparency of beneficial ownership on legal persons and arrangements. TCSPs are involved in the formation, management, or administration of legal entities and arrangements, though in many countries any legal or natural person also may be able to conduct these activities. Where TCSPs do play this "gatekeeper" role, they may be challenged in obtaining and keeping current and accurate beneficial ownership information depending upon the nature and activities of their clientele. Other challenges may arise when on-boarding new clients with minimal economic activity associated with the legal entity and/or its owners, controlling persons, or beneficial owners, established in another jurisdiction. Finally, whether the source of beneficial ownership information is a public registry, another third party source, or the client, there is always potential risk in the correctness of the information, in particular where the underlying information has been self-reported. Those risks notwithstanding, the start point in determining beneficial ownership should almost always start with questions to the immediate client, having determined that none of the relevant exceptions to ascertaining beneficial ownership apply, e.g. the client is a publicly listed company. The information provided by the client should then be appropriately confirmed by reference to public registers and other third party sources where possible. This may require further and clarifying questions to be put to the immediate client. The goal is to ensure that the TCSP is reasonably satisfied about the identity of the beneficial owner. For more practical guidance on beneficial ownership, refer to the guidance in Box 2.

Risk of criminality. TCSPs should be alert to ML/TF risks posed by the services they provide to avoid the possibility that they may commit or become an accessory to the commission of a substantive offence of ML/TF. TCSPs must protect themselves from misuse by criminals and terrorists. This includes the sources and methods used for providing payments for the TCSP's services, which may dictate greater focus on monitoring of clients and their funds for unusual or suspicious activity.

Allocating responsibility under a RBA

43. An effective risk-based regime builds on and reflects a country's legal and regulatory approach, the nature, diversity and maturity of its financial sector and its risk profile. TCSPs should identify and assess their own ML/TF risk taking account of

the NRAs in line with R.1 as well as the national legal and regulatory framework, including any areas of prescribed significant risk and mitigation measures. TCSPs are required to take appropriate steps to identify and assess their ML/TF risks and have policies, controls and procedures that enable them to manage and mitigate effectively the risks that have been identified.[16] Where ML/TF risks are higher, TCSPs should always apply enhanced due diligence, although national law or regulation might not prescribe exactly how these higher risks are to be mitigated (e.g. varying the degree of enhanced ongoing monitoring).

44. Strategies adopted by TCSPs to mitigate ML/TF risks has to take account of the applicable national legal, regulatory and supervisory frameworks. When determining the extent to which TCSPs can decide how to mitigate risk, countries should consider the ability of the sector to effectively identify and manage ML/TF risks as well as the expertise and resources of their supervisors to adequately supervise how TCSPs manage ML/TF risks and take action to address any failures. Countries may also consider evidence from competent authorities on the level of compliance in the sector, and the sector's approach to dealing with ML/TF risk. Countries whose services sectors are emerging or whose legal, regulatory and supervisory frameworks are still developing, may determine that TCSPs are not fully equipped to effectively identify and manage ML/TF risk. In such cases, a more prescriptive implementation of the AML/CFT requirements may be appropriate until understanding and experience of the sector is strengthened.[17]

45. TCSPs should not be exempted from AML/CFT supervision even where their compliance controls are adequate. However, the RBA allows competent authorities to focus more supervisory resource on higher risk entities.

Identifying ML/TF risk

46. Access to accurate, timely and objective information on ML/TF risks is a prerequisite for an effective RBA. INR.1.3 requires countries to have mechanisms to provide appropriate information on the results of the risk assessments to all relevant competent authorities, SRBs, financial institutions and TCSPs. Where information is not readily available, for example where competent authorities have inadequate data to assess risks, are unable to share important information on ML/TF risks and threats, or where access to information is restricted by censorship, it will be difficult for TCSPs to correctly identify ML/TF risk.

47. R.34 requires competent authorities, supervisors and SRBs to establish guidelines and provide feedback to financial institutions and DNFBPs. Such guidelines and feedback help institutions and businesses to identify the ML/TF risks and to adjust their risk mitigating programmes accordingly.

Assessing ML/TF risk

48. Assessing ML/TF risk requires countries, competent authorities, including supervisors, SRBs and TCSPs to determine how the ML/TF threats identified will affect them. They should analyse the information obtained to understand the likelihood of these risks occurring, and the impact that these would have, on the individual TCSP, the entire sector and on the national economy. As a starting step,

16 R.1 and INR.1.

17 This could be based on a combination of elements described in Section II, as well as objective criteria such as mutual evaluation reports, follow-up reports or FSAP.

ML/TF risks are often classified as low, medium-low, medium, medium-high and high. Assessing ML/TF risk therefore goes beyond the mere gathering of quantitative and qualitative information, without its proper analysis; this information forms the basis for effective ML/TF risk mitigation and should be kept up-to-date to remain relevant.[18]

49. Competent authorities, including supervisors and SRBs should employ skilled and trusted personnel, recruited through fit and proper tests, where appropriate. They should be technically equipped commensurate with the complexity of their responsibilities. TCSPs that are required to routinely conduct a high volume of enquiries when on-boarding clients, (e.g. because of the size and geographic footprint of the firm) may also consider engaging skilled and trusted personnel who are appropriately recruited and checked. Such TCSPs are also likely to consider using the various technological options (including artificial intelligence) and software programs that are now available to assist in this regard.

50. TCSPs should develop internal policies, procedures and controls, including appropriate compliance management arrangements, and adequate screening procedures to ensure high standards when hiring employees. TCSPs should also develop an ongoing employee training programme. They should be trained commensurate with the complexity of their responsibilities.

Mitigating and managing ML/TF risk

51. The FATF Recommendations require that, when applying a RBA, DNFBPs, countries, competent authorities and supervisors decide on the most appropriate and effective way to mitigate and manage the ML/TF risks they have identified. They should take enhanced measures to manage and mitigate situations when the ML/TF risk is higher. In lower risk situations, less stringent measures may be applied.[19]

a) Countries may decide not to apply some of the FATF Recommendations requiring TCSPs to take certain actions, provided (i) there is a proven low risk of money laundering and terrorist financing, this occurs in strictly limited and justified circumstances and it relates to a particular type of TCSPs or (ii) a financial activity is carried out by a natural or legal person on an occasional or very limited basis such that there is a low risk of ML/TF, according to the exemptions of INR 1.6 are met.

b) Countries looking to apply simplified measures should conduct an assessment to ascertain the lower risk connected to the category of customers and clients or products targeted, establish the lower level of the risks involved, and define the extent and the intensity of the required AML/CFT measures, provided that the specific conditions required for one of the exemptions of INR 1.6 are met. Specific Recommendations set out in more detail how this general principle applies to particular requirements.[20]

18 FATF (2013a), paragraph 10. See also Section I D for further detail on identifying and assessing ML/TF risk.

19 Subject to the national legal framework providing for Simplified Due Diligence.

20 For example, R.22 on Customer Due Diligence.

Developing a common understanding of the RBA

52. The effectiveness of a RBA depends on a common understanding by competent authorities and TCSPs of what the RBA entails, how it should be applied and how ML/TF risks should be addressed. In addition to a legal and regulatory framework that spells out the degree of discretion, TCSPs should deal with the risks they identify. Competent authorities should issue risk-based approach guidance to TCSPs on meeting their legal and regulatory AML/CFT obligations. Supporting ongoing and effective communication between competent authorities and the sector is essential.

53. Competent authorities should acknowledge that in a risk-based regime, not all TCSPs will adopt identical AML/CFT controls. On the other hand, TCSPs should understand that a RBA does not exempt them from applying effective AML/CFT controls with a RBA.

Section III – Guidance for TCSPs

Risk identification and assessment

54. TCSPs should take appropriate steps to identify and assess the risk firm-wide given their particular client base that they could be used for ML/TF. They should document those assessments, keep these assessments up-to-date and have appropriate mechanisms in place to provide risk assessment information to competent authorities and supervisors. The nature and extent of any assessment of ML/TF risks should be appropriate to the type of business, nature of clients and size of operations.

55. ML/TF risks can be organised into three categories: (a) country/geographic risk; (b) client risk, and (c) transaction/service and associated delivery channel risk. The risks and red flags listed in each category are not exhaustive but provide a starting point for TCSPs to use when designing their RBA.

56. TCSPs should also refer to their country's NRAs and risk assessments performed by the competent authorities and supervisors.

57. When assessing risk, TCSPs should consider all the relevant risk factors before determining the level of overall risk and the appropriate level of mitigation to be applied. Such risk assessment may well be informed by findings of the NRA, the supra-national risk assessments, sectoral reports conducted by competent authorities on ML/TF risks that are inherent in TCSP services/sector, risk reports in other jurisdictions where the TCSP based in and any other information which may be relevant to assess the risk level particular to their practice. For example, press articles and other widely available public information highlighting issues that may have arisen in particular jurisdictions.

58. TCSPs may well also draw references to FATF Guidance on indicators and risk factors. During the course of a client relationship, procedures for ongoing monitoring and review of the client's risk profiles are also important. Competent authorities should consider how they can best alert TCSPs to the findings of any national risk assessments, the supranational risk assessments and any other information which may be relevant to assess the risk level particular to a TCSP practice in the relevant country.

59. Due to the nature of services that a TCSP generally provides, automated transaction monitoring systems of the type used by financial institutions will not be appropriate for most TCSPs. The TCSP's knowledge of the client and its business will develop throughout the duration of a longer term and interactive professional relationship. However, although individual TCSPs are not expected to investigate their client's affairs, they may be well positioned to identify and detect changes in the type of work or the nature of the client's activities in the course of business relationship. TCSPs will also need to consider the nature of the risks presented by short-term client relationships that may inherently, but not necessarily be low risk (e.g. one-off client relationship). TCSPs should also be mindful of the subject matter of the professional services (the engagement) being sought by an existing or potential client and the related risks.

60. Identification of the ML/TF risks associated with certain clients or categories of clients, and certain types of work will allow TCSPs to determine and implement reasonable and proportionate measures and controls to mitigate such risks. The risks and appropriate measures will depend on the nature of the TCSP's role and involvement. Circumstances may vary considerably between TCSPs who represent clients on a single transaction and those involved in a long term relationship.

61. The amount and degree of ongoing monitoring and review will depend on the nature and frequency of the relationship, along with the comprehensive assessment of client/transactional risk. A TCSP may also have to adjust the risk assessment of a particular client based upon information received from a designated competent authority, SRB or other credible sources (including a referring TCSP).

62. TCSPs may assess ML/TF risks by applying various categories. This provides a strategy for managing potential risks by enabling TCSPs, where required, to subject each client to reasonable and proportionate risk assessment.

63. The weight given to these risk categories (individually or in combination) in assessing the overall risk of potential ML/TF may vary given the size, sophistication, nature and scope of services provided by the TCSP and/or firm. These criteria, however, should be considered holistically and not in isolation. TCSPs, based on their individual practices and reasonable judgements, will need to independently assess the weight to be given to each risk factor.

64. Although there is no universally accepted set of risk categories, the examples provided in this Guidance are the most commonly identified risk categories. There is no single methodology to apply these risk categories, and the application of these risk categories is intended to provide a suggested framework for approaching the assessment and management of potential ML/TF risks. For smaller firms and sole practitioners, it is advisable to look at the services they offer (e.g. carrying out company management services may entail greater risk than other services).

65. Criminals deploy a range of techniques and mechanisms to obscure the beneficial ownership of assets and transactions. Many of the common mechanisms/techniques have been compiled by FATF in the previous studies, including the 2014 FATF Guidance on Transparency and Beneficial Ownership and the 2018 Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership. TCSPs may refer to the studies for more details on the use of obscuring techniques and relevant case studies.

66. A practical starting point for firms (especially smaller firms) and TCSPs (especially sole practitioners) would be to take the following approach. Many of these elements are critical to satisfying other obligations owed to clients, such as fiduciary duties, and as part of their general regulatory obligations:

a) **Client acceptance and know your client policies:** identify the client (and its beneficial owners) and the true "beneficiaries" of the transaction. Obtain an understanding of the source of funds and source of wealth of the client[21], its owners and the purpose and nature of the transaction.

[21] The source of funds and the source of wealth are relevant to determining a client's risk profile. The source of funds is the activity that generates the funds for a client (e.g. salary, trading revenues, or payments out of a trust), while the source of wealth describes the

b) **Engagement acceptance policies:** Understand the nature of the work. TCSPs should know the exact nature of the service that they are providing and have an understanding of how that work could facilitate the movement or obscuring of the proceeds of crime. Where a TCSP does not have the requisite expertise, the TCSP should not undertake the work.

c) **Understand the commercial or personal rationale for the work:** TCSPs need to be reasonably satisfied that there is a commercial or personal rationale for the work undertaken. TCSPs however are not obliged to objectively assess the commercial or personal rationale if it appears reasonable and genuine.

d) **Be attentive to red flag indicators:** exercise vigilance in identifying and then carefully reviewing aspects of the transaction if there are reasonable grounds to suspect that funds are the proceeds of a criminal activity, or related to terrorist financing. These cases would trigger reporting obligations. Documenting the thought process by having an action plan may be a viable option to assist in interpreting/assessing red flags/indicators of suspicion. Then consider what action, if any, needs to be taken.

e) The outcomes of the above action (i.e. the comprehensive risk assessment of a particular client/transaction) will dictate the level and nature of the evidence/documentation collated under a firm's CDD/EDD procedures (including evidence of source of wealth or funds).

f) TCSPs should adequately document and record steps taken under a) to e).

Country/Geographic risk

67. The provision of services by a TCSP may be higher risk when features of such services are connected to a higher risk country, for example:

a) the origin, or current location of the source of funds in the trust, company or other legal entity;

b) the country of incorporation or establishment of the company or the trusts;

c) the location of the major operations or assets of the trust, company or other legal entity; and

d) the country in which any of the following is a citizen or tax resident: a settlor, beneficiary, protector or other natural person exercising effective control over the trust or any beneficial owner or natural person exercising effective control over the company or other legal entity.

---

activities that have generated the total net worth of a client (e.g. ownership of a business, inheritance, or investments). While these may be the same for some clients, they may be partially or entirely different for other clients. For example, a PEP who receives a modest official salary, but who has substantial funds, without any apparent business interests or inheritance, might raise suspicions of bribery, corruption or misuse of position. Under the RBA, accountants should satisfy themselves that adequate information is available to assess a client's source of funds and source of wealth as legitimate with a degree of certainty that is proportionate to the risk profile of the client.

68. There is no universally agreed definition of a higher risk country or geographic area but TCSPs should pay attention to:

a) Countries/areas identified by credible sources[22] as providing funding or support for terrorist activities or that have designated terrorist organisations operating within them.

b) Countries identified by credible sources as having significant levels of organised crime, corruption, or other criminal activity, including being a major source or a major transit country for illegal drugs, human trafficking and smuggling and illegal gambling.

c) Countries subject to sanctions, embargoes or similar measures issued by international organisations such as the United Nations.

d) Countries identified by credible sources as having weak governance, law enforcement, and regulatory regimes, including countries identified by FATF statements as having weak AML/CFT regimes, in relation to which financial institutions (as well as DNFBPs) should give special attention to business relationships and transactions.

e) Countries identified by credible sources to be uncooperative in providing beneficial ownership information to competent authorities, a determination of which may be established from reviewing FATF mutual evaluation reports or reports by organisations that also consider various co-operation levels such as the OECD Global Forum reports on compliance with international tax transparency standards.

Client risk

69. In the examples given below, the client of TCSPs may be an individual who is a settlor or beneficiary of a trust, or beneficial owner of a company, or other legal entity that is, for example, trying to obscure the real beneficial owner or natural person exercising effective control of the trust, company or other legal entity. The client may also be a representative of a company's or other legal entity's senior management who are, for example, trying to obscure the ownership structure.

70. The key risk factors that TCSPs should consider are:

a) The TCSP's client base includes industries or sectors where opportunities for ML/TF are particularly prevalent.

b) The client include PEPs or persons closely associated with or related to PEPs, who are considered as higher risk clients (Please refer to the FATF Guidance (2013) on politically-exposed persons for further guidance on how to identify PEPs).

[22] "Credible sources" refers to information that is produced by reputable and universally recognised international organisations and other bodies that make such information publicly and widely available. In addition to the FATF and FATF-style regional bodies, such sources may include, but are not limited to, supra-national or international bodies such as the International Monetary Fund, the World Bank and the Egmont Group of Financial Intelligence Units.

c) Clients conducting their business relationship or requesting services in unusual or unconventional circumstances (as evaluated taking into account all the circumstances of the client's representation).

d) Clients where the structure or nature of the entity or relationship makes it difficult to identify in a timely manner the true beneficial owner or controlling interests or clients attempting to obscure understanding of their business, ownership or the nature of their transactions, such as:

   i. Unexplained use of shell and/or shelf companies, front company, legal entities with ownership through nominee shares or bearer shares, control through nominee or corporate directors, legal persons or legal arrangements splitting company incorporation and asset administration over different countries, all without any apparent legal or legitimate tax, business, economic or other reason.

   ii. Unexplained use of informal arrangements such as family or close associates acting as nominee shareholders or directors without any apparent legal or legitimate tax, business, economic or other reason.

   iii. Use of trust structures for tax evasion or to obscure ownership in order to place assets out of reach to avoid future liabilities.

e) Unusual complexity in control or ownership structures without a clear explanation, where there are certain transactions, structures, geographical location, international activities or other factors are not consistent with the TCSP's understanding of the client's business or economic purpose behind the establishment or administration of the trust, company or other legal entity with respect to which the TCSPs are providing services.

f) Unusually high levels of assets or unusually large transactions compared to what might reasonably be expected of clients with a similar profile may indicate that a client not otherwise seen as higher risk should be treated as such.

g) The offer by the person giving instructions to the TCSP to pay extraordinary fees for services, which would not ordinarily warrant such a premium.

h) The relationship between employee numbers/structure is divergent from the industry norm (e.g. the turnover of a company is unreasonably high considering the number of employees and assets compared to similar businesses)

i) Sudden activity from a previously dormant client without a clear explanation.

j) Clients that start or develop an enterprise with unexpected profile or abnormal business cycles or clients that enter into new/emerging markets. Organised criminality generally does not have to raise capital/debt, often making them first into a new market, especially where this market may be retail/cash intensive.

k) Indicators that client does not wish to obtain necessary governmental approvals/filings, etc.

l) Payments received from un-associated or unknown third parties and payments for fees in cash where this would not be a typical method of payment.

m) Clients who have funds that are obviously and inexplicably disproportionate to their circumstances (e.g. their age, income, occupation or wealth).

n) Clients who appear to actively and inexplicably avoid face-to-face meetings or who provide instructions intermittently without legitimate reasons and are otherwise evasive or very difficult to reach, when this would not normally be expected. Subsequent lack of contact, when this would normally be expected.

o) Inexplicable changes in ownership.

p) Activities of the trust, company or other legal entity are unclear or different from the stated purposes under trust deeds or internal regulations of the company or foundation.

q) The legal structure has been altered frequently and/or without adequate explanation (e.g. name changes, transfer of ownership, change of beneficiaries, change of trustee or protector, change of partners, change of directors or officers).

r) Management of any trustee, company or legal entity appears to be acting according to instructions of unknown or inappropriate person(s).

s) Unreasonable choice of TCSP without a clear explanation, given the size, location or specialisation of the TCSP.

t) Frequent or unexplained change of professional adviser(s) or members of management of the trustee, company or other legal entity.

u) The person giving instructions to the TCSP is reluctant to provide all the relevant information or the TCSP has reasonable grounds to suspect that the provided information is incorrect or insufficient.

v) Clients who request that transactions be completed in unusually tight or accelerated timeframes without a reasonable explanation for accelerating the transaction, which would make it difficult or impossible for TCSPs to perform a proper risk assessment.

w) Clients who insist, without adequate justification or explanation, that transactions be effected exclusively or mainly through the use of virtual assets for the purpose of preserving their anonymity.

x) Clients with previous convictions for crimes that generated proceeds, who instruct TCSPs (who in turn have knowledge of such convictions) to undertake specified activities on their behalf.

y) Clients who change their means of payment for a transaction at the last minute and without justification (or with suspect justification), or where there is a lack of information or transparency in the transaction. This risk extends to situations where last minute changes are made to enable funds to be paid in from/out to a third party.

z) The transfer of the seat of a company to another jurisdiction without any genuine economic activity in the country of destination poses a risk of creation of shell companies which might be used to obscure beneficial ownership.

aa) Clients seeking to obtain residents rights or citizenship in the country of establishment of the TCSP in exchange for capital transfers, purchase of property or government bonds, or investment in corporate entities.

Transaction/service and associated delivery channel risk

71. Services which may be provided by TCSPs and which (in some circumstances) risk being used to assist money launderers may include:

a) Use of pooled client accounts or safe custody of client money or assets or bearer shares, without justification.

b) Situations where advice on the setting up of legal persons or legal arrangements may be misused to obscure ownership or real economic purpose (including setting up of trusts, companies or other legal entities, or change of name/corporate seat or establishing complex group structures). This might include advising in relation to a discretionary trust that gives the trustee discretionary power to name a class of beneficiaries that does not include the real beneficiary (e.g. naming a charity as the sole discretionary beneficiary initially with a view to adding the real beneficiaries at a later stage). It might also include situations where a trust is set up for the purpose of managing shares in a company with the intention of making it more difficult to determine the beneficiaries of assets managed by the trust.

c) In case of an express trust, an unexplained (where explanation is warranted) nature of classes of beneficiaries and acting trustees of such a trust.

d) Services where TCSPs may in practice represent or assure the client's standing, reputation and credibility to third parties, without a commensurate knowledge of the client's affairs.

e) Services that are capable of concealing beneficial ownership from competent authorities.

f) Services that have deliberately provided, or depend upon, more anonymity in relation to the client's identity or regarding other participants than is normal under the circumstances and in the experience of the TCSP.

g) Use of virtual assets and other anonymous means of payment and wealth transfer within the transaction without apparent legal, tax, business, economic or other legitimate reason.

h) Transactions using unusual means of payment (e.g. precious metals or stones).

i) The postponement of a payment for an asset or service delivered immediately to a date far from the moment at which payment would normally be expected to occur, without appropriate assurances that payment will be made.

j) Successive capital or other contributions in a short period of time to the same company with no apparent legal, tax, business, economic or other legitimate reason.

k) Acquisitions of businesses in liquidation with no apparent legal, tax, business, economic or other legitimate reason.

l) Power of Representation given in unusual conditions (e.g. when it is granted irrevocably or in relation to specific assets) and the stated reasons for these conditions are unclear or illogical.

m) Transactions involving closely connected persons and for which the client and/or its financial advisors provide inconsistent or irrational explanations

and are subsequently unwilling or unable to explain by reference to legal, tax, business, economic or other legitimate reason.

n) Situations where a nominee is being used (e.g. friend or family member is named as owner of property/assets where it is clear that the friend or family member is receiving instructions from the beneficial owner), with no apparent legal, tax, business, economic or other legitimate reason.

o) Commercial, private, or real property transactions or services to be carried out by the trust, company or other legal entity with no apparent legitimate business, economic, tax, family governance, or legal reasons.

p) Products/services that have inherently provided more anonymity or confidentiality without a legitimate purpose.

q) Existence of suspicion of fraudulent transactions, or transactions that are improperly accounted for. These might include:

   i. Over or under invoicing of goods/services.

   ii. Multiple invoicing of the same goods/services.

   iii. Falsely described goods/services – over or under shipments (e.g. false entries on bills of lading).

   iv. Multiple trading of goods/services.

r) Any attempt by the settlor, trustee, company or other legal entity to enter into any fraudulent transaction.

s) Any attempt by the settlor, trustee, company or other legal entity to enter into any arrangement to fraudulently evade tax in any relevant jurisdiction.

Variables that may impact on a RBA and risk

72. While all TCSPs should robust high standards of due diligence in order to avoid regulator arbitrage, due regard should be accorded to differences in practices, size, scale and expertise amongst TCSPs, as well as the nature of the clients they serve. As a result, consideration should be given to these factors when creating a RBA that also complies with the existing obligations of TCSPs.

73. Consideration should also be given to the resources that can be reasonably allocated to implement and manage an appropriately developed RBA. For example, a sole practitioner would not be expected to devote an equivalent level of resources as a large firm; rather, the sole practitioner would be expected to develop appropriate systems and controls and a RBA proportionate to the scope and nature of the practitioner's practice and its clients. Small firms serving predominantly locally based and low risk clients cannot generally be expected to devote a significant amount of senior personnel's time to conducting risk assessments. In such cases, it may be more reasonable for sole practitioners to rely on publicly available records and information supplied by a client than it would be for a large firm having a diverse client base with different risk profiles. However, where the source is a public registry, or the client, there is always potential risk in the correctness of the information. Sole practitioners and small firms may be regarded by criminals as more of a target for money launderers than large law firms. TCSPs in many jurisdictions and practices are required to conduct both a risk assessment of the general risks of their practice, and

of all new clients and current clients engaged in one-off specific transactions. The emphasis must be on following a RBA.

74. A significant factor to consider is whether the client and proposed work would be unusual, risky or suspicious for the particular TCSP. This factor must always be considered in the context of the practice of TCSP. The RBA methodology of TCSP may thus take into account risk variables specific to a particular client or type of work. Consistent with the RBA and proportionality, the presence of one or more of these variables may cause a TCSP to conclude that either enhanced CDD and monitoring is warranted, or conversely that standard CDD and monitoring can be reduced, modified or simplified. When reducing, modifying or simplifying CDD, TCSPs should always adhere to the minimum requirements as set out in national legislation These variables may increase or decrease the perceived risk posed by a particular client or type of work and may include:

75. Examples of factors that may increase risk are:

a) Unexplained urgency of assistance required.

b) Unusual sophistication of structure, including complexity of control and governance arrangements and use of multiple TCSPs.

c) The irregularity or limited duration of the client relationship. One-off engagements for the establishment of complex trust, company or other arrangements involving legal entities without ongoing involvement may present higher risk.

76. Examples of factors that may decrease risk are:

a) Involvement of financial institutions or other DNFBPs or TCSPs which are regulated in their home jurisdiction and subject to appropriate AML/CFT regulation.

b) Role or oversight of a regulator or multiple regulators (e.g. regulating TCSPs, trustees or any other person exercising effective control).

c) The regularity or duration of the client relationship. Long-standing relationships involving frequent client contact throughout the relationship may present less risk. In addition, a relationship may present less risk where, for example, the TCSP provides an integrated service, including acting as or providing trustees or directors of the trust, company or other legal entity and responsibility for preparation of accounts or maintaining the books and financial records of such trust, company or other legal entity.

d) Trusts, companies or other legal entities that are transparent and well-known in the public domain.

e) Listed entities and other business arrangements, such as pension trusts and employee benefit trusts and other trusts used for commercial purposes.

f) TCSP's familiarity with a particular country, including knowledge of local laws and regulations as well as the structure and extent of regulatory oversight.

Documentation of risk assessments

77. TCSPs must always understand their ML/TF risks (for clients, countries or geographic areas, services, transactions or delivery channels). They should document those assessments in order to be able to demonstrate their basis and exercise due professional care and use compelling good judgement. However, competent authorities or SRBs may determine that individual documented risk assessments are not required, if the specific risks inherent to the sector are clearly identified and understood.[23]

78. TCSPs may fail to satisfy their AML/CFT obligations, for example by relying completely on a checklist risk assessment where there are other clear indicators of potential illicit activity. Completing risk assessments in a time efficient yet comprehensive manner is important.

79. Each of these risks could be assessed using indicators such as low risk, medium risk and/or high risk. A short explanation of the reasons for each attribution should be included and an overall assessment of risk determined. An action plan (if required) should then be outlined to accompany the assessment, and dated. In assessing the risk profile of the client at this stage, reference must be made to the relevant targeted financial sanctions lists to confirm neither the client nor the beneficial owner is designated and included in any of them.

80. A risk assessment of this kind should not only be carried out for each specific client and service on an individual basis, but also to assess and document the risks on a firm-wide basis, and to keep risk assessment up-to-date through monitoring of the client relationship. The written risk assessment should be made accessible to all professionals having to perform AML/CFT duties.

81. Where TCSPs are involved in longer term transactions, risk assessments should be undertaken at suitable intervals across the life of the transaction, to ensure no significant risk factors have changed in the intervening period (e.g. new parties to the transaction, new sources of funds etc.).

82. A final risk assessment should be undertaken before a transaction has completed, allowing time for any required suspicious activity report, where required and appropriate, to be filed and any authority to move or transfer assets to be obtained from law enforcement (in countries where this is applicable).

Risk mitigation

83. TCSPs should have policies, controls and procedures that enable them to effectively manage and mitigate the risks that they have identified (or that have been identified by the country). They should monitor the implementation of those controls and enhance or improve them if they find the controls to be weak or ineffective. The policies, controls and procedures should be approved by senior management and the measures taken to manage and mitigate the risks (whether higher or lower) should be consistent with national requirements and with guidance from competent authorities and supervisors. Measures and controls may include:

a) General training on ML/TF methods and risks relevant to TCSPs.

b) Targeted training for increased awareness by the TCSPs providing specified activities to higher risk clients or to TCSPs undertaking higher risk work.

[23] Paragraph 8 of INR.1.

c) Increased or more appropriately targeted CDD or enhanced CDD for higher risk clients/situations that concentrate on providing a better understanding about the potential source of risk and obtaining the necessary information to make informed decisions about how to proceed (if the transaction/ business relationship can be proceeded with). This could include training on when and how to ascertain, evidence and record source of wealth and beneficial ownership information if required.

d) Periodic review of the services offered by the TCSP, and the periodic evaluation of the AML/CFT framework applicable to the TCSP and the TCSP's own AML/CFT procedures, to determine whether the ML/TF risk has increased and adequate controls are in place to mitigate those increased risks.

e) Reviewing client relationships on a periodic basis to determine whether the ML/TF risk has increased.

Initial and ongoing CDD (R.10 and 22)

84. TCSPs should design CDD procedures to enable them to form a reasonable certainty that they know the true identity of the relevant beneficial owners of, or natural persons who actually exercise effective control over, the trust, company or other legal entity and, with an appropriate degree of confidence, know the true purpose behind the establishment or use of the trust, company or other legal entity. TCSPs' procedures should include procedures:

a) For identifying the client and verifying that client's identity using reliable, independent source documents, data or information.

b) For identifying the relevant beneficial owners and natural persons who actually exercise control as set out in Annex 1 and taking reasonable measures to verify the identity of such persons (i.e. on a risk-based approach). This is articulated in the following box:

Box 2. Beneficial ownership information obligations
(see R.10, R.22 and INR.10)

R.10 sets out the instances where TCSPs will be required to take steps to identify and verify beneficial owners, including when there is a suspicion of ML/TF, when establishing business relations, or where there are doubts about the veracity of previously provided information. INR.10 indicates that the purpose of this requirement is two-fold: first, to prevent the unlawful use of legal persons and arrangements, by gaining a sufficient understanding of the client to be able to properly assess the potential ML/TF risks associated with the business relationship; and, second, to take appropriate steps to mitigate the risks. TCSPs should have regard to these purposes when assessing what steps are reasonable to take to verify beneficial ownership, commensurate with the level of risk. TCSPs should also have regard to the AML/CFT 2013 Methodology Criteria 10.5 and 10.8-10.12.

At the outset of determining beneficial ownership, steps should be taken to identify how the immediate client can be identified. TCSPs can verify the identity of a client by, for example meeting the client in person and then verifying their identity through

the production of a passport/identity card and documentation confirming his/her address. TCSPs can further verify the identity of a client on the basis of documentation or information obtained from reliable, publicly available sources (which are independent of the client).

A more difficult situation arises where there is a beneficial owner who is not the immediate client (e.g. in the case of companies and other entities). In such a scenario reasonable steps must be taken so that the TCSP is satisfied about the identity of the beneficial owner and takes reasonable measures to verify the beneficial owner's identity. This likely requires taking steps to understand the ownership and control of a separate legal entity that is the client, and may include conducting public searches as well as by seeking information directly from the client. TCSPs will likely need to obtain the following information for a client that is a legal entity:

a) the name of the company;
b) the company registration number;
c) the registered address and/ or principal place of business (if different);
d) the identity of shareholders and their percentage ownership;
e) names of the board of directors or senior individuals responsible for the company's operations; and
f) the law to which the company is subject and its constitution; and
g) the types of activities and transactions in which the company engages.

To verify the information listed above, TCSPs may use sources such as the following:

a) constitutional documents (such as a certificate of incorporation, memorandum and articles of incorporation/association);
b) details from company registers; and
c) shareholder agreements or other agreements between shareholders concerning control of the legal person;
d) filed audited accounts.

TCSPs should adopt a RBA to verify beneficial owners of an entity. It is often necessary to use a combination of public sources and to seek further confirmation from the immediate client that information from public sources is correct and up-to-date or to ask for additional documentation that confirms the beneficial ownership and company structure. The obligation to identify beneficial ownership does not end with identifying the first level of ownership, but requires reasonable steps to be taken to identify the ownership at each level of the corporate structure until an ultimate beneficial owner is identified.

c) Enabling the TCSP to understand and, as appropriate, obtain information on the purpose and intended purpose of the trust, company or other legal entity.

d) Conducting ongoing due diligence on the business relationship. Ongoing due diligence ensures that the documents, data or information collected under the CDD process are kept up-to-date and relevant by undertaking reviews of existing records, particularly for higher-risk categories of clients. Undertaking appropriate CDD may also facilitate the accurate filing of suspicious transaction reports (STRs) to the financial intelligence unit (FIU), or to

respond to requests for information from an FIU and the law enforcement agencies.

85. Where risks are higher, TCSPs should obtain information about the source of funds in the trust, company or other legal entity and source of wealth in relation to the settlor or beneficial owner.

86. TCSPs should design their policies and procedures so that the level of CDD addresses the risk of the trust, company or other legal entity with respect to which services are being provided by the TCSP being used for ML/TF. TCSPs should design a standard level of CDD for normal risk clients and a reduced or simplified CDD process for low risk clients. Simplified CDD measures are not acceptable whenever there is a suspicion of ML/TF or where specific higher-risk scenarios apply. Enhanced due diligence should be applied to those clients that the TCSP has assessed as high risk. These activities may be carried out in conjunction with the TCSP's normal acceptance procedures, and will take into account any specific jurisdictional requirements for CDD in relation to the trust, company or other legal entity and any trustee, settlor, protector, beneficial owner or other natural person exercising effecting control over the trust, company or other legal entity.

87. In the normal course of their work, TCSPs are likely to learn more about some aspects of the trust, company or other legal entity, and the trustee, settlor, protector, beneficial owners or other natural persons exercising effective control, than other advisors. This information is likely to help the TCSP dynamically assess the ML/TF risk.

88. Identification of, company or other legal entity, any trustee or of any settlor, beneficial owner or natural person exercising effective control should be periodically reviewed. This is to ensure that changes in ownership or control are properly recorded. This may be carried out in conjunction with any professional requirements for client continuation processes.

89. Public information sources may assist with this ongoing review. The procedures that need to be carried out can vary, in accordance with the nature and purpose for which the entity exists, and the extent to which the underlying ownership differs from apparent ownership by the use of nominee shareholders and complex structures.

90. The following box provides a non-exhaustive list of examples of standard, enhanced and simplified CDD:

Box 3. Examples of Standard/Simplified/Enhanced CDD measures (see also INR.10)

Standard CDD

- Identifying the client and verifying that client's identity using reliable, independent source documents, data or information
- Identifying the beneficial owner, and taking reasonable measures on a risk-sensitive basis to verify the identity of the beneficial owner, such that the TCSP is satisfied about the identity of beneficial owner. For legal persons and arrangements, this should include understanding the ownership and control structure of the client and gaining an understanding of the client's source of wealth and source of funds, where required

- Understanding and obtaining information on the purpose and intended nature of the business relationship
- Conducting ongoing due diligence on the business relationship and scrutiny of transactions undertaken throughout the course of that relationship to ensure that the transactions being conducted are consistent with the business and risk profile the client, including, where necessary, the source of wealth and funds

Simplified CDD

- Limiting the extent, type or timing of CDD measures
- Obtaining fewer elements of client identification data
- Altering the type of verification carried out on client's identity
- Simplifying the verification carried out on client's identity
- Inferring the purpose and nature of the transactions or business relationship established based on the type of transaction carried out or the relationship established
- Verifying the identity of the client and the beneficial owner after the establishment of the business relationship
- Reducing the frequency of client identification updates in the case of a business relationship
- Reducing the degree and extent of ongoing monitoring and scrutiny of transactions

Enhanced CDD

- Obtaining additional information on the trustee, settlor, beneficial owner or natural person exercising effective control of the trust, company or other legal entity (as described in Annex 1) (e.g. occupation, overall wealth, information available through public databases, internet), and updating more regularly the identification data of such persons and sources which can be regarded as credible
- Obtaining information on the reasons for intended or performed transactions carried out by the trust, company or other legal entity administered by the TCSP
- Obtaining additional information and, as appropriate, substantiating documentation, on the intended nature of the business relationship
- Obtaining information on the source of funds or source of wealth of the settlor (as described in Annex 1) and evidencing this through appropriate documentation obtained
- Carrying out additional searches (e.g. internet searches using independent and open sources) to better inform the client risk profile (provided that the TCSPs policies should enable it to disregard source documents, data or information which is perceived to be unreliable)
- Considering the source of funds or wealth involved in the transaction or business relationship to seek to ensure they do not constitute the proceeds of crime. This could include obtaining appropriate documentation concerning the source of wealth or funds
- Increasing the frequency and intensity of transaction monitoring
- Obtaining the approval of senior management to commence or continue the business relationship.
- Conducting enhanced monitoring of the business relationship, by increasing the number and timing of controls applied, and selecting patterns of transactions that need further examination

- Where appropriate, requiring the first payment to be carried out through an account in the name of the trust, company or other legal entity with a bank subject to similar CDD standards
- Increasing awareness of higher risk clients and transactions, across all departments with a business relationship with the client, including the possibility of enhanced briefing of engagement teams responsible for the client
- Enhanced CDD may also include lowering the threshold of ownership (e.g. below 25%), to ensure complete understanding of the control structure of the entity involved. It may also include looking further than simply holdings of equity shares, to understand the voting rights of each party who holds an interest in the entity.

Politically exposed persons (PEP) (R.12)

91. TCSPs should take reasonable measures to identify any trustee, settlor, beneficial owner or natural person exercising effective control (as further described in Annex 1) in relation to a trust, company or other legal persons whether they are a PEP or a family member or close associate of a PEP. If the client or beneficial owner is a PEP or a family member or close associate of a PEP, TCSPs should perform the following additional procedures:

a) obtain senior management approval for establishing (or continuing, for existing structures) such business relationships;

b) take reasonable measures to establish the source of wealth and source of funds in relation to the settlor, beneficiaries who receive distributions, or natural persons exercising effective control over a trust or beneficial owners or natural persons exercising effective control over a legal entity or other arrangement identified as PEPs (as described in Annex 1); and

c) conduct enhanced ongoing monitoring of the business relationship.

92. Relevant factors that will influence the extent and nature of CDD include the particular circumstances of a PEP, whether the PEP has access to official funds, the PEP's home country, the type of work the PEP is instructing the TCSP to perform or carry out (i.e. the services that are being asked for), whether the PEP is domestically based or international, particularly having regard to the services asked for, and the scrutiny to which the PEP is under in the PEP's home country.

93. The nature of the risk should be considered in light of all relevant circumstances, such as:

a) The nature of the relationship between the client and the PEP. If the client is a trust, company or legal entity, even if the PEP is not a natural person exercising effective control or the PEP is merely a discretionary beneficiary who has not received any distributions, the PEP may nonetheless affect the risk assessment.

b) The nature of the client (e.g. where it is a public listed company or regulated entity which is subject to and regulated for a full range of AML/CFT requirements consistent with FATF recommendations, the fact that it is subject to reporting obligations will be a relevant factor, albeit this should not automatically qualify the client for simplified CDD).

c) The nature of the services sought. For example, lower risks may exist where a PEP is not the client but a director of a client that is a public listed company or regulated entity and the client is purchasing property for adequate consideration.

Ongoing monitoring of clients and specified activities (R.10 and 22)

94. TCSPs are not expected to scrutinise every transaction carried out by a trust, company or other legal entity to whom the TCSP provides services. Some services are provided only on a one-off basis, without a continuing relationship with the trust, company or other legal entity and without the TCSP having access to the books and records of the trust, company or other legal entity and/or bank records. However, many of the professional services provided by TCSPs enable them to identify suspicious activity or transactions carried out using trust, companies or other legal entities. For example, their direct knowledge of, and access, to the records and management processes and operations of such structures as well as through close working relationships with trustees, settlors, managers and beneficial owners may help TCSPs make a determination in this regard. The continued administration and management of the legal persons and arrangements (e.g. account reporting, asset disbursements and corporate filings) would also enable the relevant TCSPs to develop a better understanding of the activities of their clients.

95. TCSPs need to be alert for events or situations which are indicative of a reason to be suspicious of ML/TF, employing their professional experience and judgement in the formulation of suspicions where appropriate. An advantage in carrying out this function is the professional scepticism which is a defining characteristic of many professional TCSPs' functions and relationships.

96. Ongoing monitoring of the business relationship should be carried out on a risk related basis, to ensure that the trustees, settlors, beneficial owners and natural persons exercising effective control (as described in Annex 1) are aware of any changes in the client's identity and risk profile established on acceptance. This requires an appropriate level of scrutiny of activity during the relationship, including enquiry into source of funds and wealth where necessary, to judge consistency with expected behaviour based on CDD information. As discussed below, ongoing monitoring may also give rise to filing a STR.

97. The TCSP should also consider reviewing CDD on an engagement/assignment basis for each trust, company or other legal entity with respect to which the TCSP provides ongoing services. Well-known, reputable, long-standing trustees, settlors, beneficial owners or other natural persons exercising effective control (as described in Annex 1) may suddenly request a new type of service that is not in line with the previous relationship with the TCSP. Such an assignment may suggest a greater level of risk.

98. TCSPs should not conduct investigations into suspected ML/TF on their own but instead file a STR or if the behaviour is egregious they should contact the FIU, law enforcement or supervisors, as appropriate, for guidance. Within the scope of engagement, a TCSP should be mindful of the prohibition on "tipping off" the individual concerned where a suspicion has been formed. Carrying out additional investigations, which are not within the scope of the engagement should also be considered against the risk alerting a money launderer.

99. When deciding whether or not an activity or transaction is suspicious, TCSPs may need to make additional enquiries (within the normal scope of the assignment or business relationship) of the individual or entity concerned or their records – this could typically be done as part of the TCSP's CDD process. Normal commercial enquiries, being made to fulfil duties to the trust, company or other legal entity with respect to which the TCSP provides services, may assist in understanding an activity or transaction to determine whether or not it is suspicious.

Suspicious transaction reporting, tipping-off, internal controls and higher-risk countries (R.23)

100. R.23 sets out obligations for TCSPs on reporting and tipping-off, internal controls and higher-risk countries (R.20, R.21, R.18 and R.19)

Suspicious transaction reporting and tipping-off (R.20, 21 and 23)

101. Where a legal or regulatory requirement mandates the reporting of suspicious activity once a suspicion has been formed, a report must always be made promptly. The requirement to file a STR is not subject to a risk-based approach, but must be made promptly whenever required in the country concerned.

102. TCSPs may be required to report suspicious activities, as well as specific suspicious transactions, and so may make reports on a number of scenarios including suspicious business structures or management profiles which have no legitimate economic rationale. As specified under INR.23, where TCSPs seek to dissuade a client from engaging in illegal activity, this does not amount to tipping-off.

103. However, a RBA is appropriate for identifying a suspicious activity or transaction, by directing additional resources at those areas a TCSP has identified as higher risk. The designated competent authorities or SRBs may provide information to TCSPs, which will be useful to them to inform their approach for identifying suspicious activity or transactions, as part of a RBA. A TCSP should also periodically assess the adequacy of its system for identifying and reporting suspicious activity or transactions.

104. TCSPs should review their existing CDD if they have a suspicion of ML/TF.

Internal controls and compliance (R.18 and 23)

105. In order for TCSPs to have an effective risk-based approach, the risk-based process must be embedded within the internal controls of the firm and they must be appropriate for the size and complexity of the firm.

Internal controls and governance

106. Strong leadership and engagement by senior management and the Board of Directors (or equivalent body) in AML/CFT is an important aspect of the application of the risk-based approach. Senior management must create a culture of compliance, ensuring that staff adhere to the firm's policies, procedures and processes designed to limit and control risks.

107. The nature and extent of the AML/CFT controls, as well as meeting national legal requirements, need to be proportionate to the risk involved in the services being

offered. In addition to other compliance internal controls, the nature and extent of AML/CFT controls will encompass a number of aspects, such as:

a) designating an individual, or individuals, at management level responsible for managing AML/CFT compliance;

b) designing policies and procedures that focus resources on the firm's higher-risk, services, products, clients and geographic locations in which their clients/they operate. These policies and procedures should be implemented across the firm and include:

   - risk-based CDD policies, procedures and processes;
   - ensure that adequate controls are in place before new services are offered; and
   - adequate controls for accepting higher risk clients or providing higher risk services, such as management approval;

c) performing a regular review of the firm's policies and procedures to ensure that they remain fit for purpose;

d) performing a regular compliance review to check that staff are properly implementing the firm's policies and procedures;

e) providing senior management with a regular report of compliance initiatives, identify compliance deficiencies, corrective action taken, and STRs filed;

f) planning for changes in management, staff or firm structure so that there is compliance continuity;

g) focusing on meeting all regulatory record keeping and reporting requirements, recommendations for AML/CFT compliance and providing for timely updates in response to changes in regulations;

h) enabling the timely identification of reportable transactions and ensuring accurate filing of required reports;

i) incorporating AML/CFT compliance into job descriptions and performance evaluations of appropriate personnel;

j) providing for appropriate training to be given to all relevant staff;

k) having appropriate risk management systems to determine whether a client, potential client, or beneficial owner is a PEP or a person subject to applicable financial sanctions;

l) providing for adequate controls for higher risk clients and services, as necessary (e.g. additional due diligence, escalation to senior management or additional review and/or consultation);

m) providing increased focus on a TCSP's operations (e.g. services, clients and geographic locations) that are more vulnerable to abuse for ML/TF;

n) providing for periodic review of the risk assessment and management processes, taking into account the environment within which the TCSP operates and the services it provides; and

o) providing for an AML/CFT compliance function and review programme, as appropriate, given the scale of the organisation and the nature of the TCSP's practice.

108. TCSPs should review the firm-wide risk assessment that takes into account the size and nature of the practice; the existence of high-risk clients (if any); and the provision of high-risk services (if any). Once completed, the firm-wide risk assessment will assist the firm in designing its policies and procedures and in establishing the level of resources it will require to manage and mitigate the ML/TF risks.

109. TCSPs should consider using proven technology-driven solutions to minimise the risk of error and find efficiencies in their AML/CFT processes. As these solutions are likely to become more affordable, and more tailored to the needs of TCSPs as they continue to develop, this may be particularly important for smaller firms that may be less able to commit significant resources of time to these activities.

110. Depending on the size of the firm, the types of services provided, the risk profile of clients and the overall assessed ML/TF risk, it may be possible to simplify internal procedures. For example, for sole owner/proprietor firms, providing limited services to low risk clients, client acceptance may be reserved to the sole owners/proprietors taking into account their business and client knowledge and experience. The involvement of the sole owner/proprietor may also be required in detecting and assessing possible suspicious activities. For larger firms serving a diverse client base and providing multiple services across geographical locations, more sophisticated procedures are likely to be necessary.

Internal mechanisms to ensure compliance

111. The TCSP (at the senior management level) should monitor effectiveness of its internal controls. If the TCSP identifies any weaknesses in those internal controls, it should design improved procedures.

112. The most effective tool to monitor the internal controls is a regular independent compliance review. A member of staff that has a good working knowledge of the firm's AML/CFT internal control framework, policies and procedures and is sufficiently senior to challenge them should perform the review. The person conducting an independent review should not be the same person who designed or implemented the controls being reviewed. The compliance review should include a review of CDD documentation to confirm that staff are properly applying the firm's procedures.

113. If the compliance review identifies areas of weakness and makes recommendations on how to improve the policies and procedures, then senior management should monitor how the firm is acting on those recommendations.

114. The TCSP should consider its firm-wide risk assessment regularly and make sure that the policies and procedures continue to direct effort to those areas where risk of ML/TF is highest.

Vetting and recruitment

115. TCSPs should consider the skills, knowledge and experience of staff both before they are appointed to their role and on an ongoing basis. The level of assessment should be proportionate to their role in the firm and the ML/TF risks they may encounter. Assessment may include criminal records checking and other forms of pre-employment screening such as credit reference checks and background verification (as permitted under national legislation) for key staff positions.

Education, training and awareness

116. R.18 requires that TCSPs provide their staff with AML/CFT training. For TCSPs, and those in smaller firms in particular, such training may also assist with raising awareness of monitoring obligations. A TCSP's commitment to having appropriate controls in place relies fundamentally on both training and awareness. This requires a firm-wide effort to provide all relevant staff with at least general information on AML/CFT laws, regulations and internal policies.

117. Firms should provide targeted training for increased awareness by the TCSPs providing specified activities to higher-risk clients and to TCSPs undertaking higher-risk work. Case studies (both fact-based and hypotheticals) are a good way of bringing the regulations to life and making them more comprehensible. Training should also be targeted towards the role that the individual performs in the AML/CFT process. This could include false documentation training for those undertaking identification and verification duties, or training regarding red flags for those undertaking client/transactional risk assessment.

118. In line with a RBA, particular attention should be given to risk factors or circumstances occurring in TCSP's own practice. In addition, competent authorities, SRBs and representative bodies should work with educational institutions to ensure that the relevant curricula address ML/TF risks. The same training should also be made available for students taking courses to train to become TCSPs.

119. TCSPs must periodically provide their employees with appropriate AML/CFT training. In ensuring compliance with this requirement, TCSPs may take account of any AML/CFT training included in entry requirements and continuing professional development requirements for their professional staff. They must also ensure appropriate training for any relevant staff without a professional qualification, at a level appropriate to the functions being undertaken by those staff, and the likelihood of their encountering suspicious activities.

120. The overall risk-based approach and the various methods available for training and education gives TCSPs flexibility regarding the frequency, delivery mechanisms and focus of such training. TCSPs should review their own staff and available resources and implement training programs that provide appropriate AML/CFT information that is:

a) tailored to the relevant staff responsibility (e.g. client contact or administration);

b) at the appropriate level of detail (e.g. considering the nature of services provided by the TCSP);

c) at a frequency suitable to the risk level of the type of work undertaken by the TCSP; and

d) used to test to assess staff knowledge of the information provided.

Higher-risk countries (R.19 and 23)

121. Consistent with R.19, TCSPs should apply effective enhanced due diligence measures (also see paragraph 68), proportionate to the risks, to business relationships and transactions with clients from countries for which this is called for by the FATF.

Section IV – Guidance for supervisors

122. A risk-based approach to AML/CFT means that measures taken to reduce ML/TF are proportionate to the risks. Supervisors and SRBs should supervise more effectively by allocating resource to areas of higher ML/TF risk. R.28 requires that TCSPs are subject to adequate AML/CFT regulation and supervision. While it is each country's responsibility to ensure there is an adequate national framework in place in relation to regulation and supervision of TCSPs, any relevant supervisors and SRBs should have a clear understanding of the ML/TF risks present in the relevant jurisdiction.[24] The RBA to AML/CFT aims to develop prevention or mitigation measures which are commensurate with the ML/TF risks identified. This applies to the way supervisory authorities allocate their resources.

The risk-based approach to supervision

Supervisors and SRBs' role in supervision and monitoring

123. According to R.28, countries must ensure that DNFBPs are subject to effective oversight through the supervision performed by a supervisor or by an appropriate SRB, provided that such an SRB can ensure that its members comply with their obligations to combat ML/TF.

124. A SRB is body representing a profession (e.g. legal professionals, notaries, other independent legal professionals or accountants), made up of member professionals, which has a role (either exclusive or in conjunction with other entities) in regulating the persons that are qualified to enter and to practise in the profession. A SRB also performs supervisory or monitoring functions (e.g. to enforce rules to ensure that high ethical and moral standards are maintained by those practising the profession).

125. Supervisors and SRBs should have adequate powers to perform their supervisory functions (including powers to monitor and to impose effective, proportionate and dissuasive sanctions), and adequate financial, human and technical resources. They should determine the frequency and intensity of their supervisory or monitoring actions on TCSPs on the basis of their understanding of the ML/TF risks, and taking into consideration the characteristics of the TCSPs, in particular their diversity and number.

126. Countries should ensure that supervisors and SRBs are equipped in identifying and sanctioning non-compliance by its members. Countries should also ensure that SRBs are well-informed about the importance of AML/CFT supervision, including enforcement actions as needed.

127. Countries should also address the risk that AML/CFT supervision by SRBs could be hampered by conflicting objectives pertaining to the SRB's role in representing their members, while also being obligated to supervise them. If a SRB contains members of the supervised population, or represents those people, the relevant person should not continue to take part in the monitoring/ supervision of their practice/firm to avoid conflicts of interest.

[24] See INR 28.1.

128. Supervisors and SRBs should clearly allocate responsibility for managing AML/CFT related activity, where they are also responsible for other regulatory areas.

Understanding ML/TF risk- the role of countries

129. Countries should ensure, to the extent the national framework allows, that TCSPs apply a RBA that reflects the nature, diversity and maturity of the sector and its risk profile as well the ML/TF risks associated with individual TCSPs.

130. Access to information about ML/TF risks is essential for an effective RBA. Countries are required to take appropriate steps to identify and assess ML/TF risks on an ongoing basis in order to (a) inform potential changes to the country's AML/CFT regime, including changes to laws, regulations and other measures; (b) assist in the allocation and prioritisation of AML/CFT resources by competent authorities; and (c) make information available for AML/CFT risk assessments conducted by TCSPs and the jurisdiction's national risk assessment. Countries should keep the risk assessments up-to-date and should have mechanisms to provide appropriate information on the results to competent authorities, SRBs and TCSPs. In situations where some TCSPs have limited capacity to identify ML/TF risks, countries should work with the sector to understand their risks.

131. Supervisors and SRBs should, as applicable, draw on a variety of sources to identify and assess ML/TF risks. These may include, but will not be limited to, the jurisdiction's national risk assessments, supranational risk assessments, domestic or international typologies, supervisory expertise and FIU feedback. The necessary information can also be obtained through appropriate information-sharing and collaboration among AML/CFT supervisors, when there are more than one for different sectors (legal professionals, accountants and TCSPs).

132. These sources can also be helpful in determining the extent to which TCSPs are able to effectively manage ML/TF risks. Information-sharing and collaboration should take place among AML/CFT supervisors across all sectors (legal professionals, accountants and TCSPs). Supervisors and SRBs should issue guidance to the TCSPs on issues of concern. Guidance should be frequently updated.

133. Competent authorities may also consider undertaking a targeted sectoral risk assessment to get a better understanding of the specific environment in which TCSPs operate in the country and the nature of services provided by them.

134. Supervisors and SRBs should understand the level of inherent risk including the nature and complexity of services provided by the TCSP. Supervisors and SRBs should also consider the type of services the TCSP is providing as well as its size and business model, corporate governance arrangements, the compliance culture within the organisation, financial and accounting information, delivery channels, client profiles, geographic location and countries of operation.

135. Supervisors and SRBs should also consider the controls TCSPs have in place (e.g. the quality of the risk management policy, the functioning of the internal oversight functions and the quality of oversight of any outsourcing and subcontracting arrangements). Supervisors and SRBs should require TCSPs to have group wide programmes against ML/TF, including for sharing of information within the group for AML/CFT purposes. Policies and procedures should be consistently applied and supervised across the group.

136. Supervisors and SRBs should seek to ensure their supervised populations are fully aware of, and compliant with, measures to identify and verify a client, the client's source of wealth and funds where required, along with measures designed to ensure transparency of beneficial ownership, as these are cross-cutting issues which affect several aspects of AML/CFT.

137. Supervisors and SRBs should review their assessment of TCSPs' ML/TF risk profiles periodically, including when circumstances change materially or relevant new threats emerge and appropriately communicate this assessment to the profession.

138. Supervisors and SRBs should ensure that they are properly assessing the risks associated with legal persons and legal arrangements. To further understand the vulnerabilities associated with beneficial ownership, with a particular focus on the involvement of professional intermediaries, supervisors should stay abreast of research papers and typologies published by international bodies.[25] Useful reference include the Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership published in July 2018.

Mitigating and managing ML/TF risk

139. Supervisors and SRBs should take proportionate mitigating measures. Supervisors and SRBs should determine the frequency and intensity of these measures based on their understanding of the ML/TF risks. Supervisors and SRBs should consider the characteristics of the TCSPs, particularly his/her role as a professional intermediary, in particular their diversity and number. It is essential to have a clear understanding of the ML/TF risks: (a) present in the country; and (b) associated with the type of TCSP and their clients, products and services.

140. Supervisors and SRBs assessing the adequacy of the internal controls, policies and procedures should properly take account of the risk profile of TCSPs, and the degree of discretion allowed to them under the RBA.

141. Supervisors and SRBs should develop a means of identifying which TCSPs or group of TCSPs are at the greatest risk of being used by criminals. This involves considering the probability and impact of ML/TF risk. Probability means the likelihood of ML/TF taking place as a consequence of the activity undertaken by TCSPs, or a group of TCSPs, and the environment they operate in. The risk can also increase or decrease depending on other factors:

a) service and product risk (the likelihood that services or products can be used for ML/TF);

b) client risk (the likelihood that customers' funds may have criminal origins);

c) the nature of transactions (e.g. frequency, volume, counterparties);

d) geographical risk (whether the TCSP, its clients or other offices trade in riskier locations); and

e) other indicators of risk are based on a combination of objective factors and experience, such as the supervisor's wider work with the TCSP as well as

[25] Such as the FATF, the Organisation for Economic Co-operation and Development (OECD), the World Bank, the IMF and the United Nations Office on Drugs and Crime (UNODC).

information on its compliance history, complaints about the TCSP or about the quality of its internal controls. Other such factors may include information from government/law enforcement sources, whistle-blowers or negative news reports from credible media particularly those related to predicate offences for ML/TF or to financial crimes.

142. In adopting a RBA to supervision, supervisors may consider allocating supervised entities sharing similar characteristics and risk profiles into groupings for supervision purposes. Examples of characteristics and risk profiles could include the size of business, type of clients serviced and geographic areas of activities. The setting up of such groupings could allow supervisors to take a comprehensive view of the TCSP sector, as opposed to an approach where the supervisors concentrate on the individual risks posed by the individual firms. If the risk profile of a TCSP within a grouping changes, supervisors may reassess the supervisory approach, which may include removing the TCSP from the grouping.

143. Supervisors or SRBs should also consider the impact, i.e. the potential harm caused if ML/TF is facilitated by TCSPs or group of TCSPs. A small number of TCSPs may cause a high level of harm. This can depend on:

a) size (i.e. turnover), number and type of clients, number of premises, value of transactions etc.), and

b) links or involvement with other businesses (which could affect the susceptibility to being involved in 'layering' activity, e.g. concealing the origin of the transaction with the purpose to legalise the asset).

144. The risk assessment should be updated by supervisors and SRBs on an ongoing basis. The result from the assessment will help determine the resources the supervisor will allocate to the supervision of TCSPs or group of TCSPs.

145. Supervisors or SRBs should consider whether a TCSP meets the ongoing requirements for continued participation in the profession as well as assessments of competence and of fitness and propriety. This will include whether the TCSP meets expectations related to AML/CFT compliance. This will take place both when a supervised entity joins the profession, and on an ongoing basis thereafter.

146. If a jurisdiction chooses to classify an entire sector as higher risk, it should be possible to differentiate between categories of TCSPs based on various factors such as their client base, countries they deal with and applicable AML/CFT controls etc.

147. Supervisors and SRBs should acknowledge that in a risk-based regime, not all TCSPs will adopt identical AML/CFT controls and that an isolated incident where the TCSP is part of an illegal transaction unwittingly does not necessarily invalidate the integrity of the TCSP's AML/CFT controls. At the same time, TCSPs should understand that a flexible RBA does not exempt them from applying effective AML/CFT controls.

148. Supervisors and SRBs should use their findings to review and update their ML/TF risk assessments and, where necessary, consider whether their approach to AML/CFT supervision and the existing AML/CFT rules and guidance remain adequate. Whenever appropriate, and in compliance with relevant confidentiality requirements, these findings should be communicated to TCSPs to enable them to enhance their RBA.

Supervision of the RBA

Licensing or registration

149. R.28 requires TCSPs to be subject to regulatory and supervisory measures to ensure their compliance with AML/CFT requirements.

150. R.28 also requires the supervisor or SRB to take the necessary measures to prevent criminals or their associates from being professionally accredited or holding or being the beneficial owner of a significant or controlling interest or holding a management function in relation to a TCSP. This can be achieved through the evaluation of these persons through a "fit and proper" test.

151. A licensing or registration mechanism is one of the means to identify TCSPs who undertake activities specified in R.22 to whom the regulatory and supervisory measures, including the "fit and proper" test should be applied. It also enables the identification of the number of TCSPs for the purposes of assessing and understanding the ML/TF risks for the country, and the action which should be taken to mitigate them in accordance with R.1.

152. Licensing or registration provides a supervisor or SRB with the means to fulfil a "gate-keeper" role over who can undertake those activities specified in R.22. Licensing or registration should ensure that upon qualification, TCSPs are subject to AML/CFT compliance monitoring.

153. The supervisor or SRB should actively identify individuals and businesses who should be supervised by using intelligence from other competent authorities (e.g. FIUs, company registry, tax authority), information from financial institutions and DNFBPs, complaints by the public and open source information from advertisements and business and commercial registries or any other sources which indicate that there are unsupervised individuals or businesses providing the activities specified in R.22.

154. Licensing or registration frameworks should define the activities which are subject to licensing or registration, prohibit unlicensed or unregistered individuals or businesses providing these activities and set out measures for both refusing licences or registrations and for removing "bad actors".

155. The terms "licensing" or "registration" are not interchangeable. Licensing regimes generally tend to operate over financial institutions and impose mandatory minimum requirements based upon Core Principles on issues such as capital, governance, and resourcing to manage and mitigate prudential conduct as well as ML/TF risks on an on-going basis. Some jurisdictions have adopted similar licensing regimes for TCSPs, generally where TCSPs carry out trust and corporate services, to encompass aspects of prudential and conduct requirements in managing the higher level of ML/TF risks that have been identified in that sector.

156. A jurisdiction may have a registration framework over the entire DNFBP sector, including TCSPs or have a specific registration framework for each constituent of DNFBP. Generally, a supervisor or SRB carries out the registration function.

157. The supervisor or SRB should ensure that requirements for licensing or registration and the process for applying are clear, objective, publicly available and consistently applied. Determination of the licence or registration should be objective and timely. A SRB could be responsible for both supervision and for representing the interests of its members. If so, the SRB should ensure that registration decisions are

taken separately and independently from its activities regarding member representation.

Fit and proper tests

158. A fit and proper test provides a possible mechanism for a supervisor or SRB to take the necessary measures to prevent criminals or their associates from owning, controlling or holding a management function in a TCSP.

159. In accordance with R.28, the supervisor or SRB should establish the integrity of every beneficial owner, controller and individual holding a management function in a TCSP. However, the decisions on an individual's fitness and propriety may also be based upon a range of factors concerning the individual's competency, probity, and judgement as well as their integrity.

160. In some jurisdictions, a fit and proper test forms a fundamental part of determining whether to license or register the TCSP and whether on an ongoing basis the licensee or registrant (including its owners and controllers, where applicable) remains fit and proper to continue in that role. The initial assessment of an individual's fitness and propriety is a combination of obtaining information from the individual and corroborating elements of that information against independent credible sources to determine whether the individual is fit and proper to hold that position.

161. The process for determining fitness and propriety generally requires the applicant to complete a questionnaire. It could gather personal identification information, residential and employment history, and require disclosure by the applicant of any convictions or adverse judgements relating to the applicant, including pending prosecutions and convictions. Elements of this information should be corroborated to establish the bona fides of an individual. Such checks could include enquiries about the individual with law enforcement agencies and other supervisors or screening the individual against independent electronic search databases. The personal data collected should be kept confidential.

162. The supervisor or SRB should also ensure on an ongoing basis that those holding or being the beneficial owner of significant or controlling interest in and individuals holding management functions in a TCSP are fit and proper. A fit and proper test should apply to new owners, controllers and individuals holding a management function in a TCSP. The supervisor or SRB should consider re-assessing the fitness and propriety of these individuals arising from any supervisory findings, receipt of information from other competent authorities; or open source information indicating significant adverse developments.

Guarding against "brass-plate" operations

163. The supervisor or SRB should ensure that its licensing or registration requirements require the TCSP to have a meaningful physical presence in the jurisdiction. This usually means that the TCSP should have its place of business in the jurisdiction. Where the TCSP is a legal person, those individuals who form its mind and management should be actively involved in the business and may also be required to be resident in the jurisdiction (although this may not be a necessity provided that there is an appropriate person resident in the jurisdiction who has a responsibility to

report to the supervisor or SRB). A business with only staff who do not possess the professional qualifications and relevant experience to manage the TCSP should not be licensed or registered.

164. A supervisor or SRB should consider the ownership and control structure of the TCSP to determine that sufficient control over its operation will reside within the business, which it is considering licensing, or registering. Factors to take into account could include consideration of where the beneficial owners and controllers reside, the number and type of management functions the TCSP is proposing to have in the country, such as directors and managers, including compliance managers, and the calibre of the individuals who will be occupying those roles. It should also consider the extent to which the TCSP's activities are outsourced to another jurisdiction.

165. The supervisor or SRB should also consider whether the ownership and control structure of TCSPs unduly hinders its identification of the beneficial owners and controllers or presents obstacles to applying effective supervision.

Monitoring and supervision

166. Supervisors and SRBs should take measures to effectively monitor TCSPs through on-site and off-site supervision. The nature of this monitoring will depend on the risk profiles prepared by the supervisor or SRB and the connected RBA. Supervisors and SRBs may choose to adjust:

a) the level of checks required to perform their licensing/registration function: where the ML/TF risk associated with the sector is low, the opportunities for ML/TF associated with a particular business activity may be limited, and approvals may be made on a review of basic documentation. Where the ML/TF risk associated with the sector is high, supervisors and SRBs may ask for additional information.

b) the type of on-site or off-site AML/CFT supervision: supervisors and SRBs may determine the correct mix of on-site and off-site supervision of TCSPs. Off-site supervision may involve analysis of annual independent audits and other mandatory reports, identifying risky intermediaries (i.e. on the basis of the size of the firms, involvement in cross-border activities, or specific business sectors), automated scrutiny of registers to detect missing beneficial ownership information and identification of persons responsible for the filing. It may also include undertaking thematic reviews of the sector, making compulsory the periodic information returns from firms. Off-site supervision alone may not be appropriate in higher risk situations. On-site inspections may involve reviewing AML/CFT internal policies, controls and procedures, interviewing members of senior management, compliance officer and other relevant staff, considering gatekeeper's own risk assessments, spot checking CDD documents and supporting evidence, looking at reporting of ML/TF suspicions in relation to clients, and others matters, which may be observed in the course of an onsite visit and where appropriate, sample testing of reporting obligations.

c) the frequency and nature of ongoing AML/CFT supervision: supervisors and SRBs should proactively adjust the frequency of AML/CFT supervision in line with the risks identified and combine periodic reviews and ad hoc AML/CFT

supervision as issues emerge (e.g. as a result of whistleblowing, information from law enforcement, or other supervisory findings resulting from TCSPs' inclusion in thematic review samples).

d) the intensity of AML/CFT supervision: supervisors and SRBs should decide on the appropriate scope or level of assessment in line with the risks identified, with the aim of assessing the adequacy of TCSPs' policies and procedures that are designed to prevent them from being abused. Examples of more intensive supervision could include; detailed testing of systems and files to verify the implementation and adequacy of the TCSPs' assessment, CDD, reporting and record-keeping policies and processes, internal auditing, interviews with operational staff, senior management and the Board of directors and AML/CFT assessment in particular lines of business.

167. Supervisors and SRBs should use their findings to review and update their ML/TF risk assessments and, where necessary, consider whether their approach to AML/CFT supervision and the existing AML/CFT rules and guidance remain adequate. Whenever appropriate, and in compliance with relevant confidentiality requirements, these findings should be communicated to TCSPs to enable them to enhance their RBA.

168. Record keeping and quality assurance are important so that supervisors can document and test the reasons for significant decisions relating to AML/CFT supervision. Supervisors should have an appropriate information retention policy and be able to easily retrieve information while complying with the relevant data protection legislation. Record keeping is crucial and fundamental to the supervisors' work. Undertaking adequate quality assurance is also fundamental to the supervisory process to ensure decision-making/sanctioning is consistent across the supervised population.

Enforcement

169. R.28 requires supervisors or SRB to have adequate powers to perform their functions, including powers to monitor compliance by TCSPs. R.35 requires countries to have the power to impose sanctions, whether criminal, civil or administrative, on DNFBPs, to include TCSPs when providing the services outlined in R.22(e). Sanctions should be available for the directors and senior management of the firms when a TCSP fails to comply with requirements.

170. Competent authorities should use proportionate actions, including a range of supervisory interventions and corrective actions to ensure that any identified deficiencies are addressed in a timely manner. Sanctions may range from informal or written warning, reprimand and censure to punitive sanctions (including suspension or cancellation of registration or licence and criminal prosecutions where appropriate) for more egregious non-compliance, as identified weaknesses can have wider consequences. Generally, systemic breakdowns or significantly inadequate controls will result in more severe supervisory response.

171. Enforcement by supervisors and SRBs should be proportionate while having a deterrent effect. Supervisors and SRBs should have (or should delegate to those who have) sufficient resources to investigate and monitor non-compliance. Enforcement should aim to remove the benefits of non-compliance.

Guidance

172. Supervisors and SRBs should communicate their regulatory expectations. This could be done through a consultative process after meaningful engagement with relevant stakeholders. This guidance may be in the form of high-level requirements based on desired outcomes, risk-based rules, and information about how supervisors interpret relevant legislation or regulation, or more detailed guidance about how particular AML/CFT controls are best applied. Guidance issued to TCSPs should also discuss ML/TF risk within their sector and outline ML/TF indicators and methods of risk assessment to help them identify suspicious transactions and activity. All such guidance should preferably be consulted on, where appropriate, and drafted in ways which are appropriate to the context of the role of supervisors and SRBs in the relevant jurisdiction.

173. Where supervisors' guidance remains high-level and principles-based, this may be supplemented by further guidance written by the TCSP sector, which may cover operational issues, and be more detailed and explanatory in nature. Training events may also provide an effective means to ensure TCSPs are aware of and compliance with AML/CFT responsibilities. Where supervisors cooperate to produce combined guidance across sectors, supervisors should ensure this guidance adequately addresses the diversity of roles that come within the guidance's remit, and that such guidance provides practical direction to all its intended recipients. The private sector guidance should be consistent with national legislation and with any guidelines issued by competent authorities with regard to TCSPs and be consistent with all other legal requirements and obligations.

174. Supervisors should consider communicating with other relevant domestic supervisory authorities to secure a coherent interpretation of the legal obligations and to minimise disparities across sectors (such as legal professionals, accountants and TCSPs). Multiple guidance should not create opportunities for regulatory arbitrage. Relevant supervisory authorities should consider preparing joint guidance in consultation with the relevant sectors, while recognising that in many jurisdictions TCSPs will consider that separate guidance targeted at TCSPs will be the most appropriate form.

175. Information and guidance should be provided by supervisors in an up-to-date and accessible format. It could include sectoral guidance material, findings of thematic reviews, training events, newsletters, internet-based material, oral updates on supervisory visits, meetings and annual reports.

176. An SRB should ensure that advice given by the representative side of the organisation correlates to the rules and guidance set by the supervisory side.

Training

177. Training is important for their supervision staff to understand the TCSP sector and the various business models that exist. In particular, supervisors should ensure that staff are trained to assess the quality of a TCSP´s ML/TF risk assessments and to consider the adequacy, proportionality, effectiveness, and efficiency of AML/CFT policies, procedures and internal controls. It is recommended that the training has a practical basis/dimension.

178. Training should allow supervisory staff to form sound judgments about the quality of the risk assessments made by TCSPs and the adequacy and proportionality of a TCPS´s AML/CFT controls. It should also aim at achieving consistency in the supervisory approach at a national level, in cases where there are multiple competent supervisory authorities or when the national supervisory model is devolved or fragmented.

Endorsements

179. Supervisors should avoid mandating the use AML systems, tools or software of any third party commercial providers of to avoid conflicts of interest in the effective supervision of firms.

Information exchange

180. Information exchange between the public and private sector and within private sector (e.g. between financial institutions and TCSPs) is important to combat ML/TF. Information sharing and intelligence sharing arrangements between supervisors and public authorities (such as Financial Intelligence Units and law enforcement) should be robust, secure and subject to compliance with national legal requirements.

181. The type of information that could be shared between the public and private sectors include:

a) ML/TF risk assessments;

b) typologies (i.e. case studies) of how money launderers or terrorist financers have misused TCSPs or trusts, companies or other legal entities or arrangements managed by TCSPs;

c) feedback on STRs and other relevant reports;

d) targeted unclassified intelligence. In specific circumstances, and subject to appropriate safeguards such as confidentiality agreements, it may also be appropriate for authorities to share targeted confidential information with TCSP's as a class or individually; and

e) countries, persons or organisations whose assets or transactions should be frozen pursuant to targeted financial sanctions as required by R.6.

182. Domestic co-operation and information exchange between FIU and supervisors of the TCSP sector and among competent authorities including law enforcement, intelligence, FIU, tax authorities, and TSCP's supervisors is also important for effective monitoring/supervision of the sector. Such co-operation and co-ordination may help avoid gaps and overlaps in supervision and ensure sharing of good practices and findings. Such intelligence should also inform a supervisor's risk-based approach to supervisory assurance. Intelligence about active misconduct investigations and completed cases between supervisors and law enforcement agencies should also be encouraged. When sharing information, protocols and safeguards should be implemented in order to protect sensitive data.

183. Cross border information sharing of authorities and private sector with their international counterparts is of importance in the TCSP sector, taking account of the multi-jurisdictional reach of many TCSP providers.

Supervision of beneficial ownership requirements and source of funds/wealth requirements

184. TCSPs fulfil a key gatekeeper role to the wider financial community through the activities they undertake in the formation of legal persons and legal arrangements and where they are involved in the management and administration of legal persons and legal arrangements.

185. As DNFBPs, they are required to apply CDD measures to beneficial owners of legal persons and legal arrangements to whom they are providing advice or formation services. In a number of countries a TCSP may be required as part of the process of registering the legal person and will be responsible for providing basic and/or beneficial ownership information to the registry.

186. In their capacity as company directors, trustees, nominees or foundation officials etc. of these legal persons and legal arrangements, TCSPs often represent these legal persons and legal arrangements in their dealings with other financial institutions and DNFBPs that are providing for example banking or audit services to these types of customer.

187. These financial institutions and other DNFBPs may request the CDD information collected and maintained by TCSPs, who because of their role as director, nominee or trustee, will act as the principal point of contact with the legal person or legal arrangement. These financial institutions and other DNFBPs may never meet the beneficial owner/s of the legal person or legal arrangement.

188. Under R.28, countries should ensure that TCSPs are subject to effective systems for monitoring and ensuring compliance with AML/CFT requirements, which includes identifying the beneficial owner/s and taking reasonable measures to verify them. Additionally R.24 and R.25 regarding transparency of beneficial ownership of legal persons and legal arrangements, require countries to have mechanisms for ensuring that adequate, accurate and up to date information is available on a timely basis on these legal entities. The FATF and Egmont Group also published the Report on Concealment of Beneficial Ownership in July 2018 which identified issues to help address the vulnerabilities associated with the concealment of beneficial ownership.

189. R.24 and R.25 also require countries to have mechanisms to ensure that information provided to registries is accurate and updated on a timely basis and that beneficial ownership information is accurate and current. To determine the adequacy of a system for monitoring and ensuring compliance, countries should have regard to the risk of AML/CFT in given businesses (i.e. if there is a proven higher risk then higher monitoring measures should be taken). TCSPs must, however, be cautious in blindly relying on the information contained in registries. In addition it is important for there to be some form of ongoing monitoring during a relationship to detect unusual and potentially suspicious transactions as a result of a change in beneficial ownership as registries are unlikely to provide such information on a dynamic basis.

190. In accordance with R.28, TCSPs should be subject to risk-based supervision by a supervisor or SRB covering the beneficial ownership and record-keeping requirements of R.10 and R.11. The Supervisor or SRB should have a supervisory framework which can help in ascertaining that accurate and current basic and

beneficial ownership information on legal person and legal arrangements is maintained and will be available on a timely basis to competent authorities.

191. The supervisor or SRB should analyse the adequacy of the procedures and the controls, which TCSPs have established to identify and record the beneficial owner. In addition, they should undertake sample testing of client files on a representative basis to gauge the effectiveness of the application of those measures and the accessibility of accurate beneficial ownership information.

192. As part of the onsite and offsite inspection, supervisors or SRBs should examine the policies, procedures and controls that are in place for on-boarding of new clients to establish what information and documentation is required where the client is a natural person or legal person or trust or other similar legal arrangements. Supervisors or SRBs should verify the adequacy of these procedures and controls to identify beneficial owners in order to understand the ownership and control structure of these legal person or trust or other similar arrangements and to ascertain the business activity.

193. Sample testing of client files will also assist the supervisor or SRB in determining whether controls are effective for the accurate identification of beneficial ownership, accurate disclosure of that information to relevant parties and for establishing if that information is readily available. The extent of testing will be dependent on risk but the files selected should reflect the profile of the client base and include both new and existing clients.

194. Supervisors or SRBs should also consider the measures the TCSP has put in place for monitoring changes in the beneficial ownership of legal person or trust or other similar arrangements to whom they provide services or act to ensure that beneficial ownership information is accurate and current and to determine how timely updated filings are made, where relevant to a registry.

195. During examinations, supervisors or SRBs should consider whether to verify the beneficial ownership information available on the files of the TCSP with that held by the relevant registry, if any.

196. Supervisors or SRBs may also take into account information from other competent authorities such as FIUs public reports and information from other financial institutions or DNFBPs, to verify the efficacy of the TCSP's controls.

197. TCSPs should be subject to risk-based supervision by a supervisor or SRB covering the requirements to identify and evidence the source of funds and source of wealth for higher risk clients to whom they provide services. The supervisor or SRB should have the supervisory framework, which can help in ascertaining that accurate and current information on sources of funds and wealth is properly evidenced and available on a timely basis to competent authorities. The supervisor or SRB should analyse the adequacy of the procedures and the controls, which TCSPs have established to identify and record sources of wealth in arrangements.

Nominee arrangements

198. A nominee director is a person who has been appointed to the Board of Directors of the legal person who represents the interests and acts in accordance with instructions issued by another person, usually the beneficial owner. A nominee

shareholder is a natural or legal person who is officially recorded in the Register of Members (shareholders) of a company as the holder of a certain number of specified shares, which are held on behalf of another person who is the beneficial owner. The shares may be held on trust or through a custodial agreement. This nominee relationship should be disclosed to the company and to any relevant registry.

199. In a number of countries, TCSPs act or arrange for other persons (either individuals or corporate) to act as directors and act or arrange for other persons (either individuals or corporate) to act as a nominee shareholder for another person as part of their professional services. In accordance with R.24, these TCSPs should be subject to licensing/registration and supervision, and where acting as nominee shareholder, their status disclosed.

200. There will be legitimate reasons for a TCSP to act as or provide directors to a legal person or act or provide nominee shareholders. It should be apparent from the records of the legal person that it is the TCSP fulfilling these roles as the identity of the TCSP, or that of its members of staff will be disclosed on the register of directors, register of members for example.

201. There are legitimate reasons for a company to have a nominee shareholder including for the settlement and safekeeping of shares in listed companies where post traded specialists act as nominee shareholders. Company law may impose requirement for a legal person to have more than one member, which may also give rise to nominee arrangements. However, these nominee director and nominee shareholder arrangements can be misused to hide the identity of the true beneficial owner/s of the legal person. There may be individuals prepared to lend their name as a director or shareholder of a legal person on behalf of another without disclosing the identity of, or from whom, they will take instructions or whom they represent. They are sometimes referred to as “strawmen”.

202. Nominee directors and nominees shareholders can create obstacles to identifying the true beneficial owner/s of a legal person, particularly where their status is not disclosed. This is because it will be the identity of the nominee, which is disclosed in the corporate records of the legal person held by a registry and in the company records at its registered office. Company law in a number of countries does not recognise the status of a nominee director because in law it is the directors of the company who are liable for its activities and the directors have a duty to act in the best interest of the company.

203. Supervisors and SRBs should be alert to the possibility that undisclosed nominee arrangements may exist. They should consider as part of their onsite and offsite inspections and examination of the policies, procedures and controls and client records of the TCSP whether undisclosed nominee arrangements would be identified and addressed as part of the CDD process and ongoing monitoring by the TCSP.

204. An undisclosed nominee arrangement may exists where there are the following (non-exhaustive) indicators:

a) the profile of a trustee, director or shareholder is inconsistent with the activities of the trust, company or other legal entity;

b) the individual holds a number of appointments to unconnected trusts, companies or other legal entities;

c) a nominee's source of wealth is inconsistent with the value and nature of the assets within the trust, company or other legal entities;

d) funds into and out of the trust, company or other legal entity are sent to or received from unidentified third party/ies;

e) the TCSP is accustomed to acting on the instructions of another person who is not the trustee or director or other natural person exercising effective control; and

f) Requests or instructions are subject to little or no scrutiny and/or responded to extremely quickly without challenge by the individual/s purporting to act as the trustee, director/s or other natural person exercising effective control.

Annex 1: Beneficial ownership information in relation to a trust or other legal arrangements to whom a TCSP provides services

1. Taking a RBA, the amount of information that should be obtained by the TCSP will depend on whether the TCSP is establishing or administering the trust, company or other legal entity or is acting as or providing a trustee or director of the trust, company or other legal entity. In these cases, a TCSP will be required to understand the general purpose behind the structure and the source of funds in the structure in addition to being able to identify the beneficial owners and controlling persons. A TCSP which is providing other services (e.g. acting as registered office) to the trust, company or other legal entity will, taking a risk based approach, be required to obtain sufficient information to enable it to be able to identify the beneficial owners and controlling persons of the trust, company or other legal entity.

2. A TCSP that is not acting as trustee may, in appropriate circumstances, rely on a synopsis prepared by another TCSP, a legal professional or accountant providing services to the trust or relevant extracts from the trust deed itself to enable the TCSP to identify who is the settlor, trustees, protector (if any), beneficiaries or natural persons exercising effective control. This is in addition to the requirement, where appropriate, to obtain evidence to verify the identity of such persons as discussed below.

In relation to a trust

3. A TCSP should have policies and procedures in place to identify the following and verify their identity using reliable, independent source documents, data or information (provided that the TCSP's policies should enable it to disregard source documents, data or information which are perceived to be unreliable)

i. the settlor;

ii. the protector;

iii. the trustee(s), where the TCSP is not acting as trustee;

iv. the beneficiaries or class of beneficiaries, and

v. any other natural person actually exercising effective control over the trust.

Settlor

a) A settlor is generally any person (or persons) by whom the trust was made. A person is a settlor if he or she has provided (or has undertaken to provide) property or funds directly or indirectly for the trust. This requires there to be an element of bounty (i.e. the settlor must be intending to provide some form of benefit rather than being an independent third party transferring something to the trust for full consideration).

b) A settlor may or may not be named in the trust deed. TCSPs should have policies and procedures in place to identify and verify the identity of the real economic settlor.

c) A TCSP establishing on behalf of a client or administering a trust, company or other legal entity or otherwise acting as or providing a trustee or director of a

trustee, company or other legal entity should have policies and procedures in place (taking a risk based approach) to identify the source of funds in the trust, company or other legal entity.

d) It may be more difficult (if not impossible) for older trusts to identify the source of funds, where contemporaneous evidence may no longer be available. Evidence of source of funds may include reliable independent source documents, data or information, share transfer forms, bank statements, deeds of gift, letter of wishes etc.

e) Where assets have been transferred to the trust from another trust, it will be necessary to obtain this information for both transferee and transferor trust.

Beneficiaries

a) A TCSP should have policies and procedures in place, adopting a RBA to enable it to form a reasonable belief that it knows the true identity of the beneficiaries of the trust, and taking reasonable measures to verify the identity of the beneficiaries, such that the TCSP is satisfied that it knows who the beneficiaries are. This does not require the TCSP to verify the identity of all beneficiaries using reliable, independent source documents, data or information but the TCSP should at least identify and verify the identity of beneficiaries who have current fixed rights to distributions of income or capital or who actually receive distributions from the trust (e.g. a life tenant).

b) Where the beneficiaries of the trust have no fixed rights to capital and income (e.g. discretionary beneficiaries), a TCSP should obtain information to enable it to identify the named discretionary beneficiaries (e.g. as identified in the trust deed).

c) Where beneficiaries are identified by reference to a class (e.g. children and issue of a person) or where beneficiaries are minors under the law governing the trust, although a TCSP should satisfy itself that these are the intended beneficiaries (e.g. by reference to the trust deed) the TCSP is not obliged to obtain additional information to verify the identity of the individual beneficiaries referred to in the class unless or until the trustees determine to make a distribution to such beneficiary.

d) In some trusts, named individuals only become beneficiaries on the happening of a particular contingency (e.g. on attaining a specific age or on the death of another beneficiary or the termination of the trust period). In this case, TCSPs are not required to obtain additional information to verify the identity of such contingent beneficiaries unless or until the contingency is satisfied or until the trustees decide to make a distribution to such a beneficiary.

e) TCSPs who administer the trust or company or other legal entity owned by a trust or otherwise provide or act as trustee or director to the trustee, company or other legal entity should have procedures in place so that there is a requirement to update the information provided if named beneficiaries are added or removed from the class of beneficiaries, or beneficiaries receive distributions or benefits for the first time after the information has been provided, or there are other changes to the class of beneficiaries.

f) TCSPs are not obliged to obtain other information about beneficiaries other than to enable the TCSP to satisfy itself that it knows who the beneficiaries are or identify whether any named beneficiary or beneficiary who has received a distribution from a trust is a PEP.

Natural person exercising effective control

a) A TCSP providing services to the trust should have procedures in place to identify any natural person exercising effective control over the trust.

b) For these purposes "control" means a power (whether exercisable alone or jointly with another person or with the consent of another person) under the trust instrument or by law to:

i. dispose of or invest (other than as an investment manager or adviser) trust property;

ii. direct, make or approve trust distributions;

iii. vary or terminate the trust;

iv. add or remove a person as a beneficiary or to or from a class of beneficiaries and or;

v. appoint or remove trustees.

c) TCSPs who administer the trust or otherwise act as trustee must, in addition, also obtain information to satisfy itself that it knows the identity of any other individual who has power to give another individual “control” over the trust; by conferring on such individual powers as described in paragraph (b) above.

Corporate settlors and beneficiaries

4. These examples are subject to the more general guidance on what information should be obtained by the TCSP to enable it to identify settlors and beneficiaries. It is not intended to suggest that a TCSP must obtain more information about a beneficiary which is an entity where it would not need to obtain such information if the beneficiary is an individual.

a) In certain cases, the settlor, beneficiary, protector or other person exercising effective control over the trust may be a company or other legal entity. In such a case, the TCSP should have policies and procedures in place to enable it to identify (where appropriate) the beneficial owner or controlling person in relation to the entity.

b) In the case of a settlor which is a legal entity, the TCSP should satisfy itself that it has sufficient information to understand the purpose behind the formation of the trust by the entity. For example, a company may establish a trust for the benefit of its employees or a legal entity may act as nominee for an individual settlor or on the instructions of an individual who has provided funds to the legal entity for this purpose. In the case of a legal entity acting as nominee for an individual settlor or on the instructions of an individual, the TCSP should take steps to satisfy itself as to the identity of the economic settlor of the trust (i.e. the person who has provided funds to the legal entity to enable it to settle funds into the trust) and the controlling persons in relation to the legal entity at the time the assets were settled into trust. If the corporate settlor retains powers over the trust (e.g. a power of revocation), the TCSP should satisfy itself that it knows the current beneficial owners and controlling persons of

the corporate settlor and understands the reason for the change in ownership or control.

c) In the case of a beneficiary which is an entity (e.g. a charitable trust or company), the TCSP should satisfy itself that it understands the reason behind the use of an entity as a beneficiary. If there is an individual beneficial owner of the entity, the TCSP should satisfy itself that it has sufficient information to identify the individual beneficial owner.

Individual and Corporate trustee

a) Where a TCSP is not itself acting as trustee, it is necessary for the TCSP to obtain information to enable it to identify and verify the identity of the trustee(s) and, where the trustee is a corporate trustee, identify the corporate, obtain information on the identity of the beneficial owners of the trustee, and take reasonable measures to verify their identity.

b) Where the trustee is a listed entity (or an entity forming part of a listed group) or an entity established and regulated to carry on trust business in a jurisdiction identified by credible sources as having appropriate AML/CFT laws, regulations and other measures, the TCSP should obtain information to enable it to satisfy itself as to the identity of the directors or other controlling persons. A TCSP can rely on external evidence, such as information in the public domain, to satisfy itself as to the beneficial owner of the regulated trustee (e.g. the web-site of the body which regulates the trustee and of the regulated trustee itself).

c) It is not uncommon for families to set up trust companies to act for trusts for the benefit of that family. These are typically called private trust companies and may have a restricted trust licence which enables them to act as trustee for a limited class of trusts. Such private trust companies are often ultimately owned by a fully regulated trust company as trustee of another trust. In such a case, the TCSP should satisfy itself that it understands how the private trust company operates and the identity of the directors of the private trust company and, where relevant, the owner of the private trust company. Where the private trust company is itself owned by a listed or regulated entity as described above, the TCSP does not need to obtain detailed information to identify the directors or controlling persons of that entity which acts as shareholder of the private trust company.

Individual and Corporate protector

a) Where a TCSP is not itself acting as a protector and a protector has been appointed, it is necessary for the TCSP to obtain information to enable it to identify and verify the identity of the protector

b) Where the protector is a legal entity, the TCSP should obtain sufficient information that it can satisfy itself who is the controlling person and beneficial owner of the protector, and take reasonable measure to verify their identity.

c) Where the protector is a listed entity (or an entity forming part of a listed group) or an entity established and regulated to carry on trust business in a jurisdiction identified by credible sources as having appropriate AML/CFT

laws, regulations and other measures, the TCSP should obtain information to enable it to satisfy itself as to the identity of the directors or other controlling persons. A TCSP can rely on external evidence, such as information in the public domain to satisfy itself as to the beneficial owner of the regulated protector (e.g. the web-site of the body that regulates the protector and of the regulated protector itself).

Annex 2: Glossary of terminology

Beneficial Owner

Beneficial owner refers to the natural person(s) who ultimately owns or controls a customer and/or the natural person on whose behalf a transaction is being conducted. It also includes those persons who exercise ultimate effective control over a legal person or arrangement.

Competent Authorities

Competent authorities refers to all public authorities with designated responsibilities for combating money laundering and/or terrorist financing. In particular, this includes the FIU; the authorities that have the function of investigating and/or prosecuting money laundering, associated predicate offences and terrorist financing, and seizing/freezing and confiscating criminal assets; authorities receiving reports on cross-border transportation of currency and bearer negotiable instruments (BNIs); and authorities that have AML/CFT supervisory or monitoring responsibilities aimed at ensuring compliance by financial institutions and DNFBPs with AML/CFT requirements. SRBs are not to be regarded as a competent authorities.

Designated Non-Financial Businesses and Professions (DNFBPs)

Designated non-financial businesses and professions means:

a) Casinos (which also includes internet and ship based casinos).

b) Real estate agents.

c) Dealers in precious metals.

d) Dealers in precious stones.

e) Lawyers, notaries, other independent legal professionals and accountants – this refers to sole practitioners, partners or employed professionals within professional firms. It is not meant to refer to 'internal' professionals that are employees of other types of businesses, nor to professionals working for government agencies, who may already be subject to AML/CFT measures.

f) Trust and Company Service Providers refers to all persons or businesses that are not covered elsewhere under the Recommendations, and which as a business, provide any of the following services to third parties:

- Acting as a formation agent of legal persons;
- Acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- Providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangement;
- Acting as (or arranging for another person to act as) a trustee of an express trust or performing the equivalent function for another form of legal arrangement;

- Acting as (or arranging for another person to act as) a nominee shareholder for another person.

Express Trust

Express trust refers to a trust clearly created by the settlor, usually in the form of a document e.g. a written deed of trust. They are to be contrasted with trusts which come into being through the operation of the law and which do not result from the clear intent or decision of a settlor to create a trust or similar legal arrangements (e.g. constructive trust).'

FATF Recommendations

Refers to the FATF Forty Recommendations.

Legal Person

Legal person refers to any entities other than natural persons that can establish a permanent client relationship with a legal professional or otherwise own property. This can include bodies corporate, foundations, anstalt, partnerships, or associations and other relevantly similar entities.

Legal Professional

In this Guidance, the term *"Legal professional"* refers to lawyers, civil law notaries, common law notaries, and other independent legal professionals.

Politically Exposed Persons (PEPs)

Foreign PEPs are individuals who are or have been entrusted with prominent public functions by a foreign country, for example Heads of State or of government, senior politicians, senior government, judicial or military officials, senior executives of state owned corporations, important political party officials. *Domestic PEPs* are individuals who are or have been entrusted domestically with prominent public functions, for example Heads of State or of government, senior politicians, senior government, judicial or military officials, senior executives of state owned corporations, important political party officials. Persons who are or have been entrusted with a prominent function by an international organisation refers to members of senior management, i.e. directors, deputy directors and members of the board or equivalent functions. The definition of PEPs is not intended to cover middle ranking or more junior individuals in the foregoing categories.

Red Flags

Any fact or set of facts or circumstances which, when viewed on their own or in combination with other facts and circumstances, indicate a higher risk of illicit activity. A "red flag" may be used as a short hand for any indicator of risk which puts an investigating TCSP on notice that further checks or other appropriate safeguarding actions will be required.

Self-regulatory bodies (SRB)

A *SRB* is a body that represents a profession (e.g. legal professionals, notaries, other independent legal professionals or accountants), and which is made up of members from the profession, has a role in regulating the persons that are qualified to enter and who practise in the profession, and also performs certain supervisory or

monitoring type functions. Such bodies should enforce rules to ensure that high ethical and moral standards are maintained by those practising the profession.

Supervisors

Supervisors refers to the designated competent authorities or non-public bodies with responsibilities aimed at ensuring compliance by financial institutions ("financial supervisors" 90) and/or DNFBPs with requirements to combat money laundering and terrorist financing. Non-public bodies (which could include certain types of SRBs) should have the power to supervise and sanction financial institutions or DNFBPs in relation to the AML/CFT requirements. These non-public bodies should also be empowered by law to exercise the functions they perform, and be supervised by a competent authority in relation to such functions.

Annex 3: Supervisory practices for implementation of the RBA to TCSPs[26]

The Group of International Finance Sector Supervisors (GIFCS)

Originally known as the Offshore Group of Banking Supervisors, GIFCS was formed in 1980 at the instigation of the Basel Committee on Banking Supervision. Whilst maintaining a close working relationship with the Basel Committee, the group now represents the interests of its member jurisdictions in the supervision of banks, collective investment funds, securities activities and TCSP sectors. GIFCS, which represents supervisory authorities of 20 regional and international finance centres, issued a Standard for the Regulation of TCSPs which sets a minimum benchmark for the effective supervision of the sector, incorporating licensing requirements, together with principles for AML/CFT, prudential and governance supervision of the sector. https://www.groupgifcs.org/letsgo/uploads/gifcsstandardontcsps.pdf

The Standard contains principles for supervision, and specifically includes requirements that the supervisor:

- Assesses at the time of licensing and on an ongoing basis whether a TCSP, its controllers, directors, partners, and Money Laundering Reporting and Compliance Officers are fit and proper,
- Considers the ownership, structure, control and management of the TCSP ensuring that that the ownership structure does not hinder effective supervision or facilitate regulatory arbitrage,
- Requires a TCSP to demonstrate physical presence in the jurisdiction in which it is being regulated which would be demonstrated by requiring its "mind and management" being resident in the jurisdiction and actively involved in the TCSP's governance and having an operational place of business in the jurisdiction,
- Requires that a TCSP embeds a robust corporate governance culture and risk management framework,
- Ensures that a TCSP has ongoing effective management and/or administrative control mechanisms over legal persons and legal arrangements for which its acts, particularly in relation to ultimate beneficial ownership and ensuring that full documentation and information is held on the activity of those vehicles, and
- Ensures that a TCSP has controls to prevent it becoming engaged directly or indirectly with bribery and corruption.

[26] The Hong Kong Institute of Chartered Secretaries (HKICS) has issued an updated guidance to TCSP sector. This is available at: www.hkics.org.hk/media/publication/attachment/PUBLICATION_A_2380_HKICS_AML_CFT_Guideline.pdf. Further, the British Virgin Islands'(BVI's) Anti-Money Laundering and Terrorist Financing (Amendment) (No. 2) Code of Practice, 2018 is available at: www.bvifsc.vg/sites/default/files/anti-money_laundering_and_terrorist_financing_amendment_no._2_code_of_practice_2018.pdf

The Standard also underpins the FATF Recommendations and has a particular focus for supervisors on national and international cooperation and information sharing and ensuring the effective implementation by a TCSP of targeted financial sanctions. All its members are committed to meeting the Standard. A process to evaluate its members' compliance with Standard commenced in 2016.

Guernsey

Guernsey is an international finance centre with a significant TCSP sector which has been subject to prudential and AML/CFT supervision since 2001. The Guernsey Financial Services Commission ("the Commission") is the competent authority in the Bailiwick of Guernsey for licensing and supervising Trust and Corporate Service Providers ("TCSPs).

Under the Regulation of Fiduciaries, Administration Businesses and Company Directors, etc. (Bailiwick of Guernsey) Law, 2000 all licensed TCSPs must at the outset and on an ongoing basis meet a minimum criteria for licensing. This criteria includes a transparent ownership structure, capital adequacy, suitable experience and favourable track record, a suitable risk management framework, sufficient staffing and systems resources, and at least two directors resident in Guernsey who are independent of each over and of appropriate standing and experience to effectively direct and apply "four eyes" control over the business.

Within this criteria, the TCSP and each individual occupying the role of controller (including beneficial owners), partner, director or manager must at the outset and on an ongoing basis meet a fit and proper test covering competence, probity (encompassing their integrity, honesty and reputation), experience, professionalism, soundness of judgement and solvency. Individuals must complete an extensive personal questionnaire recording their employment record, professional qualifications, personal business interests and records regarding any bankruptcy proceedings and any criminal, regulatory or disciplinary sanctions or pending cases.

All licence applications are subject to careful scrutiny. The Commission has statutory powers to impose sanctions against a TCSP or an individual where it considers that the minimum licensing criteria, including the fit and proper criterion, is not or has not been met. Those powers include the power to revoke licences, prohibit individuals from holding a position in the finance sector, impose fines and issue public statements where this criteria is not met. The Commission has published its policy to enforce and use such powers where the failings are sufficiently serious that addressing deficiencies through ordinary or enhanced supervisory processes are not appropriate.

Examples of supervisory action

Example 1 (Refusal of licence application)

An application for a licence was made to establish a TCSP services. Its business model contained a number of significant inherent higher risk factors including proposals to offer "family office" services and yacht administration to high net worth individuals based in jurisdictions identified by credible sources as at a higher risk of bribery and

corruption. It also included jurisdictions which had yet to implement international tax standards on exchange of information.

The application raised the following concerns:

- The applicant proposed having two executive directors. One of the directors would work full time and the other who would give 20% of his normal working week to the business of the applicant but stating that he would increase his hours if necessary. However this director had a large number of other unrelated business interests which could limit the amount of time that he could devote to the applicant's business. The Commission was therefore concerned that there would be lack of effective challenge to the one full time director and limited "four-eyes" control over the applicant's business, a key tenant of the minimum licensing criteria.
- The quality of the application made by the applicant was extremely poor, exhibiting a lack of awareness of the requirements regarding minimum capital and insurance cover for TCSPs together with key information missing on financial forecasts and operating policies and procedures, demonstrating lack of professionalism and skill to provide trust and corporate services. The Commission was not satisfied that the applicant and its directors met the fit and proper test.

The Commission issued a notice that it was "minded to refuse the application" on the grounds that the applicant did not meet the minimum licensing criteria. The application was subsequently withdrawn.

Example 2 (enforcement)

The Commission imposed sanctions against four individuals who were controllers (owners) and directors of a TCSP, and against a fifth individual who was its independent non-executive director, after identifying during an onsite inspection significant failings in the TCSP's anti-money laundering and countering terrorist financing systems and controls. The individuals had failed to ensure that TCSP met the following regulatory requirements of Guernsey AML/CFT regime:-

- To undertake and regularly review relationships risk assessments
- To always take reasonable measures to identify and verify customers and beneficial owners or to obtain information on the purposes and intended nature of each business relationship
- To always undertake enhanced customer due diligence on customers assessed as high risk
- To perform ongoing and effective monitoring of its existing business relationships

- To have appropriate and effective procedures to ensure compliance with legislation for disclosing suspicious activity

The Commission had previously identified similar failings within the TCSP which it had been required to remediate and which had not been appropriately actioned in all instances. As a consequence of these failings the Commission concluded that the individuals had failed to understand the legal and professional obligations upon them as controllers and directors of a TCSP. In failing to remedy previously identified deficiencies the individuals had acted without sound judgement required as part of the fit and proper criterion.

The four executive directors were each fined £50,000 and the non-executive director was fined £10,000. Three of the executive directors were prohibited from acting as a controller, partner, director or money laundering reporting officer within the Bailiwick's finance industry for five years. A public statement was issued identifying the individuals, providing information on the case and the sanctions which were applied.

Example 3 (enforcement)

A TCSP and three of its directors were sanctioned by the Commission for failing to implement appropriate and effective polices, procedure and controls to mitigate ML/TF risks to which the business could be exposed. An onsite inspection identified fundamental failings in the TCSP's anti-money laundering and countering of terrorist financing systems and controls, particularly in respect of business relationships assessed as high risk involving politically exposed persons ("PEPs") linked to higher risk jurisdictions. The failings were referred to the Commission's Enforcement Division to undertake further investigation which carried out a further onsite inspection.

The Commission identified the following failings:

- That the TCSP failed to conduct customer due diligence in accordance with regulatory requirements, and in respect of individuals to whom a Power of Attorney had been granted or were potential beneficiaries of trusts;
- That the TCSP failed to undertake sufficient enhanced customer due diligence, including taking reasonable measures to establish source of wealth and funds of customers who were PEPs and had links to jurisdictions identified by credible sources as having a higher risk of bribery and corruption;
- That the TCSP failed to effectively monitor ongoing customer activity or scrutinise unusual transactions.

The failings were similar to deficiencies identified in two previous inspections to the TCSP and showed that the remedial action that it had been required to undertake had not been appropriately actioned in all instances. The Commission concluded that the TCSP's systems and

controls did not enable it to comply with Guernsey's AML/CFT regulatory requirements and therefore the TCSP had not conducted its business in a prudent manner required by the minimum licensing criteria. The Commission considered that the Directors had demonstrated a lack of probity, competence and soundness of judgement which are factors which are taken into account when considering whether a director is a fit and proper person.

The firm was fined £42,000, one of the directors who served as the compliance director and money laundering reporting officer was fined £18,375 and the two other directors were each fined £10,500. A public statement was issued identifying the parties, providing information on the case and the sanctions which were applied.

Hong Kong, China

Priority is given to and more resources are accorded to higher risk cases for targeted inspection. For higher risk cases, on-site inspections are conducted on a priority basis and the TCSP licensees are subject to more frequent compliance inspections to ensure their continuous compliance with the statutory CDD and record-keeping requirements. Customer and transaction records are checked during the on-site inspections to ensure that effective AML/CFT measures are in place for compliance with the statutory requirements. For higher risk cases, a higher proportion of such records will be selected for checking.

Also, applicants for TCSP licences and licensees are required to complete a supplementary information sheet to provide the relevant information in order to monitor their compliance with the AML/CFT requirements and to assess their ML/TF risks. Off-site supervision consists of analysis of the supplementary information sheets and ongoing monitoring of the compliance of the licensing conditions of the licensees, including compliance with AML/CFT requirements, classifying the risk profiles of individual licensees, identifying risky applicants/licensees, undertaking thematic reviews of the sector and meeting with trade representatives to monitor and assess any changes in the trade practice. Follow-up actions, including prosecution and disciplinary action, will be taken if any non-compliance with statutory CDD and record keeping requirements is identified.

Examples of supervisory action

Example 1

An application for TCSP licence was made by Corporation A. Ms B was the sole director and ultimate owner of Corporation A. She was also named as Corporation A's Compliance Officer and the Money Laundering Reporting Officer. The Companies Registry (CR) conducted on-site inspection on Corporation A to interview Ms B and inspect transaction records of Corporation A. During the inspection, Ms B was unable to produce any record or document and there was no evidence showing that Ms B as the Compliance Officer and the Money Laundering Reporting Officer was normally based in Hong Kong.

Upon consideration of all the circumstances of the case including the non-compliances above, the CR was not satisfied that Ms B was fit and proper to carry on or be associated with a TCSP business. As a result, Corporation A's application for TCSP licence was rejected.

Example 2

A group of five TCSPs operating at the same business premises applied for TCSP licences. They provided company services to a very large number of customers and acted as the company secretaries of over 70 000 companies. A Mr X was the ultimate owner and director of the five TCSPs, and was also the Compliance Officer and Money Laundering Reporting Officer of these TCSPs.

Some of these TCSPs were checked to be the company secretaries of front companies suspected of having business or connection with entities subject to the United Nations Security Council sanctions.

The CR conducted on-site inspection at the business premises and inspected records of the TCSPs' customers and transactions. Mr X was interviewed. All five applicants and Mr X failed to demonstrate that they were fit and proper to carry on or be associated with a TCSP business. They also failed to demonstrate that they had complied with the statutory CDD and record-keeping requirements. Eventually, all the five applicants had withdrawn their applications for TCSP licences before CR proceeded to reject their applications.

Isle of Man

Through the Beneficial Ownership Act 2017 (the "Act"), the Isle of Man established a Beneficial Ownership Register held by the Companies Registry and overseen by the Isle of Man Financial Services Authority. This legislation compliments longstanding requirements upon FIs and DNFBPs to undertake customer due diligence requirements including beneficial owners of their customers.

From 1st July 2017 the Act placed legal obligations on certain types of legal persons, their beneficial owners, intermediate owners, legal owners and nominated officers with regard to beneficial ownership information, namely that beneficial ownership information should be passed through the ownership chain to the legal person's nominated officer. The legal person's nominated officer must retain all beneficial owners' details, and add any beneficial owners holding more than 25% ownership or control to the beneficial ownership database. The Act does not apply to legal persons which are foreign companies, a company listed on a recognised stock exchange or entities wholly owned by a company listed on a recognised stock exchange.

The FSA has powers in order to ascertain whether the obligations and requirements imposed by the Act have been and are being complied with and whether the database is effective and its information accurate. The following case example provides an example of supervisory action:

Members of the FSA's Enforcement Division conducted an inspection in relation to 10 companies which had a common nominated officer. The nominated officer was visited and the information held by them checked against the submissions made to the

beneficial ownership database. Minor errors were identified in relation to two companies whereby the nature of ownership was recorded incorrectly and the trustees of a trust had not been considered as beneficial owners of the underlying Isle of Man company. The Authority issued a report identifying the errors, detailing how the nominated officer should regularise them and a deadline for which the corrections must be made. The database was updated by the nominated officer in the given timescale.

Jersey

Supervising TCSP's business/enterprise risk assessment

The Jersey Financial Services Commission (JFSC) received a response from a regulated TCSP to queries the JFSC raised over its risk assessment. The response provided details of a 'cash register' and cash transactions undertaken on behalf of its customers. Owing to the inherent ML risk relating to these transactions, the TCSP was formally placed under investigation, encompassing a 6-day onsite examination with Enforcement and Supervision reviewing corporate governance, the compliance function and conduct of business, with particular focus to those customers identified on the cash register. Following the on-site examination the JFSC made the following observations:

The regulated TCSP appeared to have committed significant breaches of the TCSP Code of Practice;

Contrary to legal and regulatory requirements, the TCSP had carried out cash transactions where it did not hold adequate CDD, Source of Funds or rationale for services being carried out.

The TCB was informed that the JFSC was concerned that it may have facilitated money laundering on an extensive scale, for which suspicious activity reports were submitted. Directions were issued to each principal person restricting their involvement in Jersey's finance industry, along with the issuance of a public statement in respect of the TCSP and the Principals

Examples of supervisory actions

Example 1

The JFSC undertook an onsite examination to a TCSP and identified deficiencies related to corporate governance, effectiveness of compliance function and AML/CFT issues, which included ineffective procedures, transaction monitoring deficiencies, lack of CDD/Source of Funds (including on PEPs), lack of AML/CFT awareness/training and deficient record keeping. As a result of these deficiencies, the JFSC issued a Notice requiring the appointment of a reporting professional to review a larger sample of client files. The reporting professional's findings replicated to a large extent the JFSC's findings.

Whilst the Reporting Professional's review was being undertaken, the JFSC became aware of a Notice on a foreign regulator's website regarding an action that was being taken in relation to a company that had a connection to a company that the Reporting Professional was reviewing. Contact was made with the foreign regulator and a meeting was held. Assistance was also provided to law enforcement authority from the foreign jurisdiction concerned regarding a fraud perpetrated there but where the proceeds of the fraud were received by the TCSP. Perpetrators of the fraud were jailed in the UK. The business was sold to another TCSP and the JFSC issued a public statement and placed restrictions on the Principal Persons by directions.

Example 2

The JFSC conducted a supervisory on-site examination of a regulated TCSP, which identified a number of significant concerns over corporate governance and its provision of services to structures under administration. An internal remediation process was undertaken and a regulatory consulting firm was engaged to perform an independent review of the corporate governance and customer files in respect of the trust company business. The regulated TCSP also promptly implemented initial steps in relation to training and revised policies and procedures to remediate issues identified.

Following the on-site examination, the JFSC required co-signatories to be appointed to review and pre-approve certain transactions. The co-signatories were required to provide a report of any issues identified during the course of their engagement. Two individuals responsible for approx. 70% of the trust and corporate business clients voluntarily took a leave of absence and subsequently left.

The on-site examination, co-signatories report and consultants report identified a lack of effective governance and lack of appropriate compliance oversight in relation to the trust company business. This resulted in the two individuals receiving banning directions and a public statement being issued in respect of the regulated TCSP and both individuals. Following the conclusion of the investigation, the regulated TCSP underwent intense remediation, monitored by the JFSC.

Example 3

During an on-site examination serious concerns were noted in relation to the conduct of the TCSP and its principal persons in the provision of services to a customer structure. The matter was referred to the Enforcement Division and an investigation was commenced, which identified a number of failings on behalf of the TCSP and its principal and key persons in relation to the customer structure. In order to assess whether the failings were inherent across the wider business, the JFSC required the TCSP to appoint an independent reporting professional to

conduct a wider review of customer structures. The investigation and the reporting professional's report both identified a lack of effective governance surrounding, and inadequate systems and controls in respect of the TCSP's obligations under the AML/CFT regime on issues related to obtaining sufficient CDD; applying correct customer risk ratings; understanding and documenting customer rationale, fully understanding source of wealth/source of funds; exercising control and understanding the complexity of risks; implementing a robust annual review process; considering and acting upon adverse information; poor record keeping and failing to consider obligations under the AML/CFT legislation to with regards to suspicious activity reporting

The JFSC issued directions requiring remediation and to the principal and key persons requiring further AML/CFT training.

Example 4

The JFSC was notified of a number of regulatory breaches namely four breaches of Section 8.3.1 of the AML/CFT Handbook, the late notification and internal reporting to the MLRO of suspicion relating to customers. As a result of the late notification of the breaches, the TCB was issued with Civil Penalty warning. Given the nature of the breaches, the matter was referred to Enforcement for consideration, who made the Jersey FIS aware of concerns over failing to report and late submission of SARs.

In agreement with the JFSC, the TCSP appointed a reporting professional voluntarily to conduct a review of its remediation of issues and compliance function.

The report produced alleviated much of the JFSC's concerns concerning the current compliance environment however there was still some remediation required. The matter was passed back to Supervision for monitoring of the remediation and to test at a later stage. The TCSP was notified that the JFSC would consider a Band 2 Civil Penalty should the issues not be remediated satisfactorily.

Example 5

As a result of an on-site examination, concerns were highlighted over the competency of the MLRO in AML/CFT at a TCSP. Specifically it appeared that the MLRO had failed to externalise a number of internal SARs in circumstances where he noted suspicion of criminality.

Following a referral from Supervision, Enforcement conducted an investigation in respect of the MLRO's fitness and propriety. The investigation concluded that the MLRO lacked competency in AML/CFT matters but did not lack integrity.

A without prejudice settlement was entered into with the MLRO, restricting him from acting in any Key Person role until such time he

completed further AML/CFT training. As a result of the Enforcement action, the TCB appointed a new MLRO.

Malaysia

A. Fit and Proper Requirements

Trust service providers in Malaysia consist of trust companies registered under the Trust Companies Act 1949 or incorporated under the Public Trust Corporation Act 1995. Company service providers are made up of members of professional bodies or individuals licensed by the Companies Commission of Malaysia. All TCSPs are subject to appropriate market entry controls under the respective legislation and professional obligations governing them, by which they are required to fulfil certain fit and proper requirements.

B. AML/CFT Risk-based Supervision – Bank Negara Malaysia (BNM)

Under the Anti-Money Laundering, Anti-Terrorism Financing and Proceeds of Unlawful Activities Act 2001 (AMLA), BNM is the designated competent authority for the AML/CFT supervision of the DNFBPs, including TCSPs. BNM adopts a risk-based approach supervision on TCSPs, in which the differentiation is guided by the outcome of the National Risk Assessment (NRA) and the application of Risk-Based Supervisory Framework (D'SuRF), as follows:

i. National Risk Assessment (NRA) 2017

Malaysia's third iteration of the NRA in 2017 comprising assessment of ML/TF inherent risk and overall control effectiveness stipulated the TCSPs' net ML and TF risks as **"MEDIUM HIGH"** and **"MEDIUM"** level, respectively, as exacerbated by the sector's marginal control, as follows:

ML		TF	
Inherent Risk	Medium	Inherent Risk	Low
Control	Marginal	Control	Marginal
Net Risk	Medium High	Net Risk	Medium

i. Risk-Based Supervisory Framework for DNFBPs and Other Financial Institutions (D'SuRF)

D'SuRF encapsulates end-to-end governance and supervisory process, risk-based application of supervisory tools. In line with the ML/TF rating of the sector and the application of D'SuRF, the frequency and intensity of monitoring on TCSPs are guided accordingly to include a range of supervisory tools, which include the following:

- **On-site Examination**

Firms are selected based on a robust selection process under the D'SuRF, which is in line with the risk profile of the reporting institutions (RIs). The on-site examination is in-depth, with assessments covering the RIs' inherent risk and quality of risk management. In applying RBA, BNM imposes post-onsite follow-up measures for RIs with heightened risks. This includes requiring the RI to submit proposals to BNM on planned measures to rectify any supervisory issues and progress report until full rectification. The D'SuRF sets the deadline for both submissions. The follow-up measures have been imposed on a number of TCSPs selected for on-site examination.

- **Off-site Monitoring and Supervisory Outreach Activities**

In addition, BNM employs a range of off-site monitoring and supervisory outreach activities, aimed to elevate awareness and guide the implementation of the AMLA requirements by the TCSPs. These off-site tools are also deployed according to the RBA, whereby the intensity and frequency for the TCSPs is relatively higher compared to other sectors. Among the off-site monitoring, includes the submission of data and compliance Report, internal audit reports, and statistical data. BNM and the relevant SRBs also conduct periodic nationwide AML/CFT outreach and awareness programmes.

Monaco

Monaco completed its first NRA (National Risk Assessment) in 2017 and the CSPs were included in the scope (see public NRA report in www.siccfin.mc/en/The-National-Risk-Assessment-NRA).

The assessed risk regarding CSPs was rated MH (moderate high) so the CSP are included in the priority professionals to be inspected on-site. There are about 40 CSPs in Monaco so ten to twelve inspections are planned every year. In addition, the CSPs are subject to a compulsory annual questionnaire which they have to send to SICCFIN by February 28, which helps the supervisor in detecting anomalies in their activities. The RBA is not yet fully formalized, but the selection of CSPs to be added to the inspection planning is performed as follows:

- The date of the previous inspection
- The conclusions of the previous inspection and how the CSP responded to it (improvements implemented)
- The evolution of the CSP as detected through the annual questionnaire
- Information transmitted by the FIU (which is within SICCFIN as well as the supervision of professional submitted to AML act) regarding the quality of SARs and other related topics.

Other criteria are planned to be added in the near future.

Singapore

Singapore's Registered Filing Agents and Registered Qualified Individuals Regulatory Regime

Since 2015, firms and companies which intend to incorporate legal entities on behalf of another person or provide corporate services (e.g. acting or arranging for someone to act as director, secretary, shareholders or providing registered office addresses) in the course of their business, must register with the Accounting and Corporate Authority (ACRA) as a Registered Filing Agent (RFA). These firms have to act through at least one Registered Qualified Individual (RQI) with ACRA. Lawyers and accountants are supervised by their respective regulators/regulatory bodies, but if the accountancy or law firm also provides corporate services, it also needs to be registered with ACRA as a RFA and will be subjected to ACRA's AML/CFT requirements in their role as a RFA.

These firms will not be permitted to register as a RFA if any of the firm's beneficial owners, directors, partners or managers have been convicted of criminal offences or if they are undischarged bankrupts. An individual will not be permitted to be registered as a RQI if he/she has been convicted of a criminal offence (especially those related to fraud or dishonesty) or if he is an undischarged bankrupt.

Since 15 Nov 2018, ACRA has enhanced the RFA's registration requirements to mandate anyone seeking registration or renewal as a RFA, to complete a prescribed AML/CFT training programme and also pass a proficiency test once every two years as a pre-condition to their registration or renewal. This seeks to ensure that RFAs can adequately comply with AML/CFT obligations through continuous education.

FATF

GUIDANCE FOR A RISK-BASED APPROACH
TRUST AND COMPANY SERVICE PROVIDERS

The risk-based approach (RBA) is central to the effective implementation of the revised FATF International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation, which were adopted in 2012.

This guidance highlights the need for a sound assessment of the money laundering and terrorist financing risks that trust and company service providers face so that the policies, procedures and initial and ongoing client due diligence measures can mitigate these risks.

The FATF developed this non-binding guidance with significant input from the TCSP sector, to ensure that it reflects their practical expertise and good practices.

Risks and Policy Responses

May 2020

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

COVID-19-related Money Laundering and Terrorist Financing Risks and Policy Responses

Foreword

The COVID-19 pandemic has led to unprecedented global challenges, human suffering and economic disruption. This paper identifies challenges, good practices and policy responses to new money laundering and terrorist financing threats and vulnerabilities arising from the COVID-19 crisis.

It is based on papers shared on 7 and 23 April with the FATF Global Network of FATF Members and FATF-Style Regional Bodies (FSRBs), together making up more than 200 jurisdictions. The authors thank the FATF members, observers, the FSRB Secretariats and their members for their contribution to the report. This report was written by Kristen Alma, Shana Krishnan, Colby Mangels and Mei-Lin Wang from the FATF Secretariat.

This paper is for information and does not constitute the official view of the FATF. It does not imply or constitute any changes to the FATF Standards. The measures cited, and taken by some FATF members' authorities, have not been reviewed or considered by the FATF membership as a whole.

Table of contents

Key findings

- The increase in COVID-19-related crimes, such as fraud, cybercrime, misdirection or exploitation of government funds or international financial assistance, is creating new sources of proceeds for illicit actors.
- Measures to contain COVID-19 are impacting on the criminal economy and changing criminal behaviour so that profit-driven criminals may move to other forms of illegal conduct.
- The COVID-19 pandemic is also impacting government and private sectors' abilities to implement anti-money laundering and counter terrorist financing (AML/CFT) obligations from supervision, regulation and policy reform to suspicious transaction reporting and international cooperation.
- These threats and vulnerabilities represent emerging money laundering (ML) and terrorist financing (TF) risks. Such risks could result in:
    - Criminals finding ways to bypass customer due diligence measures;
    - Increased misuse of online financial services and virtual assets to move and conceal illicit funds;
    - Exploiting economic stimulus measures and insolvency schemes as a means for natural and legal persons to conceal and launder illicit proceeds;
    - Increased use of the unregulated financial sector, creating additional opportunities for criminals to launder illicit funds;
    - Misuse and misappropriation of domestic and international financial aid and emergency funding;
    - Criminals and terrorists exploiting COVID-19 and the associated economic downturn to move into new cash-intensive and high-liquidity lines of business in developing countries.
- AML/CFT policy responses can help support the swift and effective implementation of measures to respond to COVID-19, while managing new risks and vulnerabilities. These include:
    - Domestic coordination to assess the impact of COVID-19 on AML/CFT risks and systems;
    - Strengthened communication with the private sector;
    - Encouraging the full use of a risk-based approach to customer due diligence;
    - Supporting electronic and digital payment options.

1. Introduction

This paper is part of a coordinated and timely response to the impact of the COVID-19 crisis on global anti-money laundering (AML) and counter terrorist financing (CFT) efforts and the application of the FATF Standards in this context. This response also includes a Statement from the FATF President, issued on 1 April, on how the risk-based approach of the FATF Standards provides for emerging threats and vulnerabilities to be managed effectively and in support of COVID-19 aid and containment efforts (see Annex A).

A list of statements and guidance issued by authorities in response to COVID-19 is included in Annex B, for reference.

This paper was developed in response to the unprecedented and rapidly evolving COVID-19 public health crisis. The findings contained within are likely to evolve as this crisis further develops.

This paper is informed by open-source research, and information received from member countries of the FATF and FATF-style regional bodies (FSRBs) and observer organisations such as the International Monetary Fund (IMF), World Bank and United Nations.

The focus of this paper relates to three broad themes:

- New threats and vulnerabilities stemming from COVID-19-related crime and impacts on ML and TF risks;
- Current impact on AML/CFT efforts by governments and the private sector due to COVID-19;
- Suggested AML/CFT policy responses to support the swift and effective implementation of measures to respond to COVID-19, while managing new risks and vulnerabilities identified, including: charitable activity and economic and fiscal stimulus and financial rescue packages for firms and individuals.

2. Evolving ML/TF risk picture

2.1. Increased ML Threats

The COVID-19 pandemic has generated various government responses, ranging from social assistance and tax relief initiatives, to enforced confinement measures and travel restrictions. While unintended, these measures may provide new opportunities for criminals and terrorists to generate and launder illicit proceeds.

While the precise situation and public health responses in each country varies according to the impact of COVID-19, the evolving risk picture detailed in this section is based on the following general assumptions:

- Governments, businesses and individuals are increasingly turning to online systems to enable remote work. Individuals under "lockdown" (or other movement restriction measures) are also increasingly turning to online platforms for social interaction.
- Businesses that are classified as non-essential have physically closed. Both essential and non-essential business are seeing increased online sales.

- The COVID-19 pandemic has driven significant demand for medical supplies, such as personal protective equipment, ventilators and medicines and there is a global shortage of such goods due to the overwhelming demand.
- Banks and financial institutions remain in operation with some offering more limited services and restricting in-person banking.
- The closure of many businesses due to "lockdown" measures and other restrictions on trade and travel has led to mass unemployment or the furloughing of workers, loss of government revenue and a general economic recession that will impact the financial and social behaviour of businesses and individuals.
- Government resources have been reprioritised towards responding to COVID-19, taking resources away from other areas of work.
- With global trade volumes in decline and individual travel at a near standstill, conventional transnational organised crime schemes that take advantage of global supply chains and the traditional illicit revenue schemes of organised crime groups are impacted by COVID-19.

Increased Fraud

Reporting from FATF members, observers, and open sources indicates that criminals have attempted to profit from the COVID-19 pandemic through increased fraudulent activities. At the time of writing, the primary fraudulent activities include:

- **Impersonation of officials**: In such cases, criminals contact individuals (in person, email or telephone) and impersonate government officials with the intent of obtaining personal banking information or physical cash. In some cases, criminals impersonate hospital officials who claim a relative is sick and require payment for treatment (Interpol, 2020[1]), or government officials requesting personal banking information for tax relief purposes (US Treasury, 2020[2]). Cases involving government impersonation are likely to increase as governments around the world disburse grants and tax relief payments to their citizens, with criminals attempting to profit from these payments.
- **Counterfeiting, including of essential goods (such as medical supplies and medicines)**: Given the high demand, there is a significant increase in online scams involving certain medical supplies, personal protective equipment and pharmaceutical products. In such cases, the suspects claim to be employees of businesses, charities, and international organisations offering masks, testing kits and other products, and request credit card information for payment or a shipping fee but never deliver the goods. (US FDA, 2020[3]) In some scenarios, victims were asked to make payment in advance via bank transfers and then directed to collect goods from various locations, but were then subsequently informed that there were no such arrangements. (Singapore Police Force, 2020[4]) In similar scams, the goods are delivered to the consumer but are counterfeit or ineffective.[1] Such scams target both individual consumers and businesses. FATF members are also seeing an increase in false and misleading COVID-19 treatment claims and vendors selling illegal products marketed as "miracle" cures.[2]
- **Fundraising for fake charities**: FATF members highlight an increase in fundraising scams. In such cases, criminals posing as international organisations or charities circulate emails requesting donations for COVID-19-related

[1] (European Commission, 2020[28]) (Cellule de Renseignement Financier Luxembourg, 2020[6]) (Interpol, 2020[7]) (Europol, 2020[8])

[2] (US Justice Department, 2020[9]) (US ICE, 2020[10])

fundraising campaigns (purportedly for research, victims and/or products). Recipients of these emails are then directed to provide credit card information or make payments through the suspect's secure digital wallet.

- **Fraudulent investment scams**: The economic crisis resulting from COVID-19 has led to an increase in investment scams, such as promotions falsely claiming that products or services of publicly traded companies can prevent, detect or cure COVID-19. (Europol, 2020[5]) Reporting by FATF members highlighted that microcap stocks, typically issued by the smallest companies, may be particularly vulnerable to fraudulent investment schemes as they are low-priced stocks with often limited publicly-available information. This facilitates the spread of false information about the company. (US Securities and Exchange Commission, 2020[6])

Cyber Crime

There has been a sharp rise in social engineering attacks, specifically phishing email and mobile messages through spam campaigns. These attacks use links to fraudulent websites or malicious attachments to obtain personal payment information.

- **Email and SMS phishing attacks**: Criminals are exploiting concerns about COVID-19 to insert malware on personal computers or mobile devices. In one example, cybercriminals posed as the World Health Organization (WHO) and sent email and mobile messages to lure individuals into clicking malicious links or opening attachments, which subsequently reveal the individual's user name and password. (WHO, 2020[7]) Various versions of these phishing attacks are currently being reported. Other examples include government impersonation via SMS to lure individuals to fraudulent government websites to obtain personal account information and/or sensitive usernames and passwords. (CISA, 2020[8])
- **Business email compromise scams**: Amid a sharp rise in global remote-working, cybercriminals are also exploiting weaknesses in businesses' network security to gain access to customer contact and transaction information. This information is then used in targeted phishing emails whereby the criminals pose as the compromised business and request payment for legitimate goods and/or services but instead direct this payment into their illicit accounts. (FBI, 2020[9]) In another example, a company received spoofed emails similar to those sent by their business partner to redirect payment transfers to scammers' controlled bank accounts, under the pretext of paying for large supplies of surgical masks and hand sanitiser.
- **Ransomware attacks**: Reports also indicate that cybercriminals are using different methods to insert ransomware on personal computers and mobile devices. For example, some FATF members report that cybercriminals are using malicious websites and mobile applications that appear to share COVID-19-related information to gain and lock access to victims' devices until payment is received. Organisations at the forefront of the COVID-19 response can be heightened targets for cybercriminals. Specifically, hospitals and other medical institutions have increasingly become targets of cybercriminals for ransomware attacks. (Interpol, 2020[10])

Impact on Other Predicate Crimes

- **Human Trafficking[3] and Exploitation of Workers**: Criminals may take advantage of the pandemic to exploit vulnerable groups. This may lead to an increase in the exploitation of workers and human trafficking. (Council of Europe, 2020[11]) The suspension or reduced activity of government agencies regularly engaged in detecting human trafficking cases and identifying victims of trafficking (including workplace inspectors and social and health care workers) means that cases may go undetected. (WEF, 2020[12]) The shutdown of workplaces, slowdown in the economy, rising unemployment, and financial insecurity are factors that could result in an increase in human exploitation. One FATF member has advised reporting entities to be increasingly alert to the exploitation of workers and trafficking in vulnerable persons. (Austrac, 2020[13])
- **Online Child Exploitation**: There are reports from some members of a rise in the production and distribution of online child exploitation material, often for profit. With the closure of schools, children are increasingly using the internet during "lockdown" periods, which could lead to an increase in online child exploitation. (FBI, 2020[14]) There are also reports that "lockdowns" and travel bans are increasing demand for this material. (Austrac, 2020[13])
- **Organised Property Crime**: With many properties currently uninhabited due to COVID-19, there are reports of an increase in organised property crime/theft. (Europol, 2020[15])

2.2. Other Contextual Factors and ML Vulnerabilities

Changing Financial Behaviours

Reporting indicates significant changes in financial behaviours and patterns in light of COVID-19. Many bank offices and branches are closed due to public health and "lockdown" measures. Customers are therefore carrying out more transactions remotely. Over the medium to long-term, an economic downturn could further alter financial activities and result in individuals seeking financing outside the formal economy.

- **Increased remote transactions**: FATF and FSRB members report that some banks have closed their physical branches, reduced opening hours or restricted the services available in-person. Members also report increased online banking activities, including customer on-boarding and identity verification. Some supervisors have clarified that, in line with a risk-based approach, banks can postpone certain elements of customer identity verification during confinement periods. However, FATF and FSRB members note that some financial institutions may not be equipped to verify customers' identity remotely.
- **Unfamiliarity with online platforms**: Certain population segments (e.g., the elderly, low-income groups, and remote or indigenous communities) may be less familiar with using online banking platforms, and therefore more susceptible to fraud. Reports indicate that online bank fraud targeting financial or account

[3] Human trafficking is defined in the *Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime* as: the recruitment, transportation, transfer, harbouring or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of sexual exploitation, forced labour or services, slavery or practices similar to slavery, servitude or the removal of organs.

information is on the rise. (Cellule de Renseignement Financier Luxembourg, 2020[16])

- **Unregulated financial services**: Citing correlations with past economic downturns, both FATF and FSRB members note that, in a prolonged economic recession, those with financing needs may seek out non-traditional or unlicensed lenders, which may include criminal groups. Members also indicate that traditional financial gatekeepers may become pre-occupied with business continuity issues while still having to cope with monitoring suspicious transactions.

Misdirection of Government Funds or International Financial Assistance and Increased Risks of Corruption

Many governments are providing stimulus funds to mitigate the economic impact related to COVID-19. FATF and FSRB members report that criminals may try to fraudulently claim or misdirect such funds. Corruption in procurement or aid delivery channels could also impact international financial assistance.

- **Exploiting stimulus measures**: FATF and FSRB members report that a small proportion of economic support directed to businesses and individuals may present potential fraud risks, and consequent ML. In particular, criminals can falsely claim to provide access to stimulus funds to obtain personal financial information. (US IRS, 2020[17]) FATF members report that criminals may use legal persons to make fraudulent claims on government stimulus funds by posing as legitimate businesses seeking assistance. Some FATF members reported taking steps to reduce risks, such as disbursing aid to people and businesses via existing government accounts for receiving social benefits. (Australian Ministers for the Department of Social Services, 2020[18]) Stimulus measures that involve loan schemes may also be abused by criminals to launder funds.
- **International financial assistance and increased risks of corruption**: Many countries have an immediate need for emergency financial assistance to respond to COVID-19. However, international financial institutions report that there is a risk that emergency financial aid provided to countries can be misappropriated by corrupt officials, particularly in countries where the rule of law is weak and there are poor transparency and accountability measures. FSRB members also report that government contracts to purchase large amounts of COVID-19-related medical supplies provide opportunities for corruption and the misappropriation of public funds. This activity may become more prevalent if there is a perception of decreased financial oversight on government procurement and spending. FSRB members also indicate that individuals could use corruption or informal channels to obtain lucrative government contracts outside standard procurement procedures.

Increased Financial Volatility

Recent financial and economic volatility reflects uncertainties associated with COVID-19. In this context, opportunistic criminals may shift their activities to exploit new vulnerabilities.

- **Economic downturn**: In an economic downturn, criminals may seek to invest in real estate or troubled businesses to generate cash and mask illicit proceeds. Criminal groups can also introduce illicit proceeds into the financial system by restructuring existing loans and lines of credit. In addition, corporate insolvency proceedings can free up illicit cash contained in businesses whilst masking the

funds' origins. FATF members highlight that tax evasion and related crimes may increase as individuals and companies facing economic difficulties look to reduce their fiscal burdens. A prolonged economic downturn could result in private sector entities having fewer resources to combat ML/TF, thereby increasing their risks. Finally, increases in financial hardship due to an economic slowdown could lead to a rise in certain types of subsistence crimes in developing countries (e.g., burglary, theft and wildlife poaching).

- **Increased physical cash transactions**: FATF members report that recent swings in securities values are resulting in individuals liquidating their portfolios and transferring large amounts of funds electronically. FATF and FSRB members reported an overall increase in banknote withdrawals, with some FATF members raising cash withdrawal limits. FATF and FSRB members highlight that increased use of banknotes can mask ML/TF activities in the following ways:
    - When financial markets stabilise, large movements to re-deposit funds could provide cover to efforts at laundering illicit funds, including banknotes;
    - Banknotes can be used to purchase safe haven assets (e.g., gold), which are less easily traceable;
    - An increased risk of cash-out schemes, where criminals obtain access to an individual's bank account and withdraw funds in banknotes from an ATM; and
    - Customers involved in suspicious banknote withdrawals or transactions reference "COVID-19" as the transaction purpose, thereby masking potential illicit activities.
- **Virtual assets**: FATF and FSRB members highlighted the continuing ML/TF risks associated with virtual assets. In one recent case, an individual used virtual assets to launder proceeds earned from selling fraudulent COVID-19 medicine. (US Justice Department, 2020[19])
- **Insider trading**: Reporting indicates an increase in investor fraud due to increasingly volatile financial markets. Wholesale financial service providers are transferring or liquidating assets in securities markets in response to COVID-19-related uncertainties. These large value shifts in markets can potentially increase the risk of illicit financial market activities, such as insider trading that seeks to profit from large value swings. FATF members also report individuals using securities offerings to raise capital on fake products or medicines.

2.3. Financing of Terrorism

The United Nations has warned that threats related to terrorism remain and that terrorist groups may see opportunities for increased terrorist and terrorist financing activity while government attention is focused on COVID-19. (UN, 2020[20]) This is a particular concern in the Sahel region. One FSRB Secretariat and one FSRB member raised concerns about terrorist groups using the COVID-19 crisis to raise and move funds and increase existing illicit activity to finance their operations. As international humanitarian and aid responses to COVID-19 increase, governments should emphasise the importance of implementing the risk-based approach when mitigating the risk of funds being diverted to support terrorists and terrorist groups. (US Treasury, 2020[21])

2.4. Summary of Potential ML/TF Risks

Given the relatively early stages of the health and economic crisis, the majority of risks currently reported relate to proceeds generating predicate offences. ML/TF-specific trends or typologies emerging from COVID-19 are still in the early stages of identification. Nevertheless, some national authorities have indicated that their FIUs have begun issuing COVID-19-related typologies and indicators to their private sector.

At the time of writing, ML typologies relate to misuse of virtual assets to launder illicit proceeds and misuse of the formal banking system. No specific TF typologies related to COVID-19 have been reported by FATF or FSRB members.

In summary, and as outlined in the key findings, the potential ML/TF risks emerging from the aforementioned threats and vulnerabilities could be:

- Criminals finding ways to bypass CDD measures by exploiting temporary challenges in internal controls caused by remote working situations, in order to conceal and launder funds;
- Increased misuse of online financial services and virtual assets to move and conceal illicit funds;
- Exploiting economic stimulus measures and insolvency schemes as a means for natural and legal persons to conceal and launder illicit proceeds;
- As individuals move money out of the banking system due to financial instability, this may lead to an increased use of the unregulated financial sector, creating additional opportunities for criminals to launder illicit funds;
- Misuse and misappropriation of domestic and international financial aid and emergency funding by avoiding standard procurement procedures, resulting in increased corruption and consequent ML risks;
- Criminals and terrorists exploiting COVID-19 and the associated economic downturn to move into new cash-intensive and high-liquidity lines of business in developing countries, both for the laundering of proceeds as well as to fund their operations, as well as fraudulently claiming to be charities to raise funds online.

3. Current COVID-19 impact on AML/CFT regimes

Open source research, as well as feedback received from members and FSRB Secretariats indicate that the COVID-19 pandemic is impacting government and private sectors' abilities to implement AML/CFT obligations. This is primarily due to confinement and social distancing measures introduced to contain the COVID-19 virus. Many AML/CFT government and private sector employees are now working remotely, have been redeployed to COVID-19 responses, or are not working at all. To some extent, especially for countries with more limited resources and less advanced business continuity planning, re-prioritisation efforts by governments are likely to result in a reallocation of resources away from AML/CFT activities to other areas, such as financial stability, and humanitarian and economic recovery efforts. There have been indications that some countries with less resilient AML/CFT regimes or resources may be unable to maintain AML/CFT operations while they prioritise responding to COVID-19.

The COVID-19 crisis appears to affect the following key areas, depending on the magnitude of a country's COVID-19 outbreak at the time of writing.

Supervision: The majority of FATF members indicate that their AML/CFT onsite inspections have been postponed or substituted with desk-based inspections (including the use of video conferencing). In some instances, onsite inspections are only conducted for high-risk sectors or entities. Respondents indicated that banks, financial institutions and other reporting entities continue to implement their AML/CFT requirements and provide requested information to their supervisors. Some supervisory authorities have indicated that they have provided risk-based flexibility on the filing of annual reports, and have delayed issuing new licenses, particularly for some sectors that may have been shut down, such as casinos (excluding online casinos). Regarding sanctions and other remedial actions, a number of countries have introduced suspensions on decisions, including imposing monetary penalties for AML/CFT violations. Registering new companies in registries is also delayed.

Regulation and policy reform: Many national, supranational and international policy departments have activated business continuity plans, with most or all staff working remotely or redeployed to respond to COVID-19. This has, in some jurisdictions, resulted in a significant pause in new AML/CFT policy and legislatives initiatives. This is further compounded by the suspension of meetings of some legislative decision-making bodies, or their prioritisation and focus on COVID-19 emergency matters.

Suspicious transaction reports (STRs): Banks and other reporting entities continue to file STRs. Some members indicated that financial institutions have not encountered delays or difficulties to analyse and file STRs. Other members are providing reporting entities extensions to submit STRs (except in the case of high-risk areas, such as TF) and threshold-based reports. In many cases, authorities have instructed reporting entities to expeditiously notify supervisors and/or financial intelligence units (FIU) if they encounter any delays or barriers to reporting. Jurisdictions that still rely on paper-based reporting systems, or that have inadequate database software, may face delays in receiving and processing reports.

FIU analysis: FIUs of FATF members, and FSRB members who responded are operational, even in those countries severely affected by COVID-19 at present. FIU staff are working remotely to the extent that information technology systems and security allow. There are some anecdotal reports that some FIUs in lower capacity countries are significantly reducing their operations or even shutting down completely.

International cooperation: There are mixed reports about the impact on operational cooperation due to the COVID-19 crisis. Some delegations expressed concern that delays in cooperation could be exacerbated over time due to remote working of FIU staff, and potential re-prioritisation efforts of law enforcement and supervisory authorities and within the private sector. Formal cooperation, such as mutual legal assistance and extradition are already impacted by the crisis due to the limitation or suspension of court operations, and the delayed execution of extradition orders caused by travel restrictions. Some delegations have reported that the provision of AML/CFT technical assistance has also been reduced or suspended.

Law Enforcement Authorities (LEAs): Limited feedback indicates that LEAs in FATF member countries continue to prioritise AML/CFT efforts, with a heightened focus on emerging COVID-19 predicate offences. Some prosecutions may be postponed or delayed due to the suspension of trials, hearings, and other in-person proceedings. There are some reports that the diversion of law enforcement and security resources to COVID-19 responses in high-risk, poorly resourced countries, may embolden terrorists and terrorist financiers in their activities.

Private Sector: Respondents noted that financial institutions have initiated business continuity plans in response to the crisis. Some banks are closing branches, facing

challenges at outsourcing centres, limiting their services and redeploying staff. There are reports from a few less affected countries that their banks are indirectly impacted and raised concerns about accessing information to conduct due diligence on foreign customers and foreign business relationships. Some members have flagged that there is increased activity in non-banking sectors like online gambling, the insurance sector, dealers in precious metals and stones and securities, while there is decreased activity in other sectors like casinos and real estate. The money value transfer service sector faces particular disruption as migrant workers have been affected by confinement measures and company shutdowns, and much of their business is done face-to-face. Should the current economic situation further deteriorate, there is a risk that financial institutions may re-prioritise their AML/CFT efforts and focus on broader prudential and stability measures.

4. Potential AML/CFT Responses for consideration

This section sets out a range of actions that jurisdictions are taking or could consider taking in response to these challenges, from dealing with new risks and/or reduced operational capacity to facilitating charitable activity, economic and fiscal stimulus and financial relief packages. It provides practical examples of responses taken by authorities.

Coordinate domestically to assess the impact of COVID-19 on AML/CFT risks and systems, to develop responses and engage with the private sector.

- Response teams are working with stakeholders to assess private and public sector resilience on a continuing basis (e.g., weekly situation reports).
- Supervisors, FIUs and LEAs are working together to identify, monitor and communicate the changing risk landscape (see Section 3) and provide guidance to the private sector.
- AML/CFT supervisors are engaging with prudential supervisors to ensure the appropriate prioritisation of AML/CFT measures to address potential illicit activity related to COVID-19 and its impact.

Strengthen communication with the private sector by proactively engaging on the application of their AML/CFT measures and working constructively with them to minimise potential impact.

- Supervisors and/or FIUs are providing regulated entities with a contact point where they face serious difficulties in meeting regulatory requirements and requiring them to keep relevant records and develop a plan to clear the backlog as the situation improves.
- Importantly, some countries are communicating beyond the financial sector, to designated non-financial businesses and professions, other trusted partners and industry associations, to address sectors that may have lower resilience.
- There are examples of some countries engaging proactively with the non-profit organisations (NPO) sector. Countries and financial institutions should apply a risk-based approach to ensure that legitimate NPO activity is not unnecessarily delayed, disrupted or discouraged. (FATF, 2015[22]) In one jurisdiction, the government has designated channels for COVID-19 donations.

Encourage full-use of a risk-based approach to CDD and address practical issues.

- Some supervisors are communicating with reporting entities about the importance of continuing to provide essential financial services while also

mitigating ML/TF risks by using the full range of tools at their disposal. In relation to CDD, supervisors have put in place some of the following measures:

- Applying simplified due diligence measures where lower risks are identified, for example, accounts created specifically to facilitate government payments to individuals or businesses and offering access to digital/contactless payment solutions.[4] See below section on economic relief packages.
- Providing guidance that there may be legitimate reasons for customers not providing information for ongoing due diligence or 'know-your-customer (KYC) refreshers' (e.g., if they are confined, under quarantine or ill) and that the usual processes for dealing with these situations (including exiting the customer relationship) may not be appropriate at this time.[5]
- Allowing reporting entities to accept recently expired government-issued identification until further notice in order to verify the identity of an individual (although still required to determine the authenticity of the identification).
- Considering the application of delayed verification provisions for new business relationships in line with the FATF Standards (e.g., by implementing transaction limits). Reporting entities can accept digital copies of documents as an interim measure, with the originals to be sighted in due course.

- Encouraging the use of responsible digital identity and other responsible innovative solutions for identifying customers at onboarding and while conducting transactions. See the recent FATF Digital ID Guidance (FATF, 2020[23]) that highlights that non-face-to-face onboarding and transactions conducted using trustworthy digital ID are not necessarily high-risk and can be standard or even lower-risk.

Support electronic and digital payment options.

- More broadly, supervisors are encouraging the full use of electronic and digital channels to continue payment services while maintaining social distancing. Some examples include increasing contactless limits, increasing point of sale purchase limits, raising maximum limits for e-wallets and reducing charges for domestic money transfers between banks to encourage the use of contactless payment methods in order to reduce the spread of the virus.

Undertake pragmatic, risk-based AML/CFT supervision.

- All supervisors have continued AML/CFT supervisory activities, although practices are adapted to be more pragmatic in the current situation (see Section 4).
- Supervisors continue to monitor the business continuity plans put in place and operationalised by financial institutions in order to ensure their sound operations, including implementation of AML/CFT measures. Some supervisors are adjusting their focus as relevant. For example, they are putting greater focus on online casinos and gambling platforms considering regular casinos and gambling arcades are closed, and more focus on dealers in precious metals and stones with greater investment in gold.

[4]FATF Interpretative Note to R.10 notes that "financial products or services that provide appropriately defined and limited services to certain types of customers, so as to increase access for financial inclusion purposes" are an example of a lower risk scenario.

[5]More information on how such measures can be implemented is set out in the 2017 FATF guidance on AML/CFT measures and financial inclusion, with a supplement on customer due diligence.

- Conversely, there is potentially less focus on lower risk areas such as cash-intensive businesses that have halted trading. All supervisors should consider reviewing their supervisory priorities and plans and adjust these to emerging risks, as necessary.

Understand new risks and adapt operational responses.

- Authorities are working with relevant partners, domestically and internationally, to understand and monitor the evolving risk environment (see Section 3). This requires liaising with a broad range of stakeholders. Countries with existing public/private partnerships are harnessing these forums to obtain the latest information.
- A number of countries have introduced special taskforces or other operational coordination measures to deal with COVID-19-related crime, particularly in relation to fraud.
- In some countries, authorities have issued advice to relevant agencies on the prioritisation of investigations and prosecutions.
- Some FIUs have asked regulated entities to use a keyword in their reports to triage and prioritise incoming STRs. FIUs are developing strategic analysis based on review of available bulk data and adapting STR prioritisation and analysis.
- Agencies are considering pooling available resources, including repurposing assets confiscated or forfeited from criminals to assist in COVID-19 responses (e.g., using confiscated properties as temporary/emergency hospital facilities).

Clarify AML/CFT requirements in the context of economic relief measures.

- Authorities are providing clarity on how to apply AML/CFT requirements in the context of economic relief packages for individuals and businesses.
- To facilitate the smooth processing of applications, some supervisors have approved simplified due diligence measures (including for customer verification) for transactions under government assistance programs where they are assessed to present lower risks. They include obligations for regulated entities to put in place mitigation measures, such as ongoing due diligence and to review CDD if other risks are later detected.
- One country has implemented measures to identify risk indicators, and implemented processes and controls to prevent the misuse of the aforementioned assistance packages for ML/TF purposes. These measures will likely vary depending on the scope and delivery of the relief package and contextual factors, including corruption issues.
- Countries receiving economic stimulus by international organisations such as the IMF may receive additional guidance to implement targeted AML/CFT measures to ensure those funds are not diverted for other purposes (such as corruption or ML).
- All countries should guide regulated entities to remain vigilant to detect suspicious financial transactions, particularly in the context of cross-border flows from countries that are receiving emergency COVID-19-related funding from international organisations and other donors.

Continue cooperating across borders.

- FIUs should keep the Egmont Group Secretariat appraised of any developments, including any operational disruptions that could impact international cooperation responses and provide a key contact point.
- Increased communication may be required, particularly on group-wide supervision.

Monitor the impact of COVID-19 on the private sector.

- FIUs and supervisors should continue to monitor the impact on reporting entities, as the COVID-19 situation continues.
- Prolonged economic disruption may force some regulated entities to close down. Disorderly shutdowns may leave significant ML/TF vulnerabilities.

Annex A. Statement by the FATF President

COVID-19 and measures to combat illicit financing[6]

Paris, 1 April 2020 - The members of the FATF, both domestically and multilaterally, are applying every available resource to combat the COVID-19 pandemic. As the global standard-setter for combating money laundering (ML) and the financing of terrorism (TF) and proliferation, the FATF encourages governments to work with financial institutions and other businesses to use the flexibility built into the FATF's risk-based approach to address the challenges posed by COVID-19 whilst remaining alert to new and emerging illicit finance risks. The FATF encourages the fullest use of responsible digital customer onboarding and delivery of digital financial services in light of social distancing measures. At a time when critical relief is needed in-country and beyond, effective implementation of the FATF Standards fosters greater transparency in financial transactions, which gives donors greater confidence that their support is reaching their intended beneficiaries. The continued implementation of the FATF Standards facilitates integrity and security of the global payments system during and after the pandemic through legitimate and transparent channels with appropriate levels of risk-based due diligence.

Addressing COVID-19-related financial crime risks by remaining vigilant

Criminals are taking advantage of the COVID-19 pandemic to carry out financial fraud and exploitation scams, including advertising and trafficking in counterfeit medicines, offering fraudulent investment opportunities, and engaging in phishing schemes that prey on virus-related fears. Malicious or fraudulent cybercrimes, fundraising for fake charities, and various medical scams targeting innocent victims are likely to increase, with criminals attempting to profit from the pandemic by exploiting people in urgent need of care and the goodwill of the general public and spreading misinformation about COVID-19. National authorities and international bodies are alerting citizens and businesses of these scams, which include impostor, investment and product scams, as well as insider trading in relation to COVID-19. Like criminals, terrorists may also exploit these opportunities to raise funds.

Supervisors, financial intelligence units and law enforcement agencies should continue to share information with the private sector to prioritise and address key ML risks, particularly those related to fraud, and TF risks linked to COVID-19. Additionally, criminals and terrorists may seek to exploit gaps and weaknesses in national anti-money laundering/counter-financing of terrorism (AML/CFT) systems while they assume resources are focused elsewhere, making risk-based supervision and enforcement activity more critical than ever. Financial institutions and other businesses should remain vigilant to emerging ML and TF risks and ensure that they continue to effectively mitigate these risks and are able to detect and report suspicious activity.

Digital onboarding and simplified due diligence

With people around the world facing confinement or strict social distancing measures, in-person banking and access to other financial services is difficult, and unnecessarily exposes people to the risk of infection. Use of digital/contactless payments and digital onboarding reduce the risk of spreading the virus. As such, the use of financial technology (Fintech) provides significant opportunities to manage some of the issues presented by COVID-19. In line with the FATF Standards, the FATF encourages the use of technology, including Fintech, Regtech and Suptech to the fullest extent possible. The FATF recently

[6] www.fatf-gafi.org/publications/fatfgeneral/documents/statement-covid-19.html

released Guidance on Digital ID, which highlights the benefits of trustworthy digital identity for improving the security, privacy and convenience of identifying people remotely for both onboarding and conducting transactions while also mitigating ML/TF risks. The FATF calls on countries to explore using digital identity, as appropriate, to aid financial transactions while managing ML/TF risks during this crisis.

When financial institutions or other businesses identify lower ML/TF risks, the FATF Standards allow them to take simplified due diligence measures, which may help them adapt to the current situation. The FATF encourages countries and financial service providers to explore the appropriate use of simplified measures to facilitate the delivery of government benefits in response to the pandemic.

Delivery of aid through non-profit organisations

This global public health emergency has highlighted the vital work of charities and NPOs to combat COVID-19 and its effects. The FATF has long recognised the vital importance of NPOs in providing crucial charitable services around the world, as well as the difficulties in providing that assistance to those in need. The FATF has worked closely with NPOs over the years to refine the FATF Standards to provide flexibility to ensure that charitable donations and activity can proceed expeditiously through legitimate and transparent channels and without disruption. It is important to recognise that FATF Standards do not require that all NPOs be considered high-risk and that most NPOs carry little or no TF risk. The aim of the FATF Standards is not to prevent all financial transactions with jurisdictions where there may be high ML/TF risks, but rather to ensure these are done through legitimate and transparent channels and money reaches its legitimate intended recipient. National authorities and financial institutions should apply a risk-based approach to ensure that legitimate NPO activity is not unnecessarily delayed, disrupted or discouraged. FATF encourages countries to work with relevant NPOs to ensure that much needed aid is getting to its intended recipients in a transparent manner.[7]

Ongoing outreach and advice

Regulators, supervisors, financial intelligence units, law enforcement authorities and other relevant agencies can provide support, guidance and assistance for the private sector on how national AML/CFT laws and regulations will be applied during the current crisis. Such guidance can give financial institutions and other businesses reassurance that the authorities share their understanding of challenges and risks involved in the current situation, and of the appropriate actions to take. Authorities in some countries have already taken swift action and provided this type of advice. Mechanisms by which victims, financial institutions, and other businesses can report COVID-19 related fraud may be especially useful.

At the international level, the FATF is working with the Committee on Payment and Market Infrastructures and the World Bank to help ensure coordinated policy responses for the continued provision of critical payment services against the backdrop of the COVID-19 crisis. The FATF, International Monetary Fund, World Bank, and United Nations are working with their membership to mitigate the impacts of the COVID-19 crisis, including through the use of AML/CFT measures, where relevant. In addition, the FATF is working with its members and the FATF-Style Regional Bodies to identify and share good practices in response to common issues faced in many affected countries.

FATF's commitment to support efforts to address COVID-19 issues

The FATF stands ready to provide further AML/CFT guidance to support the current global efforts to tackle the COVID-19 crisis and its effects, and welcomes feedback.

[7] See 2015 Best Practices Paper on Combating the Abuse of Non-Profit Organisations

Annex B. Statement or guidance issued by authorities in response to COVID-19

Below are statements and guidance issued by FATF and FSRB members in response to COVID-19. The measures cited, and taken by FATF members' authorities, have not been reviewed or considered by the FATF membership as a whole, and therefore do not constitute the official view of the FATF.

- **Anguilla** –The FIU has issued a public release to the reporting entities as well as the general public on the risk of potential scams/fraud.
- **Australia** – AUSTRAC updates to reporting entities on COVID-19 including advice and guidance on: working with reporting entities during COVID-19 pandemic, extension on annual compliance reporting, advice on rule changes for early access to superannuation funds, suspicious matter reporting and advice on meeting KYC requirements:

  https://www.austrac.gov.au/covid-19-updates.
- **Bolivia** – The UIF (FIU Bolivia) issued an official communication addressed to reporting entities on COVID-19 pandemic risk on ML/TF to advise them on how to better comply with their AML/CTF obligations.

  http://www.uif.gob.bo/.
- **Brazil** – COAF has replicated the FATF and GAFILAT communiqués in Portuguese and published in its web-site. Furthermore, it addressed these statements together with red flags to all reporting entities, supervisors and other competent authorities.

  https://www.fazenda.gov.br/orgaos/coaf/publicacoes/comunicado-do-presidente-do-gafi-sobre-covid-19-e-medidas-de-combate-ao-financiamento-ilicito
- **Canada** – FINTRAC message to all reporting entities in light of COVID-19:

  https://www.fintrac-canafe.gc.ca/covid19/covid19-eng
- **Cayman Islands** –The FRA (FIU) has published and circulated notices regarding the physical closure of the office and guidance on how reporting entities should submit reports during the physical closure of the office.
- **Chile** – UAF has issued several communiqués and press release addressed to the reporting entities in order to inform and guide them to better comply with the AML/CTF obligations during this COVID-19 pandemic situation. This agency also issue communiqués addressed to all relevant authorities, and a social media campaign to raise awareness on the ML/TF risk associated to the pandemic was also launched (https://twitter.com/UAF_Chile).

  https://www.uaf.cl/ArchivoEstatico/carta_so_covid.pdf

  https://www.uaf.cl/prensa/archivo_det.aspx?id=576

  https://www.uaf.cl/prensa/archivo_det.aspx?id=574

  https://www.uaf.cl/prensa/archivo_det.aspx?id=573
- **People's Republic of China** – The Peoples Bank of China (PBC) has issued Notices on AML/CFT requirements in responding to the COVID-19 pandemic to all its branches on 5th Feb 2020. All branches of PBC should continue more pragmatic

AML/CFT supervisory activities adapted to local situation and provide necessary guidance to local regulated entities when they face difficulties in meeting regulatory requirements;

PBC has also issued Guidance on how to meet the AML/CFT requirements in responding to the COVID-19 pandemic to regulated entities on 5th Feb 2020. All regulated entities are encouraged to develop contingency program meeting the AML/CFT requirements by using the full range of tools at their disposal. To support charitable activity and medical aid, simplified due diligence measures are allowed but the STR of TF and the other high-risk areas should be maintained overall.

- **Colombia** – UIAF issued a press release sent to all compliance officers and published it on its website, requesting greater rigor in CDD measures, in the context of the health emergency caused by COVID-19 pandemic. UIAF has also replicated the GAFILAT communiqué in its web-site and carried out a social media campaign to boost all the stakeholders to continue to rigorously implement AML / CFT risk management systems (https://twitter.com/UIAFColombia #YoNoBajoLaGuardia**)**.

  https://www.uiaf.gov.co/caracterizacion_usuario/slide_home/_30420

  https://www.uiaf.gov.co/sala_prensa/noticias_comunicados/la_actual_coyuntura_exige_se_sigan_30457

  https://www.uiaf.gov.co/sala_prensa/noticias_comunicados/comunicado_gafilat_covid_19_sus_30438

- **Costa Rica** – The FIU/ICD issued a statement to all relevant authorities and the reporting entities to guide them on the ML/TF risk associated with COVID-19 and to advise them on possible good practices:

  http://www.icd.go.cr/portalicd/images/docs/uif/ALACFT/Comunicado_a_la_Red_Global_ALACFT.pdf.

- **Cuba** – The Central Bank of Cuba has issued communiqués in line with the FATF's and GAFILAT's statement on COVID-19 and its associated ML and FT risks to raise awareness of the reporting entities and the public sector on this matter.

- **Denmark, Kingdom of** – FSA Fighting money laundering and terrorist financing must continue during the Covid-19 crisis: https://www.dfsa.dk/News/Press-releases/2020/Fighting_money_laundering_covid19.

- **Dominican Republic** – To prevent citizens from being scammed during the Covid-19 emergency, information campaigns are carried out in order to inform the population about the channels and mechanisms to receive financial aid programs. In the official websites of the relevant organizations, specific sections have been created for said programs, which are reported by press and social media.

  https://www.hacienda.gob.do/ministerio-de-hacienda-informa-cambio-para-aplicar-al-fase/

  https://www.quedateencasa.gob.do

  http://vicepresidencia.puntosolidario.gob.do/

- **EGMONT Group** - The ECOFEL eLearning platform - accessed by FIUs and other competent authorities from all over the world - now hosts a large quantity of

reports and other content related to ML/TF threats and vulnerabilities arising from COVID-19 outbreak, including the online course "COVID-19 emerging risks".

Furthermore, the ECOFEL will soon start organizing round-table discussions that will bring together the FIUs from jurisdictions that are experiencing different stages of COVID-19 outbreak, in order to share their experiences and lessons learned as to how to tackle the relevant managerial and operational issues they face and prepare the FIUs to efficiently return to a normal operational routine once the lockdown decisions by governments are lifted.

- **Egypt** – Guidance issued by the Central Bank of Egypt on bank operations during COVID-19 on 20 March 2020.
- **European Banking Authority** – Statement on actions to mitigate financial crime risks in the COVID-19 pandemic:

  https://eba.europa.eu/eba-provides-additional-clarity-on-measures-mitigate-impact-covid-19-eu-banking-sector.
- **Europol** – press release and report on pandemic profiteering: how criminals exploit the COVID-19 crisis:

  https://www.europol.europa.eu/newsroom/news/how-criminals-profit-covid-19-pandemic.
- **Finland** – FIU-FI disseminated an alert to reporting entities concerning the possible typologies related to COVID -19 on 26 March 2020.
- **France** – Joint communiqué by financial supervisor (ACPR-AMF) on the scam financial risks related to Covid-19 (in French):

  https://www.amf-france.org/fr/actualites-publications/communiques/communiques-de-lamf/lamf-et-lacpr-mettent-en-garde-le-public-contre-les-risques-darnaques-dans-le-contexte-de-lepidemie.

  Portfolios management sector (in French):

https://www.amf-france.org/fr/actualites-publications/actualites/continuite-des-activites-de-gestion-en-periode-de-coronavirus.

- **GAFILAT**– The heads of delegations, together with the Presidency and the Executive Secretariat of GAFILAT, approved an official statement on COVID-19 and its associated ML and FT risks. The document was developed with the inputs received from the member countries and in accordance with the measures reported by FATF. This statement attempts, on the one hand, to alert the authorities of the member countries and the private sector about possible emerging risks and, on the other hand, to share good practices and mitigating measures identified in response to the common problems faced by the GAFILAT's member countries and the international community.

  https://www.gafilat.org/index.php/es/biblioteca-virtual/gafilat/documentos-de-interes-17/3823-gafilat-covid19-en-gafilat/file

- **Germany** – BaFin information on new developments and key points on the COVID-19 situation (in English and German):

  https://www.bafin.de/EN/Aufsicht/CoronaVirus/CoronaVirus_node_en.html;

  https://www.bafin.de/DE/Aufsicht/CoronaVirus/CoronaVirus_node.html.

- **Guatemala** – SIB, (FI's regulator) issued statements related to financial supervision on AML/CTF and to the use of cash in order to prevent and mitigate the possible ML/TF risk emerging from the CODIV-19 pandemic situation.

  https://www.sib.gob.gt/c/document_library/view_online_get_file?folderId=6762386&name=DLFE-35734.pdf

  https://www.sib.gob.gt/c/document_library/view_online_get_file?folderId=6762638&name=DLFE-35740.pdf

- **Guernsey** - The Guernsey Financial Services Commission has issued press releases emphasizing to the financial services and DNFBP community the importance of operational resilience in the face of increased fraud risk (including cybercrime) arising from Covid-19 measures being taken domestically and worldwide, and on encouraging regulated firms to move to electronic customer verification measures. Consumers have also been alerted to various types of potential Covid-19 scams.

  https://www.gfsc.gg/news/article/commission-warns-licensees-increased-risk-fraud-arising-covid-19

  https://www.gfsc.gg/news/article/coronavirus-update-2-–-commission-support-financial-services-industry

- **Honduras** – UIF, has published on its website, the statement issued by GAFILAT in this regard, as well as the document issued by the United Nations Office on Drugs and Crime (UNODC) on Cybercrime and COVID-19. These documents were shared with the compliance officers of the reporting entities, so that they can use them as a tool to identify possible risks.

  http://pplaft.cnbs.gob.hn/blog/2020/04/30/el-covid-19-problemas-actuales-y-futuros/

  http://pplaft.cnbs.gob.hn/

- **Hong Kong, China** – Hong Kong Monetary Authority guidelines for financial institutions:

https://www.hkma.gov.hk/media/eng/doc/key-information/guidelines-and-circular/2020/20200407e1.pdf;

https://www.hkma.gov.hk/media/eng/doc/key-information/guidelines-and-circular/2020/20200407e2.pdf.

- **Isle of Man** - The regulators and the financial intelligence unit in the Isle of Man have published statements providing guidance to the regulated sector on potential risks, and also setting out expectations of the regulators, during COVID-19:

  https://www.iomfsa.im/covid-19/

  https://www.gov.im/categories/business-and-industries/gambling-and-e-gaming/

  https://www.fiu.im/fiu-covid-19-response/

- **Israel** - The Israeli National Police, IMPA (the Israeli FIU), the Bank of Israel (Banking Supervision Division), the Israel Securities Authority and the Israeli Capital Markets, Insurance and Savings Authority have published notices to reporting entities and the public, concerning specific risks arising in connection with the COVID-19 crisis.

- **Italy** – At the outset of the lockdown, Unità di Informazione Finanziaria per l'Italia – UIF provided obliged entities in all relevant sectors with indications on how to maintain appropriate contacts for any communications, disclosures or requests and for facilitating compliance: https://uif.bancaditalia.it/pubblicazioni/comunicati/documenti/Contatti_lavoro_a_distanza.pdf.

  With a second Communiqué UIF indicated the need to leverage IT tools to identify suspicions through remote screening. Also, based on an assessment of the impacts of the emergency, the terms for the filing of certain data related to threshold-based disclosures have been prolonged: https://uif.bancaditalia.it/pubblicazioni/comunicati/documenti/Comunicato_UIF_Covid19.pdf.

  Furthermore, UIF has set out to monitor developing trends and identify emerging threats and vulnerabilities, with a view to highlighting areas of risk and providing obliged entities with indicators for the detection of suspicious transactions in the context of the emergency. In the wake of initiatives undertaken by the FATF and European bodies and of similar measures adopted by counterparts in other jurisdictions, UIF issued on 16 April a Communiqué drawing the attention of AML/CFT obliged entities and their staff to the new threats and risks to which they may be exposed and to the need to promptly detect suspicions related to the Covid-19 emergency and report them: https://uif.bancaditalia.it/normativa/norm-indicatori-anomalia/Comunicazione-UIF-16.04.2020.pdf.

  On April 10, 2020 Banca d'Italia issued a communication to banks and financial intermediaries drawing the attention on the central role of the financial system to transmit the effects of governmental measures, and to avoid detrimental impacts on clients. In this framework, Banca d'Italia also issued recommendations on the implementation of anti money laundering safeguards, recalling to calibrate AML obligations according to the emerging ML/TF risks associated with COVID-19. In this respect, specific attention is requested in order to prevent misuse of financial public aid to individuals and corporations:

https://www.bancaditalia.it/compiti/vigilanza/normativa/orientamenti-vigilanza/Comunicazione-intermediari-aprile.pdf

- **Japan** – Consumer Affairs Agency & National Police Agency advice public to be aware of COVID-19 related frauds (in Japanese):

  https://www.npa.go.jp/bureau/soumu/corona/index_corona_special.html;

  https://www.caa.go.jp/policies/policy/consumer_policy/information/notice_200227.html.

- **Jersey** - The Jersey FSC has issued guidance and launched a series of webinars about working in the pandemic, including a specific webinar on the subject of customers due diligence.

  https://www.jerseyfsc.org/news-and-events/webinar-covid-19-implications-on-customer-due-diligence/

  https://player.vimeo.com/video/411514721?autoplay=0&loop=1

- **Republic of Korea** – KoFIU has issued guidance for reporting entities on STR reporting requirements during the crisis.

- **Luxembourg** – the FIU (CRF) has published a COVID-19 typologies report: https://justice.public.lu/dam-assets/fr/organisation-justice/crf/2020-04-02-COVID19-EN.pdf (in English);

  https://justice.public.lu/dam-assets/fr/organisation-justice/crf/note-covid19-1.pdf (in French).

- **Mexico** – FIU and the National Banking and Securities Commission (CNBV) Joint statement to regulated entities; CNBV statement on prudential and AML/CFT requirements; FIU and Tax and Customs Authority joint statement for DNFBPs (all public documents and in Spanish). In addition, the FIU and the CNBV shared with the financial entities a non-public document about the ML and TF Risks related to COVID-19:

  https://uif.gob.mx/work/models/uif/imp/AVISO_UIFMARZO.pdf;

  https://www.dof.gob.mx/nota_detalle.php?codigo=5590567&fecha=26/03/2020;

  https://uif.gob.mx/work/models/uif/imp/ComunicadoCOVID19.pdf.

- **Morocco** – Bank Al-Maghrib has issued a press release on measures taken during COVID-19 on 29 March 2020.

- **Namibia** – FIU public statement on COVID-19 lockdown and public alert on COVID-19 scams:

  https://www.fic.na/uploads/Public_Awareness/General_Publications/COVID-19%20%E2%80%93%20National%20Lockdown.pdf;

- **Saudi Arabia** – SAMA provided guidance to regulated entities.
- **Seychelles** – Advisory from the FIU and Financial Services Authority statement on COVID-19 to reporting entities:

  https://www.seychellesfiu.sc/FIU/?p=1109;

  https://www.fsaseychelles.sc/wp-content/uploads/2020/03/Communique-COVID19.pdf.

- **Singapore** – The Singapore Police Force (SPF) and AML/CFT authorities (e.g. Monetary Authority of Singapore) have provided guidance and advisories to regulated entities and the public respectively. SPF has issued an advisory warning of a new type of e-commerce scam involving sale of face masks:

  https://www.police.gov.sg/media-room/news/20200222_others_new_type_of_ecommerce_scams_involving_the_sale_of_face_masks.

  SPF also regularly shares news on types of scams, including those relating to COVID-19, via www.scamalert.sg/news.[8]

  The Ministry of Law has issued a statement to all Registered Dealers, describing government-wide measures taken in response to Covid-19:

  https://acd.mlaw.gov.sg/news/notices/remain-vigilant-during-covid-19.

  The Monetary Authority of Singapore has been providing guidance to financial institutions on risks and expectations of regulators and supervisors during COVID-19:

  https://www.mas.gov.sg/news/media-releases/2020/mas-takes-regulatory-and-supervisory-measures-to-help-fis-focus-on-supporting-customers.

- **Spain** – SEPBLAC public message:

  https://www.sepblac.es/en/2020/03/18/covid-19/.

[8] Recent advisories on scams include one where Singapore Prime Minister Lee Hsien Loong warns of fake COVID-19 emails purportedly sent by him asking for "contributions" and the Ministry of Health's warning of scammers impersonating its COVID-19 contact tracing personnel to request for personal information and financial details.

Bank of Spain public releases on COVID 19:

https://www.bde.es/bde/en/Home/Noticias/covid-19/

CNMV public releases on COVID 19:

http://www.cnmv.es/portal/gpage.aspx?id=COVID19

- **Sweden** – Police advice to general public:

  https://polisen.se/aktuellt/nyheter/2020/mars/forandrade-brottsmonster-till-foljd-av-coronaviruset/.

- **Trinidad and Tobago** – Guidance has been issued to reporting entities on filing STRs using online secure reporting solutions and on CDD for on-boarding customers using digital identification (online at: www.fiu.gov.tt) and (issued notifications on COVID-19 scams (online at: https://www.fiu.gov.tt/wp-content/uploads/COVID19-SCAM.pdf).

- **United Kingdom** –

  Law Enforcement Agencies have produced threat assessment and published advice on the risk of Covid-19 fraud:

FATF

FATF REPORT

Illicit Tobacco Trade

June 2012

FINANCIAL ACTION TASK FORCE

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit the website:

www.fatf-gafi.org

TABLE OF CONTENTS

1. EXECUTIVE SUMMARY

1. The Financial Action Task Force (FATF) Plenary met in Mexico City, during June 2011. It was at said Plenary where a proposal to conduct typology research work into money laundering and terror financing to be associated with the Illicit Trade in Tobacco (ITT) was accepted.

2. March of 2011 also saw the OECD launch the "Oslo Dialogue" with the aim of promoting a whole of government approach to the tackling of financial crimes and illicit flows. This has been augmented by the G20 calling for strengthened inter-agency cooperation to fight illicit activities as well as the FATF adding tax crimes to the list of predicate offences.

3. The proponents of the typology stated that the illicit tobacco trade was prone to money laundering. Trade was considered to be cash intensive and profitable whilst being accompanied by low levels of risk posed to the criminal groupings (in terms of detection, seizures, penalties, criminal procedure) contributing towards the manifestation of the related illicit activities. Key areas of concern included:

a) Loss of revenue to the fiscal authorities.

b) The use of the illicitly generated proceeds (*i.e.,* to fund other crimes or the financing of terror).

c) The ability to distinguish between illicit activities as undertaken by licit and illicit players in the tobacco sector.

d) To identify the extent that governments enforcement agencies prioritise the addressing of illicit trade in tobacco when compared to other crimes.

4. It was furthermore mentioned that the project was to augment work already conducted by the FATF, which included *Trade Based Money Laundering* (June 2006), *Laundering the Proceeds of VAT Carousel Fraud* (February 2007), *ML Vulnerabilities in Free Trade Zones* (February 2010) as well as the then recently published *Global ML/TF Threat Assessment* (June 2010).

5. The identified key objectives were:

a) To determine the extent of the Money Laundering and Terror Financing (ML/TF) vulnerabilities associated with illicit trade in tobacco at a global, regional and domestic level.

b) To identify relevant case studies and determine trends and patterns from a global, regional and domestic perspective.

c) To identify possible indicators which may assist financial and non financial institutions in developing mechanisms to identify, report and counter smuggling activities and the misuse of trade practices.

d) To assist jurisdictions and FATF-Style Regional Bodies (FSRBs) in knowledge building and the identification of harms, drivers and measures associated with the illicit trade in tobacco.

e) To enhance the efforts aimed at curbing ML and TF associated with the illicit trade in tobacco.

6. This document provides a synopsis of the nature and extent of the ML/TF risks currently associated with the illicit trade in tobacco. It contains an overview of the problem statement and the data provided, as well as an analysis of the predicate offences, extent of associated money laundering and terror financing activities coupled lastly to the various jurisdictional enforcement responses to the curbing of this specific phenomenon.

7. The typology also attempts to highlight the primary reasons for the prevalence of ITT and should by no means be regarded as an exhaustive reflection of the subject. It must be borne in mind that jurisdictional approaches will differ in accordance to whether their territories can be characterised as a country of origin, transit or destination for illicitly traded tobacco as well as the related laundered proceeds thereof. This to a large extent is also characterised by jurisdictions health and related taxation policies as well as the differing approaches to the criminalisation of the predicate offences and the resulting money laundering, which ultimately impacts on organised crime groups (OCGs) responses thereto.

8. It can be stated that the international nature of ITT requires a global response. This once again, as with other typologies underscores the importance of international cooperation and the sharing of information. This should be done through (and not be limited to) active participation within and across a multitude of international forums such as the OECD, the FATF, the WCO, Interpol as well as amongst taxation authorities. Efforts should furthermore also be undertaken to incorporate inputs from organs of civil society.

9. Nationally, governments could guide reporting institutions on how to identify funds emanating from ITT. This can naturally emanate predominantly from within the law enforcement and customs environments. The setting up of centralised databases can also assist in identifying transnational organised crime groupings, their primary role players, their financiers and beneficiaries.

10. The purpose of this document is to therefore highlight the vulnerabilities that the ITT and related ranging predicate offences pose to the manifestation of money laundering and financing of terror. It highlights the nature of the predicate offence, the resulting money laundering as well as the propensity or appetite to investigate lastly mentioned. The typology also indicated the approaches as followed amongst enforcement agencies with special emphasis placed on customs authorities, law enforcement, financial intelligence units (FIUs) and lastly taxation authorities.

2. MONEY LAUNDERING, TERROR FINANCING AND THE ILLICIT TRADE IN TOBACCO

11. Various studies concur that that the illicit trade in tobacco accounts for a significant percentage of the global cigarette market. The revenues generated by this are estimated to amount to tens of billions of dollars. These revenues are usually hidden from taxation regimes and may also be used to fund other forms of crime and terror. The illicit trade in tobacco (ITT) therefore generates significant amounts of criminal proceeds, arising from both the trade itself and associated customs and tax offences.

12. A corollary affect is the increase in tobacco related illnesses and deaths because of the availability of cheap or counterfeit cigarettes. This has serious implications for the provision of appropriate health and welfare services to support an increase in consumption, of which the financial issues are exacerbated with a linked fall in tax revenues.

A. THE NEED FOR THE TYPOLOGY

13. Various FATF members are exposed to the risks posed by the illicit trade in tobacco. These risks manifest along the value chain, from the growing of raw tobacco, to national and international distribution, through to the final point of sale, whether it be in the formal or informal sectors. Extensive market penetration, coupled with cash intensive trade highlights the need for a typology evaluating the risk from ITT, especially in understanding how and where the criminal proceeds are laundered. Key areas of concern include:

a) The percentage of lost government revenues due to evaded taxes and customs duties.

b) Identifying the nature and extent of the risks posed by illicit tobacco trade in comparison to enforcement actions taken to curb the phenomenon.

c) The final destination and purpose of aggregated illicit funds.

d) The methodologies used to launder these illicit funds and the potential to uncover new mechanisms specific to ITT, and

e) A need to better understand the totality of ITT criminal finances, including opportunities for disruptive activity targeting perceived or identified financial pinch points (such as during the laundering of street cash following sales of illicit tobacco products).

B. SCOPE

14. The FATF Working Group on Typologies (WGTYP) is mandated to identify new threats and vulnerabilities as well as to conduct research into money laundering and terrorist financing techniques, with an emphasis on differentiating between the predicate offence and associated money laundering. The report aims to:

a) Define the illicit trade in tobacco, including the supply chain associated with the different types of smuggling.

b) Determine and assess the extent of the money laundering and terror financing (ML/TF) vulnerabilities associated with the illicit trade in tobacco and illustrate this via case studies provided by key contributors.

c) Identifying possible indicators to assist financial and non-financial institutions in uncovering, reporting and countering smuggling activities, the misuse of trade practices and money laundering or terrorist finance techniques.

15. In line with guidance given in the FATF Global ML/TF Threat Assessment, this will inform and assist jurisdictions and FATF Style Regional Bodies (FSRBs) in knowledge building as well as the identification of the harms, drivers and measures associated with the illicit tobacco trade.

C. METHODOLOGY

16. The research methodology included the development of a questionnaire sent to FATF member countries as well as FSRBs. The development of the typology was limited to evaluating the following research propositions:

a) Illicit trade in tobacco is a significant predicate offence to money laundering.

b) The proceeds of illicit trade in tobacco are used to fund terror.

c) Law Enforcement regards the effect of the illicit trade in tobacco as insignificant when compared to trade in other forms of contraband.

d) FIU suspicious transaction reports (STRs) will be insignificant in terms of identifying illicit trade in tobacco as predicate to ML or TF.

e) Despite the threat of civil or criminal investigations and disruption, ITT represents a good opportunity for Organised Crime Groups and / or Terror Groups to generate large sums of criminal profit.

f) The proceeds of illicit trade in tobacco is either laundered or used to fund other crimes or terror.

g) The use of trade in tobacco is significant within the trade based money laundering typology.

h) High taxes on tobacco stimulate illicit trade in tobacco.

17. A typologies workshop was also held with inputs received from various participants. These inputs are incorporated into the typology. It must however be noted that the primary theme to emerge from the workshop focused primarily on the predicate offence with information sourced from the returned questionnaires providing the bulk in terms of addressing money laundering and or terror financing to be associated with the phenomenon. Other sources of information used were accepted academic studies as well as pieces of information from various other accepted open sources.

3. AN OVERVIEW OF THE ILLICIT TRADE IN TOBACCO

DEFINITION OF THE ILLICIT TRADE IN TOBACCO AND THE HIGH-LEVEL RISKS ASSOCIATED WITH IT:

18. The illicit trading of tobacco products is the supply, distribution and sale of smuggled genuine, counterfeit[1] or cheap white[2] tobacco products. In generic non-commodity specific terms, it works on the following principle – there is a financial incentive to source a product in a lower-priced market and transport, distribute and sell it in a higher-priced market. This can include international movements or within countries that allow for intra-community price differentials. Illicit trade in tobacco is made up of various activities. Smuggling is conducted for one or both of the following reasons: to avoid excise taxes, and to evade rules prohibiting the sale of such goods. Merriman defines smuggling as the evasion of excise taxes on goods by circumvention of border controls.[3]

19. The sophistication and complexity of the smuggling depends upon the size and ambition of the groups involved and the nature of the commodity. For example, some Organised Crime Groups (OCGs) will manage all aspects of the production process, from sourcing raw tobacco product, through to developing specific tobacco packaging that will generate suitable market interest and / or appear legitimate if counterfeit product. Others will rely on the work of key facilitators, often based overseas, who engage with smaller legitimate tobacco manufacturers in sourcing the tobacco goods and associated packaging. The OCG then agrees a distribution route with the facilitator and agrees risk mitigation mechanisms to ensure successful delivery. Certain groups simply exploit lower cross-border[4] prices of genuine tobacco products and smuggle them to their chosen destination for sale.

20. Whatever the size and scale of the smuggling operation, the illicit trade in tobacco has crosscutting implications for governments, private businesses, law enforcement agencies, healthcare providers and the public, both smokers and non-smokers alike. The most tangible of these implications, financial or otherwise, are:

a) Deprivation of tax revenues, which can mean increases in other tax instruments to support a shortfall and / or the cutting of other public expenditure to ensure budgets, are managed within available funding profiles.

---

1 A product which is an identical copy of a branded product and packaging that is manufactured by parties that do not have the relevant intellectual property rights authorising them to manufacture such branded products. These products are illicit at the point of production because they have been manufactured without the authorisation of the legal brand owner.

2 Cheap whites are factory made cigarettes produced with the approval of a licensing authority in that jurisdiction. These are sometimes known as illicit whites but this is an incorrect term as they are produced legally.

3 Merriman, D (n.d.).

4 While there is a legitimate market for cross border trade, it is exploited by organised crime groups or individuals when the volumes exceed agreed personal allowance limits and / or the volume would be considered for commercial use.

b) If the perceived threat from smuggling is large enough, pressure on law enforcement to focus a percentage of available resources to interdict contraband, which can have implications for deployments against other border priorities and / or criminal activities.

c) A disproportionate impact on health services, such as reducing the provision of health care to treat other non-tobacco related / causal conditions, further exacerbated if the country also suffers a reduction in tax revenues.

d) Legitimate manufacturers who produce licensed tobacco products struggle to compete in an economy suffering an influx of cheap or counterfeit tobacco products. This has consequences for those frameworks aimed at regulating legitimate manufacturers (such as a reduction in tax receipts) and the overall attractiveness of a jurisdiction to associated trade.

21. Tobacco smuggling is attractive to criminals (or opportunists), for several reasons, including the generation of large sums of money for criminal reinvestment or funding lavish lifestyles, and the perception of lesser punitive sanctions or penalties if caught smuggling. The subsequent sections explore the different types of smuggling methodologies, including an assessment of the supply chains of each method.

DEFINING THE SUPPLY CHAIN AND SMUGGLING METHODOLOGIES:

22. A supply chain means the transformation of raw materials and components into a finished product, including any subsequent transportation and storage before distribution to the end customer. Although tobacco smuggling is an illicit activity, much of its supply chain is predicated on legitimate commodity movements, including people, technology, information and resources involved in moving and storing the products from the supplier (complicit or not) to the customer. Each methodology will include different supply chain requirements, which are further differentiated depending on the size, scale and sophistication of the smuggling activity. Organised Crime Groups (OCGs) or opportunist smugglers will add in their own variations depending on a number of factors. These factors include:

a) Mitigating the risk of detection at source, in transit or at point of sale, as this affects criminal profit margins. For example, monies set aside to pay off corrupt officials or the purchase of counter-surveillance equipment at storage or distribution points. Smaller groups or individuals will have a different attitude towards risk of detection and adapt their supply chain mechanisms accordingly.

b) The volume and type of the commodity they intend to smuggle. For example, packaged cigarettes require different logistical mechanisms than raw product or hand-rolling tobacco (HRT), while larger quantities of packaged cigarettes will place a different emphasis again on distribution and storage supply chain requirements.

c) The relative maturity of the individuals or groups involved in the smuggling. Experience may determine the level of sophistication they employ to smuggle goods into the identified jurisdiction. Less well established groups or individuals might sacrifice volume smuggled in an effort to mitigate risk of detection, while still making a

profit for reinvestment. As they become established, they may move from one particular distribution methodology for reasons of cost, increased volume or risk mitigation.

23. The supply chain of the illicit trade in tobacco, shows similarities with legitimate commodity importation. Each element of the supply chain (manufacturers, warehouse storage, transport, sale to the public) will carry a particular risk (financial or otherwise), which the smugglers evaluate and determine the best methodology to suit their needs.

BOOTLEGGING:

24. This involves the purchase of cigarettes or other tobacco products in relatively smaller quantities than would be associated with OCGs, but would still exceed limits set by customs regulations. Typically, bootleggers operate individually or in small groups whose membership is known and tightly managed. Compared to large-scale smuggling, bootleggers' methodologies are often less sophisticated, determined by whether it is opportunistic or market driven.

25. The smugglers purchase products either in low-tax jurisdictions or at duty-free or similar outlets (*i.e.,* cross-border ferry crossings or hypermarkets etc). The smuggler will transport the goods into the high-tax jurisdiction and sell them on an ad-hoc basis (opportunist) or deliver to an agreed customer, such as a wholesaler or other tobacco retail outlet. Typically, those involved in bootlegging use specially modified delivery vans or trucks, which include compartments to store the goods and evade customs detection. If foot passengers, they may also rely on the volume of passenger traffic to evade detection, storing the tobacco goods in their luggage[5].

26. This will also affect the frequency of smuggling activity, with those involved in bootlegging controlling much of the acquisition, transportation and distribution of the product. To avoid attracting the attention of law enforcement or justify travelling modes, bootleggers often manufacture elaborate and seemingly legitimate travel patterns to acquire the goods.

27. The relative maturity of bootleggers will also influence their attitude to supply chain risk and mitigation tactics, and by extension, their resilience to interdiction. That said, compared with large-scale smuggling, it is unlikely that bootleggers could absorb constant interdiction by enforcement agencies. Instead, they will often rely on the seemingly smaller scale of their smuggling activities to avoid detection.

LARGE-SCALE SMUGGLING:

28. Large-scale smuggling involves the acquisition and transportation of commercially sized consignments of tobacco products. Depending on the nature of the smuggling, one group or series of interconnected groups will take responsibility for the subsequent inland distribution and sale of the products; otherwise, distinct individuals (with relationships based on provision of service) manage elements of the supply chain demands. Large-scale organised smuggling likely accounts for the vast majority of cigarettes smuggled globally.

5 Joossens, *et al.* (2000).

29. While the greatest scope for profit generation is in jurisdictions with high taxation rates, this is not the only determinant. The smugglers will operate wherever there is scope to undercut a legitimate market and generate a suitable profit against their initial outlay. There is also anecdotal evidence to suggest OCGs involved in large-scale smuggling are territorial and will sell tobacco product(s) in their own jurisdiction.

30. While there are regional and market-level differences, several characteristics are common in large-scale smuggling operations:

a) Historically, prior to the control of genuine product supply chains, large-scale smuggling involved international brands, produced by the large multinational tobacco companies, because of the familiarity of the products and the ease in selling them.[6] However, recent operational activity has shown an increase in the smuggling of cheap whites, counterfeit goods and even counterfeit cheap white tobacco products due to the relative success of supply chain controls.

b) Secondly, large-scale smuggling takes advantage of the 'in transit' system developed to facilitate international trade. This system allows for the temporary suspension of customs duties, excise taxes, and VAT payable on goods originating from and / or destined for a third country, while in transit across the territory of a defined customs area. For example, cigarettes exported from the United States that are destined for North Africa will enter Belgium while en-route. Once in Belgium, the smugglers transported the cigarettes via the European road network to Spain, and then shipped to North Africa. As long as confirmation is given of re-exporting the goods, no tax liability is generated while the cigarettes are in transit.

c) Thirdly, large-scale cigarette smuggling can involve multiple individuals or gangs who will facilitate the transportation of the goods. Depending on the type of goods and the method of transport, these transactions can happen over a short period with the value of the product increasing as it nears the final point of distribution or sale. The likelihood or risk of detection also affects the price of the goods.

d) Finally, large-scale smuggling requires a good local distribution network, which can involve middle market distributors who may supply their own customers with the product and made available at an agreed distribution point or similar (sometimes referred to as a slaughter point). Otherwise, the importing OCG is involved in widespread street selling, allowing for the quick and effective sale of the smuggled cigarettes.[7]

31. Naturally, the supply chain for large-scale smuggling is longer and more sophisticated than that associated with bootlegging or opportunist smuggling, although this means a commensurate rise in the risk of infiltration from law enforcement or rival crime gangs. Whereas the bootlegger or opportunist smuggler is inclined to retain complete control over their product, OCGs tend to relinquish this responsibility to others; due to the significant volumes of goods smuggled, and

6 Barford, M.F. (1993).

7 Joosens, *et al*. (2000).

complexity of transportation and warehousing methods employed. Therefore, operating methods mitigate liabilities over safe delivery and accountability for any financial losses in the event of product seizure before reaching its final destination.

32. Those engaged in large-scale smuggling tend to use storage facilities in locales close to the point of importation or within the final jurisdiction. Not only does this allow the OCG control over access to these sites, it also builds resilience into their smuggling models as they can stock pile goods to offset the risk of detection, counter attacks from rival OCGs, and develop a more flexible response to evade frontier enforcement capabilities. While OCGs loathe losing loads to interdiction, unlike bootleggers or opportunistic smugglers, their business models will build in an acceptable level of loss.

33. Large-scale smuggling usually involves the transportation of volumes in excess of one million cigarettes per consignment, rather than an aggregated figure. Large-scale smugglers purchase master cases, which contains 10 000 cigarettes broken down into 50 cartons, which are 10 packets of 20 cigarettes. Buying in such large volume allows for the negotiation of purchase price for the initial importer and the middle market receiver.

34. Although smugglers will have an end destination for their tobacco product(s), some OCGs are willing to realise part of their consignment en-route or will 'sell' complete loads to other crime groups close to or around the point of final importation. Thus, the secondary OCG takes responsibility (and accountability) for transporting the goods into the final destination. The original owners will then re-purchase the goods at a higher price but still within suitable tolerances for them to generate a significant profit in country.

THE ECONOMICS OF TOBACCO SMUGGLING

PRODUCT PRICE:

35. As mentioned above, a variety of jurisdictions, produce cheap whites, with a large concentration of manufacturers in the United Arab Emirates free trade zones, but also in Malaysia, South Africa and Eastern Europe. Manufacturers in the UAE will sell a master case of cheap white cigarettes (10 000 cigarettes) for as little as 35 USD.

36. Counterfeit products operate under a different pricing structure because of the additional distance the goods have to travel, the illegal nature of the goods and the fact they sell for close to the recommended retail price in an effort to 'prove' they are genuine. On average, a master case of counterfeited cigarettes can cost between 140 and 150 USD, and a 50g pouch of counterfeited HRT costs between 7 and 8 USD at the point of production.

37. The price of genuine tobacco products is dependent on the retail price in the country of purchase, or if the smuggler abuses lower duty or duty free markets, such as cross-border ferry crossings. The product price rises as it is nears the final point of sale, reflecting an increase in risk of detection and associated costs of transportation and storage. The following is just one example of a smuggling methodology used by an OCG and involves the importation of cheap whites into the UK.

Box 1: **Case study – Pricing model of large scale smuggled tobacco**

Pricing Model

A UK-based OCG, via its overseas purchaser, arranges to buy 1 000 master cases from an independent tobacco manufacturer for 35 USD each. This appears legitimate to any law enforcement agencies based in the country of production. The overseas purchaser will arrange to sell the 1 000 master cases to a key EU-based transport facilitator for 65 USD a master case. At this stage any relevant customs documentation may correctly list the goods as cigarettes. Although the financial responsibility for safe transportation of the goods reverts to the EU facilitator, the OCG retains 'ownership' of the goods.

Once safely deposited into a near-continent based warehouse controlled by the UK-based OCG (who now takes formal ownership of the goods and any associated risks), the EU facilitator will receive, on average, 600 EUR per master case, a percentage of which represents the risk the facilitator took in delivering the product. Any related customs documentation is altered so the goods are listed as a less suspicious commodity.

Upon successfully importing the goods into the UK, the OCG will sell them to their UK middle market suppliers for 700 EUR to 1 100 EUR a master case, depending on the quantity ordered and the brand requested. The OCG retains accountability for any losses until the goods reach the agreed distribution point. At the point of sale, the cigarettes will sell for anything between three and four GBP, which appears to be an 'acceptable' price to the consumer for buying illicit cigarettes.

If the middle market distributor purchased a mastercase for 700 EUR (approx 560 GBP) and sells all 500 packets of 20 cigarettes for 3 GBP, they will make a profit of just under 1 000 GBP when subtracting the cost of purchase. However, this doesn't take into account any other associated costs which can affect the profit margin.

Source: United Kingdom

38. Putting the illicit tobacco trade into context, Table 1 shows the price and tax burden of a pack of 20 cigarettes in eight of the 27 EU Members states, representing the four most and least expensive jurisdictions. As the table indicates, bootleggers or organised smugglers can make significant profit (and by extension a tax loss experienced by the government) from purchasing genuine duty-paid cigarettes in Estonia, transporting them to any of the four most expensive jurisdictions and sell them for a discounted price.

Table 1: **The price and tax burden of 20 cigarettes in the premium cigarette price category in eight of the 27 EU Member States.**

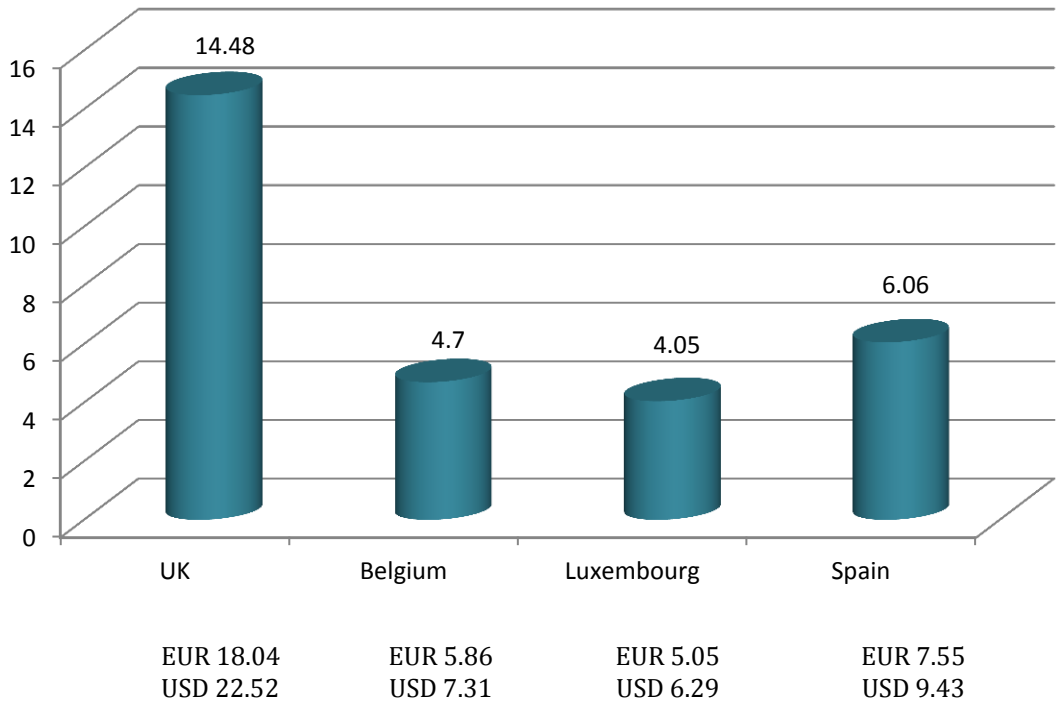
	RRP per 20 cigarettes			Tax burden per 20 cigarettes			Tax Incidence
Country	GBP	EUR	USD	GBP	EUR	USD	
Ireland	7.41	9.27	11.62	5.82	7.28	9.13	79%
UK	6.95	8.69	10.89	5.40	6.75	8.47	78%
Sweden	5.71	7.14	8.95	3.95	4.94	6.19	69%
France	5.12	6.40	8.03	4.09	5.12	6.41	80%
Bulgaria	2.65	3.31	4.15	2.08	2.60	3.26	79%
Lithuania	2.41	3.01	3.77	1.78	2.23	2.79	74%
Hungary	2.40	3.00	3.76	1.88	2.35	2.95	78%
Estonia	2.38	2.97	3.73	1.85	2.31	2.90	78%

Source: The Tobacco Manufacturers' Association website

39. Figure 1 shows selected EU price differentials for 50g hand-rolling tobacco pouches, reinforcing the UK's position as an attractive jurisdiction for the smuggling of genuine and smuggled HRT product.

40. The price of the smuggled goods is dependent on several issues, including the brand, *i.e.,* whether it is a cheap white or a counterfeited genuine product, the evaluation of law enforcement capability and the existence of a reliable internal distribution market. Smugglers will test different brands and prices to find a balance that maximises market penetration and profit generation. As a rule of thumb, the distributors sell the products for between 50% and 75% of the recommended retail price of genuine tobacco products. However, as mentioned above, wherever there is scope for a smuggler to undercut an existing market, they will transport goods into the jurisdiction and determine a suitable price based on their experience in gaining market penetration and the cost of legitimate products.

Figure 1: **Hand-rolling tobacco price differentials of selected EU countries April 2011 (in GBP)**



TRANSPORTATION & STORAGE COSTS:

41. This is dependent on the nature of the product smuggled and the money available. Large-scale smuggling requires more money set aside to cover transport and storage costs than required by opportunist smuggling or bootlegging. The main methodologies for all types of smuggling are:

a) Via container shipped from point of production either directly to point of consolidation for in-country wholesale or retail distribution or via other ports to disguise their origin and / or secondary distribution. Containers can hold up to 10 million cigarettes in total, but OCGs can reduce the overall volume by smuggling the products within legitimate cover loads.

b) Roll on / Roll off (Ro-Ro) freight traffic, sometimes used in collaboration with sea-shipped containers. A twenty-foot trailer can hold 475 master cases, which is approximately 4.75 million cigarettes. OCGs may operate haulage companies directly or financially incentivise otherwise legitimate haulage companies to transport shipments to the final point of sale. The costs associated with the use of these businesses, including payments paid to the drivers are not well known. For example, in two separate UK investigations involving Ro-Ro, one driver received GBP 1 500 per successful crossing, while another OCG was paying its drivers up to GBP 10 000 to ensure successful transportation.

c) Fast parcel / airfreight of smuggled goods and transport packaging material associated with tobacco products, such as HRT pouches and even the raw tobacco product itself.

As with the other methodologies, smugglers incorrectly describe loads to frustrate law enforcement intervention.

d) The abuse of cross-border shopping by vehicle or foot traffic, which can mean the overall volume is less than large-scale smuggling, but with a still noticeable impact on a country's tax receipts from the importation of non-duty paid genuine product. However, certain OCGs realise the potential from infiltrating the bootlegging market and exploit these cross-border opportunities. For example, coach loads of seemingly legitimate holidaymakers working on behalf of a crime group will travel to a jurisdiction where the price of genuine product is low and bulk buy. This gives the OCGs a stock of genuine product to sell, with the monies generated covering the costs of the method but still delivering a healthy profit.

42. It is likely large-scale smugglers will employ a combination of methods to spread the risk of detection. By having a flexible transportation model, it allows them to manage more effectively spikes in demand from customers as well as maintain a strong grip on costs.

43. Not all smuggling methodologies lend themselves to the acquisition of warehousing or storage facilities, but when used; they provide the OCGs with resilience in the face of a possible increase in the efforts of investigating agencies. When transporting illicit cigarettes to the UK, several OCGs own and manage 'super warehouses' in various near continent jurisdictions such as France, Belgium and the Netherlands. This allows them to stockpile goods in the event of an increase in enforcement authority at border locations or seizures of commodity inland.

ILLICIT DISTRIBUTION POINTS & CASH COLLATION

44. Many OCGs transport larger consignments to distribution points only known to them and their customers. Here the load is split down and sold to middle market suppliers. These distribution points change on a regular basis, with the location determined as close to importation date as possible to frustrate law enforcement intervention opportunities. There is no fixed typology for the type of location favoured. It can be a rented plot on an industrial estate, housed within a self-storage facility or if a smaller load, kept in a lock-up or garage.

45. Depending on the reliability of middle market buyers, the smugglers can generate at these illicit distribution points, which is either collated offsite before the OCGs launder the proceeds or is immediately returned overseas, often via a cash courier or using concealments in a vehicle. Again, there is no fixed typology to identify cash remittance methodologies but it represents a tangible risk to the smugglers until used to a) pay for any future loads or b) the criminal profit is laundered.

THE IMPACT OF THE ILLICIT TRADE IN TOBACCO

46. The illicit trade in tobacco affects governments, private business, labour and society. The most visible of said consequences are:

a) Governments deprived of tax revenue, which necessitates increases in other tax instruments to deliver mandated public expenditure programmes. A general decrease in tax compliance and expected revenues undermines the tax system as a whole.

b) The potential promotion of criminality and corruption within government, which can coincide with an increase in tolerance of criminality, which in turn encourages and attracts national and international organised crime groups or opportunistic smugglers.

c) The severe affect on consumer health and healthcare provision, especially where tobacco products do not comply with minimum health requirements.

d) Difficulties for legal tobacco manufacturers to compete openly and fairly, which undermines regulatory regimes aimed at governing the legitimate industry.

47. Joossens, *et al.* (2000) sight the following as consequences of unabated illicit trading in tobacco.

a) Smuggled cigarettes compete with legal cigarettes. The two implications are an increase in cigarette consumption and an artificial impact on cigarette pricing. This can be lowered to secure the legitimate market but is affected by government commitments to tackle cigarette consumption. Moreover, the presence of smuggled cigarettes can put legitimate retailers at a competitive disadvantage, leading some to be less compliant with tobacco-control laws than they would be in the absence of competition from a black market.

b) A black market in cigarettes can undermine efforts to limit youth access to tobacco products and other approaches to reducing overall availability of these products. While tobacco retailers may comply with national or local policies prohibiting the sale of tobacco products to underage persons and otherwise limit availability, it is much less likely that vendors of smuggled cigarettes will comply with these policies.

c) The potential profits associated with large-scale cigarette smuggling create incentives for organised crime networks to develop, bringing with them a number of problems. Cigarette smuggling can be a relatively low-risk source of revenues for these networks, and then used to support more high-risk activities. In addition, the growth of these networks can increase the general level of corruption in a country, both among its citizens who purchase cigarettes in the black market and among public officials who facilitate black market activities.

48. The aforementioned is very difficult to measure, both for the illicit economy as a whole but also in the case of measuring the effect of illicit trading in one commodity. This has consequences for developing suitable metrics to quantify the associated money laundering.

APPROACHES TO THE DEVELOPMENT OF A MEASUREMENT TOOL

49. It is not the purpose of this document to provide a measurement tool to test the prevalence of the illicit trade in tobacco. A short synopsis of a tool as designed by Merriman is provided to indicate that approaches do exist and that further study may identify the prevalence of money laundering associated with quantified illicitly traded tobacco.

50. Reliable quantitative measures of tobacco smuggling can enhance tobacco control policy. Baseline measurements of tobacco use and tax avoidance and evasion can develop, upon which policies are then established. Further measurements can provide appropriate benchmarks to ensure

the implementation, review, and improvement of such policies. In addition, sound measurements of the association between changes in tobacco control policies and changes in smuggling can prove the success of these policies.

51. Estimating the true nature of smuggling is challenging because it is an illegal and hidden activity. A number of useful and reliable methods to measure smuggling are available, but each method has limitations. When time and resources permit, it is best to use several different methods in order to cross-validate estimates minimizing any methodological objections.

52. This tool offers five methods to measure tobacco smuggling. The methods are ranked, with the first requiring the least technical and statistical sophistication and the last requiring the greatest level of technical complexity and statistical inference:

a) Observe the producers and ask the experts for smuggling data.

b) Observe smokers directly and ask them about their methods of obtaining tobacco.

c) Monitor and analyze data on the export and import of tobacco.

d) Compare the sale of tobacco with estimated consumption of tobacco by using household surveys.

e) Compare the sale of tobacco with estimated consumption of tobacco by using a mathematical formula and economic inference.

53. Following the development of indicative figures quantifying the illicit trade in tobacco, domestic and international agencies can work together to determine the volume and value of associated money laundering. This type of complementary statistical analysis can support a step-change in investigative response, moving agencies away for a solely commodity seizure based response to a more holistic position of targeting both the commodity and the associated business model, including efforts at laundering criminal cash. The next section evaluates existing investigative responses in more detail.

THE OPPORTUNITIES FOR AN IMPROVED INVESTIGATIVE RESPONSE

54. According to the foreword to the World Customs Organisation's 2010 Customs and Tobacco report, the WCO had "witnessed an unparalleled growth in the illicit trade of tobacco products over recent years" recognising a need for countries to step up their efforts to tackle this problem. The report also stated "that where goods are highly taxed, easily portable and penalties remain relatively light for smuggling, trans-national criminal organisations will take advantage of any weaknesses in customs, revenue or other border controls to amass profits".[8]

55. With such a commodity intensive crime type, the default setting is to seize as much of the product before it reaches the middle market suppliers / point of sale, supported by a criminal investigation aimed at tackling the smugglers. Depending on the capability of the investigating agency, it establishes a parallel financial investigation seeking to recover assets bought or associated with the criminal proceeds.

8 WCO (2011).

56. For relatively inexperienced or low-volume smugglers, such an approach can seriously undermine their ability to establish a foothold in the market. They do not have time to build up additional stock in the event of product seizures, nor will they have the ability to change their smuggling methodology. It is likely they have invested their own start up capital and are reliant on the sale of several smuggled loads before they can realistically absorb the financial losses associated with a seizure. They may also use relatively simple mechanisms to launder the proceeds of their crime and the acquisition of property and other assets takes place in their home jurisdiction. As such, asset denial or recovery can have a serious impact on their ability to continue smuggling and disrupt their seemingly legitimate life.

57. As assessed above, those involved in large-scale smuggling will adopt risk mitigation strategies to offset any potential financial and commodity losses via law enforcement interdiction. This includes 'losing' loads to investigating agencies to frustrate anti smuggling / investigation capability in the knowledge that they have subsequent loads en-route or passing through the point of entry at the same time. Law enforcement authorities may also use upstream interdiction tactics, though from a financial perspective tobacco products will not have acquired the value that generates substantial criminal profit. Given the propensity of OCGs to purchase assets overseas or use complex mechanisms to launder the profits from their criminality, it can be extremely difficult to dismantle the more sophisticated crime groups without international cooperation.

58. What is required is an improved understanding of the business models underpinning tobacco smuggling. Whilst each jurisdiction may have discrete ITT methodologies, mapping economic models against generic supply chain models will enhance enforcement opportunities and impact on the ITT using concurrent financial, frontier and inland intervention activities.

59. The growing threat from the ITT requires greater sharing of acquired knowledge and understanding of criminal activity and financial business models to improve enforcement impact at domestic and international levels. The international nature of the ITT demands a global response that includes tackling the financial dimensions of the trade and recovering illicitly derived assets.

4. THE JURISDICTIONAL APPROACH TOWARDS THE ILLICIT TRADE IN TOBACCO

60. The purpose of this chapter is to provide an overview of the various jurisdictional approaches towards the criminalisation of the illicit trade in tobacco. The body of information was obtained from the jurisdictions via responses to a questionnaire. (Refer to the list of respondents in Chapter 5, Table 2.) The focus of the questionnaire was to place emphasis on the criminalisation of ITT as well as other types of offences which may be associated with ITT. Consideration was also lastly given to possible penalties or remedies at the disposal of the said jurisdictions.

A. THE CRIMINALISATION OF THE ILLICIT TRADE IN TOBACCO (ITT) AND POSSIBLE ALTERNATIVE OFFENCES

61. The vast majority of respondents indicated that the ITT is a criminal offence. An aspect that was however clear is that the definitions of what would constitute the ITT differed between jurisdictions. The penalties associated with these acts were in some cases also dependant on the volume and or value of illicitly traded tobacco.

62. Jurisdictions therefore stated that ITT was a criminal offence but then also indicated that transgressions could be found within the criminal, customs, tax crimes and trademark modalities. The core themes being smuggling, evasion of customs duties and tax, tax fraud and the violation of monopoly law. Respondent 5 indicated that the illicit production of tobacco for instance was also an offence. Respondent 6 also made reference to the trading of counterfeit goods.

63. Respondent 15 however indicated that ITT is not a criminal offence and that charges related to it would be importation offences under customs legislation or legal proceedings derived from trademark infringements.

64. **Conclusions:** The following is therefore of importance:

a) Most Jurisdictions do see the ITT as a criminal offence. This does not however imply that they would see it as a predicate offence to ML.

b) Other associated offences include tax crimes and transgressions within the trademark environment.

c) The ITT can therefore be associated with tax offences which have then also been accepted as a predicate offence to Money Laundering.

B. PENALTIES TO BE ASSOCIATED WITH CONVICTIONS REGARDING ITT

65. The following significant responses are provided:

a) Respondent 3: "There are various instruments for recourse that are provided by the country's legislation for contraventions related to the illicit trade in tobacco products. These include, but are not limited to the Customs and Excise Act, 91 of 1964, the Tobacco Products Control Act, 83 of 1993 and the Financial Intelligence Centre Act, 38

of 2001, as well as the Value Added Tax Act, 89 of 1991 and Criminal Procedure Act, 51 of 1997. The identified contravention determines the legal instrument that will be applicable. Fines and sentences differ from case to case. Some of the suspects were apprehended on more than one occasion with the equivalent of a USD 2 500 fine and or 3 years imprisonment, suspended for five years (In this case 13800 sticks were being traded). The revenue service has also raised schedules on manufacturers and distributors for the diversion of cigarettes. Non-compliance with section 3 and (3) A of the Counterfeit Goods Act (Act 37 of 1997) as amended constitutes a criminal offence in accordance with section 7(3) of the act and any person found guilty of such an offence shall on conviction be liable to a fine not exceeding the equivalent of USD 120 000. With respect to the Customs and Excise Act (as amended) the omission of the stamp is regarded as an offence in terms of section 80(1) and any person found guilty shall be liable on conviction of a fine not exceeding the equivalent of USD 2500 or treble the value of the goods.

b) Respondent 4 indicated:

   i) For smuggling: from two to eight years or four to eight years of imprisonment depending on the circumstances and;

   ii) For evasion (tax fraud): from two to six years or three years and six months to nine years of imprisonment.

   iii) For counterfeit transgressions: one to six years of imprisonment (when official stamps are involved); or three months to two years of imprisonment (when trademarks are involved).

c) Respondent 5 indicated that penalties are up to the twofold of the evaded duties. In case of commercial perpetration up to the threefold of the evaded duties, as well as in criminal and in administrative procedures. In addition criminal courts can apply imprisonment of up to two years (in case of commercial perpetration up to three years). In cases of qualified tax fraud, imprisonment of up to ten years is applicable. Administrative panels can apply additional imprisonment up to three months. All illicit traded tobacco has to be confiscated. If confiscation is not possible (*i.e.,* it has been consummated), perpetrators are then also charged with a compensation penalty.

d) Respondent 8 indicated that a penalty of up to five years imprisonment or a monetary fine can be imposed for tax evasion. In particularly serious cases, a penalty of between six months and ten years imprisonment shall be imposed. A case shall generally be deemed to be particularly serious where the perpetrator deliberately understates taxes on a large scale or derives unwarranted tax advantages, abuses his authority or position as a public official, solicits the assistance of a public official who abuses his authority or position, repeatedly understates taxes or derives unwarranted tax advantages by using falsified or forged documents, or as a member of a group formed for the purpose of repeatedly committing acts, understates turnover taxes or excise duties or derives unwarranted turnover tax or excise duty advantages. Whoever evades import or export duties on a commercial basis or who illegally imports, exports or transports goods on a commercial basis in contravention of monopoly regulations

shall be subject to imprisonment from six months up to ten years. In less serious cases, the penalty shall be imprisonment for up to five years or a monetary fine.

e) Respondent 9 interestingly states that tobacco smuggling is considered a crime when the amount of product dealt is more than ten Kilos. It is normally punished by imprisonment (from two to five years) and a financial sanction of 5 EUR per grams. The punishment increases (from three to seven years) in relation to particular conditions. Heavier penalties are provided when the offence is committed by criminal organisations (imprisonment that can go from a minimum of three years to a maximum of eight years).

f) Respondent 13 states in a similar vein that no person shall sell, offer for sale or have in their possession a tobacco product unless it is stamped (duties/taxes paid) Dual offence: Indictment: min fine to the max fine or max of five years in jail or both (fine & jail) Summary conviction: min fine to a max of USD 500 000 or up to 18 months in jail or both (fine & jail) Min fine: USD 0.17 x number of cigarettes Max fine: USD 0.255 x number of cigarettes.

66. **Conclusions:** It is therefore clear that a wide array of penalties is at the disposal of law enforcement entities. These penalties range from transgressions in terms of tax evasion and fraud, customs duty/excise evasion and fraud, smuggling etc. The nature of penalties imposed range from varying periods of incarceration and fines dependant on other factors such as relations to organised crime as well as the volume and or weight of the illicitly traded product. Of importance however was to then determine whether money laundering charges and convictions could be associated with the aforementioned.

C. MONEY LAUNDERING INDICTMENTS TO BE ASSOCIATED WITH CHARGES RELATING TO THE ILLICIT TRADE IN TOBACCO

67. Of the 18 responses received only 6 respondents indicated that they could relate money laundering cases to the illicit trade in tobacco. A total of three successfully prosecuted cases were claimed by three separate jurisdictions with one jurisdiction stating that "Of the 157 tobacco cases adopted for criminal investigation during 2010 – 2011, 22 also included ML as a secondary regime. These operations are still live and no charging decisions have yet been finalised".

68. **Conclusions:** It is therefore clear that authorities are convicting perpetrators of ITT on varying offences but that ML is very seldomly included in the charge sheet. The question that then remained was what the relation would be between terror financing and the ITT.

D. INDICTMENTS ASSOCIATED WITH THE ILLICIT TRADE IN TOBACCO CAN BE LINKED TO TERRORIST ORGANISATIONS

69. Only one possible indictment related to ITT and terror financing could be sighted out of the possible 18 respondents.

E. OTHER CRIMINAL ACTIVITY TO BE LINKED/ASSOCIATED WITH THE ILLICIT TRADE IN TOBACCO

70. In essence an array of other crimes could also be associated with ITT. These once again included the normal tax and customs offences which were then also indicative of the illicit trade in other commodities or contraband.

71. Respondent 11 for instance indicated that intelligence suggested that there continues to be some crossover between tobacco fraud and the following:

a) MTIC (Missing Trader Intra-Community) fraud by criminals known to the said jurisdictions customs and revenue service.

b) Secondly, alcohol excise fraud was also prevalent with intelligence indicating that some Organised Crime Groups involved in tobacco fraud are also involved in illicit alcohol shipments. Furthermore some hauliers used by Organised Crime Groups for tobacco smuggling are also used for alcohol smuggling.

c) Oils excise fraud – "we have seen intelligence indicating that some Organised Crime Groups involved in tobacco fraud associated with illicit oils movements".

d) Drugs – we have seen intelligence indicating that some Organised Crime Groups involved in tobacco fraud are involved in drug smuggling.

e) Money Laundering – criminally complicit haulage companies have been known to act as cash couriers on behalf of the Organised Crime Groups, aiding their efforts to launder / transfer the proceeds.

f) There is also strong evidence and intelligence linking criminally complicit MSBs (including hawaladars) with the laundering of monies generated by tobacco smuggling.

F. CONCLUSIONS

72. The primary focus to be determined from this specific section of the questionnaire was to obtain a broad view on how jurisdictions approach ITT. The primary trend to emerge was that jurisdictions tended to investigate and prosecute on the predicate offence with little to suggest an emphasis on pursuing money laundering and or terror financing cases to be associated with the illicit trade in tobacco. It is possible that this might occur where perpetrators are known to be involved in organised crime. The tax and customs offences are also sighted to be investigated in isolation. A more detailed overview is however supplied in the following chapters.

5. THE MODUS OPERANDI PERTAINING TO THE PREDICATE OFFENCE

73. The purpose of this chapter is to provide an overview of how various jurisdictions view the Illicit Trade in Tobacco as a predicate offence. It is important for contextual purposes to provide a description of the respondents. The differentiating factors are:

- Status in terms of FATF membership.
- Member of observer organisations to the FATF.
- Geographic location.

74. The aforementioned can therefore be displayed as follows:

Table 2: **Respondent List**

Serial No	Country	Membership of FATF and other	Observer organisations to FATF	Location
1.	Japan	FATF APG MONEYVAL[1] EAG[1]	AfDB, AsDB, Egmont Group, EBRD, IADB, IAIS, IMF, Interpol, IOSCO, OAS[1], OECD, UN, World Bank, WCO	Asia
2.	Hong Kong	FATF APG	AsDB, Egmont Group, IAIS, IMF, IOSCO, OGBS, WCO	Asia
3.	South Africa	FATF ESAAMLG	AfDB, Egmont Group, Commonwealth Secretariat, IAIS, IMF, IOSCO, Interpol, UN, World Bank, WCO	Africa
4.	Argentina	FATF GAFISUD	AfDB, Egmont Group, IADB, IAIS, IOSCO, IMF, Interpol, OAS, UN, World Bank, WCO	South America
5.	Austria	FATF	AfDB, AsDB, Egmont Group, EBRD, ECB, Europol, IADB, IAIS, IMF, IOSCO, Interpol, OECD, UN, Word Bank, WCO	Europe
6.	Belgium	FATF	AfDB, AsDB, Egmont Group, EBRD, Europol, ECB, IADB, IAIS, IMF, IOSCO, Interpol, OAS[1], OECD, UN, World Bank, WCO	Europe
7.	France	FATF APG[1] CFATF[2] EAG[1] GAFISUD[1]	AfDB, AsDB, EBRD, Egmont Group, Europol, ECB, IADB, IAIS, IMF, IOSCO, Interpol, OAS[1,] OECD, UN, World Bank, WCO	Europe
8.	Germany	FATF EAG[1]	AfDB, AsDB, EBRD, Egmont Group, Europol, ECB, IADB, IAIS, IMF, IOSCO, Interpol, OAS[1], OECD, UN, World Bank, WCO	Europe
9.	Italy	FATF EAG[1]	AfDB, AsDB, EBRD, Egmont Group, Europol, ECB, IADB, IAIS, IMF, IOSCO, Interpol, OAS[1], OECD, UN, World Bank, WCO	Europe
10.	Switzerland	FATF	AfDB, AsDB, EBRD, IADB, IOSCO, Egmont Group, IAIS, IMF, Interpol, OAS[1], OECD, UN, World Bank, WCO	Europe

Table 2: **Respondent List**

1. Observer
2. Co-operating and Supporting Nations

75. 14 of the 18 respondents are member countries to the FATF. The four remaining respondents are members of FATF Associate member countries. Seven of the respondents are from Europe with two respondents representing North America, one representing Africa and one representing South America with five respondents from Asia and two respondents from Central America.

76. The chapter and the relevant questions are to be addressed in terms of geographic location. The purpose being to determine whether specific trends can be ascribed to certain regions.

A. PRIMARY ROLE-PLAYERS ASSOCIATED WITH THE ILLICIT TRADE IN TOBACCO (*I.E.,* DOMESTIC VS. FOREIGN ROLE-PLAYERS)

77. **Asia.** Answers obtained from jurisdictions were not substantial enough to provide a trend. The primary theme being that both domestic and foreign role-players have been involved.

78. **Africa.** Respondent 3 indicated that both domestic and foreign role players play a major role in the illegal manufacturing, importation and distribution of illicit tobacco with undocumented immigrants, and asylum seekers also recently being seen to form part of the specific transportation and distribution of the illicit product.

Box 2: **Case study –ITT cross border cash movement and money laundering**

Company Y was an established legitimate registered producer of cigarettes. In an effort to improve competitiveness said company mixed imported products with locally manufactured products. These products were then distributed in the host country at a discounted rate. The money that was obtained through the evasion of taxes was then used to further capitalize the company. Company Y also "round-tripped" their products back into the host country and proceeded to sell it locally as well. Duties were furthermore evaded by making use of bond to bond mechanisms. Company Y in the process of investigation admitted to importing close on 50 containers of cigarettes over an extracted period of time. Funds were moved offshore using various Special Purpose Vehicles. The matter was investigated by Tax Authorities with an assessment plus penalties raised to the value of USD 4 million.

Source: South Africa

79. **Europe.** EU countries indicated that domestic and foreign role-players were involved but that the majority of foreign role players were also nationals. Respondent 9 however indicated the involvement of East European nationals.

Box 3: **Case study – Operation 'Desert Tree'**

On 27 October 2009, as part of a Multi Agency Operation, Irish Customs Officers seized:

- a total of 120 304 000 contraband cigarettes;
- the general cargo vessel MV Anne Scan;
- 200 tons of Copra animal feed;
- three articulated vehicles; and
- a quantity of cash (approximately EUR 30 000)

Following an operation at Greenore Port, Co Louth and the surrounding area. The operation was supported by the Irish Air Corps, Irish Naval Service, An Garda Siochana (Police), HMRC, PSNI and the European Fraud Office (OLAF).

The vessel MV Anne Scan, IMO 9145126, The Philippines, on 15 September 2009 with a declared cargo of 1 490 bags of animal feed, the port of destination being Greenore, Co Louth, Ireland. The vessel was monitored on the high seas en route to Greenore Port, arriving at 0600 on Monday 26 October 2009. Surveillance of the vessel was maintained over a period of time.

Following the discharge of part of the cargo from the vessel on Tuesday 27 October 2009 onto awaiting trucks, which were allowed onwards to their place of offloading, the Multi Agency Task Force moved in and raided several premises in the Co Louth area, in addition to mounting an operation on the vessel.

Investigation

Documents uplifted and enquiries conducted during the course of the subsequent investigations have revealed that the vessel was chartered for one direct voyage from The Philippines to Ireland.

The Irish based importer provided all cargoes (cigarettes and copra) and various packaging material to the warehouse in advance of shipping to Ireland. He supervised the stuffing of cigarettes and copra in jumbo bags until completion of loading the outbound vessel.

The individual gave strict and specific instructions to change the descriptions of the goods and the vessel's final destination as Vietnam and the cargo as animal feeds 'in order to protect the cargo against piracy during the voyage'.

He paid the haulage firm in cash (USD) for rental of the warehouse, charter of the vessel, stevedoring, consolidation of jumbo bags and other related expenses. (The cash payment for the charter of the vessel alone amounted to USD 540 000.)

Track and Tracing of the cigarettes

The brands and quantities of cigarettes seized were Palace (99 431 000), Chelsea (13 240 000) and a mixture of other genuine brands.

The Imperial Tobacco branded products have been confirmed as genuine product, which was sold by Imperial Tobacco, UK to a bond store in India, which later shipped them to The Philippines. While the Palace and Chelsea branded cigarettes were traced as being shipped by Silver Eagle Manufacturing Tobacco Company, Cavite to the consolidation warehouse in The Philippines.

Conclusions

- Various jurisdictions were involved. India to Philippines to Ireland using Vietnam on the papers as final point of destination.
- Multiple nationalities were involved.
- Use of cash (EUR 540 000) for payment which was most likely not declared at ports of exit and entry or use of front companies.
- Key themes would have been tax and duties evasion, fraud (false declarations in terms of final destiny and type of commodity)
- Success was achieved through sound sharing of information and amongst multiple local and foreign law enforcement agencies.

Source: United Kingdom

80. **America.** Respondent 12 indicated that the primary international source of counterfeit tobacco products originated from China. Domestically, Indian reservations, importers, and duty free stores have been a source of untaxed tobacco products illegally into the commerce of the respondent's economical areas. A trend highlighted by the respondent was the use of the Internet to sell and purchase tobacco products. Mail and express consignment facilities were also being used

more often, instead of the traditional cargo container, to ship illicit tobacco products in small amounts which fall under prosecutorial guidelines in many jurisdictions.

Box 4: **Case study – Cigarette smuggling and protection fees**

In 2002, the European Community (EC) filed suit against an American tobacco company alleging money laundering activities surrounding cigarette smuggling. According to the complaint, the company violated the trade embargo with Iraq and paid the PKK a fee for every container that moved across the Kurdish region of Turkey during the 1990's. The cigarettes were smuggled from Turkey, through the northern border of Iraq, and into two PKK controlled areas of Iraq. The profits were suspected of funding the terrorist activities of the PKK and other terrorist organisations operating in Northern Iraq. Ironically, whereas the group controlled the flow of contraband cigarettes into Iraq during the 1990s, they now control the flood of counterfeit cigarettes streaming out of Iraq.

Source: United States

81. **Conclusions:** The answers and case study provided confirms the transnational nature to be ascribed to the illicit trade in tobacco.

a) All respondents indicated that tobacco tended to originate from beyond their borders. That would be because their tax rates probably act as an incentive for outside role players to offset their illicit products within their higher duty jurisdiction.

b) Little support could be found for products being produced and sold within jurisdiction only. Risk is limited by producing the tobacco products for export and then offsetting the product whilst evading the duties and income taxes due in both respective jurisdictions.

c) Various different role players facilitate the value chain of the illicit trade.

d) Investigations and enforcement actions were successful due to multiple foreign and domestic agency interaction.

B. THE FACILITATION OF ILLICIT TRADE IN TOBACCO.

82. The key themes to emerge from this section would also have to relate to question 1 insofar as the methodology utilised by smugglers.

83. **Asia.** Respondent one's answer was indicative that the illicit trade in tobacco is mainly approached from a single passenger perspective as methods of concealment was equated to crew members or airlines and ships make use of private luggage to store said contraband. Respondent two indicated the use of cross border vehicles and pedestrian crossings. The extent hereof is however not known.

Box 5: **Case study – Facilitation of illicit trade**

In 2008, Customs smashed an illicit-cigarette syndicate which was involved in delivering illicit cigarettes to street-level peddlers scattered all over the territory in Hong Kong for local consumption.

The syndicate head had never physically taken part in the distribution of illicit cigarettes. He hired culprits to do the illegal business and controlled them behind the scene. He made use of eight bank accounts (of his sister and wife) to deal with the proceeds of crime.

The total proceeds derived from illicit-trade in tobacco for the period January 2006 to November 2008 amounted to approximately HKD 114 million. The whole syndicate was rolled up in 2008. A total of 17 persons, including the syndicate head and his family members, were arrested with a total seizure of over 10 million sticks of illicit cigarettes.

The three core members of the syndicate and 14 peddlers were charged with money laundering offence(s) and/or forged trade mark offence(s). They were subsequently convicted and sentenced to imprisonment with 5.5 years being the maximum. Assets to the value of HKD 9.18 million were restrained for subsequent confiscation proceedings.

Source: Hong Kong, China

84. **Africa.** Respondent three indicated that cigarettes had in the past been found in trucks (false apartments in tankers and containers), falsely declared in containers, in commercial vehicles, hidden in passenger vehicles, planes, passenger trains, goods trains, border pedestrian crossings and carried across the border by persons (mules). Up to 200 mules at a given time and place can handle more than 1000 Master cases that are carried over the border per night at a single crossing point. The conclusion to be made is that ITT is rife and that diversified methods of distribution are being used.

85. **Europe.** All forms of transportation were sighted by the various respondents. Respondent five stated that as a transit country for trade with neighbouring countries (Such as France, United Kingdom, Germany, The Netherlands) and in accordance with the type of vehicles identified in the national police database (non-representative sample) the goods were transported by road (cars, lorries) and by sea. The port of Antwerp was sighted as an important gateway to Western Europe, especially for unloading containers with Chinese cigarettes. There are also sea links (and railway links) to the United Kingdom. Respondent 11 sighted that counterfeit and illicit white cigarettes in large quantities is primarily smuggled into the Jurisdiction via container or Roll-on Roll-off transport. Genuine cigarettes are predominantly smuggled by passengers and in passenger/small commercial vehicles - often via abuse of cross border shopping limits. It was lastly also mentioned that substantial quantities of counterfeit and loose tobacco are also smuggled via postal packets.

86. **America.** Respondent 12 indicated that ITT is facilitated predominantly through cargo vessels as well as mail and couriers as was also expressed by respondent 11. Respondent 13 mentioned that a significant amount of domestic grown tobacco originating from its jurisdiction could be making its way to illicit manufacturers but the cheaper costs of foreign tobacco from bordering jurisdictions have been intercepted whilst attempts were being made to smuggle the

contraband across borders to manufacturing sites. Container trucks, vehicles, boats appear to be the most common methodology and certainly mis-descriptions and even under-evaluation of shipments have been reported and were done for the purpose of avoiding detection at border crossings. It was also stated that illicit tobacco entered the respondent's jurisdiction primarily through tractor-trailer shipments, marine container shipments, commercial courier and postal shipments and by passengers in the air and highway modes. Respondent four also indicated that the land modality (77%) was regarded the predominant method.

87. **Conclusions:** Various methods were sighted to smuggle the illicit goods. Land, See and air modalities were used or combinations thereof. Methods sighted included:

- Use of trucks with or without false compartments.
- Use of commercial vehicles
- Use of passenger vehicles
- Planes
- Cargo Vessels
- Passenger and goods trains
- Mules
- Roll on roll off transport
- Abuse of cross border shopping limits
- Postal packets
- False declarations
- Under valuation

C. THE FINANCING OF ILLICIT TRADE

88. The purpose of this section is to determine whether the established illicit enterprises are run in isolation and or whether the criminal enterprises are vertically and or horizontally integrated or disintegrated. This is dependent on the size and level of development of the enterprise. The money flows are then indicative of this and may determine the propensity for ML to occur from said predicate offences.

89. **Asia.** Respondent two indicated as much "It is believed that perpetrators obtained start up capital from selling of illicit cigarettes at street level beginning with a small scale of operation. Crime proceeds obtained from small scale ITT operations were then used to buy more illicit cigarettes again and to finance/support the subsequent illicit cigarette business".

90. **Africa.** Respondent three's reply was indicative of more sophisticated networks at play within said respondent's jurisdiction. "Various models are possible here. Most of the illicit trade in tobacco involves the purchasing of manufactured products from the neighbouring countries. Therefore the origin of the finance could be from any source possible. Regarding the illicit trade in undeclared production, cigarettes meant for export and not exported, again the origin of the finance

could be from any source. Sometimes the tobacco products form part of the barter system whereby another illicit product is provided to the supplier".

91. **Europe.** Responses from the European based respondents indicated the use of fronting, cash based businesses as well as commingling with other forms of contraband. Respondent six indicated that: "Apart from legitimate businesses that buy loads of cigarettes with their (illegal) proceeds we find that companies in financial trouble (transporters) are often approached. "Black" money is injected into the company to keep it going but in return the company is later used to import illegal products. The manager of the company in trouble acts as a front man, initially sometimes without his knowledge".

92. Respondent 11 recently commissioned a project to evaluate its knowledge of the criminal finances associated with large-scale tobacco smuggling. The project is however still in its infancy with the respective body responsible for said project having committed to feeding the findings into the FATF typology. It was however noted that in one large-scale cheap white smuggling operation, alcohol fraud was used to acquire the necessary seed capital allowing for diversification into tobacco smuggling. The costs of production, sourcing raw tobacco and labour are kept low by working with a tobacco broker overseas who engages with manufacturers based in Free Trade Zones.

93. **America.** Respondents 12 and 13 once again highlighted the involvement of organised crime with respondent 13 specifically referring to "Organised Crime networks which have had smuggling networks in place since the early days if tobacco smuggling dating to the late 1980's. Many smaller players have seen themselves pushed out of the way or risk repercussions from these networks that then tended to simply consume the smaller groups into their own ranks". It would be interesting to determine what responsibilities these smaller players then had to take on as part of the bigger enterprise *i.e.*, selling of the existing project or sharing of profits from own operations, etc.

94. **Conclusions:** Various methodologies came to the fore.

- Seed capital obtained from small scale sales which are accompanied by a systematic increase in size of the illicit trade.
- Bigger role players absorbing smaller role players within the OCG environment
- The maturity cycles as applied to normal business operations are applicable within this realm as well *i.e.,* introduction, growth, maturity and decline phases.
- Commingling of funds and or products with linkages between the proceeds of illegal alcohol then used for trade in illicit tobacco to eventual bartering for drugs. **Remark.** The ITT then either having its own value chain or making up a part of a more sophisticated/diversified product range.

D. ORIGINS OF ILLICIT TOBACCO

95. It must be noted that only 12 out of the 18 respondents provided information pertaining to where they perceived the illicit tobacco to originate from. The sample is therefore not regarded as representative

enough to warrant serious consideration at this stage. It can however be stated at a rudimentary level that 17 countries were sighted as possible points of origin with China and Dubai being the most sighted. Only two respondents highlighted that illicit tobacco was sourced domestically.

Box 6: **Case study – Origins of illicit tobacco**

In 2009 a smuggling organisation was identified by the Austrian customs investigation service which was responsible for smuggling of about 540 million sticks of cigarettes in the period from 2003 to 2009. The cigarettes were concealed in containers from China behind legal cover loads.

The consignments were customs cleared in Germany, Netherlands, Belgium and Austria. All consignees were given only addresses at various tax consultants but no real business addresses. The companies were all run by the same person who used fake identities for each separate company. After each seizure the concerned company name was not used anymore and all documents were destroyed.

Source: Austria

E. POINTS OF SALE

96. The purpose of this section is to determine the destination (*i.e.,* country, province, city, reservation etc in the case of countries used as transit) for illicit tobacco as well as the nature of the final point of sale per jurisdiction. The answers obtained varied.

97. From a destination perspective most respondents indicated that the illicit tobacco was destined for local consumption within the jurisdiction. Some respondent's answers also indicated that their jurisdictions could also be utilised for transit purposes to other more profitable jurisdictions with the reason being the utilisation of infrastructure which match the smugglers modus operandi. Respondent 6 for instance indicated that transit goods are usually destined for the United Kingdom or France. Respondent 8 indicated that tobacco was predominantly destined for local consumption but were identified as transit goods usually destined for the United Kingdom as well.

98. Respondents 11 and 18 provided more information related to the nature of the point of sale. Localities identified included local pubs, clubs and other centres of the community; alongside legitimate products in small retailers; at local markets and car boot sales; via 'tab' houses and 'international' shops. More rudimentary points of sale listed were tobacco usually sold by peddlers discreetly along streets and alleys.

Box 7: **Case study – *Modus Operandi* on methods and point of sale, counterfeit cigars**

A joint investigation conducted by Federal, State, and local authorities identified two subjects engaged in the counterfeiting of Swisher Sweet cigars. While executing a search warrant, unrelated to the cigarette counterfeiting offense, at the residence of Subject 2, handwritten notes referencing counterfeit cigars were discovered. Surveillances were initiated on both subjects which determined that Subject 2 was receiving cigars (legally) from India, and Subject 1 was receiving counterfeit Swisher Sweet labels from the People's Republic of China. Both items were married into a

counterfeit Swisher Sweet Cigar then sold at convenience stores throughout three southern states. Controlled purchases of counterfeit cigars were conducted utilizing a confidential informant and sufficient evidence was developed to obtain two state-issued search warrants that were executed at the residences of Subject 1, resulting in the seizure of approximately 50 000 counterfeit cigars. Subject 1 and Subject 2 were subsequently indicted for conspiracy and trafficking in counterfeit goods (18 USC 371 and 2320). Both subjects pled guilty to all charges. Subject 1 was sentenced to 12 months incarceration and ordered to pay USD 6 000 in restitution and Subject 2 was sentenced to 18 months incarceration and ordered to pay USD 6 000 restitution.

Source: United States

Box 8: **Case study – Terror financing**

The Real IRA has flooded Ireland with contraband cigarettes and imported counterfeit versions of popular brands and cigarette smuggling has emerged as a top funding source for the organisation. The combined IRA groups have reaped an estimated USD 100 million in proceeds from cigarette smuggling over a five-year period.

Source: United States

F. PRICE COMPARISONS OF LEGAL AND ILLICIT TOBACCO

Table 3: **A price comparison between legitimate and illicit tobacco (USD, per pack of 20 sticks)**

Region	Respondent	Price Legitimate	Price Illicit	Difference
Asia	1	[1]	[1]	0
	2	6.40	3.30	3.10
	14	[1]	[1]	0.00
	17	[1]	[1]	0.00
	18	9.30	3.90	**5.40**
Africa	3	3.50	1.20	2.30
Europe	5	4.60	3.20	1.40
	6	[1]	[1]	0.00
	7	6.90	5.15	1.75
	8	5.79	2.57	3.22
	9	1.00	0.80	0.20
	10	[1]	[1]	0.00

Table 3: **A price comparison between legitimate and illicit tobacco (USD, per pack of 20 sticks)**

Region	Respondent	Price Legitimate	Price Illicit	Difference
	11	10.00	6.17	**3.83**
America's	12	5.00	4.00	1.00
	13	9.00	1.00	**8.00**
	14	1.72	0.83	0.89

1. No information

6. THE MODUS OPERANDI PERTAINING TO THE LAUNDERING OF THE PROCEEDS OF ILLICITLY TRADED TOBACCO

99. The previous chapter provided an overview of the modus operandi followed in terms of the predicate offences to be associated with the illicit trade in tobacco. An estimation of the finances involved was provided which then also underscores the need for perpetrators to launder said proceeds.

100. The questions asked, which if answered, should provide a broad overview of whether money laundering is firstly, associated with ITT and secondly, whether differing techniques might have been identified which could be regarded as unique to this specific commodity. The said questions were:

a) Question 1: How do perpetrators of illicit trade in tobacco launder the proceeds thereof and or finance terrorism?

b) Question 2: What aggregated amount (total as per cases per year since 2005) has been laundered or used to finance terror?

c) Question 3: Which acts of terror can directly be associated with the proceeds that stem from the illicit trade in tobacco?

A. METHODS UTILISED TO LAUNDER THE PROCEEDS ASSOCIATED WITH ITT

101. The answers obtained indicated the extent of the ITT as defined by the varying respondents and their respective law enforcement agencies.

102. **Africa.** Respondent 3 indicated that most of the proceeds associated with ITT were illegally moved to offshore accounts. It was sighted that there were known cases of couriers whose purpose it was to move money to these accounts. These suspects specialised in this function and are said to smuggle the money using private jets and yachts. Some of the operations are run by foreigners who simply move the money to the countries of origin using front companies. Sometimes the money is washed through legitimate operations and consumed locally.

103. **Europe.** Respondent 6 indicated that foreign currency was changed at well-known exchange offices in one of its major centres. An increase in oversight has resulted in "messengers" changing money into small denominations to avoid any suspicion. Money remittance transactions were carried out using well known money remittance agencies. When they were found out as part of a banking investigation messengers were used. It has also been mentioned that money is transported in cash to the final destination. The use of money remitters were also highlighted by respondent 7. Respondent 11 showed that the nature of ML was determined by the scale and size of the smuggling operation. Perpetrators will use a variety of methods to launder their proceeds. It was also mentioned that they will use, hawaladars, cash couriers (either individuals or their continued use of complicit haulage companies), money service businesses and the international banking system. It was also mentioned that no evidence could be found to link the proceeds of ITT with the financing of

terror. The primary theme was that money was used to improve and maintain lifestyles of the perpetrators.

104. **America.** Respondent 12 indicated that the perpetrators involved in the illicit tobacco trade use similar methods to launder the proceeds of their illegal activities as in other criminal schemes. Some of these methods include bulk cash smuggling of currency out of the US and exploitation of the US and international banking systems. Furthermore, they are also known to launder proceeds of their illegal activities through complex trade based money laundering schemes and engage in terrorist financing.

Box 9: **Case study – Contraband cigarettes, money laundering and wire fraud**

In 2004, 10 people were arrested and charged with possession and distribution of contraband cigarettes, wire fraud and money laundering as part of a scheme to smuggle more than USD 2 million in cigarettes bought in Virginia to New York. One subject was arrested in Detroit and found with hundreds of thousands of dollars in wire transfer receipts showing payments to people associated with Hezbollah.

Source: United States

Box 10: **Case study – use of money transmitters**

Company X and Company Y

A multi-agency Federal investigation revealed that Company X was operating as an illegal money transmitting business. The investigation revealed that Company X was involved in the illegal transfer of monies from the U.S. to Pakistan without the proper State of Illinois Transmitter of Money Act (TOMA) license and registration in violation of 18 USC 1960, illegal money transmitting business. Subject 1 was listed as the registered agent/president for Company X and was the primary signer on all the financial accounts associated with Company X.

Company Y was incorporated at the same address as Company X. The president was listed as Subject 2 and is the brother of Subject 1. The secretary of Company Y was listed as Subject 3 and is the son of Subject 1. Company Y registered with FINCEN in March 2005 and received a license from the Illinois Department of Financial and Professional Regulation in March 2005 as a money service business.

Investigative analysis of financial records revealed that Company X transferred in excess of USD 5 994 502 to Pakistan without a license. Analysis further revealed that Company X structured approximately USD 3 954 136 into several domestic bank accounts.

An undercover operation successfully transferred a total of USD 100 200 represented to be proceeds from the sale of counterfeit cigarettes to an unwitting recipient in Karachi, Pakistan through Company Y. Subject 1 conducted each of these transactions with the undercover and wilfully structured USD 97 000 in order to avoid filing a Currency Transaction Report (CTR). Two of these undercover transactions were conducted at the residence of Subject 1.

As a result of the investigation, Subject 1 was indicted on 35 counts of structuring in violation of 31

USC 5324 and 18 USC section 2, and subsequently pled guilty to money laundering in violation of 18 USC 1956 and was sentenced to two years probation.

Source: United States

Box 11: **Case study – Money laundering stemming from ITT (Counterfeits)**

Cigarette smuggling

This investigation targeted a cigarette smuggling and distribution organisation operating in the North-eastern United States. The organisation obtained and sold genuine/counterfeit and taxed/untaxed cigarettes to convenience stores in the North-eastern United States. The proceeds from this organisation were believed to be laundered through various methods including, including bulk cash smuggling.

Federal Authorities seized approximately USD 61 625 in US Currency from an individual associated with the target (TARGET 1) of the investigation. This seizure was the result of an enforcement action initiated from a communication between the individual and his associates (TARGET 1 and a third individual) regarding the purchase of 30 master cases of un-taxed cigarettes, valued at approximately USD 63 000. Pursuant to a consent search, approximately USD 61 625 was discovered in the vehicle the first individual was operating. The first individual did not claim ownership of the currency, but provided incriminating statements as to his involvement in the purchase and transportation of stolen merchandise and untaxed cigarettes. The currency was seized and was administratively forfeited.

Source: United States

105. Respondent 13 gave a substantial account of ML to be associated with ITT. The illicit tobacco trade use all the standard methods of money laundering, from the use of cash to purchase goods, property and deposit to the accounts of financial institutions, to the use of professionals such as lawyers and accountants when organised crime groups are involved. It has been noted that illicit tobacco funds have been moved between first nations communities using the "bulk cash smuggling method". It should also be noted that several first nations communities are found on and covering the border between the United States and Canada. This allows illicit funds to be moved between the two countries in these regions.

106. In reviewing over 40 ML/TF FIU case disclosures linked to illicit trade in tobacco, several money laundering methods were identified, including:

- **Commingling** by mixing illicit revenues with the revenues of a non-profit organisation, cigarette manufacturers, auto parts businesses, pizza parlour businesses, frozen food companies, financial services, cigarette wholesale distributors, construction companies, transportation companies, private casinos and bars/night clubs.
- **Smurfing** consists of several cash deposits by members of the same group.

- **Structuring,** which involves numerous transactions (deposits, withdrawals, transfers), or a number of people, or high volumes of small transactions, or numerous accounts to fall below the reporting threshold at banks and money service businesses (MSBs). Currency exchange transactions at MSBs.
- **Use of nominees or 3rd parties** (including family members) to deposit cash or cheques into accounts then transfer the funds to a beneficiary account all to obscure the identity of persons controlling the illicit funds.
- **Use of lawyers and/or accountants** as professional intermediaries in the movement of funds. Used both to obscure the identity of the person controlling the illicit funds and the source of funds.
- **Complex movement** of funds to hide the origin of funds. For example, cash deposits made at one institution and issuing cheques to be deposited at a third institution and (again) issuing cheques payable to third parties.
- **Refining at casinos** by exchanging USD 20 dollar bills into USD 100 at casinos. As well as purchasing casino chips with no gaming activities, then requesting monetary instruments (ex: casino cheques).
- **Purchase of real estate property** to invest illicit proceeds in high-value negotiable goods in order to obscure their source.
- **Investment in various entities**
- **EFTs to beneficiaries**
- **EFTs to individuals/entities linked to terrorist organisations**

B. AGGREGATED AMOUNTS (TOTAL AS PER CASES PER YEAR SINCE 2005) TO BE ASSOCIATED WITH ML/TF

107. Only two of the 18 respondents provided an answer to this question. Lacking data makes it therefore unfeasible to provide answers to this question.

C. ACTS OF TERROR OR TERROR FINANCING TO BE ASSOCIATED WITH ITT

108. Phony cigarette tax stamps were found in apartments used by the perpetrators in the 1993 bombing of the World Trade Centre in New York.

Box 12: **Case study – Acts of terror and the financing thereof to be associated with ITT**

Terrorist Financing and Cigarette Smuggling

Subject was born in Lebanon, moved to the United States illegally in 1992 and lived there by virtue of three sham marriages to US citizens until his arrest on 21 July 2000. Subject, along with two of his brothers and 22 others, were indicted and convicted of providing material support to Hezbollah, cigarette smuggling, money laundering, conspiracy, racketeering, and immigration fraud. His guilty

verdicts rendered by the jury were upheld by the Supreme Court of the United States.

Subject was a student and member of Hezbollah as a youth in his home country and moved to the United States on a Hezbollah-driven mission. He accomplished his mission by creating a criminal enterprise which smuggled more than USD 8 million worth of cigarettes from North Carolina to Michigan with profits sent to Hezbollah in Lebanon. He purchased businesses in the U.S. and preached radical Muslim fundamentalism as he led a clandestine terrorist cell in Charlotte, North Carolina and raised funds for the cause through cigarette smuggling.

During his imprisonment and while awaiting trial, he ordered the murder of the prosecuting attorney and the bombing of Charlotte's federal courthouse. The 2002 trial was the first in the country of a federal "material support to a designated terrorist organisation" charge. The investigation and prosecution involved law enforcement cooperation at every level: state, federal, and international, involving the substantial assistance of Canadian intelligence officials.

The case was investigated by agents and officers of the Federal Bureau of Investigation, Alcohol, Tobacco, and Firearms, Department of Homeland Security–ICE/Homeland Security Investigations, US Citizenship and Immigration Services, IRS Criminal Investigations, the Charlotte-Mecklenburg Police Department, and the Iredell County, N.C. Sheriff's Office. These law enforcement agencies received substantial assistance from the Canadian Security Intelligence Service and the Royal Canadian Mounted Police.

Source: United States

7. A RESPONSE FROM LAW ENFORCEMENT AND SUPPORTING AGENCIES

109. Preceding chapters have shown the nature and extent of the illicit tobacco trade is voluminous, intricate and has far-reaching consequences across varying illicit value chains. Those engaged in the trade operate across various jurisdictions and perform multiple functions in the growing, production, supplying and distribution of the product.

110. The purpose of this chapter is to highlight the response to the illicit tobacco trade by differing agencies across the globe. This will not only encompass the actions of governments within the varying jurisdictions but also highlight the extent and / or lack of cooperation amongst these bodies to curb the phenomenon. Four primary agencies were identified as the most relevant bodies involved in the counter illicit tobacco trade environment. They are:

a) Customs Services

b) Financial Intelligence Units/Centres

c) Relevant Law Enforcement (*i.e.,* Police Services, Federal agencies etc)

d) Taxation Authorities

111. The chapter is to highlight similarities in approaches to better determine what could be considered best practices regarding operational and intelligence best practice, with special emphasis on the inclusion of money laundering as an offence.

A. CUSTOMS AUTHORITIES

112. The overarching themes emerging from the responses of Customs Authorities are:

a) A disconnect between the investigation of the predicate offence and any associated money laundering investigation(s). Many of the Customs Authorities do not have the capability or authority to undertake a ML investigation and if a cross-agency platform is not in place, the focus remains on the predicate customs or tax offences.

b) The importance of information collection and sharing, nationally and internationally, to effectively develop strategies to respond to the threat. While many of the Respondents collect relevant trade data, their answers do not confirm to what extent this is analysed and trends or patterns are identified.

113. On such matters, the World Customs Organisation (WCO) has an important role to play in facilitating dialogue between international partners. While several Respondents identified the WCO as a key partner, it noted in its Customs and Tobacco Reports for 2008, 2009 and 2010, and not all countries were returning data to the Customs Enforcement Network (CEN) database, which can compromise the ability to quantify the illicit tobacco trade. This data is vital in providing an accurate picture of the national and international risk that the ITT presents, as well as identifying possible developments or new methodologies with any associated money laundering.

114. In recognising the risk from the illicit tobacco trade, the WCO states that "…tobacco and cigarette smuggling remains a global problem, which continues to increase in spite of Governments' enforcement strategies." In tackling the problem, the WCO notes "…that many countries are the targets of cigarette smuggling so enhanced multi-agency cooperation at the national level is urgently needed. The WCO has been working with other regional and international organisations in an attempt to identify the best possible enforcement strategies to counter this problem, including joint Customs enforcement projects."

115. The following is a summation of answers as received from the various respondents.

CUSTOMS AND THE CONDUCTING PREDICATE AND MONEY LAUNDERING OFFENCES RELATED TO THE ITT

116. Table 4 captures the variety of approaches used in tackling the illicit trade in tobacco and related money laundering investigations. Many of the respondents included additional narrative clarifying the approach within that jurisdiction, which has been included to provide context for the subsequent analysis of the data.

Table 4: **ITT and Customs jurisdictional approaches**

Resp. No	Do Customs investigate ITT	Do Customs investigate money laundering	Description
1.	Yes	No	Money laundering investigations are conducted by the police agency.
2.	Yes	Yes	
3.	No	No	No, the Customs Border Management (CBM) division through the Customs Border Control Unit (CBCU) conducts interventions on illicit trade in tobacco. The Revenue authority, of which CBM is a division, has an investigating arm in the National Investigations unit within the Enforcement division, which conducts the appropriate investigations. CBM conducts interventions including all the follow-ups that pertain to those specific interventions. The CBM's function is to handle the customs contraventions. The cases on this trade are investigated within the Enforcement division; however investigations into money laundering are handled by the police (commercial crimes).
4.	N/A	No	The responsibility for money laundering rests with the FIU.
5.	Yes	No	The matter is reported to the FIU.
6.	Yes	No	
7.	Yes	Yes	The Customs Investigations Directorate and the National Judicial Customs Department conducts investigations into tobacco smuggling. For money laundering cases, Customs works in conjunction with other financial investigation services.
8.	Yes	Yes	Next to the Customs Investigation Service also other Customs divisions, mainly responsible for checking/controlling the trafficking of persons and goods, carry out investigations
9.	No	No	Collected information is forwarded to other law enforcement agencies for the development of the investigations.

Table 4: **ITT and Customs jurisdictional approaches**

Resp. No	Do Customs investigate ITT	Do Customs investigate money laundering	Description
10.	Yes	No	
11.	Yes	Yes	Revenue & Customs has operational responsibility for investigating tobacco smuggling. If its Criminal Investigation directorate has adopted the case, a financial investigator is appointed to develop the appropriate confiscation investigation, which may include money laundering offences. If the investigation is civil in nature, there is no confiscation or money laundering investigation conducted in tandem.
12.	Yes	Yes	A separate investigative agency has The Customs authority and is responsible for enforcing customs laws within the respective jurisdiction, and conducting investigations related to tobacco smuggling. These investigations include, but are not limited to, the domestic and international smuggling of cigarettes; counterfeit or genuine, trafficking in counterfeit cigarettes; trafficking in stolen cigarettes; smuggling of cigarettes in violation of embargoes; and international money laundering investigations where one of the underlying crimes is tobacco-related.
13.	Yes	No	In this case, the Customs authorities work closely with police with initial information stemming from customs.
14.	Yes	N/A	
15.	No	N/A	Customs is represented on the country's Money Laundering Reporting Authority.
17.	Yes	No	Customs would conduct investigation into the illicit tobacco trade, but if criminal activity is involved the case would be passed to the Judiciary Police. The authority to investigate money laundering activities, including trade related offences, is vested with the Anti-Money Laundering Division of the Judiciary Police
18.	Yes	NA	Offences with suspected money laundering links are referred to the Commercial Affairs Department for further investigations
19.	Yes	Yes	There is a government institution which in is charge of tackling money laundering, so these cases are referred to this agency (MASAK). Customs inspectors can be assigned to conduct some aspects of a money laundering investigations on behalf of MASAK.
20.	Yes	No	
21.	Yes	No	Investigations into money laundering is referred to NAM POL
22.	Yes	No	

117. **Conclusions:** The majority of Customs authorities can investigate any customs offences related to the ITT. However, only around half of these authorities would also conduct a money laundering investigation, with the remaining respondents referring the matter to other agencies, such as the Police, the Financial Intelligence Unit (FIU) or a specified anti-money laundering agency. In such circumstances, it is possible that cases suitable for money laundering investigation are not pursued, due to jurisdiction and enforcement limitations of the Customs authority concerned. In such cases, unless detections are referred for financial investigation elsewhere only predicate

customs or taxation offences are likely to be pursued. This may be indicative of the lack of money laundering investigations associated with the illicit tobacco trade.

118. The following case study highlights a typical investigation into the predicate offence, which also included a money laundering angle. It also reinforces the need for international agreement in tackling the risks posed by the illicit tobacco trade.

Box 13: **Case study – Press release, customs related investigations**

The United States Attorney for the Southern District of Florida and the Special Agent in Charge, U.S. Immigration and Customs Enforcement (ICE), Office of Investigations, announced that an individual was arraigned on an indictment returned by a federal grand jury in Miami yesterday. The charges were conspiracy to commit mail fraud and wire fraud in violation of 18 U.S.C. § 1349, mail fraud in violation of 18 U.S.C. § 1341, and smuggling goods out of the United States in violation of 18 U.S.C. § 554. The individual was released pending trial on bond on February 20, 2009.

According to the indictment and an affidavit filed with the complaint, the investigation revealed that an organisation smuggling cigarettes out of the Port of Miami operated out of Spain, the United Kingdom, Ireland and Florida. The individual indicted ran the Miami portion of the operation, arranging for the purchase of hundreds of cases of cigarettes from Panama and the transportation of those cigarettes into the Port of Miami.

They then arranged for the purchase of other cargo, such as wood flooring and building insulation material, for use as cover loads to conceal the cigarettes, which were re-packed with the cover load material. False bills of lading were prepared that only declared the cover load material and were subsequently presented to the shipping companies and overseas customs services. No duties or taxes were paid on the cigarettes.

Information contained in the affidavit linked the defendant to two separate occasions consignments of approximately 13.3 million cigarettes shipped to Ireland and the United Kingdom respectively. Based upon the false bills of lading, custom duties and taxes paid on these shipments were approximately, USD 2 900 and USD 2 500, respectively. The true customs duties and taxes that should have been paid on these shipments were USD 2.1 million each.

The Attorney for the Southern District of Florida thanked Immigration and Customs Enforcement, Office of Investigations, and OLAF for their outstanding joint working on this case. Extensive assistance was provided by law enforcement agencies from Ireland, the UK, Germany and Spain as well as the U.S. Department of Justice, Organized Crime and Racketeering Section, Criminal Division.[1]

Source: OLAF (2009)

119. The following section is to determine whether any mechanisms were put in place to ensure a cross-cutting approach in tackling both the predicate customs offences and any related financial / money laundering investigations.

CUSTOMS PARTICIPATION IN JOINT FINANCIAL INVESTIGATION/MONEY LAUNDERING TASK TEAMS

120. Only six of the 22 respondents indicated its Customs authorities do not take part in any form of joint financial investigations.

121. Respondent 8's Customs Investigation Service is part of a series of Joint Financial Investigation Groups, established in 1992. Within the Federal Criminal Police Office and the Bureaus of Criminal Investigation, were established specialised departments for financial investigations, where customs officials and the police work together as Joint Financial Investigation Groups.

122. Respondent 18 indicated that although there is no formal task force, relevant agencies including the Customs and the Commercial Affairs Department, have conducted joint and parallel money laundering investigations.

123. Exploring these differing approaches further, the following section sought to determine what impediments (if any) Customs authorities experienced in conducting investigations into the illicit tobacco trade.

IMPEDIMENTS ENCOUNTERED WHEN CONDUCTING INVESTIGATIONS

124. Only seven respondents replied making it difficult to extrapolate these as the main common difficulties experienced. However, for those who did reply, two primary themes emerged:

a) Jurisdictions can struggle with the deployment of resources in tackling all risk areas.

b) There is a need for better cooperation and coordination between jurisdictions.

125. The following feedback from Respondent 11 captures the breadth of the issues articulated by the other six respondents:

a) Difficulties in aligning available resources at mutually convenient times to execute operational strategies that cover the range of risk areas associated with the illicit tobacco trade.

b) Sharing relevant intelligence and information because of legislative difficulties for domestic and international matters.

c) Difficulties with IT systems hampering effective information sharing or more importantly extraction and evaluation.

d) For operations with an international dimension, it can be difficult to tackle the illicit tobacco market upstream, particularly if no offence has actually been committed in the source country (e.g. manufacture of cheap whites / purchase of genuine brands).

126. **Conclusion:** While the investigation of tobacco offences and any parallel money laundering offences occurs as standard, capturing strategic and tactical intelligence is critical to develop a more holistic understanding of the risks of the illicit tobacco trade and enhance the operational impact.

INFORMATION COLLECTION, ANALYSIS AND MANAGEMENT

127. All but seven of the respondents collected customs data, including the details in the question asked. Many will also seek additional information from a wide variety of other sources, including national and local police forces, immigration and border control authorities, enforcement agencies in neighbouring countries, the tobacco industry, health providers and health policy makers. This gives the Customs authorities an extremely broad information base to work from and supports enforcement activity geared to predicate customs and tax offences. In some cases, it may help Customs authorities quantify the financial risks attributable to the illicit tobacco trade.

128. This breadth of information is best illustrated by Respondent 12, which detailed the customs information it collects: "framework of fields that assist which are entry number, entry type, surety number, bond type, port of entry, entry date, importing carrier, mode of transport, country of origin, import date, export date, bill of lading/air waybill number, manufacturer ID, exporting country, immediate transportation number and date, missing documents, foreign port of loading, port of unloading, location of goods, consignee number, importer number, ultimate consignee name and address, importer name and address, description of merchandise, HTS number, gross weight/manifest quantity, net quantity in HTS units, entered value, charges, relationship, HTS rate, duty tax, broker/filer (name, address, telephone number, and number)"

129. However, several respondents identified opportunities to widen the breadth of information collected. For example, Respondent 11 "engages with the key Tobacco Manufacturers who are undertaking their own efforts in analysing and quantifying the risk from the illicit tobacco trade". Respondent 21 does not currently carry out trade-based analysis but "a risk management section about the illicit tobacco trade has been created and such analysis will be done in the near future".

130. As noted, a small number of respondents indicated that no information is collected, but it would be disingenuous to draw too many inferences. For example, is it reflective of the extent of illicit tobacco trading in the jurisdiction or its importance against other crime types? Alternatively, was it too difficult for the respondents to research the information from their Customs authorities? Initially Respondent 1 answered, "No information" when asked to describe information collected but was able to confirm in the following question "based on customs information regarding shipped goods, analysis is being conducted in order to crack down on illegal export/import". Respondent 14 left the question regarding information collected blank but confirmed in the following question that analysis of trade information took place with the information collected from the Police agency and the market control agency.

131. When the captured trade data is analysed, just over half of the Respondents noted that illicit tobacco goods were usually trans-shipped. Some respondents like Respondent 5 listed generic routes – "East/southeast to Rotterdam, United Kingdom and France", while others like Respondent 3 gave more precise routes, suggesting it is both a point of distribution and a nexus point for smuggling into neighbouring countries:

- UAE (Dubai) – South Africa,
- UAE (Dubai) – Namibia – South Africa,
- UAE (Dubai) – Namibia- Angola – Botswana/Namibia – South Africa,

- China – South Africa
- China- Namibia-South Africa- Zambia
- Zimbabwe – South Africa – Mozambique…"

132. However, not all Respondents provided data on the origin or destination of suspected loads of illicit tobacco products so the answers are indicators rather than trends. Dubai was noted as a key jurisdiction for the production and distribution of cheap white cigarettes, while China was linked heavily to the production of counterfeit cigarette products. Some respondents also identified production sites in Eastern Europe and the Far East.

133. Unsurprisingly, nexus points were spread across the globe. Due to the fluid nature of the criminality, it is difficult to pinpoint specific jurisdictions because as soon as the smugglers perceive an increased risk in detection or other instability factor, they will identify a new methodology or nexus point limiting the disruption to their supply chain. The receiving countries were predominately in Western Europe, with the United Kingdom and Republic of Ireland featuring in a number of responses.

SHARING OF INFORMATION

134. The majority of the respondents provided positive feedback, mentioning a wide array of local and international bodies as potential sources of information. These International bodies included; the World Customs Organisation (WCO), Europol, Interpol, SECI Centre, OLAF the European Anti-Fraud Office as well as other countries' customs and law enforcement agencies.

135. Another positive element is the liaison with national and overseas Financial Intelligence Units (FIUs). The nature of the requests are dependent on the extent of the investigation and trends and patterns which may be unique to specific jurisdictions, but overall it confirms the value of such Units in supporting predicate and money laundering investigations. Some of the responses about sourcing information were:

a) "If required, Customs seeks information from the FIU for information on Suspicious Transaction Reports, Police for criminal records, Immigration Department for passenger movement records, Inland Revenue Department for tax returns and Company Registry for company records, etc. Information will also be sought from overseas LEAs. Requests for information from overseas FIUs on STRs will be routed through the local FIU. Information on the modus operandi of illicit cigarette syndicate(s), persons and companies, shipment and bank records etc, would typically form part of the requests for information".

b) Respondent 8 highlighted existing structures within the WCO domain. "Gathering information from internal partners results already logically from the organisational structure of the Customs investigation service. In the framework of mutual legal assistance treaty in criminal and administrative matters the authorities also receives information from international partners. The information gathered from international partners during investigations depends on the needs of the investigators. Apart from that, international partners forward case independent information which is usually shipment data."

c) Respondent 11 identified a number of information requests depending on the scope and scale of the investigation, including the assessment of risk to revenue:

i) The location of tobacco production or if unknown, the jurisdiction(s) where the goods are exported to for onward transportation.

ii) The key individuals involved in the various aspects of the smuggling operation.

iii) Financial intelligence including how the goods are purchased and any other costs generated in smuggling the goods into the jurisdiction – *i.e.,* distribution, storage, security / risk management.

iv) The methodologies used to launder the profit generated from the sale of the smuggled goods and the jurisdictions used as money laundering nexus points and final destination.

v) The location of any assets associated with known individuals and the opportunities of collaborative asset recovery / denial work."

136. Several of the Customs authorities have officers deployed in foreign jurisdictions to aid operational work and promote international intelligence sharing. Respondent 11 has a network of Fiscal Crime Liaison Officers (FCLOs) based in a number of jurisdictions across the world and they receive tasking about supporting operational activity or building and developing intelligence or relationships with law enforcement partners about key assigned matters, including tobacco smuggling. These overseas law enforcement partners have also provided support with overseas surveillance and assisted with controlled deliveries. The service also contributes to international forums such as the WCO, OLAF and ASEM.

137. Respondent 13's reply should be noted due to the different perspective to illicit tobacco trade in its country "While we are a participant with the World Health Organisation's (WHO) Framework Convention on the Tobacco Controls (FCTC), most domestic issues pertaining to illicit tobacco are unique in nature to our jurisdiction with the occasional tie to another countries who may source precursors but overall very little international interactions"

138. The following case study illustrates the importance of international cooperation and information sharing in targeting and interdicting against a sophisticated organised crime groups with links to counterfeit cigarette smuggling in the US, France and Belgium. It also highlights the value that international bodies such as OLAF have in facilitating dialogue between overseas investigative agencies.

Box 14: **Case study – Multiple jurisdiction case of ML to be associated with ITT**

Case Barrie

On 28 September 2005, Customs in Antwerp harbour carried out administrative verification on container no. TEXU 534506-7 arrived on 22 September 2005. Some aspects particularly drew customs officers' attention.

- The title of the bill of lading: « Delivery bamboo articles

- The Origin: China – Destination: Belgium
- Final destination: Rue de Brabant in 1030 Brussels, in the neighbourhood well known for counterfeiting of all sorts of goods. On this suspicious ground, customs decided to put in place a controlled delivery.

A truck loaded with the container left Antwerp harbour in the direction of Brussels. However, instead of going directly to Rue de Brabant, the truck went to Chaussée de Ninove at 1070 Brussels after having picked up one Alpha Mamadu BARRIE.

The address was found to be that a company called SHURGARD SELF STORAGE. Customs officers stopped and controlled the truck and the container. Instead of bamboo items, the container was loaded with 9 800 000 counterfeit cigarettes Marlboro red. It also appeared from the controlled delivery that the cigarettes boxes were sealed with a false tax seal. A quick estimation was made with the container then holding tobacco amounting to a fraud of about EUR 2 million. Customs informed the Brussels prosecutor's office at the end of the preliminary verifications and the Federal judicial police (Economic and financial crime unit) continued to investigate the case.

The Investigation

The 1st Phase

When under arrest, the conveyor, Alpha BARRIE, carried EUR 1 150 and 3 mobile phones (even though he had no other income other than social revenue). He had committed similar acts in 2004, for which he had been indicted and expected the trial. He also had 3 rental contracts between SHURGARD SELF STORAGE and a so called Mahmood BARRY (the phone number on the contract was actually BARRIE's number).

Then BARRIE's car was searched and the following goods and documents were found:

- Another rental contract at SHURGARD SELF STORAGE used the name Mahmood BARRY;
- A bedroom's (magnetic) card at SHERATON Brussels.

We asked Alpha BARRIE why Mahmood BARRY rented storage at SHURGARD SELF STORAGE. Alpha BARRIE explained that Mahmood BARRY's ID card was given to him by a person called "Mr. UNIT" for the renting several boxes at SHURGARD SELF STORAGE. He declared that he did not remember why he was asked to rent these boxes for Mr UNIT. We carried out a search at Alpha BARRIE's. There a business card TUNG CHUN FAI INTERNATIONAL – TONY LAM was seized. Alpha BARRIE declared that Mr UNIT is actually Mr. Tony LAM (from Asia). Alpha BARRIE also said that he needs to contact Tony LAM; he dials a specific mobile phone number. He knows that when he is in Belgium, Mr. LAM drives a grey BMW. He said that Mr. LAM has already been with him at the SHURGARD's boxes in Brussels.

We were then informed that a second container could be linked to the container seized on 28 September 2005 and was to be delivered in Mechelen. This second container is linked to Mamadou Bailo SOW. It comes from verifications that Sow is known from French Justice and that Alpha BARRIE is involved in another legal cases in Belgium (BARRIE I in 2004).

The link between the two containers was the beneficiary company mentioned on the bills of lading

namely FIMIDRA. Customs officers indicated that this company could be linked to seven more containers. According to the customs data base, the manager of FIMIDRA was also involved in another company named EUROPEAN CAR with a further two containers to be linked to lastly mentioned company.

This amounted to a total of 9 containers inbound from China, including the 2 seized on 28 September 2005. A quick evaluation indicated that a total of about 100 million smuggled cigarettes have been imported into the target country and that this represented a fraud of more or less €16 million. Customs furthermore confirmed the participation of: BARRY Alphonse, SOW Mamadou, and VERSTREPEN Stéphanie.

The origin of the counterfeit cigarettes was obtained from Chinese authorities through the assistance of OLAF (European anti-fraud office). EUROPOL also indicated that SOW, BARRIE Salam and SANI Lassana were furthermore involved in criminal proceedings in France. SANI Lassana was indicted for money laundering in Belgium EUR 285 000.

During the investigation (2006), Mahmood BARRY was involved in another case of counterfeit perfumes and cigarettes. The investigating magistrate required OLAF's assistance. OLAF informed us that another container had been seized in Shanghai on 9 September 2005. It contained 9 750 000 cigarettes for the company FIMIDRA in Brussels.

Through contacts with the US authorities, OLAF learned that a person named LAM Wei Tung had been arrested in Arizona. He had contacted a Belgium national named Corinne THISSEN from prison. Further investigations revealed that LAM was involved in an additional 2 cases in the US, in Arizona & California. To summarise:

1. The investigation that revealed that an organised group was involved in the smuggling of counterfeit cigarettes. Its financial impact was regarded as significant.
2. The indicted persons were involved in 9 related criminal proceedings.
3. To be more effective, research/investigation was streamed in 8 points of focus.
4. A total of 11 containers could be linked with the company FIMIDRA (and/or its managers). This observation was made on the basis of the bills of lading.
5. FIMIDRA was found to be a shell company owned by BARRIE Salam since 2005.
6. This company would be the beneficiary of the container seized in Shanghai on 9 September 2005.
7. To purchase FIMIDRA, BARRIE Salam received financial and technical support from CHASSEUR (stepfather of Corinne THISSEN), SANI and CEUPPENS.

The 2nd Phase

2nd issue / trail for the investigation focused on the rental contracts and taking account of the fraudulent use of an identity card. A copy of the video surveillance of SHURGARD was seized. We found out that on 27 September 2005, in the evening, an African person driving a metallic grey car arrived. Here he met SHURGARD and inspected the premises with SHURGARD showing the capacity of the storage area. Alpha BARRIE was provided with a document that proved the rental of storage

boxes. This document was found in his vehicle when searched. Once the administrative arrangements were made, Alpha BARRIE joined back an Asian who was then identified as LAM Wei Tung. BARRIE proceeded to show to LAM the boxes he just rented. BARRIE and LAM left the storage area together. LAM goes back to BARRIE's car. BARRIE confirms the rental of the boxes. Then they leave together with Alpha BARRIE's grey car.

The 3d Phase

3rd issue / trail for the investigation: WAREHOUSE IN MECHELEN: concerning the 2nd container (dated 28 September 2005), the bill of lading indicated some elements similar to those of the container seized at the SHURGARD. On this ground, the warehouses Mechelen were searched. The 2nd container was found and seized. The security seals were on the floor and rental contracts were found that demonstrated links with 5 containers which had been loaded with smuggled goods. In Mechelen (at least 3 containers), it was established that BARRY Alphonse and VERSTREPEN Stéphanie with a third unidentified person rented the warehouses using false identity.

The 4th Phase

4th issue / trail for the investigation: TRANSPORTS MAGEMAR: on the basis of elements of proof found during the search and statements, we found that 4 containers were directly related to CHASSEUR, BARRIE Alpha, BARRIE Salam and LAM Wei Tung.

The 5th Phase

5th issue / trail for the investigation: SHERATON HOTEL: A hotel magnetic key was seized in Alpha BARRIE's car. It was a card from the SHERATON in Brussels. On this ground, the hotel was requested to communicate the dates and identity of the person who paid for the room. It was KITTY Jie Fan, LAM Wei Tung's wife. The dates match with the dates of arrival of 4 containers.

The 6th Phase

6th issue / trail for the investigation: in FRANCE: two French cases were reviewed. These cases related to 7 containers. The bills of lading show the same features than those targeted in Belgium. It was found that the scheme used the same modus operandi in France as in Belgium, *i.e.,*:

- China Belgium France
- Similar Bills of lading
- Involvement of FIMIDRA (company)
- Involvement of SOW – BARRIE Salam – BIDANESSY Séta – LAM Wei Tung

We learnt that

- LAM bought a house in France for EUR 586 000 in 2003;
- He had several issues with customs authorities concerning cash transportation while entering in the UK, France and Senegal. When we returned from France, we verified whether LAM had similar issues in Belgium. In 2003, he did not declared USD 350 000 and EUR 900 000 while arriving at Brussels airport. He declared to the customs officers that he needed large amount of cash for his business in Africa.

The 7th Phase

7th issue / trail for the investigation: while executing a mutual legal assistance in conjunction with OLAF (EU anti-fraud office) in the US, contact was made with US law enforcement agents – ICE in Arizona. Information was shared with respect to a consignment of counterfeit shoes. In that case LAM had been convicted to 30 months custody. Investigators also met with ICE officials California. They also gave us access to their information concerning the trafficking of counterfeit shoes and cigarettes. The information confirmed the active participation of Corinne THISSEN, CHASSEUR's stepdaughter, in the trafficking in counterfeit cigarettes with LAM Wei Tung. It also appeared that LAM had a problem concerning a declaration of cash at JFK airport in 2006 (USD 131 000).

The 8th Phase

8th issue / trail for the investigation: EUROPEAN CAR: 2 containers could be linked to the company EUROPEAN CAR. CEUPPENS, Alpha BARRIE and CHASSEUR were involved in taking over this second shell company. The company was to be used as FIMIDRA had become too exposed and was by then well-known to Belgian Judicial Authorities. One of the two last containers was related to Alphonse BARRY and contained counterfeit cigarettes 'BENSON & HEDGES' (more probably for the UK black market).

Investigative Findings

At the end of these investigations, the investigating magistrate kept the following offences :

- Forgery and use of forged documents;
- Criminal organisation;
- Money laundering;
- Counterfeiting of goods;
- Offences to the Customs and excise legislation.

On this basis, LAM Wei Tung was extradited in July 2009 from the US to Belgium where an arrest warrant had been issued against him.

In April 2010 the criminal organisation trial started. The court decided as follows:

- LAM Wei Tung as head of the criminal organisation;
- CHASSEUR Roger member of the organisation;
- Company FIMIDRA as member of the organisation;
- BARRIE Alpha & BARRY Alphonse as members;
- CEUPPENS Daniel & BARRIE Salam as architects of the fraud scheme.

In total, cumulated penalties were established as follow:

- 19 years and 4 months of imprisonment;
- Confiscation of 2 containers + 2 cars + EUR 1 561 154;

- Criminal fines: EUR 435 500;
- Tax fines: EUR 62 474 594.

Source: Belgium

139. **Conclusions:** It is apparent that Customs authorities capture or can access a huge library of information, which could support a robust analysis of the risks to their jurisdiction. A key issue is the extent to which information management systems supports existing investigative work and identifies new risk areas, with appropriate analysis of the data to support the development of strategies and policies to help combat the illicit tobacco trade. The issue of data extraction and analysis is explored in more detail in the following section.

UTILISATION OF DATABASES

140. The majority of Respondents hold databases, which contain customs information based on data entered on custom declaration forms. Respondent 7 has a searchable database that "contains the details of the import and the export declarations of the last three years"; however, no other respondents confirmed how far back they kept records on their own databases.

141. Just under half of the respondents confirmed they were able to cross-reference this information with other government databases. For example Respondent 11 indicated that while "no specific intelligence database is held even though we do hold details of goods and seizures, whenever the service commences an investigation into an individual or Organised Crime Group a number of basic intelligence checks are completed. These checks scan across a variety of intelligence databases, including the FIU, Companies House, credit reference agencies, the Police National Computer and any relevant customs owned databases to evaluate our previous dealings (if any) with the suspected individuals." .

142. However, access to such wide-ranging data is not without its difficulties, Respondent 13 highlighted the issue of access to sensitive information and the need to obtain the correct permissions; "personal or industry documents can only be obtained through a judicial authorisation if we are conducting a criminal investigation as not all information can be feely shared."

143. **Conclusions:** The responses reconfirmed several of the issues raised when the Customs authorities were asked about the impediments to successful illicit tobacco trade investigations. It is clear that more needs doing internationally to piece together a global intelligence picture about the continued and expanding threat from the illicit tobacco trade.

INDICATORS AND RED FLAGS OF ML AND OR TERROR FINANCING TO EMANATE FROM ILLICIT TRADE IN TOBACCO

144. Very few Respondents completed this question. Of those that did, three Respondents were able to list some indicators of money laundering or terror financing emanating from the illicit tobacco trade. Two respondents stated that there was "no relation to such activity to date". The indicators and red flags included:

a) Deposit of a large amount of cash in bank accounts.

b) Abnormal and frequent bank transactions without legitimate business reason(s).

c) Payments to unrelated third parties via:

   i) Cash.

   ii) Wire transfers.

   iii) Checks, bank drafts or postal money orders from unrelated third parties,

d) False reporting: such as commodity misclassification, commodity over-valuation or under-valuation.

e) Carousel transactions: the repeated importation and exportation of the same high-value commodity,

f) Commodities being traded do not match the business involved,

g) Unusual shipping routes or transhipment points,

h) Packaging inconsistent with commodity or shipping method.

i) Double-invoicing

B. LAW ENFORCEMENT

145. The following section follows the same train of thought as covered under customs. The purpose for the differentiation is to determine the differences in approaches in terms of the investigation of ML and or TF to emanate from ITT when compared amongst jurisdictions and their respective agencies tasked with conducting the investigation as well as determining whether certain best practices can be ascribed to differing models.

146. The first differentiator lies with which department has the mandate to conduct the ML investigation. In certain cases as mentioned above, the customs authorities have the mandate to conduct the ML investigation. The opposite model as mentioned implies that customs authorities provide relevant information to law enforcement to pursue money laundering investigations.

147. It should therefore be noted that some of the answers provided in this section will be the inverse of the aforementioned but that focus is to be placed on law enforcement's approach as opposed to looking solely at the role of customs. The following section will therefore aim to highlight this.

THE NUMBER OF ML/TF CASES/INVESTIGATIONS TO STEM FROM THE ILLICIT TRADE IN TOBACCO SINCE 2006

148. From a money laundering perspective, respondents indicated internal difficulties in terms of linking amounts/volumes of tobacco seized as a result of investigations to possible funds laundered that could be associated with the predicate offence. Herewith some of the responses:

a) Respondent 6 indicated that "Money laundering is an autonomous offence. As a result we cannot determine the exact nature of the predicate offence from the money

laundering reports registered in the national police database. When examining the details of the investigations we received (and when the quantities of goods were provided) we found that the cases investigated by the police related to intensive trade of illicit cigarettes (between 1.4 to 8 million cigarettes in each case). In these cases cigarettes were transported and imported. The quantities found at local points of sale are much smaller (several hundred packets). We do not have any information on the laundered amounts".

b) Respondent 11 indicated that it "does not keep complete records on the amount and volume of tobacco involved in its adopted criminal investigations. Often, as the extent of the smuggling is unknown, making inferences on the number of cigarettes seized is likely to under-estimate the amount and volume of tobacco involved in the investigations. This measurement problem also applies to accurately assessing the scale and scope of associated money laundering. However, as part of the aforementioned project into the criminal finances of tobacco smuggling, it is an area in which the relevant service wishes to expand its understanding.

149. **Conclusions:** Cigarettes are a legal commodity that can be transported and sold on the open market making it simple to establish a supply source, distribution channels, and move in large quantities. It is a low risk, high profit enterprise that entices traditional criminal traffickers to move into more lucrative and dangerous criminal enterprises such as money laundering, arms dealing, and drug trafficking. Law enforcement investigations have directly linked those involved in the illicit tobacco trade to terrorist organisations who are looking for a high-profit, low-risk way to finance their operations.

LAW ENFORCEMENT AND THE CONDUCTING OF INVESTIGATIONS INTO ILLICIT TRADE IN TOBACCO AND MONEY LAUNDERING

150. Perhaps of the most pertinent reasons for lacking ML cases to stem from ITT was provided by respondent 6. "The police carry out reactive investigations, mostly based on international requests (sic) but also based on local information (identification of retailers), or based on disclosures to the jurisdictions FIU or based on complaints of manufacturers. Apart from investigations launched on the basis of a report by the FIU *we do not automatically open money laundering files. This is not appropriate when the goods have already been seized and when the financial flows have already been identified*. Investigation into the assets suffices to secure the seizure and confiscation of the illicit assets. *Opening a section on the financial aspect or money laundering complicates the procedure*. The Public Prosecutor can decide to open a money laundering investigation when appropriate. This investigation is then carried out by the economic and financial department of the federal police.

151. Respondent 11 also indicated that financial investigators are assigned to cases but that the decision to add ML as a charge was dependant on a case by case basis. This was done in conjunction with the prosecution service and dependant on the evaluation of the strength of the generated evidence.

152. Respondent 12's respective agency covers the aforementioned as said agency has the responsibility of enforcing customs laws within the jurisdiction, and conducting investigations related to tobacco smuggling. These investigations include, but are not limited to, the domestic and

international smuggling of cigarettes; counterfeit or genuine, trafficking in counterfeit cigarettes; trafficking in stolen cigarettes; smuggling of cigarettes in violation of embargoes; and international money laundering investigations where one of the underlying crimes is tobacco-related.

LAW ENFORCEMENT AND THE CONDUCT OF JOINT FINANCIAL INVESTIGATIONS

153. Only three respondents provided answers to this question. The primary theme being that inter departmental work groups had been established to address AML/CFT. No indication was however given where ITT was seen as a separate commodity to warrant intergovernmental arrangements for this specific commodity.

154. Respondent 9 indicated that the Guardia di Finanza is the main law enforcement agency involved into investigation on tobacco smuggling. At the same time, the Guardia di Finanza has the charge of investigative development of STR's also and has the knowledge to carry out financial investigation in general. For these reasons Guardia di Finanza is able to ensure investigation on all the aspects related to tobacco smuggling, keeping contacts, when it is necessary, with the FIU and any other authority which may be interested into investigation carried out If suitable, it may commence a separate ML investigation into a complicit business (*e.g.* a MSB) outside of the predicate investigation into tobacco smuggling.

155. Respondent 12 indicated that the Joint Terrorism Task Force (JTTF)) serves as a centralised, coordinated entity for law enforcement information or investigation of suspected or real terrorist activities, including terrorist financing. The JTTF uses the concept of enhancing communication, coordination and cooperation between federal, state, and local government agencies representing the intelligence, law enforcement, defence, diplomatic, public safety, transportation and homeland security communities by providing a point of fusion for terrorism intelligence to identify disrupt and dismantle any potential terrorist threat.

Box 15: **Case study – ITT and linkage to TF and ML**

Cigarette Smuggling, Money Laundering, Firearms, and Conspiracy

In 2009, the Joint Terrorism Task Force investigated a subject who smuggled 20 000 cartons of cigarettes and profited the USD 1.38 margin between Tennessee's USD 0.62 tax and Michigan's USD 2 tax. His Knoxville to Detroit operation reportedly cost Tennessee and Michigan more than USD 500 000 in tax revenue. During the course of the investigation, a wiretap caught the subject recruiting for Al-Qaeda and discussing blowing up a shopping centre. In 2010, the subject pled guilty to 16 counts including firearms, conspiracy, cigarette smuggling, and money laundering.

Source: United States

156. Respondent 13 indicated that the Judiciary Police is a member of the interdepartmental Anti-money laundering working group which comprises government agencies in charge of judicial, supervisory, law enforcement and FIU responsibilities. The working group meet every quarter to discuss recent trends in money laundering/terrorist financing, exchange views and ideas on that

and initiate necessary actions in relation to AML/CFT. However, the AML working group by itself has no investigative power, and such investigation could only be conducted by the Judiciary Police under the guidance of the Public Prosecution Office.

157. **Conclusion:** It should therefore be noted that cooperation amongst law enforcement is important and that this extends beyond internal engagements. The following section then serves to identify other impediments to the investigation of ITT.

IMPEDIMENTS ENCOUNTERED WHEN CONDUCTING INVESTIGATIONS?

158. Once again only three responses were received from which any deduction could be made. It is possible that this could extend into other areas of investigative endeavour and includes:

a) Borders often slow down such investigations. Customs can act based on a "request for mutual assistance".

b) Some countries are not very cooperative.

c) Finalised investigations show that the interest of foreign partners largely depends on their own interest in an investigation.

d) Illicit Tobacco is one of many substantive offences related to proceeds of crime and money laundering investigations. The financial crime units have to prioritize on what investigations to undertake and illicit tobacco is not always at the top.

e) Respondent 18 stated that in cases involving foreign predicate offences, while they have been proactive in commencing domestic money laundering investigations, were reliant on foreign counterparts to be forthcoming with evidence in a timely manner. When this is not done, or if the foreign country decides to enter into plea bargains with the suspects, said respondent would not be able to take further action.

THE USE OF CORPORATE STRUCTURES BY CRIMINAL SYNDICATES TO SMUGGLE TOBACCO AS WELL AS LAUNDER THE PROCEEDS OF THE ILLICIT TRADE IN TOBACCO

159. This section aims to provide an overview of multiple jurisdictions identification of specific methods utilised by perpetrators to launder the proceeds of ITT. Three respondents provided a detailed overview of methods utilised by groupings.

a) Respondent 6 "Our investigations have identified various structures: The use of companies managed by a front man. The goods are sent to these companies and used to set up the lease of warehouses. The front man is usually unaware of the procedure used. The use of fictitious buyers with fake invoices and CMRs. The use of companies in financial trouble. Using payment in kind money is injected into this company. This easy money is attractive to the managers of these ailing companies and once they are caught up in this system they cannot get out. Managers of legitimate businesses use dirty money to purchase loads of cigarettes and finance the trade. The profits are channelled abroad using money remittance or cash couriers and invested in foreign property. Furthermore, transport companies allow cigarettes to be hidden in the cargos of legitimate products.

b) Respondent 11 indicated the following "This is an area the responsible agency is investigating as part of the aforementioned project into the criminal finances associated with tobacco smuggling. There is operational intelligence to suggest Organised Crime Groups (OCGs) will establish seemingly legitimate import/export companies involved in bulk consumer goods, which act as suitable cover loads to support the illicit tobacco trade. For ML, the OCGs may own or become involved with criminally complicit Money Service Businesses, which provides an element of legitimacy in handling consistent volumes of cash. There is limited intelligence to suggest the involvement of offshore companies. The responsible agency is hoping to improve its understanding of how prevalent this methodology is in supporting the ML of funds generated by the trade of illicit tobacco products. In one large-scale operation, the overseas cheap white tobacco purchaser and distributor is linked to non-tobacco related companies in the UAE, Singapore, Malaysia and Greece. It is suspected these businesses provide a legitimate front for global import / export of goods acting as cover loads for smuggled cheap whites. This type of methodology is repeated by other OCGs but should not be considered as the prevalent MO. OCGs have proved flexible and fluid in setting up other corporate structures to support smuggling and the associated money laundering."

c) Respondent 13 stated that it is difficult to say with accuracy whether credit companies or banks are permitting the use of debit machines within retail outlets that sell illicit products then in a sense they could be facilitating illicit sales. However in many instances they would probably be totally unaware of where and to what end their services are being used to sell illegal tobacco products. It was sighted that corporate structures could be used depending upon the sophistication of the organisation. At the least corporations could be used for nominee ownership, banking, and tax evasion, within criminal organisations they could hire professionals to set up corporate structures to layer and then integrate the illegal funds in money laundering schemes. Based on FIU's analysis of numerous cases related to illicit tobacco, the following types companies were either subjects of investigations or ordered/benefited from financial transactions, including international wire transfers:

- Cigarette suppliers/manufacturers/ distributors
- Real estate companies
- Auto dealerships/repairs/parts
- Construction/landscaping companies
- Financial services
- Import/export or trading companies
- Restaurants/bars
- Non-profit organisations
- Transportation companies
- Pawn shops

CONCLUSIONS

160. The information as provided by the respondents once again indicates that law enforcement agencies do investigate Organised Crime activities to be associated with ITT but very few examples were sited where ML was also investigated. In the Customs section strong emphasis was placed on the fact that Customs hand over potential money laundering cases or financial investigations to be associated with ITT. It is however clear that very few of these cases are investigated from a money laundering perspective.

C. FINANCIAL INTELLIGENCE UNITS

161. In the previous sections it became clear that FIU's play a pivotal role in the coordination or facilitation of information sharing amongst law enforcement agencies. The following section therefore provides an overview of how FIU's interact with other agencies as well as assess money laundering and terror financing to be associated with the illicit trade in tobacco.

SUSPICIOUS TRANSACTION REPORTING TO BE ASSOCIATED WITH ITT

162. The responses varied with countries focused on ITT once again providing a more detailed response. Not all jurisdictions could place a financial value on said STR's. Some jurisdictions also provided an overview of how their respective reporting regimes function. Certain jurisdictions also highlighted which other jurisdictions could be linked to their domestic smuggling aspects.

163. Respondent 3 indicated that for the required reporting period a total of 245 STR's had been received. The figures had increased drastically from six STR's received in 2007 to 43, 57, 95 and 44 for the respective years 2008-2011. Financial values were not included.

164. Respondent 11 indicated its reporting institutions are not required to identify suspected predicate offences and in many cases will not be aware of the predicate offence. This means that many reports are received on suspicious activity that has taken place without knowledge or suspicion that the money or arrangement relates to illicit tobacco trade. Some reporters, however, may suspect this crime is taking place and indicate this in their SARs.

a) Since January 2006 said jurisdiction identified: 953 SARs containing the word "tobacco": 68 SARs containing "tobacco" and "smuggling" 793 containing the XXF2XX glossary code (this glossary code refers to Excise Fraud, of which tobacco forms only a part).

b) Domestic: All SARs are made available to law enforcement via a nationwide database.

c) International: Due to information recording methods, reliable statistics (specific to illicit tobacco trade) is not available.

165. Respondent 13 in turn indicated that its FIU had between 2007 to 2011, disclosed 59 money laundering cases linked to illicitly traded tobacco. These disclosures were sent to domestic and international law enforcement and intelligence agencies. Nine of the cases actually originated from a suspicious transaction report (STR) received by the FIU's reporting entities. Of the 59 disclosures, a total of 48 cases contained at least one STR linked to an individual or entity under investigation.

(i) & (ii): All STRs combined for cases related to illicit trade in tobacco totalled to 377 reports. (iii): The total monetary amount indicated in the 377 reports came to USD 40 821 493.70.

166. Respondent 18 declared that its respective FIU had from 2006 to 2010, received 21 Suspicious Transaction Reports (STRs) relating to illicit tobacco trade Of the 21 abovementioned STRs, 9 STRs were detected which disclosed possible offences of illicit trade in tobacco and these were referred to domestic and international authorities.

167. **Conclusion:** It is therefore clear that various jurisdictions do have STR's associated with ITT. It is disconcerting to note that several of these STR's cannot be linked to subsequent ML law enforcement investigations. This could be reflective of the method used to obtain information for the purposes of developing this typology or be indicative of STR's related to ITT not being converted to ML investigations.

THE FIU AS PART OF A JOINT FINANCIAL INVESTIGATION/MONEY LAUNDERING TASK FORCE

168. Previous sections highlighted the role FIU's play in conjunction with other law enforcement agencies. This section aims to highlight the specific role played by FIU's in terms of countering ML or TF to stem from the illicit trade in tobacco. Invariably the role of the FIU is dependent on whether it has investigative and or administrative capacities.

169. The majority of the respondents indicated that they do not take actively part in joint financial investigations but do however disseminate information to other law enforcement and Customs agencies. Respondent 13 provided a sound summation of the aforementioned *i.e.*, their respective FIU is an administrative FIU and does not conduct investigations. However, law enforcement and other government institutions or agencies are able to provide voluntary information to the FIU. If, on the basis of analysis and assessment, the FIU has reasonable grounds to suspect that designated information would be relevant to investigation or prosecution of money laundering or terrorist activity financing offences, the FIU must disclose the information to the appropriate domestic disclosure recipient. The FIU may also disclose internationally to an equivalent agency when there is an MOU in place.

170. **Conclusion:** FIU's seem to act predominantly as investigative support function and as conduit in terms of obtaining and distributing relevant information. The FIU's therefore are not necessarily part of a task team but through their functioning can support existing task teams. Indications were that STR or SAR's had been obtained and forwarded. Difficulties will however be experienced to link said reports to successfully concluded ML investigations to stem from ITT.

IMPEDIMENTS ENCOUNTERED WHEN CONDUCTING INTELLIGENCE GATHERING

171. All respondents indicated that there were no impediments in terms gathering intelligence and day to day functioning. Respondent 13 did however indicate that its FIU is one of many key players in its jurisdictions anti-money laundering/terrorist financing regime. The Centre provides disclosures of tactical financial intelligence to its disclosure recipients as described above. The FIU also shares its strategic intelligence products with domestic and international partners.

172. In terms of intelligence gathering, it is important for administrative FIUs (especially) to have access to as many law enforcement databases as possible. For example, in these types of cases, having access to customs and intelligence files on suspected smugglers would assist analysis greatly.

THE RELATIONSHIP BETWEEN FIU'S AND CUSTOMS AGENCIES

173. This section relates specifically to the relationship between FIU's and customs agencies. The purpose was to highlight the ability to report and receive information relating specifically to ITT. The majority of respondent's inputs were in the positive.

174. Custom agencies can receive financial information from the FIU under the following circumstances: (1) Referrals: Where STRO's analysis detects possible offences under Customs purview, STRO will disseminate the analysis results to Customs; and (2) Screenings with STRO: STRO allows domestic agencies, including Customs, to conduct screenings against the STRO database.

175. Respondent 13s Border Agency can receive financial information from the FIU. There is a dual threshold that applies as explained below. The FIU is able to disclose to the agency if the Centre, on the basis of its analysis and assessment, has reasonable grounds to suspect that the designated information would be relevant to investigating or prosecuting a money laundering offence or a terrorist activity financing offence AND If the Centre determines that the information is relevant to: An Offence of evading or attempting to evade paying taxes or duties imposed under an Act of Parliament administered by the agency and investigating or prosecuting an offence of smuggling or attempting to smuggle goods subject to duties or an offence related to the importation of goods that are prohibited, controlled or regulated under the Customs Act.

176. Respondent 6 specifically stated that where the notification contains information regarding the laundering of money derived from an offence related to serious and organised fiscal fraud setting in motion complex mechanisms or using procedures with an international dimension, or from an offence within the competence of the Customs and Excise Administration, the FIU shall inform the Minister of Finance of this notification.

177. **Conclusion:** It is clear that many FIUs do provide the information to Customs authorities. The challenge would be to determine whether said customs agencies then red flag suspects and or identify the potential to forward said information or work in conjunction with law enforcement agencies.

THE SHARING OF FINANCIAL INTELLIGENCE (FIU TO FIU, FIU TO LEA ETC)

178. This section was to then also highlight the importance of sharing of information across borders as opposed to within jurisdictions only. Unfortunately the answers provided were not indicative of significant international sharing of information on the illicit trade in tobacco.

Box 16: **Case study – FIU and the sharing of information**

The case was triggered from a suspicious transaction report (STR) filed by a financial institution describing unusual large cash deposits conducted into a joint personal account held by Individual A

and Individual B. The STR revealed that Individual A is employed by Entity X

Over a period of 6 years, approximately 120 large cash transaction reports involving the two individuals were reported to FIU. In an article published in a local newspaper, it was stated that Entity X, a construction company, was used as front company by an organised crime group to smuggle tobacco products between Canada and the United States. Under the Canadian excise tax law, the owner of the company was sentenced to pay a large fine.

Entity X was also identified in the media as part of company consortium linked to suspected drug trafficking and organised crime.

Comment

In this case, FIU was able to link an article in a local newspaper with financial transactions conducted by Individual A and Individual B. The case also shed light on money laundering methods used by cigarettes smugglers. Money from cigarette smuggling was given to the front company's employee to be deposited into his personal account.

Source: Canada

Box 17: **Case study – ITT ML between the UK and Belgium**

In the past transactions mainly consisted of changing GBP (and to a lesser extent SCP and NIEP) into EUR that could be linked to tobacco smuggling between Belgium and the United Kingdom. Since 2007 the transactions have mainly been cash deposits followed by cash withdrawals. In several files the accounts of Belgian companies selling tobacco were credited by cash deposits followed by cash withdrawals.

Information from the special tax inspectorate – Fraud scheme information service the list of suppliers of these companies showed that the tobacco was purchased without being declared. Given the discrepancy between the amounts listed for the purchase compared to the amounts sold we can conclude that some of the purchased goods were resold without being declared.

Due to the large amounts it is beyond doubt that the actual nature of the business transactions involved paying excise duties in the United Kingdom, which are considerably higher than the excise duties applicable in Belgium. EUR were purchased using GBP which are the proceeds of fraudulent tobacco sale in the United Kingdom for which excise duties and VAT in the United Kingdom were not paid. The EUR were used to supply smuggling networks with purchases that are supposedly carried out by individuals.

This money laundering is also detrimental to the financial interests of the European Communities because by not paying excise duties in the United Kingdom the fraudsters also do not pay the applicable VAT and 10% of this amount goes to the budget of the European Union.

Typologies related to the individuals involved. Some of the individuals involved in these transactions are British nationals. They either lived in the United Kingdom or in Belgium. Often they have already committed this kind of illegal activity or drug trafficking or state that they change currencies to purchase cigarettes or tobacco in Belgium. They changed EUR at exchange offices but

also at bank branches in the Belgian coastal region. Over time CTIF-CFI has found that money launderers moved their activities to Brussels to avoid any suspicions. Transactions were also split among various people as to not arouse suspicions.

Other files involved Belgian nationals that could be linked to the United Kingdom; they were lorry drivers who often travelled in the United Kingdom. CTIF-CFI forwarded several files linked to illicit trade in tobacco to the judicial authorities. Links with the United Kingdom were identified in these files. The excise duties in the United Kingdom are considerably higher than those in Belgium. In these files British nationals changed considerable amounts of GBP, SCP and IEP into EUR. Some of them lived in Belgium and CTIF-CFI's analysis showed that they could be linked to the United Kingdom. Many of them were lorry drivers who often travelled in the United Kingdom. Several individuals involved in these files were given prison terms. Nationals of Central and Eastern European countries that were not linked to Belgium in any way were also often involved in this kind of trafficking. Several nationals of Central and Eastern European countries repeatedly went to the same exchange office in Brussels to change GBP into EUR. Several thousand EUR were changed into EUR in a few months' time. These individuals were not officially registered in Belgium and did have any professional links to our country. They were known to the police for illicit tobacco trade. The GBP changed in Belgium were probably proceeds of this illicit trade, which were laundered by purchasing these EUR.

Source: Belgium

D. TAXATION AUTHORITIES

179. The concluding government stakeholder to be addressed is taxation authorities. Of importance to note is that various jurisdictions ascribe differing responsibilities to their taxation authorities and are therefore not always comparable when viewed from a law enforcement functionality perspective.

a) Firstly, some revenue services are a combination of Inland Revenue and Customs Services. It is therefore possible that differing responsibilities and mandates will come to the fore where combined services are utilised.

b) Secondly, cognisance should also be taken regarding the various jurisdictions approach in terms of whether tax crimes are considered a predicate offence to ML or not and or whether the illicit trade in tobacco is viewed as a taxation offence.

180. If one were to assume that tobacco smuggling and the accompanying false declaration occurs for the purposes of tax (duty) evasion, and that said jurisdiction does not consider tax crime a predicate offence to Money Laundering, one could then conclude that the possible money laundering to stem from the illicit trade in tobacco will possibly not receive the same impetus when viewed from an investigative perspective when say perhaps that as perpetrated by a drug smuggler or smuggling ring. The following section will centre more on the differing approaches as followed by the responding jurisdictions, the identified successes, weaknesses, shortcomings as well as the affected standards.

TAXATION AUTHORITIES: THE CONDUCT OF INVESTIGATIONS INTO THE ILLICIT TRADE IN TOBACCO AND MONEY LAUNDERING.

181. Respondent 2 stated that the Field Audit and Investigation Unit of the Inland Revenue Department ("IRD") is responsible for conducting field audits and investigations on businesses and individuals with a view to combating tax evasion and avoidance. The IRD does not differentiate transactions involving illicit trade in tobacco and/or other types of arrangements which have led to tax evasion or avoidance. IRD does not conduct money laundering investigation for the reason mentioned above. Money laundering investigations will be investigated by Customs, Police and the Independent Commission Against Corruption respectively

182. Respondent 3 stated that it sees the Illicit Trade in tobacco as a significant problem and that a national project has been registered relating to high risk entities within the tobacco industry. It is not the mandate of the Tax/Customs Authority to conduct investigations into money laundering. These investigations are referred to the Assets Forfeiture Unit (AFU) under the National Prosecuting Authority (NPA) as well as the Financial Intelligence Centre (FIC).

183. Respondent 11 stated that its Tax Authority conducts criminal and civil investigations into the illicit trade in tobacco.

184. Respondent 12 has a specific agency charged with this responsibility and has the primary jurisdiction of collecting the domestic Federal tobacco excise tax, as well as enforcing other related provisions of the Internal Revenue Code. In enforcing this jurisdiction, the agency works to target individuals and companies that are wilfully seeking to avoid excise taxes, defraud the Federal government and participate in illegal activities. Some examples of illegal activity investigated by the agency includes: the evasion of FET on manufactured tobacco products; illegal manufacture of tobacco products; smuggling of tobacco products into the United States without payment of FET; and the diversion and non-payment of tax on tobacco products which were held by wholesalers and distributors when a subsequent FET Floor Stocks tax became due. Agency auditors and investigators are able to detect money laundering and other financial fraud schemes while conducting their audits. However, the agency currently does not have a permanent criminal enforcement component. Under special appropriations that expired September 30, 2011, the agency was appropriated funding for use towards the "hiring training and equipping of special agents" to conduct criminal investigations. Under this authority, the agency negotiated and signed an Interagency Agreement with the Internal Revenue Service (IRS) in which the IRS provided criminal investigation services to the agency. This partnership proved to be very successful. The investigations conducted by the Special Agents assigned to the agency included money laundering as one of the related offences. The agency has requested funding to permanently continue a criminal enforcement program, however; until such time as additional monies are received, the agency must again look to other law enforcement agencies, including the Criminal Investigative Division at IRS, to accept and conduct any new criminal related investigations on behalf of the agency.

185. Respondent 13 indicated that vast steps have been taken to enable said investigations. The agency has in the past conducted both civil audits and criminal investigations into the illicit tobacco trade. Under its special enforcement program, it audits criminals engaged in this sector. The agency

will conduct investigations into this sector when it suspects tax evasion and/or tax fraud. The recent changes (July 2010) to the jurisdictions Criminal Code has seen tax evasion become a designated offence to money laundering. As such, the agency and its investigative component can conduct its own investigations into ML aspects of these cases.

186. In contrast respondent 17 indicated that its Tax Authority does not conduct any investigations regarding illicit trade in tobacco, but audits would be done for taxation purpose. The Tax Authority does not conduct the money laundering aspect of the investigation. Judiciary Police is the government agency vested with the power to conduct money laundering investigations. Respondent 18 responded similarly insofar as that there are no specific programmes by the tax authority to target the illicit trade of tobacco. Investigations on criminal activities with financial implications such as money laundering of criminal proceeds are handled by other agencies with tax offences then also not currently being a predicate offence for money laundering.

187. **Conclusions:** The following primary themes were identified:

a) Some jurisdictions allow for tax evasion (as derived from the smuggling or illicit trade) and the Money Laundering associated with it to be investigated by the tax authorities. The statistics where provided however reveal that very few Money Laundering cases have been investigated within these jurisdictions even where they have the mandate to do as such. The emphasis thus remaining with the investigation of the predicate offence.

b) Some jurisdictions indicated that they are responsible for investigating the tax evasion offences but that the ML offence investigation is referred to another law enforcement agency. No statistics were provided to indicate the number of cases provided as well as the success rate when viewed from a prosecution perspective.

c) One respondent indicated that it does not conduct any form of investigation into ITT as well as ML investigations with a last respondent indicating that its customs authority is responsible for investigating the ITT and local law enforcement investigating the ML offence. Once again no corresponding statistics were provided.

d) It can therefore ultimately be summated that the responses indicate that the majority of tax authorities do not single out ITT as a significant tax evasion offence and that very few of the authorities conduct ML investigations or refer possible ML investigations to stem from ITT to law enforcement.

TAXATION AUTHORITIES: STATISTICS ON THE NUMBER OF ILLICIT TRADE IN TOBACCO, RELATED TAX EVASION CASES AND THE MONEY LAUNDERING TO STEM FROM IT.

188. The answers here are dependent on whether the tax authority is responsible for tax evasion investigations to stem from the illicit trade in tobacco as well as whether said authority differentiates and maintains databases or statistics in terms of the origin of the investigated cases of tax evasion. Only four of the respondent's replies were indicative of this.

189. Respondent 3 has registered a project which focuses solely on tax evasion offences to stem from the illicit trade in tobacco. The tax authority can be described as a combined customs and Inland Revenue service. Multiple tax entities related to the illicit trade in tobacco have been

identified with the various remedies at the authorities' disposal being used to counter the illicit value chain to be associated with the groupings activities. This includes search and seizures as well as the raising of tax assessments across various tax types. The total tax liabilities regarding only four of the investigated entities is in excess of USD 45 million. No money laundering cases have been associated with the project.

190. Respondent 11's response was indicative of a similar approach. The tax authority is also a combined agency of Inland Revenue and customs. In its response it is noted that following any successful prosecution, the said agency, will seek to recover the proceeds of an individual's involvement in unlawful conduct. As the jurisdiction operates a value-based confiscation system, this is not necessarily linked to the recovery of assets. However, where possible Financial Investigators will assess an appropriate benefit figure to deny the individual access to or ownership of legitimate and illicitly obtained assets. If prosecution has not been successful or is unlikely to succeed, the agency will evaluate the opportunities it has to mount a civil investigation into the individual(s) with the aim of recovering (at the very least) monies owed to the fiscal authorities.

191. Respondent 12 has a dedicated agency responsible for the collection of excise taxes on tobacco products, and for eliminating or preventing tax evasion and other criminal conduct in regard to regulated tobacco commodities. Tobacco manufacturers and importers, among other entities must obtain a permit from the said agency in order to operate. They also must comply with recordkeeping and tax payment requirements under local legislation. Violations of the Internal Revenue Code with the intent to evade excise taxes may result in a civil fraud penalty or criminal prosecution. Over the past 5 years, the agency has had 47 tobacco cases involving tax evasion. Ten of these cases are current criminal cases that are still under open investigation, 14 are still open audits/investigations, 4 were resolved with no further action and 19 of these cases were resolved administratively through adverse action. Adverse action can include: offers in compromise (OIC), basic permit suspension or the voluntary surrender of a basic permit by an industry member. The 19 adverse action cases were resolved via the following manner: The total tax liability estimated for the 10 criminal cases is estimated to be USD 13 161 995, although since the investigations are on-going, this amount could turn out to be significantly higher. Further, there are likely to be as yet unidentified money laundering charges that will stem from these cases. The 23 cases that were resolved administratively had no monies associated with them. Three other cases that were settled totalled USD 5 million.

192. The reply from respondent 13 also indicated successes to be had should tax authorities utilise their specific mandates. The specific Revenue Agency has worked alongside its Ministry of Finance to tackle the illicit tobacco trade from both a civil liability and a tax evasion point of view. In around 2005 the Agency and the specific jurisdiction entered into a Joint Forces Operation (JFO) that saw referrals from the jurisdiction to the Agencies Special Enforcement Program (SEP). Those cases that had indications of possible tax evasion were referred from the SEP to the Criminal Investigations Program (CIP). There were a total of 4 cases that were referred to the CIP in the past five years, with two resulting in convictions. The other two cases were eventually aborted.

193. **Conclusions:** The following primary themes were identified:

a) Given the nature of how taxation authorities operate (*i.e.,* the differing mandates and jurisdictional approaches) information and lacking statistics obtained indicates that

taxation authorities do not focus on the Money Laundering offence per se and tend to focus more on the tax evasion offences.

b) Furthermore, very little indication was obtained that taxation authorities differentiate between where the illicit income had been derived from. This then meaning that the ITT is not differentiated from other forms of illicit income generation.

TAXATION AUTHORITIES: IMPEDIMENTS ENCOUNTERED

194. It is well known that tax legislation is strict in terms of governing the obtaining and sharing of tax payer information. One of the drawbacks would for instance be the provision of information under civil or administrative auspices which is then subjected to scrutiny by criminal investigators. This and related aspects has been discussed at length within the FATF realm. There are however certain jurisdictions that have relaxed impediments to the aforementioned which have in turn assisted significantly in the countering of organised crime and related activities.

195. Respondent 13's reply is indicative of the aforementioned. The respective revenue authority has a long standing policy and legal obligation to respect the confidentiality provisions of both the Income Tax Act and the Excise Tax Act. This applies to all aspects of the compliance cycle, be it during the intelligence gathering stage or the actual investigation or audit. However, when seeking information from other law enforcement authorities, for the most part the provisions have not significantly limited the agency in its intelligence gathering activities. It is worth noting that data houses in certain police databases is not available to Special Enforcement Program (SEP) auditors and therefore, SEP intelligence gathering of this nature must be relied on through liaison with law enforcement. Once the information is with the agency, the provisions are, however, more restrictive pertaining to disclosures from the agency. In general, the agency cannot share information related to case specifics with external partners. The agency is impeded by legislation in some respects as Section 241 of the Income Tax Act and Section 295 of the Excise Tax Act (GST/HST) restrict the agency's ability to provide external partners with compliance action case specific details that would assist in gaining a better understanding of the characteristics and details of potential tax evasion cases.

196. Respondent 3 indicated that its legislation is applied in the same vein. The tax and customs legislation prohibits the sharing of tax and customs information in terms of section 4 of the Income Tax/Customs and Excise Act. However, if a matter is registered with the National Prosecuting Authority (NPA) in terms of the Prevention of Organised Crime Act (POCA) this legislation supersedes the secrecy provisions in the Tax and Customs legislation allowing for the sharing of information. The Financial Intelligence Centre Act also supersedes the secrecy provisions insofar as placing a reporting obligation (in the form of a suspicious transaction report) on the revenue authority where money laundering is suspected. In recent times the working relations between the various law enforcement structures have improved due to joint prioritisation of investigations.

197. Respondent 12 also mirrors the two prior respondent's approaches. The respective agency experiences several impediments in its attempts to collect intelligence. The agency for instance does not have access to several criminal history databases, and must look to other sources and databases to fulfil its mission of granting permits, as well as to detect and investigate tax evasion. Another primary roadblock to information sharing is the inability of the agency to share tax

information with other law enforcement agencies, which precludes said agency from releasing any information about a taxpayer that was obtained via a tax return or from return information (return information includes a taxpayer's identity and the nature, source, or amount of their income, payments, receipts, deductions, exemptions, credits, assets, liabilities, etc). Although there are exceptions to the non-disclosure provision, the procedures that allow for information to be shared can be arduous and too restrictive. The agency holds some information that would benefit other law enforcement and taxing agencies and vice versa, however without the ability to freely share information in a timely manner among agencies, it is difficult to collect intelligence that portrays the complete picture. We note that the STOP Act S.1706, a bill recently reintroduced in Congress to reduce tobacco smuggling, removes some of the restrictions by allowing information sharing with designated state, federal, and international law enforcement and tax agencies.

198. **Conclusions:** It is therefore clear that these similarities create an environment which could be regarded as conducive towards the illicit trade in tobacco to occur. This lack in ability to share information emanates from law enforcement and from the taxation authorities. It could therefore be argued that the inability to share information pertaining to crimes that are committed predominantly within the taxation and customs domain can be considered as conducive for illicit trade to occur.

199. The primary cause would be the decrease in the risk of detection coupled with lacking criminal procedure and money laundering convictions to stem from the illicit trade.

200. Secondly, not all taxation authorities have investigative powers pertaining to these offences which if seen in the context of lack in sharing of information creates a void from detection, investigation and successful prosecution.

Box 18: **Case study – operation 'Samhna'**

A multi agency operation, code named 'Samhna', headed up by Revenue's Customs Service, is currently underway in Greenore Port, Co Louth, and surrounding area.

The operation, targeting the suspected criminal activities of an organised crime group operating both north and south of the border, involved the surveillance of a general cargo vessel M/V Anne Scan, which sailed from the Philippines on 15/09/2009 for Greenore Port, arriving at approximately 0600 hours on Monday, 26/10/2009, carrying a cargo declared as 'animal feed'. Officers kept the vessel under surveillance, as they suspected that a large consignment of contraband cigarettes was concealed within the cargo.

Following the discharge of part of the cargo from the vessel earlier this morning onto awaiting trucks, which were allowed onwards to the importer's premises, the multi agency task force, involving Officers of Revenues Customs Service and An Garda Siochana, moved in and raided several premises in the Co. Louth area, in addition to mounting an operation on the vessel itself. A large consignment of contraband cigarettes has been confirmed, estimated to be in excess of 120 million cigarettes with a retail value of about EUR50m and a potential revenue at risk of approximately EUR40 million. Several persons have been arrested at various locations by the Gardai for questioning.

The operation in the Republic of Ireland involved Officers of Revenue's Customs Service, An Garda

Siochana, The Criminal Assets Bureau, the Irish Naval Service and Air Corps and in Northern Ireland, Officers of HM Revenue & Customs and the PSNI. In addition the European Anti-Fraud Office (OLAF), which was also involved, will co-ordinate the international enquiries which will form part of the follow-up investigations. It is estimated that in excess of 150 Officers from the various Agencies participated in the field in today's operation.

Two of the vessels that supported the operation were Revenue's Customs cutter RCC Faire and the Navy vessel LE Niamh. Hailing the operation as a great success, Revenue Commissioner Liam Irwin said:*"The success of this operation is a credit to the close working arrangements and cooperation between the various law enforcement agencies both nationally and internationally. Criminals have no respect for national borders and international cooperation is now more essential than ever for law enforcement agencies. This is a shining example of a multi-national, multi-agency response to criminal activity and all the agencies involved should be commended for the part they played in this successful operation".* Garda Commissioner, Fachtna Murphy said:"This is a significant strike against organised crime. The success of the operation illustrates the results and benefits that flow from close interagency cooperation. I want to pay tribute to both our colleagues in Revenue Customs Service and my own members of An Garda Síochána who were involved in this morning's operation. Their hard work and dedication helps us to secure a safer community for everyone."

Defence Forces Chief of Staff, Lieutenant General Dermot Earley congratulated "this joint action by the Revenue Customs Service, Garda Siochana and our LE Niamh which proves the need for this joint co-operation yet again. I know there is a lot of hard work to follow behind the scenes and the Defence Forces will continue to assist in every way it can".

TAX AUTHORITIES: ALTERNATIVE METHODS OF INVESTIGATION

201. This section is to highlight the propensity for tax authorities to offset the negative effects of the aforementioned through the establishment of task teams and the utilisation of a collaborative approach. Once again this differs from jurisdiction to jurisdiction.

202. Unfortunately no significant answers were obtained. The absence of responses could be interpreted as such that collaborative approaches are not being followed to offset the limitations as posed by the ability to share information.

203. **Conclusions:** It is however known that within the taxation arena great effort is being placed on the enhancement of the ability to share information. In the case of taxation authorities that follow an Inland Revenue approach only the utilisation of DTA's with other member countries can assist in obtaining information which may help to curb transnational smuggling. Jurisdictions following a combined approach (*i.e.,* Customs and Revenue Service) can take further advantage of Mutual Administrative Agreements between Customs Authorities.

TAXATION AUTHORITIES: AWARENESS TRAINING ON INVESTIGATING OR REPORTING ML TO STEM FROM ITT

204. The responses received indicated that very little emphasis has been placed on Money Laundering stemming from the illicit trade in tobacco or the tax evasion to be associated with it. The following section then serves to provide an overview of the emphasis that taxation authorities place as a whole on ML investigations and whether this would impact on the ability to associate ITT with ML and TF. This facility will be dependent on whether investigations are conducted internally, are outsourced or performed by other law enforcement agencies. Only five responses were received which all indicate a degree of ML awareness programmes to fully fledged courses. Not one of the respondents indicated whether this was performed with specific reference to the ITT.

TAXATION AUTHORITIES: PREVALENT FORMS OF TAX EVASION TO BE ASSOCIATED WITH THE ILLICIT TRADE IN TOBACCO

205. Respondent 12 stated that a prevalent form of tax evasion associated with the illicit trade in tobacco is the interstate movement of tobacco products from lower taxed jurisdictions to higher taxed ones. It is estimated that states lose several billions of dollars annually to this type of tax evasion. Under the authority of the Contraband Cigarette Trafficking Act (CCTA), and in conjunction with various state agencies, ATF investigates this form of tax evasion. Federal tax dollars are also at stake, and in terms of TTB jurisdiction, diversion schemes vary widely and change in response to targeted enforcement efforts. Schemes include:

a) The illicit manufacture of product,

b) Diversion of "exported" and non-tax paid product, and;

c) Smuggling or misclassification of imported product to evade tax.

d) Another major source of tobacco diversion is the illicit manufacture and sale of tobacco products.

Box 19: **Case study – Tax investigations**

Retailers legally sold tobacco duty free to the reservations of Canadian Natives who then sold to store owners who used 'runners' to deliver the goods to various store owners for resale. Once the tobacco leaves the reserve for sale, it attracts duty and none were paid in these cases.

They both were cases where the Province of Ontario Tobacco Tax investigators performed surveillance and executed the search warrants on the cases. The CIP then obtained the records via a Provincial Offences Act application. The investigations were then conducted via a net worth using both the evidence seized from the province as well as those obtained from 3rd parties via production orders.

Box 20: **Case study – ITT, tax evasion and terror financing**

Study: Material support to terrorism and cigarette smuggling

In 2002, The Lackawanna Six were identified as an Al-Qaeda Sleeper Cell, living in Lackawanna, NY, USA. They reportedly travelled to Afghanistan in April and May 2001 to join in Islamic jihad and receive military training at the Al Farooq training camp run by al-Qaeda; met with Osama bin Laden; and are believed to have been encouraged to go to Afghanistan by two American veteran mujahidin. They were indicted on two counts of providing material support to terrorism.

In 2004, another subject also of Lackawanna, New York, was convicted of money laundering and cigarette smuggling. An investigation revealed that this subject and more than a dozen co-defendants smuggled millions of cartons of untaxed cigarettes purchased from a Seneca Indian Nation wholesaler and sold them for huge profits in Michigan and in New York.

The operation cost the states millions in lost tax revenue. The members of the Lackawanna Six said that this subject had given them USD 14 000 which they used to travel to the training camp in Afghanistan.

Source: United States

CONCLUSIONS

206. Questions posed focused on whether taxation authorities have the mandate to conduct investigations into ITT and if so whether resulting ML will also be investigated within the realm. Of importance was also to determine whether tax authorities differentiated between tax evasion offences to be derived from ITT as opposed to other predicate offences which may hold tax implications. Questions were also posed in terms of impediments experienced where tax authorities have the mandate to conduct ITT investigations and whether other remedies are sought should such impediments arise. Lastly, taxation authorities had to indicate whether ML investigations forms part of their training curriculum and overall assess how important it is for taxation authorities to link money laundering with tax evasion as predicate offence as arising from the ITT.

8. FINAL REMARKS: MONEY LAUNDERING, TERROR FINANCING AND THE ILLICIT TRADE IN TOBACCO

207. The illicit trade in tobacco accounts for a significant amount of illicitly generated proceeds. These proceeds then emanate not only from the illicit trade in tobacco but also tax and customs offences to be associated with it.

208. The concern that was sighted was that very few Money Laundering or Terror Financing cases could be associated with the Illicit Trade in Tobacco (ITT). The primary purpose of the typology was to determine whether different modus operandi could be ascribed to this specific commodity as well as whether authorities responses to the countering of the predicate offence as well as the associated ML and TF to stem from it, differed from endeavours with respect to other illicitly traded products such as drugs.

209. The purposes of this chapter is to therefore provide an overview of the various conclusions reached as well as ascertain the veracity of the identified research propositions.

A. CHAPTER 3: AN OVERVIEW OF THE ILLICIT TRADE IN TOBACCO

210. A review of existing literature on the subject provided an overview of the nature and extent of ITT. The implications to arise from unabated smuggling activities were:

a) Deprivation of tax revenues to governments.

b) Redirection of limited government resources to address illicit activities associated with this specific commodity.

c) A disproportionate effect and impact on health services. This is exacerbated by decreases in tax revenue and simultaneously fuels debate to increase taxes on the specific commodity which in turns stimulates the incentive to increase smuggling activities.

d) Legitimate brand holders struggle to compete in and against an unfairly created market.

211. The chapter then also provided explanations with respect to differing forms of smuggling to be associated with the product, *i.e.,* bootlegging and/or large scale smuggling. Of importance was also to note the section pertaining to the economics of tobacco smuggling. Here emphasis was placed on the product price and how the price rises as the product moves along the illicit value chain, the effects of transportation and storage costs as well as the nature of illicit distribution points and cash collation. It is only at the lastly mentioned aspect that the propensity for ML to occur was sighted. The tangible risk and vulnerability being the difficulty experienced in identifying a fixed typology to identify cash remitters for instance.

212. Reviewed literature also indicated that a primary difficulty experienced in countering ITT lays in an inability to measure or quantify the extent of this form of illicit trade. A section was devoted to the different measurement tools that governments can employ to assist in policy making.

A lacking coordinated response will, however, continue to hamper the curbing of the phenomenon at a global and national level. This was also cited in the last section that focused on opportunities for an improved investigative response. Here the WCO report states that "where goods are highly taxed, easily portable and penalties remain relatively light for smuggling, transnational criminal organisations will take advantage of any weaknesses in customs, revenue or other border controls to amass profits".[9]

213. The countering of ITT requires a greater sharing of acquired knowledge and understanding of criminal activity and financial business models if enforcement impact is to be improved at domestic and international levels. The international nature of the ITT demands a global response that includes tackling the financial dimensions of the trade and recovering illicitly derived assets.

B. CHAPTER 3: THE JURISDICTIONAL APPROACHES

214. Of importance here was to obtain a broad overview of responding countries approaches to ITT. The primary conclusions were:

a) Most Jurisdictions do see ITT as a criminal offence. This does not, however, imply that they would see or link it as a predicate offence to ML.

b) Other associated offences include tax crimes and transgressions within the trademark environment.

c) The ITT is associated with tax offences which have then also been accepted by the FATF as a predicate offence to Money Laundering.

d) A wide array of penalties is at the disposal of law enforcement entities. These penalties range from transgressions in terms of:

   i) Tax evasion and fraud, customs duty/excise evasion and fraud, smuggling etc.

   ii) The nature of penalties imposed. These range from varying periods of incarceration and fines dependant on other factors such as relations to organised crime as well as the volume and or weight of the illicitly traded product.

e) It became clear that authorities are convicting perpetrators of ITT on varying offences but that ML is very seldom included in the charge sheet.

215. The primary trend to emerge from this chapter is that jurisdictions tend to predominantly investigate and prosecute on the predicate offence only and that very few money laundering and or terror financing cases could be associated with the illicit trade in tobacco.

9 WCO (2011).

C. CHAPTER 4: THE MODUS OPERANDI PERTAINING TO THE PREDICATE OFFENCE

216. This section confirmed the extent of the predicate offence. At first, a summary of the various jurisdictions international bodies' membership was provided. It was clear that most of the jurisdictions belonged to the same bodies but that approaches in terms of addressing ITT differed.

217. In terms of the location of the primary role players involved with ITT it was found that all respondents indicated that tobacco tended to originate from beyond their borders. That would be because their tax rates probably act as an incentive for outside role players to offset their illicit products within their higher duty jurisdiction. Modest support could be found for products being produced and sold within single jurisdictions only. Where investigations had proven to be successful it was due to multiple foreign and domestic agency interaction.

218. The methods identified with the smuggling of illicit goods as sighted were:

- Use of trucks with or without false compartments.
- Use of commercial vehicles
- Use of passenger vehicles
- Planes
- Cargo Vessels
- Passenger and goods trains
- Mules
- Roll on roll off transport
- Abuse of cross border shopping limits
- Postal packets
- False declarations
- Under valuation

219. Various methodologies came to the fore regarding the financing of ITT. This included seed capital obtained from small scale sales which were accompanied by a systematic increase in size of the illicit trade. Also noted was that bigger role players absorbed smaller role players within the OCG environment. Further, maturity cycles as applied to normal business operations were also found to be applicable within this realm *i.e.,* introduction, growth, maturity and decline phases. Of importance was the identification of commingling of funds and or products with linkages between the proceeds of illegal alcohol then used for trade in illicit tobacco, to the eventual bartering for drugs. The ITT then either having its own value chain or making up a part of a more sophisticated/diversified product range.

220. Four case studies were also provided that indicated varying levels of illicit enterprise operations as well as the differing investigative responses. The following chapter then focused on the modus operandi pertaining to the money laundering to be associated with ITT.

D. CHAPTER 5: THE MODUS OPERANDI PERTAINING TO THE MONEY LAUNDERING AND TERROR FINANCING TO BE ASSOCIATED WITH ITT

221. For all purposes this chapter was to be the most important as the responses was supposed to provide an indication of how jurisdictions have linked ML to ITT. The primary methods as sighted was as with other typologies dependant on the levels (nature and size) of operations, the technological and infrastructural tools at the launderers disposal as well as the nature of methods of payment to be associated with the product. This included:

a) The use of cash couriers.

b) Cash couriers using private jets and yachts as methods for transportation of the cash.

c) Bulk cash smuggling

d) Money remittance transactions

e) Cash spent on additions to life styles of the perpetrators and therefore subject to self laundering or not laundering the proceeds at all.

f) Commingling, smurfing, use of professional service providers, casinos and real estate purchases.

222. Four case studies were provided to indicate the actual manifestation of the aforementioned. It can however not be stated that the MO pertaining to ML and TF differed significantly from other typologies. Of importance to note are the amounts involved and the low levels of reporting pertaining to the ML or TF. The next chapter therefore focused on the law enforcement response.

E. CHAPTER 6: THE RESPONSE FROM LAW ENFORCEMENT AND SUPPORTING AGENCIES

223. This chapter focused on the responses from customs, law enforcement, FIUs and taxation authorities.

CUSTOMS

224. The following key themes emerged from the responses from Customs Agencies:

a) A disconnect was identified between the investigation of the predicate offence and any associated money laundering investigation(s). Many of the Customs Authorities do not have the capability to undertake a ML investigation and if a cross-agency platform is not in place, the focus remains on the predicate customs or tax offences.

b) The importance of information collection and sharing, nationally and internationally, which helps develop strategies to respond to the threat. While many of the Respondents collect relevant trade data, their answers do not confirm to what extent this is analysed and trends or patterns identified.

225. The majority of respondents have capability within their Customs authorities to investigate any customs offences perpetrated by tobacco smugglers. However, only around half of these same authorities would also conduct a money laundering investigation, with the remaining respondents

referring the matter to other agencies, such as the Police, the FIU or a specified anti-money laundering agency. In such circumstances, it is possible that cases that could be pursued as money laundering investigations are not due to jurisdiction and enforcement limitations of the Customs Authority concerned. In such cases unless detections are referred for financial investigation elsewhere only predicate customs or taxation offences are likely to be pursued. This may be regarded as the reason for the lack of money laundering investigations associated with the illicit tobacco trade.

226. It is apparent that Customs authorities capture or can access a huge library of information, which could support a robust analysis of the risks to their jurisdiction. A key issue is the extent to which information management systems supports existing investigative work and identifies new risk areas, with appropriate analysis of the data to support the development of strategies and policies to help combat the illicit tobacco trade.

LAW ENFORCEMENT

227. The information as provided by the respondents once again indicates that law enforcement agencies do investigate organised crime activities to be associated with ITT but very few examples were sited where ML was also investigated. In the Customs section strong emphasis was placed on the fact that Customs hand over potential money laundering cases or financial investigations to be associated with ITT. It is however clear that very few of these cases are investigated from a money laundering perspective.

FIUS

228. Various jurisdictions demonstrated that they do have STR's associated with ITT. It was disconcerting to note that several of these STR's cannot be linked to subsequent ML law enforcement investigations. This could be reflective of the method used to obtain information for the purposes of developing this typology or be indicative of STR's related to ITT not being converted to ML investigations.

229. FIU's seem to act in a predominant investigative support function and act as a conduit in terms of obtaining and distributing relevant information. The FIU's therefore are not necessarily part of a task team but through their functioning can support existing task teams. Indications were that STR or SAR's had been obtained and forwarded. As mentioned difficulties are experienced to link reports to successfully concluded ML investigations to stem from ITT.

230. Little information was obtained to indicate that FIU's shared STR's related to ITT. This was disconcerting given the fact that ITT is an offence which occurs in multiple jurisdictions. This could be as result of very few customs authorities or taxation authorities reporting STR's to their respective FIU's. This is a clear area where greater strides can be made.

TAXATION AUTHORITIES

231. Some jurisdictions allow for tax evasion (as derived from the smuggling or illicit trade) and the Money Laundering associated with it to be investigated by the tax authorities. The statistics where provided however revealed that very few Money Laundering cases have been investigated

within these jurisdictions even where they have the mandate to do as such. The emphasis once again remaining with the investigation of the predicate offence.

232. Some jurisdictions indicated that they are responsible for investigating the tax evasion offences but that the ML offence investigation is referred to law enforcement agencies. No statistics were provided to indicate the number of cases provided as well as the success rate when viewed from a prosecution perspective.

233. It can therefore ultimately be summated that the responses indicate that the majority of tax authorities do not single out ITT as a significant tax evasion offence and that very few of the authorities conduct ML investigations or refer possible ML investigations to stem from ITT to law enforcement.

234. The inability to share information pertaining to crimes that are committed predominantly within the taxation and customs domain can almost be considered as an incentive to trade illicitly.

a) The primary cause would be the decrease in the risk of detection coupled to lacking criminal procedure and money laundering convictions to stem from the illicit trade.

b) Secondly, not all taxation authorities have investigative powers pertaining to these offences which if seen in the context of lack in sharing of information creates a void from detection, investigation and successful prosecution.

F. THE RESEARCH PROPOSALS

235. Below follows the initially posed research proposals with the resulting findings.

236. Illicit trade in tobacco is a significant predicate offence to money laundering.

a) ITT can be considered a significant predicate offence if one takes the values of smuggled tobacco into account.

b) Lacking money laundering cases to stem from this could however be regarded as indicative that Law Enforcement can either not establish the connection with the smuggling activity and resulting money laundering investigations, or that other predicate offences enjoy preference where ML cases are pursued.

a) A second predicate offence to be linked with ITT is the tax evasion offence. The FATF has recently added this specific offence as a predicate offence. This study however found it difficult to link the specific income derived from ITT with evaded taxes and resulting money laundering cases.

237. The proceeds of illicit trade in tobacco are used to fund terror.

a) Case studies were provided where linkages could be made between ITT and individuals and organisations identified to be involved with terror activities.

b) Some of these individuals established cigarette smuggling rings where the proceeds were derived for the purposes of providing material support to identified terror organisations.

c) Limited examples were however cited to indicate that ITT could specifically be linked to TF when viewed from a multinational/jurisdictional perspective. This deduction is made due to responses only being received from one jurisdiction. It is however acknowledged that ITT can pose a significant vulnerability to generate proceeds in support of terror organisations. This is based on:

   i) Relatively low risks of detection of the smuggling activity.

   ii) Relatively low likelihood in linking the smuggling activity to terror organisations or suspects.

238. Law Enforcement regards the effect of the illicit trade in tobacco as insignificant when compared to trade in other forms of contraband. Responses obtained did not confirm or refute this proposition. Subjective information does however indicate that lacking coordination between the various law enforcement agencies does show a degree of less importance being placed on ITT as for instance levels of cooperation, which coincides with drug smuggling and offenders. This can therefore be considered an area for further study.

239. FIU STRs will be insignificant in terms of identifying illicit trade in tobacco as predicate to ML or TF.

a) Some jurisdictions were able to provide STRs based on ITT. This was not significant when compared to other predicate offences.

b) A possible explanation for this would be that government reporting institutions are not reporting suspicious or falsely declared proceeds or the suspected tax evasion to their respective FIU's.

c) This also provides some difficulty in linking suspected offenders to other forms of organised crime or previous suspicions pertaining to ML and TF.

d) Institutions with reporting obligations have difficulty in identifying suspicious transactions linked to ITT. This is due to the absence of clear indicators to assist in identifying proceeds from ITT. The requirement would therefore be to provide these indicators and allow internal systems to cross verify said information against third party data. It is foreseen that this problem can also be experienced within other typologies.

240. Despite the threat of civil or criminal investigations and disruption, ITT represents a good opportunity for Organised Crime Groups and / or Terror Groups to generate large sums of criminal profit.

a) Academic study reveals that tens of billions of dollars of illicit proceeds are generated through ITT. This is augmented by figures as provided by the WCO. Limited prosecutions where viewed from a worldwide perspective therefore confirms that an environment exists which may be regarded as conducive for ITT to occur.

b) There were specific jurisdictions whose responses indicated that where ITT was considered serious that strong linkages could be proven with OCG's, that it involved highly organised international role-players, and that where subsequent ML or TF was pursued, significant sentences had been handed down

241. The proceeds of ITT is either laundered or used to fund other crimes and or terror.

a) Obtained information suggests that where OCG's or individuals were identified to be involved with ITT that jurisdictions tended to focus more on prosecuting the predicate offence.

b) Lacking prosecution and convictions within this domain would therefore suggest that:

i) OCG's or criminals do not launder the proceeds of ITT of fund terror, or;

ii) Jurisdictions low conviction rates should not be regarded as the primary indicator whether ITT can be linked to ML and TF.

242. The use of trade in tobacco is significant within the trade based money laundering typology.

a) Information obtained was not significant enough to confirm or refute the proposition.

b) It was however noted that the high taxes on tobacco products could act as a deterrent to TBML.

c) The inverse is also true where tobacco products could be traded in low tax areas as a TBML methodology. One jurisdiction sited an example of this.

243. High taxes on tobacco stimulate illicit trade in tobacco. Most jurisdictions as well as academic research confirmed that high taxes acts as one of the incentives for illicit trade in tobacco to occur.

G. FINAL CONCLUSION

244. The aforementioned coupled with low detection rates, low levels of prosecution for offenders, easy payment of fines (pre determined financial risk), lacking cooperation, coordination and information sharing at national and international levels as well as the lacking of a common strategic impetus at said levels, all act as factors to be regarded as conducive towards ITT and resulting ML and TF to occur.

245. The converse is also true. This is insofar as that where jurisdictions have chosen to pursue ITT and associated ML and TF to stem from it, great successes have been attained. Several of the case studies provided attests to this and can act as an incentive for the FATF to highlight more prominent responses were viewed from a jurisdictional perspective. This is especially so with respect to government agency reporting obligations as well as closer cooperation with international bodies where requested.

246. It is trusted that this document will highlight the need to enhance international cooperation and recognize the illicit trade in tobacco as a significant global money laundering and terror financing threat. Future challenges include the identification of financial pinch points, enhancing ML investigations as well as providing improved standardised data to member countries to assist in the shaping of strategic and tactical responses to the Illicit Trade in Tobacco.

FATF PRESIDENT'S PAPER

Anti-money laundering and counter terrorist financing for judges & prosecutors

June 2018

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

TABLE OF CONTENTS

Foreword

> “The work of judges, prosecutors and other investigative authorities is crucial for stable institutions, transparency and the rule of law, which are all pillars of an effective AML/CFT system.”

Santiago Otamendi
FATF President 2017-2018

It is a pleasure to introduce the FATF President's Paper "Experience, Challenges and Best Practices" on anti-money laundering and counter terrorist financing (AML/CFT) for judges and prosecutors.

Under the Argentine Presidency, the FATF initiated a global outreach programme to the criminal justice systems given the crucial role it plays in the effective implementation of FATF Standards. The work of judges, prosecutors and other investigative authorities is crucial for stable institutions, transparency and the rule of law, which are all pillars of an effective AML/CFT system. The objective of the outreach programme was to reinforce the effectiveness in the investigation and prosecution of ML and TF offences and in the recovery of the proceeds of crime.

This initiative allowed us to learn about the experiences, challenges and best practices in investigating financial criminality from judges and prosecutor from across the globe. The initiative aimed to improve international co-operation and maintain an up-to-date understanding of the methods that are used to launder money from organised crime or to fund terrorism.

The FATF, in a joint effort with the FATF-Style Regional Bodies (FSRBs) and other international organisations, gathered knowledge through six regional workshops which brought together almost 450 judges and prosecutors from more than 150 jurisdictions and observers organisations.

We invited relevant institutions such as the Organization for Security and Co-operation in Europe (OSCE), the International Prosecutors Association, the International Magistrates Association and Asset Recovery Networks to join the conversation and add value to the project considering their unique perspective.

I would like to express my gratitude to the judges and prosecutors that participated in the project; to Argentina, Ecuador, China, Tunisia and Guyana for hosting the workshops; to the Financial Action Task Force of Latin America (GAFILAT), the Caribbean Financial Action Task Force (CFATF), the Asia/Pacific Group on Money Laundering (APG), the Eurasian Group (EAG), the Eastern and Southern Africa Anti-Money Laundering Group (ESAAMLG), the Inter Governmental Action Group against Money Laundering in West Africa (GIABA), the Task Force on Money Laundering in Central Africa (GABAC), the Middle East and North Africa Financial Action Task Force (MENAFATF), the Council of Europe Committee of Experts on the Evaluation of Anti-Money Laundering Measures and the Financing of Terrorism (MONEYVAL), the OSCE and FATF Training and Research Institute (FATF TREIN) for co-organising and supporting the events; to FATF Delegations for their input on this paper and to the FATF Secretariat for their assistance.

At the FATF Plenary in June 2018, I presented the conclusions of this exercise, which are outlined in this paper. FATF members supported them and agreed to broadly disseminate and publish them through the FATF Global Network and among relevant institutions and organisations.

This paper identified challenges and highlights useful elements and best practices in the conduct of investigations, prosecutions and convictions of money laundering, terrorist financing, and in confiscations of proceeds of crime. It also highlights the need for international cooperation, a key element when investigating criminal networks and recovering assets that are often spread over multiple countries.

Based on these findings, the US Presidency of FATF will continue this joint effort to enhance the effectiveness of the criminal justice system.

I am glad to deliver this important outcome which I hope will help us to produce results in this global fight against money laundering and terrorist financing.

Santiago Otamendi

Executive Summary

FATF global anti-money laundering and countering terrorist financing efforts are focused both on effective prevention and disruption and on achieving convictions and asset recovery for the benefit of States and victims. Although FATF has had some interaction in recent years with prosecutors and similar experts on various issues, the relationship between the FATF and the criminal justice sector needed to be strengthened. For these reasons, the Argentine Presidency of the FATF initiated a global outreach programme to Criminal Justice Systems.

The main objectives of the project were:

- to prepare a report which identifies the experiences and challenges in relation to money laundering (ML) and terrorist financing (TF) investigations and prosecutions and the confiscation of criminal assets, and the good practices to deal with these issues;
- to enhance the FATF outreach to judges, prosecutors and investigators from different regions, boosting current and potential networks of collaboration, and getting practitioners and relevant actors in close contact to discuss their common challenges and possible solutions, generating a framework to enhance international working relationships; and
- to get FATF and FSRBs countries to work together on these key elements of effectiveness for a successful AML/CFT system.

Through several regional workshops , the FATF in a joint effort with the FSRBs and other international organisations[1] brought together almost 450 judges and prosecutors from more than 150 jurisdictions and observers to share experiences and best practices. This FATF President's paper presents the conclusions from the workshops. Some of the main findings are listed below.

1. Relevant organisations were invited to participate and contribute to the discussions such as the Organisation for Security and Co-operation in Europe, the International Prosecutors Association, the International Magistrates Association and Asset Recovery Networks

Underlying and Supporting Elements

ML and TF investigations and prosecutions and the confiscation of criminal assets are supported by a range of important underlying elements in the wider AML/CFT regime:

- A comprehensive understanding of the jurisdiction's ML and TF risks sets the foundation for an effective AML/CFT regime.
- Effective and timely domestic co-operation and co-ordination is fundamental. Some good practices in this area include setting up a permanent multi-agency coordinating committee on ML/TF and establishing robust inter-agency working relationships based on mutual trust.
- The creation of multidisciplinary agencies/ units that focus on ML/TF and/or on asset confiscation, or at a minimum having expert staffs that are dedicated to this role within larger agencies or public prosecution services.
- Collaborating with the private sector to both provide and obtain information related to ML/TF.
- Provide specialised training for investigators and prosecutors – particularly focusing on building skills in gathering information and evidence, financial investigative techniques, and presenting complex cases to judges or juries.

Money Laundering: Investigation, prosecution and convictions

Investigating and prosecuting money laundering (ML) offences presents a distinct set of challenges for jurisdictions. The overall results of the assessments conducted to date demonstrate the significant challenges that countries face in obtaining convictions. Among the good practices mentioned in the report, some that could be highlighted are:

- Properly criminalising the offence: expand the scope of predicate offences to the broadest list of serious offences or to adopt an all-crimes approach, which may provide clarity and more flexibility for the prosecutors, especially when combined with a system that also incorporates the principle of opportunity.
- Establish, whether through legislation or case precedent, that the predicate offence need not be proven in order to convict for ML, as established in the FATF Recommendations.
- Fixing plea bargaining and deferral prosecution agreements as a legal possibility, subject to judicial control and oversight.
- Having internal guidelines, handbooks, or in-person trainings to teach investigators how to begin and pursue a basic financial inquiry. Also, to have policies or directives which establish the mandatory requirement of opening a parallel financial investigation in every investigation of a predicate offense of ML.

Terrorist Financing: Investigations, prosecutions, and convictions

Investigating and prosecuting terrorist financing (TF) offences presents a distinct set of challenges for jurisdictions. The majority of the reviewed jurisdictions had not prosecuted TF offences or obtained TF convictions at the time of their mutual evaluation. Among the good practices mentioned in the report, some that could be highlighted are:

- Comprehensive criminalisation of TF is directly related to the jurisdiction's ability to investigate and prosecute TF effectively. Drafting the offence to be as broad as possible: for example, structuring the offence in a way that the suspect's intent to finance specific terrorist acts does not need to be proven.

- Ensuring that a TF investigation can be launched without an underlying terrorism case, and that the TF investigation can continue even where the linked terrorism investigation has already been concluded.

- Having legislation or judicial procedures that specifically deals with the use or introduction of classified material or intelligence (e.g. laws or rules may permit judges and/or defence counsel to review information, redactions may be made, information can be "declassified" by the state, etc.).

- Involving the prosecutor at an early stage to determine what pieces of intelligence may be admissible as evidence, or what steps would need to be taken for it to be admissible.

- Having a designated special court to deal with terrorism and terrorist financing cases that often include classified information.

Confiscation: freezing, seizing, and recovering assets

Tracing, freezing and confiscating the proceeds and instrumentalities of crime is fundamental to the effectiveness of measures to combat money laundering and terrorist financing. Serious crime generates a vast amount of proceeds every year. However, the level of implementation of an effective confiscation regime among the assessed countries is modest at best. Some practices particularly useful for asset confiscation are:

- Ensuring that criminal asset confiscation is a policy priority, with a linked strategy that sets out how all relevant authorities can work to achieve the objectives/goals that are set.
- Having a full range of powers to trace, freeze and confiscate criminal proceeds and instrumentalities, including the ability to quickly seize assets of the defendant and associated third parties, confiscation powers that rely on civil standard of proof, or are non-conviction based or where there are appropriate provisions to reverse the burden of proof.
- An effective framework to manage or oversee the management of frozen, seized, and confiscated property, including by competent authorities that are freestanding or part of an LEA, and, as needed, the ability to hire outside vendors or contractors for complex assets.
- Working in co-operation with international partners was seen as a key ingredient of success, especially early outreach to freeze criminal assets subject to confiscation.

International co-operation: mutual legal assistance, extradition & other co-operation

International co-operation is often critical to the success of ML/TF investigations and prosecutions and also for asset recovery. ML and TF networks are often spread over multiple countries and foreign jurisdictions may have the missing pieces of information or evidence which facilitate a successful prosecution.

- Devoting sufficient resources to rapidly process and respond to requests, including having mechanisms and technology that allow authorities to engage in a dialogue with the requesting countries to facilitate case consultations.
- Considering informal methods of international co-operation such as FIU-FIU, police-police or prosecutor-prosecutor co-operation before submitting a formal MLA request.
- Using networks as such as EUROJUST or CARIN and ARINs prior to making a formal request to facilitate international co-operation and target the assistance that will be sought.
- Making contact with overseas authorities and sending a draft copy of a proposed MLA request, so that they can advise on the content and wording of the request.
- Using the Mutual Legal Assistance Request Writer Tool (MLA Tool) that has been developed by UNODC to assist states to draft requests with a view to facilitate and strengthen international co-operation.

FATF/MONEYVAL/OSCE Workshop for Judges and Prosecutors
March 2018, Strasbourg, France

FATF/GAFILAT/CFATF Workshop for Judges and Prosecutors
September 2017, Quito, Ecuador

Introduction

FATF President Santiago Otamendi
FATF/GAFILAT/CFATF Workshop for Judges and Prosecutors
September 2017, Quito, Ecuador

FATF is committed to maintaining a comprehensive understanding of how criminals launder money and how terrorists raise, move, and use funds with the key objective of ensuring up-to-date and effective global standards and their effective implementation.

While the supervisory and regulatory agencies and the private sector play a critical role in preventing money laundering and terrorist and proliferation financing, there is agreement that if global AML/CFT efforts are to be effective, countries must have strong operational authorities to bring prosecutions and obtain convictions, as well as to seize and confiscate the proceeds and instrumentalities of crime for the benefit of states and victims.

As shown through the Mutual Evaluation Reports conducted on the basis of the 2012 FATF standards and 2013 Methodology, many countries have enacted the necessary legislative measures to criminalise money laundering (ML), as well as terrorist financing (TF), however, the results obtained in terms of convictions and confiscations are modest overall. Achieving results in this area of the AML/CFT regime is mainly an issue for prosecutors, judges and investigators, as part of the criminal justice system. From the initiation of an investigation through the sentencing of a defendant, the criminal justice system can involve many governmental actors with different roles who need to coordinate among domestic authorities and international partners to fight ML and TF threats which are increasingly global in nature.

Additionally, financial institutions and DNFBPs covered by the FATF Standards are subject to laws and regulations at the national level. Generally, supervisors ensure compliance with AML/CFT measures, but in exceptional cases, compliance failings may also be dealt in the criminal justice system.

The correct functioning of the criminal justice system must be supported by foundational elements such as stable institutions, accountability, integrity, transparency and the rule of law. These are all pillars of an effective AML/CFT system.

Although FATF has had some interaction in recent years with prosecutors and similar experts on various issues, the relationship between the FATF and the criminal justice sector needed to be strengthened. An enhanced engagement, collaboration and effective communication with the prosecutorial services, investigating judges and some other elements of the criminal justice system is vital given the crucial role they play in the effective implementation of the FATF Standards.

For these reasons, the Argentinean FATF Presidency decided to bring forward an initiative intended to share experiences, and to identify the challenges and good practices which can be critical for improving jurisdictions' effectiveness in terms of ML/TF prosecutions and confiscating criminal proceeds.

Participant at the FATF/MONEYVAL/OSCE Workshop for Judges and Prosecutors
March 2018, Strasbourg, France

Objectives

The main objective of the project is to produce a report that identifies those experiences and challenges, and good practices to deal with them. The paper focuses on the factors that can result in an effective system for prosecution and confiscation, and less on technical legal requirements, although the report also seeks to identify legal powers that appear to lead to effective results.

Also the initiative is designed to enhance the FATF outreach to judges, prosecutors and investigators from different regions. The aim was to, establish networks of collaboration and facilitate discussion among practitioners about common challenges and possible solutions, generating the opportunity to build valuable work relationships. Thus, jurisdictions could learn from each other not just in a theoretical sense as well as make contact with regional and inter-regional counterparts that could be useful in operational matters.

The project also had the benefit of bringing the FATF and FSRB countries together to work more effectively on the investigation and prosecution of ML and TF and the recovery of assets. This is an important element considering that through the mutual evaluation process, it has been observed that most of the countries that are part of the FATF Global Network had had challenges in these particular areas.[2]

Finally, this initiative provided an opportunity for the FATF to extend the outreach and scope of collaboration to other relevant international or inter-governmental organisations.

2 See the analysis of the results of IO7, IO8 and IO9 in each of the dedicated sections.

Methodology

The primary source of information for the exercise was the series of workshops for investigating judges and prosecutors, which were organised by the FATF on a regional basis, in conjunction and with the support of FSRBs and the hosting countries/organisations. These workshops provided a venue to gather experiences and views from a wide perspective of different practitioners on the challenges and difficulties they face in combating ML and TF, and on effective mechanisms and good practices to deal with these.

The information on the experiences drawn from the workshops was supplemented by a desk review of relevant reports and material on these issues and on a horizontal review of all the published Mutual Evaluation Reports, focusing on the country results on the relevant immediate outcomes, as further described below.

Based on the information and views expressed during the workshops, combined with the results of the desk review and the horizontal study, the FATF Secretariat with the support of FATF TREIN, conducted an analysis and identified challenges and good practices, including issues specific to particular regions or type of legal system, and areas for potential further work. That information and analysis is the basis for this report.

FATF President Santiago Otamendi
FATF/GAFILAT/CFATF Workshop for Judges and Prosecutors
September 2017, Quito, Ecuador

The workshops

In order to ensure that experts in all regions had an opportunity to input into the project, and to gather the full range of experiences and views that included a regional perspective, FATF conducted an evolving process of regionally-based workshops in co-ordination with each of the FSRBs:[3]

- Americas - GAFILAT and CFATF
  September 2017
- Asia/Pacific - APG and EAG
  January 2018
- Africa/Middle East - ESAAMLG, GIABA, GABAC and MENAFATF
  February 2018
- Europe - MONEYVAL and the Organization for Security and Co-operation in Europe (OSCE)
  March 2018
- FATF wrap up workshop
  May 2018[4]

Through workshops in different regions, the FATF brought together almost 450 judges and prosecutors from more than 150 jurisdictions to share experiences and best practices. In addition to the FATF and FSRB Secretariats and FATF TREIN, relevant international organisations such as the OSCE, the International Prosecutors Association, the International Magistrate Association and the various Asset Recovery Networks participated and contributed to the discussions.

3 There were another two workshops conducted by CFATF (May 2018) and by GAFILAT (April 2018). Both FSRBs sent a report setting out the topics discussed, the participation and conclusions, which were considered for this report.

4 With the support of FATF TREIN.

Scope

The topics for discussion during the workshops were generally the challenges and good practices around:

- investigating and prosecuting money laundering cases,
- investigating and prosecuting terrorist financing cases,
- seizing and confiscating criminal proceeds and instrumentalities and
- providing international co-operation and mutual legal assistance.

Participants in each of the workshops included investigating judges and magistrates, prosecutors, and investigators with experience and expertise in investigating and prosecuting ML and TF, or seizing and confiscating assets. Participants from FATF members attended various workshops, while those from the FSRBs were involved with the workshop in their region.

Underlying and Supporting Elements

Identifying risks, strategic policies and priorities

A comprehensive understanding of the jurisdiction's ML and TF risks sets the foundation for an effective AML/CFT regime. Properly identifying the risks and common ML/TF methods also assists investigators and prosecutors in detecting and ultimately proving criminal activities. The workshops for judges and prosecutors highlighted the good practice of involving investigators and prosecutors in the risk assessment process. These actors can provide information that feeds into the countries' overall understanding of risk by participating in the process.

In addition to helping authorities identify criminal threats, a good understanding of ML and TF risks contributes to the setting of national strategies and priorities for combatting ML and TF. Knowing the level and type of risks in the country helps to allocate resources for agencies charged with investigation and prosecution, including resources that can be used to hire personnel, train them, and build specialised capacity. In the case of TF, the jurisdiction should integrate counter-terrorism and CFT strategies, to the extent possible.

The strategies should clearly articulate why criminal prosecutions and asset confiscation are desirable outcomes. They should also be used to incentivise investigations, prosecutions, and confiscation of assets. For example, many jurisdictions have set up asset forfeiture funds which can be used to fight crime, benefit society, or compensate the victims of crime. If appropriately used, these mechanisms can provide useful incentives for action. Strategies can also inform the budgetary process and ensure adequate resources for the law enforcement authorities (LEAs), including prosecutorial authorities and asset confiscation units. Finally, the involvement of the criminal justice sector in the risk assessment or even strategy-making process can promote legislative change, as those who work with the law most closely are in a good position to identify loopholes or areas for potential changes and updates.

ML and TF investigations and prosecutions and the confiscation of criminal assets are supported by a range of underlying elements in the wider AML/CFT regime. This section explores the FATF and FSRB jurisdictions' experiences related to certain aspects of the wider framework surrounding the work of investigators, prosecutors and judges. It also highlights specific challenges and good practices.

Institutional framework

Investigating and prosecuting ML/TF cases often involves broad set agencies with differing skills. It is therefore important to ensure that the institutional framework to investigate and prosecute these offences incorporates the appropriate range of agencies and facilitates the use of specialist expertise where necessary.

One of the key good practices discussed in the workshops is the "task force" model of investigation. This may include setting up multi-disciplinary teams to conduct ML or TF investigations and collaborate on the development of cases. Effective task forces can consist of a mix of investigators, specialised LEAs (such as drug, tax, anti-corruption, or customs agencies), prosecutorial offices, intelligence authorities, and financial analysts, to include the FIU. The exact composition of the task force depends on national practice, but the intention of the task force model is to leverage expertise, resources, tools and authorities in an interagency setting to achieve the best results. Such models also help avoid operational conflicts and bring all relevant authorities together, potentially with the effect of speeding up the completion of cases and simplifying tasks.

Another good practice is setting up specialised ML/TF investigation units and designating specialised prosecutors to focus on ML/TF and asset confiscation cases. The task forces and special units should be sufficiently resourced, including staff with the requisite skill-sets. A good practice is to use special expertise such as forensic accountants, financial analysts and experts in computer forensics in investigations. If necessary, this expertise can be employed from external sources outside of the unit or task force.

Domestic co-operation and information sharing

The workshops highlighted the importance of effective and timely domestic co-operation and co-ordination. This is particularly critical in TF cases. Some good practices in this area include setting up a permanent multi-agency coordinating committee on ML/TF and building up trust between domestic agencies. [5]

Involving multiple agencies in the investigative process also increases the need to share information across institutional borders. This can be acute where the investigative and prosecutorial authorities are separated – such as in common law jurisdictions. Where the authorities are separated, involving the prosecutor in the investigation at an early stage has proven to be a useful practice. Practitioners mentioned that such early involvement can guide investigators to develop useful, admissible evidence that can prove the elements of the offense and that prosecutors may be necessary in seeking the authority to use certain investigative techniques. Additionally, in jurisdictions where authorities have prosecutorial discretion, working hand-in-hand with investigators can increase the chances that the police "referral" will result in charges.

In 2017, the FATF finalised a guidance paper to improve co-operation and exchange of information within jurisdictions: Inter-agency CT/CFT information sharing: good practices and practical tools. While not publicly available, the guidance is accessible to agencies involved in combatting terrorism and its financing, as well as agencies not traditionally involved in CFT activities.

5. In terms of TF, the MER of the United States notes that the task force environment in that country is particularly useful for enhancing information-sharing and expertise and helping the authorities to conduct financial investigations effectively. The U.S. approach consists of 104 multi-jurisdictional (i.e. federal, state, and local) Joint Terrorism Task Forces (JTTFs) led by the Federal Bureau of Investigation.

Engagement with the private sector

Many jurisdictions participating in the workshops highlighted the importance of collaboration with the private sector to both provide and obtain information related to ML/TF. Some good practices include:

- Setting up public-private partnerships to facilitate information sharing, and producing typologies together with the private sector[6].
- Sharing sanitised information about real cases and other contextual data.
- Supporting the private sector in identifying ML/TF cases by providing red flags, risk indicators and feedback on suspicious transaction reports.
- Particularly for TF, engaging with a broad range of private sector entities beyond the financial sector, such as airline and rental car companies and retail stores.

Capacity and experience

Many of the practitioners noted the lack of capacity and experience to investigate and prosecute ML/TF cases and confiscate assets in their jurisdictions. Jurisdictions have found it beneficial to provide specialised training for investigators and prosecutors – particularly focusing on building skills in gathering information and evidence, financial investigative techniques, and presenting complex cases to judges or juries. The capacity building was often triggered by a risk assessment, or when ML/TF issues were prioritised at a national level.

It was noted during the workshop that many jurisdictions with only a few TF investigations and often no TF prosecutions face particular challenges in building expertise and capacity in the TF field. This can be problematic because when TF expertise is required, it is usually at a very short notice. Joint investigations, if the facts permit partnering with a foreign LEA, could partly alleviate this issue through "case mentoring". The workshops also highlighted the importance of having capacity to not only respond to TF cases, but to proactively look for and identify potential TF activity, especially in jurisdictions where there is a low risk of terrorist attacks.

6 The joint typologies work completed by authorities in the Netherlands with the private sector was noted as a useful example.

Money Laundering
Investigation, prosecution and convictions

Results of the FATF/FSRB Mutual Evaluations

Immediate Outcome 7

Immediate Outcome 7 of the FATF Methodology measures the extent to which ML offences and activities are investigated, prosecuted and subject to effective, proportionate and dissuasive sanctions. In line with the FATF Methodology, the jurisdictions' effectiveness is determined by considering five core issues[7]:

- How well and in what circumstances potential cases of ML are identified and investigated;
- Whether the types of ML activity being investigated and prosecuted are consistent with the country's threats and risk profile and national AM/CFT policies;
- Whether different types of ML cases are prosecuted (e.g. foreign predicate offences, third-party laundering, stand-alone offence) and offenders convicted;
- Whether the sanctions applied against natural or legal persons convicted of ML offences are effective, proportionate and dissuasive;
- Whether countries apply other criminal justice measured in cases where an ML investigation has been pursued but where it is not possible, for justifiable reasons, to secure an ML conviction.

Of the 50 country assessments completed in the current round of mutual evaluations, only 7 countries achieved a substantial level of effectiveness while none were able to demonstrate a high level of effectiveness.

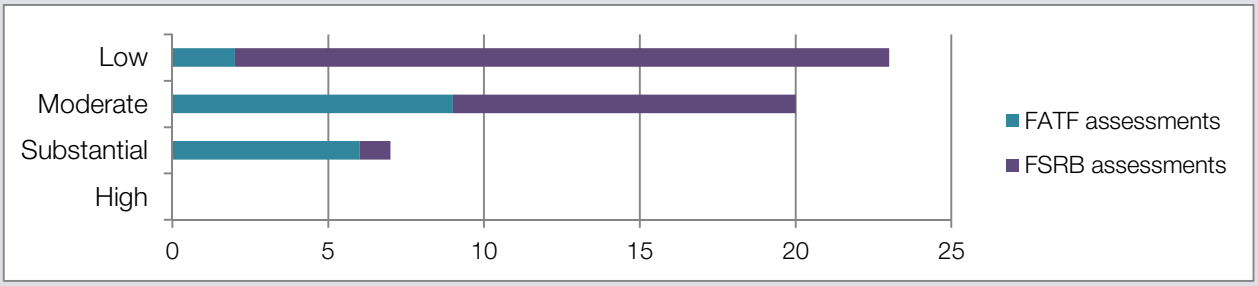
This section is intended to provide targeted analysis regarding the implementation of an effective criminal system response to money laundering offences. It is based on the findings of the discussions conducted during the workshops and on the horizontal and the literature reviews done by the FATF Secretariat with the support of FATF TREIN. It also discusses the legislative basis and of other core elements of effectiveness, such as the proper use of parallel financial investigations, the production and use of evidence and the specific investigative powers and techniques that could be useful to obtain successful results in this area.

7. The full text of the core issues can be found in the FATF Methodology, as well as examples of information and specific factors that a country may use to demonstrate effectiveness. See http://www.fatf-gafi.org/media/fatf/documents/methodology/FATF%20Methodology%2022%20Feb%202013.pdf

Table 1. Effectiveness results under Immediate Outcome 7

	Number	High		Substantial		Moderate		Low	
		Number	%	Number	%	Number	%	Number	%
FATF assessments	17	0	0%	6	33%	9	53%	2%	12%
FSRB assessments	33	0	0%	1	3%	11	33%	21	64%
All assessments	50	0	0%	7	14%	20	40%	23%	40%

Figure 1. Comparison between FATF and FSRB member countries on effectiveness with Immediate Outcome 7



Note Table 1 and Figure 1: Results from the 4th Round of Mutual Evaluations as at 15 May 2018
Source Table 1 and Figure 1: Published assessment reports and the consolidated assessment ratings, available on www.fatf-gafi.org/publications/mutualevaluations/documents/assessment-ratings.html.

While FATF countries obtained better results on effective implementation, the overall results demonstrate the significant challenges that countries faces. Also, where jurisdictions had obtained convictions, the sanctions were often not considered effective, proportionate or dissuasive. This is another indication of the challenges that countries are facing in investigating and prosecuting ML offences.

Overall, these very modest results across the Global Network demonstrate the significant challenges that countries around the global network have experienced in effectively combatting ML activity through investigation and prosecution. These results suggest that countries could improve how they investigate and prosecute ML offences. The results may also signify a variety of other realities and country circumstances, such as a lack of data and statistics, an insufficient priority placed on ML, inadequate resources or weak institution, corruption that impacts the criminal justice system, or even poor preparation or presentation in connection with the mutual evaluation process.

Technical compliance

On the technical compliance side, the assessments of Recommendations 3, 30 and 31 show that countries generally had established the necessary legal and institutional frameworks for investigating and prosecuting ML in their national system.

Recommendation 3 requires countries to criminalise money laundering on the basis of the United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances, 1988 (Vienna Convention) and the United Nations Convention against Transnational Organized Crime, 2000 (Palermo Convention). It also establishes that countries should apply the crime of ML to all serious offences, with a view to including the widest range of predicate offences.

The level of compliance with Recommendation 3, throughout the Global Network, is substantial.

Figure 2. Technical compliance with Recommendation 3 (money laundering offence)

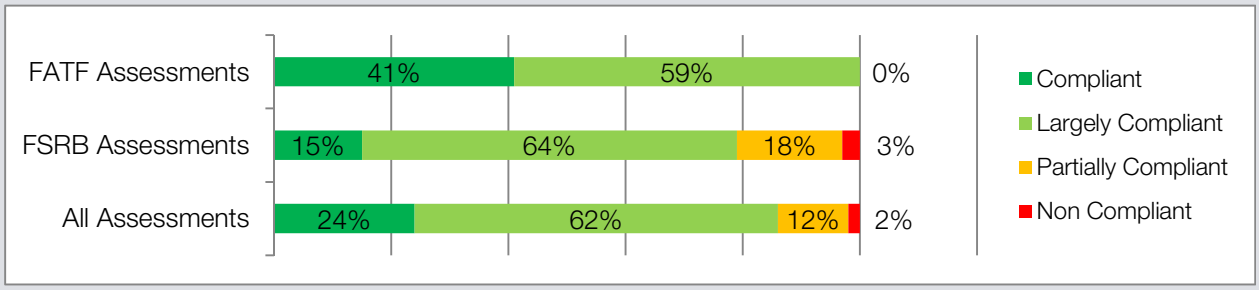


Figure 3. Technical compliance with Recommendation 30 (responsibilities of law enforcement and investigative authorities)

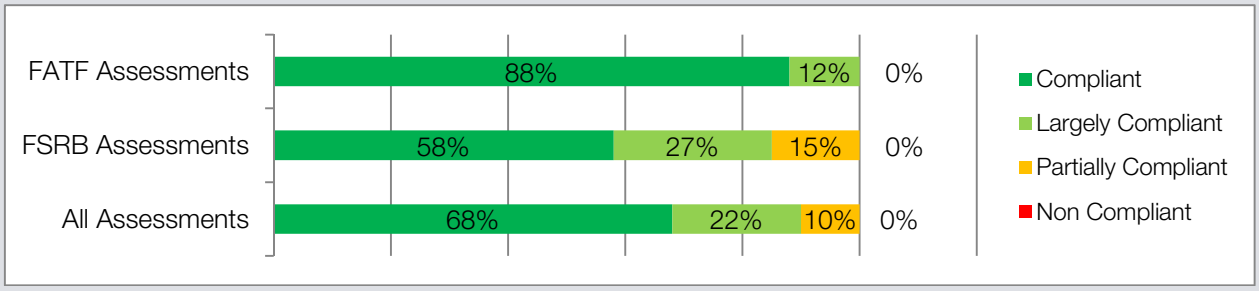

Figure 4. Technical compliance with Recommendation 31 (powers of law enforcement and investigative authorities)

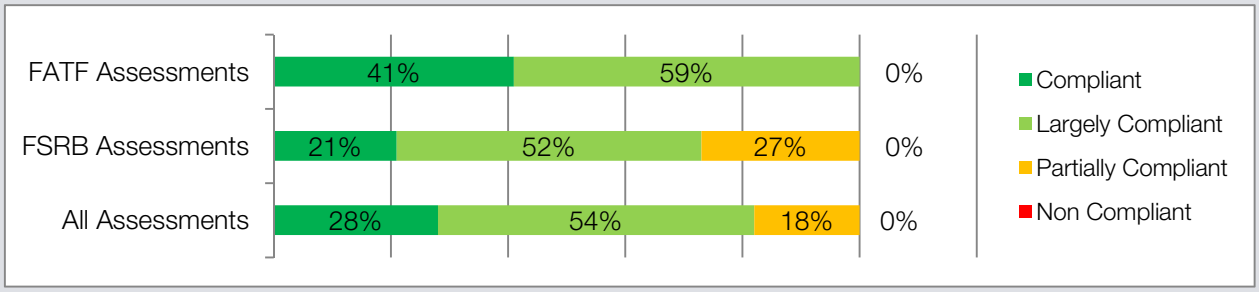


Note Figures 2-4: Results from the 4th Round of Mutual Evaluations as at 15 May 2018
Source Figures 2-4: Published assessment reports and the consolidated assessment ratings, available on www.fatf-gafi.org/publications/mutualevaluations/documents/assessment-ratings.html.

Around 86% of the assessed countries have no shortcomings or minor shortcomings. This demonstrates that there is a good technical implementation of this standard.

Recommendation 30 sets the responsibilities of law enforcement and investigative authorities, demanding that countries should ensure that designated law enforcement authorities have responsibility for ML and TF investigations within the framework of national AML/CFT policies.

The level of compliance with recommendation 30, throughout the Global Network, is very positive. Around 90% of the assessments revealed that countries have no shortcomings or minor shortcomings. This demonstrates that most countries have clearly designated authorities that are responsible for investigating ML/TF offences.

Finally, recommendation 31 establishes the basis of the powers that law enforcement and investigative authorities should have in order to carry out their missions. This includes the possibility to: access all documents and information needed during an investigation; compel the production of records held by financial institutions, DNFBPs, and other natural or legal persons; search persons and premises; take witness statements; and seize and obtain evidence. It also establishes that competent authorities need to be able to use a wide range of investigative techniques, including special techniques that are suitable for the investigation of ML, associated predicate offences, and terrorist financing.

The level of compliance with recommendation 31, throughout the Global Network, is largely good. Around 82% of assessments reveal that countries have no shortcomings or minor shortcomings. This demonstrates that generally most countries have the necessary investigative powers and tools to pursue ML/TF offences.

Legislative basis

To effectively investigate and prosecute money laundering, countries must start with properly criminalising the offence. FATF recommendation 3 (R.3) sets out the specific elements required to comply with the obligation to criminalise money laundering based on the Vienna and the Palermo conventions. In addition, R.3 contains other elements which go beyond the various obligations in the international conventions.

- Experts from several jurisdictions highlighted challenges they face in utilising their domestic ML offences.

- Some participants reported that their national legislation still contains a requirement to prove the predicate offence beyond reasonable doubt in order to be able to convict for ML.

- Other participants from countries without an "all crimes" approach to predicate offenses expressed a desire for simpler legislation that clearly defined the crimes which can be the basis for money laundering charges.

- Also, participants signalled that it could be problematic when legislation does not define properly the extent of subjective knowledge that is sufficient to prove the offence, considering that an unclear standard of proof can cause difficulties in relation to the principle of presumption of innocence and how the defendant can use that to his advantage.

- Finally, it was mentioned that in several countries, the criminalisation of self-laundering is not possible due to constitutional issues and that limits the capacity to investigate and prosecute those types of cases. It should be noted though that in all FATF evaluations where jurisdictions have argued that criminalising self-laundering is contrary to fundamental principles of domestic law, this has been rejected by the Plenary.

It is a common practice in many jurisdictions to focus on the prosecution of the predicate offence and to ignore or deprioritise the prosecution of related ML. This is reportedly done for various reasons: the evidentiary thresholds under other legislation may be easier to meet, or the prosecutors may be more familiar with prosecuting predicate offences and have not been sufficiently trained on the benefit or importance of pursuing ML charges. In some cases, it might be easier to convict on the predicate offence, as the prosecutor has already accumulated enough evidence to proceed with predicate charges but has not fully developed the financial evidence needed to bring ML charges. There are many justifications for the pursuit of predicate offenses at the exclusion of ML related to convenience. Prosecuting ML in addition to a predicate offence is often resource-intensive and time-consuming. In some countries, the laws did not properly incentivise ML charges because the sentence would be essentially the same if the defendant were only prosecuted for the predicate offense.

While there are differences in legal traditions and the way legislation is drafted in jurisdictions, some good practices related to criminalising ML can be identified:

- It was recommended during the workshops to expand the scope of predicate offences to the broader list of serious offences or to adopt an all-crimes approach, which may provide clarity and more flexibility to the prosecutors, especially when combined with a system that also incorporates the principle of opportunity. It should be noted that Recommendation 3 does require coverage of all serious crimes as predicate offenses, to include, at a minimum, those listed in the Glossary to the FATF Recommendations (i.e. a range of crimes within 21 different categories).

- It was also stated as a good practice to elaborate the definition of subjective knowledge, either in the law establishing the ML offense or through case law.

Practitioners felt it was better to work with a lower threshold on the mens rea element, such that they would only need to demonstrate that the defendant had a belief or suspicion of the possible illicit origin of the funds. The ability to show "willful blindness" or that the defendant should have known that the funds or assets were criminally derived, was also deemed useful.

- Several practitioners agreed that it was helpful to establish, whether through legislation or case precedent, that the predicate offence need not be proven in order to convict for ML, as established in the FATF Recommendations. Some practitioners noted that their domestic laws have removed the obligation to prove that money laundered comes from a criminal act altogether.

- Some participants mentioned that it is sufficient for the prosecutor to demonstrate that the defendant has unexplained wealth, which then places the burden on the defendant to provide an objectively reasonable explanation for why he has or dealt with funds under investigation. This was presented by the Dutch delegation as the consistent approach they take for ML cases; being this one of what they call the "6 steps approach."[8] This means that building on unexplained wealth or a tax inconsistency, investigators are able to start an investigation for ML even though they do not have direct evidence of a specific predicate offence. After an initial showing by the state, the Dutch system reserves the burden of proof to the indicted, requiring him to explain the licit origin of the funds. Other delegations noted that while prosecutors must show that the proceeds have derived from some criminal offense, they need not show which specific act generated them, or, in other words, a crime committed on a certain day, by a certain person.

The European Court of Human Rights in a recent decision[9] found that reversing the burden of proof after a prima facie showing is in line with the conventional law. The Court agreed that the practice is respectful of the principles of innocence and of fair trail, as long as the defendant has the possibility defend against the ML charges.

A good practice which has proven useful in some jurisdictions is plea bargaining, or the process of settling a criminal case with a defendant in exchange for him pleading guilty to some crime in addition to providing co-operation. Often, this can result in the defendant admitting guilt to less serious or fewer offenses than those alleged in the indictment. Thus, the defendant may receive a lower sentence than would have been otherwise possible.

The "bargain" benefits the defendant because, if he had gone to trial, he could have been found guilty of all charges against him (particularly in a country with a high conviction rate) and/or faced a much stiffer sentence. The government benefits from economy of not putting on a full trial, and, more importantly, the government could stand to gain valuable co-operation from the defendant, who may provide evidence or testimony which can be used against other, higher-level targets in the criminal organisation or conspiracy.

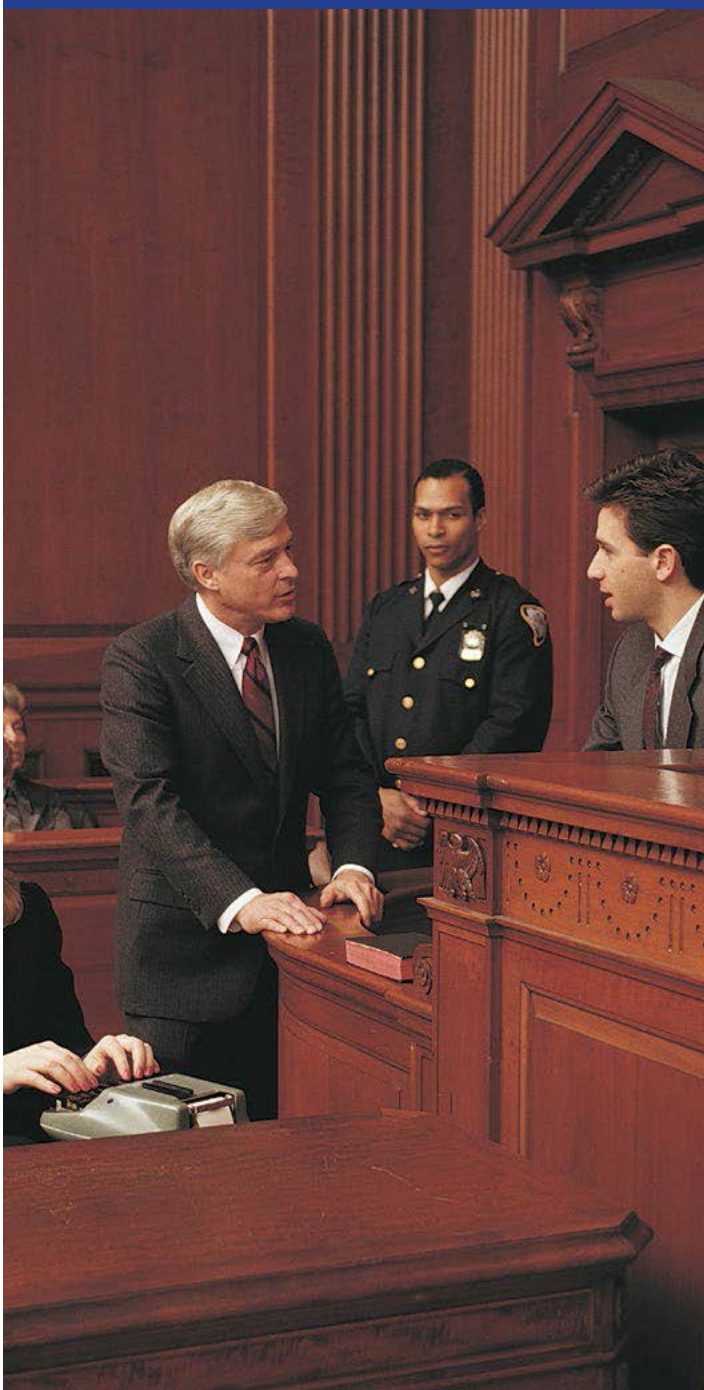
Another similar legal power is a deferred prosecution agreement, which is an agreement reached between a prosecutor and an organisation which could be prosecuted, permitting a prosecution to be suspended for a defined period provided that the organisation meets certain specified conditions. Both legal powers should be subject to judicial control and oversight.

8. The 6 steps are: 1) no direct evidence of a specific predicate offence; 2) a suspicion of ML; 3) obtaining the statement of the suspect; 4) abiding by the requirements for a suspect's statement; 5) investigation by the Public Prosecution Service; 6) drawing a conclusion.

9. Zschüschen v. Belgium (application no. 23572/07)

However, it was also mentioned that the practice of plea bargaining or deferred prosecution agreement would be challenging or impossible in those criminal systems that rely on the principle of legality and do not give the prosecutor the power to negotiate.

Furthermore, it was also stated that the principle of opportunity is a very important tool considering the primary importance of choosing the best or most impactful cases to investigate and prosecute and not having to prosecute all crimes, which can be very resource intensive. Prosecutorial discretion was widely regarded as a good feature, especially in light of the risk of setting bad judicial precedents or prosecuting those not truly worthy of punishment.



Burden and standard of proof

The issue of the burden of proof was discussed during the workshops as a potential challenging area for the prosecution of the ML offence. While several countries' laws permit a reversal or shifting of the burden of proof, other countries' laws or constitutions contain a principle or presumption of innocence. This means that the prosecution has the responsibility to prove that the defendant committed the crime beyond reasonable doubt. In the context of ML, it also means that the "proceeds" element must be proven as well: the funds involved must be shown to be derived from an illicit source. Countries that permit a shifting, or dynamic, burden of proof have expressed that this has proven to be very useful.

Evidence

One of the biggest challenges in ML cases is gathering the evidence linking the assets to the criminal activities or proving that assets/ funds that were laundered were derived from an offence (either committed by the accused or a third party). It is not uncommon for this element to be required to be proven at trial, and it is also, ordinarily, the element requiring the deepest investigation.

To establish this link, practitioners must identify and trace assets or "follow the money" until the connection between the predicate offense and the assets can be determined.

Establishing this nexus between a financial transaction and a predicate offence may be essential for certain investigative measures in some countries (e.g. production orders, search warrants, wire-tapping orders, and surveillance orders). Other legal systems may require a lesser showing (e.g. probable cause or relevance), but investigators and/or prosecutors in many countries must seek judicial authorisation when obtaining evidence via more intrusive methods.

Furthermore, competent authorities expressed that they may have difficulty showing that the defendant knew he or she was dealing with criminal proceeds or that he intended to conceal or disguise them, depending on national requirements.

During the workshops, participants agreed that, in line with the FATF Standards, it is imperative to be able to use circumstantial evidence, especially with regard to the knowledge or intent of the defendant and the showing that the money laundered, was, in fact, dirty. Also, it was noted as a good practice to have legislation admitting a test of reasonable grounds to prove that proceeds have a criminal source.

ML investigations are often driven or reliant on financial intelligence provided by the FIU. Workshop attendees discussed how prosecutors could be tempted to utilise that information directly in the process instead of obtaining the underlying evidence upon which the financial intelligence report was based. This temptation could be especially strong when the case has cross-border elements (i.e. in situations where information is exchanged through the Egmont Group channels). In this regard, it was noted as a good practice to train practitioners on the characteristics of the information-sharing system, the powers and capacities of the FIUs, and on the guidelines and limitations on use for information obtained through the Egmont Group.[10] Also, close engagement between the investigators and the FIU may help to have a clear understanding of the possibilities and the limits of the financial intelligence that the FIU can provide.

It was mentioned that financial intelligence is an excellent source of lead information, but in many countries, it should not be used as evidence. In some countries, the FIU may be able to participate as a party to the prosecution, and in rare cases, the defendant may be able to access financial intelligence if it contains evidence tending to exculpate him.

Powers and techniques

Recommendation 31 provides a framework for the powers that law enforcement and investigative authorities should have. Experts stressed the importance of competent authorities conducting investigations of ML, associated predicate offences, or TF should be able to access all necessary documents and information for use in those investigations and prosecutions. This should include available compulsory measures to: obtain records held by financial institutions, DNFBPs and other natural or legal persons; search of persons and premises; take witness statements; and seize and obtain evidence.

The FATF Standards also requires jurisdictions to be able to use a wide range of other investigative techniques, some of which entail more specialised expertise, such as undercover operations, intercepting communications, accessing computer systems, and conducting controlled deliveries. Participants from certain regions stated that the use of particular investigative techniques was more or less common, but their use, generally, seemed to be on the rise. Some challenges were mentioned with regard to a lack of capacity to conduct forensic investigations (e.g. of computer hard drives), accessing evidence held by foreign service providers, or limited technical tools to intercept communications. Some practitioners mentioned successful experiences in co-ordinating controlled deliveries with international partners.

Other tools and techniques emerged the workshops discussions as being effective for combatting ML were: the capacity to conduct electronic surveillance or location tracking, phone geolocation and communication trends analysis, and having the capacity to do audio or video recordings in public spaces. Also mentioned were several new tech-related tools such as monitoring internet use and gathering forensic information from the dark web (e.g. block-chain analysis technologies). Finally, it was signalled that being able to access and intercept social media communications and to monitor other web-based chats and chat rooms could potentially provide important inputs to the investigations. Encrypted communication channels were deemed problematic by the participants.

It was noted during the workshops that investigators should ensure that the tools and techniques are not a substitute for conducting financial analysis, which can often be thought as difficult to conduct, but which can be aided by technology such as automated bank record scanning systems or intelligent link software.

It was mentioned that some techniques are resource intensive and in that regard it is important to undertake their use with a defined purpose, knowing exactly what evidence can be produced and how that evidence can go towards proving the case. Finally, the importance of good co-ordination between law enforcement and prosecutors was stressed so as to avoid possible defence strategies, the unlawful obtaining or retaining of evidence, and collection of information belonging to non-suspects.

Finally, as noted in the FATF's 2012 financial investigations guidance, ongoing law enforcement collaboration and exchange of information with FIUs should play an important role in investigations. This can lead to the FIU providing additional financial intelligence to the investigative team, thus contributing to a fuller picture of the financial modus operandi of an organised criminal group. In doing so, care should be taken to ensure that any action by the FIU does not unduly jeopardise or hinder the criminal investigation.

Agreement

Terrorist Financing:

Investigations, prosecutions, and convictions

Investigating and prosecuting terrorist financing (TF) offences presents a distinct set of challenges for jurisdictions. TF cases often involve classified intelligence, can span multiple jurisdictions, and require rapid responses from the investigative and prosecutorial authorities. The authorities may also need to find a balance between gathering sufficient evidence to obtain TF convictions and disrupting the activity to prevent a terrorist act from occurring. As an initial matter, participants in the workshops noted that TF investigations can be initiated in many ways, and that TF investigations do not simply pre-date or post-date a terrorist act or require a link to an attack. Donor networks operate constantly and shift methods; states sponsor and fund terrorist organisations; terrorist organisations generate revenue from the territory they control; and individuals may be inspired to provide material, resources, or other support, including themselves.

This section draws from FATF and FSRB members' experiences in conducting TF investigations and prosecutions. It identifies common challenges as well as good practices from jurisdictions that have successfully dealt with TF cases.

Results of the FATF/FSRB Mutual Evaluations – Immediate Outcome 9

Immediate Outcome 9

Immediate Outcome 9 of the FATF Methodology measures the extent to which TF offences and activities are investigated and persons who finance terrorism are prosecuted and subject to effective, proportionate and dissuasive sanctions. In line with the FATF Methodology, jurisdictions' effectiveness is determined by considering five core issues[12]:

- The extent to which different types of TF activity are prosecuted and offenders are convicted, and whether this is consistent with the country's risk profile.
- How well cases of TF are identified and investigated.
- Integration of the investigation of TF with national counter-terrorism strategies and investigations.
- The effectiveness of sanctions or measures applied against natural and legal persons convicted of TF offences.
- Whether other criminal justice, regulatory or other measures to disrupt TF activities where it is not practicable to secure a TF conviction.

The review of MERs highlighted the nearly direct correlation between the jurisdiction's understanding of TF risk and its level of effectiveness under IO 9. This illustrates the importance of understanding TF risks: for example, whether the country experiences activity such as collecting, transferring or using funds intended for terrorist purposes.

12. The full text of the core issues can be found in the FATF Methodology (http://www.fatf-gafi.org/media/fatf/documents/methodology/FATF%20Methodology%2022%20Feb%202013.pdf)

Table 2. Effectiveness results under Immediate Outcome 9

	Number	High		Substantial		Moderate		Low	
		Number	%	Number	%	Number	%	Number	%

Relevant data from the mutual evaluations

The majority of the reviewed jurisdictions had not prosecuted TF offences or obtained TF convictions at the time of their mutual evaluation. Only 14 (29%) of the reviewed jurisdictions had prosecuted any TF offences, and only 10 (20%) had obtained convictions. For a large majority of countries that reported charging or convicting for TF, the numbers are in the single figures and sanctions were often not considered effective, proportionate or dissuasive.

To some extent, these numbers highlight the challenges that countries are facing in investigating and prosecuting TF offences. However, they do not necessarily fully reflect the rate of TF prosecutions and convictions because:

- Many jurisdictions had prosecuted TF conduct by using alternative offences in addition to, or instead of TF charges. These included association with a terrorist organisation or aiding and abetting a terrorist act.
- In some cases, the TF charges formed a part of a wider terrorism case, but these cases did not contribute to the total number of TF prosecutions in the country.
- In some cases, the low numbers were simply indicative of the lower TF risk profile of certain jurisdictions.

Technical compliance

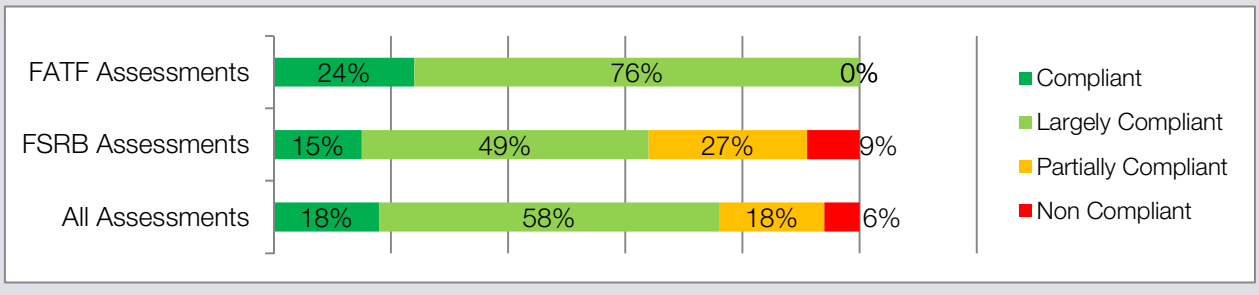
A foundational aspect for effective investigation and prosecution of TF activity is the criminalisation of TF as a separate offence.

FATF Recommendation 5 (R.5) provides measures to assist countries in fulfilling the legal requirements of the International Convention for the Suppression of the Financing of Terrorism (1999) (The Terrorist Financing Convention), and, indeed, contains elements which deliberately go beyond the existing international legal obligations.

The level of compliance with R.5 was reasonably high across the assessed jurisdictions, particularly after the FATF's global review of compliance with recommendations 5 and 6 (relating to targeted financing sanctions) after the terrorist attacks in Paris in November 2015. Globally, 76% of the reviewed jurisdictions were either compliant or largely compliant with the R.5, to include all the FATF members and 64% of the FSRB members. Common deficiencies included the lack of criminalisation of the funding of an individual terrorist without a link to a terrorist act and the low level of available sanctions. Other deficiencies range from exemptions to the definition of terrorism or a list of terrorist acts which is too narrow in scope and which, in turns, narrows the scope of the TF offense.

Figure 5 shows the technical compliance ratings on R.5 from the 50 MERs conducted to date.

Figure 5. Technical Compliance Recommendation 5 (Terrorist financing offence)



Note: Results from the 4th Round of Mutual Evaluations as at 15 May 2018

Legislative basis to investigate and prosecute TF

Comprehensive criminalisation of TF is directly related to the jurisdiction's ability to investigate and prosecute TF effectively. For example, the lack of criminalising the financing of an individual terrorist without a link to a terrorist act can prevent a jurisdiction from prosecuting the financing of travel of a foreign terrorist fighter.

The FATF has focused on improving the global level of criminalisation of TF in recent years. For example, in 2015 the FATF launched a fact-finding initiative to determine whether 194 jurisdictions around the world had implemented measures to cut off terrorism-related financial flows, including adequately criminalising TF[13]. The results of the initiative prompted the FATF to design a follow-up process to ensure countries were making the required changes. In 2016, the FATF also issued Guidance on the criminalisation of terrorist financing – a guidance paper aiming to assist countries in implementing the requirements of R.5[14].

In the various workshops, practitioners noted that the key challenges related to the criminalisation of TF and self-financing and the difficulties in defining terms such as "terrorism", "terrorist" or "terrorist organisation" in legislation. In many jurisdictions TF offences are also relatively new compared to money-laundering offences, some of which have been set in law for decades. The good practices discussed and identified in the workshops included:

- Drafting the offence to be as broad as possible: for example, structuring the offence in a way that the suspect's intent to finance specific terrorist acts does not need to be proved[15].

- Involving prosecutors in the drafting of the offence to ensure the provisions are workable in practice.

13. The FATF's report to G20 leaders with the results of the review can be found at www.fatf-gafi.org/media/fatf/documents/reports/Terrorist-financing-actions-taken-by-FATF.pdf

14. www.fatf-gafi.org/media/fatf/documents/reports/Guidance-Criminalising-Terrorist-Financing.pdf

15. For example, the MER of the United States notes that the offence of knowingly providing material support or resources to a designated Foreign Terrorist Organisation is the most often charged TF offence. Specialist prosecutors confirmed that this is because this offence allows for effective TF prosecution and conviction without needing to prove any specific intent on behalf of the defendant to fund terrorist activity/acts.

Core elements of effectiveness

Parallel financial investigations

Practically speaking, counterterrorism and TF investigations are often linked (however, it is important to note that they do not need to be). To ensure that all the relevant actors in the network are discovered, it is important to conduct systematic parallel financial investigations in every terrorism-related case. The investigation can either be a standalone TF investigation, or where applicable, form a part of a wider terrorism investigation.

Many jurisdictions face challenges with the investigative capacity and capability to conduct parallel financial investigations. Experts at the workshops reported that often, financial investigations are not pursued if the underlying terrorist activity appears to be primarily self-funded or if the sums involved are very small.

The workshop identified good practices, which include ensuring that a TF investigation can be launched without an underlying terrorism case, and that the TF investigation can continue even where the linked terrorism investigation has already been concluded. Another useful practice is to issue manuals and procedures for identifying and investigating TF.

In addition, the FATF Guidance on the criminalisation of terrorist financing has a specific section on terrorist financing investigations, providing further information on good practices. For example, it notes that financial investigations should be viewed not only from a prosecution-oriented perspective, but also from an intelligence standpoint.

Evidence

Many of the challenges in TF cases relate to the availability and admissibility of evidence. Some particular challenges related to proving the elements of the TF offence include:

- Proving mens rea, i.e. that the defendant intended or knew that the funds were to be used by a terrorist, a terrorist group, or for a terrorist act – especially where the defence claims the funds were meant for personal expenses such as rent or food or charitable purposes.

- Proving that the recipient of the funds or assets is a terrorist or a terrorist organisation, especially where they have not been designated by the United Nations Security Council or national authorities as such or before a terrorist attack is planned or committed.

- Proving TF when the funds are sent oversees or may not ever actually be used to finance an attack.

TF cases may be initiated by or rely on classified pieces of intelligence. The defendant may also know from personal experience information that is classified and thus pose a disclosure risk to the national authorities. There are particular challenges related to "converting" classified intelligence into admissible evidence:

- The prosecution may have to find a way to recreate or corroborate information that is otherwise only found in classified material.

- The prosecution may find itself in a position where it would have to reveal secret information if it intended to prosecute, and therefore, it may decline to pursue the charges or dismiss the case.
- Sentences may be lower as not all elements of the TF activity can be taken into account due to the inadmissibility of evidence.
- Additional, burdensome steps may need to be taken to keep the sources and methods of intelligence gathering confidential.
- Different levels of intelligence may be accessible to different people – such as the intelligence service, police, or the prosecutors – which can complicate co-operation among agencies.

While gathering and using evidence is one of the most challenging areas in TF prosecutions, there are also some good practices in the area:

- Having legislation or judicial procedures that specifically deal with the use or introduction of classified material or intelligence (e.g. laws or rules may permit judges and/or defence counsel to review information, redactions may be made, information can be "declassified" by the state, etc.).
- Involving the prosecutor at an early stage to determine what pieces of intelligence may be admissible as evidence, or what steps would need to be taken for it to be admissible.
- Steering the investigation in a way that the confidential intelligence is supplemented or supplanted with admissible evidence, such as financial records or records of communications obtained through judicial authorisation.
- Developing jurisprudence to enable the use of circumstantial and indirect evidence to prove knowledge and intent.
- Using the defendant's own words and activities, such as on social media, to help prove intent or finding witnesses who can testify to the defendant's behaviour or beliefs and changes thereto.
- Implementing all UN-required terrorism and related designations and establishing a system of domestic designations to help prove that an individual is a terrorist or an organisation is a terrorist organisation, or developing jurisprudence which gives weight to foreign designations[16].
- Using the 24/7 electronic evidence system under Article 35 of the Budapest Convention to obtain and offer immediate assistance concerning the collection of electronic evidence. [17]
- Having a designated special court to deal with terrorism and terrorist financing cases that often include classified information.
- Using administrative powers to freeze or seize assets based on confidential intelligence that could not be used to support a prosecution.

16. In particular, many workshop participants noted that they monitored closely the Specially Designated Nationals and Blocked Persons List of the U.S. Office of Foreign Assets Control (OFAC).

17. Article 35 of the Budapest Convention on Cybercrime (24/7 Network) states that Each Party shall designate a point of contact available on a twenty-four hour, seven-day-a week basis, in order to ensure the provision of immediate assistance for the purpose of investigations or proceedings concerning criminal offences related to computer systems and data, or for the collection of evidence in electronic form of a criminal offence.

Powers and techniques

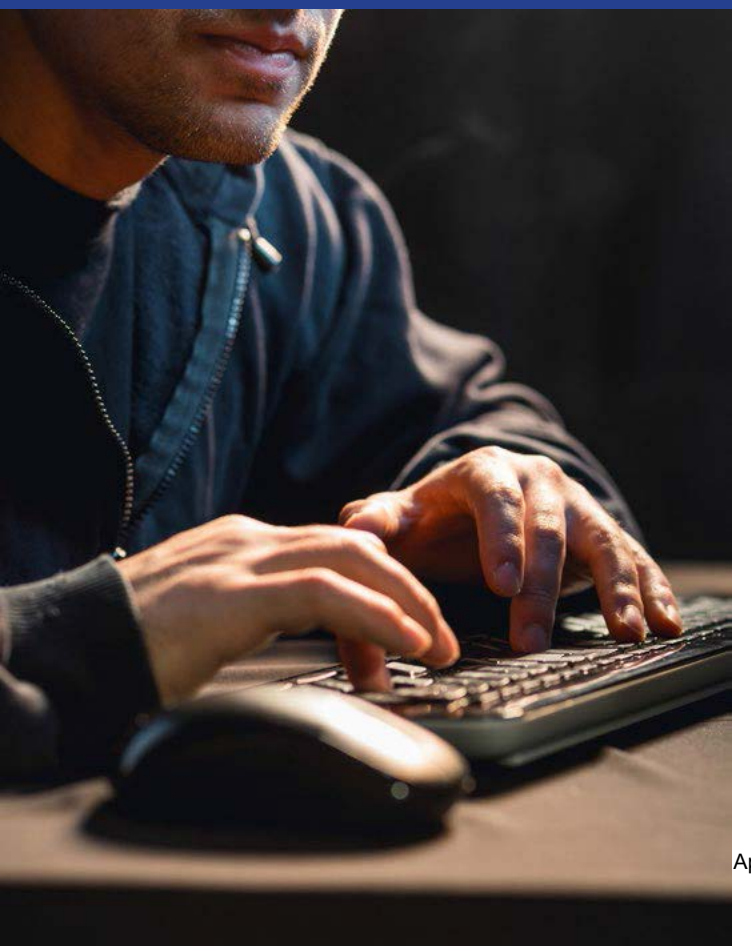
Special investigative techniques, such as the use of wiretaps, monitoring internet use, intercepting social media communications, or using confidential human sources (informants) or undercover agents, are often important sources of evidence in TF cases. It is imperative that competent authorities have a wide variety of techniques available to them.

In terms of confidential informants, jurisdictions have experienced challenges in trying to protect the identity of the informant. Further, it is often necessary to change the sources and find new informants.

Social media can often be an important source of evidence in TF cases. There can, however, be challenges in obtaining evidence from social media platforms: intercepting communications may require a pre-authorisation from the court or it can be challenging to obtain social media content from overseas. Social media content may also not be admissible as evidence.

Some good practices related to using social media content as evidence include:

- LEAs might create profiles on social media platforms, enter into closed groups, and communicate with suspects to produce direct evidence (i.e. screen shots)
- Using the law enforcement agent who participated in the communications with suspects as a witness.
- Communicating with the social media platforms and their law enforcement sections directly. Early engagement – even before a TF investigation is opened – can be useful to find out what type of information or evidence is available and how it can be obtained. One example is to use preservation orders to ensure the social media content is not routinely deleted while the investigation is ongoing.



Prevention & Disruption

TF cases are often time-sensitive and there is a difficult balance between allowing the TF activity to continue to gather further evidence and disrupting the activity to prevent a possible terrorist attack. Many jurisdictions have opted for disrupting the activities early instead of pursuing a TF prosecution. This is often done in the interest of public safety, or where it has been clear that the available evidence would not be able to support a TF prosecution.

The need to disrupt TF activities is also reflected in the FATF Methodology. In addition to prosecuting TF offences, IO 9 takes into account jurisdictions' use of the other criminal justice, regulatory or other measures to disrupt TF activities where it is not practicable to secure a TF conviction.

It should be noted that disrupting the terrorist or supporting network fully can be very challenging. This is particularly true in cases where the identity of the recipient is not known, and the funds have been sent to an unstable conflict zone. Authorities may be able to cut off one part of the network but other financiers are able to continue their activity and keep transferring funds to the same recipient.

Common methods to disrupt TF activity identified in the workshops include:

- Targeted financial sanctions to freeze the funds of designated terrorists and terrorist organisations – the burden of proof to designate is often lower than to prosecute, yet the desired disruptive impact can often be reached [18].
- Non-conviction-based asset seizure and confiscation.
- Withdrawal of passports, extradition, and deportation; although such measures should be coordinated or coupled with advanced notice to the country where the suspect is sent.
- Taking a broader view, the workshop participants also highlighted the importance of de-radicalisation efforts in jurisdictions both to prevent TF activity and prevent recidivism.

18. See 2013 FATF International Best Practices on Targeted Financial Sanctions Related to Terrorism and Terrorist Financing (Recommendation 6) which outlines the importance of an effective freezing regime.

Investigating and prosecuting terrorism offences vs. TF offences

It is a common practice in many jurisdictions to prosecute alternative offences such as association with a terrorist organisation, money laundering or fraud instead of prosecuting TF offences. Common justifications for doing so included: the evidentiary thresholds under other legislation can be easier to meet or the prosecutors may be more familiar with other legislation. In some cases, there may be an urgent need to disrupt the activity, and the prosecutor has enough evidence already to charge another offence instead of TF.

Discussions during workshops highlighted that prosecuting TF cases can often be labour-intensive and time-consuming and add to the workload of the prosecutors without necessarily increasing the sentence. In some cases, TF prosecutions are not pursued because the suspect has been self-funding their terrorist activities and a terrorism prosecution is pursued instead. Still, prosecuting non-terrorism related offences can lead to lower sentences because these other offences do not fully reflect the gravity of terrorism-related charges. Some experts reported that, in fact, the inclusion of TF charges as part of a larger prosecution might be the only charge of conviction if the direct participation of the accused in terrorist acts is not proven.

However, despite the challenges, seeking TF prosecutions is important, especially where there is any suspicion of TF activity, for example, based on a suspicious transaction report or information provided from another country. Investigating and eventually prosecuting TF offences can lead to discovering and disrupting a wider network financing the same terrorist organisation. It may also uncover criminal activity that generated funds used for TF or the laundering of assets derived from TF. Finally, although TF can occur in formal financial systems and through informal channels, and may be accomplished in comparatively small amounts, the ultimate impact of the financing can be hugely detrimental. While the political will to prosecute persons that commit acts of terrorism is strong, those who financially facilitate and support terrorism are just as critical to the terrorist ecosystem as those who carry out heinous acts. Prosecuting TF was also recognised for its deterrence value, as national financial systems can be vulnerable origin or transit points for TF even if terrorism does not occur within particular countries' borders.

Confiscation:

freezing, seizing, and recovering assets

Tracing, freezing and confiscating the proceeds and instrumentalities of crime is fundamental to the effectiveness of measures to combat money laundering and terrorist financing. Serious crime generates a vast amount of proceeds every year. Some of the main reasons that criminals launder their proceeds are to prevent competent authorities from detecting their illegal conduct, prevent authorities from depriving them of their ill-gotten gains, and to use these ill-gotten gains to promote ongoing criminal activity. Confiscation strangles the operational budgets of criminal organisations, ensures that crime does not pay, and recovers value which can be used to compensate the victims of crime.

This section draws from FATF and FSRB members' experiences in identifying and tracing, seizing and freezing, and ultimately, confiscating and recovering, criminal assets. It identifies common challenges and good practices from FATF and FSRB jurisdictions.

Results of the FATF/FSRB Mutual Evaluations – IO 8 & R.4/R. 38

Immediate Outcome 8 of the FATF Methodology measures effectiveness of the confiscation regime - the extent to which proceeds and instrumentalities of crime are confiscated. This can be contrasted with the legislative and other measures that are required pursuant to Recommendation 4 (domestic confiscation and provisional measures) and Recommendation 38 (mutual legal assistance for freezing and confiscation), which set out several elements that underpin for an effective confiscation (or forfeiture) regime.

These ratings demonstrate that, to date, the level of implementation of an effective confiscation regime among the assessed countries is modest at best. According to all assessments, almost three-quarters of jurisdictions are not succeeding in this area. Although the Methodology for the current round of assessments dates from 2013, the concept that criminals should be deprived of their proceeds is one that has been a core element of the FATF Recommendations since the original 1990 Recommendations.

In line with the FATF Methodology, jurisdictions' effectiveness in depriving criminals of the proceeds and instrumentalities of ML, TF, and predicate offences (or their equivalent value), is determined by considering five core issues:

- Whether confiscation is a policy objective in the country.
- If the country is confiscating proceeds/ instrumentalities/equivalent value related to both domestic and foreign predicate offenses and where assets are located overseas.
- Whether falsely or non-declared currency or bearer negotiable instruments moved across the border are confiscated.
- How well confiscation results align with ML/TF risks and national AML/CFT priorities.

Many of the assessments reviewed cited deficiencies in the way that the jurisdiction addressed these following issues:

- Confiscation was only occasionally laid out as a policy priority, and this was mostly found in jurisdictions having specialised agencies or units dedicated to confiscations.
- Actions taken on false or non-declaration of physical cross-border transportation of cash and bearer negotiable instruments were limited and inconsistent. Not many cases were linked to ML/TF and many countries applied a small fine to these cases. It also appears that in many cases the cash declarations or disclosures are not used to their fullest extent as part of the AML/CFT system, due often to technical limitations.

Table 3. Effectiveness results under Immediate Outcome 8

	Number	High		Substantial		Moderate		Low	
		Number	%	Number	%	Number	%	Number	%
FATF assessments	17	1	6%	4	23%	11	65%	1	6%
FSRB assessments	33	1	3%	5	15%	9	27%	18	55%
All assessments	50	2	4%	9	18%	20	40%	19	38%

Note: Results from the 4th Round of Mutual Evaluations as at 15 May 2018
Source: Published assessment reports and the consolidated assessment ratings, available on www.fatf-gafi.org/publications/mutualevaluations/documents/assessment-ratings.html.

- With respect to the linkage between confiscation and the risks faced by jurisdictions, MERs frequently noted that the results obtained were not in line with the risks faced, whether as regards the amount confiscated, or the nature of the results (e.g. limited confiscation in relation to predicates generating the most proceeds of foreign predicate offences).

- A misalignment between amounts subject to provisional measures (freezing, seizing) and amounts confiscated, or between amounts *ordered* confiscated and *actually* recovered.

Overall, too small an amount of money was confiscated considering the risks and contexts of the country or a lack of focus on parallel financial investigations such that assets which could be confiscated were not identified or traced.

Although both qualitative and quantitative information is important in determining effectiveness under IO 8, the amount of criminal proceeds and instrumentalities that are ultimately confiscated and recovered by the government (or where there is restitution to victims), is an important overall element. In an ideal world, competent authorities are able to identify and trace a significant proportion of the proceeds of crime located or generated within the jurisdiction, freeze or seize those assets, then confiscate and recover them. This is a significant challenge. Experts referred to a number of complications in the workshops, most often the inability to follow the money trail; the criminals' use of webs of companies, accounts, and nominees to hold assets; or the movement of assets abroad, potentially to non-cooperative countries.

Reliable or comprehensive data and statistics on confiscation, such as the number of cases and the value of the assets that were frozen, confiscated, and recovered, is variable or lacking across the MER reports. Furthermore, that data is not always consistent across agencies within one country, and thus is difficult to interpret. Similarly, there are few estimates of the size of the criminal economy for jurisdictions, and any such estimates that do exist have to be treated very cautiously, thus making it more challenging to determine how well a country is doing in terms of the amount it confiscates. The lack of data also often makes it hard to identify the nature of the deficiencies or weaknesses that lead to results that defy expectations. Qualitative information, such as case examples, is presented across the MERs as well.

In terms of the amounts ordered to be confiscated, there are two FATF members that confiscate noticeably larger amounts (i.e. reaching into the low billions of USD/EUR annually). The amounts confiscated by other countries range from minimal amounts (less than a million) to 100-200 million. As regards the numbers of cases, this varies also from 0-20 cases a year (annual average) to several thousand. With respect to the number of cases and the value of the amounts confiscated, there can often be significant variations between jurisdictions (even ones of a similar size in terms of population or economy, legal systems etc.), with the reasons for this being less apparent.

Technical Compliance

There appears to be a large degree of technical compliance, with all FATF members being Compliant (C) or Largely Compliant (LC) on both Recommendation 4 and Recommendation 38, to date. For FSRBs members, the results show more than 80% are C or LC on R.4 and 70% C or LC on recommendation 38.

The most frequently cited deficiencies are:

(a) Recommendation 4 – inadequate mechanisms to manage property, lack of equivalent value confiscation, gaps regarding instrumentalities and limitations in the range of offences where confiscation can be pursued.

(b) Recommendation 38 – similar deficiencies as for R.4, inability to enforce non-conviction based orders, lack of mechanisms to share confiscated assets or to co-ordinate actions with other countries.

In general it appears that though there are a mix of deficiencies under both R.4 and 38, these are relatively minor, taking into account the requirements laid out in the FATF Standards.

Figure 6. Technical Compliance Recommendation 4 (Confiscation and provisional measures)

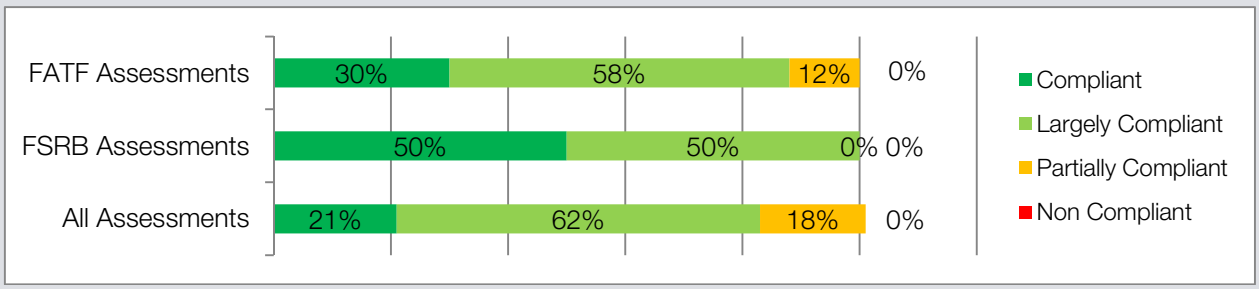


Figure 7. Technical Compliance Recommendation 38 (MLA: freezing and confiscation)

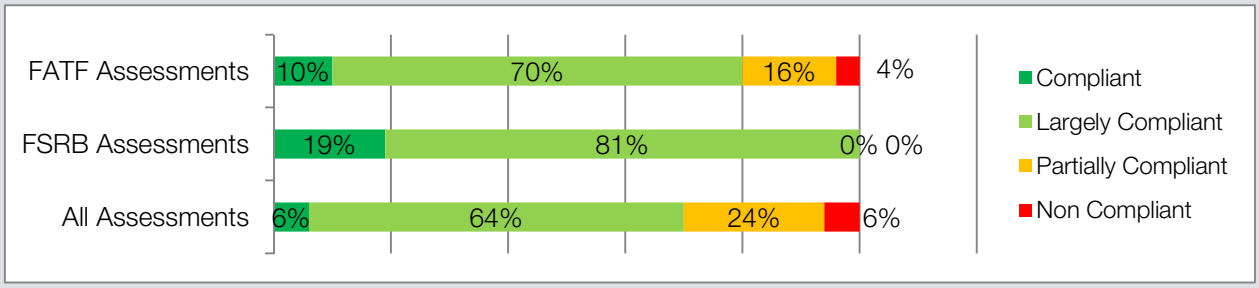

Note Figures 6 and 7: Results from the 4th Round of Mutual Evaluations as at 15 May 2018
Source Figures 6 and 7: Published assessment reports and the consolidated assessment ratings, available on www.fatf-gafi.org/publications/mutualevaluations/documents/assessment-ratings.html.

Core elements of effectiveness

The effectiveness of any confiscation regime (all aspects thereof) is based on a number of factors, which include the underpinning laws and regulations that provide a full range of powers, the institutional framework and competent authorities that have responsibility for taking action, and the mechanisms, processes and tools that are used. Some practices particularly useful and effective practices for asset confiscation are:

- Ensuring that criminal asset confiscation is a policy priority, with a linked strategy that sets out how all relevant authorities can work to achieve the objectives/goals that are set.

- The creation of multidisciplinary agencies/ units that focus on asset confiscation, or at a minimum having expert staff that is dedicated to this role within larger agencies or public prosecution services. There is a need for expert lawyers, investigators, forensic accountants, financial analysts, and increasingly, IT experts.

- A framework to manage or oversee the management of frozen, seized, and confiscated property[19], including by competent authorities that are freestanding or part of an LEA, and, as needed, the ability to hire outside vendors or contractors for complex assets. Judges were not seen by participants in the workshops as generally able to manage seized assets or dispose of them effectively in addition to their other duties.

- Unlike other aspects of the criminal justice system, confiscation can result in revenue for governments; this provides an opportunity for confiscation offices to be self-sustaining.

- Working in co-operation with international partners was seen as a key ingredient of success, especially the early outreach seeking the imposition of provisional measures against assets subject to confiscation. Furthermore, the legal ability to domesticate or enforce foreign confiscation orders was regarded positively by practitioners.

Financial investigation and Asset tracing

As noted above, parallel financial investigations should be a routine part of any investigation into crimes that generate proceeds or where money or assets are being used for criminal or terrorist purposes. If effective action is to be taken against the proceeds of crime, it is critical that investigators can, in a timely way, identify all parties (whether natural or legal persons) involved in or linked to the criminal activity and/ or the criminal, as well as identify all assets (and the persons holding or controlling those assets) which might be subject to confiscation or be an asset that could be used to meet a value-based confiscation judgment. As the practitioners in the workshops emphasised, where possible, as much financial investigation as possible of the criminal should occur before the arrest or before the point in time at which the criminal becomes aware he is being investigated, to include the tracing of assets and liabilities, net worth analysis, and understanding of income and expenditures, as appropriate. This will allow more effective results in terms of freezing/seizing. If there is more than one agency or body involved in the criminal investigation and the confiscation, then this requires a well-coordinated approach. It could also be effective to employ a task-force approach for certain types of investigations

Investigative powers - It is essential that authorities have a full set of investigative powers available to them to investigate the financial activity of criminals.

- At the most basic level, participants in the workshops mentioned this means that law enforcement/prosecutors should have the power issue to production orders or subpoenas (commonly used to require

19. FATF Best Practices Paper Confiscation (Recommendations 4 and 38) and a Framework for Ongoing Work on Asset Recovery.

financial institutions to produce financial records) or to conduct searches that allow documents, assets, or other items to be seized as evidence or even in view of confiscation. Such powers should have a purpose that extends beyond the traditional gathering of evidence for a criminal offence to the tracing and/or analysis of criminal proceeds.

- It is important that these powers, if used at a pre-arrest stage, are linked to provisions that prevent third parties from tipping-off the criminals or the owners of the assets. Experts noted that such authorities would normally be obtainable on relatively lower factual showing or such as "reasonable grounds to suspect".

- Some of the other techniques and powers set out in R.31 such as undercover operations, intercepting communications, and accessing IT systems could also be useful for asset tracing.

- One power that exists in some common law jurisdictions and which was noted as useful in certain cases is a monitoring order power, whereby a court order requires persons (usually financial institutions) to report any transactions with the suspected criminals for a future period. This in effect provides real-time financial intelligence.

- With respect to accessing records, investigative authorities may use judicial processes to request a warrant to compel a search or seizure, or a subpoena to require testimony be given or records produced.

- The attendance of witnesses and the production of records may be required from any place or in any territory or other place subject to the jurisdiction where the investigation is taking place. In some cases, the prosecutor may also apply to a court for the issue of a search warrant to be executed upon a legal person. For example, an agent of the court may "serve" the subpoena upon the recipient (e.g. bank, title company, registered agent, trustee, etc.).

- Standard investigative techniques can also be used to overcome investigative difficulties or impediments to understanding trusts, which may be used to hold or conceal criminal assets. Once the trustee is located, law enforcement may use compulsory measures to obtain records and identify those who exercise control over the trust such as a protector or a person with a general power of appointment. Competent authorities are able to "follow the money" to the non-trustee individual (if any) who ultimately benefits from the trust or similar structure.

- Various tools were cited in the workshops as useful in "following the money," such as using records to trace funds through numerous accounts or institutions, developing informants or key witnesses; executing search warrants to obtain relevant documents including financial records and business records; cross-referencing business or travel records; the power to ask financial institutions to confirm whether they hold an account in a particular name; and utilising special investigative techniques such as electronic surveillance or monitored undercover operations to pierce the veil of legal entities to their true owners.

Timely access to databases and other sources of information regarding assets – it is often essential to obtain information about a criminal's assets very quickly, and an important issue in this regard is the capacity to search against a database(s) for different types of assets to know whether assets that may be subject to confiscation are held by the criminal, an associate or third party. For example all police forces would have access to registers of motor vehicles. There is currently also considerable debate about timely access to beneficial ownership records for legal

persons and arrangements, with an increasing amount of information being held within company registries.

- Many countries have one or more government registries for real property, and some countries maintain a central database of all bank accounts held in that country or have some capacity to query all reporting entities for relationships or transactions with specified individuals or entities [20]. Such databases or any rapidly accessible record keeping system showing assets and owner for important types of assets appears to be a very useful tool for authorities to trace assets in a timely way. However, any such systems should have measures to verify the accuracy and authenticity of the information it holds.

- Direct or indirect access to taxation records it also very important as a way to cross-check what a defendant or associate declared as legitimate income, assets etc. It is important that all databases are searchable in an effective way.

20. In the European Union the Fifth Anti-Money Laundering Directive requires EU members to create a database of all bank accounts held in the country.

Seizing/freezing

Attendees at the workshops noted that it was essential that competent authorities are able to take action to freeze or seize assets that may ultimately be subject to confiscation. Depending on national law or procedure, or the facts of the case, this may entail measures affecting all assets of a defendant (e.g. a global prohibition on dealing with assets owned or controlled by the defendant, even if held by third parties) or only specifically enumerated assets (often those that are directly traceable to crime). Also, depending on the legal system, the power to order restraint or seizure may rest only with a court or judge, or the prosecutor or investigating judge may have certain powers. Important elements in an effective regime include:

- **Ability to take timely action** - As noted, it is important that there is the legal possibility and practical mechanism in place to freeze/seize most or all relevant assets before or at the same time as arrest. In jurisdictions where investigations can be conducted covertly, the seizures might be timed to the moment when the investigation becomes overt. Preferably, freezing and seizing this can occur after assets have been traced and some amount of financial analysis carried out, but this may not always be possible. Participants at the workshops agreed that the ability to act on an ex parte basis, without notice to the suspect, even for just a short period, was helpful to ensure the efficacy of provisional measures so that the suspect did not have a chance to move or dissipate assets. Practitioners agreed that an evidentiary requirement on the government to prove a risk of dissipation before it is possible to obtain an order was burdensome. Such a requirement is often difficult to prove in practice and would negatively impact the ability to freeze assets. With respect to practical mechanisms, action can be taken more swiftly if prosecutors are involved in the case at an early stage and either have appropriate powers themselves or can apply rapidly for a court order. It is also helpful for courts to have procedures permitting emergency or urgent applications.

- **Evidence and burden of proof** – Experts expressed the view that the evidentiary requirements and burden of proof should not be unduly onerous at the freezing/seizing stage of proceedings. Authorities were comfortable with standards such as reasonable grounds to suspect the defendant has assets derived from crime or probable cause to believe that there is property that would be subject to confiscation in the event of a conviction.

- **Third party property** – Frequently, the criminals that commit the predicate offences will seek to launder the proceeds and place the proceeds in the hands of third parties (family, associates, or legal persons or arrangements) that were not directly involved in the crimes. Prosecutors need to be able to trace and have the power to freeze such property, including in cases where equivalent value confiscation that will be sought because the proceeds are unavailable or have been spent. Countries

use different legal powers in this regard, and three mechanisms that were cited were: (a) directly tracing the criminal proceeds through any transactions/ transfers into the property that is to be restrained; (b) producing evidence to show that the third party received a gift of property from the defendant or was not a bona fide purchaser of the asset; and (c) showing that the defendant has effective control of the property even if it is held in the name of a nominee. Of course, the rights of bona fide third parties should be appropriately protected.

- **Extent and nature of the provisional order** – Whichever authority is competent to issue preliminary orders should ensure that property will be preserved and available to satisfy any confiscation order that is subsequently made. Practitioners agreed that the scope of the order should be broad, and, if possible, include income derived from property that can be confiscated and equivalent value or substitute assets. The nature of proceedings giving rise to the order will vary. Depending on the legal system, they could be in rem or in personam, orders could be made against specific assets or all assets of a defendant, and they may have extraterritorial reach. According to the FATF Standards, courts or other authorities should be able to issue provisional measures covering assets located abroad, but of course mutual legal assistance would be required to give effect to the order in the foreign country. Practically, property could be: (a) restrained in place (e.g. a financial institution may be ordered to simply freeze accounts) (b) subjected to conditions (e.g. a prohibition on the sale of real property may be ordered which does not evict occupants before conviction), or (c) seized and taken under the control of a law enforcement, the court, or other authorised body, if there is a concern that the nature of the property might lead to it being dissipated or hidden regardless of the court order, such as with cash, personal property, vessels, vehicles, or other movable assets.

- **Ancillary powers/orders** – Following the legal developments that have occurred around Mareva injunctions in a civil law context, many countries have also provided prosecutors with additional powers that can assist in ensuring that assets are located, effectively frozen and then available to meet any confiscation order. One such power is the possibility for a court to order that a defendant make a sworn declaration about all his assets. If obtained at an early stage of proceedings this can potentially provide useful additional information regarding assets, and place an onus on a defendant to be truthful about all the assets he owns or controls, or run the risk later of being shown to have perjured himself. Another option, available in some jurisdictions is that the government has the power to ask the defendant questions about things such as finances which the defendant is required to answer. Such a power must be carefully used, and should not negatively impact the defendant's basic right to not

be forced to incriminate himself, i.e. the answers could not be forced and also used as evidence of a criminal offence. A third mechanism that is used is for the defendant to agree, or for the court to order, that a defendant repatriate assets that are located in another jurisdiction.

- **FIU power to freeze** – A number of FIUs have the power to temporarily place a hold on (freeze) assets involved in suspicious transactions. Another similar mechanism is a "no consent" order whereby the FIU refuses to consent to a reporting entity's processing of a suspicious transaction. Such administrative holds can be useful to expeditiously prevent monies from being transferred abroad, for example in fraud cases, where it can then be difficult to recover them. Freezes may only be available for certain types of transactions/assets and they are temporary—some lasting a matter of hours or days—but they give the prosecution sufficient time to gather evidence to seek stronger judicial orders.

Confiscation/forfeiture

Consistent with Recommendation 4, and various international Conventions, countries should have a full range of powers to confiscate (a) property laundered; (b) proceeds from, or instrumentalities used or intended for use in ML or predicate offenses; (c) proceeds or instrumentalities linked to TF; and (d) property of corresponding value. These are long-standing norms, and as noted above, most countries have the basic authorities in place in their laws. Surprisingly, quite a number of countries do not have adequate powers to ensure confiscation of equivalent value. Experts noted that it is important that the defendant is not incentivised to benefit from his criminality by spending proceeds first while retaining other property that was legally acquired.

Evidence and standard of proof - The nature of the evidentiary requirements and the burden of proof varies according to the type of confiscation (criminal, civil, administrative) and the jurisdiction and its legal system. The issue is not one that is discussed in many MERs, but is important in terms of the ultimate effectiveness of the regime.

- In all jurisdictions, there are laws allowing confiscation of proceeds and instrumentalities post-conviction, in particular for the offences of conviction. This is often viewed as part of the criminal sentence, and the procedural rules that apply for that purpose will also apply to confiscation; however, some jurisdictions apply a lesser standard of proof than the normal criminal standard (beyond reasonable doubt) to confiscation.

- Experts surmised that it could be effective if the burden were the normal civil standard of balance of probabilities or something similar.

- One issue where broader sentencing considerations are relevant relates to confiscation of instrumentalities, and the need to ensure that the nature and value of the property being confiscated is somehow proportionate to the scale of the criminality involved.

- Workshop attendees also considered the issue of how the court will take into account the proceeds gained in circumstances where the prosecution does not include all possible charges, but a representative set, such as when additional offences are believed to have been committed, but it would not be cost-efficient to proceed with all charges. The benefits from this unindicted conduct might also be taken into account for confiscation purposes.

Non-conviction based (NCB) confiscation – An increasing number of countries have adopted NCB confiscation regimes in addition to their conviction-based laws. In such proceedings—which are sometimes also referred to as civil confiscation, civil forfeiture, or extinction of dominion—assets can be declared forfeited to the state without the condition precedent that the defendant has been convicted of a crime. The nature of the proceedings is in rem (against the asset itself rather than against a person).

- Some participants described situations where NCB is available in limited circumstances, such as when the accused has died or absconded, while other workshop participants discussed fuller NCB regimes in which the state proceeds on the legal fiction that the property is "standing in" for the defendant and is forfeitable due to its involvement in crime is separate from any criminal proceeding and the standard of proof is usually the same as or similar to the civil standard (e.g. the state must show by a preponderance of the evidence or on balance of probabilities that the property constitutes the proceeds or an instrumentality of crime).

- In some jurisdictions, Ireland, for example, NCB is the main mechanism used to confiscate criminal proceeds and

instrumentalities and is integrally linked to efforts to combat serious organised crime. Experts noted that the civil confiscation can backstop a criminal prosecution, or even succeed in the event of acquittal.

- A variation on NCB that is used in some jurisdictions is administrative confiscation/ forfeiture or abandonment. This is usually conducted by LEAs and authorised only for certain types of assets, e.g. assets under a certain value or amount or cash that is seized at the border. Assets can be forfeited by administrative notice if uncontested or can be heard in civil proceedings, if contested. The standard of proof in such cases is also lower.

Unexplained wealth orders, unjust enrichment offenses, and burden-shifting provisions – Many countries have introduced additional powers, in both criminal and civil proceedings, that require the government to produce sufficient evidence that a person has assets that cannot be explained by his known legitimate income or legitimately acquired assets, and then place the burden on the defendant to show otherwise.

- Thus, for serious offences such as drug trafficking, where the convicted person does not have known legitimate income to explain his wealth, the prosecution present evidence of net worth or similar accounting evidence.

- There are also certain presumptions that may be triggered by the defendant's "criminal lifestyle" or lack of legitimate income over a period of time where he committed multiple offences. Similarly, unexplained wealth orders, originally conceived as useful in combatting corruption, are being used more broadly to attack criminal assets in civil proceedings. Practitioners at the workshops expressed a desire to learn more about these tools.

Other remedies, including tax and civil restitution – Countries are also adapting their responses to profit-generating crime by looking to use the broadest possible range of powers. Increasingly, using tax collections, penalties, and assessments to recover assets is seen as an avenue of last resort. Tax recovery can be an option when prosecutors lack the evidence to show that the property is criminal proceeds that would meet a civil or criminal burden of proof, but they do have evidence that the defendant has engaged in tax evasion or fraud. While it is preferable to be able to obtain a criminal conviction and also deprive the person of their proceeds, having an option to impose a tax assessment, combined with penalties and interest, can have a similar punitive impact on the defendant in terms of the amount he must disgorge. Proving that assets came from legitimate income may be a much more difficult task for the defendant.

Also, many experts cited restitution as a worthy objective which can, depending on the legal system, be a complimentary power to and work in tandem with confiscation. Many financial crimes have victims, and persons that have been defrauded should receive full restitution, if at all possible. Experts discussed how their legal traditions encompass both restitution and confiscations; depending on the circumstances, it may even be possible to provisionally restrain assets and confiscate them, at which point the state can use the resulting funds to satisfy a restitution order. Some experts said that a combination of confiscation proceedings combined with a civil claim by the victim may accomplish the dual objective of depriving criminals of proceeds while also ensuring victims receive compensation. However, other jurisdictions noted that communication with potential victims is key, as legal claims filed by victims can slow or complicate confiscation where the prosecution intends to ultimately distribute money to victims who can demonstrate their pecuniary losses.

Asset management and recovery

Assessments to date demonstrate that many countries have inadequate legal powers, and lack the institutional frameworks and skill sets needed to effectively manage and/or realise assets that are frozen, seized, or confiscated.

The objective and intention in both Recommendations 4 and 38 is that counties should have mechanisms for managing and disposing of assets domestically and when the confiscation is co-ordinated with another jurisdiction. Assets, depending on the type, require preservation and safeguarding; some require active management; yet others should be sold on an interlocutory basis to maximise the value that can be obtained (or make sure that the defendant's value is maintained if he prevails and the property is not confiscated). Best practices in this area were identified as having dedicated agencies for asset management or else persons who can be charged with such tasks as part of their official duties. Some experts mentioned that they have found it effective to outsource this work to contractors or vendors through government contracting mechanisms, especially when specific expertise is necessary (e.g. to run an ongoing business operation or manage tenants, etc.).

Additionally, in many countries, the value of property realised to satisfy confiscation orders is often considerably less than the value of the property ordered confiscated, or the property has depreciated considerably in value since it was first seized due to lack of maintenance. The issue of asset management and recovery has been looked at previously by FATF and other organisations/bodies, and good practices are detailed, as in the FATF Best Practices on Confiscation (Recommendations 4 and 38) and a Framework for On-going Work on Asset Recovery (2012), or the study by the UNODC Open-ended Intergovernmental Working Group on Asset Recovery (2017)[21].

21. https://www.unodc.org/documents/treaties/UNCAC/WorkingGroups/workinggroup2/2017-August-24-25/V1705952e.pdf

Institutional mechanisms – It is important that there is an effective and cost-efficient mechanism to manage assets and that there are professionals who can appraise and sell assets in a way that maximises the return to the state. In considering which mechanism could be most appropriate, there are numerous considerations such as the likely value and type of assets at issue, whether there are existing bodies that carry out similar functions, cost efficiency of a model, and the need for adequate transparency and accountability. Many different approaches exist, for example:

- In some countries there is no specialised agency or body that has this function, and it is left to general law enforcement or individual judges to manage seized assets, with court services being left responsible for realisation or recovery of assets. Neither entity is usually well equipped with the necessary powers and skills to handle this role for anything other than the most straightforward case.

- Another option which is used is that the Asset Recovery Office in a jurisdiction is not only responsible for asset tracing but also asset management, sometimes with support of other government agencies, as in Belgium and the Netherlands. There are also specialised law enforcement agencies responsible for managing and selling seized assets such as the U.S. Marshals Service, which also handles assets seized by other LEAs.

- There are free-standing government agencies that either solely manage seized/confiscated assets or do that along with other asset management functions.

- Receivers, trustees, or asset managers may be appointed by the court, such as private sector accountants or specialists in bankruptcy or liquidation; some experts cautioned that, fees and charges can sometimes raise issues.

- Additionally, specialised private sector firms have entered the market which can offer asset management and auctioneering services. Some have a particular focus on asset recovery, and many work on a commission basis.

Ultimately, the model or mechanism that is chosen should be cost-effective, with the maximum possible amount being paid into central revenue or specialised asset forfeiture funds, after costs for management and realisation are met. Whether confiscated funds enter the general treasury, budgetary process, or a special fund, practitioners noted at the workshop that it is advisable to use confiscated assets in a responsible, transparent, and accountable way, such as to finance crime-fighting efforts and initiatives or on projects which benefit the general public. Participants recounted the unique and lawful uses for confiscated assets in their jurisdictions and some explained the benefits of having a fund subject to auditing and other controls. Asset sharing with countries whose assistance has made the confiscation or return of assets possible should also be considered where appropriate and is encouraged by the FATF Standards.

International cooperation:
mutual legal assistance, extradition and other cooperation

Appendix H

FATF/MENAFATF/GIABA/GABAC/ESAAMLG Workshop for Judges and Prosecutors
February 2018, Tunis, Tunisia

International co-operation can be critical for the success of ML/TF investigations and prosecutions and also for asset recovery. ML and TF networks are often spread over multiple countries, and foreign jurisdictions may have the missing pieces of information or evidence which facilitate a successful prosecution. Where there are financial or other records located abroad, foreign witnesses whose testimony is critical, or suspects present in another jurisdiction, timely co-operation can be outcome determinative.

The FATF Standards deal with international co-operation in a holistic manner. As a baseline for co-operation, countries should become a party to and fully implement four important multilateral instruments[22]. Countries should also be able to execute extradition requests in relation to ML and TF[23], have mechanisms in place for the rapid provision of a wide range of mutual legal assistance for ML/TF and associated predicate offences investigations, prosecutions and related proceedings; and be able to take expeditious action in response to requests for freezing and confiscation[24]. Finally, Recommendation 40 states that countries should ensure that their competent authorities (to include FIUs and financial supervisors, and LEAs) can rapidly, constructively and effectively provide the widest range of international co-operation and exchange information in relation to ML associated predicate offences and terrorist financing.

22 See Recommendation 36. From an AML/CFT perspective, the most important international agreements are the Vienna Convention (1988), Palermo Convention (2000), Merida Convention (2003), and the TF Convention (1999).

23. See Recommendation 39.

24. See Recommendations 37 and 38.

Other forms of co-operation and information exchange

During the workshops, practitioners emphasised the need for international co-operation that is less formalistic. This may be conducted at an investigator-to-investigator level, among counterpart agencies, or even between agencies that are not direct counterparts (i.e. diagonally). Such informal co-operation—outside of MLA or diplomatic channels—was widely promoted as a beneficial first step to pursue international co-operation. Considering that formal mutual legal assistance is considered to be a slow and resource-intensive mechanism, it was agreed that this could be done more effectively having preliminary direct contacts between counterpart law enforcement agencies and financial intelligence units or from liaison magistrates or law enforcement/judicial attachés posted locally or regionally (agency-to-agency assistance).

As mentioned in the FATF operational guidance for financial investigations, such assistance could lead investigators into a rapid identification of evidence and assets, confirm the assistance needed and even more importantly provide the proper foundation for a formal MLA request (government-to-government assistance). Such contacts also offer an opportunity to learn about the procedures and systems of the foreign jurisdiction and to assess various options for conducting investigations, prosecutions and confiscation.

Workshop attendees also stressed the importance of forming personal connections with foreign colleagues and having close contact through different networks, such as those provided by Interpol or Europol or utilising the contact points of the Camden Asset Recovery Interagency Network (CARIN) and the other regional ARINs.

Finally, the FATF's financial investigations guidance highlighted that it is essential for financial investigators to discuss issues and strategy with foreign counterparts, and this should involve consideration of conducting a joint investigative team or providing information to foreign authorities so that they can conduct a parallel investigation.

Mutual legal assistance

Mutual legal assistance is one of the most decisive weapons states have to fight serious international crime. The need for a mutual legal assistance requests may arise quickly, but they need to be drafted in such a way that complies with treaty requirements and makes it easier for the requested state to comply with the request. Challenges to executing requests can arise when criminal justice practitioners from different legal systems attempt to work together.

Practitioners noted that central authorities should be proactive, communicative, and arrange for direct consultation between operational authorities if required. Countries noted that they had better results seeking co-operation when they shared draft requests before sending final versions, actively followed up on requests, answered questions from the requested state, and engaged in a dialogue instead of blindly mailing documents back and forth. Participants noted that the system of treaty-based assistance can be speeded up using technological aids, such as video-teleconferencing and emailing advanced copies of MLA requests.

There are, however, some particular challenges related to international co-operation. A jurisdiction may choose not to seek formal co-operation such as mutual legal assistance (MLA) where they consider it is unlikely to receive a response. Some obstacles to co-operation included a lack of bilateral or multilateral treaty basis, not having the knowledge or guidance to draft a quality, actionable request, or having very rigid standards for seeking international co-operation. Finally, during the workshops, one major challenge to effective international co-operation was the lack of a clear political commitment to co-operate, especially when one country's nationals are being investigated in another country.

International co-operation in a TF case may also be difficult where one of the cooperating jurisdictions may be seeking capital punishment in the case. There have also been issues with dual

criminality, especially in situations where the funding an individual terrorist is not adequately criminalised.

As detailed, good practices in this area include:

- Considering informal methods of international co-operation such as FIU-FIU, police-police or prosecutor-prosecutor co-operation before submitting a formal MLA request.
- Prioritising MLA requests that have a ML or a TF element or seek urgent action to seize assets.
- Providing assurances about the penalties that are being sought by the prosecution in certain cases to facilitate extradition (e.g., assurances that the death penalty will not be sought in a terrorism-related prosecution).
- Using networks as such as EUROJUST or CARIN and ARINs prior to making a formal request to facilitate international co-operation and target the assistance that will be sought.
- Making contact with overseas authorities and arrange to send a draft copy of a proposed MLA request, so that they can advise on the content and wording of the request.
- Demand to keep the fact or the contents of a MLA request remain confidential.
- If countries utilised central authorities, the secondment of confiscation, ML, and/or TF specialists to such a central authority was seen as advantageous.
- Using regional tools such as European Investigation Orders and Council of Europe Convention no. 198 ("Warsaw Convention").
- Building trust and informal connections between jurisdictions to facilitate MLA and more informal channels of international co-operation and information exchange.
- Using the Mutual Legal Assistance Request Writer Tool (MLA Tool) that has been developed by UNODC to assist states to draft requests with a view to facilitate and strengthen international co-operation.

FATF/APG/EAG Workshop for Judges and Prosecutors
January 2018, Shenzhen, China

Potential next steps

The criminal justice system is a crucial component of effective anti-money laundering and countering terrorist financing systems (AML/CFT), and FATF places considerable importance on countries ensuring that criminals and terrorists are convicted and given dissuasive sentences, and deprived of their proceeds.

The findings from the process initiated by FATF President Santiago Otamendi to thoroughly examine the experiences, challenges and best practices in investigating and prosecuting money laundering (ML) and terrorist financing (TF), and in confiscating assets linked to criminal activity are laid out in this President's paper. The findings are laid out in detail above, with key points mentioned in the Executive Summary, and draw on both the experiences of national experts, but also on the review of mutual evaluation reports and other research.

The exercise has reinforced the FATF's focus on achieving effective results as regards the investigation and prosecution of ML and TF offences and on the recovery of the proceeds of crime.

The FATF programme of several regional workshops, carried out jointly with the FSRBs and other international organisations, has brought together almost 450 judges and prosecutors from more than 150 jurisdictions to share their experiences and best practices. This by itself has already provided real benefits with strengthened contacts and informal networking by the judges and prosecutors attending.

The FATF can follow up in a range of ways on the strong progress made under this Presidency initiative:

- **Dissemination**
  The paper will be broadly disseminated, not only through the FATF and FSRB delegations, but also to other relevant international organizations such as the Organization for Security and Co-operation in Europe, the World Bank, the International Monetary Fund, the International Prosecutors Association, the International Magistrates Association and various Asset Recovery Networks, among others.

- **Training needs**
  The FATF may consider how further training and capacity building for investigators, prosecutors, and judges on ML/TF investigation and prosecution and asset confiscation can be provided. This could also involve increased action to effectively coordinate the efforts of countries and other donors and match the technical assistance provided with the specific needs observed.

- **Networks for judges, prosecutors and investigators**
  The value of international cooperation networks were highlighted during the regional workshops. Workshop participants considered that a network for judges and prosecutors focusing on ML/TF cases and asset confiscation would be very useful, and FATF may consider how to better ensure that adequate channels promoting informal information sharing are put in place.

- **Enhanced participation and collaboration**
  The expert input of judges, prosecutors, and investigators is vital to ensuring a good understanding of ML/TF risks and threats, and to the development of standards, policies, and new tools to effectively investigate and prosecute ML and TF. Strengthening this input will also provide an opportunity to have better informed policy decision making. FATF already works closely with many international partners, and will work to strengthen even further its engagement with relevant bodies and networks such as CARIN and the ARINs, EUROJUST, the International Association of Prosecutors, and the International Association of Magistrates.

- **Further products**
  FATF can also consider how it can work with partner organisations to create further products that will also be useful for practitioners. Workshop participants already identified potential value from products such as handbooks, checklists, investigative guides, and a model MLA request database.

The work undertaken over the year has reinvigorated and refocussed FATF's attention on the criminal justice system, which is a fundamental underpinning to all national and international efforts to combat money laundering and terrorist financing. Based on these findings, the US Presidency of FATF will continue this joint effort to enhance the effectiveness of the Criminal Justice System.

FATF GUIDANCE

PRIVATE SECTOR INFORMATION SHARING

NOVEMBER 2017

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

CONTENTS

INTRODUCTION

BACKGROUND AND CONTEXT

1. Effective information sharing is one of the cornerstones of a well-functioning AML/CFT framework. Constructive and timely exchange of information is a key requirement of the FATF standards and cuts across a number of Recommendations and Immediate Outcomes. Financial institutions should not be unduly prevented from sharing information for the purpose of ML/TF risk management.

2. Information sharing for AML/CFT purposes in financial institutions such as banks can occur at different levels within the same group. Other financial institutions such as money and value transfer service providers (which operate mostly through agents or other distribution channels) may have different business models and structures. The underlying objective of effective information sharing applies to all such financial institutions operating through various structures.

3. Information sharing also takes place between different entities and sectors for example between financial institutions not part of the same group and public sectors, and vice versa. Such information flow can take place within the domestic context or it can be across borders. Public-to-public sharing of information is equally critical and is an important element for the effectiveness of the domestic co-ordination and co-operation regime.

4. Information sharing is critical for combatting money laundering, terrorist financing and financing of proliferation. Multinational money laundering schemes do not respect national boundaries. Barriers to information sharing may negatively impact the effectiveness of AML/CFT efforts and conversely, inadvertently facilitate operations of such criminal networks. This underscores the importance of having rapid, meaningful and comprehensive sharing of information from a wide variety of sources, across the national and global scale.

5. Sharing information is key to promoting financial transparency and protecting the integrity of the financial system by providing financial institutions, and relevant competent authorities the intelligence, analysis and data necessary to prevent and combat ML/TF. Similarly, financial institutions look to the public sector to share information on trend analysis, patterns of behaviour, targeted suspects or geographical vulnerabilities in order to better manage their risk exposure, monitor their transaction flows and provide a more useful input to law enforcement. Public and private sector institutions can be source as well as target of information flow. The use of data in this manner highlights the importance of a continuous dialogue between the public and private sectors. The reliance on shared information also underlines the increased focus of international efforts towards identifying potential barriers to information sharing which might impinge on the effectiveness of the system and exploring possible policy and operational solutions to overcome them.

6. In June 2016, FATF issued Consolidated Standards on Information sharing[1] containing relevant excerpts from the FATF Recommendations and Interpretive Notes which relate to information sharing. The consolidation of existing Standards without any amendments was done in order to add value and to help to clarify the requirements with respect to information sharing, which are spread across 25 of the FATF Recommendations, and which impact 7 Immediate Outcomes in the FATF Methodology for assessing effectiveness. These are a starting point for the issues considered in this paper.

[1] Consolidated FATF Standards on Information Sharing.

PURPOSE OF THIS GUIDANCE, TARGET AUDIENCE, CONTENT AND THE STATUS OF THIS GUIDANCE

7. The purpose of this Guidance is to:

i. Highlight the usefulness of information sharing among entities of the private sector (particularly financial institutions) to increase the effectiveness of their ML/TF prevention efforts.

ii. Identify key challenges that inhibit sharing of information group-wide and between financial institutions not part of the same group;

iii. Clarify the FATF Standards on information sharing regarding: a) group-wide AML/CFT programmes and within its context, sharing of information on suspicious transactions within the group, and how STR confidentiality and tipping-off provisions interact with such sharing; and b) between financial institutions not part of the same group;

iv. Highlight country examples of collaboration between data protection and privacy and AML/CFT authorities to serve mutually inclusive objectives;

v. Provide country examples to facilitate sharing of information within group, between financial institutions not part of the same group; and of constructive engagement between the public and the private sectors;

vi. Support the effective implementation of the AML/CFT regime, through sharing of information, both in the national and international context.

8. The target audiences of this Guidance are:

i. Countries and their national competent authorities with responsibility for AML/CFT;

ii. Practitioners in the private sector, including financial institutions that have group-wide AML/CFT programme obligations to fulfil or that process customer transactions with other institutions; and

iii. National and supra-national data protection and privacy (DPP) authorities.

9. The paper sets out the challenges to information sharing and provides guidance both in the context of group wide and between financial institutions not part of the same group. Annex-1 articulates how differences in DPP regimes or their application can affect the information flow. Annex-2 includes country examples and approaches on addressing some of these challenges, including of national DPP and AML authorities working together to meet their respective objective. It also sets out innovative practices adopted by countries to promote group-wide information sharing and between financial institutions which are not part of the same group. The section further contains examples of established mechanisms and processes to ensure guidance and feedback for the private sector, which helps facilitate better information sharing among all stakeholders. It should be noted that these examples are presented for information only. These examples are illustrative in nature and not to be construed as FATF recommended approaches. These examples are also cross-referred with respective sections of the guidance. When considering the general principles outlined in the Guidance, national authorities will have to take into consideration their national context, including the legal framework. This Guidance is non-binding and it draws on the experiences of countries and of the private sector and may assist competent authorities and financial institutions to effectively implement some of the Recommendations.

GENERAL INFORMATION SHARING ISSUES

10. Information sharing plays a vital role in allowing financial institutions and supervisory and law enforcement authorities to better deploy resources on a risk based approach, and develop innovative techniques to combat ML/TF. The size and geographical scope of the international financial system makes it imperative to improve coordination and collaboration between all the stakeholders if the measures to identify and prevent ML/TF are to succeed. Enabling greater information sharing is a key element of collaboration whether it involves sharing across borders, between entities of the same financial group, between different financial groups or between private and public sector or vice versa.

11. Improvements in information sharing are also critical to enabling the full exploitation of the potential improvements to AML/CFT safeguards, and access to financial services, promised by new technologies and evolving business models. However, there remain obstacles to effective information sharing which can obstruct this progress and create legal and regulatory uncertainty. Challenges which have been identified are discussed below:

A. Legal Issues

12. Legal constraints may inhibit availability, access, sharing and processing of information for AML/CFT purposes. This may be on account of different policy objectives, customer confidentiality concerns and record retention requirements. In some instances, regulated entities are uncertain as to the sharing permitted under these legal regimes, and this clear lack of understanding inhibits effective information sharing. Countries should therefore overcome the challenges and implement an effective information sharing regime concerning application of different legal provisions in this context by providing appropriate clarifying guidance of their laws and regulations to eliminate ambiguity regarding sharing.

13. In particular, these challenges may emerge due to following concerns:

i. Different legal frameworks of Data Protection and Privacy (DPP) and their implementation

14. AML/CFT laws and regulations of a jurisdiction are designed to prevent, detect, disrupt, investigate and prosecute ML/TF. Individuals have the right to privacy and to protect their personal data[2]. This is a fundamental right in many jurisdictions. This right represents an important policy objective in accordance with the fundamental principles of domestic law. AML/CFT goals also serve significant national security and public interest objectives and should be pursued vigorously, in a way that is balances an individual's rights to protection of personal data and privacy. AML/CFT and DPP public policy goals are not mutually exclusive and should recognise support and be balanced.

15. Differences in DPP laws across jurisdictions may create implementation challenges, particularly for the private sector in sharing information. The issue may be further compounded if there is a lack of regulatory guidance, or an inconsistent approach towards AML/CFT requirements and DPP obligations. The perceived conflict between AML/CFT and DPP objectives may be due to lack of adequate coordination between different authorities at the rule making stage, leading to lack

[2] Personal data could mean any information relating to a natural person who can be identified, directly or indirectly, by reference to an identifier such as a name, an identification number, location data, an online identifier or to one or more factors specific to the physical, physiological, genetic, mental, economic, cultural or social identity of that natural person.

of the proper balance between data protection on one hand and prevention or combating of crimes on the other hand. The apparent complexity of different DPP approaches and the fear of penalties and risk avoidance have a significant impact on availability, access, processing or sharing of information by the private sector, even when such sharing is permitted.

16. While there are some situations where DP authorities try to provide support to public authorities and private stakeholders, there are many cases where, more clarity from national regulators and public authorities on how to effectively manage differing regulatory requirements may be helpful in this regard. For example, global financial institutions operating in multiple jurisdictions would benefit from data protection authorities issuing clarifying interpretation and guidance on the extent to which sharing personal data across borders for AML/CFT purposes is permissible under the public interest or other derogation(s) contained in different data protection regulations on data transfers (*e.g.* the extent to which transfers of data made for the purpose of complying with AML/CFT is permissible).

17. Countries should examine and if needed, amend and/or clarify the national legislations in order to ensure the proper balance. A dialogue between national authorities responsible for data protection and privacy and AML/CFT is useful, to adopt compatible and coherent policies such that financial institutions are able to meet legal requirements. National authorities could also consider developing and sharing, where necessary, an analysis of national laws and regulations to support effective information sharing (Paragraphs 3-7 of Annex-2).

ii. Financial institution secrecy provisions

18. Financial institution secrecy laws can inhibit information sharing. For example, financial institution secrecy can sometimes not be invalidated by "legitimate interest" or security concerns, depending on national legislation. In this respect, it should be noted that under Recommendation 9, countries are required to ensure that financial institution secrecy laws do not inhibit implementation of the FATF Recommendations.

B. Operational Challenges

19. Operational challenges may occur at an institutional and/or national level. IT capability of the financial institutions and their record-maintenance procedures may hinder effective sharing of information in a timely manner. For example, some customer information that might be useful for CDD purposes may not be integrated into financial institutions' AML/CFT systems because it was collected for a different purpose. Outsourcing rules which place a restriction on how much work can be centralised offshore and conversely data or onshoring rules which mandate that data, IT system and operational process remain onshore can create limitations leading to operational complexity and process fragmentation.

20. Inadequate IT tools, different data formats, lack of policies and procedures on how to deal with the information available and a general lack of appreciation of the value of information available both on the part of the public and private sector may act as barriers to information sharing, even when it is available. Issues of IT capability and IT integration may also arise when financial institutions grow a global footprint through acquisition, necessitating the integration of different IT systems into those of the acquiring institutions.

21. In certain cases, information exchange between the public and private sector as well as among private entities relies on predefined templates that allow for automatic analysis and

aggregation of information. These templates should be flexible enough to take into account other relevant information (such as IP addresses, phone numbers, usernames, job title and organisation etc.) that is available to financial institutions. Standardisation of data formats may also promote data sharing by enabling integration.

C. Challenges for Supervisors

22. From the perspective of supervisors, lack of information sharing may inhibit implementation of consolidated supervision for AML/CFT purposes (e.g., as required under Recommendation 26). For example, in case of financial institutions operating through a network of branches/subsidiaries in a number of countries, host country laws (applicable to such branches/subsidiaries) may not permit the home supervisor of the parent bank to have access to, and examine all the customer's information maintained by such branch/subsidiary. This may necessitate separate arrangements between the home and host supervisor whereby the home supervisors examine such customer files on behalf of the parent (home) supervisor. This may hinder the timely and comprehensive review of records and also adversely impact the effective application of the consolidated group supervision for AML/CFT purposes.[3]

23. Supervisors should thus promote bilateral or multilateral agreements that efficiently support information sharing for AML/CFT purposes, specifying the information to be exchanged when exercising consolidated or group-wide supervision, along with the definition of timelines for the provision of that information. While these arrangements cannot overcome legal impediments that hinder information sharing, in case the consolidated supervision of the group is hindered due to any reasons (including lack of access to relevant information), or if the group is exposed to excessive risks that are not properly managed, home supervisor may limit the range of activities that the group may conduct and subject it to escalating supervisory measures, including directing the financial group to close the foreign offices in extreme cases.

[3] Essential Criteria 8 of the BCBS Core Principle 13 (home-host relationships) requires that the home supervisor is given on-site access to local offices and subsidiaries of a banking group in order to facilitate their assessment of the group's safety and soundness and compliance with customer due diligence requirements.

INFORMATION SHARING UNDER FATF RECOMMENDATIONS

24. This section sets out key FATF Recommendations (R.18, R.20 and R.21) and their expectations in the context of information sharing within financial group. The section also covers information sharing between financial institutions not belonging to the same group, as provided under FATF Recommendations.

A. Information sharing within financial groups

Recommendation 18- Internal controls and foreign branches and subsidiaries

Financial institutions should be required to implement programmes against money laundering and terrorist financing. Financial groups should be required to implement group-wide programmes against money laundering and terrorist financing, including policies and procedures for sharing information within the group for AML/CFT purposes.

Financial institutions should be required to ensure that their foreign branches and majority-owned subsidiaries apply AML/CFT measures consistent with the home country requirements implementing the FATF Recommendations through the financial groups' programmes against money laundering and terrorist financing.

i. Meaning of 'financial group' or 'group-wide' in the context of information sharing

25. A financial group's programmes against ML/TF should be applicable to all branches and majority owned subsidiaries of the financial group.[4] These programmes should include policies and procedures for sharing information required for the purposes of CDD and ML/TF risk management. Group-level compliance, audit, AML/CFT and other functions with a role in oversight/management of group-level ML/TF risks should also be provided with customer, account and transaction information from branches and subsidiaries when necessary for AML/CFT purposes.[5] This should be subject to safeguards sufficient to ensure confidentiality of information and its use for the intended purposes only.

26. The term "Group wide" (or "enterprise-wide") used in the context of AML/CFT Programme requirements for the financial group under FATF Recommendation 18 includes all the entities (in domestic and cross border environments) comprised by the definition of financial group laid down in the FATF Glossary. This is in line with the principle that a financial group as a whole may be exposed to ML/TF risk due to activities of its group entities, which are covered under FATF Recommendations, and hence such risk should be identified, managed and mitigated at the group level.

27. As per the FATF Glossary, "Financial Group means a group that consists of a parent company or of any other type of legal person exercising control and coordinating functions over the rest of the group for the application of group supervision under the Core Principles, together with branches and/or subsidiaries that are subject to AML/CFT policies and procedures at the group level."

[4] Interpretive Note to Recommendation 18, paragraph 4.
[5] Interpretive Note to Recommendation 18, paragraph 4.

ii. Information required to be shared for group-wide programmes

28. Information sharing in the financial group is meant to effectively identify, manage and mitigate ML/TF risks by the group. This should include information and analysis of transactions or activities which appear unusual (if such analysis was done); and could include an STR, its underlying information, or the fact that an STR has been submitted. Countries may determine the scope and extent of this information sharing, based on the sensitivity of the information, and its relevance to AML/CFT risk management (see paragraphs 50-54 below for further details). This should be in accordance with the legislative framework (both of home and host countries), determining the scope, extent and mechanism of such information sharing.

29. The table below explains the broad AML/CFT purposes that such sharing seeks to achieve. This is to reinforce the point that sharing of information for group compliance is meant to ensure comprehensive and effective ML/TF risk management and compliance. All the information as indicated in the below table may not be available, collected or needed in each and every case. This would depend upon the products and services being provided to the customers, geographical location, the existing legal framework as well as risk and context. Nevertheless, intra group information sharing may lead to an effective group-wide compliance programme.

Table 1. **AML/CFT Purposes for Information Sharing**

Types of Information	Examples of information elements (as available, when necessary)	AML/CFT purposes for sharing information within the group
Customer Information	Customer identification and contact information (name and identifier), in case of legal persons and arrangements: information on nature of its business and its ownership and control structure; legal form and proof of existence; address of registered office and principal place of business; Legal Entity Identifier (LEI) information, financial assets records, tax records, real estate holdings, information on source of funds and wealth, economic/professional activity, and account files, whether the customer is a PEP (including close associates or family members) or not and other relevant elements from documents collected while on-boarding the customer or updating records, targeted financial sanction information and any other information, whether identified from public sources or through internal investigation relating to ML/TF, risk categorisation of customer etc.	Manage customer and geographical risks, identify global risk exposure as a result of on-boarding of the same customer by multiple entities within the group, more efficient record-keeping of customer information.
Beneficial Owner Information	Beneficial owner identification and contact information, real estate holdings, information on source of funds and wealth, economic/professional activity, and account files, whether the beneficial owner is a PEP or not and other relevant elements from documents collected while on-boarding a customer or updating records.	Manage beneficial owner and geographical risks, identify the same beneficial owner for multiple entities within the group, more efficient record-keeping of beneficial owner information.

Types of Information	Examples of information elements (as available, when necessary)	AML/CFT purposes for sharing information within the group
Account Information	Bank/other account details, including the intended purpose of the account, expected location of transactions/activity as expressed by the customer and business correspondence etc.	Effective due diligence and transaction monitoring at group level, justification of transaction pattern vis à vis financial profile, follow-up on any alerts or abnormal trading pattern across the group.
Transaction Information	Transaction records, credit and debit card records and usage, past credit history, digital footprints (IP address, ATM usage information etc.), attempted/failed transaction information, currency transaction reports, information on closure of account or termination of business relationship due to suspicion, analysis made to detect unusual or suspicious transactions etc.	Global transaction monitoring, alert processing and identifying suspicious transactions, flagging and checking the existence of similar behaviour across business lines within the group.

iii. Importance of sharing of information for group-wide programmes

30. In the broader context, sharing of information for group-wide compliance is important for effective identification, mitigation and management of ML/TF risk by the financial group. It will also allow the group to exercise better internal controls and improve the quality of decision-making on due diligence, transaction monitoring and suspicious transaction reporting. The sharing of information by group entities, including subsidiaries and branches with the head office allows the group compliance to put in place comprehensive risk management processes. Consolidated screening and monitoring of customers and transactions to identify potential breaches of targeted financial sanctions also depends on the availability of information about listed entities and customer's activities with different entities of a group.

31. The BCBS's 2017 Guidelines[6] on *"Sound management of risk related to money laundering and financing of terrorism"* also provides comprehensive guidance to banks on the effective management of ML/TF risk in a group-wide and cross-border context. It explains the rationale behind and principles of consolidated risk management; how group-wide AML/CFT policies and procedures should be consistently applied across the group, and, where reflecting local business considerations and the requirements of the host jurisdiction, should still be consistent with and supportive of the broader policies and procedures of the group; and how banks should address differences in home/host requirements. It also provides detail on how banks that are part of a group should share information with members of the same group with a view to informing and

[6] See BCBS Guidelines on Sound Management of Risks Related to Money Laundering and financing of Terrorism.

strengthening group-wide risk assessment and the implementation of effective group-wide AML/CFT policies and procedures.[7]

32. The following are the main outcomes expected of information sharing for group-wide programmes:

a) Global risk assessment

33. For an effective group-wide compliance programme, financial institutions should understand the ML/TF risks they are exposed to on a global basis. Such risks may be due to customers, products, geographical profile of their operations, transaction pattern or other factors from each entity belonging to the same group. A comprehensive understanding and identification of these risks will allow the financial institutions to better structure its risk profile and take commensurate measures. Information from branches, subsidiaries and other parts of its business should feed into overall risk assessment. It will help identify and determine the nature and level of ML/TF risk of each entity belonging to the group and the level of ML/TF risk of the group on a global basis, particularly where the shared information relates to cross border relationships. Thus, it is important that the group compliance is able to obtain and has access to such information, including from its overseas operations, where required. For example, if Bank A, located in Country X, identifies a money launderer and closes his accounts, but that same money launderer has an account with Bank A's subsidiary in Country Y, that subsidiary will continue to provide banking services to the money launderer as it will be unaware of the activity and bank actions in Country X. Financial institutions should also, when assessing the ML/TF risks they are exposed to on a global basis, take into consideration the barriers to required information sharing, which may inhibit effective implementation of FATF Recommendations, as an autonomous risk and consider mitigation measures accordingly.

34. Sharing of information with group compliance (i.e. at a head office level) does not assume that the ML/TF risks should be assessed only by the group compliance for the whole group in all the locations where it operates. Each operation in a given location should be responsible in its own right for assessing its ML/TF risk and should have information relevant for its own risk assessment. For this purpose a local operation of a multi-national group in a given jurisdiction would equally require access to information from group compliance or from other parts of the group that is relevant to its own risk assessment. A multi-national group should, therefore include in its risk assessment and management framework a mechanism to determine when its local operations are required to assess multi-jurisdictional risk in relation to a customer relationship and when it would be justified, or indeed required, to share customer or transaction information across more than one geographic location.

35. Furthermore, centralised storage of records should not be equated with group-wide sharing of the information contained in records. Access to electronically/centrally stored records should be managed in accordance with confidentiality and other obligations. Global transaction monitoring must always be done in a manner that enhances compliance with risk management and reporting obligations in all the locations where a multi-national group operates. Thus, monitoring in one location should not weaken compliance with these obligations in other locations where the group operates. Consideration should be given to local legal constraints on access to confidential

[7] "Regardless of its location, each office should establish and maintain effective monitoring policies and procedures that are appropriate to the risks present in the jurisdiction and in the bank. This local monitoring should be complemented by a robust process of information sharing with the head office." (Paragraph 72).

information and addressed in the global risk assessment with commensurate measures implemented by the financial group.

b) Effective mitigation of customer, product, services and geographical risks

36. Developing appropriate measures to mitigate customer, products and services and geographical risks requires having adequate information on customers, their transaction patterns, expected location of transactions/activity as expressed by the customer, products and services used and, where necessary, on the source and/or destination of funds. Information so obtained by the financial groups will help in devising appropriate solutions to manage and mitigate risks. For example, based on an overall assessment of customers or customers' categories, financial institutions may devise policies on additional or enhanced due diligence measures, stricter transaction monitoring procedures, face-to-face interaction with certain customers, more frequent review of customer information etc.

37. Similarly, information shared by a financial institution with group compliance on identified misuse of new or existing products or services and measures taken to mitigate the risks may help the group take a consistent approach in a multi-national environment. Such mitigation procedures at a group level can be implemented effectively only if the group compliance has adequate information about its customers, their transactions and activity level and any abnormal pattern based on available customer information. For example, a politically exposed person (PEP), located in Country X, a high risk jurisdiction for corruption, sends one high-value wire inconsistent with their profile, without an explanation in response to bank's inquiries, which leads the bank to close the PEP's account. The same PEP uses another account in Country Y with the same banking group to send structured wire transfer and lies about the source and purpose. The subsidiary in Country Y will not be aware of the account closure in Country X by its subsidiary which will prevent them from properly risk managing the customer. This may also prevent detection of potential STRs in the cross border context based on information gathered from various sources within a group.

c) Consistent application of controls

38. Local operations of a global firm have to be in line with local laws and regulations. At the same time, these should also be subject to its group wide compliance programmes to ensure consistent application of controls across the group level. Enforcement of group wide controls and procedures requires sharing of relevant information with the financial institution's group compliance. In the case of their foreign operations, where the minimum AML/CFT requirements of the host country are less strict than those of the home country, financial institutions should be required to ensure that their branches and majority-owned subsidiaries in host countries implement the requirements of the home country, to the extent that host country laws and regulations permit. If the host country does not permit the proper implementation of internal controls (including sharing of information, as required under FATF Recommendations), financial groups should apply appropriate additional measures to manage the ML/TF risks, and inform their home supervisors. If the additional measures are not sufficient, competent authorities in the home country should consider additional supervisory actions, including placing additional controls on the financial group, including as appropriate, requesting the financial group to close down its relationships with the host country.[8] This may be required, for example, when the risks outweigh the institution's ability to manage the risk through commensurate measures.

[8] INR 18.5.

39. Information on customers' identification and acceptance policies, internal and external audit reports, supervisors' on-site inspection reports and sanctions and remedial actions imposed as well as sample records evidencing due diligence measures undertaken, reporting done and record-keeping requirements complied with, where appropriate shared with the group compliance may help enable assessment of implementation. This will allow the firm to enforce its global controls, taking into account the specificities of each country and location. For example, lack of CDD and record-keeping measures undertaken by bank A's subsidiary in country X may weaken the overall effectiveness of group controls of the bank. Financial institution at a global level may verify the implementation of these measures if its group compliance has access to such records on a sample basis.

d) Common approach by financial conglomerates having multiple businesses

40. Quite often, financial groups have their operations across multiple line of business (bank, securities, insurance, commodities etc.). Group-wide compliance means that such financial conglomerates should be in a position to monitor and share information on their customers' identities, their transaction and account activities across the entire group. While some adjustments may be needed due to different AML/CFT requirements for each sector, sharing of information would enable a comprehensive risk management approach on a consolidated basis. For example, if financial group A has presence in banking, securities and insurance sector under the same group, unexplained cash deposits by a high-risk customer X in his bank account should trigger an alert about his transactions across other business lines. Absence of such information will allow the customer to continue his transactions in other sectors without similar monitoring or additional due diligence.

B. Sharing of information on suspicions that funds are the proceeds of crime or related to terrorist financing within the financial group

Recommendation 20- Reporting of suspicious transactions

If a financial institution suspects or has reasonable grounds to suspect that funds are the proceeds of a criminal activity, or are related to terrorist financing, it should be required, by law, to report promptly its suspicions to the financial intelligence unit (FIU).

41. FATF Recommendation 20 requires financial institutions to report suspicious transactions if it suspects or has reasonable grounds to suspect that funds are the proceeds of a criminal activity, or are related to terrorist financing. Recommendation 20 only requires the reporting of suspicious activity in good faith and that does not equate to criminal liability. That is a determination for the national authorities (e.g. law enforcement) to make.

42. Technological advances in recent years have improved the analytic and processing capacity of financial institutions, and their ability to dig deeper in transactions and to identify trends and typologies based on information-flow from multiple locations, products and services and sectors. Advances in data science techniques and analytics enable financial institutions to sift through large amounts of structured and unstructured data to identify patterns and trends. Harnessing of this potential requires as much information as possible to be brought together, often in a centralised pool, and is in the interest of both the public and the private sectors.

43. Sharing of information and analysis of transactions or activities which appear unusual (if such analysis was done); including an STR, its underlying information, or the fact that an STR has been submitted by branches and subsidiaries with group compliance promotes effective implementation of group-wide compliance programmes.[9] Similarly, branches and subsidiaries should receive such information from group-level functions when relevant and appropriate to risk management. This applies both to domestic and cross-border environment where customers may have exposure across a group's operations and across more than one geographic location. It allows financial institutions to identify higher risk customers across the group's business and deploy specific monitoring mechanisms or enhanced measures. It also enables emergence of a global picture of the risk exposure of the financial institution to such customers, thereby promoting implementation of an effective risk-based approach. Such sharing, which may occur before or after filing of an actual STR by the financial institutions, where required will enable the group compliance to look at the suspect customer's activities or transactions across different verticals, lines of business and jurisdictions. This will also allow them to conduct sophisticated analyses of suspicious activities, assess these analyses against the client database and build the scenario across its global operations (paragraph 8 of Annex-2).

44. In the context of terrorist financing, timeliness of information sharing is critical. The instant sharing of relevant information within a financial group could be crucial, particularly where customers that were assessed as higher risk (due to their transaction history and/or country of origin) are involved. An initial suspicion by a financial institution that a transaction may involve TF may further be corroborated or confirmed if information on transactions involving the same customer or recipient of funds across the financial group is available. Such a chain of transactions would likely only be picked up if the initial suspicion was shared across the financial group and the customer or recipient was flagged for further attention. The process of sharing the information relating to a suspicion of TF and obtaining further corroborating information should, however, not cause a delay in the timely submitting of an STR in the host jurisdiction where the suspicion first arose or where the transactions in question have taken place.

45. The inability to lawfully share such information may potentially lead to inconsistent application of the group-wide compliance programme within the same corporate umbrella. As an example, it may result in a situation where one subsidiary has filed an STR about a particular client or transaction, but another group entity which is not aware, may fail to notice suspicious behaviour based on similar facts, warranting further scrutiny or an STR filing as needed. This inhibits the effectiveness of global group-wide compliance programmes. Furthermore, there may be cases in which such a scenario might render the group entity as a whole not compliant with STR requirements in the second jurisdiction, as knowledge of potential suspicious behaviour by the first subsidiary could be imputed to the entity. However this does not imply that intentional non-compliance to a financial group is imputed when the inability to communicate effectively is the result of the inability to lawfully share such information in the first instance. It is also incumbent upon the financial institutions to document appropriate criteria for the sharing of information (in accordance with laws and regulations in the host country) in support of a group-wide risk management compliance program and to ensure that safeguards are in place for the protection of the confidentiality of the information and its restricted use for the intended purpose of AML/CFT. Where there are challenges to the effective implementation of group-wide risk management, financial

[9] The Egmont group of FIUs issued a 'white paper on enterprise-wide STR sharing: issues and approaches' in February 2011. It sets out key issues for a cross border STR sharing regime and also presents possible approaches to facilitate enterprise STR sharing. The paper concludes that the cross-border element of enterprise-wide STR sharing necessitates that jurisdictions coordinate their actions in this field.

institutions should apply appropriate additional measures to manage the ML/TF risks and inform their home supervisors, as appropriate.

C. Confidentiality of STR and tipping-off and how it interacts with group-wide sharing

Recommendation 21 - Tipping-off and confidentiality

Financial institutions, their directors, officers and employees should be:

(a) …

(b) prohibited by law from disclosing ("tipping-off") the fact that a suspicious transaction report (STR) or related information is being filed with the FIU. These provisions are not intended to inhibit information sharing under Recommendation 18.

i. Concerns on sharing of information on suspicious transactions within the group and potential solutions

46. One of the main concerns that relates to sharing of STRs (or sharing the fact that a STR has been filed or the underlying STR information) is ensuring their confidentiality, which is critical to the effective functioning of the reporting regime. Confidentiality of STRs is needed so that the subject of STR and third parties are not tipped-off, as this can adversely affect intelligence gathering and investigation, and can enable persons to abscond or dispose of assets. Confidentiality also protects the reputation of the person who is the subject of an STR. Finally, confidentiality protects the safety and security of the person filing the report, and breaches of confidentiality have the potential to undermine the entire suspicious transaction reporting regime. Unauthorised disclosure of STRs could also result in a financial institution facing criminal liability in many jurisdictions. These concerns necessarily place limits on the sharing of STRs.

47. The issue of STR confidentiality can get more complex if such sharing occurs across borders, where different national laws come into play. These may include, for example, national provisions relating to discoverability and production of available records (including STRs filed in host country and shared with group-compliance in home country) in home country's judicial proceedings, access to databases of financial institutions by national authorities etc.

48. Another concern that relates to sharing of STRs relates to how information can be shared domestically and internationally. Concerns also exist on the treatment of foreign STRs or information that reveals the existence of a foreign STR in legal proceedings. This is unclear and varies considerably in both civil and criminal cases across countries. While some countries have regulations which require regulator notification of judicial requests and subpoenas concerning domestic STRs so that the regulators can intervene to ensure STR confidentiality in the legal proceedings, these regulations may not protect foreign STRs submitted to a foreign FIU. Quite often, concerns also exist regarding the confidentiality of STRs once these are shared cross border, including their potential misuse for unrelated purposes, leakage to media for political gains, and sharing without due process of law. From an FIU's perspective, one of the key concerns is to avoid situations where third parties (including authorities in third countries) may have unjustifiable access to the relevant information especially if STRs are shared across jurisdictions systematically rather than because they have a multi-jurisdictional element to them. In order to ensure the confidentiality of STRs which are shared across jurisdictions, countries should consider extending

the same legal protections to foreign STRs which are given to domestic STRs within their legal system.

49. Finally, there are concerns that group-wide suspicious information sharing could potentially lead financial groups to systematically submit STRs only in their home jurisdiction, rather than in the jurisdictions in which the relevant financial institutions of the group are located. A related concern is that even if the STR is submitted in the relevant jurisdictions, the financial group's internal investigation may take place only in one jurisdiction (of the parent company), leaving some relevant information outside the reach of the host FIU's powers to request additional information from the financial institution. Such coordination and internal investigation across the group should be handled expeditiously so as to not lead to delay in the timely filing of the STR with the financial intelligence unit in the host jurisdiction. To allay these concerns, it is emphasised that financial institutions are required to file suspicious transaction reports with the financial intelligence unit of the host jurisdiction[10] where they are operating promptly, regardless of any sharing.

ii. Possible mechanisms for sharing of suspicious information within financial group

50. There are different ways in which information relating to unusual or suspicious activity can be shared within a financial group, based on the domestic or supra-national legal framework of jurisdictions concerned. This does not necessarily have to be by sharing an STR itself, which is prohibited in certain jurisdictions. This can be achieved, for example through: (a) sharing of information and analysis of transactions or activities which appear unusual, if such analysis was done (e.g. facts, transactions, circumstances and documents, including personal information). These information elements are illustrative and not meant to provide an exhaustive list. Sharing of relevant information in such cases could be without disclosing the fact that an STR is filed; or (b) disclosing the fact that a STR has been filed; or (c) disclosing the fact that an STR has been filed and sharing underlying information (e.g. information on suspicions and the results of any internal analysis or examination, (but not the STR itself); or (d) sharing of STRs and underlying information. This can be depicted as follows:

Table 2. **Possible ways for sharing suspicious information within financial group**

Possible ways	Information on suspicions, internal analysis or examination	Fact that an STR is filed	The STR itself
(a)	✓		
(b)		✓	
(c)	✓	✓	
(d)	✓	✓	✓

[10] Under the EU framework, financial institutions have to report suspicious transactions to the FIU of the Member State in whose territory the obliged entity transmitting the information is established. This means that in situations of free provision of cross-border services, STRs must always be submitted to the home FIU; if financial institutions operate establishments in another Member State, they must submit STRs to the host FIU. In some specific circumstances and subject to limitative criteria, national laws may go beyond EU passporting rules. The European Court of Justice confirmed that, subject to the conditions that no effective mechanism ensuring full and complete cooperation between the Member States exists which would allow AML/CFT crimes to be combated effectively, and on condition that the legislation is proportionate, EU law would not preclude Member State's national legislation which requires credit institutions operating in that Member State without being established there, to forward directly to these Member State's authorities information necessary for combatting ML/TF (see C-212/11 - Judgment of the Court (Third Chamber) of 25 April 2013 - Jyske Bank Gibraltar Ltd v Administración del Estado)

51. One of the key objectives of information sharing in this respect is to improve compliance with risk management and reporting obligations in all the locations where a multi-national group may operate. The overarching principle should be that the shared information may be found relevant by group compliance for an overall analysis and ML/TF risk management across the group or for some entities belonging to the group. There should, therefore, be a cross-jurisdictional element to the shared information such as a customer that has exposure to operations of the group in more than one location or aspects of the flow of transactions or funds that affect operations in the relevant jurisdictions. Such sharing should be subject to adequate controls and monitoring by the group compliance to protect confidentiality of information and ensure its use only for ML/TF risk management.

iii. Criteria for sharing information within financial group

52. Financial institutions should determine appropriate criteria for sharing such information for the purpose of group compliance. This need not be the same criteria as for reporting of STR. For example, in some cases, there may still not be sufficient grounds to convert triggered red flags into to an STR, though sharing of information on any further analysis carried out in such cases to group compliance, may reveal additional information which may help making a filing decision. Depending on the circumstances, a financial institution may reach the STR reporting threshold at the same time as the unusual or potentially suspicious activity is initially detected (including prior to the execution of the transaction for attempted transactions). Or, in many cases, further analysis will be needed in order to determine whether the threshold for suspicion is met. This analysis may or may not result into filing a STR. Further, the very nature of transaction or business relationship of customer with financial institution may make some information irrelevant for the purpose of group compliance. This may happen if the transactions are localised, without any potential for them to extend to other branches, subsidiaries or sectors. Financial institutions should make appropriate decisions in such instances based on the context, complexity and materiality of identified cases.

53. Systematic sharing of such information on a group-wide basis in each and every case may not be necessary or conducive to improved compliance with risk management and reporting obligations. Financial institutions should expressly address in their risk assessment and management framework where it should lay the basis for identifying the instances and the types of information that will be shared for group compliance. Criteria for reporting suspicions for the purpose of group compliance should be under periodical reassessment to take into account relevant events (such as group-wide audits or reviews) and be subject to supervisory scrutiny.

iv. Safeguards to protect information shared

54. Financial institutions should establish sufficient safeguards concerning the information shared to ensure that (a) confidentiality of information so shared is protected (including against tipping-off) and (b) information is used only for AML/CFT purposes and not for any other purpose. These should include policies, protocols and procedures for such sharing and setting up of access controls and firewalls, including conditions of information flows between the different entities of the group when needed (e.g. when different entities of the group have the same client) so that such information is ring-fenced, and accessible only by AML/CFT staff and only for specific AML/CFT purposes. Furthermore, the existence of suspicion on a client from an entity of the group does not imply automatically/systematically filing an STR by other entities of the group concerned, though it may be an important element for the risk analysis and the risk profile of the business relationship and may require enhanced CDD measures, where needed.

v. Resolving legal barriers and engagement with private sector

55. Countries should seek to address any legal and regulatory barriers which impede the flow of information within the financial group, thereby inhibiting effective implementation of FATF Recommendations. This may require a thorough assessment of the existing provisions (DPP, financial secrecy, AML/CFT or any other legislation) restricting information sharing. A proactive engagement with the private sector can also identify areas where there is a divergent view between the public sector and private sector on expectations of the existing requirements. This may be followed by issuing appropriate guidance and clarifications to create an enabling environment for sharing of information.

INFORMATION SHARING BETWEEN FINANCIAL INSTITUTIONS NOT IN THE SAME GROUP

56. Effective AML/CFT systems at national and international level also require information sharing between different financial institutions, which are not part of the same financial group. This includes information sharing between different institutions both within a single country, and internationally, and is affected by all the constraints and obstacles noted above. Key FATF Recommendations requiring information sharing between financial institutions which are not part of the same financial group are R.13 (correspondent banking), R.14 (MVTS), R.16 (wire transfer) and R.17 (Third party reliance). Each of these requires specific information to be provided or available, in order to implement essential preventive measures.

57. Sections III and IV set out information sharing between different financial institutions based on key FATF Recommendations, and also describe the benefits of voluntarily sharing additional information, and how this can be facilitated.

A. Information sharing under FATF Recommendations

i. In the context of correspondent banking relationships (R.13)

58. Financial institutions are required to gather sufficient information about a respondent institution to fully understand the nature of its business and to assess respondent institution's AML/CFT controls and be satisfied with the mode of use of payable-through accounts. This would include an understanding of types of customers the respondent institutions intends to service through such relationship, the expected nature of transactions, their value etc. In some specific cases the correspondent institution may require additional information from respondents to effectively monitor respondent's transactions. Such monitoring may require the respondent banks to provide specific transaction and customer information to correspondent banks to allow them to dispose the alerts generated by their transaction monitoring systems. However, this review of information by the correspondent bank should not be triggered by and does not amount to a requirement to conduct CDD on the customer of the respondent but as a consequence of the monitoring of the transactions to or from the respondent bank.[11]

59. Respondent institutions should be able to provide additional targeted information requested by correspondent in some specific cases on specific customers and transactions. Due to absence of such information on account of information sharing restrictions, correspondent banks may not be able to apply appropriate AML/CFT controls to manage the risks associated such relationships.[12] In such cases, without further information, correspondents may have no alternative but to suspend the business relationship. This could eventually lead to a delay in processing or even the termination of correspondent banking relationships, thereby exacerbating the de-risking phenomenon (paragraph 12 of Annex-2).

60. To avoid such a scenario, appropriate mechanisms should exist to allow respondent financial institutions to share the requested information with correspondents. For this purpose, authorities of the respondent institutions should understand and clarify the cases in which correspondent institutions may request information and the type of information they may request, so that an appropriate sharing mechanism is put in place by respondent financial institutions to

[11] See FATF Guidance on Correspondent Banking Services (in particular, paragraphs 3, 4, 5 and 18).
[12] See FATF Guidance on Correspondent Banking Services (in particular, paragraphs 32, 33 and 41).

enable such information-flow. Countries could also consider encouraging responsiveness from respondent banks and expressly set out their obligations to share information with their correspondent.

61. Where warranted, countries should consider conducting evaluation of their existing legal framework to address challenges to information sharing in this respect, to ensure their own data protection, financial secrecy provisions or other related regulations are not causing their financial institutions to lose access to correspondent banking services. A dialogue and engagement between public and private sector may also further help identify specific areas or issues where guidance may be needed.

ii. In the context of Money or Value Transfer Services (MVTS) (R.14)

62. Under R.14, MVTS providers working through agents (regardless of their location) are required to include them in their AML/CFT programmes and monitor them for compliance with these programmes. This would require sharing of information from agents to their MVTS providers to enable them to effectively monitor their transactions. This would enable the MVTS providers to not only fulfil their oversight responsibility but also add value to the transaction monitoring and reporting mechanisms put in place by agents through sharing of feedback and further information.

63. In appropriate cases, targeted sharing of information on suspicious transactions may also help MVTS providers better manage their ML/TF risk, and ensure compliance with existing risk management and reporting obligations. Countries could consider issuing necessary guidance in this respect and identify and address any specific barriers that prevent sharing of such information.

iii. In the context of wire transfer (R.16)

64. FATF Recommendation 16 requires countries to ensure that financial institutions include required and accurate originator information, and required beneficiary information, on all domestic and cross-border wire transfers and related messages, and that the information remains with the wire transfer or related message throughout the payment chain. The objective of R.16 is to ensure that the basic information on originator and beneficiary of wire transfers should be immediately available to FIU/LEAs and also to ordering, intermediary and beneficiary financial institutions for transaction monitoring and filing STRs, sanctions screening, freezing and tracing of wire transfers.[13]

65. In case the relevant information is missing, intermediary and beneficiary financial institutions are required to have risk based policies and procedures for determining (a) when to execute, reject or suspend a wire transfer lacking required originator or beneficiary information; and (b) the appropriate follow-up action. This could, for example, include asking the previous financial institution in the payment chain for providing the missing or incomplete information as soon as possible. More fundamentally, such basic information about the originator and beneficiary is necessary for financial institutions to effectively execute wire transfers, and the transmission of such information would accordingly generally be authorised by non-AML legal frameworks.

66. Information sharing restrictions which impede financial institutions from sharing such information may lead to a considerable delay in processing. Countries should create enabling regulatory framework that removes barriers to information sharing in this respect. Appropriate guidance and feedback may further clarify regulatory expectations from financial institutions.

[13] FATF Interpretive Note to Recommendation 16, paragraph 1 and 2.

67. Further, consistent with paragraph 22 of the INR 16, MVTS providers are required to comply with all of the relevant requirements of Recommendation 16 in the countries in which they operate, directly or through their agents. In the case of a MVTS provider that controls both the ordering and the beneficiary side of a funds transfer, the MVTS provider: (a) should take into account all the information from both the ordering and beneficiary sides in order to determine whether this gives rise to suspicion; and (b) where necessary should file an STR with the appropriate FIU, and make relevant transaction information available to the FIU.[14] This would also require information flow in respect of cross border transactions executed by an MVTS provider. Countries should remove any existing barriers to information sharing and consider issuing appropriate guidance so that MVTS providers are able to comply with these requirements.

iv. In the context of third party reliance (R.17)

68. Under Recommendation 17, financial institutions may be allowed to rely on third parties (whether domestic or cross-border), to perform elements (a)-(c) of the CDD measures set out in Recommendation 10 or to introduce business. These elements are: (a) identification of customer, (b) identification of beneficial owner, and (c) purpose and intended nature of business relationship. The relying financial institution is required to immediately obtain necessary information concerning such elements, and to take adequate steps to be satisfied that copies of identification data and other CDD documents will be made available from the third party without delay, when so requested.

69. Use of third party reliance procedures is thus pre-conditioned on the ability of the financial institutions to be able to obtain relevant information from third parties. The need to understand the purpose and intended nature of business relationship may also necessitate sharing of additional information such as financial position of customers. This may help determine if the transactions being conducted are consistent with the financial institution's knowledge of customer, their business and risk profile. Information sharing restrictions or regulatory uncertainty may impede the ability of financial institutions to rely on third parties, especially in a cross border context. This may require intervention from host authorities of third parties to address any existing challenges, which prevent third parties from sharing information with financial institutions of the home countries, where permitted for reliance purposes.

v. In the context of regulation and supervision of financial institutions (R.26)

70. In the context of effective implementation of FATF Recommendations, for cross-border supervision, supervisors of the home jurisdiction should have access to the customer, account and transaction information maintained by the financial institution in the host jurisdiction, to the extent permissible under the legal frameworks of both jurisdictions. This should include STR and related information, where this is necessary to assess compliance with AML/CFT obligations and the robustness of risk management procedures. While host supervisors will be assessing compliance with local laws and obligations, home supervisors should have the ability to assess compliance with group-wide AML/CFT policies and procedures. Lack of such access may inhibit the ability of the home supervisor to effectively assess group compliance, thereby impacting the effective implementation of FATF Recommendations. If impediments to information sharing prove to be insurmountable, and there are no satisfactory alternative arrangements, the home supervisors should make it clear to the host supervisor that the financial institution may be subject to additional

[14] See paragraph 67 of FATF Guidance on RBA for MVTS, February 2016.

supervisory actions, such as enhanced supervisory measures on the group, including, as appropriate, requesting the parent group to close down its operations in the host jurisdiction.[15]

[15] See BCBS Guidelines on Sound Management of Risks Related to Money Laundering and financing of Terrorism, June 2017: Section IV

INNOVATIONS IN INFORMATION SHARING

Information sharing beyond the FATF Recommendations

71. Sharing of additional information between financial institutions - beyond the required information noted above that is required by the FATF Recommendations - can have wider benefits by strengthening the understanding of risks and vulnerabilities. It can also ensure better compliance and leveraging of capacities by the private sector and preventing criminals from exploiting individual financial institutions' lack of awareness of their activity with other institutions.

72. For example, some jurisdictions have found that sharing alerts or information about customers who are refused or exited due to ML/TF concerns can prevent arbitrage of the financial system by criminals, who may attempt to engage with many different institutions. Consolidating information on payments by multiple institutions can identify criminals structuring payments using multiple institutions to avoid detection by other means.

73. However, such information sharing can also raise a range of public policy concerns about how the information will be used (or misused), including unfair commercial practices, encouraging de-risking and financial exclusion, potentially breaching STR confidentiality and increased risk of tipping-off, customer confidentiality, data protection and privacy, financial institution secrecy, as well as the general information sharing challenges described in the earlier part of this guidance.

74. For example, sharing of customer information between financial institutions could potentially raise competition concerns resulting from selective sharing of information with only a small group of participants. De-risking and defensive STR filing behaviour may be exacerbated, e.g. if financial institutions feel obliged to file an STR on a customer simply because they have learnt that other financial institutions have done so (and without conducting their own internal investigations). Overreliance on a system of sharing of suspicious information or a common platform could potentially lead to moral hazard where a financial institution would regard a potentially suspicious customer as suspicious before proper due diligence is done, and hence preventing the customer from accessing the entire financial system.

75. Countries should carefully consider the legal, policy and operational concerns noted above, and design means of mitigating them. This would for example, include consideration of measures to avoid abuse of the sharing mechanism, unauthorised use of the information obtained and violation of the underlying principles of such sharing arrangements, as well as potential implications of such behaviour.

76. Countries should also provide clarity on what types of information can be shared, with whom, under what circumstances, for what purposes, and subject to which restrictions, depending on the sensitivity involved and the need to ensure confidentiality of information. This understanding could be documented and be supported by information security guidelines and access protocols. This would avoid varied interpretation, ambiguity in understanding and inconsistency in implementation, all of which can impede information sharing under these provisions. Suitable oversight mechanism and transparency would also ensure the confidence in and accountability of all stakeholders.

77. Nonetheless, in recent years, countries and the private sector have made great strides in data analytics that aid in the detection of ML/TF activities and trends. In order to share such information, sufficient safeguards and mechanisms within existing legal frameworks are permitting

information sharing that provides improved and more real time and actionable information, leading to positive outcomes. Some such mechanism and processes are described below and in Annex-2.

A. Types of information sharing

78. A range of information can be shared in this context, and in a number of different ways. This is set out below:

i. Information on risks, crime trends and typologies

79. Financial institutions can collaborate to share analytical and strategic information on recent risk and crime trends, methods, techniques, common typologies and modus operandi identified to abuse the financial system. Such information, stripped of personal data, would accordingly not implicate data protection and privacy, tipping off, or other protections for personally identifiable information. Such information sharing may provide good insights which can be used by participating financial institutions in their operations. This promotes a greater collaborative environment among participants and can also help keep the risk assessment up-to-date based on current trends and methods.

80. Often law enforcement authorities are also part of these initiatives and can provide a more comprehensive update on these crime trends and typologies, including through case examples and specific information on ML/TF risks. This can raise general awareness of the current financial crime scenario, strategic and operational risks derived from such crimes and their possible impact on the financial industry as a whole.

ii. Information on transactions and customer information

81. Some countries under their own domestic legal framework specifically allow sharing of certain transaction information, and other information on suspicious transactions (but not necessarily of the STR itself) between financial institutions which are not part of the same group. This may include information on customers, representatives and/or beneficial owners associated with two or more financial institutions or covered entities, including information on individuals or entities suspected of ML/TF. This applies, for instance, in cases where financial institutions share or have the same customers (paragraphs 10-14 of Annex-2).

82. Such information sharing may provide additional elements to asses customers' risk more effectively or may also facilitate confirmation of initial suspicion for example, when a newly opened account with some activity for a few months suddenly receives a huge wire transfer and it becomes necessary to request information from the remitting bank to confirm the source of funds and other related details. Countries could consider encouraging financial institutions to share specific threat information and high risk customer information with one another. This facilitates sharing of intelligence and assists in decision-making by authorities and the private sector, wherever relevant.

B. Mechanisms for information sharing

83. A number of possible models are currently being developed which may encourage such voluntary sharing of information. It could include include bilateral information exchange between financial institutions and/or **shared KYC utilities and/or centralized data repositories**, which capture key elements of customer and transaction information and disseminate such information to participating financial institutions with appropriate protocols and access controls. Such utilities can contain different types of information for AML/CFT purposes. It includes identification information on customer and/or beneficial owner and additional information to support risk assessment and risk profiling of customer by financial institutions. These utilities can be used at the time of on boarding a customer, to access customer information, as well as on an ongoing basis, to perform further customer due diligence measures. Such utilities can also contain updated information on respondent institutions, which can facilitate their risk assessment and ongoing due diligence by correspondents. In all such cases, the ultimate responsibility for due diligence remains with the financial institution using such utilities.

84. These utilities and databases can be hosted by the authorities or the private sector or both through a public private partnership. For example, in some countries databases to share information on international wire transfers conducted or either the fact that STRs have been filed and/or the content itself of STRs and related information have been created to facilitate information sharing in appropriate cases among reporting entities, as well as administrative and law enforcement authorities. However, such utilities and/or repositories, whoever hosted by, could give rise to questions on where the ultimate responsibility for monitoring lies, and who should be held accountable for failures – another form of moral hazard.

85. In some cases, **specific information sharing arrangements** to facilitate information sharing among financial institutions for AML/CFT purposes have been reached between jurisdictions. This can provide statutory gateway to facilitate information sharing between financial institutions in a cross border environment for AML/CFT purposes.

86. **Public private partnerships** for information sharing are also being developed in a number of jurisdictions and have achieved positive outcomes. Through such partnerships, information is shared across law enforcement, FIU, vetted participants from the private sector as well as international partners in some cases, to facilitate a more comprehensive view of transactions and customers' behaviour. Such sharing often happens in a secured environment in order to facilitate further data-mining, operational analysis and scanning by the private sector to fill potential intelligence gaps.

87. **Industry forums or platforms-** Initiative can also be steered by financial institutions by creating structures such as inter- bank forum or through their banking/industry associations to share information on recent crime trends, modus operandi and typologies across participants. Representatives of law enforcement and supervisors could also collaborate in such initiatives to further support the work.

88. Information sharing on customers and suspicious transactions may be facilitated by safe harbour provisions for financial institutions, provided that the safe harbour is not abused, and they have established and maintained adequate procedures to protect the security and confidentiality of the information. Such safe harbours can carve out specific legal protection to enable information sharing between financial institutions for AML/CFT purposes.

89. Annex-2 of the guidance provides information on the approaches taken by a number of countries to facilitate such information sharing. These are set out in detail in particular, in paragraphs 10-22, 29-30 and 32-34 of the Annex. These examples are presented for information only and their inclusion in this guidance does not amount to their endorsement by the FATF. Further, the Annex is only illustrative and does not contain an exhaustive list of all the examples, which may be leading to diverse outcomes. It, however highlights how different types of information (strategic as well as operational and customer related) can be shared following different models or mechanisms in different contexts for AML/CFT purposes.

90. There are significant benefits of information sharing between financial institutions and at the same time, there are potential risks that need to first be addressed or mitigated. It is also affected by the same challenges as noted above. Countries are encouraged to assess how such voluntary information sharing which is beyond what is required by the FATF Standards can improve their AML/CFT system, and to develop their legislative framework to enable such sharing of information.

GUIDANCE AND FEEDBACK

91. Lack of guidance and feedback by public sector authorities on information shared by the private sector may hinder private sector's ability to effectively monitor transactions and provide well-developed reports to FIUs. In appropriate cases, countries could consider putting in place enhanced "feedback loop", whereby more consistent and more fully explained feedback is provided to the private sector on suspicious transactions reports. Further developing communications channels where the private sector receives feedback on thematic cases or information on targeted areas of focus would help provide clarity on regulatory expectations (paragraphs 23-28 of Annex-2). Countries could also consider developing specific engagement programmes with sectors that appear vulnerable to ML/TF threats (paragraph 31 of Annex-2).

92. Lack of guidance and feedback by public sector authorities may also impede or discourage information sharing between different private sector entities, or between private and public sectors, and vice versa, e.g. because regulatory expectations are unclear or because there is insufficient information available about risks. The public sector should clearly communicate via guidance and feedback the mechanisms that should be put in place to share information in this context. Countries should also consider publishing information on the existing legal mechanisms, gateways and permissions, which permit financial institutions to share information, both group-wide and across financial institutions. This will provide greater clarity and assurance, and promote a consistent understanding across the private sector.

CONCLUSIONS

93. An effective system of national coordination and cooperation and international cooperation hinges on how well different stakeholders, both in the public and private sector interact and engage with one another and exchange information, intelligence and analysis.

94. Legal constraints such as different legal frameworks of data protection and privacy and their implementation, financial institution secrecy provisions and operational challenges may impede information sharing in group wide context as well between financial institutions not part of the same group. With the rapidly evolving threat and risk scenario, especially regarding terrorism financing, it is vital that appropriate solutions to barriers to information are devised by national authorities and also the private sector in a coherent manner. These measures may include authorities (for example, AML/CFT authorities and data protection and privacy authorities) engaging with one other, wherever appropriate to arrive at a shared ground. This engagement can also identify areas where there is a lack of clarity or divergent views between the public sector and private sector. Clarity and guidance on such issues may help facilitate an efficient application of obligations.

95. AML/CFT and data protection and privacy, are both significant public interests. National legal regimes should facilitate both, so as to prevent money laundering, terrorist and proliferation financing, and other financial crimes in a way that pays sufficient regard to individuals' rights to privacy and data protection, while providing a legally certain regime for financial institutions which ensures that AML/CFT and data protection laws do not cut across one another. It is incumbent that national authorities responsible for AML/CFT and data protection recognize derogations in law when necessary to prevent conflicts, and provide clear and consistent guidance to the private sector to prevent misunderstandings or conservative approaches to information sharing for AML/CFT purposes.

96. The private sector is an important partner in combatting ML/TF and holds valuable information which is of critical importance to law enforcement and other competent authorities. Effective and timely exchange of such information helps law enforcement in pursuing its objectives. Furthermore, it is a two-way relationship between the public and the private sector, and this can be achieved if there are appropriate mechanisms for sharing of strategic, operational, tactical and targeted information by law enforcement with the private sector as well. Building of networks, an environment of trust and ongoing dialogue between authorities and the private sector may help achieve a positive outcome in this regard.

ANNEX-1 – DIFFERENCE IN DPP REGIMES AND THEIR APPLICATION

1. As stated in section 1 of this guidance, the differences in legal frameworks of DPP laws across jurisdictions, may create implementation challenges, particularly for the private sector, both in the group-wide and inter-institutional context of information sharing. These challenges can emerge due to following specific factors:

i. **Barriers to group-wide sharing of information.** Some jurisdictions treat group-wide sharing of information containing personal data the same as information sharing with third parties. This is because some data protection legislation considers other subsidiaries or branches as third parties resulting in sharing restrictions. This may also apply to group-wide offices across jurisdictions where such transfer is also made subject to sharing restrictions. This impacts group-level information sharing for AML/CFT risk mitigation purposes among subsidiaries and their head office and parent companies. For global firms, different regional and jurisdictional levels of data protection requirements are often cited as being significant as they limit the free flow of information within the firm.

ii. Principle of data minimisation under DPP framework requires that an organisation should only process the personal data that it actually needs to process in order to achieve its processing purposes, which are not defined in sufficiently clear and specific manner. It often leads to ambiguity on legality of information sharing. When personal data processing is required under domestic AML/CFT framework, ambiguity arises when the law does not prescribe the obligation to process personal data in sufficiently clear way, more particularly due to lack of regulatory guidance on the purposes for which such data can be collected, processed and shared. National data authorities in some instances are currently working on developing a compliance framework that will take into account the issue of group-wide data sharing.

iii. **Processing of personal data** occurs at all financial institutions at account opening for customer due diligence purposes and thereafter as customers engage in transactions for business accounting and risk mitigation purposes, including AML/CFT. In certain jurisdictions, the processing of personal data requires specific and explicit consent of customers, depending on the type of information concerned. In such cases, it is required that consent should be freely given, specific, informed and explicit indication of the individual's wish to agree to the processing of his or her personal data, as expressed either by a statement or by a clear affirmative action. Consent, where required, also applies to transfer of data. It leads to uncertainty, whether there can be a general consent obtained by the financial institutions at the time of on boarding customers or a more specific consent is needed each time the data is processed by the financial institutions. Furthermore, there may also be an absolute prohibition in certain jurisdictions on transfer of personal data (or some of such data) even in situations where the customer consents. It can be challenging for financial institutions to rely upon general consents or public interest exemptions to transfer customer data for the purposes of combatting financial crime. Express legislative provisions or guidance defining the circumstances in which customer data can be transferred across jurisdictions for such purposes can help facilitate information sharing.

iv. **In some cases, transfer of personal data to third countries is prohibited** unless the data protection authorities of the home country confirms that information sent to the third

country will be subject to satisfactory levels of data protection, using some safeguards (for instance, for transfers of data within the group, the use of Binding Corporate Rules may be approved by such authority). The absence of such a determination may affect the information exchange. While such legislation provides the derogations on grounds of public interest, often these grounds are stated to be available only for case-by-case data transfer and not for systematic transfers of information, which may require a specific legal framework. The timely flow of information in a seamless manner may be impeded by requirements to give prior notification to national data protection authorities and obtain multiple authorisations, which has an impact on information sharing.

v. **When beneficial owners are included in the business relationship of financial institutions, the access to information concerning beneficial owners may be hindered when the financial institution or affiliates may be located in jurisdictions which do not allow processing such information.** Therefore, in such cases, the financial institution may be unable to obtain the beneficial owner's consent, where required, to the collection, processing, or sharing of their personal information. This may lead to conflicts between DPP and AML/CFT requirements, and in practice means financial institutions face additional problems sharing beneficial ownership information. At a group -wide level, this may impede the ability of financial institutions to detect any abnormal patterns by establishing linkages and connections (e.g. transactions between two or more companies with the same beneficial owner), and hinder identification of suspicious patterns of activity. This may pose additional problems in many cases as the beneficial owner's identity is generally disclosed by a third party (representative of a legal entity), or is obtained and held by the financial institution itself, without the beneficial owner coming into the picture. Obtaining specific consent in these cases is often stated to be challenging.

vi. **Implementation of the requirement to apply additional measures to family members and close associates of PEPs** in a way that is compatible with data protection principles is not easy. Gathering identification details from various data sources, including information on known relationships between customers (such as family members, close associates etc.) may be considered challenging due to data protection and privacy concerns. For instance, the fact of the PEP being an important official of a certain political party, or a same-sex partner of PEP, would reveal political opinions or sexual orientation. Both are considered sensitive data, and as such the processing of those personal data for one or more specified purposes may be prohibited unless the data subject has given explicit consent to it or for reasons of substantial public interest. This, however, does not prevent financial institutions to obtain such information directly from customers or through public sources. In this respect, it should be recalled that financial institutions should have appropriate risk management systems and take reasonable measures to determine whether the customer or the beneficial owner is a politically exposed person. This requirement should apply to family members or close associated of PEPs.

vii. **The right of anonymity and to data deletion may limit the period of record-keeping requirements and their availability for ML/TF investigations.** Customer and transaction records are required to be kept for a minimum period of five years as per the FATF Standards. Data protection laws may have maximum retention periods that are shorter than the minimum retention periods provided under the FATF standards. In some jurisdictions, there remains uncertainty as to how data retention requirements interact with data protection laws and the "right to be forgotten/right of anonymity" that exists as a corollary of right to data protection.

ANNEX-2 – SELECTED EXAMPLES AND PRACTICES

2. This section highlights country examples on constructive engagement between AML/CFT and DPP authorities, and other practices to promote information sharing within financial institutions, between the public and private sector and among the financial institutions. Country examples are presented for information and meant to be illustrative only. Their inclusion in this guidance does not amount to an endorsement by FATF. This section builds upon the information contained in Section 3 of the TF Risk Indicator Report and contains additional practices and examples provided by countries. These practices and examples relate to the following broad areas:

A. Interplay between AML/CFT and data protection frameworks.

3. Some countries have issued guidance to financial institutions to ensure that they are able to reconcile and comply with the regulatory expectations contained in the two types of legislations. In some countries AML/CFT supervisory authorities also meet and consult with each other to better articulate their respective regulatory objectives. Such dialogue happens prior to rule making by the data protection and privacy authorities and also on an ongoing basis, with a view to provide further guidance and responses to frequently asked questions (FAQs). Creation of working groups between supervisory authorities, data protection authorities and regulators, FIUs and financial services to ensure a coordinated approach and consistent guidance on respective regulatory requirements

France

Each instruction, guideline or position of the French supervisory authority in the field of AML/CFT should, prior to its adoption and its publication, receive an opinion of an advisory committee called the Consultative Commission Anti-Money Laundering and Terrorism Financing (CCLCBFT) which has been set up by the board of the supervisory authority. The French Treasury Department, as well as the French Financial Intelligence Unit and other concerned authorities, including the French data protection and civil liberties' authority (the CNIL - Commission for Data Protection and Liberties), are invited to participate to meetings of the CCLCBFT. It was especially the case when the French supervisory authority issued guidelines on exchange of information within a financial group and outside the group.

Moreover, the CNIL shall also issue opinions on the government's draft legislation that will impact data protection or create new files in matter of ML/TF. Finally, from 2005, the French DPP authority has adopted a single authorisation (general standard) in cooperation with public authorities and private sector representatives. The single authorisation is regularly updated. The aim is to find a balance on the implementation of AML/CFT measures and the data protection requirements for a harmonised and more comprehensible framework by the concerned parties. Furthermore, this single authorisation is also a tool for simplification; nearly 1800 organisations have notified a commitment of compliance using this framework. Besides this single authorisation permits the sharing of customer data under conditions with competent French legal authorities in charge of the fight against ML/TF.

4. In many cases data protection and privacy authorities are also consulted and invited to provide specific comments on AML/CFT measures to avoid any potential conflict and uncertainty between the two regulatory provisions. Data protection and privacy authorities are also encouraged to consult with AML/CFT authorities in development of measures. Such practices foster and develop

an environment of collaborative partnership between the two authorities and reinforce the point that their policy goals and objectives are not necessarily mutually exclusive.

Canada

DPP authorities and AML/CFT authorities routinely work together prior to the drafting of relevant legislation. The *Personal Information Protection and Electronic Documents Act* (PIPEDA) is Canada's federal private-sector privacy law. The Office of the Privacy Commissioner of Canada has posted guidance on its website, "Privacy and PCMLTFA: How to balance your customers' privacy rights and your organisation's anti- money laundering and anti-terrorist financing reporting requirements. There is also a set of Questions and Answers, developed with input from FINTRAC.[16] The guidance acknowledges that the Proceeds of Crime (Money Laundering) and Terrorist Financing Act (PCMLTFA) requires organisations subject to the Act to undertake certain compliance activities, such as client identification and record keeping activities. In addition, certain transactions are required to be reported to the Financial Transactions and Reports Analysis Centre of Canada (FINTRAC). It further states that the Office of the Privacy Commissioner of Canada supports efforts to combat money laundering and terrorist financing and that programmes or initiatives should be implemented in a manner that is privacy sensitive and consistent with privacy laws.

5. In some cases, data protection authorities are part of the AML/CFT institutional framework and are directly involved in the AML/CFT rule-making process. The close interaction and involvement of agencies helps better coordination and appreciation of different perspectives.

Spain

The main co-ordination mechanism for developing and co-ordinating Spain's AML/CFT policies is the Commission for the Prevention of Money Laundering and Monetary Offences. It is comprised of over 20 key agencies, including the Spanish Data Protection Agency. One of the main functions of the Commission is issuing an opinion on draft legal provisions regulating matters related to the prevention of money laundering and terrorist financing. This high level co-ordination has permitted to adopt legislation where there are waivers of the rules laid down in the Data Protection Law.

6. In certain jurisdictions, the data protection legislation provides for certain derogations and carve-outs which may be necessary to comply with obligations imposed by other legislation. This may relate to the restrictions on the right of access of the data subject, right to obtain consent, prior notification, right to be forgotten etc. These derogations are aimed at balancing security and privacy concerns. National authorities can consider providing more guidance in these areas, if found appropriate. In the European Union (EU) context, work on harmonising the European data protection Rules is underway.

[16] See the Office of the Privacy Commissioner of Canada

European Union

In the EU context, the EU General Data Protection Regulation (GDPR) was adopted at the EU level on April 14, 2016 and will be directly applied in all EU countries. It replaces EU and national data protection legislation. This will become applicable on May 25, 2018. It is a further step towards the harmonisation of European data protection rules. The GDPR considers location data, IP addresses and online identifiers personal data in most cases; as this data could be used to identify individuals, in particular when combined with unique identifiers. The GDPR has also introduced additional transfer tools (codes of conduct and certifications) in order to facilitate exchange of information.

Italy

Domestic legislation provides clear gateways for the processing and sharing of personal data for the purposes of compliance with the AML/CFT laws and regulations. In some instances, for further clarity, national data protection authorities have issued a general order on AML measures on group-wide communications, which facilitates group-wide data sharing in financial intermediaries. The consent from the data subject is not required in such cases.

7. In certain jurisdictions, financial institutions are enabled to share customer information through specific exemptions under the data protection legislation and by lifting restrictions on sharing of information for the purposes of AML/CFT. Financial institutions should carefully consider all such derogations while making a determination on their own procedures and practices with regard to sharing of information.

Singapore

The exchange of customer information between financial institutions is subject to Singapore's Banking Act and Trust Companies Act, which supersede the general data protection provisions laid out in the Personal Data Protection Act (PDPA). Financial confidentiality provisions under the Banking Act and Trust Companies Acts are lifted for the combatting of money laundering and terrorist financing (e.g. for compliance with requests made by a parent supervisory authority, internal audits, or risk management purposes by head-offices). Further, the PDPA requirements are also lifted and financial institutions are also required to share information with their head offices and their branches and subsidiaries within the financial group under the MAS AML/CFT Notices, where necessary for money laundering and terrorism-financing risk management purposes.

B. Group-wide Information sharing

8. Sharing of STRs by a subsidiary or branch of a financial institution with its head office complements the group-wide risk management processes and discharge of oversight responsibilities by head office. Moreover, further sharing of STRs within the group also promotes a more effective internal control procedures and risk management. This is specifically allowed in certain jurisdictions, subject to appropriate confidentiality controls.

USA

In January 2006, FinCEN and federal banking agencies (OCC, FRB, FDIC and OTS) determined that a U.S. branch or agency of a foreign bank may share a SAR with its head office. The January 2006 Guidance also stated that a U.S. bank or savings association may share a SAR with its controlling company (whether domestic or foreign). The sharing of a SAR or, more broadly, any information that would reveal the existence of a SAR, with a head office or controlling company (including overseas) promotes compliance with the applicable requirements of the Bank Secrecy Act (main AML/CFT law) by enabling the head office or controlling company to discharge its oversight responsibilities with respect to enterprise-wide risk management, including oversight of a depository institution's compliance with applicable laws and regulations.

Further, in November 2010, the joint guidance issued by FinCEN and federal banking agencies provided that a depository institution that has filed a SAR may share the SAR, or any information that would reveal the existence of the SAR, with an affiliate, provided the affiliate is subject to a SAR regulation. The sharing of SARs with such affiliates facilitates the identification of suspicious transactions taking place through the depository institution's affiliates that are subject to a SAR rule.

France

Article L. 561-20 of the French monetary and financial code authorises exchange of information in this context. Furthermore, financial institutions have to fill in -on a yearly basis- an AML/CFT questionnaire including legal obstacles that they met in the area of information exchange with their branches or subsidiaries. In such situations, the foreign laws and regulations that prohibit/hinder a financial institution to implement equivalent AML/CFT measures in their branches and subsidiaries abroad must be sent by the REs to the French supervisory authority. The FIU must be also informed of these difficulties by the REs.

9. In some financial groups, analysis of suspicious information shared with group compliance is conducted by a monitoring and analysis centre, which is established centrally within a financial group to consolidate its focus on suspicious customers and to reduce the number of access points so as to prevent information from leaking. Such a centre can take prompt actions on different circumstances of suspicious transactions and alert other departments through their group system, which aims to prevent the customers from having exposure in more than one location or aspects of the flow of transactions or funds that affect operations in the relevant jurisdictions.

C. Information sharing between financial institutions not part of the same group

10. Timely and spontaneous sharing of relevant information by financial institutions more generally among one another with sufficient safe harbour provisions and protection from legal repercussions may help fight ML/TF more effectively, reinforce the integrity of the financial system and prevent its abuse by criminals. It also has the ability to provide better and more comprehensive intelligence to law enforcement authorities. In some jurisdictions, there are specific legislative enablers and safe harbour provisions to facilitate such sharing of information among the financial institutions which are part of the framework.

USA

Section 314(b) of the USA PATRIOT ACT (Information sharing Between Financial Institutions) provides that two or more financial institutions and any association of financial institutions may share information with one another regarding individuals, entities, organisations, and countries suspected of possible terrorist or money laundering activities. A financial institution or association that transmits, receives, or shares such information for the purposes of identifying and reporting activities that may involve terrorist acts or money laundering activities shall not be liable to any person under any law or regulation of the US, any constitution, law, or regulation of any State or political subdivision thereof, or under any contract or other legally enforceable agreement (including any arbitration agreement), for such disclosure or for any failure to provide notice of such disclosure to the person who is the subject of such disclosure, or any other person identified in the disclosure.

11. In some countries, exchange of information between two financial institutions which do not belong to the same financial group is permitted if some criteria are met.

France and Romania

In France, exchange of information between two financial institutions which do not belong to the same financial group is permitted if some criteria are met (Art. L. 561-21 of the financial and monetary code). Among these conditions, financial institutions are required to ensure that their counterpart applies AML/CFT measures consistent with the French requirements implementing the *FATF Recommendations.*

In Romania, Article 25 (4) of the AML/CFT Romanian Law permits financial institutions to exchange information with another financial institution. In particular, paragraph (b) permits credit and financial institutions to exchange information subject to secrecy when they (1) are within the same group, (2) are situated in the EU, the EEA or a third state which imposes similar AML/CFT requirements (3) apply CDD and record-keeping measures which are equivalent to those under the AML/CFT Law and (3) are subject to AML/CFT supervision. Credit and financial institutions may also exchange information subject to secrecy, even when they are not within the same financial group, if (1) they are situated in the EU, the EEA or a third state which imposes similar AML/CFT requirements (2) the information relates to the same client and transaction (3) they are within the same business category (4) are subject to similar secrecy and protection of data requirements.

12. Specific bilateral arrangements to facilitate information sharing among financial institutions for AML/CFT purposes have been reached between some jurisdictions. It highlights the importance of mitigating specific national/regional ML/TF risks through the mechanism of bilateral or multilateral arrangements.

USA and Mexico

Ongoing efforts have taken place between the U.S. and Mexico to jointly increase financial transparency and to prevent ML/TF in the context of correspondent banking.

As part of on-going monitoring requirements, US banks are required to monitor all transactions

when they are an intermediary financial institution and file STRs as appropriate. US banks regularly send Requests for Information (RFIs) to respondent institutions to request additional information related to an unusual transaction. This is intended to clear alerts rather than file STRs. Due to the Mexican bank secrecy provisions and Data Privacy Law, Mexican banks could not respond, which could result in more STRs and termination of respondent accounts. Mexican banks inability to respond to U.S. banks' RFI may result in U.S bank filing of STRs and potentially terminating the correspondent account. In order to address this, in December 2014 the Mexican AML/CFT General Provisions applicable to banks were amended to allow, for the first time, the possibility of Mexican banks sharing information with foreign banks, for AML and CFT purposes.

Specifically, the Mexican government amended its AML/CFT General Provisions applicable to banks and has set in place a legal mechanism by which Mexican banks can share information of their clients and occasional customers, as well as of their transactions with foreign banks, exclusively for AML/CFT purposes. Pursuant to the Mexican Credit Institutions Law, banks shall treat their clients' and occasional customers' information as confidential. Banks are therefore forbidden from divulging the transactional history, or personal data of their clients' or occasional customers' to anyone but the account holders, beneficiaries, trustees, creditors or legal representatives. As an exception, banks shall provide said information if requested by: (i) a Judge through a subpoena; (ii) the Attorney General's office; (iii) the Military Attorney General's office; (iv) the Ministry of Finance authorities for AML/CFT or tax purposes, or (v) the federal oversight authority. Likewise, banks may share the relevant information with other banks for AML/CFT purposes, regarding their clients' and occasional customers' information, as well as of their transactions.

Prior to starting the sharing such information, the Mexican Ministry of Finance has to approve the foreign banks. Likewise, before Mexican and foreign banks begin to exchange information, they have to convene in writing the confidentiality of the information, as well as to state the information and positions of the individual officers authorised to conduct the exchange. Such agreement has to be filed before the National Banking and Securities Commission.

U.S. and Mexican authorities and banks jointly developed the questionnaire currently used as a template for the information sharing mechanism. In this regard, before or at the time of sharing information, Mexican banks shall provide the authorities copy of the information shared and relevant data thereof.

With this mechanism, Mexican banks can now share information with non US banks as well, subject to the same protocols.

13. In other cases, countries have mandated financial institutions to share specific information on certain financial transactions through centralized databases operated by such institutions or a financial authority, and take that information into account as part of the risk assessment that such institutions must carry out on their customers.

Mexico

In 2017, based on the same rationale as that related to credit bureaus, an AML/CFT regulation was issued to mandate banks to provide to a centralized database operated by the central bank or by such banks certain information on every international wire transfer or domestic wire transfer in foreign currency that they send or receive on behalf of their customers. In addition, under that regulation, banks are obligated to obtain from the database certain aggregate information of the wire

transfers processed by their customers in the banking system as a whole and take that information into account to carry out the due diligence on their customers that request a wire transfer, and the general risk assessment of them. Customers must consent with their respective banks that they submit and obtain that information from the database. The applicable AML/CFT regulation specifies the information that banks must submit to the database as well as the statistical information that the database will provide to the banks. The central bank has developed this database and banks will be able to exchange the information on their customers transactions at the end of 2017 and in a second stage, banks will have to provide certain KYC information and documents of such customers and check that information in the database.

14. There is a case for exploring how private sector entities could share specific threat information and high risk customer information with one another. In some jurisdictions databases to share STRs and related information have been created to facilitate information sharing among obliged entities, as well as administrative and law enforcement authorities. This facilitates better information sharing, as well as intelligence to assist in decision-making by authorities and the private sector, wherever relevant.

Spain

Article 33 of the Law on the prevention ML/TF permits obliged persons to exchange information relating to the transactions reported to the FIU with the sole purpose of preventing or forestalling transactions related to ML/TF when the characteristics or pattern of the specific case suggest the possibility that, following its rejection, a transaction wholly or partially similar to the latter may be attempted with other obliged persons.

To that end, central data bases can be created to share this information. Obliged persons and the judicial, law enforcement and administrative authorities competent for the prevention or suppression of ML/TF may consult the information contained in the files created. Regarding the obliged entities, access to the data shall be limited to the internal compliance units established by obliged persons.

D. Information sharing between financial institutions and authorities

15. A close relationship between the private and public sector is a critical element of a well-functioning AML/CFT system. The FATF Standards require countries to develop strong legal and operational frameworks to inform the private sector of ML/TF risks and to ensure that the private sector takes ML/TF risks into account in the course of its business. In the TF context, in particular, this may require combining information obtained from reporting entities with contextual and sanitised information from authorities.

Russia

Under the provisions of the Federal law on AML/CFT, a system of cooperation between FIU-Rosfinmonitoring, supervisory body- the Bank of Russia and REs is provided for in cases where there has been a denial in conducting transactions, opening an account or a contract has been terminated. In all such cases REs have to report to the FIU, where information is analysed and then transferred to the Bank of Russia in order to be communicated to the credit institutions and non-credit financial institutions via secured channels. The information received by REs is to be taken

into account by them in conducting risk assessment of their clients thus facilitating determination of relevant level of risk and elaboration of corresponding commensurate risk mitigation measures.

a) Public/Private Partnerships

16. The private sector holds a wealth of data, which can be utilised by the law enforcement for investigative purposes. In some countries, a public-private partnership has been created to foster information exchange between the public and private sector and among financial institutions which are part of that partnership. The objective of such formal or informal platforms is to provide a conducive environment for feedback and guidance between public and private sectors, as well as to share operational intelligence, information on risks and prevent, detect and disrupt possible threats.

Switzerland

Switzerland has different mechanisms or platforms to mutually exchange information with the private sector. In 2010, in the context of the revision of the FATF Standards, the Swiss authorities established a working group with the private sector bodies (ISFIN) to ensure mutual exchange of information in relation to the development of the regulatory framework in the field of AML/CFT. More recently, in the broader context of the interdepartmental coordinating group on combatting ML and FT established in 2013 – that is also responsible for the NRA – an additional contact group with the private sector has been set up. This group encompasses experienced selected AML/CFT experts in different sectors subject to AML/CFT legislation, such as banks, insurances and MVTS. It is established as a permanent platform to exchange views on the evolution, understanding and mitigation of existing and emerging ML/FT risks. It has already identified areas of future work between the public and the private sectors, such as typologies of TF and correspondent banking. This group helps enhance the communication with the private sector and awareness-raising on AML/CFT matters.

Hong Kong, China

The Fraud and Money Laundering Intelligence Taskforce is a public-private intelligence sharing mechanism involving the Hong Kong Police, the Hong Kong Monetary Authority and the banking industry with the aim of improving the detection, prevention and disruption of fraud, money laundering and other types of financial crimes relevant to Hong Kong's economy. Launched in May 2017 under a 12-month pilot project, the taskforce builds on existing levels of informal cooperation and sharing; preparatory meetings have taken place through 2016 to provide a formal structure for banks and competent authorities to improve collective understanding of threats to enhance targeting and intervention activity for law enforcement and better risk management for banks. The taskforce operates at both strategic and operations levels with threat-specific information alerts disseminated to the wider financial sector through a secure platform.

Australia

On 3 March 2017, AUSTRAC launched Fintel Alliance, which brings together government, industry, academia and international partners in collaborative and secure information sharing environment, thereby constituting a holistic approach to discovering, understanding and disrupting serious and organised crime, bribery and corruption and terrorism through the analysis of financial intelligence. The Fintel Alliance membership continues to grow with new applications currently being assessed. As of the end of April 2017, the Fintel Alliance comprises 19 partners including AUSTRAC, the AFP, NSW Police, the ATO, Australian Banks – ANZ, Commonwealth, Macquarie

Bank, National Australia Bank, Westpac, Western Union and PayPal. The UK National Crime Agency has joined the Fintel Alliance, and AUSTRAC is in discussions with other potential international partners.

The Fintel Alliance has established an Operations Hub where Government and industry intelligence analysts work side by side in joint operational projects, sharing information in near real-time. Three projects were undertaken to establish operations:

- examining the Panama Papers;
- identifying and profiling online money mules; and
- enhancing the use of Australian Cyber Online Reporting Network data.

17. These partnerships acknowledge the importance of involving the private sector, not only as a source of information, but also as a recipient for sensitive information and intelligence held by the public sector to better detect potential terrorist financing. Such sharing often happens in a secured environment after proper clearances are obtained, in order to facilitate further data-mining, operational analysis and scanning by the private sector to fill potential intelligence gaps. The engagement must be an ongoing process and not just transactional and driven by particular events, as the private sector should also have an accurate understanding of the constantly changing risk environment to complement the efforts of law enforcement.

Canada

Promoting TF-vigilance and STR Reporting by REs: Immediately after the attacks in Ottawa & Quebec, FINTRAC issued an advisory to REs to highlight the importance of filing STRs that may relate to similar types of TF threats. STR filings increased by 22% in the month of the Ottawa attacks (over 8,700 in October 2014). In addition to issuing reminders following other ISIL related attacks, FINTRAC has also developed and shared relevant TF indicators with REs.

Developing a real partnership with REs and sharing Operational Alerts and Briefs: Over the last few years, FINTRAC has worked closely with major financial institutions in fight against ML/TF. FINTRAC has developed a new line of products which include "Operational Alerts". Its purpose is to provide up-to-date indicators of suspicious financial transactions and high risk factors related to specific methods of ML/TF that are important either because they represent new methods, re-emerging methods or long-standing methods that present a particular challenge. This is intended to operationally support REs in identifying, assessing and mitigating related risks, as well as the reporting of related suspicions to FINTRAC. FINTRAC also developed "Operational Briefs" to provide clarification and guidance on issues that impact the ability of REs to maintain a strong regime of compliance with the Canadian legislation. More specifically, these products are focused on risk and vulnerabilities associated with exploitation for ML/TF, and on meeting STR obligations. FINTRAC is also currently developing a suite of TF-relevant "Operational Alerts" to provide Canadian REs with important contextual knowledge on TF, and attempt to provide indicators/red flags that REs can operationalise and use in their in house transaction monitoring and internal investigative processes, and ultimately increase the volume and quality of TF-related financial intelligence from REs.

18. The private sector is often looking for assistance and more detailed contextual information from the public sector to help interpret the data they already have. This could include, for example,

sharing a list of relevant individuals (i.e. people under monitoring, surveillance or investigation) suspicious behaviour. Such list-based approaches may help in identifying specific transactions and to detect the network or associations of subjects related to those listed. However, sharing lists of subjects is a sensitive issue as preserving the confidentiality of on-going investigations and operations is a priority for law enforcement authorities. This also has the potential to flag such customers as high risk and may lead to suspension or termination of business relationships, without due process of law or consideration, leading to legal challenges. Even if it is not possible to divulge the particular facts of a case, a general indication of the type of activity occurring can assist them to provide actionable financial intelligence. The sharing of indicators provides reporting entities with the ability to better detect suspicious activity and provide more effective STRs to the FIU.

19. The private sector maintain certain non-financial data about a customer for CDD purposes such as Internet Protocol (IP) addresses, mobile phone numbers, email and residential address and real-time geolocation data for online banking users. In combination with information from competent authorities, such information can become useful for law enforcement for detection and investigation purposes.

b) Information sharing in the context of suspicious accounts and transactions

20. Specific safe harbours provisions or specific forums and gateways can allow the sharing of suspicious transaction information, without necessarily the full content of the STR itself. Under strict provisions to protect the confidentiality of the information, those specific gateways can allow better information sharing not only between financial institutions that don't belong to the same group, but also in an inter-agency context. Such specific gateways aim at an effective and timely exchange of such information and helps law enforcement in pursuing its objectives of countering money laundering and terrorist financing.

EU-OF2Cen

EU-OF2Cen initiative is an EU-funded Italian project on internet fraud that now is rolled out at EU level. Its aims to enable the systematic, EU-wide sharing of internet fraud related information between banks and law enforcement services for the prevention of payments to fraudsters and money mules and for the investigation and prosecution of the perpetrators involved. The project is co-funded by the European Commission and supported by several key stakeholders from the banking sector and law enforcement.

21. Collaborating and sharing information, experiences and trends on risk indicators, for example the ones associated with TF, FTFs and small terrorist cells and raising awareness in a proactive manner by authorities helps build the capacity of the private sector. Meaningful results have been achieved through these successful public partnerships at FATF and Egmont group (for example, the recent TF Risk indicator report finalised by FATF, EGMONT bulletin regarding FTFs etc.)

USA

FinCEN's regulations under Section 314(a) of the USA PATRIOT Act enable FinCEN to reach out to more than 43,000 points of contact at more than 22,000 financial institutions to locate accounts and transactions of persons that may be involved in terrorism or money laundering. FinCEN makes these requests for its own analytical and investigative purposes and on behalf of federal, state,

local, and certain foreign (e.g. European Union) law enforcement agencies. Section 314(a) provides lead information only (financial intelligence) and is not a substitute for a subpoena or other legal process, which is typically used following the identification of relevant information to obtain the information for further investigative or evidentiary purposes.

Through an expedited communication system, FinCEN's 314(a) process enables an investigator to provide sensitive investigative lead information directly to reporting entities. FinCEN provides a secure e-mail system to disseminate this sensitive information. Based upon the initial information that the financial institutions provide, the investigative focus quickly zeros in on relevant locations and activities. In addition FinCEN will organise and host information sharing discussions with appropriate financial institutions to issue requests for information pursuant to Section 314(a). This cooperative partnership between the financial community and law enforcement allows disparate bits of information to be identified, centralised and rapidly evaluated.

Furthermore, the Domestic Security Alliance Council, or DSAC, is a security and intelligence-sharing initiative between the FBI, the Department of Homeland Security, and the private sector, including the largest US banks. Created in 2005, DSAC enables an effective two-way flow of vetted information between the FBI and participating members.

European Bankers Alliance initiative

The European Bankers Alliance initiative was launched in 2015, involving leading international financial institutions operating in the EU and Europol. It aims to help financial institutions develop jointly with law enforcement 'red flag' indicators related to human trafficking, to scan their systems for suspicious transactions and then alert the police.

22. Terrorism and TF information, by its nature, is highly sensitive and needs protection. A lack of trust between competent authorities and the private sector may inhibit sharing sensitive data. The public sector has the difficult task of balancing the confidentiality of sensitive operational information and creating awareness of TF risks with stakeholders. This highlights the importance of building a close relationship based on mutual trust and confidence. Strong formal and informal relationships with the private sector can assist in breaking down some of the barriers/delays in accessing information. In certain jurisdictions for example, often individual contacts are maintained by authorities with the money laundering officers of the financial institutions via whom information can be obtained.

UK

The Joint Money Laundering Intelligence Taskforce is a shared endeavour between financial institutions, industry regulators, Government and law enforcement operating in the UK. It was established in February 2015 and is now a permanent part of the UK's response to money laundering and terrorist financing. Its purpose is to provide an environment for the financial sector and government to exchange and analyse intelligence to detect, prevent and disrupt money laundering and wider economic crime threats against the UK. Its work includes strategic information sharing on common money laundering and terrorist financing methodologies, risks and typologies which are developed and shared with the wider financial sector through targeted alerts. It also has a tactical information sharing function which seeks to fill intelligence gaps where suspected laundering crossed multiple financial institutions. This tactical information sharing function is delivered through a co-located operations group, where vetted members of financial institutions meet with law enforcement officers every week to progress enquiries of

mutual interest. This work is underpinned by clear legal framework (provisions of section 7 of the Crime and Courts Act) and formal Information sharing Agreement. Enquiries progressed through this co-located operations group have resulted in arrests, the recovery of criminal funds, changes to banks internal systems and controls and new bank led investigations.

c) Guidance and Feedback

23. It is also important to provide the private sector with guidance and feedback, including to clarify regulatory expectations regarding the implementation of AML/CFT requirements, or to provide feedback on their reporting. For the private sector, this reinforces the need to commit substantial resources to compliance and engagement with law enforcement. Information shared on the emerging trends, patterns of behaviour and threats is vital for the private sector in order to enable them to run or modify their transaction monitoring systems, keeping in view the evolving situation and also to sensitise their frontline staffs who have a direct day to day relationship with customers.

24. Authorities may also discuss and share the types of information and intelligence that are of value to the private sector in identifying suspicious activity. While sanitised case studies and typologies on money laundering and terrorist financing can often be produced by the FIU in the form of an annual report, newsletter or e-bulletin, more detailed versions of case studies or analysis of past pattern can be shared with specific entities though appropriate channels, such as the forums and partnerships noted above. Another useful mechanism used to disseminate case studies and typologies are National Risk Assessments. These assessments are useful in engaging with the private sector at an early stage and in increasing the awareness of specific risks.

25. Information about particular countries which may pose a greater risk of terrorist financing or certain businesses that may pose a heightened security risk can also be shared by authorities with the private sector. In some cases, authorities may provide detailed data analysis on geographical areas concerning borders, logistical or transit areas. In other cases, financial information seized by law enforcement (e.g. bills of lading, receipts, etc.) may be shared with financial institutions, which may then use it to check against records in their own system to identify any relevant suspicious transactions.

France

The French FIU gives feedback to all entities which submit STRs. This opportunity to provide feedback is administered both generally and specifically. General feedback and guidance is provided through conferences, annual reports, participation in the AML Group of the Bankers' or Insurance's Association and compliance meetings with financial institutions. Specific feedback and guidance is given through informal contact with staff in companies, through offering acknowledgement of the receipt of reporting and offering review of reported cases. Furthermore, since the 3rd of June 2016, to organise the sending of information from financial institutions with the aim of reinforcing the fight against TF, the FIU has the power to designate natural or legal persons that might present higher ML/TF risks, which implies that financial institutions shall put in place enhanced CDD measures and special monitoring on these designated transactions or individuals.

Russia

General cooperation with the private sector participants, including for the purposes of improving quality of information sharing with competent authorities and feedback, is conducted regularly through established under the Interagency Commission on AML/CFT Consultative Council where largest financial institutions associations are represented and through established as a working body of the abovementioned Interagency Commission Compliance Council representing particular entities carrying out operations with money and other assets.

26. Guidance, feedback and outreach provide REs with meaningful or "targeted" information with the explicit purpose of helping the private sector provide better suspicious activity reporting. This cycle (or "feedback loop") ultimately leads to even better outreach by the competent authorities to the reporting institutions that further enhance reporting standards. This may also help the private sector needs to build typologies across a number of parameters. This can be carried out keeping in view the sensitivity of the information and the kind of input solicited from the private sector.

China

The People's Bank of China summarised main features of suspicious transactions related to TF, developed TF suspicious transaction monitoring model, and shared this model with key financial institutions and financial institutions in key regions. Use of this model leads to a significant increase of the number of TF related STR reported by financial institutions and leads to several successful investigation and prosecution of TF Crime. A commercial bank successfully screened transactions of one individual related to ISIL. At present, the PBC is making continuous optimisation and adjustment of the model based on practice.

Australia

Regular meetings with relevant private sector institutions– e.g. AUSTRAC engages with private industry through quarterly forums with major reporters and efforts to share information about behaviour patterns.

Romania

The annual report of the Romanian FIU is a strategic analysis product and primarily aims to provide relevant feedback to reporting entities. It shows the FIU's perspective considering its position as collector of information from the entire financial and non-financial system. The material provides a description of the main categories of suspicious financial behavior, based on the information from STRs submitted. Through its partnership with the reporting entities, the FIU seeks to support their need to know: What they should report? What the other entities are reporting from their field? The feedback increases the trust and helps reporting entities regulate the suspicious behavior detection systems. In addition, the reports are relevant to the common effort of the LEAs.

27. Providing feedback on the quality of reporting is vital to ensure that financial institutions develop a sense of ownership and are able to update their systems and procedures. This also facilitates a clear articulation of the supervisory expectations and a better response from the financial institutions to meet those objectives. Guidance, especially when shared with a wider audience is also helpful in developing a good industry practice across the sector.

France

Many FIUs and sector regulators provide such feedback on a regular basis, with a view to improve the quality and quantum of reporting being made by the financial institutions. For example, France provides feedback during bilateral meetings with reporting entities on an annual basis and provides general feedback during industry forums.

Turkey

In Turkey, MASAK regularly meets with compliance officers of the banks in relation to AML/CFT matters which also include terrorist financing risks. In those meetings, compliance officers of banks are informed of the latest developments and the parties exchange ideas with each other.

Australia

Australia provides guidance and feedback on STRs to a number of key stakeholders on a periodic basis. Each quarter the FIU and law enforcement will meet with the four largest banks to discuss compliance issues and provide feedback on STRs. These meetings have resulted in a 300% increase in STRs relating to TF, following targeted outreach on TF risk indicators.

Hong Kong, China

The Joint Financial Intelligence Unit (JFIU) and the Hong Kong Monetary Authority (HKMA) have worked together to increase both the quality and quantity of STRs in the territory. A guidance paper was issued in December 2013 by the HKMA and JFIU providing feedback from thematic examinations (such as specific guidance on quality and consistency of reports) and specific industry training was jointly provided in 2014. Immediately following this work STR volume increased by 14% from 27,328 in 2013 to 31,095 in 2014. In parallel JFIU provides sector wide feedback in annual AML training for all sectors and individually on a needs basis while the HKMA continues to include reviews of STRs made by banks in its on-site work with a focus on quality. General feedback and guidance to private sectors is also provided by JFIU and HKMA, for example through STR quarterly reports promulgated in JFIU's website, conferences and AML/CFT seminars. Specific feedback and guidance is also given through informal contact or ad-hoc meetings with the reporting entities offering views of the reported cases.

28. Feedback from the private sector on drafts of risk profiles and risk indicators may be helpful in order to refine the final product; before they are issued by the authorities as a formal guidance. Some countries have developed a TF platform for this purpose as well as for providing feedback on STRs and share new trends and methods.

29. Information regarding real time incidents needs to be more detailed and specific to enable the private sector to take immediate action. Data held by the private sector can also assist authorities to identify specific threats and to provide real-time information during or after a terrorist incident, for example. However, concrete information relating to specific individuals and events are often subject to restrictions. Practical challenges exist with respect to ongoing or active terrorism or terrorist financing investigations. In some cases, authorities and private sector entities are therefore not able to act in good faith because of legal restrictions, privacy protection or liability issues. Establishing exceptions or protocols should be considered to allow authorities to share information

with the private sector, as needed on an urgent basis, when there is a real-life incident unfolding or where there is actual, or potential for, loss of life.

30. Some countries have developed a separate online portal and other tools for making requests for information from the private sector and for sharing of information in a secured and efficient manner. This ensures that such requests are prioritised and are addressed in a timely manner, especially in matters involving terrorism or terrorist financing, where the objective is to prevent such attacks.

China and Turkey

Online portals for making requests and receiving reports from the private sector and for providing information to the private sector are being used in certain countries (e.g. China - Digital Information Inquiring System) between the public security and the banking sector. In Turkey, MASAK requests the financial data in banks electronically through red network established with each bank and the data imported electronically via red network. The security of data is ensured through adequate safety protocols and authentications.

d) Sector-specific engagement, outreach and guidance

31. Some countries have developed specific engagement programmes with sectors that appear vulnerable to threats, including TF threats. Such sectors may or may not be within the regulated community, but may be important in view of the emerging pattern and analysis. Local authorities and other stakeholders in vulnerable terrorist areas, including the NPO sector may also be involved to collaborate and identify preventive and other measures to address these threats.

France and Switzerland

Reaching out to vulnerable sectors is an important strategy of many jurisdictions in the fight against terrorism and TF. For example, Ministry of Finance (MoF), France communicates with art and antiquities dealers in order to draw their attention to the specific TF risks related to their field of business, especially with regard to ISIS's ongoing financing activities. The MoF has published a guide for NGOs, which invites financial institutions to undertake concrete measures to sensitise their customers to these specific risks (antiques, oil trade with Iraq). Similarly, following the publication of the NRA in Switzerland, the Swiss authorities initiated a dialogue with the art trade sector to discuss the AML/CFT measures applied by this sector. Separate meetings were held with the sector to raise awareness. This included, representatives of a major international auction house involved in the business.

Canada

Outreach to the charitable sector is conducted to advise charities of their legislative obligations and how to protect themselves from terrorist abuse. This includes general guidance on topics related to sound internal governance, accountability procedures and transparent reporting, as well as specific tools such as a checklist on avoiding terrorism abuse and a web page on operating in the international context. Outreach can take on a variety of forms, including a web presence/RSS feed, email distribution lists, webinars and face-to-face meetings.

e) Mechanisms of Information sharing

32. Two-way relationships between the private and public sector are necessary to combat ML/TF. Mechanisms for information sharing can include formal meetings and informal briefings, both at the one-on-one level and with multiple entities. Many countries hold at least a yearly forum or seminar with the private sector to discuss emerging threats, risks and trends. Operational entities such as law enforcement or security agencies are often included to provide practical case examples or specific information on risk. In other cases, discussions on MLTF risks take place as part of the conferences, seminars, and training for reporting entities. Additionally, this outreach may also occur at the initiative of the private sector to enable more expansive discussion of the potential criminal activity.

33. There may also be a case for a having a mechanism or process within a jurisdiction for the private sector to report potential TF transactions or at least those that appear to indicate that a terrorist act may be imminent to law enforcement/security services in near real time. This presupposes that the competent authority has the channel to receive this type of information and can act accordingly. Examples include dedicated telephone "hotlines or a legal obligation on financial institutions to report such cases on an immediate basis rather than within the time-frame of a STR filing obligations.

34. In some cases, specific TF working groups or task forces have been established between the public and private sector. These types of task forces provide a forum for operational collaboration which is instrumental in improving the analysis and investigation functions of all parties involved.

Egypt

The Federation of Egyptian Banks (FEB), established as a non-profit independent entity, connects all Egyptian banks and foreign banks working in Egypt. The objectives are to discuss and share common issues between the members of the federation; this is in addition to giving opinions of draft laws and suggesting amendments of current legislation related to the banking sector.

In 2003 a Compliance Officer Association was created as an initiative of the FEB. All compliance officers of the banks operating in Egypt are members in this association. Regular meetings are held on issues regarding combatting ML/TF. The Central Bank and FIU are always invited to attend these meetings to provide feedback and technical assistance on the issues raised by the compliance officers.

FATF

PRIVATE SECTOR INFORMATION SHARING

The guidance identifies the key challenges that inhibit sharing of information to manage ML/TF risks, both group-wide within financial groups, and between financial institutions which are not part of the same group. It articulates how the FATF standards on information sharing apply and highlights examples of how authorities can facilitate the sharing of information, as well as examples of constructive engagement between the public and the private sectors.

FATF

FATF REPORT

Operational Issues Financial Investigations Guidance

June 2012

FINANCIAL ACTION TASK FORCE

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

TABLE OF CONTENTS

FINANCIAL INVESTIGATIONS GUIDANCE

I. PURPOSE OF THE GUIDANCE

1. During the latest revision of Financial Action Task Force (FATF) standards, greater attention was given to the operational anti-money laundering/countering the financing of terrorism (AML/CFT) framework. One goal was to strengthen the law enforcement standards (Recommendations 30 and 31) to enhance the functions, responsibilities, powers and tools of law enforcement to effectively conduct money laundering (ML), terrorism financing (TF) and asset-tracing investigations. The revised standards now recognise financial investigations as one of the core elements of the FATF's operational and law enforcement Recommendations. This guidance note is not a standard or interpretative note and is only intended to help countries better understand law enforcement's role in the larger AML/CFT context, specifically addressing the role of financial investigations. The intention of this guidance note is to assist policy makers as well as practitioners by providing ideas and concepts that they can incorporate into their AML/CFT frameworks that might lead to more effective financial investigations. These ideas can go beyond the scope of the standards but are intended to provide examples of ways in which countries conduct financial investigations. As an added benefit, the guidance can also be useful to future AML/CFT assessments and could assist countries in improving the effectiveness of the operational AML/CFT regime.

2. The term *financial investigation*, for the purpose of this guidance note, means an enquiry into the financial affairs related to criminal conduct. The major goal of a financial investigation is to identify and document the movement of money during the course of criminal activity. The link between the origins of the money, beneficiaries, when the money is received and where it is stored or deposited can provide information about and proof of criminal activity.[1] By identifying the extent of criminal networks, the scale of criminality, by tracing proceeds of crime, terrorist funds and other proceeds subject to confiscation and by developing evidence which can be used in criminal proceedings, the overall effectiveness of a country's AML/CFT regime will be enhanced. This guidance contains overarching concepts, strategies and techniques which are meant to be applicable to different legal systems and different types of operational frameworks and is intended to assist countries on how best to implement the FATF Recommendations associated with conducting financial investigations. This guidance will highlight areas where training and technical assistance for financial investigators and prosecutors[2] can be sought but is not to be viewed as a training manual on financial investigations. Throughout the document references are made to information that provides further detail on financial investigation.[3]

3. Before any of the requirements of the FATF standards can be implemented by operational authorities, a comprehensive legal framework is necessary to underpin these requirements, and the

1 See FATF (2012), Interpretative Note to Recommendation 30, 2nd paragraph.

2 For the purposes of this guidance note the term prosecutor also includes investigative magistrate and investigative judge

3 See also the list of selected sources relating to financial investigation at the end of this document.

use of investigative techniques can only be applied if they are permitted by and within the possibilities of the basic principles of a country's domestic legal system. This guidance will highlight elements of the Palermo Convention[4] which are necessary to implement many of the law enforcement powers and techniques described in this guidance.

STANDARDS RELATED TO LAW ENFORCEMENT

4. The FATF Recommendations are designed to detect illicit financial activity, protect the integrity of financial markets, bring criminals to justice and prevent threats to national security. Law enforcement should seek to prevent, deter and disrupt ML, associated predicate offences, the financing of proliferation of weapons of mass destruction and TF activity. Also, law enforcement should be aiming to deprive criminals of their illicit proceeds and terrorists of the resources needed to finance their activities. For the purposes of this guidance note – which seeks to clarify the role of law enforcement in conducting financial investigations – the following FATF Recommendations are relevant:

5. **National cooperation and coordination:** According to the new standards, each country should have a national policy on anti-money laundering and counter terrorist financing, (Recommendation 2). This policy should be informed by the risks identified, and such policy should be regularly reviewed in order to ensure that it stays accurate and contemporary. Knowledge acquired through financial investigations can be used for risk assessment and monitoring purposes. Countries need a national policy to drive the national agenda for combating money laundering, associated predicate offences, terrorist financing and proliferation. Countries should have formalised co-ordination mechanisms which enable authorities to develop and implement these policies. This should facilitate co-operation, informal and formal, between authorities in general and within law enforcement in particular.

6. **Statistics:** FATF places emphasis on effectiveness, and the collection of data is a necessary element to understand how countries determine the effectiveness of financial investigations. For example, money laundering offences and activities should be pursued criminally using financial investigations, and offenders should be prosecuted and appropriately sanctioned. Recommendation 33 is designed to ensure that effective record-keeping systems are in place for reporting statistically what has been accomplished through ML/TF investigations, prosecutions, convictions, property freezing, seizures and confiscation, along with other relevant data.

7. **ML and TF offences:** Recommendations 3 and 5 are the core Recommendations requiring that money laundering and terrorist financing activities be criminalised as independent criminal offences. To successfully prosecute these offences without a prior financial investigation is extremely difficult. This guidance note is to assist countries to better develop their capacity to conduct a proper financial investigation.

8. **Confiscation and provisional measures:** Recommendations 4 and 38[5] address measures to identify, trace and evaluate property which is subject to confiscation. The Recommendations call for

[4] United Nations (2000).

[5] FATF (2010): A list of selected sources for financial investigation with complete bibliographic information is included at the end of this report.

the use of provisional measures, such as freezing and seizing, to prevent any dealing, transfer or disposal of such property. The standards recommend that countries initiate appropriate investigative measures.

9. **Responsibilities of law enforcement and investigative authorities:** Recommendation 30 calls on countries to designate criminal investigators to pursue ML and TF offences. New requirements include the need to pursue parallel financial investigations as well as to make use of domestic and international investigative task forces or multidisciplinary teams. Therefore, countries should ensure that their legal framework does not impede the usage of such multi-disciplinary groups. The Interpretative Note to Recommendation 30 applies ***to criminal investigators*** who are responsible for pursuing the criminal violations involving the ML and TF offences. The note also clarifies that law enforcement investigators of designated offences[6] should either be authorised to pursue the investigation of any related ML/TF offences during a parallel investigation or be able to refer the case to another designated agency to follow up with such an investigation. Further, this guidance note also applies not only to those ***competent authorities*** which are not law enforcement authorities per se but also to those authorities which have the responsibility for pursuing financial investigations of predicate offences to the extent that they are exercising functions covered under Recommendation 30. For example, anti-corruption enforcement authorities and tax authorities with enforcement powers may be designated to investigate ML and TF offences arising from or related to corruption or serious tax offences under Recommendation 30, and these authorities should also have sufficient powers to identify, trace, and initiate freezing and seizing of assets in accordance with the laws of the jurisdiction. This guidance is also relevant to ***public prosecutors***, especially when their role is to co-ordinate the necessary investigative resources in the field which are required to pursue complex financial investigations and organised crime cases. Prosecutors are often responsible for a variety of tasks associated with the financial investigation and in preparing evidence to support formal charges. While the focus is on creating specialised "financial investigators", all criminal investigators should be trained on the value of financial evidence to support all criminal investigations. Raising awareness should also apply to street level crimes, in addition to long-term investigations, thus requiring changing the dynamics and attitudes of investigators and prosecutors regarding the utility of financial investigations. This guidance should also be useful to ***policy makers*** and those who deliver technical assistance.

10. **Powers of law enforcement and investigative authorities:** Recommendation 31 stresses the need for investigators to have access to all necessary documents. This includes having powers to compel the production of financial records and obtain evidence. The Recommendation is designed to enable the use of a wide range of investigative techniques which include undercover operations, intercepting communications, accessing computer systems and controlled delivery. Section VI of this report addresses these techniques. Specific requirements also include establishment of mechanisms to identify the owner/controller of accounts, including the ability to identify assets without tipping off the owner and to seek and utilise information from the FIU.

11. **International co-operation:** Recommendation 40 calls on countries to establish mechanisms allowing financial investigators to obtain and share information on each other's behalf. Countries are expected to establish mechanisms for investigators to use their powers to assist

6 See FATF (2012), Glossary.

foreign financial investigations. Recommendation 40 states that law enforcement should be allowed to establish and utilise joint investigative teams with law enforcement in other countries and promotes the posting of liaison officers. Some co-operation can be accomplished through bilateral and multilateral arrangements, including memoranda of understanding (MoUs), when needed. Financial investigators are encouraged to strategically include co-operation with non-counterparts as part of financial investigations, indirectly or directly. Recommendation 40 is designed to ensure that information received from other countries is used for investigative and law enforcement purposes and that information received is protected from unauthorised disclosure. Further, the Recommendation advocates that countries establish procedures to allow informal exchanges of information to take place (prior to the submission of a formal request); in essence, advocating the exhausting of all forms of informal co-operation prior to the submission of a mutual legal assistance (MLA) request.

12. **Cash couriers:** The requirements to collect, record and share information related to Recommendation 32 are invaluable when pursuing a financial investigation. In particular, on-going criminal investigations can benefit greatly when it is known that targets or associates have previously filed cross-border cash declarations. These declarations often help investigators establish knowledge and intent in on-going money laundering or criminal investigations. While the main objective of Recommendation 32[7] is to put measures in place to detect the physical cross-border movement of currency and negotiable instruments, a financial investigation is an important follow up component of any Recommendation 32 regime.

OBJECTIVES AND BENEFITS OF FINANCIAL INVESTIGATION

13. Countries should ensure that financial investigations become the cornerstone of **ALL** major proceeds-generating cases and terrorist financing cases and that their key objectives include:

- Identifying proceeds of crime, tracing assets and initiating asset confiscation measures, using temporary measures such as freezing/seizing when appropriate.
- Initiating money laundering investigations when appropriate.
- Uncovering financial and economic structures, disrupting transnational networks and gathering knowledge on crime patterns.

14. A financial investigation involves the collection, collation and analysis of all available information with a view towards assisting in the prosecution of crime and in the deprivation of the proceeds and instrumentalities of crime. Criminals usually like to maintain some degree of control over their assets, and as a result there is usually a "paper trail" that will lead back to the offender. That paper trail can also be followed to identify additional offenders and potentially the location of evidence and instrumentalities used to commit the crimes. The ability of law enforcement agencies to conduct financial investigations and have access to financial and other information is essential to effectively combating ML, associated predicate offences and TF offences. Such investigations will

7 FATF (2005).

often establish the existence of otherwise unknown crimes and assets that have been purchased with proceeds of criminal activity, thus allowing these assets to become subject to confiscation.

15. A financial investigation can be used as an instrument to reveal undiscovered predicate offences and to identify other people or companies. Thus, it is imperative for countries to use financial intelligence upstream and downstream within their value chain. This means that the flow of financial intelligence between regulators, supervisors, FIUs, law enforcement and other competent authorities (the value chain) should be free-flowing to and from all entities in accordance with existing domestic laws, policies and procedures and should be results-driven, not process-driven. If such a fluid system of sharing financial information and intelligence is established, the country will make more effective use of financial data, thus becoming more effective in combating money laundering, terrorist financing and major proceeds-generating offences.

16. Countries should take appropriate measures to protect the human rights of the targets of their investigations. Financial enquiries are often intrusive and result in obtaining private information on an individual. Competent authorities involved in financial investigations must be aware of their country's human rights legislation protecting the right to privacy, along with associated considerations. Investigators should be able to justify such enquiries as proportionate, non-discriminatory, legitimate, accountable and necessary to the investigation being undertaken. As a rule, such measures ensure that the targets of investigation have the right to a fair trial, the presumption of innocence and the protection of property.

II. OPERATIONAL FRAMEWORK

INVESTIGATIVE STRATEGY

17. Financial investigation should be an integral part of an overall crime strategy. Countries should establish a comprehensive policy that sufficiently emphasises financial investigation as an integral part of law enforcement efforts. Clear objectives, dedicated action, sufficient resources, training for investigators and use of the legal tools available in a comprehensive, creative, consistent, and committed manner are all important elements of an effective financial investigation strategy in any country. Countries should take active measures to ensure that financial investigations become a routine part of all law enforcement inquiries related to crime with financial gain.

18. Countries should be proactive in developing effective and efficient strategies to make financial investigations an operational part of their law enforcement efforts. The following are some of the key elements that should be contained in these strategic plans:

- Ensuring support from high-level officials within the country who publicly promote and adopt a national AML/CFT strategy.
- Releasing public statements by high-ranking officials supporting and demonstrating commitment to the national strategy and recognising their accountability.
- Establishing strategic planning working groups to develop an effective policy that incorporates the skills of all relevant agencies into an action plan; these groups include representatives from all relevant agencies and components participating in financial investigations.
- Conducting needs assessments and advocacy in promoting proper allocation of resources.
- Creating specialised investigative units that focus on financial investigations.
- Developing operational initiatives that promote the proactive use of powers to freeze assets.
- Articulating clear objectives for relevant departments and agencies that include effective coordinating structures and accountability.

19. Countries should make it a policy priority to ensure that there are an adequate number of properly trained financial investigators. These financial investigators should be experienced in financial investigation matters involving both domestic laws and international conventions and standards. Countries should create institutional conditions that provide the appropriate environment to carry out financial investigations and to facilitate cooperation by providing the proper legal authority for any involved competent authorities as indicated in Recommendation 31. Financial investigations should be worked in close association with or fully integrated within "normal" or other predicate offence investigations. Ensuring that financial investigative specialised

units can work closely with different competent authorities where specialised knowledge and expertise is required should be part of "standard operating procedures."

20. Countries should establish a strategic approach to financial investigations and consider implementing programmes whereby agencies, such as confiscation agencies, certain law enforcement agencies or financial intelligence units (FIUs), are reimbursed costs incurred on financial investigations with asset recovery actions such as the hiring of experts, translation costs, international travel, etc.

PARALLEL INVESTIGATIONS

21. Parallel investigations represent, in relation to financial investigations, focusing on the predicate offence and the money laundering offence simultaneously. In relation to terrorism investigations, parallel investigations focus on the terrorism offences and terrorist financing offence at the same time.[8] Recommendation 30 states that, for all money laundering, associated predicate offences and terrorist financing, law enforcement authorities should develop a proactive parallel investigation. The concept of having parallel investigations brings together expertise from both investigative backgrounds which is complementary and ensures offences are fully investigated.

22. Conducting a parallel financial investigation of the predicate offence is being proactive, as it identifies the proceeds of the crimes currently under investigation for seizure/restraint. It therefore ensures that the assets will not dissipate/disappear and prevents the infiltration of illegal profits into the legal economy, thereby removing the instrument for committing future crimes. The practice thus contributes to upholding the principle in both law and society that no person should benefit from crime.

23. Financial investigations are data intensive. Specifically, they involve records, such as bank account information, which point to the movement of money. Any record that pertains to or shows the paper trail of events involving money is important. The major goal in a financial investigation is to identify and document the movement of money during the course of the commission of an offence. The link between where the money comes from, who receives it, when it is received, and where it is stored or deposited can provide proof of criminal activity. Financial information can also assist the parallel investigation into the predicate offences by:

- Identifying motives, associations and links to people and places.
- Identifying the use of other services such as phones, transport and amenities relevant to the case.
- Locating or identifying suspects, witnesses or victims.
- Providing information on a suspect's movements (proactive, covert use of financial information).
- Providing information to address the issue of prolific and priority offenders where no previous method has been successful.
- Tracing persons.

8 See Section III on terrorist financing.

24. For many major proceeds-generating offences, money laundering is simply the by-product of criminal activity. After the criminal receives the proceeds of the crime, he/she usually wants to do something with these proceeds. The ability to follow the paper trail allows the full development of the facts and circumstances involved in the case to be shown in a logical and sequential pattern, and simplifies the understanding of how the financial pieces fits together. Parallel investigations ensure competent authorities uncover and identify all of the participants in a criminal enterprise. A parallel financial investigation provides insight into the hierarchy of criminal organisations, exposing them to possible prosecution.

25. Information, intelligence[9] and evidence obtained during parallel investigations can be shared and resources can be effectively used to avoid duplication of services. For example, a predicate offence investigation may be utilising the interception of communication to collect information/evidence not only of a predicate offence but also of the associated money laundering offence; this information could then be used in seizure/restraint and forfeiture orders. A financial investigation enhances and corroborates a predicate offence investigation, as it shows lifestyle, unexplained wealth and, depending on the country, can be used as indirect proof (inferred by the courts) as the only explanation that the wealth is from illegal activity, thereby helping to establish sufficient evidence to prosecute a person on criminal charges for both predicate and related money laundering offence. This will form the basis for seizure and forfeiture and can be accomplished through the collation and presentation of either direct or circumstantial evidence. Thus, financial investigations help to target the top echelon of a criminal organisation.

26. Countries should consider including in their standard operating procedures for investigative agencies some form of checklist or outline of the essential elements for conducting financial investigations. This can help structure each financial investigation and be used as a guideline for investigators.

MULTI-DISCIPLINARY GROUPS OR TASK FORCES

27. Particularly in large, complex financial investigations, it is important to assemble a multi-disciplinary group or task force to ensure the effective handling of the investigation, prosecution and eventual confiscation. There should be a strategic approach to intra-agency and inter-agency co-operation in an effort to support information/intelligence sharing within and between agencies and with foreign counterparts.

28. Multi-disciplinary groups may comprise a range of individuals, including specialised financial investigators, experts in financial analysis, forensic accountants, forensic computer specialists, prosecutors, and asset managers. Experts may be appointed or seconded from other agencies, such as a regulatory authority, the FIU, a tax authority, an auditing agency, the office of an inspector general, or even drawn from the private sector on an as-needed basis. The multi-disciplinary groups should include individuals with the expertise necessary to analyse significant volumes of financial, banking, business and accounting documents, including wire transfers, financial statements and tax or customs records. They should also include investigators with experience in gathering business

[9] The term *intelligence* in this context includes and focuses on intelligence agencies working on national security matters.

and financial intelligence, identifying complex illegal schemes, following the money trail and using such investigative techniques as undercover operations, intercepting communications, accessing computer systems, and controlled delivery. Multi-disciplinary groups should also consist of criminal investigators who have the necessary knowledge and experience in effectively using traditional investigative techniques. Prosecutors also require similar expertise and experience to effectively present the case in court.

29. After assembling multi-disciplinary a group, it is imperative to have efficient and effective co-ordination between members of the team as well as all agencies involved. The failure of agencies or departments to link information/intelligence often plagues complex financial investigations. Some mechanisms that promote intra-agency and inter-agency co-operation are:

- Establishing information sharing systems whereby all investigative services would be aware of previous or on-going investigations made on the same persons and/or legal entities so as to avoid replication; conducting conflict resolution discussions and promoting cross-fertilisation.
- Establishing policies and procedures that promote the sharing of information/intelligence within intra-agency and inter-agency co-operative frameworks; such policies and procedures should promote the strategic sharing of the necessary information.
- Establishing a process whereby intra-agency or inter-agency disputes are resolved in the best interest of the investigation.
- Competent authorities should consider establishing written agreements such as MoUs or similar agreements to formalise these processes.

30. To enhance the level of expertise in relation to financial investigation within competent authorities, it should be possible to engage experts. In some cases, it may be useful or necessary to appoint experts or consultants who bring technical expertise in financial analysis, forensic accounting and computer forensics. Adequate safeguards should be in place when engaging private entities which minimise the risks of compromising the integrity of investigations.

31. Countries should develop a strategy to enhance co-operation between the public and private sectors beyond their reporting obligations (see Annex). As a source of financial information, the private sector is the owner of its data, has a vested interest in protecting its standing, has the ability and the expertise to process its data and often may be in a better position than law enforcement agencies. Adequate protection of information and right to privacy should also be part of the information exchange done within legal parameters. Thus, information exchange within legal parameters should be enhanced between the sectors to better and more effectively identify activity that may assist law enforcement in conducting financial investigations.

ASSET RECOVERY

32. Successful asset recovery requires a comprehensive plan of action that incorporates a number of important steps and considerations. Competent authorities will need to gather and assess the facts to understand the case, assemble a team, identify key allies, communicate with foreign practitioners (if a foreign nexus is established), grapple with the legal, practical, and

operational challenges and ensure effective case management. Countries should also strategically look at options other than criminal confiscation, such as *non-conviction based* (NCB) or even administrative proceedings.

33. One of the biggest challenges in asset recovery investigations is producing the evidence that links the assets to the criminal activities (*property-based* confiscation) or proving that assets are a benefit derived from an offence committed by the target (*value-based* confiscation). To establish this link investigators must identify and trace assets up to the point where the link with the offence or location of the assets can be determined. To achieve this, countries should consider creating specialised confiscation units, made up of financial investigators and prosecutors to identify and trace assets for the purpose of confiscation. If such an approach is taken, financial investigators dedicated to tracing and confiscating assets must then work closely with their counterparts in pursuing the criminal prosecution. Failure to do so can have negative consequences for the criminal case, and that in turn is likely to affect confiscation efforts.

34. As discussed in the Interpretative Notes to Recommendations 4 and 38, countries should establish mechanisms that will enable their competent authorities to effectively manage and, when necessary, dispose of, property that is frozen or seized or has been confiscated.[10] These mechanisms should be applicable both in the context of domestic proceedings and pursuant to requests from foreign countries.[11] Asset management units should work closely with financial investigators and prosecutors to prevent the confiscation of assets that could be too cost-prohibitive or cumbersome to maintain.

35. Another challenge in asset recovery investigations is the lack of central oversight as each asset recovery case passes through the various stages of the judicial system. A lack of central oversight of the process can result in blockages within the criminal justice pipeline. This can result in each stage of the process becoming fragmented; dealt only in isolation, making it difficult to co-ordinate financial investigation, seizure and confiscation from start to finish. To overcome this, countries should consider the creation and use of a national asset recovery database which records information on each asset recovery case as it passes through the criminal justice system. This allows information to be considered and analysed centrally with all stakeholders uniformly applying a statistical methodology. This should enable the identification of blockages in the process which in turn allows the swift resolution of such issues.

36. Such a database provides a single source of historic information about asset recovery actions for the use of on-going investigations and also facilitates greater understanding and co-operation among competent authorities. Such a system often contributes to better co-ordination, allowing for more assets to be identified, seized and successfully confiscated. A national database is also an important tool because it helps to improve the effectiveness of the asset recovery regime and support a "joined-up" approach to legal and operational processes. Statistics for the purposes of Recommendation 33 may also be retrieved from the database.

10 FATF (2010).

11 See Brun, J.P., *et al* (2011).

REGISTRIES

37. As mentioned in Recommendation 24, countries should ensure that there is adequate, accurate and timely information on the beneficial ownership and control of legal persons that can be obtained or accessed in a timely fashion by competent authorities. Moreover, as mentioned in Recommendation 25, countries should ensure that there is adequate, accurate and timely information on express trusts, including information on the settlor, trustee and beneficiaries that can be obtained or accessed in a timely fashion by the competent authorities. Such accurate and timely information is vital to a financial investigation. Complex financial investigations involving the use of corporate vehicles require imaginative, tenacious and expert investigators. Hence, in order to properly investigate complex cases involving corporate vehicles, countries should provide financial investigators more education, development and training regarding:

- The nature of corporate vehicles around the world and their potential for misuse.
- The most effective investigative skills and techniques for "piercing the corporate veil".

38. In order to facilitate financial investigations, countries could develop and maintain publicly available registries, such as company registries, land registries, and registries of non-profit organisations. If possible, such registries should be centralised and maintained in electronic and real-time format, so that they are searchable and updated at all times. Such a system will speed up the access of financial investigators to necessary information related to identifying, tracing, freezing and subsequently confiscating assets.

39. In order to assist competent authorities in obtaining access to relevant information in financial investigations, certain basic information on legal entities should be maintained in corporate registries.[12] Such basic information must be easily verifiable and unequivocal.[13] Where feasible, the transition of company registry systems from passive recipients of data to more active components in a country's AML/CFT regime is encouraged. Countries are also encouraged to direct more resources to their company registries to ensure that the basic information supplied is compliant with the Recommendations. Registries would benefit from implementing a robust *on-going* fact-checking component (even if based solely on statistically significant random sampling). Those that demonstrate an effective capacity to enforce financial penalties or other punitive measures against noncompliant registered legal entities will contribute to improving the accuracy of data. As a result, financial investigators would have immediate access to high-quality data rather than the outdated often inaccurate information.

40. Countries should make technological investments in their corporate registry systems. If a registry is to become an efficient AML/CFT tool, this development, including the upgrading of resources specifically for this purpose, needs to be planned carefully. A computerised registry is preferable to a paper-based one, and an online registry is preferable to a closed-network.

---

12 See FATF (2012), Interpretative Note to Recommendation 24 - Transparency and Beneficial Ownership of Legal Persons.

13 See US Department of Justice (n.d.)a, for a list of the information that should be maintained.

41. Countries could assign unique identifiers to legal entities incorporated within their jurisdiction. This enables financial investigators to collect evidence from different domestic agencies within the jurisdiction (for example, tax, licensing, or municipal authorities) most efficiently. This is especially pertinent to operational entities, and if the process of receiving a unique identifier is sufficiently streamlined, it may be further applicable to all legal entities in the jurisdiction (including foreign legal entities, which may have only an operational connection or only be administered from that jurisdiction).

42. Documented particulars of a legal entity's organisation, including those details that indicate beneficial ownership and control, copies of all banking documents, as well as all powers granted to non-officers, should be kept at the registered domestic address of the legal entities. This allows law enforcement authorities to find all necessary information in one location. Moreover, such information should be held physically or electronically within the jurisdiction under whose laws it has been created.

III. TERRORIST FINANCING

43. Money laundering and terrorist financing activity appear as interrelated topics; however, nuanced differences exist between these two distinct criminal offences. These differences need to be understood by law enforcement and those who conduct financial investigations. While terrorist organisations may utilise money laundering techniques when raising funds from criminal proceeds, there are certainly many sources and techniques that these groups use in order to raise funds "legitimately" without engaging in illegal activity[14]. Put another way, money laundering is the process of making dirty money appear clean whereas terrorist financing most often involves clean money being utilised for nefarious purposes.

44. Terrorist financiers want to mask their activities from law enforcement authorities. The motivation of the perpetrators is ideology based with the primary goal of advancing the organisations goals or agenda. This includes having access to funds to meet broad organisational requirements including, but not limited to, propaganda, recruitment, travel and acquiring weapons.

45. In the case of a terrorism investigation, a terrorist financing investigation is crucial, as it can identify targets early in a terrorism plot, such as when they set up a safe-house, and it allows more time for investigation and disruption. Terrorist financing should be viewed not only from an evidentiary perspective but, arguably more importantly, from an intelligence standpoint. Terrorist financing investigations can greatly benefit from focusing on the relationships financial information reveals and the intelligence value that can be derived from the associated "non-financial" information such as phone numbers, email addresses, passport numbers, etc. contained in financial documents. Detecting and investigating terrorist activity is significantly enhanced when national security intelligence and financial information are used together. Exploiting this additional intelligence can identify those leads that may otherwise go undetected and help prevent future attacks.

46. In order for a terrorist operation to be conducted there must be a source of funding no matter how big or small. While the sources of funding are only limited by imagination, individuals engaged in terrorist financing can be viewed with more specificity. Financial supporters of terrorist operations may be involved in four distinct but interrelated roles: *donor*, *fundraiser*, *facilitator*, and *operative*. More specific examples of these different interrelated roles will help explain how terrorist financing in practice can occur, but are not to be considered as legal definitions. *Donors* are individuals who, wittingly or unwittingly, support the terrorist organisation's goals through financial contributions and usually exhibit limited interaction with the group beyond monetary support. *Fundraisers* are individuals who actively solicit funds on behalf of the terrorist organisation and are often more engaged in the movement and concealment of money. *Facilitators* are directly associated with terrorist organisation leadership and operatives, often directly involved in promoting the terrorist agenda and knowledgeable of operational plans. Finally, the *operative* is an individual committed to conducting a terrorist attack and, through either funding provided by the terrorist organisation or via self funding, procures the necessary resources to this end.

47. While it is certainly possible for one individual to fulfil all four financial roles (the "lone wolf" example), most often the previously mentioned financial hierarchy is the norm within organised

14 See FATF (2008), for descriptions and examples of how terrorists raise move and use funds.

terrorist's infrastructures. Identifying the financial role that an individual plays within the organisation is the key to focusing investigative strategies in an effort to disrupt terrorist financing activity. In order to be effective, countries should develop legal mechanisms that enable their law enforcement and other competent authorities tasked with investigating terrorist financing to collaborate with their counterparts in the intelligence community. Countries should create an environment whereby these typically two distinct cultures work toward the common goal of disrupting terrorist financing.

48. In the case of terrorist activity (such as a bombing where there will be serious injury and loss of life), investigation of the financing of the operation should be integrated with investigation of the terrorist activity since the financing of an operation is an integral element in the overall activity cycle of a terrorist group. Parallel investigations not only foster relationships between different competent authorities but also encourage working relationships among competent authorities, the financial sector, and financial regulators. These relationships promote a more comprehensive approach in developing capability and financial intelligence that can be useful in tracing terrorist financial trails – not only in post-attack investigations but also during the planning and preparation stage – so as to be able to prevent attacks and work towards a common goal of preserving life. Community, financial sector and competent authorities have knowledge or information that could lead to useful pieces of intelligence. At the same time, the regulatory and competent authorities have the capability to provide the policies and the tools necessary to build that intelligence.

IV. SOURCES OF INFORMATION

49. Financial investigators develop hypotheses and draw conclusions based on available information. A financial investigation combines tried and tested investigative techniques and traditional accounting and auditing practices to investigate the financial affairs of targets of investigations. Facts that are relevant to a financial investigation may be found from a variety of sources. Traditional "fact-finding" is, of course, highly relevant in financial investigations and includes interviews with suspects, searches of residences and/or offices, forensic examination of computer(s), collection and analysis of financial and business records to include bank statements, tax returns, etc.

50. The nature of the hypothesis determines to a large extent the type of information required to prove the merits of the hypothesis. Identifying the type of information needed allows financial investigators to determine where such information is held. Once financial investigators have determined where the required information is held, they should determine the methods and challenges in obtaining the information. Thus, they should develop and implement an action plan that leads to the successful acquisition of the required information and such an action plan could include many of the investigative techniques discussed in this guidance note.

51. After identifying a potential evidence source, the evidence needs to be collected. Regardless of the source, all evidence should be legally obtained; otherwise, unlawfully obtained evidence could jeopardise the success of the prosecution or confiscation. Investigators should be aware of any legal privilege issues while searching for evidence and seek advice from prosecutors or other relevant competent authorities. Moreover, some information may be considered potential *evidence* from a prosecutorial stand-point however be considered sensitive *intelligence* by intelligence agencies. Thus, co-ordination between prosecution and intelligence authorities is required.

DATA SOURCES AND TYPES OF INFORMATION

52. Within each country there will be differences in the way that various types of information can be made available to investigative authorities and this may be influenced by legal requirements including human rights considerations (such as freedom of information and privacy legislation). The producers and owners of the different information and intelligence products will differ between countries. Additionally, access to that information or intelligence and under what circumstances presents a challenge to countries when designing an effective AML/CFT legal and operational framework. Access to and management of sensitive personal data by the competent authorities requires adequate training of staff in order to ensure adherence to data protection laws and laws that protect the right to privacy.

53. This guidance is primarily concerned with examining how information and intelligence are made available in support of financial investigations, prosecutions and the identification of assets for confiscation efforts. In order to conduct financial investigations, law enforcement should have access to the widest possible range of financial, administrative and law enforcement information. This should include information from open or public sources, as well as relevant information collected and/or maintained by, or on behalf of, other authorities and, where appropriate, commercially held data.

54. The form of the data will vary considerably and will range from papers/documents to electronic data to physical items. The ownership and control of these data types varies. On the one hand, much of the data law enforcement can access is of a public nature and is freely available to the general population. On the other hand, data related to personal, financial or law enforcement records are protected and are often considered highly sensitive and confidential. Safeguards need to be put in place to ensure that this data is protected from misuse and is being accessed and utilised for legitimate purposes.

55. The sources of information that law enforcement and competent authorities can use in furtherance of financial investigations varies but typically can be found in six different categories:

- **Criminal records and intelligence:** This is law enforcement information related to the subject and/or criminal activity. Information such as previous arrests, indictments, convictions, but also reports of links with known criminals. Criminal information is typically gathered from surveillance, informants, interviews/interrogation and data research, or may be just picked up "on the street" by individual police officers.
- **AML/CFT Disclosures:** In addition to suspicious transaction reports (STRs), this includes other information as required by national legislation such as cash transaction reports, wire transfer reports and other threshold-based declarations or disclosures.
- **Financial Information:** This is information about the financial affairs of entities of interest that helps to understand their nature, resources, structure and capabilities, and it also helps predict future activity and locate assets. This goes beyond the information contained in AML/CFT disclosures and is normally maintained by private third parties. This includes bank accounts, financial accounts, other records of personal or business financial transactions and information collected in the context of meeting customer due diligence (CDD) obligations.
- **Classified information:** Information that is gathered and maintained for national security purposes to include terrorism financing information. Access is typically restricted by law or regulation to particular groups of persons.
- **Open source:** All information that is available through open sources such as the internet, social media, print and electronic media, as well as via registries operated publicly or privately.
- **Regulatory information:** Information that is maintained by regulatory agencies; access is typically restricted to official use only. This category of information could be held by central banks, tax authorities, other revenue collecting agencies, etc.

56. Multi-disciplinary groups or task forces (described in Section II) serve to integrate information from different law enforcement and intelligence sources which had previously been separated by organisational and technical boundaries. In some jurisdictions this requires changes

in laws and regulations or may require formalised agreements such as MoUs. These task forces leverage existing technologies and develop new technologies in order to provide cross-agency integration and analysis of various forms of data. Furthermore, this information is stored in centralised databases so that any future investigation of any new target of a participating task-force agency can be cross-referenced against that historical data.

V. LAW ENFORCEMENT COLLABORATION WITH FINANCIAL INTELLIGENCE UNITS (FIU)

57. Along with intelligence divisions of law enforcement or other competent authorities, FIUs are one of the competent authorities that can initiate or enhance financial investigations. Financial intelligence collected by law enforcement, FIUs, and other competent authorities should be thoroughly manipulated and result in the proactive initiation of financial investigations. A core function of FIUs is to analyse the information it collects and to disseminate the results of this analysis. An FIU's analytical capabilities allow it to develop different intelligence products that can be useful to investigative authorities. As a routine task, FIUs spontaneously (*i.e.,* without being solicited) disseminate intelligence to investigative authorities relating to suspected ML and TF offences. Disseminated information could relate to an existing entity of interest, support an existing investigation, or prompt a proactive investigation based on new information made available to investigative authorities.

FIU AND AML/CFT DISCLOSURES IN FINANCIAL INVESTIGATIONS

58. Effective financial investigations are characterised by extensive law enforcement use of FIU information and exchanges of information and personnel. Investigative authorities should be able to ask the FIU for relevant information they may hold when conducting lawful investigations. FIUs should be able to respond to information requests from competent authorities pursuant to Recommendation 31. Under Interpretative Note to Recommendation 29 the decision on what information an FIU can provide in response to a request from a competent authority should always remain with the FIU.

59. The overarching aim of both the FIU and investigative authorities should seek to work as a *virtual team*, sharing information in appropriate circumstances to support financial investigations. Successful and effective financial investigations can be achieved through obtaining and using the outcomes of FIU financial analysis, as well as proactive sharing of information between the FIU and investigating authorities. Providing an FIU with an information requirement – (such as) detailing information priorities – can assist the FIU in identifying useful information for spontaneous dissemination. Many investigative authorities have seconded personnel working in the FIU, or FIU personnel seconded to investigative authorities, to facilitate co-operation between the FIU and to assist the effective exchange of information. Single points of contact in investigative authorities and FIU can also assist consistent, efficient information exchange.

60. Formal arrangements between investigative authorities and the FIU can be documented in MoUs, memorandum of agreements (MoAs) and standard operating procedures (SOPs). Documenting how competent authorities and FIUs interact and establishing communication channels can provide clarity on the procedures and processes that are required in order to exchange information appropriately. Agreeing on the use of standard electronic reports and request forms that can be securely exchanged between the FIU and investigative authorities can also facilitate efficient exchange of information. When exchanging bulk or structured data in relation to financial investigations (such as computer files with the results of analysis) consideration should also be given on compatibility of software used by competent authorities and the FIU. Some jurisdictions provide their investigative authorities with restricted access to the FIU database. Investigators are able to directly query the FIU database in certain agreed circumstances. Arrangements for

investigator access to the FIU database should take into consideration information handling issues such as confidentiality, human rights, privacy and data protection.

LAW ENFORCEMENT UTILISATION OF AML/CFT DISCLOSURES AND FIU ANALYSIS IN FINANCIAL INVESTIGATIONS

61. While this guidance is not focused on the analysis function of the FIU, FIUs can provide high-quality, useful and timely analysis to law enforcement and other competent authorities. This can only be accomplished through a two-way mechanism between the FIU and recipients of their information which will require feedback from all parties involved.

62. AML/CFT financial disclosures and FIU analysis are considered a particular category and source of information collected as part of a national AML/CFT regime. This information is intended to be available to law enforcement, and in particular, to financial investigators. Reporting entities are required to file AML/CFT disclosures. These disclosures will include suspicious transaction reports (STRs) and other information required by AML/CFT legislation such as cash transaction reports, wire transfers reports and other threshold-based declaration/disclosures and reports made in relation to the physical cross border transportation of currency and bearer negotiable instruments.

63. AML/CFT disclosures constitute a particularly valuable source of information for financial investigations. Given that the main focus is on the use of STRs, the unique nature of this data should be highlighted. In most countries, STR information is used for intelligence purposes and is not used as evidence in court proceedings. In some countries, STR information is directly admissible in court and when such instances occur between these different systems, countries should coordinate and promote the effective use of the information. There are also strict confidentially issues associated with access to and use of this information. It is essential that only appropriately trained and authorised law enforcement officers have access to this information.

64. The national and international frameworks for providing access to FIU/STR information are important in determining how intelligence can be made available to operational authorities and developed into investigative leads or evidence. In order to promote the timely sharing of information, law enforcement authorities can expect to see clear and precise handling instructions from the FIU upon initial dissemination and where possible prior consent to share this information.. Such arrangements could be discussed bilaterally between FIUs in order to address any privacy concerns and to ensure that such information is shared lawfully and appropriately with the competent authorities conducting a lawful financial investigation. However, if such prior consent (also known as third party rule) is required, FIUs should establish mechanisms whereby such consent is obtained in a timely manner. Because of the practical differences among countries, there is no exact model for STR utilisation that would necessarily fit every country. Regardless, countries should consider putting into place mechanisms that allow their investigative authorities prompt delivery of FIU information and analysis in furtherance of their investigations. The procedures for delivery should be clearly delineated and subject to strict safeguards to ensure proper security and use of the information. Any model should have in place monitoring systems while ensuring that the process is free of unnecessary hurdles. In all cases, investigators should handle information in accordance with confidentiality, human rights, privacy and data protection requirements.

ACCESSIBILITY OF FIUS TO ENHANCE FINANCIAL INVESTIGATIONS

65. The objective of this section is to ensure FIUs work with law enforcement agencies and that financial intelligence is promptly available to enhance investigations. Requesting all relevant FIU information should be a basic step in the investigation of any predicate offence and any crimes, which are financially motivated. This should be included in an investigators "checklist." This is one of the reasons why it is essential that law enforcement has timely access to AML/CFT disclosures filed in their country. As stated earlier, this access does not have to be direct but should be prompt so as to facilitate the incorporation of significant and relevant findings and to further active investigations.

66. Information contained in STRs, when checked against operational or historical intelligence databases, can complement existing ML/TF investigations by helping to identify laundered money and money intended for terrorist use. STRs can help investigators connect other pieces of information, provide information on where the proceeds of criminal activity or funds intended for terrorist use are located and when and where these funds are moved, or even what methods are being utilised. STRs are not to be considered as criminal charges and should not be viewed as "criminal activity reports". However, in many cases, the financial activities reported in the STRs are themselves illegal, such as check, credit card or loan fraud, check kiting, counterfeiting, embezzlement and the structuring of transactions to avoid the filing requirement of threshold based reporting.

67. FIUs can enhance investigations by responding to requests by investigative authorities. This information can support existing activity by identifying and locating proceeds of crime and also supply information which can assist in securing convictions and confiscations. The FIU will hold, or have access to its own information and information gathered from 3rd parties (domestic and foreign) that can enhance investigations. Some of this information will be confidential or sensitive and may be restricted in the manner in which it can be shared. These restrictions may be imposed by law or by the 3rd party originator of the information. When receiving information from the FIU, investigators should note the restrictions on the use of information, and, how it can be utilised or "handled", in particular for investigative purposes. It is important that law enforcement personnel handling this information be trained and knowledgeable on the applicable disclosure rules.

REVIEW OF STR INFORMATION AND OTHER AML/CFT DISCLOSURES

68. A financial investigator's understanding is often greatly increased when STR- or disclosure-related information is compared with information from other sources. The real added value of STR information lies in the analysis/assessment (usually in the first instance by the receiving FIU), when STR information is combined with information from other sources, other STR information, other types of transaction reports and open and closed sources of intelligence. The cross reference of STR information with other information available to law enforcement is therefore fundamental for the successful utilisation of STR information in financial investigations. It is essential that law enforcement and the FIU work together to ensure that both parties understand what checks have been conducted and which aspects of the disclosure are the most useful to pursue.

69. A cursory review of the STR information generally includes a selected approach for those STRs that will be assessed and researched on other databases including existing intelligence on

illegal activities, criminal records, on-going investigations, historical investigative reports, and in some cases income tax records. These preliminary investigative steps are part of the process to identify those STRs that merit further investigation and de-confliction of STRs with on-going criminal investigations.

70. The need for efficient utilisation of limited resources is a challenge faced by most investigators. When necessary, STRs should be prioritised based on relative significance and general investigative priorities and strategies for the country. In some countries, where a large number of STRs are generated each month, experienced and sufficiently trained support personnel can be designated to conduct initial reviews. These reviews would identify those STRs of particular interest to law enforcement based on pre-established criteria, e.g., STRs that reflect structuring or illegal money transmitting activity. Such an approach narrows the field of STRs to be reviewed and eliminates from consideration those that investigators may have decided not to pursue. Providing an FIU with an information requirement – (such as) detailing information priorities – can assist the FIU in identifying useful information for spontaneous dissemination. This demonstrates the need for law enforcement and FIUs to share information upstream and downstream allowing for more effective allocation of resources.

71. Concerning other AML/CFT disclosures, such as those described above in the section on data sources and types of information, countries should ensure that such information is readily available to FIUs and the competent authorities conducting lawful financial investigations in accordance with confidentiality, human rights, privacy and data protection requirements.

REVIEW OF CROSS – BORDER CASH DECLARATIONS FOR FINANCIAL INVESTIGATIONS

72. Recommendation 32 calls on jurisdictions to implement measures to detect and prevent the physical cross-border transportation of currency and bearer negotiable instruments, which are one of the main methods used to move illicit funds, launder money and finance terrorism.[15] This collected information can be useful to financial investigations. As a result, such information should be accessed, verified and analysed by competent authorities in furtherance of financial investigations. This analysis can result in the identification of frequent travellers, links between travellers, and the discovery of other evidence or leads. Recommendation 32 requires jurisdictions to ensure that persons who make a false declaration/disclosure and persons who are carrying out a physical cross-border transportation of currency or bearer negotiable instruments (BNI) related to ML/TF are subject to effective, proportionate and dissuasive sanctions, whether criminal, civil or administrative. In practice, this means that jurisdictions need to be able to investigate and/or prosecute and sanction such conduct.[16]

73. Recommendation 32 calls for sharing of information with the FIU, other domestic partners and international counterparts, subject to strict safeguards to ensure proper use of the data. It is best practice to set out such safeguards in law and co-operation agreements such as MoUs. It should be noted that information sharing and feedback among the FIU, other domestic partners and international counterparts can considerably improve the targeting of illicit cash couriers. It is best

15 See FATF (2005).

16 *Ibid.*

practice to ensure that the information being shared is comprehensive, tailored to the needs of the FIU and law enforcement authorities and includes all recorded data. It is also best practice to ensure that the sharing is takes place in a timely fashion (preferably in real time). Recommendation 32 calls on countries to implement a system that informs the FIU of suspicious cross border transportations incidents or ensures that the FIU has access to information on all cross-border transportations of currency and BNI. The competent authorities conducting financial investigations should routinely access this information in furtherance of their investigations.

74. As mentioned in the FATF Best Practices Paper on detecting and preventing illicit cross-border transportation of cash[17], investigating the reasons why a false or no declaration/disclosure was made may uncover information that may be useful for intelligence purposes, or to support an investigation, prosecution and/or sanction against the traveller.[18] This information could be important for an on-going financial investigation, thus access to such information by the competent authorities should be timely and efficient. Moreover, ML/TF cases can result equally from truthful declarations/disclosures or false declarations/disclosures, and such information can be useful to financial investigators by providing new investigative leads and perhaps evidence.

17 *Ibid.*

18 *Ibid.*

VI. INVESTIGATIVE TECHNIQUES

75. This section describes various investigative techniques that can be used in financial investigations. It is not exhaustive in covering all techniques but only highlights techniques that have specific relevance in relation to financial investigations. Recommendation 31 states that countries should use a wide range of investigative techniques which include undercover operations, intercepting communications, accessing computer systems, and controlled delivery. Countries can implement these requirements within their legal systems. This guidance note recognises that countries may have differing mechanisms available to investigators for compelling records that are relevant to financial investigations. For example, some countries use production orders, subpoenas, orders issued by prosecutors, orders issued by investigative magistrates, etc. Regardless of the instrument or process used, it is important that the financial investigator has access to and effectively uses such powers so as to obtain necessary information.

76. **Physical Surveillance:** This is a useful technique to gain general background and intelligence and information on individuals/businesses, habits and relationships of suspects. Surveillance can be especially useful in financial investigations in cases involving the movement of bulk currency and by identifying "gatekeepers" involved in the development and implementation of ML or TF schemes. Surveillance of targets can often identify where financial and related records might be stored and lead to the discovery of assets. In addition, surveillance can help corroborate financial data and identify other targets and associates.

77. **Trash runs:** (*i.e.,* searching the suspect's discarded trash for evidence): This technique can be an effective way of obtaining leads where assets are maintained, as well as help develop probable cause for more coercive measures and evidence for use at trial. Suspects frequently discard evidence, including financial records and correspondence that may be valuable to a financial investigation.

78. **Compulsory measures to obtain evidence:** These measures, including the use of search warrants and other instruments, should be used to gather evidence of criminal activity that cannot be obtained by other means. The timely use of these powers to obtain evidence minimises the opportunity for suspects to purge records and/or destroy evidence. In addition to seizing paper documentation, investigators should seize and examine computer systems and other electronic data. The execution of these powers should be properly planned and be lawfully conducted in accordance with existing policies and procedures. Moreover, to protect the integrity of evidence, investigators should adhere to the established policies and procedures related to the handling of evidence to include chain-of-custody documentation. If such policies and procedures are not present, countries should develop appropriate policy and procedures that ensure the proper handling of evidence. Adherence to such policies and procedures protects the integrity of evidence as it is introduced into court proceedings. When financial investigators encounter computers or other digital media during the course of an investigation, they should consider the value of the evidence these may contain. In these instances, consulting with a trained computer evidence specialist or technical expert is appropriate. Attempts to access electronic data or transport and store electronic evidence by untrained investigative personnel, without the necessary equipment may result in unintentional tampering and/or permanent lost of valuable evidence. In all instances, original digital evidence should be deposited in an appropriate evidence container and a written chain of evidence should be

prepared at the same time. Analysis of this evidence should be conducted by a computer forensic specialist.

79. **Interviews[19]:** Investigators should use this technique to gather evidence and information in furtherance of their financial investigation. Investigators should first attempt to obtain voluntary statements from suspects and witnesses. However, if suspects or witnesses will not voluntarily submit to an interview, their *testimony* may be compelled in accordance with a country's existing laws, policies and procedures. Such interviews should not commence before careful consideration of the potential negative impact on the investigation by soliciting the suspect's/witness's co-operation. Detailed reports of investigation should be completed to document interview results. Investigators should consider all other legal means of obtaining evidence to corroborate testimony and statements. Interview reports may be invaluable in refreshing investigators and witnesses' recollections of events during criminal or civil proceedings.

80. **Controlled delivery:** This is an effective investigative technique involving the transportation of contraband, currency, or monetary instruments to suspected violator(s) while it is under the direction or surveillance of law enforcement officers. The contraband, currency or monetary instruments may be discovered subsequent to a seizure at the ports of entry or through other investigative means such as undercover operations. Controlled deliveries are conducted to:

- Identify, arrest, and convict violators.
- Disrupt and dismantle criminal organisations engaged in smuggling contraband, currency, or monetary instruments across borders.
- Broaden the scope of an investigation, identify additional and higher level violators, and obtain further evidence.
- Establish evidentiary proof that the suspects were knowingly in possession of contraband or currency.
- Identify the violator's assets for consideration in asset forfeiture.

81. Although controlled delivery can be a successful technique, there are serious risks that should be adequately addressed. For example, there is a risk of losing the evidence during the course of the controlled delivery. Countries should ensure that their competent authorities are properly trained in using this technique, that clear policy and procedural guidelines are established and followed and that proper operational oversight is conducted at the managerial level.

82. **Intercepting communications:** Electronic surveillance techniques, such as electronic intercepts of wire, oral communications, electronic media and the use of tracking devices can be very useful in financial investigations. This technique can help identify co-conspirators, provides insight into the operations of the criminal organisation, provides real time information/evidence that can be acted upon using other investigative techniques and can lead to the discovery of assets, financial records and other evidence.

83. Countries should train their competent authorities to properly intercept communications in furtherance of financial investigations in accordance with the basic principles of their domestic

19 See US Department of Homeland Security (n.d.).

laws, policies and procedures. Countries should ensure that their competent authorities are properly resourced so that such operations are available to the competent authorities as a viable investigative technique. However, intercepting communications is intrusive, coercive and resource intensive measure, thus countries should put in place mechanisms that ensure the usage of this technique is used lawfully, effectively and efficiently.

84. **Undercover operation:** This is an investigative technique that can be effective regarding financial investigations but also has inherent risks. Undercover operations typically allow investigators access to key evidence that cannot be obtained through other means. An undercover operation is an investigative technique in which a law enforcement officer or operative of a law enforcement authority, under the direction of a law enforcement authority, takes action to gain evidence or information. Properly conducting undercover operations often requires substantial resources, extensive training and significant preparatory work. The resources, the unique and diverse required skill sets and the inherent risks typically make utilising this technique a last resort – normally after more traditional investigative techniques have been unsuccessful. The actions performed by law enforcement during undercover operations should be in accordance with the basic principles of existing laws, policies and procedures, and all undercover officers should be highly trained before engaging in such operations.

85. There are various significant factors that should be considered when contemplating the use of an undercover operation. The investigators should determine motive/reliability of informant(s) (if applicable), research applicable laws and policies, conduct background investigation(s) of the potential subjects and determine that an undercover operation will likely yield positive results. The investigators should continuously re-evaluate the need for an undercover operation and be prepared to terminate the operation when appropriate. Resources that are to be employed must also be considered such as the person(s) to be used in undercover capacity, other staff needed to support the operation, equipment needs and plans for locations and estimated expenses. Investigators should also establish termination criteria, secure advice from a prosecutor and obtain the necessary approvals required by the country's laws, regulations and policies.

86. Given the inherent risk with this technique, undercover operations proposals should be *reviewed and authorised* by designated officials from the competent law enforcement authorities. These officials should be knowledgeable on all aspects of undercover operations. Moreover, the proposal should indicate that traditional investigative techniques have been utilised and have been largely unsuccessful and that the undercover operation is likely the only technique available to gather evidence of the suspected criminal activity. Only highly trained undercover agents should be used in undercover operations[20].

87. **Methods of Proving Income:** A key component of financial investigations is the determination of the financial gain or profit derived from the predicate offence. Establishing the amount of the illegal proceeds often supports the motive for the crime and provides circumstantial evidence of the predicate offence. For this reason, it is essential that financial investigators be proficient in the various methods of proving income and determining which method is applicable, based on the facts and circumstances of a particular investigation.

20 See US Department of Homeland Security (n.d.), for more information about undercover operations.

88. This guidance encompasses two general evidentiary ways of proving income. These include using direct evidence, as in the *specific items method*, or circumstantially, as in the three indirect methods of proof: (1) *net worth and expenditures*, (2) *sources and applications* and (3) *bank deposits*. These methods are discussed in more detail in the Annex to this report.

89. While financial investigators are conducting financial criminal analysis using the indirect method of proof, they should be cognizant that all *indirect method* investigations are subject to evidentiary difficulties, which can be addressed by properly completing the following investigative steps:

- Account for all sources of funds such as inheritances, loans and transfers between accounts. Non-income sources need to be identified in order to accurately compute unreported income for serious income tax evasion cases or illicit source income for other predicate offences.
- Address defences raised by the suspect. Indirect methods of proof are based on circumstantial evidence. Any reasonable defence raised by the suspect needs to be investigated in order to determine whether or not it has merit.
- Establish a likely source of income for the understated income in a tax evasion investigation or the predicate offence as a source of the unexplained income.
- The investigator must identify all cheques payable to cash and determine whether or not there are any missing checks, particularly when using the *bank deposit method* of proof. This is because cheques payable to cash and missing cheques should be considered a source of currency deposited, hoarded or spent, unless there is compelling evidence to refute it.

VII. TRAINING

90. Training and education programmes should be standardised within the competent authorities, basic training should be envisaged at entry level, and specialised training on select officers should be conducted at both entry level and throughout the investigator's career. However, such specialisation would differ between the tasks of a financial investigator and those of a financial analyst. Officers on such specialised career paths should be provided career and pay incentives. Basic financial investigative skills should be routinely included in training for entry level police officers and other competent investigators.

91. The training structure should follow operational needs. Formal selection of staff should be followed by formal instruction in the three primary disciplines: financial intelligence, evidence gathering, and asset tracing/freezing. Further training should be given on money laundering investigation, enhanced financial intelligence, criminal confiscation and non-conviction based confiscation. Where possible, the training should be aligned with training for line managers and specialist prosecutors. Moreover, the judiciary should be trained on appropriate laws and how to properly adjudicate on financial investigative matters.

92. Training should not be exclusive to law enforcement but should include those sectors that are required to report suspicious activity and others that may pose a risk. The FATF and FATF-style regional bodies have developed typologies reports describing various ML/TF methods and techniques. This material may also be a useful to include in training on financial investigation.

93. Training may also include multiple jurisdictions in order to share best practices, learn differences in legal procedures and enhance co-operation. Moreover, staff should be vigilant in staying current to new trends and typologies. Countries should encourage their financial investigators to attend regional and international training workshops with their foreign counterparts.

94. Reports are an integral part of financial investigations, thus report writing should be part of the training curriculum for financial investigators and intelligence analysts. The ability to convey concepts, findings and conclusions in a clear, concise and informative manner is essential to the success of complex financial investigations. Countries should dedicate the necessary resources to train their competent authorities properly in the skill of report writing. In financial investigations, report writing takes on an even greater importance because the investigations can be lengthy, complex and multi-jurisdictional. Accurate, timely and concise reports will assist, for example, in drafting the necessary background information to meet evidentiary requirements in domestic court proceedings as well as MLA requests for evidence. It is imperative that practitioners document their findings periodically throughout the entire investigation, as well as after significant events. Reports should be written in a clear and concise manner, preferably on the same day as the event being described, and should include all relevant information and events. They should be reviewed and approved by a supervisor as soon as possible.

95. A sample curriculum of training courses for financial investigators is available[21]. This list and types are not exhaustive but cover many skills required to be a high-quality financial investigator.

21 See (NPIA (National Policing Improvement Agency), n.d. a-g; Golobinek, R., 2006).

VIII. INTERNATIONAL CO-OPERATION

96. Recommendation 40 states that countries should ensure that their competent authorities can rapidly, constructively and effectively provide the widest range of international co-operation in relation to money laundering, associated predicate offences and terrorist financing. This guidance note recognises the importance of international co-operation for successful financial investigations. Financial investigations often reach beyond domestic borders; therefore, it is important that competent authorities immediately focus on both formal and informal international co-operation efforts and ensure they are maintained for the duration of the case. Establishing early contact aids practitioners in understanding the foreign legal system and potential challenges, in obtaining additional leads and in forming a common strategy. It also gives the foreign jurisdiction the opportunity to prepare for its role in providing co-operation.

97. There are particular channels for international co-operation which can be used by financial investigators:

- Contact existing liaison officers[22] in or of the foreign jurisdiction.
- Exchange information between national (or regional) police units using channels such as INTERPOL, Europol and other regional law enforcement bodies.
- Inform the national FIU which has a possibility to contact its foreign counterparts and collect further intelligence through the Egmont Secure Web or by other means.
- Through the central authority for transmitting MLA requests to foreign countries.

98. In order to legally obtain evidence that is admissible in court, investigators and/or prosecuting authorities must make use of the applicable international arrangements which may be based on reciprocity, MoUs, bilateral or multilateral arrangements. Once a decision has been taken as to which country has responsibility for prosecuting and/or investigating which part of the case, mechanisms should be agreed ensuring that all relevant evidence can be made available in the competent country in a form that will allow production in a criminal court and which respects due process of law.

99. Forming personal connections with foreign counterparts is also important to successful financial investigations. A telephone call, an e-mail, a videoconference or a face-to-face meeting with foreign counterparts will go a long way to moving the case towards a successful conclusion. Communication is important in all phases: obtaining information and intelligence, making strategic decisions, understanding the foreign jurisdiction's requirements for assistance, drafting MLA requests or following up requests for assistance. It helps reduce delays, particularly where differences in terminology and legal systems may lead to misunderstandings.

---

22 This should include multinational bodies such as EUROJUST (a European agency with some non EU liaison officers) or multinational judicial or police networks that may exist in some regions of the world (in the European Union for instance the European Judicial Network).

100. Some important information can be obtained more quickly and with fewer formalities through direct contact with counterpart law enforcement agencies and financial intelligence units or from liaison magistrates or law enforcement attachés posted locally or regionally (agency-to-agency assistance). Such assistance may lead to a more rapid identification of evidence and assets, confirm the assistance needed and even more importantly provide the proper foundation for a formal MLA request (government-to-government assistance). Such contacts also offer an opportunity to learn about the procedures and systems of the foreign jurisdiction and to assess various options for conducting investigations, prosecutions and proceeds of crime actions.

101. In order to constructively and effectively provide the widest range of international co-operation, it is essential for financial investigators to discuss issues and strategy with foreign counterparts. Such discussions should involve consideration of conducting a joint investigation or providing information to the foreign authorities so that they can conduct their own investigation. If the financial investigation is in the early stages and investigators are concerned about the integrity of the investigation, they can still engage with their foreign counterparts and discuss issues from a "hypothetical" perspective. Such discussions allow all involved parties to get a better understanding of the parameters and requirements of an investigation without having to discuss too many specific details. Such details can be shared at a later stage as necessary.

102. To address the transnational nature of MLAs requests, all countries should be able to investigate, prosecute and bring to judgment cases of ML, associated predicate offences and TF regardless of whether the predicate offence occurred within its jurisdiction or abroad. If the predicate offence was committed in a foreign country, the prosecution of the money laundering offence generally requires some knowledge of the associated predicate offence in the foreign jurisdiction, and such information should be made readily available.

103. In the FATF best practices paper on confiscation[23], mention is made of best practices for countries to help strengthen legal frameworks and ensure that asset tracing and financial investigations can be conducted effectively. These best practices include having appropriate procedures and the legal framework to allow the informal exchange of information, the use of appropriate regional and international bodies to facilitate co-operation, the spontaneous sharing of information with proper safeguards and the entering into of asset sharing agreements.

23 FATF (2010).

ANNEX

ADDITIONAL INFORMATION

BASIC INFORMATION THAT SHOULD BE MAINTAINED IN A CORPORATE REGISTRY

- Entity name (including governmentally unique identifier and alternative names)
- Date of incorporation, formation, or registration
- Entity type (for example, LLC, sociedad anónima)
- Entity status (for example, active, inactive, dissolved—if inactive or dissolved, date of dissolution and historical records of the company)
- Address of the principal office or place of business
- Address of the registered office (if different from principal office) or the name and address of the registered agent
- Particulars of formal positions of control, that is, directors or managers and officers (for example, president, secretary)
    - — If a natural person—their full name, any former name, residential address, nationality, and birth date
    - — If a corporation—the entity name, address of the principal office, address of the registered office, and (if applicable) for foreign corporations, the registered office in its country of origin
- History of filings (for example, formation documents, annual returns, financial filings, change of registered office, change of registered agent, and so on)
- Required annual returns that verify the correctness of each particular required to be filed in the system, even if it has not changed since the last filing date
- To the extent feasible and appropriate, electronic copies of filings and documents associated with the legal entity (for example, formation documents, annual returns, financial filings, change of registered office, change of registered agent, and so on).

ADDITIONAL INFORMATION ON UNDERCOVER OPERATIONS

OPERATION STAFFING AND TRAINING

1. Article 29 (1)(g) of the Palermo convention calls on countries to initiate, develop or improve specific training programs for its law enforcement personnel, including prosecutors, investigating magistrates and customs personnel regarding the use of undercover operations. The number of employees involved with an undercover operation will naturally be dictated by the nature of the operation.

INDIVIDUALS PROPERLY TRAINED IN VARIOUS ROLES ARE NORMALLY INVOLVED IN EVERY UNDERCOVER OPERATION.

2. For example: The *supervisor's* responsibilities include overall management control of the operation and will ensure that the daily activities of the other participants are directed towards the objectives of the operation. A *cover agent* should be assigned at location of the undercover operation to perform on-site liaison with the undercover agent and be primarily responsible for the safety and security of the undercover agent. The *undercover agent* must be trained and is generally brought from another location into the area where the undercover operation will be conducted. They may develop multiple cover identities so that at any given occasion they can work on undercover assignments under each identity. A *tech agent* is a trained technician who is knowledgeable in the installation and operation of audio and video monitoring equipment. The *tech agent* is a regular member of the undercover operation team and should participate in all the periodic review, pre-operational and post operational meetings. The *case agent* will manage the day to day activities of the undercover operation. Other duties of the case agent involve timely reviewing, analyzing, and determining the value of all information or evidence obtained. Typically, the *case agent* is responsible for report writing, documenting evidence, duplicating and storing recordings and other record keeping functions.

CONFIDENTIAL INFORMANTS

3. Undercover operations may be supported by cooperating private individuals (confidential informants) who can play an effective role in the success of an undercover operation. A well-placed cooperating private individual can assist the undercover agent in making contacts with the subject(s) of the operation, and lend credibility to the undercover agent. While the confidential informant is not a member of the investigative team, he or she is often in a fiduciary/controlled status to the law enforcement agency conducting the undercover operation. The confidential informant role is often critical to the undercover operation. However, the appropriate law enforcement personnel should closely monitor all the confidential informant's activities in any undercover operation.

DEVELOPING INFORMATION GATHERED BY AN UNDERCOVER OPERATION

4. In an undercover operation, evidence and information gathered is transmitted to the cover agent by reports of activity prepared by the undercover agent. These reports detail the undercover agent's activities as it relates to the operation. They should contain the names of all people with

whom the undercover agent had contact; and should include a comprehensive summary of the day's events.

5. Another source of information or evidence gathering may come from electronically monitored conversations between the undercover agent and the subject(s). The content of these monitored conversations will not be included in the undercover agent's daily activity reports except for a reference to with whom and at what time the conversation took place.

6. Additional information and evidence can also be obtained by other members of the investigative team and support personnel by such investigative activities as surveillance, public record checks, law enforcement contacts, financial information analyses, etc.

REVIEW AND CONCLUDING THE UNDERCOVER OPERATION

7. It is a good practice to have periodic reviews (*i.e.,* 90 day intervals) of ongoing undercover operations. The participants in this review should include the supervisor, case agent, cover agent and if possible, the undercover agent. This review should address and memorialize the progress of the operation within the stated objectives and any changes in strategy and/or actions needed to realize the goals.

8. The termination of an undercover operation should generally be decided based on facts and circumstances. These include whether the stated objectives have been accomplished, cannot be accomplished or would require expending an unreasonable amount of resources. An undercover operation should also be terminated when the allegations are proven false.

ADDITIONAL INFORMATION ON NET WORTH METHOD COMPUTATION

9. The purpose of a net worth computation is to arrive at taxable or illegal income. The basic computation of net worth is assets less liabilities. The change in net worth is the difference in net worth from period to period, for example one calendar year to the next. Changes in net worth can be the result of purchasing assets, selling assets, reducing liabilities or increasing liabilities. Expenditures are then added to any change in net worth to determine the total amount of funds used by the subject in any given period.

10. A net worth statement (Assets - Liabilities = Net Worth) is similar to a balance sheet in its presentation (Assets - Liabilities = Owner's Equity).

11. The net worth indirect method of proof is a very effective method of determining income amounts derived from illegal activities. There are three basics steps in calculating the illegal income as follows:

12. **Calculate the change in a subject's net worth (assets less liabilities).** Determine the net worth at the beginning and end of a period (a taxable year or years), subtract the beginning period's net worth from the ending period's net worth. This computation yields the change in net worth, either an increase or decrease in net worth.

13. **Make adjustments to the net worth computation**. These include personal living expenses (expenditures), certain losses and legal income sources.

14. Illegal or unexplained income is determined through the **comparison of total income to known sources**; any unexplained income is attributed to the illegal sources.

FATF, *FATF Report: Money Laundering/Terrorist Financing Risks and Vulnerabilities Associated with Gold* (Paris: FATF, 2015)

FATF REPORT

Money laundering / terrorist financing risks and vulnerabilities associated with gold

July 2015

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

Contents

GLOSSARY OF TERMS AND ACRONYMS

AML	Anti-money laundering
APG	Asia/Pacific Group on Money Laundering
ASM	Artisanal or small-scale mining (ASM)
DNFBPs	Designated non-financial businesses and professions
EAG	Eurasian group on combating money laundering and financing of terrorism
FIU	Financial intelligence unit
FSRB	FATF-Style Regional Body
Gold Bullion	Refined gold, valued by weight
Gold Ingot	Block of gold, usually in the shape of a bar
HSI	Homeland Security Investigations (United States)
Investment gold	Particular class of gold with a specific purity
LEA	Law enforcement agency
LSM	Large-scale or medium-scale mining
MENAFATF	Middle East & North Africa Financial Action Task Force
ML	Money laundering
STR	Suspicious transaction report
TBML	Trade-based money laundering
TF	Terrorist financing

EXECUTIVE SUMMARY

This joint FATF–Asia/Pacific Group on Money Laundering (APG) research project into the gold sector arose as a result of the apparently natural transition or displacement of money laundering (ML) and terrorist financing (TF) from the formal financial sector and the cash market to the gold market, as regulators and law enforcement harden those environments.[1]

Chapter 2 identifies the features of gold that make it attractive to criminal organisations as a mechanism to move value.

Chapter 3 maps the nature, source and scope of gold production, markets and trade, to assist practitioners to recognise the common predicate offences (such as theft, smuggling, fraud, illegal schemes and tax evasion) that occur in the gold market. A good understanding of how these activities operate is required to recognise the ML and TF activity that is being perpetrated.

Chapter 4 builds a library of 'red flag' indicators that could assist designated non-financial businesses and professions (DNFBPs), financial institutions and others in identifying and reporting suspicious activities associated with ML and TF in the gold sector.

The key findings of this report are intended to promote effective risk mitigation and preventative measures or encourage further work on areas requiring further investigation.

Key findings:

- Gold is an extremely attractive vehicle for laundering money. It provides a mechanism for organised crime groups to convert illicit cash into a stable, anonymous, transformable and easily exchangeable asset to realise or reinvest the profits of their criminal activities.
- The gold market is a target for criminal activity because it is highly lucrative. Understanding the various stages of the gold market continuum, and the types of predicate offending that can occur in each stage, is critical in identifying money laundering and terrorist financing risks emanating from this industry.
- Further research is required to establish the impact of regulation on detecting and discouraging criminal activities in the gold market, and the potential links between the gold market and terrorist financing. Such research into the correlation between financial flows and the gold market will also lead to a better understanding of how criminals use gold and gold products to launder money.

[1] See also, *Money Laundering and Terrorist Financing through Trade in Diamonds* Report, FATF (2013a).

1. INTRODUCTION

Gold has been used in various cultures since antiquity as a medium for exchange or payment. Historically, governments minted coins out of a physical commodity such as gold, or would print paper money that could be redeemed for a set amount of physical commodity (Gold standard). Most modern paper currencies are referred to as 'fiat currencies'. They have no intrinsic value and are used solely as a means of payment. Even with the modern use of fiat money, precious metals remain an alternative means of payment due to their high intrinsic value and ease of exchangeability.

Recent shifts in the global economy have resulted in an increased demand for stable-value investments and commodities. Gold is a universally accepted currency that has remained stable in spite of fluctuations in global financial markets. Internationally enforced anti-money laundering (AML) measures are influencing a shift in criminal behaviours towards methodologies with lower law enforcement visibility, which makes gold very attractive. Further, gold is an integral part of the cultural heritage of many countries, like China and India, where it features heavily in religious and social exchanges.

As with the diamond sector, the gold sector (via dealers in precious metals) is covered under the FATF Standards by Recommendation 23 - Designated Non-Financial Businesses and Professions (DNFBPs). However, like the diamond sector, it is different from other DNFBPs.

This paper is not intended to describe the various elements of the gold market continuum - it is complex and there are a number of papers that cover this topic comprehensively. In order to effectively understand gold market vulnerabilities, this report should be read in conjunction with, for example:

- *The Direct Economic Impact of Gold*[2] - written by PriceWaterhouseCoopers and commissioned by the World Gold Council which is working diligently to improve governance and compliance of the entire gold industry. This paper provides a unique look at the entire gold value chain.
- *The Gold Paper*[3] authored by the British Jewellers' Association and the National Association of Goldsmiths.

In addition to reviewing existing literature on the gold sector, this report is the result of extensive consultation with the international public and private sector via:

- *Survey responses from public and private sector participants involved in the gold market.*
  Separate questionnaires were directed at both the Government and private sectors, circulated through FATF, APG and other FATF-Style Regional Body (FSRB) jurisdictions, for completion by relevant bodies. Analysis of these responses assisted in identifying or confirming commonalities amongst various jurisdictions regarding the challenges in understanding and tackling the vulnerabilities of the gold market to ML and TF.

---

2 PricewaterhouseCoopers (2013), 'The Direct Economic Impact of Gold'. Hereafter referred to as the 'PWC Report'.

3 British Jewellers' Association (BJA) and National Association of Goldsmiths (N.G.A) (2013), 'The Gold Report'. Hereafter referred to as the 'Gold Paper'.

- *Case studies provided by law enforcement agencies.*
  This report uses the limited number of case studies that were reported to illustrate the operating environment and to help develop 'red flags' to identify ML and TF activity.

2. GOLD AS A VEHICLE FOR MONEY LAUNDERING – SIGNIFICANT VULNERABILITIES

There are two broad characteristics of gold and the gold market which make it enticing to criminal groups. The first is the nature and size of the market itself which is highly reliant on cash as the method of exchange. The second is the anonymity generated from the properties of gold which make tracking its origins very difficult to do. These factors make gold highly attractive to criminal syndicates wishing to hide, move or invest their illicit proceeds.

THE GOLD MARKET IS CASH INTENSIVE

The regulatory characteristics of the gold market in a number of countries make it attractive for organised crime groups to own cash-for-gold businesses in order to place and integrate illicit proceeds. Given the limited level of industry oversight and licencing requirements, cash-for-gold businesses have the potential to provide criminal groups with a continuous supply of untraceable gold commodities from various sources. Furthermore, this supply is purchased at below market cost, directly from the general public—who do not have to prove that they own the second-hand gold presented for sale.

The high-volume, low value transactions conducted through these cash-intensive businesses can be easily falsified or co-mingled with the proceeds of crime, while the purchased gold can be used to make untraceable gold-based payments for illicit goods and services. Because much of the recycled material is purchased in cash, large numbers of transactions are undertaken anonymously.

Individuals who have a need to launder cash, especially those involved in organised crime, are very willing to participate in the cash-for-gold business because there is a high propensity to make a profit and in most jurisdictions there is little governance or oversight of this type of activity. People with no criminal history are also prepared to undertake this activity even if they suspect that the underlying purpose of the activity is ML.

Trade in recycled gold, both legal and illegal, requires little start-up capital and therefore operations can be very itinerant, opening and closing with little difficulty. This adds to the difficulty for regulators to monitor these activities.

Case study 1 illustrates how cash from the sale of drugs is exchanged for gold and smuggled internationally by a third party money laundering syndicate.

Case study 1. **Third party gold smuggling syndicate used to launder proceeds of illegal drug sales**

In early 2014, the French police uncovered an international money-laundering network, used to launder the proceeds of the sale of cannabis in the Paris region of France. This case study summarises the findings of the French law enforcement investigation. Moroccan dealers smuggled hash to France and sold it at street level. An Indian national (who was subsequently arrested in

March 2014) organised the collection of the proceeds from the street sales. This money collection (called '*amana*' by the syndicate) was undertaken by so-called '*salafs*' (mules) who were aware that they were dealing with the proceeds of the crime, but not of the crime itself. This was an intentional decision by the group to put some distance between the predicate criminal activity and the *salafs*. This segregation of roles makes it difficult to demonstrate that the money is the proceeds of a specific predicate offence, which is necessary in a number of jurisdictions to prove money laundering.

In this case study, the *salafs* took their orders from the Moroccan drug dealers and supplied the money to the Indian national. The investigation estimated that in a six-month period the *salafs* collected well in excess of EUR 10 million. Whilst the Indian national kept a very low profile in France (he had no official income apart from his wife's social allowances, and lived in social housing in the suburbs of Paris), he held a number of valuable assets in India.

On receipt of the money, the Indian national arranged the transportation of the cash by car to Belgium where it was used to purchase gold and jewellery. The bulk of the cash was deposited in cash into the different accounts of companies associated with an identified gold trader and used to purchase gold from a wholesaler. False invoices generated by the Indian national (in the name of companies set up by him) were used to support the transactions on the gold coins and ingots as well as gold certificates, whenever authorities would question the holder of the gold.

The investigation established two main routes used to move the gold to India.

First route: Both the jewellery and the gold were sent to Dubai using false invoices and fake companies in the UAE. If the transactions were completed without intervention these false invoices were destroyed and if not, then they were used to support the activity. The investigation established that the gold trader kept official records for the sale of 190 kilograms of gold in 11 months with a value of approximately EUR 6 million. However, the investigation calculated the need for gold by the syndicate was closer to 20 kilograms of gold per week. Details of this shortfall of gold were not established.

The Indian national used relatives to transport the gold to India and the UAE with one of the relatives travelling more than 200 times to India and the UAE from 2008 to 2014 (two to three times a month) The head of the India syndicate controlled a travel agency in India which provided flight tickets to the mules and sometimes fake invoices for the purchase of gold. According to information, the gold was not smuggled to Dubai but officially exported and declared to customs, using the false invoices as a cover.

In the first instance the gold was transported to Dubai where it was sold to local people or Indian nationals (via a *hawaladar*). On the sale of the gold the Moroccan drug dealers were paid via controlled foreign exchange operations in Dubai. The physical gold was then smuggled into India, in this instance with the assistance of an employee of a travel agency based in Dubai who recruited mules to undertake the work for a small fee amounting to approximately EUR 220. The investigations identified, couples, elders and on one occasion the use of a 'toddler' to undertake this activity.

A jeweller transformed the gold to make it easier to conceal including mixing gold flakes with coffee,

nickel electrolysis of jewels, and 100 g gold drops for internal concealment.

Second route: An alternate route to transport the gold from Belgium to India was via the international airports of Bangkok and Singapore to a professional Burmese smuggler. The gold was then conveyed through Myanmar to India where it was sold.

Irrespective of the route used, from the moment the money was collected off the streets in France, it took five days for the money launderers to pay back their Moroccan silent partners.

The Indian syndicate's profit was based upon the conversion and resale of gold. By smuggling gold and avoiding taxes, the Indian syndicate was able to sell it competitively and still make a profit. The gold in question was purchased at EUR 31 per gram in Belgium and resold for EUR 36.32 per gram in Dubai or India. The Belgium gold trader received a fee of EUR 325 per kilogram which equated to a profit of EUR 5 000 per kilogram for the syndicate.

This system used by the Indian syndicate was so profitable that the Indian gave up his normal commission of 2.25% on the money laundered. His only desire was to channel as much *amana* as possible in order to buy the gold again and again. Thus he offered the unique opportunity for his Moroccan partner to launder his money at no cost.

Source: French National Judicial Police (DCPJ)

Case study 2 below illustrates how buying gold for cash can allow criminal organisations to place, layer and integrate funds into the formal financial sector.

Case study 2. **Trading in gold to legitimise the proceeds of drug trafficking**

The United States Homeland Security Investigations (HSI) uncovered a scheme where illicit proceeds from a drug trafficking organisation were being used to purchase gold.

A criminal organisation in the US was buying gold from various precious metals retailers using illicit proceeds from narcotics sales. The gold was then sold to a precious metals broker who then sold it to other businesses.

The proceeds of the sale were then wired to a third party out of the US with links to the drug trafficking organization, thus completing the money laundering cycle.

Source: US-HSI

GOLD CAN BE TRADED ANONYMOUSLY AND TRANSACTIONS ARE DIFFICULT TO TRACE AND VERIFY

As the following case study from Belgium illustrates, many transactions involving gold occur anonymously, with little to no record identifying the seller, or purchaser, of gold. This means that law enforcement agencies have little to assist them to identify what the source of the gold is or the identity of the person who sold it. It may be difficult to refute false claims about the source of gold due to the challenges in correctly identifying gold.

Case study 3. **Buying and selling gold anonymously**

A wholesaler in precious metals (wholesaler A), held various bank accounts in Belgium. Analysis of these accounts showed that the wholesaler mostly paid suppliers of precious metals in cash. Over the period of one year a total amount in excess of EUR 800 million was withdrawn in cash. The account mainly received payments from a Belgian bank for purchases of bullion gold.

Company/trader B supplied used gold to wholesaler A and is paid in cash. Company/trader B also pays its gold suppliers in cash. In its financial records, company/trader B records the supplying companies as private individuals, without any form of identification. Company/trader B is suspected to be a cover for the owners' illegal activities, i.e. laundering proceeds of crime by exchanging money.

Wholesaler A was known to the police to engage in money laundering. Its customers are apparently mainly shops selling gold in Antwerp, private individuals and intermediaries that were all recorded as "private individuals" in the accounts. Wholesaler A did not ask its customers for any identification nor did he inquire into the origin of the gold. Enquiries established that much of this gold was said to have come from the 'black market' (jewellery theft) as well as from criminal organisations linked to prostitution and drugs. Wholesaler A paid for the gold in cash, larger quantities of gold were split up so the price would never be more than EUR 15 000, the threshold for anti-money laundering / countering the financing of terrorism (AML/CFT) reporting of cash transactions.

Apart from company/trader B, other suppliers of wholesaler A's were also known to the police. This lead to suspicion that wholesaler A was being used to launder criminal proceeds. Providing anonymity and cash payments attract customers from a criminal environment.

Source: Belgium Financial Intelligence Unit (FIU)

GOLD IS A FORM OF GLOBAL CURRENCY AND ACTS AS A MEDIUM FOR EXCHANGE IN CRIMINAL TRANSACTIONS

Due to the inherent value of gold, and its worldwide exchangeability, retail gold is often seen as a viable alternative to cash to settle debts and distribute profit from criminal activity. Particular ethnic groups operating international *hawala* networks have been found to use gold as a medium to settle outstanding balances (although such use of gold is not an illegal activity in itself)[4]. Case study 4, highlights that a syndicate leader, who was a former bank manager and had intimate knowledge of the formal banking sector, strategically identified gold as a way to launder money and pay his criminal associates for their services. Similarly, in case study 5, a corrupt official seeks to distort the link between himself and a bribe by asking for the bribe to be paid in gold to his wife.

[4] *Hawala* (and other similar service providers such as *Hundi*) are defined as money transmitters, particularly with ties to specific geographic regions or ethnic communities, which arrange for transfer and receipt of funds or equivalent value and settle through trade, cash, and net settlement over a long period of time (FATF (2013b), *The role of hawala and other similar service providers in money laundering and terrorist financing*).

Case study 4. **Major drug syndicate paid workers in gold**

An investigation into a well-organised and resourced drug syndicate identified a former bank manager as the head of the operation. Allegedly, the suspect was involved in financing and facilitating the multi-million dollar cannabis and amphetamines production operation and was linked with several well-known criminals.

The head of the operation was suspected of laundering the proceeds from the drugs syndicates through the purchase and sale of gold, the purchase of cattle and through gambling. Authorities believe the suspect used cash to purchase gold from prospectors at a reduced price and then sold the gold to unrelated businesses and declared it as legitimate revenue. Police located a large quantity of gold nuggets and AUD 161 000 cash hidden by the syndicate.

Those involved in the operation were paid well, and some received bonus payments in drugs and gold. One worker was paid a total of AUD 250 000 in cash, drugs and gold in the four seasons he was involved in the operation. Syndicate chiefs were paid more than AUD 300 000 each harvest, as well as being paid in gold bullion.

Commonwealth proceeds of crime action was taken against the offenders and resulted in the restraint of over AUD 4 million worth of assets, including rural properties, cattle, machinery, AUD 220 000 cash and a large quantity of gold. The law enforcement operation led to the arrest of number of syndicate members, who were subsequently charged and jailed for lengthy periods of time.

Source: Australian FIU

Case study 5. **Gold used to exchange value in corruption deals – no banking transactions linking the perpetrators**

Chairman A is the head of an Indian public entity responsible for awarding contracts for industrial work. Person B is the Managing Director of a company that has applied for a contract with the public entity. Person B approaches Chairman A's friend, Person C, to broker a deal to obtain the contract with a bribe of INR 2 million (Indian rupees).

Chairman A directed Persons B and C to contact his wife for the details on how the money was to be exchanged. Chairman A's wife asked for the cash to be converted into gold and handed over to her. Once the gold was provided to her by Person B, she deposited the gold into a bank locker.

Acting on a tip off, the Central Bureau of Investigation registered a case against Chairman A and conducted searches at his premises and lockers and recovered the gold.

The Central Bureau of Investigation charged the offenders for the predicate offence under Prevention of Corruption Act, which is a scheduled offence under Prevention of Money Laundering Act of India and 10kg of gold was restrained as part of a money laundering investigation.

Source: Enforcement Directorate of India

INVESTMENT IN GOLD PROVIDES RELIABLE RETURNS

In the money market, gold as an asset is used to reduce risk and stabilise return on investment. The predominant reason for this is that for the average investor, the gold trade is more easily understood and gold is trusted more than complex financial instruments. Further, gold is less volatile than most commodities and equity indices which allow account managers to better balance investment portfolios because it gives them greater ability to manage risk associated with volatility. For these same reasons, there is a bias for money laundering syndicates to prefer cash or precious metals such as gold when conducting transactions especially international transactions. Case study 6 illustrates that criminals are willing to invest in, and stockpile gold, to distance themselves from the predicate crime, even as a medium-term investment.

Case study 6. **Investing in gold to realise the proceeds of crime at a later date**

A Swiss financial intermediary, which offers a complete set of services related to melting, refining, sourcing and trading of precious metals, received a business proposition via e-mail from a person with an Asian-sounding name. The intermediary did not know the person nor the e-mail address (through a commercial provider).

In this e-mail message, the sender indicated that a large sum of gold was to be put up for sale. Attached to the e-mail message was a letter, including letterhead, from a company in Switzerland. In this letter, the company confirmed that it had been asked by a second company to locate potential buyers and serve as the clearing agent for the gold transaction. The letter claimed that this second company was also domiciled in Switzerland and had been contacted directly by a bank, which was the actual seller of the gold. The bank in question, however, was not mentioned. The business proposition was referred to as “a major gold deal” and that the sale price would be 4% below the London Gold Fix rate.

The reporting financial intermediary suspected foul play as such large gold transactions are usually handled by professional dealers and yet the bank seeking to sell the gold was not mentioned in the offer. In addition, the reporting financial intermediary suspected that neither of the two companies mentioned were licensed to act as financial intermediaries.

A report was made to the Swiss FIU and as a result of a search of the FIU database; it became apparent that a representative of one of the companies involved had been convicted in a fraud case abroad several years before. The financial intermediary surmised that perhaps some of the illicit gains from this fraud had been used to buy gold. This gold would then have been hoarded somewhere and now that the gold price had risen; the moment to sell had come.

The Swiss FIU contacted the partner FIU abroad to find out whether all of the assets in question had been seized at the time of sentencing. The foreign FIU replied that there was the suspicion of fraud and the person in question had been investigated by the responsible police. He was also known under his first name and under an alias name. However, records were no longer available. For this reason, a possible link between the gold and illicit gains from fraudulent activities could not be explored further and the suspicious transaction report (STR) could not be forwarded to a law

enforcement authority.

GOLD IS EASILY SMUGGLED AND TRADED – BOTH PHYSICALLY AND VIRTUALLY

The survey responses for this report indicate that the majority of money laundering and predicate offences relating to the gold market are associated with international and domestic trading.

In the physical sense, it is easy to melt gold bullion and convert it into different forms to disguise the fact that it is gold. For example, there have been media reports about the interdiction of gold shipments between North and South America where the gold was disguised as American souvenirs. The case studies below, give examples of gold being reshaped into cones and common items such as wrenches, nuts, bolts and belt buckles. Gold in these forms is easier to conceal from border authorities and its value can be considerably understated on the Bills of Lading.

Case study 7. **Gold reshaped into common objects to avoid detection by customs**

The United States Homeland Security Investigations (HSI) and Internal Revenue Service-Criminal Investigation (IRS-CI) uncovered a scheme related to gold being reshaped and exported as common objects like cones. From December 2001 through May 2003, Jaime Ross, owner of Ross Refiners, a gold refining business in Manhattan's Diamond District in New York, was selling bulk quantities of gold to an undercover agent posing in an undercover operation as a narcotics money launderer.

Ross would sell the gold knowing that the currency used allegedly came from narcotics sales. Ross would recast the gold into cones and alter the colour of the gold to avoid detection while being smuggled to Colombia. Ross was arrested on 4 June 2003 and charged with money laundering and failing to file IRS Forms 8300, declaring the cash transaction relating to the sale of gold.

Source: US-HSI

Case study 8. **Gold reshaped into common objects like wrenches, nuts, bolts, belt buckles etc.**

Under 'Operation Meltdown', The United States Homeland Security Investigations (HSI) investigators uncovered a carousel scheme in which jewellers were converting the proceeds from drug sales into the equivalent value in gold.

The scheme involved a criminal organization with links to gold suppliers in the New York area that were laundering millions of dollars in drug proceeds. The HSI investigation disclosed that the exported gold from Colombia was described as 'gold pigments' and upon importation into the United States the same merchandise was then described as 'gold bullion'.

The gold bullion was then transported to New York, where jewellers who were cooperating with drug trafficking organisations disguised the gold into a wide range of common objects like

wrenches, nuts, bolts, belt buckles and trailer hitches. These items were exported back to Colombia at a declared value far below the worth of their weight in gold. Upon arrival in Colombia, the same gold was recast into bullion and exported again to the US as 'gold pigment'.

The investigation of this case resulted in the arrest of 23 jewellers charged with money laundering and others arrests along with the seizure of 140 kg of gold, more than 100 loose diamonds, USD 2.8 million, 118 kg of cocaine, 6 guns and two vehicles.

Source: US-HSI

Because the exact amount of gold harvested from recycling activity is difficult to identify, smuggling is an ideal method of moving it from one location to the next either domestically or to international jurisdictions where it can then be refined.

Criminals may recruit couriers to carry gold across borders both legally and illegally (smuggling). This allows the criminals to remain anonymous and distance themselves from the transfer.

The classification and description of gold as an excuse to move value are techniques used by the criminal organizations to give the appearance of legality to the flow of funds of licit or illicit origin and also allow the gold itself to be transferred to places more conducive to their ongoing criminal activity. This usually occurs through routes that do not have strong governance over the tracking of the movement of gold or the gold is smuggled to avoid detection.

In some cases due to the nature of the market, the gold does not have to exist or be moved physically to be traded. Rather, citing 'gold' as the traded good on an invoice can be used to justify large movements of money, either domestically or across borders.

This is a form of trade-based money laundering (TBML) which is actually promoted by the market itself; the movement of value without the movement of the underlying commodity was created to reduce the cost of physically moving a risky, high valued commodity. TBML is 'the process of disguising the proceeds of crime and moving value through the use of trade transactions in an attempt to legitimise their illicit origins.'[5]

As indicated, the gold sector includes depository and certificate products which provide legal title to gold bullion which is stored on behalf of the owner. These certificates provide another mechanism for criminals to launder money whilst distancing themselves from the asset. These certificates can be purchased or traded by third parties.

5 FATF (2006), *Trade Based Money Laundering*, p. i.

3. OPPORTUNITIES FOR GENERATING ILLICIT PROFIT IN THE GOLD INDUSTRY

This chapter outlines some of the many opportunities available for criminal groups to exploit the gold market for profit. As with the mining of other precious materials, the journey of gold, from production to the consumer and investor, consists of several stages. There are two main sources of 'new' gold put on the market each year – the first is gold that is mined and the second is gold that is recycled. Mining accounts for two thirds of 'new' gold production each year and recycling accounts for the remaining one third.[6]

This section gives an overview of the type of predicate offending that can occur in the gold market continuum to assist practitioners to better understand the related money laundering and terrorist financing risks. This is intended to provide practitioners with a starting point as there is limited knowledge of the financial flows associated with the gold industry.

Practitioners should also be aware that criminal organisations may choose to infiltrate this industry to easily access mechanisms to place, layer and integrate their illicit proceeds with the proceeds of legitimate activity in the gold industry.

LARGE-MEDIUM SCALE MINING

Large scale or medium scale industrial mining (LSM) covers formalised extraction processes using industrial and mechanised methods.[7] This sector is dominated by large corporate companies such as Anglo Gold Ashanti, Rio Tinto and Newmont.[8] LSM operations require significant capital which may be sourced privately or publically. Projects of this kind have high barriers to entry. Research by PricewaterhouseCoopers in 2012, identified China, Australia, the United States, Russia, Peru, South Africa, Canada, Mexico, Indonesia, Ghana, Uzbekistan, Brazil, Papua New Guinea, Argentina and Tanzania as the world's largest gold producers (in order of significance).[9]

- *Corruption*: Due to the high barriers to entry, including obtaining the necessary environmental and regulatory permission of LSM projects, these activities are susceptible to corruption of a large scale. The capacity to obtain the necessary clearances through corruption maximises the benefits and minimises the costs associated with mining, to the detriment of other businesses and individuals.
- *Theft of mined ore*: As the concentration of gold ore extracted from the ground can only be estimated, there is potential for organised crime groups to infiltrate the production supply chain, siphon off mined ore and have it refined, then sold, to generate income.

6 PWC Report, p. 12.

7 Gold Paper, p. 7.

8 Gold Paper, p. 7.

9 PWC Report, p. 3.

- *Fraud and other scams involved with mining gold*: Due to the broad appeal of gold to a large sector of the population and the speculative nature of mining start-up companies, the gold market is highly susceptible to fraudulent schemes and other scams, such as Ponzi schemes, which provide fertile ground for organised groups to generate illicit funds.

ARTISANAL SMALL-SCALE MINING

Artisanal or small-scale mining (ASM) is usually informal or semi-formal gold collection using basic hand tools or simple mechanised equipment. It is often carried out by individuals, sometimes seasonally or as a nomadic activity, or by groups. This form of collection accounts for about 12% of global mine supply and provides income to significant numbers of people, especially in less developed or emerging economies.[10]

- *Illegal mining*: Due to the challenges of governing this sporadic form of mining and the low barriers to entering the sector, there is significant scope for organised crime groups and terrorist groups to harvest gold ore from ASM operations. Similar to LSM mining, corruption can also assist to facilitate illegal ASM activities. Case study 9, illustrates the lucrative nature of illegal mining. Case study 10 explains how a narco-terrorist group used the proceeds of illegal gold mining to support their operations.
- *Smuggling*: Gold that is illegally mined will often need to be smuggled into another jurisdiction to be refined. This is because gold refineries are not necessarily located in the same jurisdiction that the gold ore is mined. Sophisticated smuggling syndicates are engaged to transport the illegally mined ore across borders. Case study 11 provides an example of ASM and gold smuggling in Ecuador.

Case study 9. **Example of gold smuggling and laundering from Zimbabwe**

The Zimbabwe FIU commenced an investigation based on a suspicious transaction report (STR) from a financial institution in Zimbabwe (Bank A). This STR reported that the subject, a holder of a personal bank account, attempted to make a cash deposit of ZAR 4.1 million (South African rand, equivalent to about USD 410 000) into his account and sought to immediately withdraw the money in US dollars.

Prior to the attempted transaction, his account had been overdrawn, thereby raising suspicion regarding the source of the substantial cash deposit. The bank was not satisfied that the funds were from a legitimate source, and it declined to accept the deposit and immediately filed an STR with the FIU.

The FIU conducted an interview with the individual who explained that the money was proceeds

10 PWC Report, p. 17.

from the sale of gold which he had purchased from small-scale miners and illegal dealers who operate in and around Kwekwe, one of Zimbabwe's gold producing regions. The Kwekwe region is dominated by small-scale licensed miners as well as illegal gold "panners" who prefer to make a quick sale and, therefore, sell to buyers such as the subject who pay cash on the spot. It was also asserted that gold buyers such as the subject, offer the small-scale and illegal miners, not only cash on the spot, but also offer a more attractive price than the state licensed buyer, which withholds a percentage as a statutory levy.

The subject told the FIU that he smuggled the gold to South Africa (with which Zimbabwe shares a border), where he would sell the gold to different buyers, including licensed gold millers. The subject indicated that his buyers, in turn, smuggled some of the gold from South Africa to Asia where they sold it to jewelers. The subject added that the attempted deposit was intended to enable him to exchange the South African rand (which he gets upon disposal of the gold in South Africa) for US dollars, which he would use to purchase more gold on the black market and continue the cycle. The US dollar is the currency acceptable to the gold suppliers.

On being asked how he disposed of his ZAR4.1million, after his bank had declined to accept his deposit, the subject revealed that he exchanged the South African rand through black market currency exchangers in Harare.

This case is one of many similar STRs which the Zimbabwean FIU has received and processed. While a few of the illegal gold dealers change their South African rand to US dollar, through banks, many others prefer to change the South African rand on the foreign currency black market to avoid detection.

Source: Zimbabwe FIU

Case study 10. **Mining and commercialising of gold to finance terrorism - Colombia**

A narco-terrorist group takes control of a territory where a gold mine is in production. To gain control of the mine the narco-terrorist group extorts the owners by way of violence and forcing the community to transfer the ownership titles to the group.

This narco-terrorist group uses the mine illegally where part of the gold from the mine is sold to a legal business and the transaction is paid in cash. The cash is then used to buy equipment, munitions, medicines, and other supplies needed to continue with their terrorist activities. The remaining gold is safely kept for future transactions.

Source: GAFILAT

Case study 11. **Illegal mining in Ecuador**

In 2010, approximately 20% of the Ecuadorian territory was registered as mining territory. However, the informal and sometimes illegal nature of the mining sector in Ecuador has impeded the ability of Ecuador and its neighbouring countries to identify how much gold is being mined and leaving the country illegally.

Ecuador estimates its annual production to be approximately 15 to 20 tonnes of gold.

Artisanal mining produced approximately six tonnes of gold in the 2012 equalling approximately USD 9.5 million in revenues for the State. Of the total of six tonnes produced, approximately two tonnes were dedicated to internal consumption (for jewellery) and the four remaining tonnes were legally exported, returning approximately USD 160 million during 2012.

The illegal mining is calculated to amount to between six and eight tonnes of gold every year. A significant amount of this production is smuggled over the border. This is due to the fact that it is easier in the neighbouring countries to sell the gold because, unlike in Ecuador, permits are not required.

Source: Ecuador FIU

RECYCLING

Recycled gold accounts for about one third of new gold introduced to the market each year.[11] Sources of recycled gold include industrial equipment, scrap generated from retail manufacturing, or jewellery. Recycling of gold is more likely to occur in areas of high gold consumption and is not tied to areas where gold is mined. In 2012, the United States, Italy, China, India, the United Arab Emirates, Turkey, the United Kingdom, Mexico, Egypt and Indonesia were the top source countries for the supply of gold for recycling purposes in order of quantity supplied. The supply of recycled gold is more responsive to demand than gold from mining where lag-time in development and other barriers limit rapid responses.

- *Theft*: Many jurisdictions identified jewellery theft as a significant form of predicate offending that occurs in the gold market. Cash-for-gold businesses provide criminals with the opportunity to convert stolen gold into cash without having to prove ownership over the second-hand gold presented for sale.

SMELTING/REFINING

All gold, both mined and recycled, is required to go through a refining process, referred to as smelting, to bring it up to what is referred to as 'investment quality'. Refineries may or may not operate in the same jurisdiction where the gold is mined, and in the majority of cases they do not.

11 PWC Report, p.1.

- *Smuggling*: As mentioned in the section on ASM, illegally mined gold will often need to be smuggled to a refinery to be smelted. Whilst some enforcement action has been undertaken against smelting operations, anecdotal evidence indicates that the smuggling of gold from both legal and illegal mine sites is widespread.
- *Misrepresentation/fraud*: Organised crime groups can misrepresent the purity, weight, origin and value of gold to create profits or to justify the instrument or proceeds of crime. As demonstrated in case study 12, misrepresentation can also aid in tax fraud.

Case study 12. **Fraudulent claims to earn tax credits – Australia**

Criminals can exploit jurisdictional tax schemes in relation to precious metals by combining trading and refining activities. In this case, 'syndicates' utilised inter-related transactions with associate entities to conceal the true nature of the transactions in order to fraudulently obtain tax refunds or avoid paying the Australian goods and services tax (GST). This process is also known as a 'missing trader' fraud.

Investigations suggest that gold bullion is cycled through gold refining entities, with claims that the bullion is broken down into a taxable form prior to being 'reconstituted'. It is then sold GST-free to a precious metal dealer after GST credits have been fraudulently claimed on the purchase by misrepresenting the nature and status of the transactions. Tens of millions of Australian dollars in GST payments are made on fraudulent claims.

Broadly, the criminal activity occurs through:

- Claiming GST credits on acquisitions of gold which were GST free and no entitlement exists.
- Incorrectly claiming GST credits under the special rules in relation to acquiring second-hand goods where gold is specifically excluded from the definition of second-hand goods under the GST Act.
- Incorrectly treating some supplies of gold bullion as GST free where the product does not meet the criteria under the Act.
- Individuals receiving payments emanating from the proceeds of the GST claims which are not being reported as income in the respective income tax returns.

Participants at the end of the supply chain are making GST-free sales (on the assumption gold has changed form) and claiming income tax credits on acquisitions from associated suppliers. Further, individuals within the syndicates are benefiting from the receipt of payments generated by the GST fraud which are not declared as income in the appropriate income tax returns.

Source: Australian Taxation Office

RETAILING

Retailing of gold is a significant market internationally, and as indicated below there is some understanding of the predicate offending that occurs in this sector, but there is little understanding of the financial flows in the trade. In 2012, the highest consumption demand came from India, China, the United States, Turkey and Thailand (listed in order of the size of the demand).[12]

- *Fraud:* As gold ownership has deep-rooted cultural significance, criminal organisations have developed a range of schemes to profit from the fraudulent sale of processed gold. These schemes can range from misrepresentation of jewellery pieces, to more complicated activities involving false identities and fraud committed online. For example, a jurisdiction who contributed to this report identified a scam involving a gold dealer looking for an interested partner to purchase gold from a royal family. Fake contact details and websites were created to project an appearance of professionalism in order to attract unsuspecting victims.
- *Exploitation of gold incentive schemes:* Due to the overall demand for gold-based commodities, many jurisdictions see the trade in gold as beneficial to their economy. For this reason a number of jurisdictions have incentive programs usually in the form of tax incentives to help promote the trade. Arbitrage between countries on the different schemes provides opportunities for organised crime to exploit these vulnerabilities by sourcing illegal payments from these jurisdictions for perceived legitimate activity.

INVESTMENT

Investment gold is a particular class of gold with a specific purity. Gold can act as a financial instrument through online gold trading services which provide loans and credit. The traders and recipients receive a right in gold without the actual physical exchange of gold.

- Tax fraud: As gold is easy to obtain and conceal, it often forms the basis of tax fraud where gold commodity is purchased and stored legally in foreign jurisdictions. Whilst stored in foreign jurisdictions, markets are set up to sell the value locally. This allows cash to be drawn on the value of the stored gold without actually accessing the gold.

12 PWC report, p. 29.

4. RED FLAGS

ML/TF ACTIVITY (AND UNDERLYING PREDICATE CRIME ACTIVITY)

CUSTOMER BEHAVIOUR

- Established customer (including bullion dealers) dramatically increasing his purchase of gold bullion for no apparent reason.
- Foreign nationals purchasing gold bullion through multiple transactions over a short time period.
- Bullion transferred among associates using bullion accounts (including family members) for no apparent commercial purpose.
- Occupation inconsistent with customer's financial profile. For example, the customer may list their occupation as 'student' or 'truck driver' yet transfer large values of funds to bullion accounts.
- Customer buying gold bullion and using a General Post Office (GPO), or private service provider, mail box as their address, without listing a corresponding box number.
- Unusual pattern of bullion transactions and the nature of the transactions are inconsistent with the customer profile.
- A previously unknown customer requesting a refiner to turn gold into bullion.

COMPANY BEHAVIOUR

- Non-reporting to the FIU by the gold industry organisations (where there is an obligation to report).
- Changes to business name of entities registered to deal in gold.
- Registration of a trading company in a tax haven even though its business relates to another jurisdiction.
- Movement of abnormally large sums of money in various accounts of the individuals and companies which are not related to the nature of their business.
- Unusual deposits i.e. use of cash or negotiable instruments (such as traveller's cheques, cashier's cheques and money orders) in round denominations (to keep below reporting threshold limit) to fund bank accounts and to pay for gold. The negotiable instruments may be sequentially numbered or purchased at multiple locations and may frequently lack payee information.

- Numerous sole proprietorship businesses/private limited companies set up by seemingly unrelated people (proxies) but controlled by the same group of people. False addresses are used to register such businesses.
- Use of a corporate structure of shell companies located across the jurisdictions.
- Significant number of companies registered to one natural person.
- Commercial activities are not easy to track as the companies are registered elsewhere.
- No clarity of how the company transports the merchandise it has bought.

TRADE-BASED BEHAVIOUR (ALSO RELATED TO TRADE-BASED MONEY LAUNDERING)

- Cash payments for high-value orders are an indication of trade based money laundering (TBML) activity.
- Misclassification of gold purity, weight, origin and value on customs declaration forms.
- Gold is shipped to or from a jurisdiction designated as 'high risk' for money laundering activities or sensitive / non co-operative jurisdictions.
- Gold is transhipped through one or more such high risk / sensitive jurisdictions for no apparent economic reason.
- Consignment size or type of commodity being shipped appears inconsistent with the scale or capacity of the exporter or importer's having regard to their regular business activities or the shipment does not make economic sense i.e. there is no reasonable explanation for the client's financial investment into the shipment.
- The transaction involves the use of front or shell companies. Both shell and front companies can be used to facilitate TBML but in different ways. A shell company has no real operating activity and is used to hide money laundering activity and the identities of individuals involved so as to obscure the money trail. If activity is traced to the company it is literally an empty shell.

PRODUCT DIFFERENTIATION

- The bullion has physical characteristics that are inconsistent with industry standards.
- Gold prices higher than those of the local gold market.

PAYMENT BEHAVIOUR

- A number of affiliated entities in the payments chain.

- Transit movement of funds and changes in purposes of payments.
- Payments to shell companies with further withdrawals.
- Granting of loans (with zero interest rates) to foreign companies.
- Granting of loans (with zero interest rates) to natural persons.
- Natural person or business sells gold saying that it comes from a place with no extraction license or from places with no gold mines.
- Large amount of funds transferred internationally and then withdrawn very quickly.
- International transfers to countries where the company is not registered.
- Significant cash withdrawals from bank accounts by participants within the gold trading industry.
- Division of funds in cheques and smaller cash transactions to pay for merchandise.
- Purchase of gold bullion with bank cheques may be an attempt to conceal the source of the funds and underlying ownership.
- The use of cash to purchase bullion, especially when there are multiple purchases in a short timeframe, or when large amounts are purchased at once, or when there are structured cash deposits into an account to finance a single gold bullion purchase.
- Original source of funds to buy gold bullion cannot be established. The transaction involves the receipt of cash (or by other payment methods, including cheques or credit cards) from third party entities that have no apparent connection with the transaction or front or shell companies or wire instructions / payment from parties which were not identified in the original letter of credit or other documentation. The transactions that involve payments for goods through cheques, bank drafts, or money orders not drawn on the account of the entity that purchased the items also need further verification.
- Transactions between domestic buyers and sellers with sales proceeds sent to unknown third parties overseas.

PREDICATE CRIME ACTIVITY

GOLD MINING BEHAVIOUR

- Production and commercialisation of gold by a person or business without a license.
- An ethnic community hires a third party for the entire operation of the mine.

- Licensed mines where the production has decreased with no apparent explanation.
- The development of mining activities using machinery and equipment that is not in accordance with the characteristics of the licensed small or artisanal mining.
- The development of mining activities without compliance with the administrative, technical, social and environmental regulation.
- The development of mining activities in prohibited areas.

CONCLUSION

The main finding of this report is that the characteristics of gold make it both attractive for, and vulnerable to, exploitation by criminal organisations that need to legitimise assets. Gold has intrinsic value, is easily smuggled and exchangeable worldwide and can be traded anonymously. Not unlike other precious stones and metals, gold's widespread historical and cultural significance, as well as its potential to legitimise illicit cash, create opportunities for its misuse.

This report has also identified a range of profit-making opportunities for criminals in the gold market continuum. The report also sets out a range of red-flags to identify predicate offences that could occur in the mining, recycling, refinement, retail and investment of gold. While the techniques employed to launder these profits may not be specific to the gold industry, it is important to note that criminal organisations are likely to benefit from infiltrating the gold market continuum due to the inherent value of gold and the ability to use gold to combine aspects of the placement-layering-integration process.

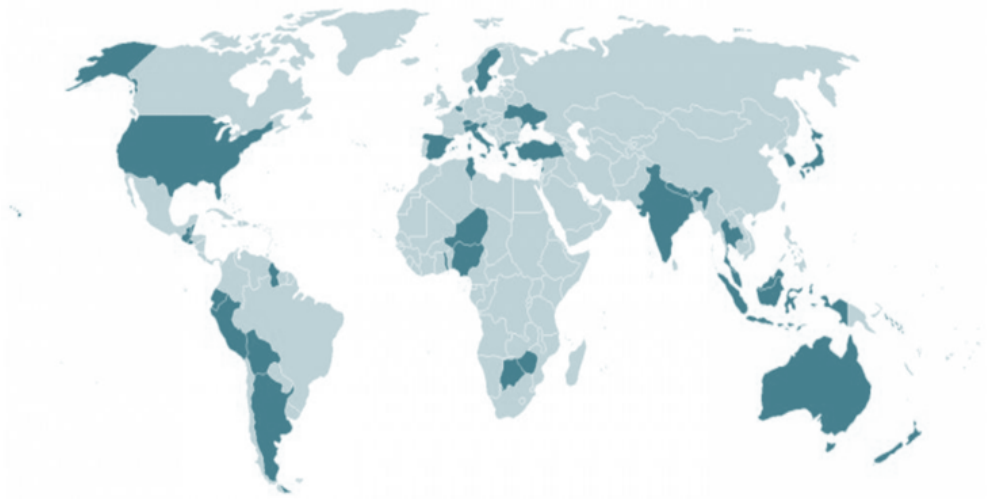
These are important findings, but further work needs to be done to identify any trends or patterns within jurisdictions and internationally in relation to money laundering and terrorist financing in the gold sector. While this report includes one case study on the abuse of the gold market by a terrorist group, it would be worthwhile considering to what extent terrorist groups are moving or raising funds through the gold sector. In addition to the financial flows, more information is required on the commodity flows.

Further work also needs to be done to map the regulatory controls relating to all aspects of the gold continuum, including formal and informal activity, to provide law enforcement agencies with an overview of starting points for regulatory information on gold production, wholesale, distribution and retail. Approximately one third of companies that responded to the questionnaire provided to the private sector revealed that they are not regulated by any Government or statutory authorities. While no conclusive statement can be drawn from this, it would be useful to undertake further study on how the gold industry is regulated both locally and internationally. A key question for this research is whether the gold industry is collecting relevant information, including financial information or customer details, to assist in the investigation of money laundering or terrorist financing and how this information is impacting on investigations.

APPENDIX A – ANALYSIS OF QUESTIONNAIRES

On the basis of the discussions held at the Middle East & North Africa Financial Action Task Force (MENAFATF)/FATF Joint Experts' Meeting in December 2013, a questionnaire was drafted to collect information from policy makers, investigators and FIU officials. The questionnaire was circulated through FATF and FSRB networks. Forty one countries responded to the questionnaire including Argentina, Australia, Belgium, Belize, Bhutan, Brunei Darussalam, British Virgin Island, Bolivia, Botswana, Denmark, Ecuador, El Salvador, Greece, Guatemala, Guyana, Italy, India, Indonesia, Japan, Lebanon, Malaysia, Nepal, New Zealand, Niger, Nigeria, South Korea, Peru, Singapore, Slovenia, Solomon Islands, Spain, St. Kitts & Nevis, Sweden, Switzerland, Thailand, Togo, Tunisia, Turkey, Ukraine, United States of America, Zimbabwe. The diagram below illustrates the geographical span of countries that responded to the questionnaire.

Graph 1. **Respondent countries to the questionnaire**



After consultation and discussion with private sector representatives, a questionnaire was also circulated to private sector representatives. The questionnaire was circulated through the FATF and the FSRBs Secretariats to the contact points of various countries who in turn obtained responses from the private sector. These countries included Australia, South Africa, Ecuador, Indonesia, Thailand, Japan, Lao PDR, Namibia, Peru and Switzerland. The questionnaire consisted of four parts relating to the mining, refining, financial gold products and gold trade sectors, the sectors responded as follows:

- Mining sector: Sixteen companies in six countries
- Refining sector: Seventeen companies in seven countries
- Financial gold products sector: Ten companies in three countries
- Gold trade sector: Forty companies in nine countries

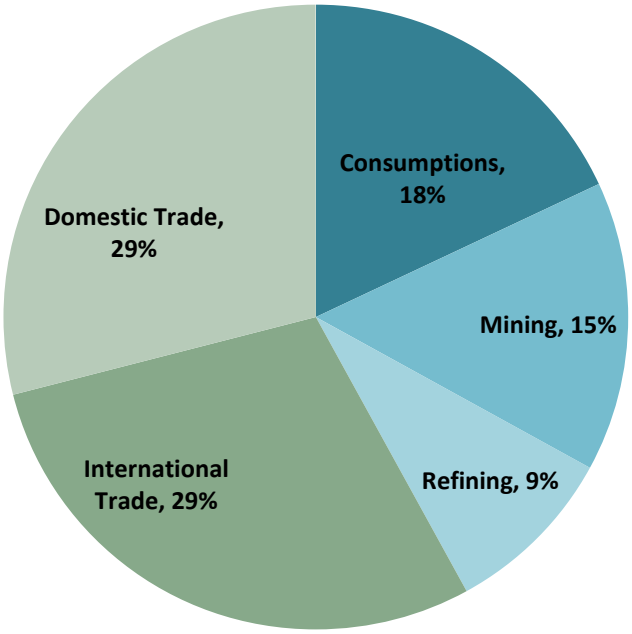
The results, summarised in the next section, lead to certain important findings relating to the money laundering and terrorist financing risks and vulnerabilities arising from gold mining, refining and trade, as well as the efforts being made to mitigate and combat such risks and vulnerabilities.

SUMMARY OF KEY FINDINGS OF THE QUESTIONNAIRE

In view of the limited sample size, the findings of the analysis of the questionnaire results are tentative. However, the tentative findings corroborate the observations which have been made in this Report on the basis of case studies, presentations made during APG Annual Meetings in Shanghai and Macau, the APG/Eurasian group on combating money laundering and financing of terrorism (EAG) Typologies Workshop in Mongolia and Joint Experts' Meeting in Doha.

The questionnaire results reveal that significantly high ML/TF risks and vulnerabilities arise in the domestic and international trade of gold. This is clearly demonstrated by the fact that jurisdictions have reported the highest number of predicate offences relating to gold, and ML cases related to gold, in the sectors relating to international and domestic trade of gold. The responses from the policy makers illustrate that besides the mining sector, the international trade sector is the most highly regulated. It is not clear whether that regulation relates to money laundering or whether, more broadly, international trade is a form of economic activity which is regulated in a lot of jurisdictions.

Graph 2. **Predicate offences and money laundering cases relating to gold**



Source: responses to questionnaire to policy makers

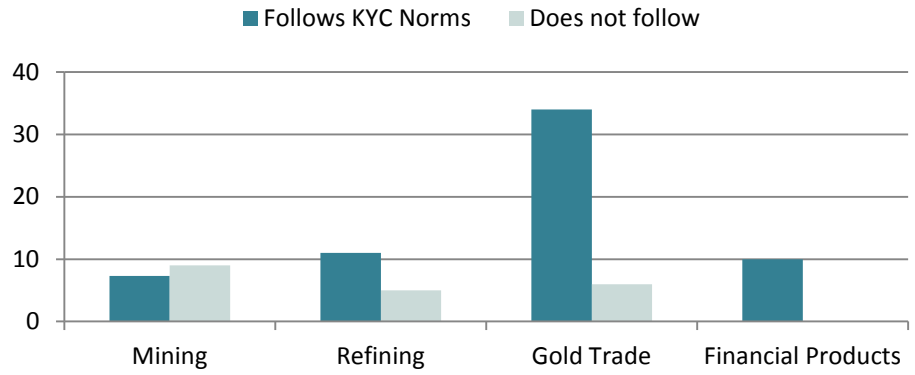
The questionnaire responses indicate that imported gold is a major source for the refinement and domestic consumption of gold. This supports findings of the literature review that gold is often not refined in the country where it is mined. These findings present vulnerabilities and risks arising from of trade-based money laundering related to gold. The details provided on reported predicate offence and ML cases indicate that while the absolute number of such cases may be low, the amount involved is substantial. Hence, even low volume of gold movement across border can transfer substantial value. The predicate offences relating to money laundering offences of gold are serious

in nature ranging from smuggling, fraud, corruption to narcotics trade. The statistical findings do not support commensurate international cooperation required to prevent and combat risks and vulnerabilities arising out of the gold trade.

Responses from the gold industry reveal that overwhelmingly the activities relating to mining, refining, trade and financial products of gold are carried out by the private sector. Most of the mining companies do not refine the gold which they mine and the refining companies also refine gold other than ore, in particular scrap gold. Most of the refining companies which have responded do not mark the gold that they refine. On the other hand, companies which are predominantly trading in gold do have quality marking norms for measuring the purity of gold.

The majority of companies in all four gold sectors (mining, refining, retailing and financial products) are subject to government regulation and laws but it is not clear how closely these controls relate to anti-money laundering or counter-terrorist financing. The majority of the companies in all four sectors settle their transactions through formal banking channels. Except for the mining sector, the majority of the companies in the other three Sectors follow know-your-customer (KYC) norms. Except for the financial gold product sector, the majority of the companies in the other three sectors do not claim to be operating in more than one country. Again apart from the financial gold products sector, the majority of the companies in the other sectors are affiliated to international/domestic associations.

Graph 3. **Application of KYC norms per sector**



Source: questionnaires responses

Note: the graph above illustrates that all of the companies in the financial gold products sector which responded to the Questionnaire follow KYC norms. Similarly, the majority of companies in the gold trade, also claim to follow KYC norms.

While the responses above indicate that there are measures in place to address the risks and vulnerabilities arising from gold production and trade, it is important to note that these responses are from the organised sectors of the gold market and the results may be very different for organisations operating in the sector in an informal or unorganised manner.

APPENDIX B – FURTHER CASE STUDIES ON MONEY LAUNDERING OR PREDICATE CRIME INVOLVING GOLD OR THE GOLD INDUSTRY

Case study 13. **Smuggling/undervaluation scheme using scrap gold**

The United States Homeland Security Investigations (HSI) uncovered a smuggling/undervaluation scheme with scrap gold upon entry to the United States (US). From January 2012 to November 2013, a US importer (ultimate consignee) was smuggling scrap gold into the US from countries in Central America at undervalued prices and subsequently providing payments to the exporters at overvalued amounts.

During this time frame two Central American companies sent scrap gold with a total declared value of approximately USD 6.4 million to the US importer yet during that same period wire transfers valued at approximately USD 24 million where sent back to the Central American companies for those imports. The owners of the US business were arrested and charged with conspiracy to commit money laundering using customs violations as a predicate offence.

Source: US-HSI

Case study 14. **Gold mines operated by family alleged to be involved in drug trafficking**

The reporting financial intermediary is a privately held group of international companies which has been operating since the 19th century and whose business is precious metals. The activities of the group are executed by its companies in Switzerland and in the USA.

Two mining companies were reported by the reporting entity on June 2007. Since the establishment of a business relationship between the reporting entity and the two mining companies, all obligations of due diligence according to the Swiss Anti Money Laundering Act and the US legislation in this field had been complied with.

The two companies sent gold from the mines for refining to the reporting intermediary. Once the transaction had been executed, the proceeds of the sale were transferred to the bank accounts of the companies. However, in March 2007, a magazine article about the owner family of the two mines was published. It claimed that the family had been involved in drug trafficking and had gained its fortune through trade in firearms. In the 1980s, one family member, who was close to the actual shareholders of the two mining companies, was prosecuted for drug trafficking but was later acquitted, only to be murdered a few years later. It seemed that during the processing of the Suspicious Activity Report (SAR) the owner family of the two mining companies was in court proceedings with a Canadian company in connection with the purchase of a mine in Peru.

As there only had been press articles and no entries in the police data bases, the Swiss FIU asked the financial intermediary for further information concerning the allegations in the press articles and their accuracy. As there had been no established connection to a predicate offence or money

laundering, the SAR at that stage could not be forwarded to the Law Enforcement Authority for action. However, the Swiss FIU made a request concerning the involved persons to a foreign FIU. The Swiss FIU was promptly informed that there was an ongoing criminal proceeding against one member of this family for embezzlement.

In November 2007, there had been a further SAR from the same financial intermediary. The financial intermediary had done some additional research and established that the press articles were false. Local barristers of the group of the financial intermediary had communicated to the financial intermediary that according to their current knowledge there had been no legal proceedings raised officially in relation to the two companies and its representatives.

After receipt of the second SAR, the Swiss FIU made another request to the foreign FIU concerning the two companies and its representatives. The reply was that there was a formal criminal investigation carried out by the Public Prosecutor regarding the companies and members of the owner family. The predicate offence alleged against the family was drug trafficking.

Due to this new information, the SAR was forwarded to the office of the Attorney General of Switzerland. The assets were seized by order of this competent law enforcement authority.

Source: Switzerland FIU

Case study 15. **Proceeds of alleged fraud involved in the gold market**

A financial intermediary operating in refining and trading of precious metals sent a suspicious transaction report (STR) to the Money Laundering Reporting Office Switzerland (MROS), the Swiss FIU, in April 2014.

The reporting financial intermediary is one of the world's largest processors of precious metals and is considered among the top three in Switzerland. Behind the decision of the financial intermediary to send an STR, was the publication of 'open source' information indicating that a client had been arrested following an investigation relating to fraud, forgery of documents, drug trafficking and money laundering. After undertaking due diligence, the financial intermediary could not exclude the possibility that the assets (i.e. the gold that was to be refined) were the proceeds of crime.

The STR related to the CEO and representative of a Spanish company specialising in buying retail gold with a turnover of more than EUR 1100 million in 2013. The company described itself as a very professional trading company for gold investments. A US private equity firm specialising in buying and building companies controlled at 51% of the company. The remaining 49% belonged to a European fund, of which the CEO and the representative of the Spanish company held 49%. The company was active in the sale of gold bullion and, more recently, in acquiring jewellery and other gold pieces in order to refine and transform them in gold bullion. In 2009, its turnover was less than EUR 150 million while the following year, in 2010, it was more than EUR 500 million. In 2012, the turnover doubled from that of 2010 and was approximately 1000 million.

The Swiss financial intermediary and the company were bound by a contract, which provided for both the refining of gold and the marketing and sales on behalf of the company. Based on the

information provided by the financial intermediary and information held by the Swiss FIU, there was a question as to whether there were reasonable grounds to suspect that the concerned assets (i.e. the gold) were the proceeds of crime.

In order to receive more information MROS sent two information requests to foreign FIUs. Unfortunately, only one foreign FIU answered the information request. The other FIU, the most important from the point of view of the relevance of the information, did not respond. Finally, the STR was forwarded by MROS to the competent law enforcement authority (LEA) in Switzerland. Before starting a preliminary investigation, the LEA waited on the results of the information request and, in particular, on more information about the investigation conducted on-site and about the reliability of the information concerning the alleged crimes. Meanwhile, the aforementioned company went through bankruptcy proceedings.

Source: Switzerland FIU

Case study 16. **Source of the commodity is often not revealed and therefore a significant conduit for stolen commodity**

The United States Homeland Security Investigations (HSI) uncovered a scheme where a jewellery businessman hired a burglary ring to rob clients of previously purchased jewellery.

The jewellery businessman would sell jewellery to clients and then hire an organized burglary ring and provide them the details of the jewellery to be stolen. The information provided by the jewellery businessman contained detailed product descriptions including the residential address of the customers. The burglary ring would then target both the jewellery the customer recently purchased as well as other items of value.

During an HSI undercover operation, the jewellery businessman purchased allegedly stolen jewellery from an undercover agent and indicated that the jewellery would need to be melted and sold as scrap.

The jewellery businessmen was arrested and charged with money laundering and sale of receipt of stolen goods.

Source: US-HSI

Case study 17. **Sale of gold used as justification for movement of funds to another jurisdiction – Costa Rica**

A company operating in country A frequently sent representatives to country B offering services to buy gold, jewellery and precious stones / metals above local market prices. As a consequence of this activity, high quantities of funds were transferred from country A to country B with the reason given that the funds will be used to buy gold. The funds were then withdrawn from financial institutions in country B as either cash or cheques very soon after the funds transfer were made. Little was known about the movement of the merchandise purchased.

The same organisation organised a significant event held at a luxurious hotel in country B, advertising an intention to buy gold. However, few clients were present at the event. Monies (of unknown source) said to be surplus to the cost of holding the event were then sent back to country A or sent to other countries where the company did not operate, with the argument that they would be used for similar events.

Source: Costa Rica FIU

Case study 18. A Gold Smuggling Case of Bangladesh

A smuggler used air route for this crime. He came from Riyadh in Saudi Arabia to Dhaka, Bangladesh by Saudi Airlines.

The smuggler's luggage was scanned and found to contain items consistent with metal goods. After opening the luggage, two bottles of a well-known soft drink were found in a carton. Each bottle contains 6 gold bars of investment quality; each gold bar was wrapped with foil paper.

The luggage also contained two 135 gr bars of luxury soap, each soap contained a gold bar weighing 100 gr. In the smuggler's trouser pocket, were 77 gold chains and 2 gold earrings with a total weight of 240 gr.

The authorities did not receive intelligence on this event prior to the detection. The smuggler was passing the 'green' channel. The duty officer scanned his luggage as a routine check and found the presence of the gold.

Bangladesh has a unique operating environment when it comes to the gold market. In recent times no gold has been legally imported into Bangladesh but still the gold market is operating. The smuggling of gold, either for domestic consumption or as a transit point for other countries, has replaced the lack of legal importation. This is despite the possibility of the death sentence for smuggling gold. *Hundi* or *hawala*[13] are the most practiced method of moving value in the country in relation to the movement of gold.

Analysis by Bangladesh Law enforcement concerning the movement of gold has established that Dubai, Mascot and Riyadh are the primary wholesale markets of gold. The gold is purchased from

13 See footnote 4 for a description of *hawala* or *hundi*.

those markets and smuggled to Bangladesh, or via Bangladesh to other parts of the world. It has been established that, on occasion, such gold is used in the barter for arms or drugs. The money used to purchase the gold is sent either by currency smuggling or Hundi however little is known about the people responsible for this.

On occasions it has been established that gold is smuggled to Bangladesh as a final payment to legal businesses where the partial payment owing has been undertaken legally. On other occasions people would smuggle gold to Bangladesh for purely economic reasons, in order to profit from the different market prices of gold globally.

Source: Bangladesh Law Enforcement (Police)

Case study 19. **A gold smuggling and money laundering case - Zimbabwe**

The Tunisian FIU received a Suspect Transaction Report (STR) related to a person X whose bank account registered a large amount of funds by means of cash remittances in short period of time and sought to withdraw the money in form of US dollar cash. Information gathered by the FIU as part of its analysis revealed that person X was linked to a network of gold smuggling.

In country A, gold is a regulated sector overseen by the Central Bank. Enquiries established that person X procured gold by different illicit ways, particularly gold smuggled through land frontiers and robbery.

Person X refined the gold into ingots and gave it to air hostess A. Air hostess A had access to all the airport zones and was able to avoid the customs and police controls. Air hostess A left the ingots supplied to her in a toilet near the gates and made a telephone call to smuggler/gold courier Y and told him where she had placed the ingots.

Smuggler/gold courier Y retrieved the ingots and flew to country T. Once there, smuggler/gold courier Y delivered the ingots to person Z in return he received payment and returned to country A where he shared the profits derived from gold smuggling with person X.

A month later the Tunisian FIU received additional information on person X. On this occasion person X had used the account of a company which he owned to try and disguise his identity. This was a more sophisticated scheme to conceal the nature of the transaction however the bank was able to detect the transaction because they had already flagged his name after the first STR. Person X had deposited an amount of ZAR 2.39million (approximately USD 239 000) into his company's account where, soon thereafter a converted US dollar amount was transferred to a third party telecommunications company.

Investigations by the FIU revealed that, after depositing the South African rand into his company's account instead of seeking to withdraw the amount in the form of US dollar cash, as he had wanted to do in his earlier activity; he instead transferred the amount, in batches, over a few days, to the telecommunications company to purchase mobile air-time in bulk quantities.

Investigations revealed that person X was purchasing bulk airtime on behalf of airtime vendors in

and around Kwekwe (Zimbabwe) and that person X made the purchases using the funds that he deposited as South African rand into his company's account, and which could now be transferred as US dollar. Person X would deliver the airtime to the airtime vendors in Kwekwe, who gave him instant cash, in US dollar. Through this method, person X had achieved his objective, to convert a large amount of South African rand cash into US dollar.

Person X would then use the USD cash to make gold purchases, which he smuggled and sold outside the country.

Source: Zimbabwe FIU

Case study 20. **Using a third party account to facilitate gold smuggling and money laundering**

A Suspect Transaction Report (STR) was received by the FIU relating to person Z from bank B. Bank B had become suspicious after person Z had made several large cash deposits, in South African rand, into the bank account of a company that he owned and controlled. The deposits were followed by withdrawals of the amount in US dollars. The total amount involved was USD 6.6 million.

Investigations by the Zimbabwe FIU revealed that person Z had been conducting the transactions on behalf of a well-known gold dealer, in return for a commission. Person Z's friend person Y, was known to be involved in illegally buying gold from illicit suppliers and then smuggling the gold for re-sale out of the country. Estimates based on the amount of USD 6.6 million involved in this case, suggests that over one tonne of gold was illegally acquired, and smuggled out of the country.

Source: Zimbabwe FIU

Case study 21. **Pakistan Gold Trade – A Need for a Temporary Ban on the Import of Gold Initiative**

The Gold initiative was an initiative of the Pakistan Government to diversify exports by promoting the export of value-added gold jewellery. For this purpose, special schemes were in operation to support jewellery exporters whereby they are able to import gold without payment of any duty on the condition that the same gold was re-exported after converting it into value-added jewellery.

These schemes were referred to as the "Entrustment" and the "Self Consignment" schemes. The Entrustment Scheme provides for the export of gold jewellery and gold articles. Under the scheme, the quantity of gold exported must equal the quantity of gold imported less the wastage that occurred in the manufacture of the items to be exported. The scheme allows foreign buyers, exporters or an authorized representative to send the gold by air/sea cargo or bring gold into Pakistan personally. The Self-Consignment Scheme regulates the export of gold jewellery and gemstones taken out by authorized representative of an exporter on self-consignment basis. Stringent conditions apply under both schemes, including measures that allow authorities to

monitor and oversee all relevant shipments.

As these schemes matured, there were reports that the some of the importers of gold were circumventing the procedures under the schemes to smuggle gold in and out of Pakistan. The Pakistani rupee exchange rate also came under pressure.

The Pakistani Government then took immediate steps to prevent further damage to the national economy. It decided to impose a short-term, temporary ban of 30 days on the duty-free import of gold under these special schemes. This allowed time to restructure these schemes to remove loopholes and deficiencies while still facilitating exporters of gold jewellery to contribute to the national objective of increasing exports. These reforms included limits to the amounts of gold that can be imported by a single party, a shortening of the maximum period within which the gold must be exported in the form of value added gold jewellery, and a stricter control by Pakistan's authorities of all relevant shipments. Also, the Government of Pakistan started auditing all the duty free imports of gold for export purposes in order to ascertain the misuse of the facility.

Source: Pakistan

Case study 22. **Smuggling of gold and jewellery from Special Economic Zones**

Special Economic Zones (SEZ) are designated areas that have been created to enhance trade and in particular increase exports for the purpose of earning foreign exchange. Imports into a Special Economic Zones are allowed duty free. However due to the relaxed rules governing SEZ, these zones are also vulnerable to money laundering and tax evasion activity.

Background: Directors of the companies identified in this case study were operating in the SEZ and had extensive contacts in the gold trade in India for more than 25 years. They had previously been investigated for gold smuggling and were also known to have committed customs/foreign exchange and income tax violations. One of the directors was also the owner of a gold manufacturing and trading company operating in Dubai.

Modus Operandi: Companies A and B located inside a SEZ were authorised to manufacture and to trade in gold jewellery. This involved importing gold in either bullion form or as semi-finished jewellery from foreign jurisdictions. Generally, due to the special nature of SEZ there is no examination made by the authorities when the goods are imported or exported. These companies had opted for self-certification of the export goods as long as the activity met certain conditions.

Representatives of companies X and Y (mostly run by families) would travel abroad and select jewellery in demand in the Indian market. This jewellery would be paid for at the time of purchase in the foreign jurisdiction in which it was bought. It would then be imported into the SEZ by the companies operating there recorded as jewellery for either scrapping or further finishing.

After customs clearance the goods would be moved from the airport to SEZ (a distance of 20 km). On the way, either the employees of the relevant company or one of the directors replaced the sealed imported packets with certain other sealed packets containing brass, scrap metal or other imitation jewellery. The jewellery that had been imported was then taken and sold to customers in

legitimate gold markets.

The sealed packets containing the brass, scrap metal or other imitation jewellery was self-certified as gold and studded jewellery and subsequently exported. These exports were to their own related companies with remittances being received as required by law. This scheme was made possible due to the absence of even random checks on exports of jewellery from SEZ.

The Directors would charge their customers in INR 25 (Indian rupees) per gram of gold as a delivery charge and also offered commission of INR 5 per gram to the people coordinating the buyers in India.

Magnitude: During the investigation DRI (Directorate General of Revenue Intelligence, India) seized 79 kg of gold jewellery valued at approximately USD 3 million. Examination of intercepted export consignments declared to contain 190 kg gold jewellery with a value of USD 7 million were found to contain scrap metal. DRI seized cash close to USD 100 000. Further 30 kg gold jewellery belonging to a related company was seized valued at USD 1.2 million. A total volume of doubtful imports covered were USD 100-120 million. The total quantum of customs duty evasion amounted to USD 10 million in addition to evasion of other taxes.

Source: Enforcement Directorate of India

Case study 23. **international funds transfers in relation to gold business**

The Financial Intelligence Centre (FIC; the FIU of South Africa) obtained information that a subject, person A, received an inflow of USD 129 995.17 from the US in August 2012.

FIC investigations revealed that person A maintained four different accounts in one bank. All accounts were dormant prior to the transaction. Person A had established a company but could not provide evidence to support his gold business, although he alleged that he had been in the business for four years.

Person A claimed inflows were from his partners in the US who had jewellery shops in Europe. Person A indicated that he bought the gold from the black market and sent it to the USA. Web searches revealed person A to be among several foreign investors who had been duped by fake gold dealers. He was featured in a video filmed by Ana's Aremeyaw Anas (an Investigative Journalist) and broadcasted by Al-Jazeera.

Source: South Africa FIU

Case study 24. **Fraud relating to the export of gold jewellery**

A strategic consultant for jewellery making companies and senior employee of trading company A conspired to commit a fraud so that jewellery would be exported in the name of trading company A but other activities would be handled by the conspirators.

According to the agreement, 80% payment was to be made by trading company A to jewellery making companies after the jewellery was exported, and the remaining payment was to be made on realisation of the export proceeds which, as per terms of the agreement, was 170 days from the date of export.

In the first year of operation, all export payments were realised from overseas buyers. In the second year, while export turnover doubled, only 15% of exports proceeds were realised. On the export of the gold jewellery consignments, the conspirators would present the proof of export documents to trading company A, which paid 80% of the value of the exports immediately to the jewellery makers. In order to bridge the gap of 170 days credit, trading company A got the export bills discounted with a bank. Trading company A failed to get the export proceeds from the importers located abroad. The bank and trading company A had to thus bear the losses due to non-realisation of export proceeds. The conspirators in collusion and on behalf of jewellery makers defrauded the trading company A and the bank.

Investigation conducted by the Enforcement Directorate revealed that exports were made to companies abroad that were related to the jewellery makers. The jewellery exported by them, to related importers abroad, was sold for their gain. The advance payment received by the jewellery makers from trading company A was laundered into other businesses, such as real estate. The Enforcement Directorate traced and attached the laundered assets. The overseas investigations are in progress.

Source: Enforcement Directorate of India

Case study 25. **Ghanaian gold scam**

In August 2011, a lawyer and a self-styled traditional chief used the internet to lure a businessman from a country in the Middle East to Ghana with the offer of a supply of gold from a criminal syndicate. In this transaction, the lawyer represented both the buyer and the seller.

The buyer wired USD 3.5 million to an established bank in Ghana (bank A) and was subsequently cashed. As a result of the wire transfer, 1% of the agreed quantity of gold was supplied. When the buyer demanded the balance of the supply the criminal syndicate commenced intimidation and also solicited the help of corrupt police to chase the businessman out of the country.

The FIC commenced an investigation seeking particulars of suspects from various banks and information relating to the lawyer from other jurisdictions. This information was then disseminated to a law enforcement agency (LEA) who subsequently arrested the Lawyer and chief who were remanded in custody for two (2) weeks.

A review of the case by the office of the Attorney General found a number of flaws in the evidence which have not yet been resolved and the matter has not progressed.

July 2015

This report identifies the features of gold and the gold trade that have made it an alternative means for criminals to transfer value and generate proceeds. Gold is anonymous, has a stable value and is easily transformable and transportable, which have made it an attractive alternative for criminals to store or move and generate value as regulators implement stronger anti-money laundering / counter terrorist financing (AML/CFT) measures to protect the formal financial sector from abuse.

This report provides a series of case studies and red flag indicators to raise awareness, particularly with AML/CFT practitioners and companies involved in the gold industry, of the key vulnerabilities of gold and the gold market.

EXECUTIVE SUMMARY

This report, examining Money Laundering (ML) and Terrorist Financing (TF) vulnerabilities related to the trade in diamonds, began as an Egmont Operational Working Group project in February 2012. In June 2012, the project was also adopted by the Financial Action Task Force (FATF) and it became a joint FATF and Egmont typologies initiative. There were two main reasons for the Egmont Group of Financial Intelligence Units (FIUs) and FATF to commission typologies research into the diamond trade:

a) Neither FATF, Egmont Group nor any of the FSRBs had ever conducted an in-depth research of the diamond trade and its exposure to ML/TF risk.

b) During the last ten to fifteen years, Egmont and FATF delegations noted a number of indications that the diamonds trade was being exploited for ML/TF purposes.

Given the limited research into ML/TF through the trade in diamonds, the report provides a basic overview of the subject matter and then focuses on ML and TF issues. **Chapter 2** provides a general overview of the international trade in diamonds. The distinction between the use of diamonds themselves and the exploitation of the trade in diamonds which is conducted through financial institutions or alternative/internet payment mechanisms is important to note. Diamonds and the diamond trade can be used in all stages of ML (placement, layering and integration) and for the stages of TF (collection, transmission, and use).

The research conducted has brought to light evidence that the diamonds trade is subject to considerable vulnerabilities and risks, creating a challenge for both stakeholders within the industry and relevant national authorities for AML/CFT. The contributions from the project team and consultation with private sector have shown that the various entities within the diamond industry on both national and international level have made efforts to counter ML and TF risks.

The diamonds trade has existed for centuries. It has developed a unique culture and trade practices, which have their own characteristics and variations across countries and continents.

However, the international diamond trade has changed in the last few decades:

- De Beers no longer holds the same all inclusive diamonds monopoly.
- A number of smaller diamond dealers have entered the market.
- Distribution channels have become more diverse.
- New trade centres have emerged with billions of dollars' worth of diamonds, and financial transactions go in and out of newly founded bourses and their ancillary financial institutions.
- Cutting and polishing has shifted (except for the most valuable stones) from Belgium, Israel and the US mainly to India and China, with smaller cutting centres emerging.
- Cash transactions are still prevalent but the usage of cash is diminishing.

- The internet, as in all other facets of life, is rapidly taking its place as a diamonds trading platform.

These significant changes in the "diamonds pipeline" structure and processes raised the question of whether the risks and vulnerabilities remain the same and whether current AML/CFT standards and national regulations are sufficient to mitigate the different ML/TF risks and vulnerabilities identified in the research.

While the level of risk posed by the misuse of the diamond trade may not be accurately established within the scope of this report, the analysis conducted within the framework of the current research identifies issues affecting the level of risk posed by criminals seeking to misuse the trade. **Chapter 6** provides a detailed analysis of the risks and vulnerabilities, including

a) ***Global nature of trade*** - The trade in diamonds is transnational and complex, thus convenient for ML/TF transactions that are, in most cases, of international and multi-jurisdictional nature. This, in turn, may create difficulties for national law enforcement to conduct investigations and necessitates international cooperation between law enforcement agencies across countries in which the trade is taking place.

b) ***Use of diamonds as currency*** - The research noted criminals' use of diamonds as a form of currency[1] is a characteristic unique to the diamond trade[2]. Diamonds are difficult to trace and can provide anonymity in transactions.

c) ***Trade Based Money Laundering (TBML)*** - This is one of the most common methods used by criminals to launder illegally gained funds. The specific characteristics of diamonds as a commodity and the significant proportion of transactions related to international trade make the diamonds trade vulnerable to the different laundering techniques of TBML in general and over/under valuation in particular. This should be viewed in light of the significant world annual trade volume which includes rough diamonds, polished diamonds and diamond jewellery[3].

d) ***High amounts*** - cases show that the trade in diamonds can reach tens of millions to billions of US dollars. This has bearing on the potential to launder large amounts of money through the diamond trade and also on the level of risks of the diamonds trade.

e) ***Level of awareness of law enforcement and AML / CFT authorities*** (including FIU awareness) to potential ML/TF schemes through trade in diamonds is low in most countries. This can be seen in the trade statistics provided by the project team: there are almost no reports that were filed by precious stones dealers to FIUs and very few intelligence reports have been disseminated by FIUs to law enforcement agencies. The complexity of the diamonds trade requires particular study and expertise to analyse and evaluate the financial

---

1 For example, instances have been found where diamonds were used to pay for and to finance drug trafficking.

2 Within the regulated sectors according to the FATF recommendation, this is a characteristic of precious metals and stones in general.

3 In 2011 the rough trade in diamonds amounted to approximately USD 51 billion and the polished trade in diamonds amounted to USD 214 billion (see Figure 5, p. 33).

and trade transactions. The opaque and closed nature of the diamond industry are also obstacles to investigations of ML/TF by Law Enforcement Agencies, which in many cases are unaware of the benefit and the possibilities for ML which diamonds may allow.

f) There are cases, even though relatively few, indicating that the diamonds trade has also been used for TF during the last 10 to 15 years.

g) All this is conducted within an industry where, although efforts to reduce such trade practices have been made, the traditional ethics of trust are an integral part of the trade culture and record keeping is minimal.

Chapter 7. of the report provides red flags and indicators based on analysis of country contributions and red flags derived from submitted cases:

a) Red flags and indicators for regulated entities.

b) Red flags and indicators for diamond dealers and jewellers.

c) Red flags and indicators for customs.

Chapter 8 and **Chapter 9** provide an analysis of the different methods and techniques used for ML and TF. In total, 64 cases were received from team members or retrieved from open sources. From the cases collected, 38 cases were used in the report. Cases collected displayed links between the different stages of the diamonds trade and various predicate offences. These include drug trafficking, fraud, smuggling, theft and robbery, large scale tax offences, forgery and fictitious invoices among other offences. Drug trafficking and smuggling were found to be the most prevalent predicate offences.

Almost 50% of the cases concerned non-cash payment means. Cash as the sole method of payment was reported only in 10% of the cases. These figures echo one of the main conclusions of the report that the extent of cash usage in the trade is growing smaller. This has significance with respect to the FATF definition of *Dealers in Precious Stones* and the AML/CFT standards which apply to Diamond Dealers only when they engage in cash transactions with their customers. Taking into account the risk and vulnerabilities identified in the report which does not relate to cash usage the FATF definition of Dealers in Precious Stones is an issue to be further considered.

The vulnerabilities and risks of the diamonds trade noted in the report are made in general terms. However, it should also be stressed that since the trade in diamonds is dependent upon the trade characteristics pertaining to each jurisdiction in question, it is important to understand that there may be considerable differences in the level of risk between countries and a more country specific evaluation of risk is required. With respect to jurisdiction where diamond trade is a significant part of the economy or where trade volumes are high it should be considered by relevant national authorities to incorporate the diamonds trade as part of their national ML/TF risk assessment.

Generally speaking, international AML/CFT regulation must be as consistent as possible, in order to obstruct the laundering of proceeds of crimes and to prevent terror financiers to achieve their goals. Wherever loop holes exist in the AML/CFT standards, regulations or enforcement, criminals will tend to utilise them for their ML/TF transactions.

Other precious stones – Finally, the scope of the project was narrowed in February 2013 from ML and TF through trade in diamonds and other precious stones to the diamond trade only.

Information collected, before limiting the scope to diamonds, shows the use of gold and other precious stones for ML/TF purposes. The information is provided here without further analysis as an awareness raising step and as an indication that further research is required on this topic.

Important remarks - In this report, when reference to the diamond trade is made, this is taken to mean all the sectors noted in **Figure 1 – diamond pipeline diagram.** Where possible, the different parts of the industry will be distinguished: production, rough diamond sales, cutting and polishing, jewellery manufacturing and jewellery retailers.

The term diamond dealers refers, throughout the report, to a person dealing in rough or polished loose diamonds (mostly business to business). Unless otherwise specified, the term does not including diamond jewellers (mostly business to consumer).

CHAPTER 1.
INTRODUCTION

Banks and other financial services have traditionally been the preferred conduit for ML and often the ultimate destination for laundering proceeds of crime. Global efforts to mitigate the risks of ML/TF through financial services have reduced the likelihood of ML/TF through this sector. Through country specific legislation and international cooperation promoted by the FATF and Egmont Group, criminals have been challenged in their ML/TF activities. The implementation of AML/CFT measures has forced criminals to seek out other methods to launder the proceeds of their crimes. The ML aspect of the criminal enterprise has become more complex and sophisticated in order to conceal and disguise profits gained by their criminal activity and the origin of such profits. As a result, other business sectors have been targeted by criminals including the precious metals and precious stones industries, and specifically the trade in rough and polished diamonds and diamond jewellery.

The diamond sector as a Designated Non-Financial Business and Profession (DNFBP) is different in some respects from financial institutions and other DNFBPs. Diamonds are a commodity traded in international markets. The diamond trade is a dynamic international trading sector, where a significant amount of business is transacted through financial institutions. They are used not only for trade but also for investment purposes, although probably to a limited extent. Diamonds are traded mainly through dozens of bourses and cutting and polishing ('manufacturing') centres around the globe. As this research has discovered diamonds are also used as a form of currency, which distinguishes this industry from other trade based DNFBPs such as real estate agents and most trade based industries. The use of diamonds as a form of currency or as a means of payment is of significance from an AML/CFT perspective.

The FATF recognised that diamonds and other precious stones are vulnerable to ML/TF by including the diamonds and precious stones dealers under the definition of DNFBP when they engage in cash transactions with their customers above an applicable designated threshold. The FATF Report on Money Laundering Typologies 2002-2003[4] recognised the inherent risk that diamonds and other precious stones pose as a ML commodity.

This 2002–2003 typologies report identified cases where diamonds and the trade in diamonds have been exploited for ML and TF purposes. However, the team undertaking this project found that in many cases, Financial Intelligence Units (FIUs) and Law Enforcement agencies know little about diamond trade business practices, the methods of its utilisation for ML or TF and the typologies of the criminal exploitation of the diamonds trade, in comparison to their awareness of other types of ML/TF activities.

As will be detailed later in this report, the diamond trade was found to be linked to different predicate offences, including to offences conducted by organised crime, such as drug trafficking, illegal weapons trade and tax offences, as well as to ML offences. Additionally, one of the

4 FATF (2003)

complexities noted in the laundering activities that utilize diamonds is that diamonds can be both the vehicle to generate criminal profits as well as the vehicle to launder them.

Documented[5] cases of terrorist utilization of diamonds are few; however it should not automatically be assumed that terrorist utilization is uncommon because of the limited case examples that have been published. Often, law enforcement and intelligence organisations have documented the factual details that are not released to the public. Unless the use of diamonds leads to an arrest or criminal charges as the case may be, these details will not be made public. In addition, this knowledge may not be shared as willingly as criminal use of diamonds due to national security concerns.

Before the implementation of the *Kimberley Process*, researchhad shown that diamonds had been exploited extensively by war criminals in many African civil wars by a multitude of rebel and government forces, to exercise the acquisition of munitions. Some of the war lords and militia commanders had mastered the art of converting illicit diamonds into arms. Historically this may be the greatest example of terrorist or terrorist-like utilisation of diamonds.

The business practices prevalent in the diamonds trade are unique:

- Confidentiality of transactions.
- Agreements made by word of mouth.
- Deals conducted via a diamond bourse located in Free Trade Zones (FTZs)
- "memo" transactions.

Alongside, these factors, the diamonds trade is also characterised high value to mass ratio, million dollars' worth of diamonds may be carried across borders either legitimately through trade or illegally (*e.g.*, smuggling) with relative ease. These characteristics make diamonds a commodity vulnerable to exploitation by transnational criminal organisation and terrorist groups seeking to transfer value or legitimise illicit transactions and profits[6]. These characteristics, among others, also mean that the trade is difficult to monitor by regulators and law enforcement agencies.

The FATF definition of ML is based on the definitions included in the UN Vienna and Palermo Conventions. These definitions note that ML includes the acquisition, possession, concealment or disguising or conversion / transfer of property derived from criminal offences (listed as designated categories of offences by the FATF). Examining ML in its broadest sense, diamonds may be:

a) acquired as a "property of an offence" (theft of diamonds);

b) used to conceal or disguise "proceeds of crime" (as they are a high value/low mass good and relatively easy to hide from detection); and

c) converted into other financial instruments or conveyed or transferred relatively easily across borders and hold their value for a very long period of time. *I.e.,* diamonds are liquid assets.

5 See for example: GAO (2003); Global Witness (2003); and Douglas Farah (na).

6 FATF (2003), *pp.* 21- 24.

The flexibility of diamonds as a commodity that can generate profit, retain value and serve as means of payment, in conjunction with traditional ethics of trust and undocumented trade practices, indicate the potential for diamonds to be used as a laundering mechanism and why this industry is worthy of further examination by AML and CFT authorities.

I. REASONS FOR CONDUCTING THE RESEARCH

The FATF last conducted a typologies research on the topic of diamonds in 2002-2003. This typologies report was not dedicated fully to the topic of diamonds but rather covered several issues each in a very limited way. Diamonds as a topic for a typologies research has not been dealt with by the FATF nor by FATF-Style Regional Bodies (FSRBs) leaving the issue in need of attention. The purpose of this research is to create a better understanding of the diamond trade and in particular the "diamond pipeline", including the vulnerabilities and risks facing the trade.

The diamond industry (rough, polished and jewellery) is international in character, and demand for diamonds remains high. The whole industry "pipeline" needs to work so that rough diamonds can find their way from the earth as a rough diamond to a cut and polished diamond in someone's necklace, watch or ring. While the value of rough diamond production amounts to USD 14.06 billion[7] annually, the financial volumes of the trade on all its parts amount to hundreds of billions of dollars every year. In many countries the diamond industry has become an important economic factor.

Indications exist that point to the misuse of the legitimate diamond trade. NGOs such as Partnership Africa Canada, and government bodies, such as the US Government Accountability Office (GAO) have researched and published information revealing investigations involving the use of diamonds for ML. However, it remains an open question as to what extent the diamond industry itself has been exploited for ML/TF.

AML/CFT authorities recognise the potential risk of misuse of the diamond industry. The IMF has been engaged in Technical Assistance with African countries that produce and deal in diamond, gold, and precious metals to strengthen their defences against ML, smuggling, and TF. The IMF noted that: "the trade in precious minerals has been linked to illicit financial flows, corruption, drug trafficking, arms smuggling and the financing of terrorism[8].

II. AIM AND OBJECTIVES

The diamond trade is global in nature and can be highly complex. The characteristics of the trade vary along the supply chain and by location, whether it is African mining countries, diamond trading centres like Belgium, US, Israel and Dubai, or manufacturing centres such as India and China. For this reason this report aims at the outset to provide a general overview of the diamond industry, the way it works and the characteristics of diamonds as merchandise, through an AML and CFT lens. The aim is to provide the basic knowledge needed in order to have a better understanding of the

7 According to KPCS statistics for the year 2011.

8 IMF (2010).

manner in which the diamond trade / industry operates and the way this sector might be exploited for ML and TF purposes. This overview is provided in **Chapter 2** of the report.

In 2008 the FATF, in consultation with the private sector[9], published a ***Risk Based Approach (RBA) for dealers in precious metals and stones*** (DPMS). This document conducted an analysis of risks which may be considered by both dealers in precious metals and precious stones in the application of the risk-based approach to the dealers' activity. One of the main aims of this typologies project is to identify up-to-date ML and TF vulnerabilities along the different parts of the "diamond pipeline", with a specific focus on international trade and the unique characteristics of rough and polished diamonds that make them vulnerable to criminal activity, as well as an evaluation of the risks associated with the vulnerabilities of the trade. This may also assist concerned parties in enhancing their application of a RBA for precious stones with respect to the diamond trade.

Additionally, the typologies report also aims to:

a) Identify "red flags" and indicators which will enable financial institutions, diamond dealers and law enforcement to recognise cases of abuse of the diamond trade and increase unusual/suspicious activity reports to FIUs. Identifying "red flags" will also assist the relevant entities in assessing the risk of their own transactions.

b) Identify known and new typologies / case examples in the diamond industry based on case examples and open source information, and establish ML/TF trends in the global diamond trade. In particular, the project aims to contribute to a better understanding of the extent to which the diamond trade is used by criminals to launder proceeds generated in predicate offences and to what extent diamonds are used for this purpose.

c) The report also aims to outline relevant policy implications by:

   i. Examining the current FATF standards with respect to the diamond trade and identifying any need for further consideration, enhancement or amendment.

   ii. Identifying best practices for AML/CFT regulatory and supervisory approaches to the precious stones industries and specifying policy implications where needed. Furthermore, if required, develop a specific set of issues for consideration that may assist both the diamond and financial sectors and national competent authorities.

III. METHODOLOGY

The methodology adopted in this project deviated from the common practice of sending a questionnaire to all FATF/Egmont members to collect information. It was decided, rather, to create a diverse group of team members from countries of importance and/or relevance to all facets of the diamond trade to collect country-specific information and to take part in the report drafting. All countries where diamond centres or diamond mines are located were invited to take part in the

[9] The following diamond and jewellery industry representative bodies were consulted for the 2008 report: Antwerp World Diamond Centre (AWDC), International Precious Metals Institute, World Jewellery Confederation (CIBJ), Jewelers Vigilance Committee (JVC), World Federation of Diamond Bourses (WFDB), and the Canadian Jewellers Association.

project. The countries that joined the project included: Argentina, Australia, Belgium, Canada, India, Israel, Mexico, the Netherlands, Russia, South Africa, Switzerland and the US. Two FSRBs (GIABA and ESAAMLG) joined the project to serve as liaisons to African mining countries. The members represent a significant part of the international "diamond pipeline", namely: Mining[10] and production, trade and manufacturing centres, distribution and jewellers[11].

However, it is important to note that, the report would have benefitted from additional information from specific input of production countries and major trade centres. For example, United Arab Emirates, one of the world largest trading centres for diamonds (with trade volumes amounting to more than USD 40 billion). The lack of information from the United Arab Emirates leaves an intelligence gap which may cause an imbalance in the results of the research. This is also true for most of the African mining countries which supplied little or no information on the mining sector (*e.g.,* Botswana, Sierra Leone, Namibia and the Democratic Republic of Congo (DRC)).

A comprehensive collection plan was devised and distributed among team members. The objectives of the collection plan were as follows:

a) **Create a better understanding** of the manner in which the diamond trade is operating from mining of rough diamonds through trade and cutting centres to the retail level of jewellery shops where polished diamonds contained in jewellery are at the end of the value chain. This included information on customs, cross-border regulation, taxation and funding made available via financial institutions.

b) **Identify "red flags"** both in the trade of rough and polished diamonds to help diamond dealers and jewellers[12] recognise transactions which may be linked to ML or TF activities; these may also assist the financial sector providing services to the diamond sector. Red flags may also be used by FIUs and law enforcement while investigating cases involving the trade in diamonds.

c) **Diagnose the vulnerabilities** and **the level of risk** associated with different parts of the trade.

d) **Collect information on money flows** related to ML or TF from the different countries, in order to identify discrepancies between countries and indications for possible ML and/or TF activities.

e) **Collect information on sanitized and actual cases** from FIUs and law enforcement.

f) **Identify associated predicate offences** with the trade and financing of the trade in diamond.

---

10 There is a previous stage to mining which is the exploration stage whereby governments and specialized diamond companies such as Alrosa, De Beers and Rio Tinto search for new site of diamond mining. The report is not looking into this phase since it precedes the actual trade in diamonds.

11 Based on KP statistics for the year 2011 (rough diamonds only) the team members covered in terms of trade volume 95% of the mining sector and approximately 83% of the import and export of rough diamonds.

12 The FATF definition applies to dealers in precious metals and stones. The scope of the report is the diamond trade only; however, the identified red flags may also aid dealers in precious stones in general.

g) **Engage national players** relevant to the diamond trade in each member jurisdiction to facilitate the collection of information.

A limited collection plan was also sent to additional countries identified by the project team as relevant to the diamond trade. These included: China; Hong Kong, China; Singapore; Switzerland, Thailand; the United Arab Emirates; and the United Kingdom.

An open source survey for actual ML/TF cases involving diamonds was conducted and information on these cases was requested from the relevant countries (Australia; Belgium; Brazil; Hong Kong, China; Israel; South Africa; Switzerland; United Kingdom; United States; Zimbabwe[13]). These open source cases where also used in the typologies analysis section.

In November 2012, a typologies workshop was held in Dakar, Senegal within the GIABA/FATF joint expert meeting on typologies, produced relevant material to the report. Several presentations were given by the participants. Additionally, team meetings were held to discuss findings[14].

Several team meetings included consultations with the private sector aimed at better understanding the trade in diamonds and its vulnerabilities as perceived by the private sector and verifying the information previously collected. Consultations were conducted with Jewelers of America and the World Federation of Diamond Bourses (WFDB).

Additional private sector consultations took place during the end of August 2013 and the beginning of September 2013, just prior to the final project team review and submission of the report to the FATF and Egmont for approval, to verify the factual information regarding the diamond trade. The draft report was sent for comments to the following private sector representatives: WFDB, Jewellers of America, a consultant gemmologist to the crown in Canada, an expert from the UN Group of Experts on Côte d'Ivoire and a representative from Kimberley Process to review information on KP sections of the report.[15]

IV. SCOPE

The project was initially envisioned in two-phases, with the first stage focusing on ML / TF through the trade in diamonds and other precious stones and the second phase focusing on ML / TF through the use of precious metals. This was in accordance with the FATF definition of precious stones dealer as a sector included in the Designated Non-Financial Businesses and Professions (DNFBPs). The project was initiated at the first stage with an aim to conduct a typologies research to cover both diamond and other precious stones but would not cover precious metals.

---

13 As of 3 June responses had been received from Australia, Brazil, Israel, Switzerland, the United Kingdom and the United States.

14 Team meetings were held in July 2012 in St. Petersburg, Russia in the margins of the Egmont Own meeting; January 2013 in Ostend, Belgium in the margins of the Egmont OpWG meeting; February 2013 in Paris, France in the margins of the FATF WGTYP meeting; June 2013 in the margins of the FATF WGTYP held in Oslo, Norway a meeting which included consultation with private sector representatives.

15 The authors of the report noted that the same terminology was sometimes used differently by some private sector experts that contributed to this report. Every effort has been made to use the same terminology consistently.

During the team meetings in February 2013, the project team decided to narrow down the research to cover only diamonds. As the project progressed, and as more information became available giving a better picture of the scope of the issue, it became clear that the diamond trade alone is a vast area of research justifying a focused effort of its own. For the same reason, synthetic diamonds were also excluded from the scope of the research.

Since one of the objectives of this report is to create a better understanding of the misuse of the diamond trade for the purpose of ML or TF and to understand how the diamond trade is used by criminals to launder funds from illegal activities or to finance terrorism, the project team also decided that "conflict diamonds" would not be part of this research

Each part of the "diamond pipeline" has its own characteristics and different geographical locations. In many cases the "players" are different, and the vulnerabilities and risks correspond to the nature of each "pipeline" segment. The project team found that the collection of information on all of these parts, and the analysis of this information within the framework of AML/CFT vulnerabilities and risks, was a difficult and time-consuming task. Based on all the information collected, the project team identified vulnerabilities. However, since not all of the jurisdictions approached by the project team provided information, there are some intelligence gaps[16]. In order to stay within the timeframe allocated to this project, these intelligence gaps have not been included in the report, leaving the diamond trade in need of further research (particularly with reference to African mining countries and some trade centres like China, Panama and the United Arab Emirates).

Given that the diamond trade is very complex, involving numerous players spanning across continents, it would be difficult within the framework of this report to conduct a country by country analysis of the vulnerabilities and risks relevant to the diamond trade. As a result, the report speaks mainly in general terms with regard to vulnerabilities and risks associated with each part of the trade, and considers geographical vulnerabilities and risks where appropriate.

Finally, the quality of diamonds can be divided into *gem*, *near gem* and *industrial* grade categories. Industrial grade diamonds have different markets and are not used for the production of jewellery due to their low quality. According to the WFDB, 30 - 35% of the volume (less than 1% by value) of mined diamonds and a large proportion of synthetic diamonds are used for industrial purposes. Since the ML and TF vulnerabilities of industrial diamonds are lower than gem quality diamonds, industrial diamonds are not part of this research. When speaking about diamonds, this research is referencing only those diamonds which are eventually used for the manufacturing of jewellery, *i.e.,* gem and near gem quality.

[16] Some intelligence gaps remain since information was not received from all jurisdictions approached by the project team.

CHAPTER 2.
THE INTERNATIONAL TRADE IN DIAMONDS - OVERVIEW

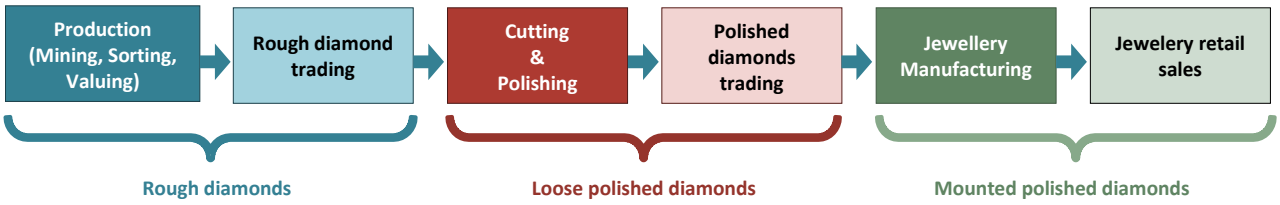
In order to understand the vulnerabilities of the diamonds trade throughout the various stages of the "diamond pipeline" and the risks associated with these vulnerabilities, it is required to understand how this unique and complex industry works, what are the processes bringing diamonds from the mine to the market, who are the "players" involved in the trade, what is the size of the industry, etc. While it is not the purpose of this report to provide a comprehensive analysis of the diamond industry, a synopsis of the sector from mining of rough diamonds to the retail level, is provided.

THE DIAMONDS PIPELINE

Bringing diamonds from production (mining) to the retail consumer involves several stages of processing and a variety of transactions (also known within the industry as the "diamond pipeline"). The stratification of the diamond industry is as follows:

- Production (including mining, sorting and valuing)[17]
- Rough diamond trading / sales
- Cutting and polishing
- Polished diamond sales
- Jewellery manufacturing
- Jewellery retail sales

Figure 1: **Diamond pipeline diagram**

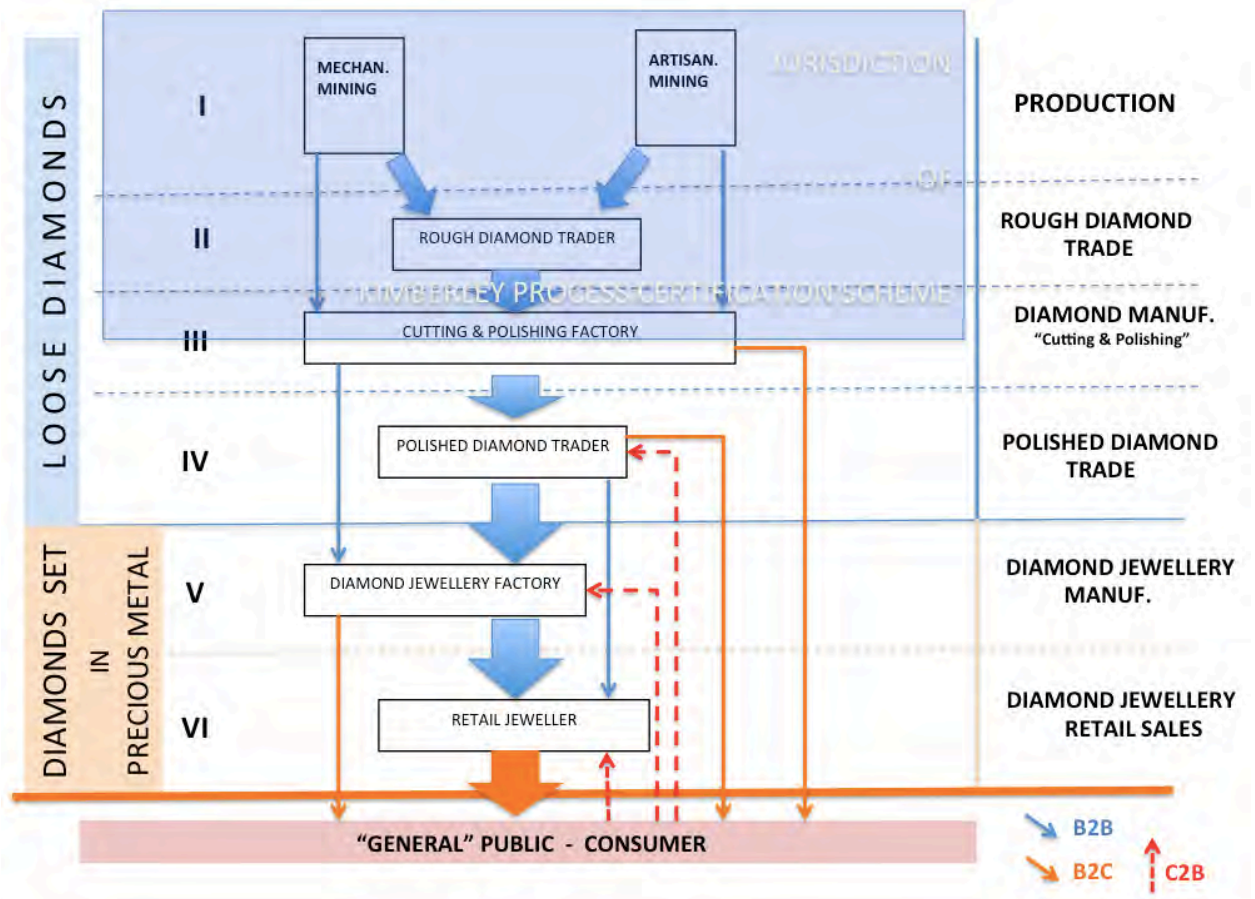


Note: This only represents this licit diamond trade.

A more complex version of the "diamond pipeline" from the post rough diamond sales step in the previous graphic, is the following version provided by industry organisations. However, even this is a far from comprehensive demonstration of the reality.

[17] There is a previous stage of exploration where diamond mines are searched for. This stage precedes the trade in diamonds and therefore it is not covered in the report.

Figure 2: **Diamonds distribution system**



Source: Information provided by industry organisations (2013)

Within this string of transactions and processes, the diamond industry has two distinct components[18]:

> **Mining and Manufacturing**, which is the segment of the industry that deals with rough diamonds and includes diamond mining through to rough diamond cutting and polishing.
>
> **Jewellery Manufacturing and Sales**, which is the segments that deals in finished (cut and polished) diamonds and includes polished diamond dealing on through to jewellery retailing.

Production - The diamond industry begins with the mining of diamonds in the production segment. Generally speaking there are a few primary locations for diamond mining the world over. These are **South, Central and West Africa, Russia, Australia and Canada**[19]. The diamond trade in most of the African mining countries is of high economic importance accounting for a large part of the GDP and export earnings.

---

18 In recent years this delineation has become, to some extent, less distinct due to vertical integration of diamond trading companies and branding of diamond jewellery. In some cases even rough diamonds companies are linked to jewellery companies.

19 There are also additional locations with a small mining sector in South America. India also produces rough diamonds worth several million dollars a year.

Diamonds occur in *kimberlitic* hard rock deposits or *alluvial*/fluvial deposits. Hard rock mines are those in which a kimberlitic pipe (and occasionally lamphorite), the host rock where diamonds are found in, is blasted from the surrounding rock and crushed to release the diamonds contained within it. *Alluvial* mining is the extraction of diamonds from river bed, sea floor, or beach deposits. They are referred to as secondary sources, since the diamonds in alluvial deposits were removed from kimberlitic mines (primary source) by natural erosion. Techniques used to collect the alluvial diamonds can be divided to industrial mechanized mining when specific conditions which make alluvial industrial mining economical are met or artisanal mining which involves diggers working in teams with simple implements such as picks, shovels and sieves. According to the literature review[20], contributions received from some of the mining countries (Australia, Botswana, Canada, Russia Sierra Leone and Zimbabwe) and discussions conducted in the workshop held in Dakar, kimberlitic mines are smaller in terms of geographical area and are much easier to secure than alluvial mines which may spread across huge geographical area which cannot be isolated. Kimberlitic mines are also highly mechanised with strict controls, while alluvial deposits (mainly artisanal) are more difficult to control because the diamonds can be extracted without large industrial machinery[21].

Loose / mounted diamonds

A distinction exists between *loose* and *mounted* diamonds.

Loose diamonds are cut and polished diamonds which have not yet been set in jewellery while mounted diamond is a polished diamond which was set in jewellery such as ring, watch necklace, etc. The regulation of loose and mounted diamonds are usually very different.

The next step of the production stage will be to sort and evaluate the diamonds and have them ready for sale. Sorting and valuation are done by dividing the diamonds into different groups according to their quality and value. This process will provide added value to the price of the rough diamonds. An important issue to understand is that when the report refers to diamonds, it covers a range of products. The price of a diamond, rough to polished, can vary from few tens of dollars per carat to tens of thousands of dollars per carat for a cut and polished diamond[22].

Rough Diamond Trading and Sales - Diamonds recovered from mining processes are purchased by rough diamond dealers through the global diamond markets. Purchases are usually arranged through diamond bourses (although there are different methods for the purchasing of rough diamonds) in countries such as **Belgium, UK, India, Israel, and the United Arab Emirates (Dubai)**. While many of these centres are located in countries that have no diamond production themselves, their rough diamond trading industry has evolved over decades or hundreds of years. A diamond bourse or exchange is a private commercial business with membership restricted to individuals only (not companies). The bourse provides a trading floor where members and buyers

20 For explanation on the difference between the two types of mines (kimberlitic and alluvial) please refer to World Diamond Council (nc). See also Diamonds A to Z (nc).

21 Comments from received from AWDC and information from World Diamond Council (nc).

22 See for example Pricescope (nc). See also, Evan-Zohar, C. (2004), *pp.* 97-98.

meet to trade in rough and polished diamonds[23]. Globally there are 29 diamond bourses affiliated with the World Federation of Diamond Bourses[24]. Other localised markets may exist in proximity to diamond mining locations, where street vendors purchase diamonds from artisanal miners. This is a vulnerable stage since it is very hard to control, as will be explained later. The diamonds are sold to regional dealers and then often to global diamond markets. The rough diamonds may be sold several times between rough diamond dealers and several diamond bourses before they are ultimately sold to a diamond cutter/polisher[25].

Rough Diamond Cutting and Polishing - The beauty of a diamond is realised through cutting, faceting and polishing. Cutting and polishing centres exist in several parts of the world, with major centres existing in **Belgium, India, Israel and China.** Once the diamonds are cut and polished they are ready for use in jewellery and are moved along the "pipeline" to be utilised in diamond jewellery manufacturing and sales. The transformation from a rough to a polished diamond is another vulnerable stage, as a diamond becomes much more difficult to track once it has been cut and polished[26]. Whilst it is possible to judge when certain diamonds were polished using antiquated techniques, for the vast majority of polished diamonds on the market it is virtually impossible to ascertain when they were polished. All diamonds one might view in a shop window might not be first hand goods.

Diamonds Dealers – Once the diamonds have been cut and polished, they are ready to be sold for use in jewellery and, to a very limited but growing market, as an investment product. Diamond dealers are the first merchants of diamonds after they have been cut and polished, and often handle hundreds of millions of dollars' worth of diamonds every year. These dealers usually operate from the major diamond dealing centres of the world including **Antwerp, London[27], New York, Tel Aviv** and in **Dubai, India** and **China**. Their clients include other diamond dealers, large diamond jewellery manufacturers and diamond wholesalers.

Diamond Wholesalers – This segment of the industry deals in smaller amounts of diamonds. They often deal with specific products, such as size or quality spectrums of diamonds or diamonds with fancy cuts or patented cut styles and they are often involved in branding their diamonds. This segment of the industry usually sells to jewellery retailers, but is increasingly selling directly to the consumer.

Diamond Jewellery Manufacturers – Structurally, organisationally, and operationally the jewellery sector is quite distinct from the diamond sector. The jewellery sector also deals in gold, other precious stones, silver, platinum and a range of other raw materials. The financing and capital structure are also entirely different. Some of the larger diamond jewellery manufacturing centres now exist in Asia (**China, Chinese Taipei and Indonesia**). Jewellery is manufactured and may be

23 Although most transactions today are conducted through diamond dealers' offices.

24 World Federation of Diamond Bourses (nc).

25 According to Chaim Even-Zohar the diamond goes through six to ten hands from the mine until it reaches the final customer, Evan-Zohar, C (2007b), pp 114.

26 The Kimberley Process Certification Scheme (KPCS) only covers rough diamonds.

27 In November 2013 De Beers will move its operations from London to Gaborone, Botswana.

sold to jewellery wholesalers and then on to jewellery retailers. Increasingly, the manufacturer is selling directly to jewellery retailers and consumers.

Jewellery Retailers – Diamond jewellery sales is the driver of the diamond industry and this occurs through retail jewellery sales. All of the processes that have previously occurred are in support of this segment of the industry. Diamond jewellery sales occur in virtually all countries of the world through brick and mortar vendors. Vendors exist as single independent stores or large corporate chains with hundreds of stores. Increasingly the internet is being utilised to market and directly sell diamonds and diamond jewellery to the consumer.

Pawn shops – polished diamonds and jewellery are also sold through pawn shops (*i.e.,* diamonds or diamond jewellery will be placed as collateral for loans extended, and only when the borrower defaults, the pawn shop owner takes possession of the collateral). Jewellery can then be resold to jewellery stores, pawn shops, lately to wholesalers, and at special fairs conducted for this purpose. Someone who wishes to sell his or her personal jewellery (in order to repay debts, sell jewellery from inheritance, etc.) can do so at these venues.

BUSINESS PRACTICES AND CHANGES IN THE DIAMOND TRADE

In many respects, the diamond and jewellery industry is not unlike any other trade industry but there are practices specific to the diamond trade. Some of these practices with relevance to AML/CFT considerations are detailed below.

Sightholders/tenders – *Sightholders*[28] are clients of De Beers who are authorised to buy bulk rough diamonds from the Diamond Trading Company (DTC) held by De Beers thus ensuring a steady supply of rough diamonds. Similar systems of rough diamond supply exist with other large mining diamond companies. The *tender* system is an alternative way to buy rough diamonds where bulk diamonds are offered for sale to diamond dealers through tenders. This system however is not limited to sightholders and large mining companies only; it allows 'smaller' rough diamond traders to sell their diamonds in a secure and controlled environment.[29]

Payment methods - Common to the diamond industry is a cash remittance system that is historically-based. Diamond sales at virtually all levels of the market function were made on cash purchases. Nonetheless, while acceptance of cash is still common, this practice has subsided in recent times and modern forms of remittance such as wired funds or credit systems are becoming more prevalent, even in cash based economies such as India and Namibia[30].

Trust – the diamond industry has always functioned on the basis of trust. Million dollar deals are sealed with a handshake. There is an accepted code of conduct and internal arbitration system. Rough or polished stones worth millions of dollars may be sent to another dealer for consignment without a written contract. For example, the owner of the stones will trust that a consignee will

[28] See Diamonds A to Z (nc).

[29] For example: Antwerp World Diamond Centre (nc).

[30] The limited use of cash in these jurisdictions is based on the reply to the collection plan submitted by India and Namibia.

transfer the correct payment upon selling or otherwise return the exact same stones. Consultations conducted with the WFDB revealed that a breach of this trust would ruin the diamond dealer's reputation[31] and consequently end his career.

Memo transactions - A practice that continues to be used in the diamond industry is the lending of a diamond or a mix of diamonds to others in the diamond industry so that they may have the opportunity to sell them – this is known as a "memo transaction." Under this arrangement, the conditions of the loan are specified, including for how long the diamond will be lent, the price of the diamond, and the terms of remittance to the owner if the diamond is sold. The vendor who has the diamond on memo may sell the diamond at a mark-up and then pay the owner in the time and amount specified by the memo. Sometimes the vendor that has the diamond on memo may lend it to another vendor on another memo. Some issues have arisen in the industry around the use of memos, including fraud. There have also been questions around who is responsible for reporting the sale of the diamond under ML reporting requirements (the owner or the seller). In addition, there have been cases in which the diamonds on memo have been sold, but the seller refuses to pay. This would be considered an outright conversion theft.

Related to the use of memos and ownership of diamonds is the variance in inventory practices at different levels of the industry and in different regions of the world. Generally speaking, while diamonds may be counted as individual units, they can also be accounted for by weight. For example, one carat of diamond could be a single one carat stone or 100 diamonds of 0.01 carat each (the per carat valuation is what will distinguish the two parcels in this case, as the one carat diamond may sell for USD 4 000/carat, whereas the 0.01 carat diamonds may only sell for USD 500/carat). While each stone has been weighed, the inventory, which has implications on the profit and hence on tax paid to the tax authority, may be registered differently, *i.e.,* some inventory practices may record diamonds by piece, others may do so by weight. This leaves room for manipulation and "playing" with tax reports, making it difficult for tax authorities to verify the level of inventory on the date of reporting, thus also allowing for manipulation of profit and income tax.

It is also common to negotiate a final price for a diamond. While there are industry suggested prices for a given quality of diamond they are in fact only guidelines, *i.e.,* a starting point from which the negotiation of the final price begins.

Special expertise - Training in gemmology requires a unique skill set, or, at the very least, industry experience. As a result those who enter the jewellery industry or trade are often those whose family is already in the industry, and through whom they can learn the business and garner the necessary experience to succeed. The independent jeweller must be a business person with savvy market-specific knowledge, keen gemmology skills (that need to be constantly upgraded), and, perhaps most importantly, industry contacts to acquire product to sell. Similarly, each level of the industry requires its own specific training, and this knowledge is only learnt through experience in the industry itself.[32]

---

[31] See Even-Zohar, C. (2004), *pp.* 35; and Siegel, D. (2009), *pp*. chapter 4.

[32] Rough diamond sorting and diamond grading of polished diamonds are regularly offered at specialized training institutes throughout the world. Well-known institutes include the Gemmological Institute of

This makes it very difficult for a person to enter the jewellery and diamond trade, as the experience required and practical market knowledge is not readily available[33]. For example, in order to become a diamond bourse member, it may be necessary to be in the business for several years and to be recommended by an existing bourse member[34]. These barriers to entry, including with regard to obtaining product from wholesalers, has made it possible for the diamond industry to protect itself from criminals infiltrating the trade. This is especially the case in countries where special 'license' needs to be obtained from the government in order to become a diamond dealer. In the past, one would receive a referral to a wholesaler from an established jeweller and then obtain an account with the wholesaler to purchase products. Once a few accounts had been set up and business arrangements with diamond/jewellery wholesalers made, these accounts could be leveraged to establish one's legitimacy as a jewellery business. However, without the initial referral from someone already in the business and the subsequently use of primary suppliers to obtain accounts with others, it was virtually impossible to become established.

Some families have been in the diamond business for several generations and have developed strong alliances and networks over time. The involvement of both religious and ethnic groups is very much a reflection of the industry's history, although, in recent times, there has been a shift in the geographic concentration of the diamond trade. This is more of a phenomenon of the finished diamond sector, particularly with respect to the wholesaler to the retailer end of the business.

So far, the overview of the diamond trade has discussed the various levels of the diamond market, presenting a simplified view of the supply chain from mine to consumer. It is important to understand that the processes of mining, the trading of rough diamonds, and even the processes of cutting and polishing diamonds may differ from country to country[35]. In addition, these processes have been subject to market forces and regulatory changes in the last 20 years that are creating new paths for bringing diamonds from mine to market.

While some of the market changes are having a dramatic effect on business practices the world over, these changes may be both positive for the relevant jurisdiction, but may also entail a shift in the level of risk posed by the diamonds industry. The following sections discuss changes in the diamond trade.

De Beers no longer holds a monopoly[36] - up until the 1980s, the rough diamond supply was controlled largely by De Beers through their African holdings. While there were a few other sources of diamonds, including from Russia, this control amounted to a market monopoly. With the emergence of a more open market for global rough diamond sales, a number of international

America in New York and Carlsbad (Calif.), the HRD Antwerp –Institute of Gemmology and the International Gemmological Institute in Antwerp, Hong Kong and Mumbai.

[33] See Even-Zohar, C. (2004), *pp.* 35 – "A closed industry guild with a high entry barriers".

[34] This is the one of the rules set up by the WFDB for all its members.

[35] Differences may lay in the type of mine (alluvial or kimberlitic, closed or open pit), in the manner in which the rough diamonds are distributed from the mine to the rough market, in the level of local beneficiation, in the level of regulation and control over the mining, rough or polished trade, etc.

[36] For a discussion on the change in the role of De Beers in the rough trade see Bain & Company (2011), *pp.* 11 "Expansion of rough-diamond sales channels".

diamond companies, such as Alrosa, BHP Billiton, Harry Winston, and Rio Tinto, increased their involvement, and Russia, Canada, and Australia have become major producers. In the past 20 - 30 years, many companies have chosen their own path for bringing rough diamonds to market instead of selling them to De Beers. It is expected that with the increasing diversity of supply, an equally diverse rough diamond trading market will follow. However, the more the market opens up for new actors, the greater the risk that money launderers will abuse the trade, potentially requiring greater oversight of the industry.

De Beers rough trade moves from London/Antwerp to Gaborone - Up to now, the rough diamond trade was mainly channelled through Europe where De Beers sorted and sold its rough diamonds from London. After an eight years transition period, from November 2013, all the sorting and selling of the global De Beers rough diamond production will have been relocated to Gaborone, Botswana, which is expected to become a major rough diamond "transit trading centre" and, in many respects, play the role hitherto played by Belgium and, to a lesser extent, Israel. Over a hundred rough diamond clients ("sightholders") of De Beers will now travel to Botswana to make their rough diamond purchases. The Botswana banking system may become recipient of some USD 6 billion of inward remittance from these sales alone. This is expected to draw new banking and trading actors to the diamond industry and the trading pattern may significantly change in the years ahead.

Beneficiation – Beneficiation covers the manufacturing of polished diamonds and the creation of diamond-set jewellery. In recent years, African mining countries have been focussing on local diamond beneficiation to sustain employment in the industry and to generate additional added values. As a result, traditional diamond producing countries are increasingly setting up domestic cutting and polishing centres to expand their involvement in the diamond supply chain[37]. The move of De Beers to Botswana means that a significant part of diamond beneficiation will move to southern Africa – mostly Botswana, South Africa, and Namibia. This is expected to have a spill over effect on neighbouring countries which are major diamond producers in their own right, such as Angola, Zimbabwe and the Democratic Republic of Congo (DRC) which may follow suit and develop their own beneficiation. This trend may have significance in terms of ML/TF which will be discussed further in the section referring to vulnerabilities of the rough trading stage.

New trading centres[38] - New diamond trading centres in **China, India, and the United Arab Emirates (Dubai)**, among others, have emerged alongside the traditional **trades centres** - The diversity in rough diamond dealers and increasing supply from multiple sources has afforded opportunity for new rough and finished diamond dealing centres to emerge and historical diamond centres are being challenged by these new diamond centres. The United Arab Emirates has become a 40 billion USD free trade zone trade market. India, and to a lesser extent China, became the major cutting and polishing centres with trade amounting to many billions of dollars. Smaller trade

[37] See for example De Beers (nc).

[38] For discussions on the new and traditional trade centres see Even-Zohar, C. (2007b), which provides an extensive survey of the different jurisdictions involved in the diamond trade. A short review of the trade centres of Antwerp (Belgium), Ramat-Gan (Israel) and Dubai (the United Arab Emirates) is provided in Siegel, D (2009), chapter 5.

centres like Panama, have also recently emerged with a view to serving South America. The emergence of these new centres is primarily a function of the aforementioned supply chain shift, and also reflects the changing tax and regulatory environments. In addition, increasing consumption of diamonds in some of these markets has drawn many diamond manufacturers (cutters / polishers) to these new centres. New trade centres should be aware of the ML/TF risks this shift might entail.

Industry regulation - *Kimberley process* - There have been some dramatic changes in the regulation of the industry in the past ten years, primarily through the implementation of the Kimberley Process Certification Scheme (KPCS) for rough diamonds. The Kimberley Process (KP) is a voluntary export/import control regime, supported by the United Nations, and focussed on stopping the illicit trade in rough diamonds to finance armed conflict (*i.e.,* the use of rough diamonds as an alternate currency used mainly to by weapons). It is not an international legally enforceable agreement, and its compliance flows from the national implementation legislation in participating countries. From an AML/CFT perspective what is important to note here is that the KPCS does not deal with ML or with TF activities and is limited to rough diamonds only. Thus polished diamonds are not covered by the KPCS as it is assumed that all polished diamonds come from KP Certificated rough diamonds.

The KP does not include all countries. Only 81 countries currently participate in the KP (including 28 countries of the EU).

AML/CFT legislation - In the last 10 – 15 years, diamonds and precious metals have been recognised as vehicles for laundering the proceeds of crime. To deal with this issue, Governments have implemented or amended their ML legislation to include diamonds. Some countries have been quick to implement AML/CFT regulatory controls on this commodity and industry.

Industry efforts - the various entities within the diamond industry on both national and international level have made efforts to counter ML and TF risks. This includes the issuance of AML guidance, participation in FATF consultative forums and industry seminars, establishing the Responsible Jewellers[39] Council, De Beers' publication of their Best Practice Principles (BPPs) which De Beers, their joint venture partners, contractors and Sightholders all subscribe to, and the industry's System of Warranties which seeks to complement the Kimberley Process Certification Scheme further down the value chain, including the trade in polished and the jewellery retail sector.

Use of the internet as a trade platform - On the wholesale and retail side of the diamond supply chain, the internet has been a driver for bringing dealers and sellers closer to consumers while squeezing out many intermediaries. In recent years there has been a flattening of the chain of participants that bring diamonds from the producer to the retailer. However, the greatest flattening has been observed in the polished diamond market, especially in the mid-market level involving diamond wholesalers. Diamond dealers who would traditionally sell their products through to diamond wholesalers are increasingly selling them through to the diamond retailer. Similarly, diamond wholesalers, who would traditionally sell diamonds to the retailer, are now offering them up direct to the consumer through the internet and by-passing the retailer. The practicality of

39 Responsible Jewellers Council (2009).

offering diamonds through the internet is enhanced by third-party diamond grading certification, as well as cost-effective and efficient courier services (such as FedEx and UPS).

The trade platforms on the internet web site are mainly *Business to Business* (B2B) but *Business to Customer* (B2C) websites also exist. Both ***rough*** and polished diamonds are offered for sale. Payment means vary from bank transfers and credit cards, as well as checks and money orders, to internet payment systems such as PayPal. Platforms like eBay also enable this direct trade in diamonds, which can amount to millions of USD for polished diamonds. These practices raise challenges for a diamond dealer selling his or her product (both rough and polished diamonds) on how to conduct *Know your customer/ Customer Due Diligence/Enhanced due diligence* procedures to either business or private customers. How are the ML/TF vulnerabilities of the trade mitigated when business is conducted through the internet? How is it possible to trade in rough stones via the internet? [40] How is a Kimberley certificate issued in this case and how can a buyer establish the value of a rough stone without physically verifying its value[41]?

Rough diamonds are offered regularly on the internet at discount prices. Several fraud cases reported by Belgium in their collection plan were conducted through the internet. The exchange of cash for fraudulent diamonds took place in a remote unpopulated place. Exchanges are often arranged in Africa or close to locations of the diamond trade in Europe, and the means of payment and the inspection of the goods take place under quite tight timelines and in remote places. Such deals may be accompanied by dubious certificates of origin, inaccurate evaluations or lack of evaluation by an expert and sometimes without proper documentation.

Recycled market - Recycling of diamonds that have been previous used in jewellery encompasses a huge secondary market estimated to be in the billions of dollars globally. This is a rather unique feature of this industry as the commodities do not need to undergo any preparation for return to the market; the diamonds may simply be inserted into new jewellery or sold as an investment diamond. The WFDB commented that it is estimated that the world probably has about 0.75 – 1 trillion USD of polished diamonds at current prices (or about 1 – 1.5 billion carats) in consumer hands[42]. About 40-50% of these would be held in America. Recycled diamonds are generally being recut to meet today's consumer preferences. This recutting is mostly done in the United States (for expensive goods), or India.

Investments in diamonds – One jurisdiction highlighted this activity as a growing phenomenon. Websites offering diamonds for sale as an investment demonstrate how the dramatic rise in the price of diamonds over the last decade has resulted in them becoming a possible investment tool.

---

[40] The fact that buying a rough diamond through the internet is problematic in terms of establishing the price was raised in a consultation conducted with the WFDB. In additional consultation with diamond experts it was stated that whilst it is possible to buy rough on the internet no diamond professional would purchase rough diamonds without seeing them first unless they were buying from an LSM (*i.e.,* De Beers, Rio Tinto, etc.) and often then a viewing will take place. If a seller over the internet is not known and offers rough stones that should be an immediate red flag.

[41] In 2010 and 2011, the KP discussed at length the problems associated with the internet-trading of rough diamonds. It became clear that most of this trade was B2C instead of B2B.

[42] Estimated by "Tacy Ltd".

While it is not possible to determine the amount of investment in the industry, the larger the investments, the easier it would be to commingle funds from non-trade sources.

Synthetic diamonds - Another important change to the diamond market has been the emergence of synthetic and treated diamonds on the retail diamond market. While these man-made cousins of natural diamonds were not included in the typology review, it is important to provide a brief overview of them here. Synthetic diamonds are made of the same composition as natural diamonds (aside from some slight atomic differentiations); the fundamental difference is that synthetic diamonds are made in a factory. The quality of the synthetic diamonds and number of methods to create them has improved tremendously over the past decade and they are being sold commercially within the diamond industry. In addition, diamonds that were once considered unsuitable for commercial jewellery use are now being treated with different processes to enhance their colour or clarity. While the project has not examined synthetic or treated diamonds in respect of laundering proceeds of crime, the use of these types of diamonds in cases of fraud has been recorded[43]. Moreover, the use of synthetics substituted for real diamonds in relation to commodity-based ML should not be underestimated. What further muddles this issue is that there is no common international nomenclature for synthetic or treated diamonds. Some legislation may refer to diamonds or natural diamonds without making distinctions between, or allocations for, synthetic or treated diamonds. Since the quality of synthetic diamonds has improved, it is important to keep in mind that the vulnerabilities and typologies identified for the trade in natural diamonds may also be relevant for synthetic ones. As the trade in synthetic diamonds expands the risks posed by the trade in this type of diamonds will grow. It was noted in the private sector consultations that as the number of diamonds available to be mined decreases, synthetic diamonds may become more of an issue. Also of importance is the fact that in most if not all cases synthetic diamonds are not part of AML/CFT legislation, although the vulnerabilities may be similar.

OVERVIEW OF DIAMONDS AND MONEY LAUNDERING AND TERRORIST FINANCING

That this report has highlighted the different and unique characteristics of diamonds and the diamond trade which make the industry vulnerable to ML and TF activities should not be taken to mean that the industry is more vulnerable relative to others. Nonetheless, it is important to keep in mind that the complexity of the international diamond trade means that the ML and TF vulnerabilities and risks may differ from one segment of the "pipeline" to another and from one jurisdiction to another.

Beyond more conventional cases of ML, including the laundering of the proceeds of crime and the generation of criminal profits, some research[44] has shed light on the use of diamonds and diamond jewellery as an alternate currency by criminals. This is particularly notable in the case of diamonds used by criminal enterprises engaged in drug trafficking, (*i.e.,* the trade of diamonds for drugs).

[43] See for example Flanders News (2012) where it was said that "The quality of synthetic or man-made diamonds is so good, that even experienced diamond dealers can't tell real from fake ones". See also JCK (2012).

[44] Nelson, D., Collins, L. & Gant, F. (2002).

Diamonds are also used by such criminals for wealth movement, storage and preservation, and use as a status symbol.

It is useful to make a distinction between ML through the diamonds trade and laundering diamond proceeds of crime. The first type of activity is where a criminal will launder cash or other payment means acquired through predicate offences he commits[45] by placing and layering through the diamonds trade. This can be done by conducting transactions with the proceeds of crime as if they were trade in diamonds where in fact the diamonds trade will only be used to transfer funds from one account to another, whether locally or internationally, or by purchasing diamonds with cash proceeds of crime and then selling the diamonds to obtain cash at a later date or a different location. The second type of activity is where illicit diamonds (e.g. stolen/robbed diamonds, or diamonds received as a form of payment for drugs) will be laundered by selling or trading the diamonds, by cutting/re-cutting and polishing the illicit diamonds etc.' so as to conceal their illicit source. In both cases the criminal has laundered proceeds of crime, but only in the former case we can formally speak about ML as such, i.e. money which is laundered through the trade. The diamond industry is a perfect example where both can occur.

This distinction may be lost among law enforcement practitioners, intelligence officers and industry representatives, who almost exclusively refer to ML as encompassing all processes related to the proceeds of crimes involving diamonds. However, with respect to the development of typologies, this distinction is very important, especially as it relates to the use of diamonds as alternate currencies and in remittance systems used by criminals. For example, Pablo Escobar laundering drug profits through jewellery stores in a massive ML scheme[46]. And in 2003, USD 150 million worth of diamonds were stolen from a central diamond vault in a single theft event[47]. In this case, selling the diamonds is profiting from the proceeds of crime. Both cases utilised the diamond market.

TF can involve the use of unlawfully and lawfully provided funds to finance terrorism activities. Diamonds could therefore be used to finance terrorism in a scenario where a donor or financier purchases diamonds legitimately, using lawfully derived funds, and then transfers the diamonds to a terrorist or terrorist organisation who use the diamonds in exchange for equipment or cash intending to finance terrorist activities.

Buying and selling diamonds within rough and polished diamond markets is critical to understanding the vulnerabilities of the criminal use of diamonds, it is important to discuss the diamond and jewellery cycles. Diamonds are often reintroduced to the diamond market to be resold. The sale and resale of diamonds within the national and international diamond industry is a function of the diamond and jewellery cycle, which in turn provides an opportunity for laundering proceeds of crime. Illicit funds that are generated can be hidden, moved and entered into financial institutions or traded for other tangible assets within the diamond and jewellery cycle. The

45 These may be predicate offences not connected to the diamond trade, i.e., drug trafficking, fraud, weapons trade, etc.'.

46 Robinson, J. (2003).

47 See The New York Times (2013).

diamond industry may be a stepping stone for criminals who utilize these commodities to enter illicit funds into the banking system, whether in their own or in an offshore jurisdiction.

This cycle is rather unique for commodities (although it also applies to precious metals and gemstones, to some extent), especially as the diamond remains in the same form from the time that it first enters the market after being cut and polished. The simplicity and ease with which diamonds can be purchased and sold, and the special characteristics of these precious stones, provides tremendous opportunity to exploit the commodity and the industry with regard to the laundering of the proceeds of crime.

In summary, the diamond supply chain at all of its stages, from production to consumption, can be the gateway to profitability, for laundering proceeds of crime, for ML or TF and for moving proceeds of crime into the financial system.

THE DIAMOND TRADE IN NUMBERS

The purpose of this section of the report is to give the reader unfamiliar with the diamond trade information on all its facets a rough idea as to the volume of the different parts of the trade (rough, polished and jewellery manufacturing levels) and to draw some inferences from available trade data.

ROUGH DIAMOND TRADE

The KP publishes annual statistics on the rough diamond trade, which include the annual volume in carat and the annual value in USD. The information is published on the KP website with respect to each of the member countries and includes data on: rough diamond production, import and export; the average price per carat[48] for both import and export; and the number of certificates issued within each jurisdiction[49]. These statistics provide a very general picture of the leading countries at each level of the rough "diamond pipeline" and the overall volume and value of the global rough diamond trade.

What is important to remember is that The KP data does not capture the entire global production. These figures exclude trade within the EU (*i.e.,* between the United Kingdom and Belgium for which no certificates are required) or internal trades on local markets. There are some suspended or sanctioned countries whose production is not recorded. In quite a few instances the production values are not correctly reported. Smuggling is still taking place, and those diamonds do somehow end up in the diamond pipeline. The Kimberley system figures should be viewed as indicative only.

The KPCS was not designed to curb ML/TF activity; it was designed to put an end to the trade in conflict diamonds. While it is not possible to draw firm conclusions based on these statistics some

48 The average price per carat is also published for each member state on the KP web site.

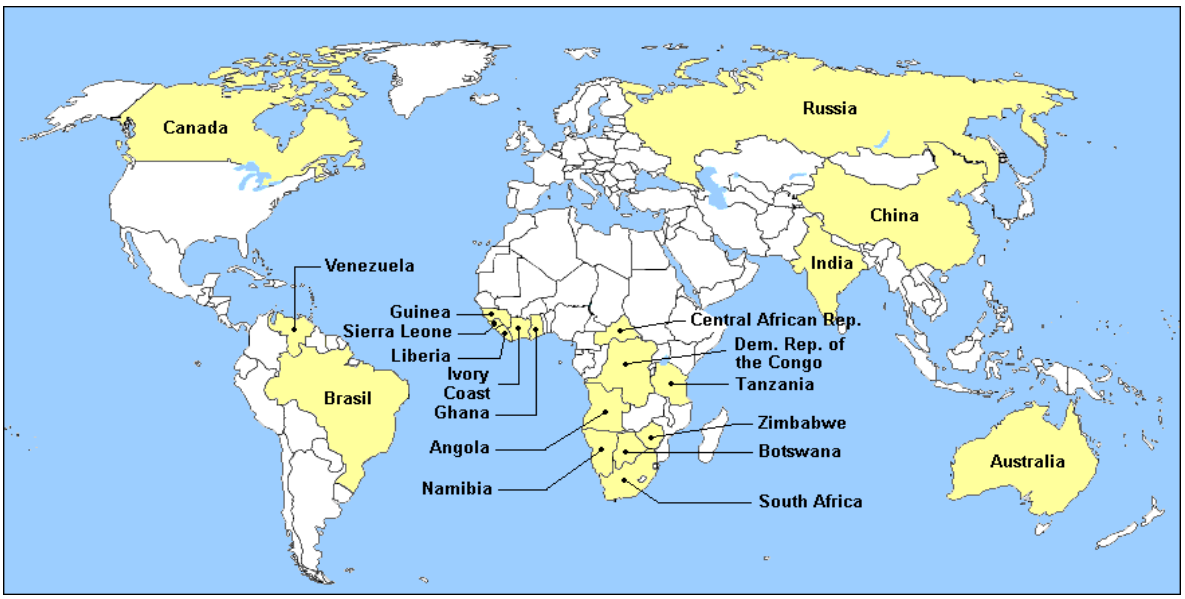
49 KPCS rough diamond public statistics area, https://kimberleyprocessstatistics.org/public_statistics. Additional statistics as to the country to country rough diamond trade are not published, but may provide a more deeper understanding of the rough diamond trade and may point to additional ML/TF issues and concerns.

indication of ML/TF activity related to rough diamond trade are provided by this information which should be addressed by participants of the KP.

DIAMOND PRODUCTION COUNTRIES

Mining activity takes place across different geographic areas around the world. The figures below provide some information on mining countries at the first level of the "diamond pipeline", i.e. supplying rough diamonds which will eventually be manufactured into jewellery. Rough diamond production is spread across different geographical areas around the world but almost 80% of the total rough diamond production is concentrated in 5 countries.

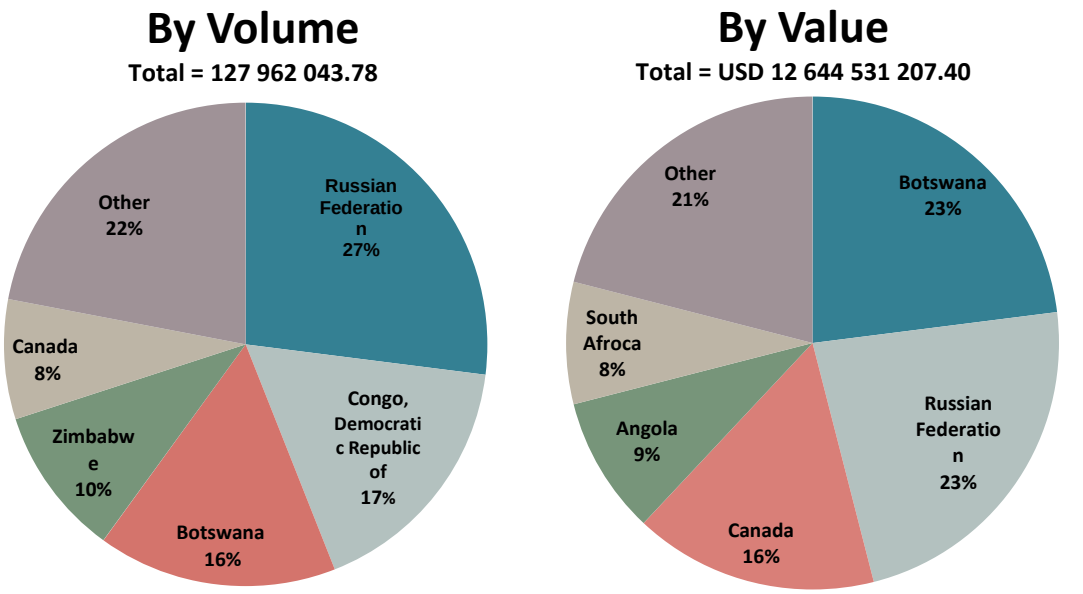
Figure 3: **Countries of rough diamond production**



Source: www.info-diamond.com[50]
Note: Lesotho, Guyana, Togo, Cameroon, Congo (Brazzaville) and Indonesia are also producers of rough diamonds. At the moment there is a total UN embargo on the import of diamonds from Côte d'Ivoire, and a KPCS "embargo" on diamonds from Venezuela and Central African Republic.

50 www.info-diamond.com/rough/map.html#prettyPhoto/0/.

Figure 4: **Countries of rough diamond production – 2012 Production**



Source: Kimberly Process Certification Scheme

According to the KP statistics for 2012, the total volume of production of rough diamonds was close to 128 million[51] carats, amounting to a total value was over USD 12.6 billion[52]. However, imports and exports of rough diamonds have reached USD 50.92 billion and USD 50.27 billion respectively. The volume of export and imports are much higher than the volume of production since rough diamonds go through many several "industry actors" in several trade and polishing centres before they are cut and polished. Mining countries may also stockpile production. The production, export and import figures of the major diamond producing countries (in terms of volume and value) are included in table below:

51 127 962 043.78 carats.

52 USD 12 644 531 207.40.

Table 1: **Production, Exports and Import of rough diamonds in major Producing countries – 2012**

	Production		Import		Export	
Country name	Volume (Carats, Carat (Millions)	Value (Billions of USD)	Volume (Carats, Carat (Millions)	Value (Billions of USD)	Volume (Carats, Carat (Millions)	Value (Billions of USD)
Botswana	20.55	2.98	7.49	2.14	23.35	3.99
Russian Federation	34.93	2.87	0.14	0.15	29.81	3.90
Canada	10.45	2.01	0.76	0.16	11.12	2.16
Angola	8.33	1.11	0	0	9.20	1.15
South Africa	7.08	1.03	11.47	1.08	8.01	1.36
Namibia	1.60	0.90	0.13	0.16	1.68	0.98
Zimbabwe	12.06	0.64	0	0	14.96	0.74
DRC	21.52	0.18	0	0	19.56	0.26

Source: KP statistics[53]

As can be seen in the table above, Botswana is currently the largest producing country in terms of value, (USD) and the Russian federation is the biggest producer in terms of volume (carat). Most of the production is exported to trading centres and then onwards to polishing and cutting centres. Botswana and South Africa are also significant importers of rough diamonds of very high volumes. The Russian Federation's exports amount to almost a billion dollars more than the value of its production. This raises a question as to the source of the diamonds exported. Since the volume in terms of carat is almost the same, this means that the average price of diamonds exported is much higher than those which were mined.

There are additional countries producing from just a few million dollars to several hundred millions dollars in diamonds (Australia, Brazil, Central African Republic, Congo, Ghana, Guinea, Guyana, India, Lesotho, Liberia, Sierra Leone and Tanzania). The Democratic Republic of Congo is the second largest producer in terms of volume (carat). Diamond mines also exist is Venezuela, but according to the KP statistics, the country has voluntarily suspended exports and imports of rough diamonds in 2008 and until further notice. However, reports exist that suggest that mining in Venezuela continues and the rough diamonds are smuggled out of the country[54].

53 Data from KP web site for the year 2012 (statistics are provided on the web site from year 2004) - Kimberly Process (2012).

54 See Time (2012).

DIAMOND TRADE CENTRES

Table 2: **Production, Exports and Import of rough diamonds in major trade centres – 2012**

	Production		Import		Export	
Country name	Volume (Carats, Carat (Millions)	Value (Billions of USD)	Volume (Carats, Carat (Millions)	Value (Billions of USD)	Volume (Carats, Carat (Millions)	Value (Billions of USD)
European community	0	0	124.80	16.79	126.80	17.81
Israel	0	0	13.27	4.66	13.79	3.61
Switzerland	0	0	8.68	1.99	8.88	2.29
United Arab Emirates	0	0	59.74	4.56	60.44	6.82
United States	0	0	3.49	0.48	1.45	0.40

Source: KP statistics[55]

In 2012 the main trade centres for rough diamond were Belgium, Israel, Switzerland and the United Arab Emirates. Belgium is the largest trade centre with a USD 34.6 billion rough diamond industry followed by the United Arab Emirates (USD 11.38 billion) and Israel (USD 8.27 billion). The role of rough diamonds trade centres is to provide the link between mining countries and polishing centres and provide the supply needed by cutters and polishers who produce polished diamonds. What stands out from the figures in the table above is the role played by the United Arab Emirates, and its significance in terms of the world-wide trade. The volumes (carat) imported to and exported from the United Arab Emirates are almost the same and stand at around 60 million carats. However the value of the exported rough diamond and the average price per carat is almost 50% higher than the value of imported rough diamonds. For 2011, the average price per carat for export in the United Arab Emirates is 74% higher than the average price per carat on import. These are the same rough stones going in and out only they are sold at a much higher price, an increase that perhaps includes more than the entire production chain mark-up. A small part of the difference may be explained by 'sorting' which may produce 10–15 % mark up. Since the United Arab Emirates is not a polishing centre the added value for the diamonds going in and out of the country is unclear and would merit further investigation[56].

55 Kimberly Process (2012)

56 Earlier research has been done on the situation in Dubai. See Even-Zohar, C. (2004), chapter six, for a discussion on transfer pricing with reference to Dubai and FTZs. In particular Even-Zohar states that "*In essence, diamond multinationals will channel their rough diamond purchases … through Dubai. Often, the parcels are not even opened and, after re-invoicing, are shipped to the final destination, often Belgium, India or far-east cutting centres. The invoice will inevitably provide a higher figure … As a result, the local company produces a profit – which is a purely paper profit, because it generally remain a transaction between affiliated companies*" (*Ibid, pp.* 101).

CUTTING & POLISHING CENTRES

Table 3: **Production, Exports and Import in major cutting & polishing countries – 2012**

	Production		Import		Export	
Country name	Carat (Millions)	Volume (Billions of USD)	Carat (Millions)	Volume (Billions of USD)	Carat (Millions)	Volume (Billions of USD)
India	0	0	151.87	14.88	34.44	1.80
China	0	0	21.14	2.73	15.00	1.66
Thailand	0	0	0.87	0.40	0.40	0.15

Source: KP statistics[57]

Most of the cutting and polishing is done today in India[58]. China has also become in recent years a major cutting and polishing centre. The traditional polishing centres were Belgium, Israel and the US (see KP data in the tables above), much of the polishing and cutting has recently moved to the Far East. Additionally, African countries such as Botswana and South Africa have invested in developing the local beneficiation industry and are becoming to some extent cutting and polishing centres. Smaller manufacturing operations are located in Angola, Armenia, Brazil, Democratic Republic of Congo, Mauritius, Namibia, Russia, Sri Lanka and Thailand.

Changes in export/import to production ratio – in the last 5 years the ratio between the volumes in USD of rough diamonds export to rough diamond production[59] has risen by 33%. During the same period of time the rate of export to production in terms of volume (carat) has gone up by 27.3%. Compared to 2008, the same stones are exported and then re-exported more times than five years ago and at a higher price per carat than the price of carat at the production level. The diamonds are going through additional "hands". In terms of ML/TF this may be an indication that there are more "circular transactions" in diamonds (and correspondently in financial transactions conducted through financial institutions supporting the trade, mainly banks) which might be a result from ML or TF activity. It is not within the scope of this project to analyse the reasons for this additional circular trade, but this should be a reason for concern for importing and exporting countries.

57 Kimberly Process (2012)

58 According to open source information India accounts today for more than 90% of cutting and polishing of rough diamonds (by volume), e.g., Bain & Company (2011), *pp*. 45, "*Before the recent recession, Indian craftspeople cut 14 out of 15 diamonds worldwide*" and Even-Zohar, C. (2013).

59 The export and import are almost identical in terms of both value in USD and volume in carat since the same diamonds which are exported are also imported in another KP member state.

Table 4: **Rough diamonds export/import to production ration for 2008 - 2012**

	2008	2009	2010	2011	2012
Export/import ratio (value, USD)	3.04	3.03	3.29	3.63	4.02
Export/import ratio (volume, carat)	2.49	2.64	3.22	3.14	3.17

Based on KP statistics

Illegal trade – the KP statistics account only for the legitimate trade between KP member states. While team members have indicated that illegal trade is taking place, there is no source of data to evaluate the extent of such trade making it hard to establish the overall global volumes of rough diamond trading. Cases provided by team members or from open source show that **smuggling accounts for a large portion of the illegal activity**, indicating that the illegal trade in diamonds is very significant. The following countries have either provided cases involving smuggling and/or indicated that smuggling of diamonds occur within their jurisdiction: Belgium, Canada, Israel, Netherland, Russia, South Africa, Sierra Leone, United Kingdom, and United States of America.

The illegal diamond trade can be divided as follows:

1. **Illegal mining** which takes place in mining countries. The illicit diamonds will then be either inserted to the trade of a local mine or smuggled to a neighbouring country with a mining industry and then commingled with the produce of a legal mine.
2. **Stolen diamonds** which are inserted to the legal trade as a laundering method (for example, it is estimated by DeBeers that USD 100 million is stolen from them annually).

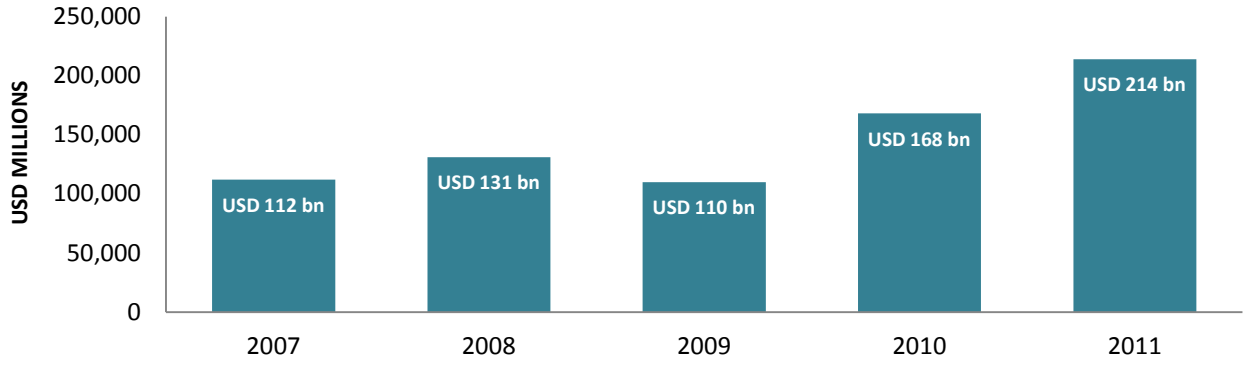
From an AML/CFT perspective the illegal diamond trade may also be used for ML/TF purposes.

POLISHED DIAMOND TRADE

In order to further understand the volume of the diamond trade and the leading countries involved in it, one must also look at the trade in polished diamonds. The polished diamond trade refers to trade in *loose* diamonds after they have been transformed from rough diamonds through cutting and polishing. As the chart below shows, the volume of trade in polished stones is much larger than the trade in rough stones amounting to approximately USD 214 Billion[60].

60 These figures include also movement of diamonds, such as memo transactions where in many instances the diamonds do not change ownership and are returned to the diamond dealer or when the diamonds are sent for appraisal.

Figure 5: **World Polished Diamonds Trade**



Source: www.diamondshades.com

The charts show a significant development in the traded value of diamonds during 2007-2011. There is one exception, the financial crisis in 2008-2009 which resulted in a shortage of rough stones as the volume in carat weight declined sharply. The general trend is a development of the extracted value by strides and jumps. There appears to be a significantly disproportionate ratio between the turnover of polished diamonds and the traded turnover of rough diamonds. This may be attributed to higher prices of polished diamonds, since the real added value in the phase of the transfer of diamonds from rough and uncut stones to polished gems is relatively small. Although not indicated, this may also be attributed to an inclusion of return shipments of polished diamonds, where polished diamonds are sent for inspection by a customer while some of the diamonds are returned to the diamond dealer.

The US is today the largest consumer market for diamond jewellery. There is also a significant polished diamond trade in China; Hong-Kong, China; India; Japan and the Persian Gulf. Trade centres such as Belgium, Israel and the United Arab Emirates also see high volumes of trade in polished diamonds with turnover reaching USD 28.67 billion in Belgium, USD 12.88 billion in Israel and USD 29.73 billion in the United Arab Emirates (for the year 2011). Finally, cutting and polishing centres also account for a large portion of the trade, with USD 47.25 billion in India and USD 4.7 billion in China[61].

JEWELLERY MANUFACTURING

At the last stage, jewellery manufacturing hold an additional large portion of the trade in volumes amounting to tens of billions of USD anually. The US is considered to be the largest consumer market for diamond jewellery with volumes amounting to billions of USD. India is one of the major manufacturing countries of diamond jewellery with volumes reaching a few tens of billions of USD. Jewellery manufacturing is also conducted in countries like China, Thailand and in western Europe. Some of the manufacturing is made by large international chain store companies where manufacturing can reach several billion USD.

61 For statistics see Diamond Shades (n.c.).

CHAPTER 3.
REGULATION AND LEGISLATION RELATING TO DIAMOND DEALERS AND CROSS-BORDER TRANSPORTATION OF DIAMONDS AND CURRENCY RELATED TO THE TRADE IN DIAMONDS

FATF STANDARDS

FATF STANDARDS RELATED TO DESIGNATED NON-FINANCIAL BUSINESSES AND PROFESSIONS

In 2008, FATF adopted a Risk-Based Approach Guidance document for dealers in precious metals and stones[62]. The guidance supported the development of a common understanding of what a risk-based approach involves, to outline the high-level principles involved in applying a risk-based approach and to indicate good practice in the design and implementation of an effective risk-based approach. In the guidance, the term 'dealer' encompasses a wide range of persons engaged in these businesses:

- Those who produce precious metals or precious stones at mining operations.
- Intermediate buyers and brokers.
- Precious stone cutters and polishers and precious metal refiners.
- Jewellery manufacturers who use precious metals and precious stones.
- Retail sellers to the public, and buyers and sellers in the secondary and scrap markets.

In addition to financial institutions, the FATF Recommendations[63] also cover a number of Designated Non-Financial Businesses and Professions (DNFBPs). DNFBPs cover dealers in precious stones, including diamond dealers. No further explanation of definition on dealers in precious stones is provided by FATF.

The following FATF Recommendations are applicable to diamond dealers.

- **Recommendation 22** mandates that customer due diligence and record-keeping requirements set out in Recommendations 10, 11, 12, 15, and 17 apply to dealers in precious stones when they engage in any *cash transaction* with a *customer* equal to or above the applicable designated threshold (USD/EUR 15 000).

62 FATF (2008a).

63 FATF (2012).

- **Recommendation 23** indicates that the requirements set out in FATF Recommendations 18 to 21, regarding measures to be taken with respect to countries that do not or insufficiently comply with the FATF Recommendations, internal AML/CFT controls and the reporting of suspicious transactions, apply to dealers in precious stones when they engage in any *cash transaction* with a *customer* equal to or above the applicable designated threshold (USD/EUR 15 000).
- **Recommendation 28** requires that dealers in precious stones be subject to effective systems for monitoring and ensuring compliance with AML/CFT requirements, which should be performed on a risk-sensitive basis by a supervisor or by an appropriate self-regulatory body.

FATF STANDARDS RELATED TO CASH COURIERS

With regard to **Recommendation 32** on Cash couriers and its interpretative note, precious stones ***are not included***, despite their high liquidity and use in certain situations as a means of exchange or storing and transmitting value. These items may be otherwise covered under customs laws and regulations. If a country discovers an unusual cross-border movement of precious stones, it should consider notifying, as appropriate, the customs service or other competent authorities of the countries from which these items originated and/or to which they are destined. The country should cooperate with a view toward establishing the source, destination, and purpose of the movement of such items, and toward taking appropriate action. Countries are not required to have measures in place to detect the physical cross-border transportation of diamonds through a declaration/disclosure system.

NATIONAL AML/CFT REGULATION/LEGISLATION IN DIAMOND TRADING COUNTRIES

As part of the project, countries were asked if they have national AML/CFT regulation applicable to diamond dealers in place, and, if so, what the reporting and record -keeping duties contained and how registration and supervision of the sector was carried out. Information was also gathered about the regulation of the cross-border transportation of diamonds, and currency related to the trade in diamonds.

It is important to note that the definition of a diamond dealer differs from country to country. For example in the US a retailer can be under certain conditions seen as a diamond dealer. However, in most countries a diamond dealer is only dealing in rough or polished loose diamonds. Further information on difference in regulation and legislation can be found in **Chapter 5**.

NATIONAL AML/CFT REGULATION ON DIAMOND DEALERS, REPORTING DUTIES AND RECORD KEEPING DUTIES

With regard to current international AML/CFT legislation, several countries do not have AML/CFT regulations pertaining to diamond dealers. As a result, businesses that buy and sell diamonds are

not obliged to implement due diligence procedures or report[64] transactions to an FIU (STRs[65], and / or CTRs)[66] or undertake AML/CFT risk assessments.

In some cases, countries without national AML/CFT regulations pertaining to diamond dealers have other legislation for the regulation of the sector. For example, legislation making it illegal to trade in rough diamonds - or are in the process of enacting an AML/CFT regime for diamond dealers.

- **South Africa** does not have industry-specific AML/CFT regulations directed at diamond traders. Diamonds are only covered under the Diamond Act, which deals with the regulation of the diamond industry as a whole.
- **Israel** indicated that, in 2012, parliament approved an amendment to the AML/CFT law to include dealers in precious stones. In the near future, diamond dealers will be regulated and supervised for AML/CFT by a supervisor and they will become subject to Administrative Sanctions for non-compliance.
- In **Mexico**, an AML/CFT law applicable to the trading in diamonds, among other non-financial businesses, entered into force on July 17, 2013. Through this law, both individuals and legal entities trading in diamonds and other precious stones and metals are subject to AML/CFT compliance measures, such as CDD and filing of transaction reports.
- The **Australian government** has also proposed amendments to its AML/CFT Act to include diamond dealers.
- Although **Switzerland** has no specific AML/CFT regulations specifically applicable to diamond dealers, it does have a reporting obligation in place for instances in which dealers are considered financial intermediaries.

In most of countries that contributed to the report, however, diamond dealers are subject to a national AML/CFT regime. Depending on the country, this includes implementing an AML/CFT programme designed to prevent the dealer from being used to facilitate ML or TF, and usually entails designating a compliance officer, providing on-going education and training, customer identification, and a customer acceptance policy, as well as record-keeping requirements, Know Your Customer (KYC) procedures, reporting requirements and a risk-based approach. De Beers provides training and awareness to law enforcement, *e.g.,* Interpol and customs.

The customer identification and identity verification range from remote identification, the identification of the ultimate beneficiaries, to the identification of the clients and sometimes identification of the suppliers. In Belgium, the identification and identity verification of clients is a legal obligation when establishing a business relation, when entering an occasional relationship for

---

65 While The FATF uses the term Suspicious Transactions Reports there are other types of reports such as SAR (Suspicious Activity Report), UTR (Unusual Transaction Report) and UAR (Unusual Activity Report) which are the legal requirement in different team member jurisdictions.

66 More details on the countries and numbers can be found in the chapter on statistics.

a transaction exceeding EUR 10 000, or generally when there is a risk or suspicion of ML or TF. Furthermore, it is required to identify such diamond suppliers for which purchasing transactions lead to payments that are wholly or partly, directly or indirectly, carried out by other means than by transfer to bank accounts held with credit institutions.

When AML/CFT legislation is applicable to diamond dealers, they are obliged to submit Suspicious Transaction Reports (STRs) / Suspicious Activity Reports (SARs) to the FIU and establish different procedures and policies for AML/CFT prevention. The statistics show that half of the countries that participated in the project received some or several STRs/SARs from diamond dealers. The reporting duties depend on the country but several of them have set a threshold (from USD 6 500 to USD 65 500) with regard to cash transactions in the diamond trade or business. In The Netherlands, consistent with the limitations set out in the European Union, diamond dealers are obligated to report cash transactions above a threshold of EUR 15 000 and on suspicion of ML.

In most countries, diamond dealers have the obligation to maintain verifiable records of all activities for a period of five years. In Argentina, diamond dealers keep documents for ten years in such a way that enables the reconstruction of transactions and allows such documents to be used as evidence in any ML and TF investigation. In general, diamond dealers need to keep, protect, safeguard and prevent the destruction or concealment of information and documentation supporting trade practices (invoices, KP certificates), as well as the information used to identify their clients. Depending on the country, diamond dealers also have to submit an annual declaration about the stocks and activities, put in place a written AML/CFT policy or keep a copy of every suspicious transaction report that they forward to the FIU.

The overall self-assessment of those countries that provided information was that the level of AML/CTF compliance of the diamond sector as medium.[67] In Canada, deficiencies related to entities' compliance programmes have been primarily identified (e.g. policies and procedures, training, risk-based assessment, etc.). Canada's AML/CTF regime for diamond dealers is more comprehensive on other elements, such as appointment of a compliance officer, record-keeping and client identification. In Belgium, an extra focus on compliance was put forward by the sector representative with an AML/CFT and Compliance Helpdesk assisting diamond dealers with their regulatory and compliance obligations and the introduction of Compliance as the 5th "c" of diamonds (next to Cut, Clarity, Carat and Colour).

LICENCE REGIME AND SUPERVISION OF THE SECTOR

Only in a few countries are licences and registration required for business activity in the diamond trade. This can be with the FIU or another licensing authority. In Belgium, all diamond dealers need to be registered with the Federal Public Service Economy for business activity in the diamond trade and a licence is required for the import and export of diamonds coming from or going to non-EU countries. By contrast, in the United States, diamond dealers are not required to register or be licensed for AML/CFT purposes. The strictest rules apply in South Africa and Namibia, where it is illegal for any unlicensed person to be in possession of or trade in uncut diamonds.

67 There were some outliners. One country assessed their level of compliance as low and one medium to high.

Compliance with the regulations imposed on diamond dealers is checked by an independent authority or the FIU (depending on the country). These regulators/controlling bodies have the authority to issue administrative fines and, in some cases, criminal penalties (monetary and imprisonment) to diamond dealers who are non-compliant with their AML/CFT obligations or to revoke the license of a diamond dealer. In the USA, some warning letters regarding the lack of a required AML/CFT programme were issued. Nonetheless, in most countries no fines have been imposed on diamond dealers, and no AML/CFT civil enforcement actions have taken place over the last two years. In Namibia, the diamond sector has not been assessed for AML/CFT compliance as of yet, thus no enforcement has taken place. Consequently, no sanctions were imposed in the last two years. This is a clear indication that the level of AML/CFT enforcement of the sector in most team members' jurisdictions is low, perhaps apart from the mining sector of some kimberlitic mines jurisdiction where level of control over the risk of theft is considered to be high. During the FATF/GIABA expert workshop held in Dakar, some participants noted that there is a need for strong enforcement on the sector and that the low level of enforcement, particularly in some African mining countries, poses a problem in terms of AML/CFT supervision.

NATIONAL AML/CFT REGULATION ON CROSS-BORDER TRANSPORTATION OF DIAMONDS AND CURRENCY RELATED TO THE TRADE IN DIAMONDS

There are several ways of transporting diamonds, via parcel or mail, courier service or by personal transport. Lower value shipments may enter by way of FedEx/UPS, whereas Brinks, G4S or other secure or armoured car services (Malca Amit) are in most cases used for the highest value shipments and bulk rough diamonds. In most cases, diamonds enter a country as paid parcels and taxes are incurred, less frequently the diamonds are entered on Memo and also under ATA Carnet[68] (tax-free – for display/show purposes). In Israel, the courier service will also deal with the documentation and transmit the information of the shipment to the customs. According to the Israeli contribution, the courier service company does not verify if the content of the shipment corresponds with the diamond dealer declaration. All Kimberley Process (KP) members have implemented domestic legislation that requires rough diamonds be exported in tamper-resistant containers.

Within the Kimberley Process Certification Scheme (KPCS), rough diamonds can only be traded between KP participants, and all imports and exports of rough diamonds must be accompanied by a KP Certificate.[69] In Russia, diamonds are transported in boxes that contain a mixture of diamonds of given types, collected in compliance with the adopted structure. The certified (validated) copy of the KP certificate and the shipping documents are enclosed with the parcel within the tamper-resistant plastic bag, the KP certificate is visible through a transparent window in the bag. The number of the KP certificate is indicated on the bag and in the shipping documents.

68 ATA Carnet cannot be used for sending rough diamonds.

69 Although it is illegal for KP participant countries to ship rough diamonds to non-KP participant, KPCS is not an international binding treaty and therefore it is not illegal for non-KP participating countries to trade in rough between themselves.

There are some major differences between countries with regard to customs control, especially on polished stones. For example, in Israel all rough diamonds imported to or exported from Israel are examined and assessed in order to collect due taxes and receive proper documentation by a special diamonds customs station located within the diamond exchange operated by three diamond and gem specialists. Similarly, the value of polished diamonds is randomly checked. In Belgium, every shipment that goes in or out is checked, verified and cleared by sworn experts, while each step is carefully monitored by the government (triple control). In Russia, customs clearance of diamonds is performed exclusively at the special customs station, where they undergo clearance and government inspection. In South Africa, where a levy is payable whenever a registered person imports or exports diamonds into or out of the country, all diamonds are transported in parcels sealed by the diamond regulator after evaluation so that the exporter cannot change the content of the parcel after evaluation.[70]

In most of the other countries there are no specific import /export customs controls on diamonds. The imported and exported diamonds fall under the same provisions as any other goods imported or exported and only have a *Harmonised Commodity Description and Coding System* code to indicate the category of diamonds (*i.e.,* rough sorted or unsorted, polished, etc.). For example, in the UK, Customs require a declaration for all imported or exported goods (including diamonds) for customs duty and or VAT purposes and there are no further controls by Border Force (Customs) on polished diamonds. In Canada and the USA, diamonds are classified using the Harmonized Tariff classification system. In Canada, imports/exports do not necessarily specify the four Cs of diamond valuation or the number of pieces, and therefore valuation exploitation can occur. This is more often the case for diamond parcels rather than single diamonds. In Namibia, diamonds are classified for shipment purposes as polished or rough diamonds and the carats are taken into consideration.

Even though all countries have either specific or general Custom regulations in place regarding the import and export of diamonds, all team members indicated that no specific AML/CFT requirements are in place to declare diamonds while entering/leaving the country. The AML/CFT requirement to declare cross-border transportation of currency related to the trade in diamonds often falls under a more general requirement for cross-border transportation of currency. For example, there is no specific legislation in Switzerland for the declaration of cross-border transportation of currency related to the trade in diamonds. This is regulated by federal legislation and is applicable to any kind of cross-border transportation of currency. In Russia, natural persons who exit or enter the country are obliged to declare cash in amounts equal to or exceeding USD 10 000. Origin of currency is indicated in the customs declaration. However, the customs authorities do not use this information, but instead file it with law enforcement agencies, including the FIU, for further use within the scope of powers vested in them. In Belgium, Israel, and the Netherlands, the FIUs received several currency Cross-Border Reports related to diamonds. In the Belgium, the Netherlands, and the UK, all movements of EUR 10 000 (or equivalent) or more entering or leaving the European Union must be declared. Some of these declarations may relate to the trade in diamonds. The declaration requests details of the owner, origin and use of the cash. Border Force

[70] Which is a general KPCS requirement valid in all KP countries.

agents may also detain cash found on a person at the border where the cash has been concealed and they believe it to be the proceeds of crime. In Namibia and the USA, there is a general requirement for diamond dealers to declare currency and monetary instruments that are being transported internationally.

Diamond are covered for AML/CFT in some countries as part of a list of precious stones (Canada, Israel, Mexico, United States, etc.) where if a certain precious stone is not included in the list than the law does not apply to trade in that specific precious stone.

CHAPTER 4.
FUNDING THE DIAMOND TRADE

In many countries, the diamond trade is funded (primarily) by financial institutions such as banks, although the participants may finance a part of the trade solely with their own equity. Some countries have specialised diamond banks or banks with designated divisions or branches that diamond dealers use for doing business and/or that provide financial services to them. In Israel where these special branches within banks exist, the financial services are only provided to licensed diamond buyers, sellers or manufacturers, where they manage a diamond designated account (DDA) in USD. Without a license, the bank will not open a DDA. specialised banks themselves hold a diamond dealer license. In those countries that do not have specialised diamond banks or designated diamond divisions/branches, financial services to the diamond industry are provided just as to any other trade. This means that many, though not necessarily all, of the following financial services are most commonly provided: bank guarantees, loans, use of diamonds as collateral, receipt and remittance of money. Israel indicated that when diamonds are used as collateral the bank will evaluate the diamonds with its specialist and after providing a loan, the bank will keep the diamond as the collateral. This is not a common practice but rather, represents exceptional cases where the account is problematic. The banks specialised in diamond trade offer a wide range of tailor-made financial services. Diamond dealers are usually treated as any other customer when providing credit, meaning that the same collateral will be requested in order to secure the loan. Vulnerabilities arise when diamond trade credit is extended at concessionary terms, thus making it more attractive in comparison to rates of credits in other sectors.

In most countries, the banks and credit institutions do not apply special Know Your Customer (KYC) or Customer Due Diligence (CDD) procedures to diamond dealers. This means that the same normal or enhanced due diligence procedures apply whether it is a diamond dealer or any other client (depending on the designated risk of the customer). However, some banks and credit institutions may consider the business as such higher risk or may take additional due diligence measures if their client is a diamond dealer. These measures can include extensive monitoring (including monitoring of transactions, site visits, etc.). Some banks or credit institutions may even have employees with a specialised technical knowledge of the industry. The diamond banks, like traditional banks, have policies and procedures for preventing ML and TF and their own monitoring and prevention systems. The specialised diamond banks perform an extensive compliance check of all diamond dealers before granting a loan. In one country, a special diamond office acts as a neutral party, verifying the copies of trading documents handed in by diamond dealers to the banks. This is because the bank works only on the basis of the documents and customer declarations and has no information on the actual diamond deal, thus making it difficult to evaluate the transactions.

The main methods of payment used by diamond dealers are *wire transfers* or *electronic funds transfer*. Cheque and cash are also used. In one country, the use of informal promissory notes for trade between diamond dealers is also accepted. These notes are generally tradable and notes that are not "crossed" are treated like ordinary cash. In many countries the use of cash is on the decline and not being used very commonly anymore. One country stated that cash is not used at all. However, cash may still be commonly used at the retail stage where small payments are sometimes

made in cash or used by smaller dealers. The use of cash is still a common method of payment in the diamond business in countries where cash is widely used such as in African and Latin American mining centres, or in trade centres like Hong Kong, China.

The prevalence of consignment agreements (or "memo" transactions) to purchase diamonds varies from country to country. A consignment is a private contractual arrangement as explained previously (see page 21). This necessitates the identification of the same diamonds by the consignor. Although consignment agreements are a very common trade method in some jurisdictions, especially in international trade, they may bear some ML/TF risks. These risks would be elaborated in the trade financing vulnerabilities.

CHAPTER 5.
STATISTICS (REPORTING, INVESTIGATIONS, INDICTMENTS ETC.)

A sample of **17** countries submitted contributions from team members and a few additional jurisdictions approached by the project team. While these jurisdictions do not include the entire diamonds industry, as mentioned previously team members represent a significant part of the international "diamond pipeline" (mining and production, trade and manufacturing centres, distribution and jewellers[71]). Not all project-participants were able to submit relevant **statistical data** in regard to the reporting and dissemination of STRs (suspicious transactions reports) by Dealers in Precious Metals and Stones (DPMS). In some cases, countries do not (yet) have reporting obligation for DPMS, thus no information concerning DPMS-reports could be submitted. This section aims to create an overview of the available information, by summarizing the project team member's input and by identifying common denominators in countries' individual AMC/CFT reporting obligations.

Based on team members contributions the following issues were looked at: is there a reporting obligation for DPMS and if so what is the reporting threshold for CTRs; what is the number of reports received from DPMS; what is the total number of reports related to DPMS (i.e. reports filed by DPMS or by other reporting entities relating to DPMS); number of reports disseminated to law enforcement authorities.

The table below presents the most important information provided by the 17 sample countries.

Table 5: **Overview DPMS reporting obligation and its results**

Co	Reporting obligation DPMS?	CTR Threshold (USD)	Number of reports from DPSM	Total number of reports related to precious stones (incl. DPSM)	Reports DPMS disseminated	Total number of reports disseminated related to precious stones (incl. DPMS)	Analysis period
1	No	n/a	n/a	n/a	n/a	n/a	n/a

TOTAL	Yes: 9 Under implementation: 1, No: 7	Yes: 7; range from 2 500 to 65 600, No: 3 n/a: 7	If yes (7), range from 0 to 112 for STRs; range from 490 to 11 839 for CTRs.	If yes (5), range from 20 to 5 820	In the case of filed reports (3), range from 3 to 23	In the case of filed reports (4), range from 18 to 139	

Note 1 : According to the contribution received, a total of 335 criminal cases related to the trafficking of precious stones have been opened in 20 different country regions since 2010 (based on law enforcement officials).

Reporting obligation DPMS: Out of the **17** countries that have submitted relevant data, 9 countries have a legal reporting obligation in place for DPMS to report STRs to the FIU (some

countries have also CTR reporting obligations). In **7** countries, AML/CFT legislation has led to CTR or STR reports by DPMS (between 0 to 112 STRs for periods which vary from one to five years). Several countries indicated that they receive reports concerning diamonds and/or other precious stones from other sectors then DPMS (mostly banks and customs). In one country, a large number of reports emanate from the banking sector (5 686 reports). In all, the information collected over the periods of time specified show low level of STRs reported by DPMS in the relevant countries.

Dissemination of reports to law enforcement: Only **2** out of **7** countries that have received reports from DPMS indicated that transactions related to diamonds and precious stones have been disseminated to investigative authorities. Two (**2**) additional countries have disseminated reports based on reports filed by reporting institutions other than DPMS. This information also show low level of FIU reporting to law enforcement and may be an indication of low awareness level of FIUs with regard to the diamonds industry.

CHAPTER 6.
THREATS[72] AND RISKS[73] RELATED TO VULNERABILITIES[74] IN THE TRADE IN DIAMONDS

Diamonds have the ability to earn, move and store value. They are a liquid and transferable asset. These are some of the features that make diamonds appealing to criminals[75] seeking to move, conceal and store the proceeds of crime. Diamonds have unique physical and commercial properties which carry value in small, easily transportable quantities.

The worldwide trade varies from modern international transactions conducted through the financial system, to localised informal markets. Dealers range from very poor individuals in some of the most remote and troubled places on the planet, to the wealthiest individuals, to large multinational companies working in major financial centres through specific unique trade mechanisms and diamond bourses. Transaction methods also range from anonymous exchanges of handfuls of stones for cash, to exchange-based government-regulated deals. A single one carat polished diamond can be worth more than USD 15 000, and, unlike cash, diamonds are often not required to be reported when transported or sent across borders.

This section of the report is based both on literature review conducted by the team members, the specific country contribution addressing the vulnerabilities and risks of their respective countries, and consultation conducted with the private sector at the national and international level.

PRODUCT VULNERABILITIES

Diamonds can be vulnerable for misuse for ML/TF purposes because they can transfer value and ownership quickly, often, with a minimal audit trail. They provide flexibility and an easy transportation of value.

A 2003 Report[76] assessed various alternative financing mechanisms that could be used to facilitate ML and/or TF. Trading in commodities, remittance systems, and currency were assessed on each of

72 A threat is a person or group of people, object or activity with the potential to cause harm to, for example, the state, society, the economy, etc. In the ML/TF context this includes criminals, terrorist groups and their facilitators, their funds, as well as past, present and future ML or TF activities.

73 Risk can be seen as a function of three factors: threat, vulnerability and consequence. An ML/TF risk assessment is a product or process based on a methodology, agreed by those parties involved, that attempts to identify, analyse and understand ML/TF risks and serves as a first step in addressing them.

74 The concept of vulnerabilities as used in risk assessment comprises those things that can be exploited by the threat or that may support or facilitate its activities. In the ML/TF risk assessment context, looking at vulnerabilities as distinct from threat means focussing on, for example, the factors that represent weaknesses in AML/CFT systems or controls or certain features of a country. They may also include the features of a particular sector, a financial product or type of service that make them attractive for ML or TF purposes.

75 GOA (2003), p 10.

76 GAO (2003).

their abilities to earn, be moved, and store value. Diamonds were the only alternative financial device that fit into all of these assessment criteria.

Diamonds possess several characteristics which make them vulnerable to ML/TF. These include[77]:

- **Very high value** – diamonds can store very high value. The higher the value, the more vulnerable a commodity is to ML/TF.
- **Low weight/mass and relatively small size – high value to mass ratio (easy to transport/smuggle)** – diamonds are easy to move and conceal, which makes them susceptible to smuggling. The transfer of value between countries is in many cases part of a ML/TF scheme and diamonds allow for the transfer of very high value.
- **High durability with stable pricing and an ability to retain value over long periods of time** – this makes them good for investment purposes (origin of money may be outside the industry). Also, it may attract criminals as they can distance the funds from their origin by transferring proceeds of crime into diamonds with minimum risk of confiscation and low risk of loss of value.
- **Ability to go undetected** (non-metallic and odourless) – diamonds will show on x-ray but because of the low density to x-rays they remain 'difficult' to detect.
- **Untraceable** - once the items change hands and enter the licit market they are difficult to trace, in terms of both their original ownership and value. Additionally, once the diamonds have gone through the beneficiation process and the rough diamonds are cut and polished, it becomes almost impossible to determine the origin of a stone, since Kimberley process only applies to rough diamonds.
- **Easily bought and sold outside the formal banking system** – AML/CFT measures are higher in the formal banking systems, but diamond transactions can be conducted outside this system and the value is carried between countries without having to go through the KYC procedures in the banking sector. Also, diamonds can be bought and sold in all parts of the world at almost any jewellery or pawn shop.
- **Unmarked** - It is virtually impossible to distinguish between rough diamonds that were illegally obtained and those that were legally obtained. Technology allows for the marking of diamonds so it would be possible to follow the trail of the diamonds, i.e. who is involved in the sale/purchase of the diamonds, however, most diamonds are unmarked. Diamonds are also

77 See for example Farah, Douglas (2005), which relates to some of the characteristics making diamond vulnerable to ML/TF: "Gemstones are ideal for several reasons: they hold their value; they are easy to transport; they do not set off metal detectors in airports; and they can be easily converted to cash when necessary".

easily disguised as other stones of much lesser value; the use of diamond simulants and synthetics can be used to commit frauds (predicate offence). Diamond marking can mitigate the risk of ML/TF the more it comes into practice and if documentation of the transactions include this data.

- **Evaluation of price -** The subjectivity of valuation of diamonds is a significant vulnerability. There are no official or agreed tariffs for rough or polished stones. The per-carat price of a diamond can vary considerably based on the crystalline shape, the carat weight, the colour and the clarity, i.e. the four (4) C's. Each qualifier imparts an individual measure of a diamond while also affecting the valuation of the other qualifiers; each measure is subjective and cannot be precisely stated (except carat weight). For rough diamonds there may be thousands of prices which are published by companies such as De Beers and Rio Tinto[78]. As stated previously, what is important to understand is that *diamonds are not one product*. From rough to cut and polished diamonds, *the price per carat can vary from few tens of USD to tens of thousands of USD*, based on the 4C's and the specific evaluation of the gemmologist or evaluator. Different professional evaluators may provide two reasonably and considerably different evaluations to the same diamond. This is one of the features enabling the manipulation of price for any specific deal (see also vulnerabilities of trade based ML/TF,). This may also cause difficulties in investigation and in judicial proceedings since it will be difficult to establish the price of a diamond where there is no true and unique value. On the other hand, it is just as difficult for criminals as for law enforcement to determine the value of diamonds.
- **Changeability** - From rough to polished, changing the dimensions of illegally gained diamonds make identification virtually impossible and can inhibit law enforcement from pursuing criminal charges.
- Readily exchangeable for other commodities or forms of currency (separate section broadens this issue below).
- **Susceptible to fraud** - The ease with which diamonds and other precious stones can be substituted for inferior or fake stones makes fraud more possible (see also vulnerabilities of the retail level). Diamonds are also susceptible for investment fraud.

These distinctive characteristics create not only vulnerabilities for ML/TF, but also for other criminal activity, including theft, smuggling and fraud. A vulnerability analysis of the diamond

78 Even-Zohar Chaim (2004), *pp.* 97, "the De Beers' Diamond Trading Company, for example sort them … into some 14 000 different categories". In the Hebrew addition it is stated that Rio Tinto sort the rough diamonds to 7 000 categories, *Ibid pp.* 113.

sector with regard to organised crime[79] awarded great vulnerability to 'the nature of the economic product'. The following properties/indicators were discussed.

- **Stability of the product**: As diamonds do not have an expiry date, no restrictions are imposed on criminal strategies by the physical nature of the product itself.
- **Mobility**: This indicator was awarded very great vulnerability since diamonds are very easy to be transported covertly.
- **Compatibility/flexibility**: Diamonds offer the criminal a lot of possibilities for setting up and continuing an extremely flexible organisation and activity.
- **Product differentiation**: diamonds, as a 'white product' cannot be individually identified or traced at any time, apart from marked diamonds. The laser inscription on marked diamonds can always be removed by a laser but this will still leave a mark of an inscription.
- **Elasticity:** Diamonds are extremely interesting as a means of payment or investment, also in relation to criminal activities of fraudulent entrepreneurs.

Certain product properties, such as the degree of mobility, as well as compatibility and flexibility, ensure that diamonds can be fit neatly into the illegal strategies of criminal groups, without a structural link to the diamond sector being necessary.

USE OF DIAMONDS AS CURRENCY

Diamonds display a high value-to-weight ratio, retain their value and are not affected by inflation or exchange rates, and are easily exchanged for other commodities or forms of currency. Diamonds can have similar characteristics as cash[80].

"Conflict diamonds" are not within the scope of this report. However, in conflict areas, diamonds were frequently used to finance wars by way of buying weapons. The KPCS was initiated to prevent the actual use of diamonds as hard currency in such a manner. These characteristics can be also used for ML/TF.

In practice, diamonds are being used as an alternate currency by criminals who use them to acquire other goods such as tobacco, guns, and, most commonly, drugs. Some countries (Australia, Belgium, Canada, Israel, USA) indicated that diamonds can or have been used as a form of currency. Canada noted that diamonds are also used by criminals for payment of debt, usually for drug debt.

79 Research carried out from 2001 to 2003. Cuyvers, L.; De Ruyver, B. & Vander Beken, T. (2004)

80 See also Even-Zohar, C. (2004), *pp*. 26 ("The easily concealable, readily transportable, high value nature of diamonds represent another factor which makes diamonds the currency par excellence for those motivated to avoid the use of "real" money").

In terms of ML/TF vulnerabilities, this is a particularly important feature since diamonds are not included in the concept of cash/currency or a bearer negotiable instrument (FATF recommendation 32)[81] even though it is possible to both launder with diamonds themselves and use diamonds as a means of payment to finance criminal activity, e.g. for the purpose of buying drugs or paying for illegal arms. The use of diamonds as a form of currency was also supported in the case studies submitted by team members. This will be illustrated below in the section analysing cases and STRs.

TRADE BASED ML

The typology of trade based ML (TBML) is defined quite clearly and was dealt with extensively by the FATF and FSRBs in recent years. In 2008 the FATF published a best practices paper on TBML[82]. The first section of the report states that:

> *"The Financial Action Task Force (FATF) has recognised misuse of the trade system as one of the main methods by which criminal organisations and terrorist financiers move money for the purpose of disguising its origins and integrating it into the formal economy. As the anti-money laundering (AML) and counter-terrorist financing (CFT) standards that have been applied to other ML techniques have become increasingly effective, such abuse of the trade system is expected to become increasingly attractive".*

This statement is very relevant to the trade in diamonds. In 2006, the FATF published a typologies report on TBML[83] and in 2012 the APG updated and extended the FATF report[84]. Both reports included TBML cases relating to the trade in diamonds, exposing the vulnerabilities of the trade to TBML. Moreover, the APG report indicated that there are goods which are more susceptible to TBML due to the difficulty in identifying the true value of the goods, especially where the goods are subjected to higher taxes/duties or where the goods are of high turnover/value. Diamonds were amongst the goods identified[85].

One of the main methods through which TBML is conducted is by way of over or under valuation. The diamond industry is tremendously vulnerable to TBML primarily because of the high subjectivity in the valuation of diamonds[86], the ability of diamonds to change their form, the trade-

---

81 "For the purposes of Recommendation 32, gold, precious metals and precious stones are not included, despite their high liquidity and use in certain situations as a means of exchange or transmitting value. These items may be otherwise covered under customs laws and regulations. If a country discovers an unusual cross-border movement of gold, precious metals or precious stones, it should consider notifying, as appropriate, the Customs Service or other competent authorities of the countries from which these items originated and/or to which they are destined, and should cooperate with a view toward establishing the source, destination, and purpose of the movement of such items, and toward the taking of appropriate action." (Interpretive Note to Recommendations, 32 paragraph 8).

82 See FATF (2008b), section 5 for a TBML definition.

83 FATF (2008b).

84 APG (2012).

85 *Ibid*, page 36, section 139.

86 See previous section on product vulnerabilities and the discussion on price evaluation.

based and global nature of the diamond market, and the long production chain involving many actors.

To compound the problem, there is no commodity or market price or "price list" for diamonds since there is no specific product[87]. With respect to parcels of bulk diamonds, which may include different diamonds of different size and quality, it is impossible and impractical for the evaluator to examine each and every diamond that is set for export and thus can be easily overvalued or undervalued to facilitate TBML schemes.

Transactions conducted by diamond dealers can amount to millions and even tens of millions of USD. This makes it easier to launder very high sums through the trade by over or under valuing the shipment by 5 to 10 per cent In the day to day trade, this will not be taken as unusual and will not alert customs official or banking institutions funding the trade and facilitating the transactions. Under these circumstances, Customs officers, who in many cases lack the expertise to evaluate a shipment, particularly bulk shipments, have no choice but to accept the shipper's self-assessment of the value of the goods. An inspection by an expert gemmologist on behalf of customs[88] may improve the situation and narrow the room for price manipulation based on expertise evaluation.

Tariff for customs declarations based on only carat - not only diamonds are hard to evaluate it is also, in many if not all countries, not necessary. Several team members stated that the declaration provided by the diamond dealer to customs as to the value of the diamonds is based only on carat, which is easier to verify since it is possible to weigh the diamonds. However, as previously explained, the price of diamonds is based on all 4 Cs and may change considerably with variation of Colour, Cut and Clarity. For example, the US has stated that the Harmonized Tariff Schedule (HTS)[89] is the primary recourse for determining tariff classifications for imports into the United States. The HTS classifies a good/commodity based on its name, use and/or the material used in its construction. US customs authorities believe that the HTS may aid in price manipulation, because the only valuation criterion it uses for diamonds is weight. In the US there are only two HTS subheadings for nonindustrial diamonds, worked but not mounted or set:

1. Weighing not over 0.5 carats each;
2. Weighing over 0.5 carats each

This means that only one of the 4 Cs (carat) is used to assess the value of a consignment of diamonds.

This is a gap built within the export/import systems which may also be easily exploited for over/under valuation while making it hard to establish whether there is an infringement of customs laws and regulation.

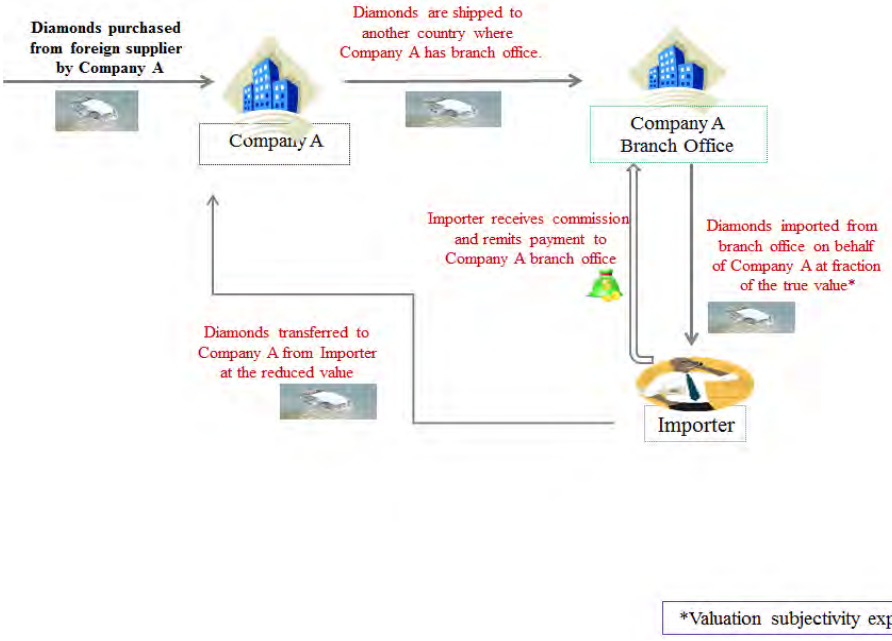
87 Every diamond has to be evaluated on its own merit. See also footnote 22.

88 Customs valuation of diamonds is subjected to the GATT 1994 Rules on Customs Valuation (Cascade system off 6 steps).

89 All members of the WTO/WCO apply the Harmonized Commodity Description and Coding System (or HS). In US it is named HTS, in EU GN, etc.

Thus, diamonds sold may be shipped from one jurisdiction to another and be assigned low value to minimize inland revenue or export duty, then traded in the other jurisdiction or re-exported from it with a much higher "price tag". The value generated from the final sale of the diamonds will be much higher than their original stated value, but no real value will be added along the trade path, except for the "mark-up" by the traders. According to KP statistics, some trade centre's show considerable differences between the average price per carat coming into the jurisdiction compared with the average per carat price leaving the jurisdiction. As previously detailed this difference can be explained to a certain extent by sorting and valuation of the diamonds which may produce an added value of between 10 to 15 per cent[90]. But, it can also provide an indication of tax evasion schemes, or ML/TF trade-based activities.

Figure 6: **Trade Based Money Laundering / Tax Evasion**



REGULATION OF DIAMOND DEALERS

FATF Recommendations on dealers in precious stones - Recommendation 22 only applies to dealers in precious stones when they engage in any cash transaction with a customer equal to or above the applicable designated threshold. Analysis showed that the extent of cash usage seems to be diminishing and that most of the transactions are not conducted in cash. There is no obligation for customer due diligence or record-keeping requirements when dealers in precious stones use wire transfers or other means of payment. This makes the sector more vulnerable to ML/TF, particularly because precious stones including diamonds can be used as a form of currency/payment.

90 Price increases between import and export are largely due to sorting and valuation activities, an essential element in the diamond pipeline. Sorting diamonds into different sizes &grades is time consuming, requires very specific know-how and is a value adding activity along the supply chain. This is an essential stage in the diamond dealing process.

Since the AML/CFT duties are only relevant to cash transactions, it is possible to establish the method of payment only when the payment is received, which can be a long time after the deal has been made and the diamonds have already changed hands. Again, this is important since it is possible to launder with diamonds, as they are themselves of intrinsic value and a form of currency.

National AML/CFT regulation of the industry - There are still several countries where diamond dealers are not subject to AML/CFT legislation and therefore have no reporting responsibilities. These businesses that buy and sell diamonds are not obliged to undertake AML/CFT risk assessments, implement due diligence procedures or report transactions to the national FIU.

The issue here is the KYC, which is neither legally required nor ordinarily carried out by the traders in diamonds who are not under an AML/CFT regulation. For diamond dealers, the risk of being involved in or being used for ML or TF is not limited to the customers (subjects to whom they sell diamonds). There is also a risk when establishing a business relationship with diamond suppliers, when purchasing transactions give rise to payments that are wholly or partially, directly or indirectly carried out by other means than by transfer to bank accounts held with referred credit institutions. Payment by other means than by transfer to bank accounts is considered a high-risk situation for illicit trafficking, which always has to be taken in account.

In order to deal with these high-risk situations, the identification requirement not only needs to be obligatory for diamond dealers, but also needs to extend to suppliers in diamonds when the delivery of diamonds results in cash payment.

AML/CFT regulation applicable according to precious stones lists - Even though the project is focusing on the trade of diamonds, it was established during the collection of information from the relevant countries that the definition of a precious stones dealer is in many cases based on a list of precious stones (Canada, Israel, US) which cover only part of the market, leaving other parts of the precious stones sector uncovered by AML/CFT regulation. This creates a ML/TF vulnerability since a money launderer or a terrorism financier can make transactions of high value without being covered by AML/CFT legislation (no KYC, no reporting, etc. will be conducted).

Record-keeping - As noted above, there are very limited AML/CFT record-keeping obligations for dealers in precious stones. Some countries reported that, due to specific business practices where the diamond trade is based on trust and verbal agreements, diamond dealers may not fully record transactions in cases where they know each other. Vague and inconsistent records within the industry complicate financial investigations for law enforcement.

False records and invoices and, more importantly, lack of detail on records precipitate laundering with these commodities. The lack of detail is important to note: while false invoice is definitively criminal, lack of detail on an invoice is not. However, without sufficient detail, law enforcement has difficulty determining the extent of criminal activity, if any, and then may not be able to articulate such in court. Additionally, lack of details may prevent banking institutions from reporting transaction to FIUs with all required information.

Physical cross-border transportation of diamonds and currency - Although diamonds can be used as a currency and to store value, they are not included in the concept of cash/currency or a

bearer negotiable instrument (FATF Recommendation 32)[91]. Countries are not obliged to have measures in place to detect the physical cross-border transportation of diamonds through a declaration/disclosure system. The Customs declarations on cross-border transportation of cash that an FIU receives do not include diamonds.

Loose vs. mounted diamonds – in general terms the legislation applying to loose diamonds is different from that which applies to mounted diamonds.

Compliance of the sector - Although the AML/CFT legislation applies to diamond dealers, FIUs have not yet received many disclosures. This may be an indication that there is not enough awareness in the sector of the importance of combating ML and TF within the diamond sector and that diamond dealers are not sufficiently aware that their sector is being misused by criminal organisations to launder their proceeds. Improved awareness of the AML/CFT legislation could result in a diminished restraint to report.

SUPERVISION, CONTROL AND ENFORCEMENT VULNERABILITIES

SUPERVISION

Registration and licenses - Only in a few countries are licences and registration required for business activity in the diamond trade. This has a major impact on supervision of the sector and this makes the KYC procedure for diamond dealers and financial institutions handling diamond dealer accounts very difficult.

Fines and penalties on non-compliance - Due to the lack of AML/CFT obligations in several countries, few AML compliance assessments on diamond dealers have been carried out. Although the overall compliance of the sector is assessed as medium in those countries with AML/CFT obligations, no fines have been issued to diamond dealers and no other AML/CFT civil enforcement actions have taken place over the last two years.

CONTROL

Customs Control and over - and under-valuation - In several countries there is no separate set of guidelines or procedures for monitoring the import/ export of diamonds by the Customs Department. The import and export of diamonds are dealt with in the same manner as those of any other article or commodity. Given the specifics of diamonds (high value in small size and not detectable by specialised equipment), effective and specific control by customs is necessary.

---

91 "For the purposes of Recommendation 32, gold, precious metals and precious stones are not included, despite their high liquidity and use in certain situations as a means of exchange or transmitting value. These items may be otherwise covered under customs laws and regulations. If a country discovers an unusual cross-border movement of gold, precious metals or precious stones, it should consider notifying, as appropriate, the Customs Service or other competent authorities of the countries from which these items originated and/or to which they are destined, and should cooperate with a view toward establishing the source, destination, and purpose of the movement of such items, and toward the taking of appropriate action." (Interpretive note to recommendation 32 paragraph 8).

Furthermore, the size of the industry makes it extremely difficult to verify each and every diamond consignment set for import or export. Additionally, it is sometimes not possible for customs to identify the correct value of the consignments (a lot of under- and overvaluation of diamonds takes place). Shortage of expertise in gemmologists makes it difficult for customs to assure the real value of every shipment of diamonds or other precious stones against invoices and freight documents.

Issues related to KP certificates - Since the implementation of the Kimberley Process Certification Scheme (KPCS), no conflict diamonds can enter a KP member country in a legal manner. All shipments of rough diamonds require a certificate specifying the origin of mining, volume and value, and are checked and confiscated immediately when no certificate is available. All trading countries are required to submit data on production, import and export of rough diamonds. The risk is situated in the fact that current enforcement efforts related to diamonds are directed more at ensuring compliance with the KPCS rather than preventing smuggling, fraud, or ML. Therefore, the primary legal and regulatory focus regarding diamond smuggling is on rough, rather than cut and polished diamonds. While important, it does little to prevent the use of finished diamonds in TBML schemes.

The KPCS lacks transparency for controlling officers at the border. There are specific requirements for KP certificates to have certain security features in place and known certificate forgeries and examples of certificates and authorised signatures are shared between KP members. Due to the lack of a universal standard for the format and/or specifications of a Kimberley Certificate (KC), it is almost impossible for customs officers not experienced in the diamond trade to intervene or recognize forgeries. This also applies to official certificates of origin and invoices of certain countries. The validity period of the Kimberley Certificate is often too long, opening up the possibility of misusing the certificate for more than one shipment[92]. The section on the KC where the weight (carat) of the diamonds needs to be filled in is sometimes not appropriate for adding numbers, which is why it is easy to manipulate the total weight (carat). This also applies to changes made on a KC - these need to be officially confirmed by means of a signature and official stamp.

Issuing new KPC also raises questions. According to the KPCS the KPC that come with imported diamonds are kept in a country and not sent with the following export of the diamonds. The rough diamonds that leave the country for export receive a new certificate issued by the responsible authority in the exporting country. This legitimate procedure may be exploited by criminals and is one of the major vulnerabilities of the KPCS whereby the actual origin of the rough diamonds is often concealed and practically impossible to retrieve[93] by moving the rough diamonds through trade centres for the purpose of issuing a new KPC. When exported from the mining country the KPC will include the country where the diamonds were mined. In a later phase, since the shipment of rough diamonds may include diamonds from several mining countries, the exported diamonds receive a certificate indicating that the diamonds originate from more than one country without

92 Legally it is not possible to use the same certificate twice.

93 The KP is not a certificate of origin and therefore the origin cannot be traced by it. This leaves the ML/TF vulnerability uncovered, not even by the KPCS.

specifying which countries[94]. This is mandatory according to the KPCS and a common trade practice; however it may create an opportunity to for criminals to misuse this practice. Information received from one jurisdiction indicated that this practice has taken place.

It should be noted that the KPCS does not regulate the movement of cut and polished stones but only focuses on rough diamonds.

ENFORCEMENT

Limited awareness - Enforcement of the diamond sector is exposed to a degree of vulnerability due to the limited number of skilled experts to appropriately enforce the regulations applicable to the sector. All enforcement of legislation and rules relevant to this industry is only enforceable through the right set of skills. The skills needed for valuing diamonds are quite rare and expensive to obtain; this makes it difficult for governments to provide the necessary investment. Most law enforcement professionals do not possess the necessary skills to identify a diamond, let alone to evaluate it. Few countries possess a specific diamond squad within their police department to tackle these cases. There is little specific enforcement of any crimes related to diamonds. Law enforcement looks at these crimes/commodities the same as all others and does not relegate specific resources towards it. In general, law enforcement has little knowledge about crimes and criminal activity involving these commodities/industry.

Collection of evidence - The diamond sector has refrained from proper documentation and book keeping for almost 90 years. As a result, there is hardly any evidence of the terms of agreements made by diamond industry representatives. The only evidence of transactions is the invoice and shipping documents presented to customs. The strict confidentiality practiced by the actors in the trade imposes secrecy even in conflict situations, breach of contract, fraud attempt, etc. There are also many unknown factors in law enforcement about what evidence is even available and then how to collect it/use it.

International police cooperation - The bottleneck in effective law enforcement remains international cooperation and confirming the relation with TF. In order to address the problem of fraud in the diamond sector, international awareness and cooperation in harmonizing and implementing legislation needs to be established. The diamond trade is characterised by international financial flows, and also by flows of goods. In order to have a successful police investigation and have the criminal assets confiscated, international cooperation of the authorities is a prerequisite. In particular, the countries **involved** in the different stages of the trade be it mining countries, trade centres, cutting and polishing centres or retail centres, such as the Lebanon, Switzerland, the United Arab Emirates and countries on the African continent. A deficiency in the information exchange could seriously undermine the investigation and the success of a conviction. The police stated with regard to one of the billion dollar trade centres that even though it is a full participant of the KP Process, it refuses to share basic KP information such as statistics on import

[94] Only if positive proof exists that the goods in the shipment consist of rough diamonds from one (KP) production country only will that be mentioned, in all other cases "*****" must be filled out on the KP Certificate.

and export of companies. The inflexible position of such jurisdiction within the trading route creates issues for other partners seeking to investigate ML and TF.

Judicial follow-up – Few examples were found of cases that were reported to judicial authorities or brought before court. Also, statistics are not available. Many files concerning ML from illicit trafficking in diamonds from the FIU reported to the judicial authorities are dismissed. The non-punishment of diamond trade-related offences is a major vulnerability in the prevention of ML/TF.

VULNERABILITIES IN THE DIFFERENT STAGES OF THE TRADE[95]

As detailed previously, the diamond industry has a very long chain of production from the mining to the final customer, known in the industry as the "diamond pipeline". This "pipeline" involves practically all parts of the globe when taking into account the retail level, including internet trading platforms. On top of the vulnerabilities of each jurisdiction in terms of the regulation, supervision and enforcement, there are vulnerabilities associated with each level of the trade where the level of risk may change from jurisdiction to jurisdiction (in light of the specific characteristics of the trade in the jurisdiction). Some vulnerabilities are relevant for all stages of the trade (e.g. theft, commingling).

MINING

Vulnerabilities of alluvial *vs.* kimberlitic mines – Kimberlitic and alluvial mines differ in their level of their vulnerability to ML/TF. The vulnerability of the mining stage is dependent on the level of supervision and control put in place by the relevant national authorities[96]. In general, the vulnerabilities of the mining stage are those associated with *illegal mining*, *commingling* of illicit diamonds and *theft*. Since kimberlitic mines are usually much easier to secure and control, they are less vulnerable and less exposed to these risks. In contrast, since alluvial deposits are much harder to secure and, as previously detailed, since mining may span over very large geographical areas, conducted to a large extent by artisanal and "informal" miners by hand, the risk of abusing these vulnerabilities is much higher. Thus, countries where alluvial, particularly artisanal mining[97], are more prevalent are more vulnerable to ML/TF activity.

Sierra Leone indicated that the diamond trade in Sierra Leone has been, and will remain to be, a major flashpoint for criminality and a high risk sector for ML and TF and has pointed to a link which can be made between ML **and** trade in diamonds to the trade in conflict diamonds. During the workshop in Dakar it was indicated that there are people coming to the country from abroad with cash and then fly out with diamonds.

---

95 For a short discussion on some of the vulnerabilities in the different stages of the diamonds pipeline, see Siegel, Dina. (2009), *pp*. 160-161.

96 See previous discussion on the characteristics of kimberlitic and alluvial mines on page 17.

97 See World Diamond Council (n.c.) - "Prevalence of small-scale alluvial diamond digging is highest in Angola and the Democratic Republic of Congo (DRC) but also takes place, on a smaller scale, in the Central African Republic, Cote d'Ivoire, Guinea, Ghana, Liberia, Sierra Leone, Tanzania and Togo. It is estimated that 1.3 million people in Africa work in this sector".

Canada indicated **that** despite the highly controlled mining and security environment, increased diamond flows will provide more opportunity for attempts by criminal groups to infiltrate diamond mining and trading.

Illegal mining – This is one of the major issues for mining countries. South Africa indicated that there is a trend of illegal mining in the country that is becoming more prevalent. The trend is facilitated by the fact that some of these illegal miners are either mine workers or former employees who know the workings of the mines they target. Because of their size, diamonds are smuggled out of the mine premises without detection as they can be slipped under fingernails or by being swallowed; the use of homing pigeons was even noted. There are unfortunately certain players in the industry who are willing to buy illegal diamonds without questioning their origin. It was also indicated that the issue is that once the illegal diamonds have entered the industry it is impossible to track them. The diamond will be presented as if they were mined legally, and afterward they will be sold to diamond dealers who would export the diamond with a KP certificate issued by the appropriate authorities. This method of commingling illegally mined diamonds is also conducted when diamonds are mined in neighbouring countries, smuggled across the border and then inserted into the legitimate trade. The problem of illegal mining and smuggling was brought up by two additional African mining countries in the 2012 FATF / GIABA Typologies workshop.

ROUGH TRADING

The product vulnerabilities discussed above are characteristics of the trade in rough diamonds. There are additional vulnerabilities with respect to the KP certificate which should also be noted.

Kimberley certificate is required only on import and export – According to section II (a) of the Kimberley Process Certification Scheme *"Each Participant should ensure that: (a) a Kimberley Process Certificate (hereafter referred to as the Certificate) accompanies each shipment of rough diamonds on export*[98]*".* When a rough diamonds is traded locally there is no need for a Kimberley certificate. Thus, it is possible to cut an illegally mined or otherwise illegally gained rough diamond, polish it locally in order to conceal its source and export the polished diamond without the need to issue or present a KP certificate[99]. While a change in the scale of beneficiation has a positive side, the more mining countries, particularly African countries, expand their beneficiation process the risk of cutting and polishing the rough diamonds locally and avoid the need for a KP certificate, as a ML/TF tool, may increase. This may also mean that the risk of rough diamonds being smuggled and then cut and polished as a mean to conceal their illegal source may also increase. For example, it would be easier to conceal rough diamonds bought with cash proceeds of crime by cutting and polishing the stones locally and exporting the polished diamonds without the need to issue a KP certificate.

Kimberley certificate and ML/TF – the KPCS was established for the purpose of curbing the trade in "conflict diamonds". While there may be some bearing on ML/TF activities in that the predicate

98 See Kimberly Process (nc), page 5.

99 For this reason the World Diamond Council has created the WDC System of Warranties, by adding a warranty stating the conflict free nature on each invoice.

offence may be committed by those who are involved in the trade in "conflict diamonds" (such as smuggling), this is not ML or TF per se. However, when a shipment of rough diamonds is accompanied by a KP certificate, this may give legitimacy to the shipment to customs officials and bank employees.

TRADE CENTRES (ROUGH/POLISHED)

Transfer pricing – transfer pricing can take place at a variety of stages of the trade, but FTZ centres are most vulnerable. As mentioned, the diamond trade is international in nature. The diamond industry includes multinational companies with operations spanning across many countries, serving as trade centres of rough and polished diamonds. The term 'transfer pricing' is usually used in the context of tax regimes where related companies (subsidiaries, affiliates) conduct international transaction between themselves[100]. Such practices are also prevalent in the diamond industry. While transfer pricing may be conducted in a legitimate fashion (i.e. in accordance with relevant tax regimes), it opens up the possibility to commit tax fraud and ML. Diamond trade centres like Dubai, which operate as FTZ are susceptible to vulnerabilities as specified in the FATF report regarding the ML vulnerabilities of FTZ.[101] This, in combination with the specific vulnerabilities of the diamond trade and the mechanism of transfer pricing, creates a significant vulnerability for ML and TF activities. By way of over or under invoicing with affiliate diamond companies located in FTZ, it is possible to illegitimately shift profits from diamond companies in high tax rate countries to FTZs and thus avoid taxes[102]. It is also possible to use the same scheme for ML/TF purposes. The combination of a lack of transparency in the diamond trade with a lack of transparency in a FTZ provides an excellent atmosphere to conduct large volume transactions without being detected.

Transfer pricing can occur during different stages of the trade, such as rough diamond trading from African mining countries to diamond trade centres where by African countries will be losing huge amounts of due tax to FTZs. One African mining jurisdiction indicated that the risk of transfer pricing is ever eminent. It can also occur as stated above between two trade centres of both rough and polished diamonds where one jurisdiction will have high tax rates and the other jurisdiction will be a FTZ or have very low tax rate.

Issuing of new KP to conceal the source of diamonds - Belgian investigators have noticed that shipments are being diverted to one of the billion dollars trade centres where the original certificate and invoice were, still in accordance with the rules of the Kimberley Certificate, turned into a new KP certificate (origin: mixed or unknown) **with a higher price** and sent further to a trading centre. Although each member state of Kimberley is obliged to make a new Certificate, the police suspect

100 For a definition of transfer pricing see TP Analytics (n.c.).

101 In March 2010 the FATF published a typologies report – *Money Laundering Vulnerabilities of Free Trade Zones*. The documents illustrates the vulnerabilities associated with FTZ particularly TBML including over and under invoicing. According to the report a FTZ provides among other things a relaxed oversight and lack of transparency. The report also states that "The existence of vulnerabilities in a system makes it attractive for money launderers and terrorist financers".

that this trade centre is used as a transit country that produces "new" documents to hide the origin of the diamonds and facilitate the diversion of payments.

The full purchase price, as mentioned on the invoice, is transferred and channelled to different accounts all over the world, private accounts or accounts of individuals. In the accounting, all transfers are recorded on the supplier situated in this particular trade centre. The relation between the beneficiaries of the funds and the supplier in the trade centre is unclear. Police investigations showed a strong relationship between the final buyers and the companies in the trade centre. Once a supplier was identified by the police, the relationship ended and the trade went on through another supplier.

Facilitating corruption - From a trading centre perspective - through under-invoicing of the rough diamonds in mining countries, acquired margins may be created to facilitate payments to PEPs, military or other invisible stakeholders in the transaction.

CUTTING AND POLISHING

Diamonds are not bound by any certification requirements to identify origin once cut and polished – This is another feature which makes diamonds very easy to move and conceal high value, and is also what lends polished diamonds similar characteristics as those of cash. This means that it is easy to move the diamond up the supply chain through trade centres for polished diamonds without an ability to verify the origin of the diamond; the larger and less supervised the market is, the easier to move the stones. Moreover, as there is no requirement to document the origin of the diamond while conducting a business transaction in polished diamonds, it may be impossible to verify who the previous sellers were, i.e. it is easy to lose the polished diamond trail. However, there are technologies in place which enable diamond marking. This technique allows a polished diamond to be traced to its origin and facilitates a better documentation of transactions by including the details of the diamond as part of the documents accompanying the transaction. However, marking is not done on all diamonds and is not documented on all transactions, leaving the possibility to lose the "diamond trail".

Untraceable diamonds - Cutting and polishing is often an important part of illicit diamond trading. A diamond's size and form can be significantly altered, making it more difficult to trace the stone back to its origin as illicit rough. It is also possible to further cut an illicit polished stone so as to avoid the identifying of the polished stone which was illegally gained (E.g., recut a stolen polished diamond). Thus, one part of disguising the origin of an illegally gained rough or polished stone can be to cut or recut it, polish the diamond and then sell it within the local or international market. It should be noted that whilst there is an increasing trend for diamonds to be cut and polished in the country of origin (beneficiation), the vast majority of diamonds continue to be processed in the 'cutting centres' that are outside of the producing nations. There have been suspicions that clandestine diamond operators in some producing nations, particularly African alluvial, have been cutting and polishing. Whist this might be true on a very limited scale there is a continued lack of evidence to support the notion of any scaled up polishing being carried out. Consequently the main focus should remain on rough diamonds.

RETAIL LEVEL

The retail level is perhaps the largest part of the diamond trade chain. It includes jewellery shops, pawn shops, trade fairs and wholesalers of jewellery, and encompasses both new products as well as the recycled market. While mining and trade centres are located in specific countries, it is estimated that there are more than a quarter-million retailers who sell jewellery to consumers around the world[103]. The entire jewellery manufacturing and retail market are too great for the scope of this report, but they may be touched upon based on the analysis conducted on the different stages of the trade and the vulnerabilities identified by team members. The following vulnerabilities were identified:

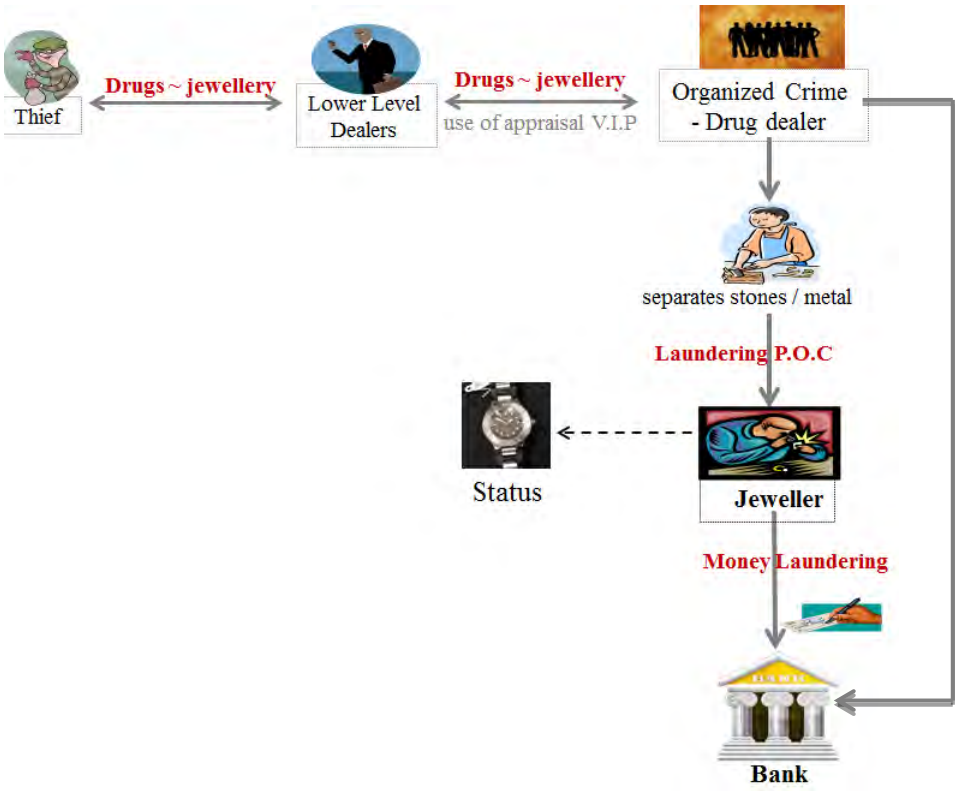
Supervision and enforcement are difficult - due to the extent of the sector it was indicated that it is very hard to conduct supervision and enforcement. Jewellery retailers can vary from very small individual jewellery shops up to worldwide chains with hundreds of outlets. Some jewellers do not have enough capacity or are not legally required to dedicate resources to AML/CFT campaigns or reporting. They may also be less wary of AML/CFT in general and could be a target for criminals to launder goods.

Use of cash - It was noted by Canada that further down the supply chain, i.e. the jewellery/retail level, the trade becomes more cash -based. Large cash deposits provide an opportunity for jewellers to introduce illicit funds into the legitimate economy disguised as proceeds of cash sales from diamonds.

Laundering of stolen jewellery/drug proceeds – this is perhaps the main vulnerability identified, particularly through actual cases submitted by team members where the retail level was used to launder funds or illicit diamonds. Second-hand jewellery shops and pawn shops were identified as vulnerable by allowing stolen diamonds or diamonds which were used to pay for the purchase of drugs to be re-entered into the market by selling the goods at the retail level, in many cases as accomplices of the criminals. As mentioned above some of the cases emphasised this vulnerability of the retail level by showing how laundering is taking place in actual means. The US indicated that small jewellery shops may deal with extremely large amounts of sales (millions of dollars annually). This provides the possibility to launder very large sums of money. This vulnerability is basically not different from that which characterises other parts of the trade, i.e. *commingling* of illicit diamonds. Commingling can be done at each and every part of the trade chain.

103 Bain & Company (2011), pp 50.

Figure 7: **Criminal Organisation Importing / Producing with several lower level syndicate dealers**



KYC/CDD measures – retailers will buy polished diamonds either from a local wholesaler or from foreign wholesalers. Conducting CDD procedures with foreign suppliers/customers can be difficult as it is not always possible to establish the identity of the beneficial owners of the foreign company and to verify that the information provided is genuine. It is often easier to conduct KYC/CDD procedures with local retailers or wholesalers since identifying information is more available.

As reported by authorities, in consultation with the relevant private sector in each country, KYC or CDD requirements for dealers in diamonds are usually not legally required for two main reasons:

- there is an informal knowledge of the actual and potential customers due to the recurring business activities and transactions conducted, or
- these requirements are covered by other reporting and registry obligations, mainly related to taxes or accounting.

While this is true for B2B transactions, the situation is different with retail transactions or sales directly to the customer.

Fraud - One jurisdiction indicated that the main vulnerability of the retail level is fraud which can be divided into several types:

a) False grading – where a stone's true grade is not reflected in the nominated grading.

b) False certificates – where a grading certificate has been counterfeited, subject to unauthorised amendment, duplicated and attached to stones of varying quality.

c) Misrepresentation of stone – where other stones are passed off as diamonds.

d) Non-disclosure of type – where synthetic diamonds and fracture-filled diamonds are not declared as such and are passed off as undamaged, naturally-mined diamonds.

e) Valuation fraud – where a stone is undervalued to avoid customs duty and/or tax.

Theft/Robbery – as other sectors of the trade, it is susceptible to theft and robbery (see also below vulnerabilities related to all stages of the trade).

VULNERABILITIES IN THE USE OF THE INTERNET

The internet has been for many years now a trading platform for goods and services of every kind, and this includes the diamond and jewellery trade. In the United States, such trade sites began operation mostly during the last decade. While the average retail sale on the internet is under USD 10 000, internet sites have become celebrated by both large and small buyers for its "price quotes". These sites give buyers across the country access to New York wholesale market prices for diamonds. Since it has no advertising overhead and gets customers through word of mouth, it may save consumers up to 40% from retail prices. This relatively new trade platform also brings with it vulnerabilities which may be applicable to all sales and purchases on the internet, including buying of rough and polished stones and diamond jewellery. A quick survey on the internet reveals that the largest diamond companies offer online platforms (De Beers, Alrosa, Rio Tinto and BHP Billiton), with a very developed international online market of diamond dealers of every size.

KYC/CDD measures – internet trading platforms allow for both B2B and B2C transactions. Conducting transactions over the internet allow for increased anonymity of the customer, making it harder to conduct KYC/CDD procedures. For example, it is possible for a customer situated in one part of the world to buy diamonds which will be sent from another part of the world via courier services such as FedEx without the diamond dealer and the customer ever meeting. The price of the diamond can be very high (for example, the price of 12.01 Carat D-IF Excellent Cut GIA Certified Round Diamond 14.69-14.73x9.13mm, up for sale on EBay, has reached 2.725 million USD, see Figure 5). When speaking about a sector which is not regulated as well as financial institutions, it is hard to enforce on diamond dealers the application of AML/CFT regulation, including KYC/CDD measures.

However, and perhaps of more importance, since the FATF definition of dealers in precious stones includes only cash transactions, the internet trading platform for diamond dealers is not covered by the AML/CFT standards[104], since payment is facilitated almost entirely through banking and credit institutions or internet payment means. While these financial institutions may perform their KYC duties based on the applicable regulation of the jurisdiction, it will be performed on the party transferring the funds only and not necessarily on the customer buying the diamond over the internet.

[104] There may be instances when national legislation goes beyond the FATF Recommendations and may cover this activity.

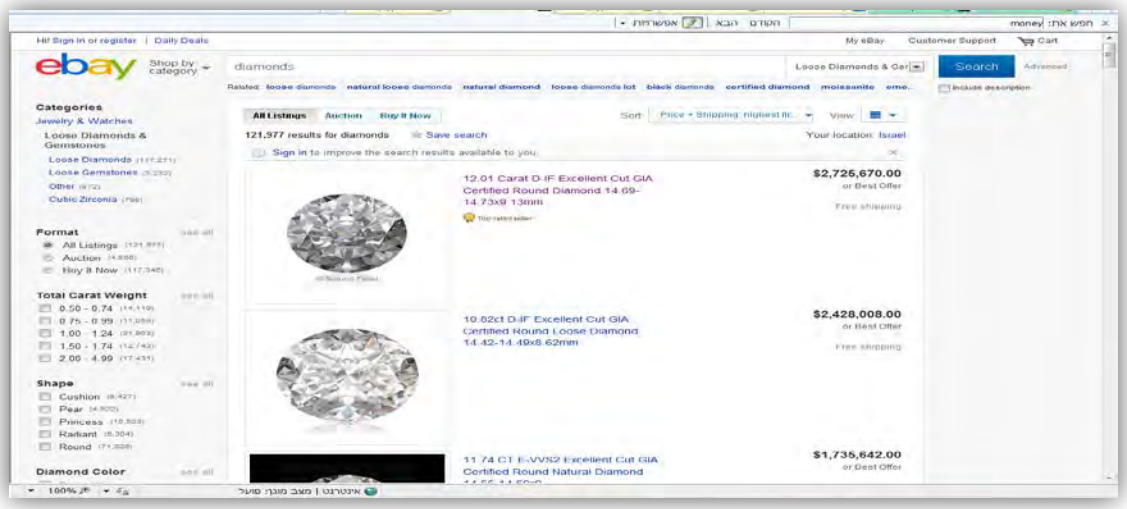
Checks conducted by the project team located trading sites providing a platform for buyers to meet sellers, conducting tens of thousands of gem stones auctions, including rough and polished diamonds, where in registration all that is required is a username password and email to verify registration:

> "*In order to participate in the auctions … you must first register to become a member. First, you must* select *a username, which is the name you will be known by while you're on our site. Please note your Username will be viewable by all … members. You will also be asked for a password to secure your account. Please note that once you've chosen a username, you will not be able to change it.*
>
> *You must provide valid contact information and a valid e-mail address. This is required so that buyers and* sellers *will be able to contact one another once an auction closes*"
>
> "*After you submit your registration, you will receive a confirmation e-mail message … You may begin bidding* immediately"

This registration procedure of minimal identifying requirements is similar to some internet payment means which in the past facilitated ML activity (*e.g.,* E-gold[105]).

This means that trading platforms may be used to easily move very high value stones internationally without either establishing the identity of the buyer or the identity of the seller.

Figure 8: **Example of eBay online trading site – cut & polished diamonds worth millions of USD**



Source: Internet screen shot July 2013

Rough diamond online sales – as mentioned above, it is also possible to buy and sell rough diamonds via the internet. This may also be done globally using international courier services. It is not clear in all websites whether a Kimberley certificate is attached to the shipments in these transactions. One web site indicated that "*all international shipments will receive a UN "Kimberley*

105 See US Department of Justice (2007).

Certificate". All domestic shipments come with the appropriate guarantees that they are non-conflict diamonds as laid out by the United Nations[106]".

In a consultation with WFDB it was noted that it would be difficult to buy rough diamonds online since it is necessary to physically examine the stone in order to evaluate the price. Online sites offer a refund in case a customer is not 100% satisfied; however, this is vulnerable to fraud[107].

Internet payment systems – in 2010, the FATF published a typology report on "Money Laundering Using New Payment Methods" (NPMs)[108]. The report identified the vulnerabilities associated with NPMs, including anonymity and the global access to cash through ATMs, but also stated that "where NPM providers are subject to AML/CFT obligations and appropriately supervised for AML/CFT purposes, NPMs can make payment transactions more transparent and help prevent corruption or other abuses". This is because a transaction via NPMs leaves an "electronic record". The vulnerabilities that were identified in the above mentioned report create risks to the trade in diamonds over the internet, in light of the previously discussed characteristics of the product and the fact that diamond dealers are not routinely subjected to AML/CFT obligations for the majority of their transactions over the internet. However, to the extent that AML/CFT obligations apply to both NPMs and diamond dealers on the internet, the "electronic records" may serve as a mitigating factor by providing an audit trail.

Trading platform as a mean to launder funds – it is relatively easy for a criminal or money launderer/terrorism financier to establish a diamond trading platform online to disguise the source of funds.

Fraud – a customer buying a diamond via an internet trading platform is exposed to the risk of fraud. Fraud -related vulnerabilities were previously specified with regard to the retail level of the trade (false grading, false certificate, misrepresentation of the stone, non-disclosure of type and valuation fraud). All of these vulnerabilities also apply to the online trading platform. However, there is an additional vulnerability of no supply, where a customer pays in advance but does not receive the stones he or she paid for. There are payment and delivery methods whereby a customer can avoid such an occurrence. For example, a diamond may be shipped to the customer for inspection and payment is made only after the customer has examined the stones and the documentation to his or her satisfaction. The stones are shipped upon proof of payment to the secure courier service. According to the consultation conducted with the Jewellers of America, in most cases the customer will see a diamond prior to purchasing it.

Laundering stolen diamonds via the "Darknet" –In spite of not being a common activity, Silk Road offers jewellery with diamonds of unknown origin. It can be purchased and paid in Bitcoins. It is delivered by Fedex or any other courier service in a plain envelope without a description of the goods inside.

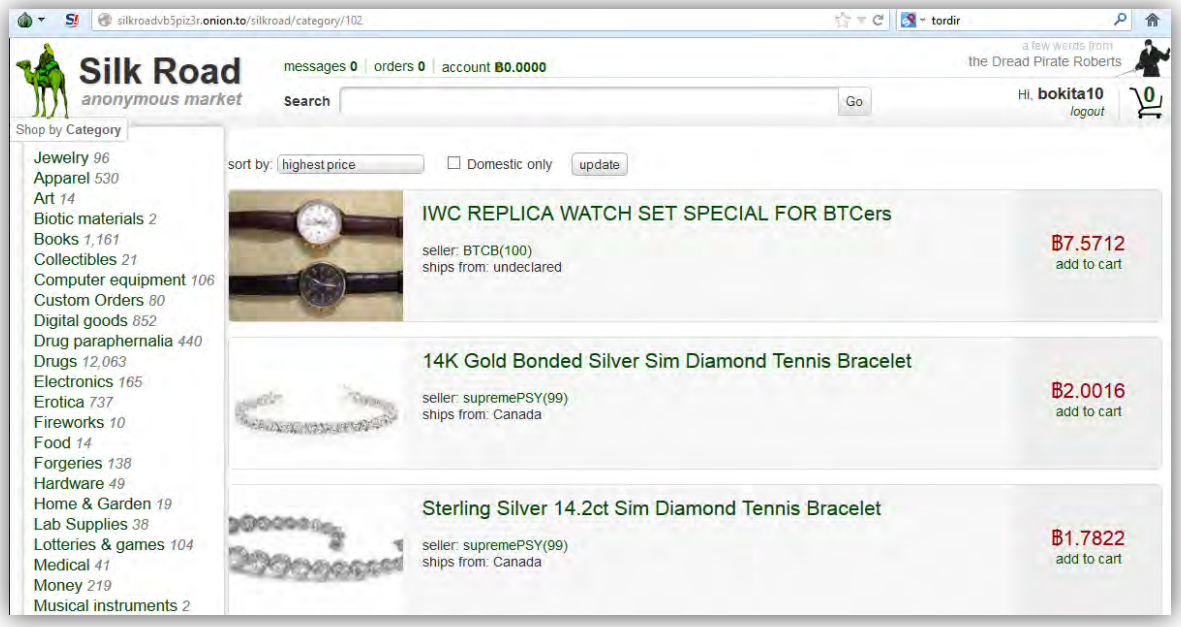
---

106 While the UN indeed supports the KP, it doesn't have any formal/legal relationship with the KP (indeed, the KP itself is not a legal entity). In other words, KP certificates have nothing to do with the UN.

107 This is not unique to online diamond trading platforms.

108 FATF (2010).

Figure 9: **Jewellery with diamonds offered for sale on "Silk Road"**



Source: Internet screen shot July 2013, Exchange Rate: 1 Bitcoin = 98 USD

There are sites that offer stolen gold and diamonds that can be pre-ordered according to customer preferences. The payment is made in Bitcoins or bank transfers and shipped by Fedex. Liberty reserve was also accepted. This illustrates one of the venues by which stolen diamonds are offered for sale and laundered using Bitcoins.

Figure 10: **Stolen gold and diamonds for sale**

VULNERABILITIES RELATING TO ALL STAGES

Theft/Robbery – Theft or robberies of diamonds can occur at all stages of the trade. Since diamonds are of very high value, they are targeted by artisanal miners, employees of diamond companies, and criminals including criminal organisations. Several countries pointed to theft as being one of the most prevalent risks of the trade. This can be seen by the cases[109] submitted by team members and also by open source information on cases of theft or robbery of diamonds in values which can reach many tens of millions of US dollars.

Heists of diamonds have probably occurred in all times, but the value and volume of diamonds' heists in the last decade has developed in leaps and bounds. In the first half of 2013 alone two robberies of very high value took place in Brussels Airport[110] and in the French Riviera[111]. The theft of diamonds and jewels owned by Israeli billionaire Lev Leviev could be the largest jewellery heist in years, the worth of the stolen jewels was estimated at USD 136 million.

The recovery rate of stolen diamonds is usually very low. Open source cases show that stolen diamonds / jewellery are usually not found. Since diamonds are laundered in many cases through the trade, this is an indication of the ease with which very high -value diamonds can be laundered without a trace. Some cases showed that criminals used diamond dealers/jewellers to dispose of the illicit diamonds in their possession.

What is interesting here from a ML/TF perspective is that since the case is that, even for such extremely high amounts, the diamonds simply disappear then the same may be said with regard to ML/TF schemes through the diamond industry – the possibility today to trace such schemes where proceeds of crime are traded for diamond and then laundered through the trade is very low[112].

However, Australia noted that there is a misconception that theft is a key vulnerability at the jewellery manufacture and retail stage. While the jewellery retailers are often targets of theft, these robberies (generally 'smash and grab' jobs where quality jewellery is not necessarily targeted) account for only a small percentage of Australian thefts.

Australia also noted that theft in the diamond industry is more likely to occur in transit than at any of the six stages of the diamond pipeline. Diamonds in transit are particularly vulnerable to third party and opportunistic theft. Many diamond industry participants view transit as their largest risk.

According to the WFDB, most of the kimberlitic mining process of the mining stage is mechanised and is laser sorted. This has reduced considerably the risk of theft from kimberlitic mines. There are indications that in general, the frequency of theft has gone down significantly.

Smuggling - Despite controls put in place by authorities and mining companies, the smuggling of diamonds remains a problem. According to the information collected by the project team, it is

109 See for example case no. 8 and case no. 16.

110 See CNN (2013).

111 See Jewish Daily Forward (2013).

112 Dina Siegel looks at the largest robberies of the 21st century in which diamonds worth many tens of millions of euros where stolen and never recovered. She provides six different ways in which the diamonds could have been laundered. See Siegel Dina (2009), *pp*. 173 - 178.

difficult to ascertain the extent of the smuggling and that of the illicit market in illegally-obtained diamonds. South Africa has indicated that once the smuggled stones have entered or left a country, they are virtually impossible to trace.

Instances of smuggling were noted in the contributions of Australia, Canada, Israel, Namibia, Netherland, Sierra Leone, South Africa, Russia and USA. The cases in the United States concerned smuggling of uncut rough stones on the body of couriers, via commercial flights. The operations were linked to a "ML organisation". The organisation provided contact points for a broker and facilitated the payments for the smuggled stones. There were indications that the stones originated from conflict areas or that they were illegally obtained. The insertion of such smuggled stones into the legitimate market is accomplished by the "ML organisation", in cooperation with local dealers and through trade shows.

Nearly all rough diamonds found in the world today are controlled by a relatively small number of governments and private mine owners and conglomerates. There are some smugglers who pilfer from the concessions of those who control the rough diamonds from both government and private mines. Another country indicated that diamond smuggling is usually perpetrated by the employees of those companies.

The larger the extent of smuggling of diamonds, the easier it is for criminals to use smuggling for ML/TF purposes, *i.e.,* buying illegal diamonds with cash, smuggling the diamonds to a different jurisdiction and inserting them into the legitimate trade with almost no possibility for the diamonds to be traced. South Africa noted that there have been cases where criminals have been found trying to smuggle diamonds into/out of the country, especially through the airport, most of these destined for Europe.

In 2007[113], an assessment by an independent diamond expert provided information on several countries where smuggling took place:

- It is stated that with regard to Brazil that most of the diamonds mined in the country are smuggled out. Locals estimate that production may reach **USD 550 million annually** where formal production is several million USD;
- With regard to Central African Republic it is argued that the total export from Central African Republic is reportedly at least twice the official export data.
- A large part of the production in Sierra Leone is smuggled through Guinea, Liberia and other countries[114].

Commingling - Once diamonds are stolen, whether rough or polished, loose or mounted diamonds, in most cases, the offender will have to reinsert them into the legitimate trade in order to receive a pay-off. The same is true for illegally mined diamonds, which, in many cases, will be reinserted into the trade through another diamond mine. Thus commingling of diamonds is actually part of the ML/TF process and every stage of the "diamond pipeline" is vulnerable to commingling.

113. Even- Zohar, C. (2007).

114 *Ibid*, *pp*. 125, 197, 234.

South Africa identified a risk whereby small-scale operators may be tempted to buy illegal diamonds from other countries and try to pass them as legally mined diamonds. This in fact is an example of commingling through the mining sector.

TRADE FINANCING VULNERABILITIES

Use of cash - In order to better understand the extent of cash use in the trade of diamonds, it must be divided into two categories: wholesale and retail.

In general terms, the trade of diamonds through wholesale or other large dealers and brokers is **becoming less dependent on cash transactions, with wire transfers becoming the preferred method of payment**. While an overall decrease in the use of cash was reported, including in cash-based economies, by financial institutions and by team members, it is difficult to assess whether the level of risk generated by the use of cash being used remain significant. Analysis of the cases provided by team members show numerous cases involving cash transactions, including some cases where by cash proceeds of crime are placed, as part of a laundering scheme, in the diamond industry by means of buying diamonds with cash or depositing cash into diamond dealers accounts. Thus, it is possible to infer that even though cash is diminishing, cash usage still poses a risk for ML/TF in the diamond trade.

There are risks involved with the use of cash in large-scale transactions. A number of African or Latin American countries, some of them being diamond producers, still have a cash based economy. This makes cash the main payment method to conclude business with such countries. There are cases in which these transactions lack documental support, thus making them a very attractive means for ML and financing of terrorism. Moreover, as reported by one of the countries, depending on the local regulations, companies or individuals are able to conduct business in cash with foreign diamond bourses or fairs without the requirement for them to file a corresponding report. Therefore, we can conclude that, while most countries agree that the use of cash for large scale business to business (B2B) is being used less frequently, there are still transactions concluded this way that create a vulnerability within the AML/CFT regime.

At the retail level, transactions are typically smaller (when compared to the acquisition of bulk diamonds), and they can be conducted using cash more easily. Smaller diamond dealers, retail shops and even pawn shops can sell finished pieces of jewellery or even separate diamonds with cash as the payment method. Trends point to a decrease in the use of cash, mainly due to the introduction in some countries of legislation restricting the use of cash to purchase high value goods, such as jewellery and diamonds. However, not all countries have retail outlets or pawn shops among their catalogue of reporting entities, which means that transaction reports may not be received for sales of diamonds in all cases.

Uses of "IOUs" or promissory notes - promissory notes are used to cover debts related to the trade of diamonds (especially in bulk) by miners, dealers, brokers, cutters and polishers. They are negotiable instruments – as opposed to IOUs, which are non-negotiable instruments – and can be treated in the same way as cash (i.e. transferrable to a third party). The free and unrecorded circulation of these mostly honoured IOUs creates an unofficial and unmonitored "banking system", that provides financing for traders, outside the official banking system. Furthermore, in most

circumstances, the circulation of the promissory notes is totally "in house" within the "guild" of diamonds. The actual financial risk of a diamond dealer is "under the radar" of the official banking creditors and regulators.

The unrecorded circulation of IOUs facilitates the transfer of high value assets, without a trace in the monitored financial system. Thus, it is possible to cause the transfer of large scale funds, just by word of mouth among two persons who are members of Diamonds exchanges in different and remote locations.

The vulnerability of these cash like mechanism lays also in that it is possible to pay for the purchase of diamonds with an IOU, even with a 3rd party IOU, with no AML/CFT duties applying since only cash transactions fall under the standard and the AML/CFT legislation in most countries. This means that through the use of an IOU it is possible to avoid KYC procedures and reporting to the FIU with no audit trail of the transaction. While cross-referencing of these negotiable instruments may be useful, it is uncertain whether or not this is common practice for notes exchanged for diamond trade. Participant countries sent limited information regarding this issue, so further research is **recommended** to better assess the extent of the use of IOUs between diamond dealers and the risks entailed by such practice.

Use of diamonds as a collateral currency - Diamonds are an attractive alternative for criminals and terrorists to transport and transfer value physically, as diamonds are relatively small in size and are high value goods. The latter has also made diamonds a feasible alternative to currency, which is used in some countries by criminal or terrorist groups to buy supplies, drugs, weapons, or pay for drug-trafficking related debts.

This is relevant considering that diamonds could be **stolen** pieces, "conflict diamonds" or diamonds used to pay for drugs or weapons. Forged Kimberley Certificates can allow them to pass as recently and legally extracted stones, those bought as investments or as used diamonds removed from pieces of jewellery.

This is particularly important to financial institution providing loans against diamonds as collateral. Without the ability to verify the source of diamonds either for rough diamonds where a KP certificate is available or for loose polished diamonds where there is no certificate, there is a risk of such loans being part of a ML/TF scheme.

Memo transactions – As mentioned, memo transactions may bear some vulnerability to misuse in terms of ML/TF. These vulnerabilities are linked to possible variation of the prices of the diamonds evaluated, over or undervalued, and to the possibility of fraud committed by the consignee. For example, a potential buyer may review a parcel of diamonds and select some of the stones while returning the unsold diamonds to the consignor. The original shipment may occur at a certain stated value while the unsold return is made at another value (potentially over or undervalued). This flexible gap of value is common and may not be considered unusual or suspicious by the financial institution. But, it may also be used for ML purposes. The difference in price also raises the question whether the stones returned were all included in the shipment in the beginning. It has to be noted that the percentage of returns of polished diamonds is high. Consignment transactions may be considered by some countries to be high-risk deals with stricter rules for financing by the banks. In certain cases that involve familiar and reliable diamond dealer account holders, some banks do transfer funds or accept funds as advance payment without any document agreement

(save for a statement by the diamond dealer account holder), and then monitor the advance payment. The bank may be limited in the ability to verify that the financial transactions correspond to the terms of the memo and the value of the diamonds. The other risk linked to memo transactions is the possibility for fraud, when the consignee does not return the diamonds consigned.

"Advance payment" – some of the accepted **financial** practices by diamond dealers may also serve as conduit to ML or TF. For one, it is an accepted practice to transfer funds as an advanced payment for the stones. These are payments conducted without sending the precious stones. In many cases the advanced payment is returned back to the customer/diamond dealer. These transactions may be used to send back money from a 3rd party.

"Return shipments" – another accepted practice which create a ML/TF vulnerability is the return of shipments (partial or hole). In transaction such as memo transactions, stones are sent to the customer for his review and in case the customer is not satisfied with the stones he will send some or all the stones back to the diamond dealer. This in many cases would be accompanied with a return of funds already paid. Banks financing the trade should be aware that the funds should be returned from the same party to which the funds were initially transferred to and also with the same value. This may also be relevant to the diamond dealer where his customer is asking to transfer or transferring such funds to a third party.

"Fork Transactions" – in general these are transactions where funds are sent/received to/from other parties then those appearing in the documents as customer/supplier. As illustrated later, several cases illustrate such transactions conducted via diamond dealers' accounts.

Date of sale vs. date of payment – while conducting a transaction, the diamond dealer and its customer (which may also be a diamond dealer) will negotiate the terms of the deal including terms of payment. In most cases the diamonds will be provided close to the date of the sale and before the payment is received. The date of payment may be upon delivery of the diamonds but may also be several month later.

According to Recommendation 22 of the FATF (customer due diligence for DNFBPs) CDD measures apply for Dealers in precious metals and dealers in precious stones: "*when they engage in any **cash** transaction with a customer equal to or above the applicable designated threshold*".

The same applies to Recommendation 23 with regard to reporting duties of DNFBPs which states that dealers in precious metals and dealers in precious stones "*should be required to report suspicious transactions when they engage in any **cash** transaction with a customer equal to or above the applicable designated threshold*"

In many cases, the form of payment will determine the AML/CFT duties, it may be the case that the KYC and reporting duties will be conducted long after transaction took place and the diamonds have been delivered to the customer. Since, diamonds are a form of currency and may be used themselves for ML/TF purposes, this creates a vulnerability in which the ML/TF process may have taken place long before the details of the customer were verified and a report was sent to the relevant FIU.

Deficiencies in KYC / CDD procedures - In a number countries, diamond dealers and brokers are not accustomed to performing KYC or CDD procedures, as the industry is fairly closed to a limited

number of persons, involved in the business even for generations, who generally know each other. According to industry sources, it is difficult for a new and unknown individual to get involved in the trade of diamonds without being referred or introduced by an already established dealer[115]. In these cases, identification and cross-referencing of information may be used, however it is not mandatory.

The procedures to identify customers that purchase diamonds at the retail level are not the same in every jurisdiction, mainly because some countries do not consider dealers in diamonds, jewellers or retail outlets, including pawn shops, as reporting entities. Depending on the jurisdiction, sales outlets or even large-scale, wholesale transactions may be subject to reporting duties for large cash transactions or suspicious transactions.

The main difficulties to perform due diligence on customers arise from the international nature of the trade. The risk of these transactions is further increased when at least one of the parties conducts business through brokers, in which case the seller and buyer may not know each other. The trade of diamonds through the internet has become both a feasible and lucrative activity. However, the online trade in diamonds lacks sufficient – or, in some cases, any – procedures to identify customers and perform due diligence on potential buyers or sellers. This provides a level of anonymity that makes this market attractive for trade of diamonds with the purpose of concealing the illicit origin of resources or financing terrorist activities. KYC will be challenging to the banking institution receiving the payment from the buyer, since if the diamond dealer selling the diamonds does not fully know who his customer is then this is even more so for his bank.

One jurisdiction identified the lack of a central and up -to -date database with information on all registered individuals and legal entities dealing with diamonds – mining, exporting, importing, cutting, polishing or sales – worldwide as a deficiency on implementing KYC measures. This can prove helpful for assessing B2B transactions, but would still have little effect on retail level transactions, which have been linked by most countries to most risks.

The WFDB indicated that someone who is not a diamond bourse member cannot walk in to another diamond bourse and trade with the local members. It is required to present a letter from the bourse where he is a member, to the bourse where he intends to trade.

Screening of transactions - Reporting duties of transactions involving diamonds and other precious stones are, for most countries, in line with reporting duties established for other activities and businesses, both financial and non-financial, with the requirement to file reports before the relevant authorities when said transaction is above the established threshold or the characteristics of the transaction could raise suspicion.

Countries have recognised that information regarding the common practice involving transactions at various market levels is far from sufficient. Also, one of the countries reported that banks usually have limited ability to confirm that the parties to a transaction are, in fact, involved in the formal production and trade of diamonds. This may be one of the explanations for the low level of reporting as evident from statistics provided by team members.

115 This is sometimes required by law. In the consultation with the WFDB it was said that this is a requirement from all bourses of the WFDB.

CHAPTER 7.
RED FLAGS AND INDICATORS OF ML/TF[116]

There are many avenues in which diamond and jewellery may be bought:

- trade centres and diamond bourses;
- precious stones fairs in HK, Thailand, Switzerland and USA;
- Tenders;
- Sights;
- internet platforms;
- jewellers/jewelleries;
- Pawn shops.

Each stage of the trade may have its own red flags and indicators on top of red flags and indicators which are general and apply to all stages of the trade.

The 2008 FATF RBA guidance paper for dealers in precious metals and stones lays the foundation for an analysis of the risks which dealers in precious metals and stones, among other relevant players, are facing while conducting their business and provides the "*criteria to assess potential money laundering and terrorist financing risks*[117]". These criteria are reflected in some of the indicators below and may assist relevant players to identify specific possible ML/TF activity.

The following indicators have been identified from an analysis of the responses and cases collected by the project team. The existence of a single indicator does not necessarily indicate illicit activity, but should encourage further monitoring and examination. In most cases, it is the existence of multiple indicators which raises suspicion of potential criminal activity. These red flags and indicators may also assist in performing more general ML/TF risk-analysis in the diamond industry.

At the onset a clear distinction should be made between two different categories of red flags:

- red flags to **financial institutions**, mainly to banking corporations, referring to financial transactions carried out by entities involved in the diamond trade; and
- red flags or indicators referring to the **entities involved in the trade of diamonds** being one sector of the DNFBPs.

The first category of indicators is much more familiar and covers many indicators which would perhaps be relevant to other types of financial activities. The second category, the trade in a

116 The following member countries provided direct responses to the Collection Plan topic on red flags/indicators – Australia, Canada, Israel, The Netherlands and the United States. The red flags and indicators provided by the Netherlands were derived from Customs related case studies. There applicability is limited to import and export situations.

117 FATF (2008a).

commodity, is somewhat different and requires knowledge of the regular patterns and characteristics of the diamond trade throughout the "diamond pipeline". This second category is targeted more to diamond dealers themselves.

Further analysis of member responses identified four categories of indicators.

a) Red flags and indicators for regulated entities

b) Indicators related to the trade in diamonds

c) Indicators for the diamond industry at each stage of trade

d) Indicators specific to customs cases involving the import/export of diamonds

All categories have been included to provide the Egmont/FATF Project Team with a strong foundation to inform this chapter of the report.

Some member responses related specifically to one or some the above categories. Where possible the stage of trade is highlighted in brackets at the end of the indicator. For example:

- Israel provided indicators which are related to the trade in diamonds (category 2 above)
- The Netherlands provided customs cases from which indicators were drawn.
- Canada reported that it provides guidance to dealers in the precious metals and stones sector. This guidance includes red flags for possible suspicious transactions. Canada also reported that many indicators from diamond-related ML/TF cases were generally consistent with common ML indicators. Canada also identified red flags specific to the diamond industry at each stage of the trade.

It is also important to emphasize that while some general indicators have been identified, they are only partial and are not a replacement of general ML/TF red flags and indicators for reporting bodies.

Important remark: for the purpose of this section *only* the term Diamond Dealer will refer to all actors along the different parts of the trade from the mining sector to through dealers in rough or polished diamonds to jewellery retailers and pawn shops (unless the stage of the trade is specifically indicated).

RED FLAGS AND INDICATORS FOR REGULATED ENTITIES

The following indicators may assist regulated entities to identify potential ML/TF activity through the trade in diamonds and diamond jewellery. In most cases, these are general indictors serving to identify ML/TF activity of customers which are diamond dealers conducting their business in other

sectors than the trade in diamonds[118]. In some cases these are specific indicators relating to the trade in diamonds or diamond jewellery.

Red flags and indicators relating to trade practices

- Profit is unlikely with respect to the investment of a diamond dealer.
- Diamonds originate from a country where there is limited production or no diamond mines at all.
- Trade in large volumes conducted with countries which are not part of the "diamond pipeline".
- An increase of the volume of the activity in a diamond dealer's account despite a significant decrease in the industry-wide volume.
- Selling or buying diamonds between two local companies through an intermediary located abroad (lack of business justification. uncertainty as to actual passage of goods between the companies).
- Volume of purchases and/or imports that grossly exceed the expected sales amount
- Sale of gold bars, coins, and loose diamonds from a jewellery store (retail).
- Payments related to the appearance of rare or unique diamonds in the international market outside of known trading procedures (e.g. Argyle's rare pink diamond appearing in the international marketplace outside of the annual tender process). This to the best knowledge of the financial institution.
- A single bank account is used by multiple businesses.

Red flags and indicators related to transactions/financing of diamond trade

- Unusual *forms of payment* in the diamond trade, for example, use of travellers cheques (all stages according to the accepted forms of payments).
- *Date of payment* not customary in the trade, (e.g. receiving/sending funds for a diamond deal conducted a very long time ago (outside accepted payment terms). Or, a customer paying upfront where the customary payment date is within a 120 days term.
- *Financial activity* is inconsistent with practices in the diamond trade. For example,

118 This is not an exhaustive list. Red flags related to financial activity in general (e.g., structuring of transactions below the reporting threshold, transactions in high risk areas, etc.) are also applicable to the activity of diamond dealers.

  - Foreign currency deposits followed by currency conversion and cash withdrawal in local currency.
  - Cheque deposits followed by immediate cash withdrawals in slightly lower amounts (possible use of the diamond dealer account for cheques discounting).
  - Transfers of foreign currency and/or foreign currency cheques deposits, followed by currency conversion and immediate withdrawal from the account (possible use of the diamond dealer account for exchange services).
- No economic rationale for transactions involving an individual or company in the diamond industry.
- Deposits immediately followed by withdrawals, atypical of practices in the diamond trade, including but not limited to:
  - Circular transaction related to import/export of diamonds.
  - Circular transactions related to local trade (between local bank accounts).
  - Circular financial transactions between a diamond company's account and the private account of the company's shareholder/director, without business or economic reason.
  - High turnover of funds through an account with a low end of day balance.
- Deposits or transfers to a diamond dealer's account from foreign companies followed by immediate transfer of similar amounts to another jurisdiction.
- Immediately after a diamond dealer's related account is opened, high-volume and high-value account activity is observed.
- Transactions between accounts of different companies which are affiliated with the same customer, particularly to or from Free Trade Zones or countries with tax leniencies [119] (may be an indication of transfer pricing or trade mispricing).
- Open export[120] is settled by offsetting to, and receiving payment from, a third party.
- Open export is settled abroad by offset in front of the importer.
- Settling an open export invoice with unrelated companies that engage in diamonds and not through value/return from abroad or return of goods to the diamond merchant.

119 These transactions should be closely monitored since they may facilitate ML/TF activity and tax evasion through transfer pricing.

120 An export of diamonds where a payment was not yet received and the sale was not cancelled.

- Details of the transaction are different from the details of the commercial invoice presented by the diamond dealer to the bank (name of importer/exporter, sum, place etc.)[121].
- High-value funds deposited or transferred to an account described as short term loans with no transactions showing repayment of loans.
- Early repayment of diamond dealer's loan (a loan for 25 years is repaid after five month) with no reasonable explanation.
- Sale of diamonds and jewellery at small incremental amounts (retail).
- Multiple cheques drawn on the same diamond dealer's account on the same day.
- Origin/destination of funds is different from the destination/origin of the diamonds.
- Diamond dealer account is credited by transactions with no evidence of diamonds sales.
- Numerous returns of advanced payments.

Customer-related red flags and indicators

- Activity does not match KYC, for example:
  - Actual trade volumes are significantly larger than the expected volume.
  - Customers and/or suppliers of the customer do not correspond to the stage of the trade initially declared.
- Diamond dealer is not familiar with trade practices.
- Diamond dealer maintains high level of secrecy.
- Diamond dealer conducting activity in a branch not specializing in diamonds (where such branches exist).
- Use of a bank account in the name of a *charity*[122] to transfer funds to/from diamond dealers.
- Frequent changes in company name and contact person for a business in the diamond industry (mainly wholesale).

121 This may indicate a false/fictitious invoice which might constitute a predicate offence.

122 In the particular case provided by Australia from which the indicator was derived the charity was not a registered charity, company and/or business name. This is an additional general indication not related to trade in diamonds.

Red flags and indicators related to the use of third parties

- Customer consults a third party while conducting transactions.
- Receiving/transferring funds for import/export activity to/from entities that are not known to be involved in the diamonds trade (either an individual or a legal entity).
- Return of an advanced payment from a third party.
- Receiving/transferring funds for import/export where the ordering customer/beneficiary is an MSB.
- Use of third parties to deposit funds into single or multiple diamond dealers' accounts.
- Return of an advanced payment from a third party.
- Name of sender in the payment transfer to the diamond dealer is not the importer/buyer (mainly rough and polished trade).
- Name of receiver in the payment from the diamond dealer is not the exporter/supplier.
- A single bank account with multiple deposit handlers (retail and wholesale).

Red flags and indicators relating to the use of missing/suspicious/falsified documents

- KP certificate is or seems to be forged.
- Long validity of a KP certificate[123].
- Transfers of funds or an attempt to transfer funds through a diamond company's account without producing appropriate documentation.
- Diamond dealer claims funds received/transferred are an advanced payment without producing any appropriate export/import invoice to support it.
- Transfers between a diamond company and a private account that are reported to the bank as diamond transactions, without presenting appropriate documentation.
- Invoice presented by the diamond dealer appears to the bank as unreliable/fake.

[123] The Kimberley Certificate has a maximum two month-validity: KP certificates have a maximum validity of two months following their issuance. A "good for one entry-only" policy, a unique serial certificate number, and by the mandatory "import confirmation" from the importing KP Authority to the KP Export Authority of the exporting KP is intended to create a closed loop.

- Failing to provide a customs declaration in relation to a foreign currency cash deposit resulting from selling precious stones abroad.

RED FLAGS AND INDICATORS FOR DIAMOND DEALERS

For each of the following red flags and indicators, the relevant level of trade is indicated in brackets.

Customer or supplier related red flags and indicators

- Purchases or sales which are unusual for customer or supplier (all stages of the trade).
- From what the diamond dealer knows about the customer or supplier, the transaction appears to him to be illogical from a business or economic point of view (all stages of the trade).
- Customer or supplier does not hold a position within a company they claim to represent (all stages of the trade).
- Customer or supplier is not familiar with trade practices (all stages of the trade).
- Customer or supplier maintains high level of secrecy (all stages of the trade).
- Customer or supplier known for their *involvement in trafficking conflict diamonds* (mainly rough trade. Could apply to diamond dealer who is involved in both rough trade and polished trade)
- Customer indiscriminately purchases merchandise without regard for value/price, size or colour (all stages of the trade).
- Sale of illicit goods from a jewellery store, such as counterfeit jewellery (retail and wholesale).
- Sale of gold bars, coins, and loose diamonds from a jewellery store (retail).

Red flags related to the sale or purchase of diamonds (transaction)

- Purchases or sales that are not in conformity with standard industry practice (all stages of the trade).
- Origin/destination of funds differs from the destination/origin of the diamonds (mainly rough trade and polished trade).
- Diamonds are not accompanied by a valid KP certificate[124].

[124] Every shipment of rough diamonds at import and export needs to be accompanied by a valid and validated KP Certificate. For transactions of rough diamonds within the jurisdiction of the same KP country no KP certificate is required, but the commercial invoice must contain the WDC system warranties declaring the shipment to be conflict free. This allows the overseeing authority of the KP country to follow the transactions from import to re-export.

- Diamond cutters receiving unwashed and uncut diamonds where the source of the diamonds is unknown or questionable (rough trade).
- The appearance of rare diamonds in the international market outside of known trading procedures (e.g., Argyle's rare pink diamond appearing in the international marketplace outside of the annual tender process. (rough trade, cutting and polishing).
- Selling or buying diamonds between two local companies through an intermediary located abroad (lack of business justification. uncertainty as to actual passage of goods between the companies).
- Purchase of diamonds with a credit card issued in a country which is not the buyer's country (where credit cards are used, mainly retail).
- Regular interval purchases, rather than seasonal purchases from foreign wholesaler (retail especially, less so with diamond dealers and wholesalers).
- Buying of diamonds or jewellery and reselling even at wholesale price (retail).
- Customer is known to purchase of diamonds off the street (retail).

Red flags and indicators related to the use of third parties

- Use of third parties to sell diamonds jewellery where this is not acceptable in terms of trade practices (all stages).
- Use of third parties including relatives to conduct transactions/receive payments where this is not acceptable in terms of trade practices (all stages).
- Customer or supplier consults a third party while conducting transactions (all stages of the trade).
- Purchase of diamond or jewellery from a company abroad (funds are sent to the selling company) and receiving the diamonds from a third company (rough trade, polished trade, jewellery).

Red flags and indicators relating to the use of suspected/falsified documents

- KP certificate is or seems to be forged.
- Long validity of a KP certificate

Red flags and indicators relating to the method of payment

- High-value cash purchases of diamonds particularly in non-cash jurisdiction and/or non-cash stage of trade (all stages and depending on jurisdiction).

- A customer paying for high-priced jewellery with cash only (mainly retail).
- Unusual *means of payment* in the diamond trade, for example, use of traveller's cheques, cashier's cheques or money orders. Higher risk where they are sequentially numbered (all stages of the trade).
- Customer or supplier appears to be indifferent to the *date of payment* (all stages of the trade).
- Paying for diamonds with cheque and noting on the cheque the payment is for something else (retail and wholesale).
- Customer attempt to use a third party cheque or a third party credit card.

Red flags and indicators related to geographic location/country

- The customer or supplier appears to be related to a *high-risk jurisdiction* (all stages of the trade).

RED FLAGS AND INDICATORS FOR CUSTOMS

The Netherlands provided customs-related case studies. These cases yielded indicators related to the import and export of diamonds. The following indicators were used to detect the cases highlighted in the Netherlands' response.

Red flags related to export/import (documentation and entities involved)

- Origin of diamonds seems to be fictitious.
- The long validity period of the KP Certificate opens up possibilities for reuse and setting up a carousel[125].
- Low invoice amount.
- Overvaluation of imported good.
- The consignee doesn't specify a permanent address on the airway bill but makes use of a hotel, or other temporary accommodation, to receive the shipment, complicating the audit trail.
- The consignee specified on the airway bill is a known diamond dealer, but a different delivery address is provided.
- The diamond appears to have been shipped as a form of payment.

[125] For countries participating in the Kimberley Process Certification Scheme, international shipments of rough diamonds must be accompanied by a Kimberley Process certificate to guarantee that they are conflict-free. See Kimberly Process (n.c).

CHAPTER 8.
MONEY LAUNDERING SANITISED CASES THROUGH TRADE IN DIAMONDS[126]

Methodological remarks - This section of the report looks at case studies which illustrate the ML/TF methods and techniques which are used in the diamond industry throughout its various stages. All the cases were provided by countries that completed the collection plan[127] or through open source analysis. The case studies included in this chapter are real cases but in most instances the real names have been omitted. For the purpose of this analysis, clear distinction should be made between two methods of ML/TF through the trade in diamonds which were already outlined in the short overview of the international diamond trade provided in the beginning of this report.

- The first method is the conduct of ML through the use of diamonds as vehicles of intrinsic high value which may often be the proceeds of crime in cases of theft or robbery.
- The second method is the abuse of the financial trade in diamonds to launder illegally gained funds generated from other predicate offences such as drug trafficking and fraud.

Other precious stones - even though the project team decided to exclude other precious stones from the scope of this report, team members provided several cases where precious stones other than diamonds were used in money laundering schemes. This information has been provided in this report to emphasize the ML/TF vulnerability and risk that concerns precious stones and to highlight the importance of AML/CFT counter measures required to mitigate such risks. These cases also point to the need to conduct further research on the use of other precious stones for ML/TF purposes.

ML methods and techniques - The analysis of the cases collected identified seven ML method. Each method may be carried out through different techniques. Many cases entail the use of more than one method or technique of ML. The methods identified are:

a) Use of diamonds as currency.

b) Acquisition of diamonds with proceeds of crime as a means to store wealth.

c) Laundering through stages of the diamonds trade (either ML of proceeds generated via offences not related to the diamond trade or laundering the proceeds of diamonds related crime such as theft or robbery of diamonds).

d) TBML and customs infractions.

e) Use of financial hubs and FTZs.

126 FIU sanitized cases, Law enforcement, open source cases / investigation.

127 Including the limited collection plan.

f) Smuggling of diamonds and cash.

g) Link with or use of gold and/or other precious stones trade.

The methods identified above correspond to a large extent to the vulnerabilities identified in the previous section dealing with the vulnerabilities of the diamonds trade. The previous discussion of the diamonds trade identified certain vulnerabilities, based on the unique characteristics of diamonds:

- the possibility to use the diamonds as currency and as a mean to store wealth,
- the different vulnerabilities entailed in each stage of the trade from mining to retail level,
- the vulnerability to large scale TBML (e.g. via under or over valuation),
- and a vulnerability to smuggling resulting from these characteristics.

These cases show that criminals and professional money launderers take advantage of the identified vulnerabilities.

The analysis show that the ML/TF methods are closely related to the nature of the diamond trade conducted within specific jurisdictions or to the stage of the "pipeline" each case is referring to. Thus, for example, Belgium and Israel have significant cases relating to diamond dealers and diamond trading companies, whereas the US identified as a retail market show more laundering through jewellers. Several intelligence gaps still remain due to the lack of cases from several African mining counties and financial hubs such as the United Arab Emirates. This raises questions about the actual AML/CFT investigations in the sector.

Case structure – since the project is dealing with a trade-related DNFBP, the project team found it important to indicate for each case, where information was available, the characteristics of the trade and the financial activity related to the trade. For each case, the associated predicate offences were specified and also the ML stage (*placement*, *layering* or *integration*). Since the cases show very large scale ML activity, the sum involved in the case was also specified. Finally, the source of information (country contribution, open source or both) was also indicated.

General remarks –

a) **Large scale ML** - many cases show very large scale predicate offences or ML activity conducted through the diamond trade. One of the vulnerabilities identified was the ability to launder large sums of money, since the transaction performed in the various stages of the trade may amount to tens of millions of USD. These cases provide an indication that this vulnerability is used in ML schemes.

b) **Common predicate offences** – the most common predicate offences identified in these cases are smuggling and tax offences, including large scale tax fraud. Tax fraud, particularly when conducted through financial hubs and trade centers such as Dubai, Switzerland, Belgium and Israel, are an indication of the use of transfer prices for the purpose of avoiding tax regimes.

c) **Third party transactions** – one important issue which surfaced from different countries is an extensive use of the diamonds trade to transfer funds to or from entities which are not related to the diamond industry.

METHOD 1: USE OF DIAMONDS AS CURRENCY

In at least 15 cases that were provided by the countries, diamonds were used as an alternate currency. As indicated previously, criminals will often purchase diamonds as a means of laundering proceeds of crime and then sell the diamonds to obtain cash at a later date or a different location. In this case, ML is engaged in to purchase the diamonds and then the diamonds are sold to recover cash. This amounts to laundering of the proceeds of crime.

Diamonds bear features which enable their use as a form of currency. This is demonstrated perfectly by the use of diamonds to finance armed conflicts. These features of diamonds bring criminals to use diamonds in a similar way while conducting other offences. Several cases from team members and open source information show that such use of diamonds is mainly prevalent with drug traffickers in different countries around the world. The use of diamonds as currency was also discussed during the workshop held in Dakar, where it was pointed out that in South African diamonds are used as a payment means by criminal syndicates, for example as payment to rhino poachers. Cases also show that diamonds are smuggled between countries along with drugs or other commodities, probably as payment between parties.

This form of payment, just as cash payments, is untraceable and allows criminals to avoid the use of financial institutions while conducting their criminal activity thus avoiding rigorous KYC procedures put forth by banking institutions where diamond dealer's accounts are managed. This provides the criminal with security that suspicious activity reports would not be filed to the FIU. The use of diamonds as currency, and the fact that the trade in diamonds is international, opens up options for the criminal or money launderer such as smuggling the diamonds to other countries and exchanging them for other forms of payment such as cash or cheque, or laundering them through much less regulated diamond dealers locally or abroad.

TECHNIQUE: DRUGS TRAFFICKING RELATED USE OF DIAMONDS AS CURRENCY

The most noted predicate offence related to the use of diamonds as a currency is drug trafficking[128]. Canada, Australia, the United Kingdom and the United States provided cases for such use. Drug traffickers/producers use these commodities for a number of reasons in support of their criminal enterprise. The drug business generates huge amounts of cash which is a well-known fact by reporting entities and law enforcement. It isn't surprising that criminal organisations that are involved in drug production and trafficking are looking for other ways of payment. Cases provided by team members have shown that diamond and jewellery are actually used by drug traffickers of different levels as a mean to finance the purchase and distribution of drugs.

128 See Annex 2 - predicate offences.

A sophisticated scheme provided by Canada illustrated the use of diamonds as a form of payment received by street-level drug dealers and the mode in which diamonds (including jewellery) are used to finance this criminal activity throughout the drug distribution/production chain. Additional cases showed drug traffickers apprehended with drugs, cash, diamonds and jewellery in their possession and changing proceeds of crime to diamonds and jewellery, smuggling them to other countries where they are laundered through local diamonds trade industry.

Case 1: ***Financing drugs trafficking with diamonds and ML through retail level***	
This case involved an organised criminal group that distributed drugs and controlled several low level (street-level) drug dealers. The higher placed distributor would distribute drugs to the street-level dealer and receive *diamonds*, *gemstones* and *jewellery* as payment, as well as cash. Likewise, the street-level drug dealer traded drugs for diamond jewellery and then traded up to the higher placed drug dealer for more drugs and debt payments. The higher placed drug distributor would then sell the diamonds and jewellery at small incremental amounts (CAD 3 000-CAD 8 000) to the jewellery market (jewellers) and **in** return would receive payment by way of *cheque*. The drug distributor also received high end jewellery (watches) instead of payment for the illicit jewellery.	
Predicate offence/s	Drug trafficking
Stage of Trade	Retail
ML/TF Stage	Placement (precious stones proceeds of crime in jewellery market)
Money/Trade flow	-
Types of financial/trade activities	Sale of diamonds and jewellery for cheques
Sums involved	-
Red flag indicators	■ Link to organised crime ■ Sale of diamonds and jewellery at small incremental amounts ■ Frequent deposits of small denomination cheques drawn on jeweller(s) where this is not typical for the customer ■ Link with other precious stones
Source	Canada (response to collection plan, 2013)

Case 2: ***Link between use of diamonds and drug trafficking***	
In October 2011 officers from the Metropolitan Police Service's Central Task Force arrested Daniel McNeill-Duncan, Aaron Bowell, Karl King and James Bailey at Bailey's Neasden home. A drugs search found more than GBP 92 000 in cash, almost 2 kilos of cocaine (street value GBP 1m+). A search of King's home found large quantities of cocaine cutting agents Boric Acid, Phenacetin and Lignocaine, scales and a money counting machine. A search at Marlon Okeowo's address - Bailey's associate – found GBP 80 000 worth of *cut diamonds*. All pleaded guilty to conspiracy to supply cocaine. Sentenced on 24/04/12 : King (6 years, 9 months), Okeowo (7 years, 3 months), Bowell (6 years) Bailey (6 years), McNeill-Duncan (5 years).	
Predicate offence/s	Drug trafficking
Stage of Trade	Manufacturing/retail
ML/TF Stage	-
Money/Trade flow	-
Types of financial/trade activities	Diamonds as currency
Sums involved	GBP 80 000 in diamonds, GBP 92 000 in cash, GBP 1 000 000 (drugs)
Red flag indicators	-
Source	United Kingdom (response to limited collection plan, 2013)

METHOD 2: ACQUISITION OF DIAMONDS WITH PROCEEDS OF CRIME AS A MEAN TO STORE WEALTH

Prices of diamond are relatively stable and provide the security that the value invested in their purchase would not depreciate significantly over long periods of time. By changing proceeds of crime into diamonds and jewellery, criminals can:

i. conceal proceeds of crime over long periods of time and avoid seizure and confiscation,

ii. transfer very high value across borders while keeping their investment relatively safe,

iii. transfer very high value across borders without a need to declare carrying value as requires by FATF standards and local legislation with regard to bearer negotiable instruments (BNIs)[129],

iv. use as a form of payment after long periods of time, and

v. insure the value of the diamonds in case of loss or theft.

At any level of the trade, a purchase of a large sum worth of diamonds or jewellery by a customer, whether in cash or any other means of payment, may be an attempt by a criminal to place proceeds

[129] For the FATF definition of BNIs see FATF glossary at: www.fatf-gafi.org/pages/glossary/a-c/.

of crime into diamonds as a vehicle to store wealth, making the diamond trade a target for placement and layering of criminal proceeds.

TECHNIQUE: DIAMONDS BOUGHT AND KEPT FOR A PERIOD OF TIME AND SOLD UPON THE CRIMINAL'S REQUEST

Case 3: ***Placing diamonds bought with proceeds of crime in safes as a mean to store wealth***

An Austrian bank filed an STR saying that a Brazilian national conducted illogical transactions. He paid a large sum (profit from sale of real property) into an account for investment. He did not make any investment but wanted to transfer the "total amount" to the USA.

Austrian FIU conducted appropriate analyses and decided to initiate criminal police investigations. Austrian FIU filed report to the competent Public Prosecutor's Office and discussed further steps with the bank obliged to report. During his next visit at the bank, the above mentioned national was contacted; his statements only reinforced suspicion of ML; therefore, surveillance was initiated. Surveillance revealed extremely conspicuous behaviour; he went to a different bank (vault). Another report of facts of the case was filed to the Public Prosecutor's Office. Finally, a court order to open the bank safe was obtained. The content of the safe revealed further safe keys, which were also opened by Court order. Austrian FIU seized a large number of false passports and diamonds.

First analysis of documents seized sufficed for the issuance of an arrest warrant regarding the Brazilian national, and execution of the warrant. Interrogation revealed that he was laundering money for a large-scale fraudster from the United States. They transferred funds to accounts of offshore companies; fraudster handed funds to money launderer; he took over the funds and purchased diamonds at "jewellers". He handed these diamonds over to middlemen who smuggled the diamonds to Austria. They placed these (precious) diamonds in safes and as the fraudster needed most of the money, he ordered for the money to be wire transferred. The money launderer sold some of the diamonds and deposited the profit into above mentioned account.

Predicate offence/s	Fraud, Smuggling of diamonds, false passport
Stage of Trade	-
ML/TF Stage	Layering
Money/Trade flow	Austria to United States (money)
Types of financial/trade activities	Use of safes, Wire transfers
Sums involved	-
Red flag indicators	■ Frequent visits to a safe. ■ Visits to a safe followed with cash deposits and a request to transfer the funds abroad
Source	Austria (2012)

Case 4: ***Drug dealer Launders jewellery received as payment for drugs and buys jewellery as a mean to store wealth***	
This case involved a drug dealer/producer who sold drugs and traded drugs for collectively over USD1 million in stolen and purchased jewellery. The drug dealer who had strong industry, commodity and market knowledge sold the least valuable (scrap) jewellery as scrap to jewellery stores and bullion dealers. Jewellery that had some aesthetic or residual market value above the component parts was sold as estate jewellery to jewellers. In return, the drug dealer received cash, gold and silver bars and coins and diamond jewellery. The drug dealer used some of the proceeds of crime from the sale of drugs and sale of jewellery obtained through trade for drugs to purchase specific diamond jewellery and gemstones items (jade) as a mean to store wealth. The drug dealer used appraisals to define the value of jewellery that was stored as wealth and to help negotiate fair prices for the resale of the jewellery to the market.	
Predicate offence/s	Drug trafficking
Stage of Trade	Retail and wholesale
ML/TF Stage	Placement through jewellery
Money/Trade flow	-
Types of financial/trade activities	Jewellery sold for cash, Jewellery sold for gold and silver bars and coins, Jewellery sold for diamond jewellery and gemstones
Sums involved	CAD1 million
Red flag indicators	■ Frequent selling of jewellery ■ Jewellery traded for jewellery ■ Jewellery traded for gold and silver
Source	Canada (response to collection plan, 2013)

METHOD 3: LAUNDERING THROUGH STAGES OF THE DIAMOND TRADE

The "diamond pipeline" is very long and complex. Each level of the trade chain offers opportunities for those seeking to exploit the nature of the trade and the unique features of the commodity traded for the purpose of ML or TF. Cases collected show the use of all levels of the trade from mining companies, dealers in rough and loose polished diamonds through diamond wholesalers to retailers and pawn shops with little information regarding ML through the mining sector where an intelligence gap exist due to limited contributions from African mining countries.

A distinction, which was detailed in the overview section of the report, can also be seen in the cases. This distinction is between on the one hand:

a) ML conducted through the trade in diamonds where proceeds are generated by crimes not related to the diamond trade (e.g., drug trafficking).

And on the other hand:

b) Laundering diamonds or jewellery generated by crime (*i.e.,* theft, diamond used as payment for drugs, illegal mining) by "legitimising" these proceeds of crime through the trade.

Cases show a variety of techniques used by criminals to use different levels of the trade for ML purposes. Some techniques may be used in a similar way in different stage of the trade. An example of this may be the laundering of illegally mined rough diamonds by way of commingling through the mining sector or commingling through a rough diamond dealer. The following techniques were identified:

a) Commingling of illegally gained diamonds through the mining sector.

b) Laundering *illegally gained diamonds* through wholesale, retail jewelleries, pawnshops or trade shows.

c) Laundering *proceeds of crime* through wholesale or retail jewelleries – these cases were mostly presented by large retail markets such as the US and Canada where large sums of money would be more easily placed.

d) Using accounts of diamond dealers as a conduit to transfer funds, particularly in favour of *third parties* which are *not part of the diamond trade* – this type of ML activity was identified by several countries and is more common in trade centres such as India, Israel and Belgium. Canada and the US also identified this type of behaviour. FinCEN indicated in a SAR analysis performed by the FIU that the diamond industry entities interacted with charitable foundations, electronics manufacturers, automobile dealers, real estate businesses and unknown entities in unknown locations. Australia submitted a case where a charity interacted with diamond industry entities. This type of activity seems to be indicative of the industry in light of the pattern spanning across the globe. It seems large amounts of money are *transferred through* the diamond sector from *unrelated entities* with a purpose to hide the source of funds, the destination of funds or both.

e) Amounts involved are high, indicating that large amounts of money are funnelled through the industry in favour of undeclared entities.

Some of the cases feature more than one technique which may result from the change of the *modus operandi*. Some cases show large scale ML activity amounting to tens and even few hundreds of millions of USD. These cases are instances of what was previously portrayed as a vulnerability, namely that since the diamond trade amounts to almost USD300 billion per annum, characterised by very large transactions, it provide an opportunity to launder very large sums.

Trade Based Money Laundering and *Smuggling* are both prevalent in the diamond industry. Since these are methods not unique to trade in diamonds and since they are not particular to a specific stage of trade, they are dealt separately.

TECHNIQUE: COMMINGLING OF SMUGGLED DIAMOND AT THE MINING LEVEL

Case 5: *Attempt of commingling illegally mined diamonds via exporting companies*

In 2005, the Guyanese government caught an attempt by a company to export 8 500 carats of rough stones with allegedly illegal origins. Given the owner's Venezuelan connections, discovered by investigators, the stones were believed to have originated in Venezuela and laundered through the company for legal export out of Georgetown.

The Guyanese government investigated in 2007 another company over a 4 000-carat batch of diamonds with nefarious origins, presumably from Venezuela, Brazil, or even West Africa, according to government documents.

Predicate offence/s	Illegal diamond trade
Stage of Trade	Rough diamond trade
ML/TF Stage	Placement and layering
Money/Trade flow	Venezuela to Guyana (suspected illegal trade)
Types of financial/trade activities	Rough diamond export
Sums involved	-
Red flag indicators	■ Lack of KP certificate for rough diamonds or certificate seems to be forged
Source	Open source: Logan, Samuel (2009)

TECHNIQUE: LAUNDERING ROUGH DIAMONDS BY CUTTING AND POLISHING

This technique provides two main benefits to the money launderer: first, once a rough diamond is cut it is almost impossible to verify the source of the stones. Second, once a diamond is cut and polished it no longer falls under the KPCS and may be exported without the controls established by the Kimberley process.

Case 6: *Illegal diamonds sent to foreign jurisdiction to be cut and polished*

A case of non-Kimberley Process rough diamonds smuggled into Canada, then the diamonds were smuggled to a foreign jurisdiction to be cut and polished (as Canada has few independent diamond cutters) and then the diamonds were sent legally back to Canada as they were now cut and polished and no longer subject to Kimberley Process protocols (this case engaged the rough diamond production and diamond cutting sector of the industry).

Predicate offence/s	Smuggling diamonds
Stage of Trade	Rough diamond production, cutting and polishing
ML/TF Stage	Laundering illegal diamonds through cutting and polishing
Money/Trade flow	-

Case 6: *Illegal diamonds sent to foreign jurisdiction to be cut and polished*	
Types of financial/trade activities	Cutting and polishing

TECHNIQUE: LAUNDERING ILLEGAL DIAMONDS THROUGH DIAMOND DEALERS

The following case concerns a technique which facilitates illegal trade in diamonds where diamonds are smuggled into Russia circumventing the KPCS. The illegal diamonds are laundered by the criminal establishing diamond companies for the purpose of selling the stones without a KP certificate.

Case 7: *Trafficking of illegal Gemstones*	
Mr. M, an Israeli national, sets up a company "M" in St. Petersburg specializing in an unauthorised distribution of precious stones (diamonds). According to the documents, precious stones are supplied by five companies that are registered in Russia and founded by the same Mr. M. According to intelligence provided by law enforcement, the said companies were set up to launder precious stones that are smuggled into Russia. Company "M" handled the smuggled stones without keeping any written records of transactions, with all deliveries being made on the basis of customers' requests. Deliveries of diamonds to the company office were made by couriers and involved no supporting documentation. The proceeds were channelled abroad in the form of interest-bearing loans to foreign companies with bank accounts in Israel and Hong Kong, China. A criminal investigation revealed that the said foreign companies owed Company "M" a total of over USD 2 million. However, a close study of STRs revealed that more than USD 8.9 million had been credited to the accounts of these companies. Yet, the total amount of Company M's debt to the suppliers of diamonds stands at more than 90 million rubles.	
Predicate offence/s	Smuggling diamonds
Stage of Trade	-
ML/TF Stage	Layering
Money/Trade flow	Israel (money Out); Hong Kong, China (money Out)
Types of financial/trade activities	Loans to foreign companies
Sums involved	USD 9 million

Case 7: *Trafficking of illegal Gemstones*	
Red flag indicators	■ Loans are provided by a diamond company to legal entities not in the diamonds industry ■ Loans provided by the diamond company are not repaid. ■ No supporting documentation to the international transactions conducted in the diamond company account
Source	Russia (response to collection plan, 2013)

TECHNIQUE: LAUNDERING ILLEGAL DIAMONDS VIA RETAIL LEVEL – JEWELLERIES, PAWN SHOPS

One of the risks identified by the team members was the risk of theft which is relevant for every stage of trade in all countries involved in diamonds trade. The jewellery market is prone for theft and is perhaps and broadly speaking the sector where the risk is the highest since in the mining sector and the trade centres control and supervision are more stringent. Retail jewellers are everywhere and constitute the largest sector of the trade in terms of entities involved and turnover per annum. These stolen items must be laundered through appropriate venues in what may be called laundering of illicit diamonds/jewellery as opposed to ML per se. The cases below present the techniques used to launder illegal diamonds or jewellery in the US.

Case 8: *Theft Case Example – Operation Cut and Run*

During January 2004, a handful of South American immigrants from New York City stole nearly USD 100 000 worth of Rolex watches from a jewellery store in Cranston, Rhode Island. They fled the scene in a minivan, with local police in hot pursuit. Minutes later, they slammed into a police cruiser. They jumped out of the van and fled on foot, but four were immediately caught and arrested.

This lead to massive investigation (Operation Cut and Run) by the FBI, the New York City Police Department, the Bureau of Immigration and Customs Enforcement (ICE)[130], the U.S. Attorney's Office in the Southern District of New York, the Queens County District Attorney's Office, and other law enforcement partners.

In the end, this multi-agency initiative uncovered and ultimately took down a criminal enterprise that had stolen more than USD 3 million worth of high-dollar pieces of jewellery across the eastern seaboard in more than 90 separate thefts. At least 16 members of the crew have been arrested or indicted, and one has pled guilty.

This case is considered by FBI to be a 'textbook" jewellery theft case. Mainly because the thefts were orchestrated by a signature international enterprise (*i.e.,* a SATG – South American Theft Group) that operated out of New York City, one of the common bases for jewellery theft rings. The ring was also sophisticated. For example, the thieves would enter jewellery stores in small groups, with some

130 Now Homeland Security Investigations (HSI).

Case 8: ***Theft Case Example – Operation Cut and Run***

members distracting sales and security personnel while others operated as lookouts. Once they determined it was safe to proceed, some of them would stand around a showcase to shield it from view while others used a tool to cut the silicone holding the case together and remove the goods. The group would then leave the scene and meet a waiting vehicle to escape.

The thefts in this case extended across state lines which brought in the FBI with its national and international network of agents. Like most other cases, "fences" (individuals who knowingly buys stolen property for later resale - see case 9 below) played a role in receiving and moving the stolen goods. The intelligence gained by law enforcement--including the modus operandi of the group and descriptions of suspects—was entered into a database. This information helps law enforcement partners nationwide coordinate any related investigations and better understand the jewellery and gem criminal enterprises operating in the United States.

Predicate offence/s	Theft
Stage of Trade	Retail
ML/TF Stage	-
Money/Trade flow	-
Types of financial/trade activities	-
Sums involved	USD 3 million
Red flag indicators	-
Source	United States (response to collection plan, 2013)

The case bellow illustrates the manner in which stolen diamonds are laundered in the United States.

Case 9: ***Trafficking in Stolen Goods***

Diamonds taken from large scale robberies, thefts and burglaries are sold to "second hand" dealers to include pawn shops, estate jewellery dealers and other high-end retail outlets. Diamonds are often targeted by highly professional groups noted above and other organised crime groups from the Balkans (e.g., former Yugoslavia, Albanian, and Kosovo). Picking up on the examples described above, professional theft crews can sell stolen goods to their fences for between 20% and 30% of retail value.

Reporting by law enforcement indicates that pawn shops may also be used or operated by criminal gangs as "front companies". Diamonds sold for cash in pawn shops are often owned by Russians affiliated with organised crime who have contracts in the Diamond District. According to the FBI it is not difficult to sell stolen property. Criminals sell stolen property at a deep discount to the pawn shops, which in turn have to negotiate with "legitimate" dealer who take stolen goods at 40% or 50% on dollar. These diamonds enter the legitimate stream of commerce in the Diamond District.

Pawn shops are required to have a license from New York to be a second hand dealer. However, the secondary market for stolen diamonds is segmented. Diamonds stolen could be "used" property or

Case 9: *Trafficking in Stolen Goods*	
they may be stolen new product from wholesalers with the "tickets" still intact. Additionally, thieves can target select high-end or estate dealers as noted above.	
Predicate offence/s	Diamond theft, robbery, burglary
Stage of Trade	Retail
ML/TF Stage	Placement of illegal diamonds or jewellery
Money/Trade flow	-
Types of financial/trade activities	-
Sums involved	-
Red flag indicators	■ Diamonds are sold for less (third to half) of their retail value, particularly if customer is not previously known ■ Links to organised crime groups ■ Frequent cash withdrawals from an account managed by jewellery dealer or pawn shop where this is unreasonable.
Source	United States (response to collection plan, 2013)

Case 10: *Buying diamond over the internet with stolen credit card numbers and laundering the goods via jewellery retailers*	
A diamond dealer has been arrested on organised crime charges allegedly laundering more than USD 100 000 in high-quality diamonds stolen by a local ring of thieves. According to court records, diamond and jewellery dealer Mr B purchased the diamonds from thieves who stole credit card information and bought the stones from Internet retailers across the country, according to the Dallas Morning News. Mr B could face five to 99 years in prison and a fine of up to USD 10 000. Mr B is one of eight people indicted in the identity-theft ring. The thieves searched trash containers for credit card receipts and then used the card numbers to purchase diamonds using a prepaid mobile phone, arranging to either pick up the stones from UPS offices or intercepting the packages as they were being delivered to the homes of the people whose identity had been stolen. Court documents charge that Mr B paid the other suspects USD 173 700 for approximately 40 stolen diamonds. The documents charge that he sold the jewellery to other retailers nationwide. It is estimated Mr B bought the stones at 50% below their real price.	
Predicate offence/s	Theft, Credit card fraud
Stage of Trade	Retail
ML/TF Stage	Placement, laundering through retail
Money/Trade flow	-

Case 10: ***Buying diamond over the internet with stolen credit card numbers and laundering the goods via jewellery retailers***	
Types of financial/trade activities	Buying diamonds with credit card online, Selling diamonds for cash
Sums involved	More than USD 100 000
Red flag indicators	■ diamonds are sold for half their value ■ customer selling diamonds at jewellers which he has no clear link to (E.g. his home and business address are remote)
Source	Open source (USA): International Diamond Exchange (2005)

TECHNIQUE: MONEY LAUNDERING THROUGH WHOLESALE AND RETAIL JEWELLERY STORES

Several cases show that these same features of the retail market described under the previous technique (*Laundering illegal diamonds via Retail level*) are exploited for ML. Proceeds generated in other predicate offences are placed in wholesale and retail jewellery store in very large amounts. As a first step in the laundering scheme these proceeds are changing their form from financial instruments received as payment for crime (cash, money orders, cheques, etc.) to diamonds and jewellery. This is done instead of depositing the proceeds of crime at a financial institution. This first stage may then be followed by using other features of the diamonds or jewellery, some of which are represented in the following cases:

- smuggling to another jurisdiction,
- using them as means of payment,
- selling the diamonds in return for payment in cash or within a financial institution locally or abroad,
- selling the diamonds over the internet exploiting the relative anonymity of the internet payment system,
- using the diamonds as a mean to store and hide wealth for long periods of time and avoid confiscation, etc.

The first case below involves a huge amount of money. Large scale ML can go unnoticed for long periods of time. This may be attributed to low level of transparency and high secrecy of the industry and to low level of enforcement. Two cases are linked to drug trafficking as a predicate offence and in a third case the predicate offence was fraud. A link to ML through gold was found in one case which is indicative of a wider link found between ML through diamonds and ML through gold based on additional cases. In one case the internet as a trading platform for diamonds was used as part of the ML scheme to quickly move the diamonds by selling them with no mark up.

Case 11: ***Laundering the proceeds of Narcotics through a jeweller (Celebrity Jeweller)***
Mr A, a New York diamond merchant, who has outfitted countless rappers and NBA players, was sentenced in 2008 to two and a half years in federal prison for lying to investigators about his part

Case 11: ***Laundering the proceeds of Narcotics through a jeweller (Celebrity Jeweller)***

in a multistate drug ring. Mr A was also fined USD 50 000, and ordered to forfeit USD 2 million to the US government.

Mr Av was arrested at his Manhattan shop in 2006 and accused of being part of a conspiracy to launder about USD 270 million in drug profits. He was among 40 people indicted in the scheme orchestrated by the Black Mafia Family, which ran drugs out of Detroit beginning in the 1990s. Mr A facilitated the purchase of jewellery utilizing drug proceeds of other defendants in order to conceal the true nature, source and ownership of the funds involved in these transactions. After receiving payments in cash, money orders and cashier checks, amounting to hundreds of thousands of dollars for each payment, Mr A would fail to report these cash payments to the IRS (Form 8300) or would falsify these records. Officials dropped the money-laundering charges against the jeweller as part of his plea agreement.

Predicate offence/s	Drug Trafficking
Stage of Trade	Wholesale
ML/TF Stage	Placement through jewellery
Money/Trade flow	-
Types of financial/trade activities	Jewellery for cash, Jewellery for money orders, Jewellery for cashier's check
Sums involved	USD 270 million
Red flag indicators	■ Jewellery is paid with money orders and cashier's check ■ Jeweller Frequently deposits money orders and cashier's check (or carrying any other financial transaction with these instruments)
Source	United States (response to collection plan, 2013), Open source

Case 12: ***Money Laundering Case Example – New York Diamond Dealer***

In 2005, Roman Nektalov, a jewellery district gold and diamond dealer, was sentenced to 10 months imprisonment for ML. The prosecution of Nektalov was part of "Operation Meltdown," an undercover investigation targeting narcotics ML activities in the 47th Street jewellery district in Manhattan.

Operation Meltdown targeted a ML method commonly used by Colombian drug traffickers. Under this method, drug traffickers and money brokers who provide laundering services to the drug traffickers employ couriers to pick up cash at designated locations and deliver the cash to gold jewellers and suppliers. The jewellers or suppliers then exchange the cash for gold, diamonds or other precious commodities, which are then smuggled to Colombia, either via couriers or hidden in cargo. Once the diamond and gold arrives in Colombia, it is sold for Colombian pesos, which are then ultimately delivered to the narcotics traffickers.

Roman Nektalov, an owner of Roman Jewellers, operated a scheme to launder what he believed to be narcotics proceeds. Cooperating Witnesses (CW) and Under Cover (UC) law enforcement agents

Case 12: ***Money Laundering Case Example – New York Diamond Dealer***

indicated that they and their associates had narcotics proceeds in the New York City metropolitan area which they wanted to exchange for gold and diamonds, and then wanted to smuggle the gold and diamonds to Colombia. In particular, at trial, the Government presented testimony and audiotape recordings of meetings in which the CW, the UC known as "Angel," and Nektalov discussed the sale by Nektalov of diamonds to the UC in exchange for cash believed by Nektalov to be drug money.

The evidence at trial showed that on 4 June 2003, Nektalov met with the CW and the UC at Roman Jewelers to exchange a large number of diamonds for USD 500 000 in cash. After the diamonds were placed on a table in a back room where the transaction was to take place, federal agents entered Roman Jewelers and arrested Nektalov seizing the diamonds.

Predicate offence/s	Drug Trafficking, Smuggling of gold, diamonds and precious commodities
Stage of Trade	Wholesale and retail
ML/TF Stage	Placement through jewellery
Money/Trade flow	United States to Colombia (smuggling)
Types of financial/trade activities	Cash payments for gold and diamonds
Sums involved	-
Red flag indicators	■ Frequent large cash purchases of diamonds ■ Link to gold
Source	United States (response to collection plan, 2013)

Case 13: ***Laundering proceeds of crime through purchase of diamonds and resale at wholesale prices to jewellers and to final customers via the internet***

This is a case where fraud was the predicate offence. The criminals had jewellery industry contacts at the wholesale level. To launder the proceeds of crime they purchased CAD 1 000 000 + of diamonds that were then re-sold back to the jewellery market and also to the general public through the internet. They did not mark up the value of the diamonds for retail purposes instead sold them to retail customs at wholesale prices and therefore moved them quickly. The diamonds were all in a size and quality class that are the most desirable and resulted a quick turn over of the diamonds. The money received from the sale of the diamonds was wired direct to their bank from the various sales locations.

Predicate offence/s	Fraud
Stage of Trade	Retail and wholesale
ML/TF Stage	Placement and layering through trade in diamonds
Money/Trade flow	-

Case 13: ***Laundering proceeds of crime through purchase of diamonds and resale at wholesale prices to jewellers and to final customers via the internet***	
Types of financial/trade activities	Wire transfers
Sums involved	CAD 1 000 000
Red flag indicators	■ Diamond bought and resold quickly ■ Diamonds are sold to retail customers at wholesale prices
Source	Canada (response to collection plan, 2013)

TECHNIQUE: LAUNDERING OF SMUGGLED DIAMONDS THROUGH TRADE SHOWS.

In the following case, smuggled diamonds are laundered through a trade show. Trade shows are held in different trade centres around the world (Hong Kong, China; Switzerland; Singapore; Israel; United States, etc.) where cash is still used to a large extent. The diamond will be sold for cash without proper certification which will then be disposed of by usual means. The case presents one of the techniques by which the illegal trade is conducted. The case also exposes the lack of expertise by custom authorities to identify diamonds that are misclassified.

Case 14: ***Selling Smuggled diamonds at gem shows***	
Homeland Security Investigations (HSI) received information that a Guinean National was attempting to sell uncut smuggled diamonds at local area Gem Shows. HSI undercover agents (UCA) conducted surveillance at several Gem Shows and negotiated with the Guinean national the sale of rough uncut diamonds from Zimbabwe. UCAs purchased one rough uncut diamond weighing approximately seven carats for USD 15 300. The subject admitted to UCAs the diamonds were smuggled to the United States and lacked the required Kimberley Certificates. During the UC meeting, two additional associates where present with a gem inventory that included rough-cut *diamonds*, *aquamarines*, and *tourmalines*. The Guinean National admitted that the rough cut diamonds had been smuggled and did not contain the Kimberley Process certificates. He also admitted that the organisation smuggles diamonds into the United States, or *misclassifies* them, depending on the quantity; and stated that the *US Customs authorities don't know what they are looking at*. An expert gemmologist certified the purchased stone was a diamond. Based on this information, HSI agents obtained a search warrant, which resulted in the seizure of 11 665 carats of rough-cut diamonds, other precious and semi-precious stones and the arrest of all three subjects. A follow-up interview was conducted with the Guinean National who admitted to have imported 12 000 carats of un-cut diamonds and *misclassified* the Customs entry paperwork as miscellaneous coloured stones. He also admitted to have purchased the diamonds from a mine in Zimbabwe from where he then flew to Thailand, then Amsterdam and arrived to the United States. All three subjects were arrested on violation of Title 18 USC 545 Importation Contrary to Law and 19 USC 3907 violation of the Clean Diamond Trade Act. It is believed that through the smuggling of diamonds, this criminal organisation generated over USD 500 000 in illicit proceeds.	
Predicate offence/s	Smuggling diamonds, misclassification of shipments in order to deceive customs authorities
Stage of Trade	Rough trading
ML/TF Stage	Layering (smuggling and moving diamonds through a number of states)
Money/Trade flow	Zimbabwe to Thailand to Netherlands to United States (illegal trade)
Types of financial/trade activities	Sale of rough stones at gem trades
Sums involved	USD 500 000
Red flag indicators	Lack of KP certificate for rough diamonds
Source	United States (response to collection plan, 2013)

TECHNIQUE: ML THROUGH DIAMOND DEALERS ACCOUNT AND USE OF A DIAMOND DEALER ACCOUNT TO TRANSFER FUNDS FOR THIRD PARTIES

Large number of cases relate to the use of diamond dealers' accounts as a conduit to transfer funds for parties not related to the diamonds trade. This technique is therefore used mainly for the

layering of funds generated in criminal activity by conducting numerous transactions between accounts to conceal their source. This is perhaps the most common activity identified in cases submitted by team members. Some of the cases show activity which may well be trade-based ML, however the information submitted refers mainly to financial transaction through the diamond dealer's account with no information as to the manner in which the trade was used to launder funds[131]. The fact that the transaction originated from, or destined for, real estate companies, charities, textile companies, metal trading companies, money service businesses, etc. is a clear indication that diamond dealers are used as a front for funds generated in criminal activity.

One of the interesting points is that this type of activity takes place in different jurisdictions[132] serving as trade centres for the diamond trade. This is indicative of the global nature of the diamond trade, the connectivity between different stages of the trade cycle and the fact that diamond dealers in many cases have an international presence and are sometimes involved in more than one stage of the trade. When a diamond dealer turns to the wrong side of things this can be exploited to transfer funds between accounts held by the same entity worldwide as part of the usual business doing.

Three cases present the activity of the diamond dealers' accounts and an additional case presents the activity of a non-diamond trade entity transferring funds to and from diamond dealers in a tax fraud case through a charity submitted by Australia. Two of the cases submitted by India and Australia show large scale ML cases amounting to tens of millions of USD.

131 TBML is dealt with as a separate method which entails use of the diamond dealer's account.

132 Australia, Belgium, India, Israel. Canada also indicated in the response to the collection plan that based on the SAR analysis, one of the red flags identified was transactions of entities not involved in the diamond trade such as construction and renovation, and the food industry.

Case 15: *Sanitised STRs relating to diamond trade Inputs from Financial Intelligence Unit*

ABC is a company represented by its directors Mr. XXX and Mr. YYY. The company opened a bank account in June 2011. The aggregate turnover in the account from April 2012 to July 2012 was INR 321 million. The total turnover in the account from July 2011 to May 2012 was INR 687 million and the average balance in the account during the period was INR 0.5 million. This triggered the suspicion that the account was being used only for *layering* of funds. The funds were received in this account through Real Time Gross Settlements (RTGS)/clearing and by transfer from other firms whose activities consisted of *real estate*, *metal trading*, *textiles*, *exporters/importers*, *diamond trade* and *steel & alloys*.

The funds were transferred to different entities whose activities were related to diamond trade. The company had also sent foreign outward remittances of INR 5.6 million to Hong Kong, China ostensibly for the purpose of import of *polished diamonds* during the period July 2011 to May 2012. The transactions happened between ABC and other diamond traders but the funds never stayed in the account of ABC except on few occasions when the funds were kept just for a day.

Mr. XXX and Mr. YYY also have their personal savings account with the same bank. An analysis of the transaction activities in this account revealed that the company used to transfer funds through RTGS to *real estate* companies and *stock-trading* firms as well. These transactions raised doubts that the company, being active in the diamond trade, may be facilitating the integration of funds received from diamond merchants in favour of real estate/share trading companies. During enhanced due diligence carried out by the bank, the directors were not forthcoming in explaining the genuineness of the transactions and as to why the fund transfers happen on the same day. The very high turnover followed by low end of day balances in the account shows that the customer was using the banking system only for fund collection and transfers.

The main points of suspicion were: 1. The operation of the account by the customer, the layering of transactions carried out by them and their business activity point to a suspicion that they may be acting as a *front for third parties*. 2. The company projected an annual aggregate turnover of INR 100 million in the account whereas the actual turnover was six times higher. 3. The fund transfers through several layers gave rise to a suspicion that the funds were transferred on behalf of certain persons to certain beneficiaries who may not have relationship with one another.

Analysis of FIU-IND's revealed heavy cash transactions in several other bank accounts of the main company and the accounts of related entities.

Predicate offence/s	-
Stage of Trade	Polished diamond trade
ML/TF Stage	Layering
Money/Trade flow	India to Hong Kong, China (money)
Types of financial/trade activities	International transfers
Sums involved	INR 687 million
Red flag indicators	-

Case 15: *Sanitised STRs relating to diamond trade Inputs from Financial Intelligence Unit*	
Source	India (response to collection plan, 2013)

The following case also demonstrates the importance of international cooperation between FIUs. This enables to confirm ML suspicions while respecting the confidentiality of the exchanged financial intelligence. After highlighting the serious ML indications, the relevant information was structured and promptly forwarded to the judicial authorities.

Case 16: *Commingling proceeds of theft in an account of a diamond trade company*	
CTIF-CFI received a disclosure from an Asian counterpart. An investigation conducted in this Asian country revealed that the main figure, of Asian origin, had deposited a large amount in cash on his account with a bank in Asia. Shortly afterwards he had these funds transferred to an account in Belgium held by a Belgian company. Based on the financial documents provided by the Asian FIU, the Belgian FIU, CTIF-CFI, was able to obtain more details on the transactions conducted in Belgium. CTIF-CFI also detected a large number of transactions that were not previously known. It became clear that the company traded in diamonds. It held an account with a bank in Belgium, on which the transfer from the country in Asia took place. The manager, of Asian origin and residing in Belgium, held power of attorney. CTIF-CFI's analysis showed that numerous transactions took place on the account: many international transfers debited and credited the account. The money he transferred from Asia to the diamond company in Belgium was clearly a layering transaction. He was suspected of ML linked to theft with violence in Asia and seemed to have used the diamond company as a cover to purchase diamonds with proceeds of this crime. Mixing funds of illicit origin with proceeds of business activities is typical of ML. The Asian FIU granted CTIF-CFI permission to use the intelligence in the request and the file was reported to the Belgian judicial authorities for theft.	
Predicate offence/s	Theft
Stage of Trade	Wholesale
ML/TF Stage	Layering
Money/Trade flow	Asian country to Belgium (Money)
Types of financial/trade activities	Cash deposits (in Asia), International transfers
Sums involved	■ Large cash deposits followed by international transactions ■ Frequent international transactions in a diamond company account (both credit and debit) without logical explanation
Red flag indicators	Belgium (response to collection plan, 2013)
Source	Theft

Case 17: *Activity in the Designated Diamond Account Deviates From Normal Practices of the Diamond Trade*

The Israel Money Laundering Prohibition Authority (IMPA) received Unusual Activity Reports (UARs) regarding person X. Analysis of the information about X revealed he held 50% of the shares of company B, operating in the diamond trade.

According to the UARs, W transferred tens of thousands of dollars to beneficiaries abroad, which did not seem to be related to the diamond trade in their countries. X transferred money to beneficiaries abroad, while the true name of the beneficiary in his order of transfer was different from the actual beneficiary stated in the Diamonds Importer Declaration form, made by him according to the AML/CFT banking order.

Moreover, X made a deposit of travellers' cheques in an amount exceeding USD 100 000 that was stated as "diamonds export return", traveller cheques as a form of payment for export return is highly irregular.

At the time, information had already been received indicating a suspicion that X had a connection to organised crime groups. The connection of X to the head of a criminal organisation raised the supposition that X assisted the criminal organisation to transfer money for its illegal operations and launder funds by giving guise of precious stones deals to the fund transfers. The information of this case was subsequently forwarded to law enforcement.

Predicate offence/s	Link to organised crime
Stage of Trade	Rough diamond trade
ML/TF Stage	Layering
Money/Trade flow	-
Types of financial/trade activities	International transfer (out), Deposit of travellers cheques
Sums involved	Over USD 100 000
Red flag indicators	■ Transfers to entities which seems to be unrelated to the diamonds trade ■ Discrepancies between names of foreign beneficiaries of the transactions in the bank account with the names of suppliers indicated on the importer declaration form ■ Unusual form of Payment in the diamond trade (use of travellers cheques) ■ link to organised crime
Source	Israel (response to collection plan, 2013)

Case 18: *Laundering of tax fraud proceeds through the diamond industry*

Over a seven-year period suspect A and his family members operated a complex ML scheme in which approximately AUD 42 million was transferred from Australia to Israel. The services provided by suspect A and his family involved the laundering of undeclared and untaxed cash from business earnings of various clients.

Suspect A opened an account in the name of a non-existent charity, a fictitious entity with no legal basis. The charity was not an incorporated company and it did not have a registered business name.

The account was used to deposit, move and launder undeclared earnings from business activities of clients of suspect A. The cash deposits made by suspect A and his family members were subsequently transferred to Israel. The funds were transferred through the bank under the guise of charitable donations. Clients used the services of suspect A specifically to launder funds with the intention of not declaring income and to avoid tax.

Suspect A also used the diamond industry to launder funds. Over a three-month period law enforcement officers observed suspect A travel from an Australian-based airport to the offices of two diamond dealers. On each occasion, suspect A left the diamond dealers' offices in possession of a plastic shopping bag which he had not taken into the dealers' offices. The following day, suspect A deposited a large amount of cash into the account of the charity and transferred the funds to Israel.

Authorities alleged that most of the money laundered by suspect A came from the cash sale of diamonds which had been imported illegally into Australia. Following the cash sale of the diamonds, the proceeds were collected by suspect A and deposited into the account of the charity. The funds were then transferred back to the overseas-based diamond suppliers under the guise of charitable donations. This method facilitated the avoidance of sales tax on the sale of the diamonds and the payment of income tax on the profits from the sale.

Enquiries identified that three bank accounts in Israel and one in Sweden received funds sent by suspect A and his family. A further two overseas-based accounts were identified. These accounts also received funds and both accounts were associated with diamond merchants in Israel and Belgium. These diamond merchants supplied wholesale diamonds to Australia.

Suspect A was convicted of conspiracy to defraud the Commonwealth and sentenced to five years imprisonment.

Suspect A's family members were convicted of conspiracy to defraud the Commonwealth and sentenced to periods of imprisonment ranging from nine months to 15 months, suspended for periods ranging from three years to five years during which, the family members are to be of good behaviour.

Predicate offence/s	Tax offences, illegal import of diamonds
Stage of Trade	Wholesale?
ML/TF Stage	placement, layering
Money/Trade flow	Belgium and Israel to Australia (trade), Australia to Israel & Sweden (money)

Case 18: *Laundering of tax fraud proceeds through the diamond industry*	
Types of financial/trade activities	Cash deposits, International transfers
Sums involved	AUD 42 Million
Red flag indicators	■ Use of account of a non-existing charity ■ Purpose of transaction (charity donation) does not correspond the activity of the account (diamond dealer) ■ Use of diamond dealer's family members to transfer funds
Source	Australia (response to collection plan, 2013)

METHOD 4: TRADE-BASED MONEY LAUNDERING AND CUSTOMS INFRACTIONS

Dealers in precious metals and precious stones are perhaps the only sector covered by the FATF 40 Recommendations in which all its activity is trade-related. By definition, almost all cases involving the use of diamonds relate to trade. Almost, since smuggling is an illegal activity outside the normal or routine trade and not part of it. Diamonds are a commodity traded worldwide through different distribution channels. This also applies to cases presented under the various methods and techniques presented in this part of the report. However, the cases presented under this method refer to specific techniques used to transfer funds through the financial system as part of a ML scheme under the guise of trade-related activity. These cases are less indicative of the characteristics of the diamonds as a commodity (diamonds as currency) or where diamonds are themselves the proceeds of crime as in the cases of theft and robbery) or where the account was just used to as a conduit to transfer funds without any reference to actual trade practices.

Some of the techniques produced by team members are known TBML techniques, such as over-valuation of the price of the traded goods as in the case provided by India, or misrepresentation of transactions as in the case provided by Israel where an "underground bank" activity was carried out under the guise of transactions misrepresented as import and export of diamonds. Where the ML activity in these two cases is conducted through trade centres and cutting and polishing centres, an additional case submitted by Sierra Leone illustrates the use of TBML in the mining sector.

As in previous cases presented, the amounts laundered in TBML cases can be huge and ML activity spans over a long period of time. In one of the cases submitted by Israel, the amounts laundered reach hundreds of millions of USD. The case presented by India exposes how through overvaluation diamonds were shipped at a value that was tens of millions of USD higher than the real value. This kind of overvaluation cannot be done in goods with a fixed or even relatively fixed price.

TECHNIQUE: ML THROUGH OVERVALUATION OF DIAMONDS

The case below submitted by India is a case of overvaluation the diamonds are exported at an extremely higher value than their real or market value. In the case of most products exported or imported, such gross overvaluation would not be possible. This kind of overvaluation cannot be done in goods with a fixed or even relatively fixed price. When the price or value of the goods shipped is more apparent, gross overvaluation may be more easily detected by customs authorities.

This case shows the level of manipulation which may be conducted through the diamond trade due to the specific characteristics of diamonds such as the very high value of the commodity and the lack of known and stable prices for diamonds which allows for the manipulation of price.

Case 19: *Overvaluation of Imports and Round-Tripping of Diamonds*[133]

Four importers of diamonds located in Surat and Mumbai imported 28 packages of rough diamonds, falling under Chapter 710231.00 of the Indian Customs Tariff Headings, from four Hong Kong, China-based suppliers. On investigation, these importers were found to have been involved in fraudulent imports by grossly overvaluing these goods to USD 544.8631 per carat, apparently with a view to transfer huge amounts of foreign exchange outside India. The goods were also not accompanied by valid Kimberley Process (KP) certificate, which is required under various regulations of the Government of India.

The consignments consisting of 28 packages of rough diamonds imported by India based importers with a declared value of **USD 98 951 493 (INR 4 880 million)** were placed under detention by Customs authorities. Subsequently, the Hong Kong, China-based exporting firms approached the Indian Customs to amend the declared value to **USD 353 328.45** (INR 17.4 million) which was not allowed by the Customs, as it appeared to be an afterthought in the light of the detention already made by the Customs. As per investigations conducted, there appears to be gross overvaluation of approximately Indian Rupees 4 860 million (USD 98.5 million) by the said companies.

All the four Hong Kong, China-based exporting firms appear to be registered in the name of the same proprietor who is an Indian national, and managed by another Hong Kong, China-based Indian national.

The table below shows the values declared before the Indian Customs and the value which was sought to be amended after detention of the goods by Indian Customs, as follows:

Name of Exporter	Original declared value (in USD) in Invoice	Value (in USD) as per revised invoice after the goods in question were detained by DRI	Difference in value (in USD)
A	24 489 997	84 787.36	24 405 209.64
B	24 585 844	90 090.07	24 495 753.93
C	21 282 561	72 906.30	21 209 654.70
D	28 593 090	104 544.75	28 488 545.25
	4538	2678.48	3857.52

Investigations have revealed that the 28 packages exported from Hong Kong, China appear to have been originally imported into Hong Kong, China from India at much lower value in the name of different Hong Kong, China-based firms. This suggests that the same diamonds have been round-tripped and brought back in India at an exorbitantly inflated price.

Further, the same four Hong Kong, China exporters have also exported 15 packages of rough diamonds at a declared value of INR 2 600 million (USD 47 million) to the same four importing firms earlier, which was cleared from Customs a week before the consignments of 28 packages were

133 Further discussion on round tripping in India was published by Chaim Even-Zohar in Evan-Zohar (2013). It was stated by Even-Zohar that a duty of 2% was put on polished diamonds import which significantly reduced this activity.

Case 19: ***Overvaluation of Imports and Round-Tripping of Diamonds***[133]

detained. The earlier consignments also appear to have been grossly overvalued and the same are also looked into by the Indian Customs.

Mr. XXX who is an authorised representative of all the four exporting companies in Hong Kong, China has earlier also come to the adverse notice of the Indian Customs in similar cases of overvaluation and circular trading of diamonds.

The investigation in this case is still going on and if the charges are proved, the offences are punishable with long imprisonment and fines.

Predicate offence/s	Fraudulent diamond import
Stage of Trade	Polished diamond trade
ML/TF Stage	-
Money/Trade flow	India to Hong Kong, China (trade) Hong Kong, China to India (Money)
Types of financial/trade activities	International transfers Export/import of polished diamonds
Sums involved	USD 98.5 million
Red flag indicators	■ Diamonds are grossly overvalued ■ Lack of valid KP certificates ■ Circular trading of diamonds ■ Proprietor and mangers of foreign counterparts Are both nationals ■ Average price per carat does not correspond to trade practices ■ Numerous counterparts are affiliated
Source	India (response to collection plan, 2013)

TECHNIQUE: PROVIDING MONEY SERVICES IN THE GUISE OF DIAMOND TRADE/USE OF FALSE INVOICES

The case below details the activity of an "underground bank" managed by a diamond dealer facilitating the transfer of large amounts of money to locations abroad to the request of the "bank's" customers. The activity is conducted by use of the diamond dealer's accounts and is declared by him to the customs and to the bank as an import and export activity, although no diamonds are being sent. In fact, these funds were received by him in cash which were then sent through his account abroad. In this manner, the diamond trade was used as a mean to transfer funds internationally through accounts of a diamond dealer. In many cases this was undeclared cash that was sent abroad so as to avoid paying tax.

Case 20: *"Underground Bank" in the guise of diamond trade*

Mr. A is a licensed diamond dealer and the owner of a designated diamonds account in a bank branch designated to serve the diamonds trade sector. In order to create import of diamonds documentation, required by the bank to conduct payment transactions, Mr. A entered Israel numerous times. He went through the customs "red Lane" and declared that he was importing diamonds purchased abroad ("by passenger" import), while actually carrying a parcel that contained low value, but good quality gems.

Later, every such shipment was presented by Mr. A in the designated customs station, operated by the Inspector of Diamonds in the Diamonds Exchange complex, for clearance. This was done after real diamonds were inserted in the shipment. There Mr. A claimed that the value of such a shipment exceeded several millions USD. Thus, A obtained a validated official importation statement from the customs which he used later at the bank to facilitate transactions abroad.

Mr. A presented the documents to his Bank together with fake invoices, to enable him to perform international foreign currency transfers to entities abroad in the guise of payment for the imported goods. Actually, these transfers did not represent any real high value acquisition of diamonds by A. The fake import was only done in order to produce the documents required by the bank to authorize the international transactions. These transactions were made to other countries for himself and other diamonds dealers wanting to receive funds abroad while avoiding questions by the bank and reports to IMPA concealing revenues and avoiding tax. Fictitious invoices were also issued to diamond dealers for the purpose of avoiding tax. In this manner Mr. A was providing money services for others of transferring funds abroad through his account in the pretence of a diamond import transaction, providing loans, discounting foreign currency checks and conversion of foreign currency.

According to open source information, indictments will be served against the entities involved, pending a hearing on suspicion of fictitious import, fictitious invoicing, tax offences and ML in amounts of many hundreds of millions of NIS (several hundred million USD).

Predicate offence/s	Smuggling/fictitious import, fictitious invoicing, unregistered MSB
Stage of Trade	Rough and polished trade
ML/TF Stage	Placement, layering
Money/Trade flow	-
Types of financial/trade activities	■ International transfers (out) ■ Physical transfer of diamonds/gems
Sums involved	Several hundred million USD
Red flag indicators	■ Frequent deposits of large FC cheques to a diamond dealer's account, particularly followed by large cash withdrawals ■ Unreasonable turnover for the diamond dealer ■ International transactions to entities not involved in the diamond trade ■ Use of fictitious documents
Source	Israel (response to collection plan, 2013)

TECHNIQUE: USE OF KP CERTIFICATE TO CONCEAL SOURCE OF ILLEGAL DIAMOND OR FOR ML PURPOSES

Case 21: *Illegal Trafficking in diamonds*

A shipment of rough diamonds arrived at Amsterdam Airport Schiphol (the Netherlands) from Dar Es Salaam, Tanzania. The airway bill indicated Brussels, Belgium, as the destination. The 2012 Kimberley Certificate (KC) specified Tanzania as the origin of the diamonds. A forensic investigation was carried out after shipment had passed and showed poorly legible stamps dating from 2007. The address of destination on the airway bill differed from the diamond dealer´s official address. It is not known whether the diamonds reached their final destination. If the KC was false, it is not possible to establish were the diamonds are coming from.

Predicate offence/s	Illegal trafficking in diamonds
Stage of Trade	Rough trade
ML/TF Stage	-
Money/Trade flow	Tanzania to Netherland (trade), Netherland to Belgium (trade)
Types of financial/trade activities	-
Sums involved	-
Red flag indicators	■ Shipment is not sent directly to destination ■ Forged KP certificate ■ Low invoice amount (possible undervaluation) ■ Fictitious legitimate origin ■ Address of destination on the airway bill differs from the Diamond dealer's official address.
Source	Netherlands

Case 22: *Operation Carbon' - Diamond fraud*

A report published by Partnership Africa Canada (PAC) in 2006 revealed a suspicion of "massive diamond fraud" in which almost half of Brazil's diamond export was fraudulent. According to PAC, the police raided three Brazilian cities in February 2006, resulting in the arrest of ten people – diamond miners, diamond dealers and money changers. Suspicions of fraud, tax evasion and ML were raised.

The case involved Mr A, a diamond dealer from Africa. Mr A was one of those arrested and was responsible for more than half of Brazil's diamond exports in 2004 (Ahmad's business exported some 54% of all Brazilian diamonds registered that year, according to Brazilian Federal Police documents). In 2005 PAC detailed a series of frauds involving one of his government-certified exports to Dubai. Mr A claimed to have purchased the diamonds from a company that in reality deals only in mineral pigments. Mr A further claimed that the diamonds had been mined in the space of seven days, from untouched ground – by a dead man (the report indicated that the sixth largest

Case 22: *Operation Carbon' - Diamond fraud*	
producer in Brazil was already dead and the fourth largest was a homeless). On top of all that, the diamonds were *undervalued* by more than USD million. Mr A's diamond smuggling operation, working under the legal cover of a company known as "Primeira Gema", used falsified documents to obtain legitimate Kimberley Certificates to obscure, or launder, the origin of his rough stones. The production statistics, the export numbers, and PAC's research all point to one conclusion: 50% of Brazil's diamond production and export was fraudulent or from highly suspect sources[134].	
Predicate offence/s	Smuggling diamonds, forgery of documents,
Stage of Trade	rough diamond trade
ML/TF Stage	-
Money/Trade flow	Brazil to Dubai (trade)
Types of financial/trade activities	-
Sums involved	-
Red flag indicators	-
Source	Open source: Partnership Africa Canada (2006a and 2006b)

TECHNIQUE: TBML THROUGH BUYING COMPANY AT THE MINING LEVEL

Case 23: *Laundering of drug trafficking proceeds through mining/buying company*	
A Foreign national registered a series of corporate vehicles including a diamond mining/ buying agency to facilitate the laundering of proceeds from alleged drug trafficking. The Law enforcement agency received a tip-off from Interpol of a possible drug trafficking ring involving the subject. Investigation revealed that the subject has received huge wire transfers of about USD 500 000 from a European country and there was no apparent justification for such proceeds. The diamond and other string of businesses were used as a cover-up to engage in more dubious business activities.	
Predicate offence/s	Drug trafficking
Stage of Trade	Mining
ML/TF Stage	Layering
Money/Trade flow	Europe (Money in)
Types of financial/trade activities	International transfers
Sums involved	USD 500 000

134 At the time Brazil suspended itself from the KPCS.

Case 23: *Laundering of drug trafficking proceeds through mining/buying company*	
Red flag indicators	Large international transfers with no apparent justification Foreign national registering numerous corporate vehicles
Source	Sierra Leone

METHOD 5: USE OF FINANCIAL HUBS AND FTZS

As mentioned at the start of this chapter, the cases that are presented here usually display more than one ML method or technique. Several cases already presented in previous chapters introduced the use of trade centres and financial hubs to launder illegally gained funds or diamonds. At the very least they presented some involvement or link to financial or trade hubs.

A significant feature of the cases below is the huge amounts of money or huge value of the diamonds laundered. The cases presented, mainly from open source information, show ML schemes amounting to ***billions*** of USD/EUROs, where the trade was conducted through trade centres such as the United Arab Emirates, Switzerland, Israel, Belgium and Panama. These cases also show additional offences committed such as smuggling, falsifying documents including invoices and large scale tax fraud. The cases show instances where the use of FTZs like Dubai or Geneva helps to lower tax payments and tax fraud, by registering the profit in the FTZ where tax levels are low.

One of the cases below (case no. 26) gives an example of the possible use of *courier services*, which form part of the industry providing services of secure transport of diamonds between different locations around the globe but also provide services as a customs agent sending and releasing diamond shipments from the customs authorities. These services were abused according to the case for smuggling, tax-evasion and ML. In another case Panama was used on the one hand as an emerging trade centre for diamonds linking the US were drug proceeds were generated and Colombia where the drug traffickers were located and as a FTZ on the other hand for the laundering of drug trafficking proceeds.

Case number 25 also illustrates a method in which the Kimberley process is circumvented by sending the diamond through the United Arab Emirates and then resending them with a certificate indicating an origin of multiple mining countries to facilitate the laundering of offences conducted in Belgium.

Case 24: *Diamonds trader involved in corruption, drugs and arms trafficking*

In 2011, a financial intermediary submitted an STR to Money Laundering Reporting Office Switzerland (MROS) concerning his client X who had made his fortune in the trade with diamonds and precious metals in Africa for counter-parts in the Middle East and the European Union. Initially, the assets were held in accounts of various branches of European banks in Switzerland. In 2004, X forwarded these assets to another foreign bank in Switzerland – which had filed the report to MROS.

Conducting research on the external database, the bank discovered that X and his company Y were subject to sanctions issued by the US authorities (OFAC Specially Designated Narcotics Trafficker Kingpin) for trafficking of weapons and drugs. X was also believed to be a member of a criminal organisation. A press article also suggested that X was involved in a case of arms trafficking,

Case 24: *Diamonds trader involved in corruption, drugs and arms trafficking*	
corruption of judges and ML in a country in South America - where he was known as a property developer. Analysis of MROS confirmed the suspicion of the financial intermediary and highlighted also other elements. Very important information was further obtained from the FIUs of other countries that have given the permission to transmit this information to the Swiss competent prosecution authorities.	
Predicate offence/s	Arms trafficking, Drug trafficking, Corruption
Stage of Trade	Rough trade (trade with diamonds in Africa)
ML/TF Stage	Layering
Money/Trade flow	-
Types of financial/trade activities	National transfers
Sums involved	-
Red flag indicators	■ Link to criminal organisations ■ Money transfer from various accounts to another account managed in foreign banks
Source	Switzerland (response to limited collection plan, 2013)

Case 25: *Laundering illegal diamonds through smuggling and financial hubs*	
Police in Antwerp investigated a massive diamond fraud in which a family smuggled diamonds worth an estimated EUR 1.3 billion over the course of several years. The family has not been named, and most of the income from the scheme is thought to have been exported to Lebanon. The investigation started with a warning from the state security service that the family had connections with known dealers in illegal diamonds. The diamonds were allegedly brought into Antwerp and the takings then exported, both undocumented, to evade huge sums in tax. The illegal diamonds, including stones originating from conflict zones (possible conflict diamonds) were mixed with legal diamonds and the whole shipment KPC indicated that the origin of the diamonds was from multiple mining countries. . The family managed to get around the Kimberley system by passing the stones through the United Arab Emirates and Switzerland before bringing them into Belgium. Meanwhile, the profits were laundered by means of false invoices and fake bookkeeping.	
Predicate offence/s	Smuggling diamonds, Tax evasion/Tax fraud, false invoices, fake bookkeeping
Stage of Trade	Rough trade
ML/TF Stage	-
Money/Trade flow	Lebanon (money in), Belgium (commodity in), United Arab Emirates (commodity in/out), Switzerland (commodity in/out)

Case 25: *Laundering illegal diamonds through smuggling and financial hubs*	
Types of financial/trade activities	
Sums involved	EUR 1.3 billion
Red flag indicators	■ Connections with known dealers in illegal diamonds ■ Documents seems to be forged
Source	Open source: Flanders today (2012)

Case 26: *Use of Companies in a FTZ - Diamond fraud*	
This case involves a large scale fraud which targeted 220 suspects. According to open source the fraud was estimated at EUR 800 million. The investigation concerned 220 individuals, including 107 diamond traders and companies charged with falsifying documents, ML and criminal conspiracy. The case centres on Company A, which once held a quasi-monopoly on diamond delivery, but which was closed down by authorities in 2005 after a courier was stopped with a huge sum of cash. Investigation suggested the company was using the *free trade zone* in Geneva, which is intended to simplify customs restrictions, to smuggle diamonds and escape tax. Swiss authorities cooperated and turned over more than 35 000 seized Company A shipping dossiers, which showed that diamonds supposedly for export, were instead rerouted to Antwerp to be sold on the black market. The 220 suspects have been identified from four fraud circuits used by Company A to launder money and avoid tax. In 2012, the case came to court. The prosecution charged 36 diamond companies and 96 people on various counts, main case being fraud. Eleven of Monstrey's employees were charged with running a courier service that transferred diamonds and jewellery without proper legal disclosure. The case presented to the court discusses EUR 66.7 million.	
Predicate offence/s	Tax fraud, forgery of documents, smuggling
Stage of Trade	Rough and polished trade
ML/TF Stage	-
Money/Trade flow	-
Types of financial/trade activities	-
Sums involved	EUR 66.7 million
Red flag indicators	Documents seems to be forged
Source	Open source: Flanders today (2013), International Diamond Exchange (2012)

Case 27: *Tax fraud and ML through financial/trade hubs*

Company D, a major market maker, came under investigation, and its executives fled Belgium, when an employee of the company revealed in 2006 how Company D had traded diamonds out of Africa for years, avoiding taxes by transacting deals through Dubai, Tel Aviv and Geneva, then moving the profits back to Belgium. The former employee is a native of Belgium with Israeli citizenship who has also spent years in Africa and Southeast Asia.

The charges allege that Company D traded diamonds out of Angola and Congo over a period of years, avoiding tax by moving the transactions through Dubai, Switzerland and Israel. Representatives from the company allegedly earned billions of Euros by buying diamonds cheaply on the black market in Angola and the Democratic Republic of the Congo. They then traded the stones to companies in Dubai, Tel Aviv and Geneva for profit and laundered the proceeds. Later they sold the diamonds to companies in Belgium, in price only slightly larger than they paid in Dubai and Geneva – so they paid tax in Belgium only on the gap between these rates were systematically neglected.

Officials who investigated the case believe that Company D did not declare considerable amounts of its profits and moved cash overseas. It is believed to have laundered money through a complex scheme of around two dozen firms and banks around the world managed by family members of the two key suspects.

Early This year it was published that in a settlement between Company D and the Belgian authorities Company D has agreed to pay a sum of EUR 150 million.

Predicate offence/s	Fraud, Tax evasion/Tax fraud
Stage of Trade	Rough diamond trade
ML/TF Stage	-
Money/Trade flow	■ Angola (commodity out), Congo (commodity out), Dubai (commodity in/out), Tel Aviv (commodity in/out), Geneva (commodity in/out), Belgium (commodity in/out) ■ Dubai (money in/out), Tel Aviv (money in/out), Geneva (money in/out), Belgium (money in)
Types of financial/trade activities	International transfers
Sums involved	EUR 2 – EUR 3 billion
Red flag indicators	Many firms and bank accounts are opened by family members
Source	Open source

Case 28: *Laundering drug proceeds through a wholesale jeweler located abroad*

More than USD 40 million worth of gold, silver and jewellery forfeited in international ML case.

US indictment of an offshore business engaged in the illicit black market peso exchange, an ML operation through which narcotics proceeds earned in the United States are exchanged for Colombian pesos and then used to purchase goods in the *Colon Free Zone in Colon, Panama*. During the course of the investigation, two natural persons were identified as major money launderers based in Panama. The two used a wholesale jewellery business, engaged in the sale of gold and silver jewellery and precious metals to many retail and wholesale customers throughout Central and South America and in Europe and the Middle East, and a related company to facilitate their illegal ML activities.

Based on a joint investigation conducted by the US and Panama, the natural persons and the related companies were charged with laundering millions of dollars in narcotics proceeds through the said companies in Panama.

According to evidence presented in the case, drug proceeds from the United States were sent to Panama through cash pick-ups, wire transfers, cashier's checks and third party bank checks. Through the companies, which together did more than USD 100 million in business annually, the two natural entities knew that the primarily South American-based customers were laundering millions of dollars in drug money from the United States through bulk purchases of jewellery. According to court documents, the companies were heavily involved in the black market peso exchange.

On 17 May 2006, a US District Court Judge signed a final order of forfeiture directing that the government of Panama transfer custody of the assets seized in Panama to the government of the United States. The assets transferred to the United States include approximately 468 boxes of gold and silver jewellery, as well as gemstones and watches, weighing ten tons, seized from the wholesale jewellery company.

From the judgment:

"*A primary modus was to sell jewellery to drug lords, knowing that it was being paid for with drug money, thus allowing them to convert dirty money into glistening clean jewellery.*"

Predicate offence/s	Drug trafficking
Stage of Trade	Wholesale
ML/TF Stage	Placement and layering
Money/Trade flow	■ United States to Panama (Money) ■ Panama to Colombia (Jewellery)
Types of financial/trade activities	■ Cross-border cash pick-ups, wire transfers, cashiers checks and third party bank checks ■ USD exchanged to Colombian pesos
Sums involved	USD 40 million worth of jewellery forfeited

Case 28: *Laundering drug proceeds through a wholesale jeweler located abroad*	
Red flag indicators	■ Use of cashier's checks and third party bank checks to purchase jewellery ■ Deposit of cashier's checks and third party bank checks to an account managed by a wholesale/retail jeweler. ■ Unusual international transaction/checks in large sums transferred/ deposited to a wholesale/retail jeweler ■ Funds are transferred from a different country than the commodity is sent to

METHOD 6: SMUGGLING OF DIAMONDS AND CASH

Diamonds are smuggled into jurisdiction for several purposes:

a) Sale of illegally gained diamonds or jewellery, either by illegal mining, by theft or robbery or by criminals accepting diamonds as forms of payment and laundering them through smuggling abroad.

b) Hide value and store wealth in another jurisdiction thus avoiding confiscation.

c) As part of a ML scheme to sell diamonds and jewellery bought with proceeds of crime.

d) As part of a TF scheme were diamonds are bought with clean money with a purpose to finance terrorist organisations.

Cases regarding smuggling of diamonds were provided by a majority of team members: Australia, Austria, Belgium, Canada, Israel, the Netherlands, Russia, Sierra Leone, South Africa and the United States. Open source information provides additional examples of instances were smuggling of diamonds occurred in Brazil, South Africa and Israel. These cases provide a clear indication that the illegal trade exists. Within the framework of this report it is not possible and outside the scope of this project to establish the extent of the illegal trade. However cases provided by team members, discussions held at team meetings and open source information indicate that illegal trade is a significant problem. Illegal trade may facilitate all the purposes detailed above.

Two cases also show the smuggling of cash by diamond dealers. Cash transactions are part of the diamond trade. In instances where the trade is used to launder illegally gained funds, cash transactions may also be used. Smuggling of cash may be part of a ML scheme, or may also be done as part of a scheme to avoid tax payments.

Case 29: *Trafficking of illegal diamonds and jewellery*
Mr. N, an Indian national who arrived on a flight from Dubai, was stopped for customs inspections by officials at a Moscow airport while attempting to pass through the Green Corridor for passengers who have nothing to declare. The ensuing luggage inspection and body search produced several pieces of jewellery (pendant and earrings) and a total of 30 401 natural diamonds valued at RUB 4 691 047, all of which were confiscated.

Case 29: *Trafficking of illegal diamonds and jewellery*	
Predicate offence/s	Smuggling diamonds
Stage of Trade	Illegal rough trade, illegal jewellery trade
ML/TF Stage	-
Money/Trade flow	United Arab Emirates to Russia
Types of financial/trade activities	Physical transfer of diamonds
Sums involved	RUB 4 691 047
Red flag indicators	-
Source	Russia (response to collection plan, 2013)

Case 30: *Smuggling polished diamonds*	
South African police have arrested a man who they say swallowed 220 polished diamonds in an attempt to smuggle them out of the country. The man was arrested as he waited to board a plane at Johannesburg airport. Officials said a scan of his body revealed the diamonds he had ingested, worth USD 2.3 million (GBP 1.4 million; EUR 1.8 million). The man was travelling to Dubai. According to the information, authorities believe the man belongs to a smuggling ring. Another man was arrested in March also attempting to smuggle diamonds out the country in a similar way.	
Predicate offence/s	Diamond smuggling
Stage of Trade	-
ML/TF Stage	-
Money/Trade flow	South Africa – Commodity Out Dubai – Commodity In
Types of financial/trade activities	-
Sums involved	USD 2.3 million
Red flag indicators	-

Case 31: *Trade in illegal diamonds*	
A Diamond Exchange has blown the whistle on one dealer who seems to be actively engaged in trading with Venezuela. The dealer, who was claiming to represent the diamond exchange, said that he was a member of the another Diamond Exchange and the WFDB. It was said that he had even submitted a request, in the name of the diamond exchange, for the government of Panama to declare his business premises as a 'Free Zone'". In the absence of official Kimberley Certification, Venezuelan rough diamonds sold by the dealer in the diamond exchange are illegal.	
Predicate offence/s	Smuggling diamonds, forgery of documents
Stage of Trade	Rough diamond trade
ML/TF Stage	-
Money/Trade flow	Venezuela to Panama (suspected smuggling)
Types of financial/trade activities	-
Sums involved	-
Red flag indicators	lack of KP certificate for rough diamonds or indication that the certificate is forged
Source	Open source: Tacy Ltd (2008)

Case 32: *Diamond smuggling network*	
An investigation of a suspected tax evasion case of a woman who operated a small kindergarten led to the discovery of a diamond smuggling network. According to the tax authorities the network operated in Israel, Belgium and Russia. During the kindergarten inquiry, investigators found that the owner's husband had travelled abroad 245 times in the past eight years, on trips that usually lasted just two days. During the investigation, 15 men and women were arrested, all suspected of being involved in the smuggling ring. The suspects were relatives who have allegedly carried out more than 500 such diamond operations in a value of hundreds of thousands of USD and were paid USD 600 per trip plus travel expenses. Among the suspects are hi-tech executives and an education advisor. The report adds that the diamonds were hidden inside "private" body parts.	
Predicate offence/s	Smuggling
Stage of Trade	-
ML/TF Stage	-
Money/Trade flow	■ Russia to Israel, Belgium to Israel (illegal trade) ■ Israel to Belgium, Israel to Russia (illegal trade)
Types of financial/trade activities	-

Case 32: *Diamond smuggling network*	
Sums involved	Hundreds of thousands of dollars
Red flag indicators	■ Family members involved ■ Frequent travels abroad
Source	Open source: Haaretz (2008

TECHNIQUE: CASH SMUGGLING BY DIAMOND DEALER

Case 33: *Cash smuggling by an employee of a diamond company*	
An employee of a Diamond company was found in possession of large amount of cash on the way from South Africa. The cash was found hidden. The suspect failed to satisfactorily explain the source of the cash. The cash was confiscated and the suspect was charged with contravening the Prevention of Organized Crime Act, 2004 (Act No. 29 of 2004). Further net worth analysis is being conducted on the suspect.	
Predicate offence/s	Customs infractions
Stage of Trade	-
ML/TF Stage	-
Money/Trade flow	South Africa to Namibia (money)
Types of financial/trade activities	Physical transfer of cash
Sums involved	-
Red flag indicators	Cash transactions conducted by an employee of a diamond company
Source	Namibia (response to collection plan, 2013)

Case 34: *Smuggling of cash by a diamond dealer and international transfers from entities not related to the diamond trade through a Diamond Dealer account*
Person A was caught by customs upon leaving the country, carrying cash in an amount higher than the amount he actually declared. Further inquiries made by the Israel Money Laundering Prohibition Authority (IMPA) revealed many UARs according to which person A was involved in several companies operating in the diamond trade. The inquiries also revealed that person A made thirteen customs declaration with reference to trans-border foreign currency transfers made by him between the years 2003-2008. The declarations showed discrepancies and errors in the data provided by person A in the declaration forms e.g., omission of letters from his name, misrepresentation of his ID number, illegible data, insertion of his passport number in place of ID number, in a manner that render the relevant data almost impossible for collation and retrieval. Person A's bank transactions were matched with dates of his exits and entries from\to the country.

Case 34: ***Smuggling of cash by a diamond dealer and international transfers from entities not related to the diamond trade through a Diamond Dealer account***

This showed additional instances where a few days after his arrival to the country a foreign currency deposit in a sum higher than the declaration threshold was made to his bank account without person A submitting a currency declaration to the customs during his entry to the country.

Moreover, STRs regarding Designated Diamonds Accounts of companies that A was connected to showed that the banks reported the transfers of value for exports from a foreign entity that was not known to be a trader in diamonds. The name of the entity was similar to names of an MSB. IMPA submitted a request for information to another FIU that confirmed the suspicion that the creditor company was known as a money services bureau.

This affirmed the suspicion that A used his Designated Diamonds Accounts as a "pipeline" to perform large foreign currency transfers, posturing as payments related to diamonds export / import activity.

Person A was brought before a sanctions committee which decided on imposing a financial sanction of ILS 80 000. After an appeal the amount was reduced to ILS 7 500.

Predicate offence/s	Cash smuggling
Stage of Trade	-
ML/TF Stage	Placement and layering
Money/Trade flow	-
Types of financial/trade activities	Cash deposit, International transfers
Sums involved	-
Red flag indicators	■ Discrepancies and errors in provided data (customs declaration) ■ Proximity between entering to the country and deposits of foreign currency to the account ■ Deposits of foreign currency to a diamond dealer's account without customs declaration about entering money to the country ■ Transactions in a diamond account to/from money service business
Source	Israel (response to collection plan, 2013)

METHOD 7: LINK WITH OR USE OF GOLD AND/OR OTHER PRECIOUS STONES TRADE

Several cases presented above display a link between ML through diamond and ML through other precious stones and/or gold. Since the project initially focused on both diamond and other precious stones, relevant cases were provided before the scope of the project was narrowed down to diamonds only. Few additional cases display similar links. This is just an initial indication that gold and/or other precious stones are used in ML schemes. Further research is required to understand

the characteristics of the trade in these commodities and to establish their vulnerabilities to ML and TF and the extent they are used in practice for ML and TF purposes.

Case 35: ***Link between proceeds of drug trafficking and diamond jewellery used as currency***	
This case involves a drug courier/trafficker who was found carrying CAD 40 000 worth of drug money. The courier's cash bag also contained a quantity of *diamond* jewellery and loose *sapphire gemstones* that collectively were valued at CAD 60 000. The jewellery had been appraised by a third party. The appraisal value listed the jewellery for its cash value if it were sold as wholesale (just below wholesale). (Aside for the appraisal obtained, the jewellery trade is not as yet being engaged in this case as the diamonds/gemstones is being used between criminals as an alternate currency).	
Predicate offence/s	Drug trafficking
Stage of Trade	Appraisal
ML/TF Stage	-
Money/Trade flow	-
Types of financial/trade activities	Physical transfer of cash Physical transfer of diamond jewellery
Sums involved	CAD 60 000
Red flag indicators	■ Request for an appraisal for high value jewellery where source of stones is not clear ■ A customer (not a diamond dealer or a jeweller) requests wholesale price on jewellery he tries to sell.
Source	Canada (response to collection plan, 2013)

CHAPTER 9.
TERRORIST FINANCING THROUGH TRADE IN DIAMONDS[135]

Only a few cases were provided by team members with regard to TF related to the trade in diamonds. Additional information based on SAR analysis was provided by Canada and the United States. The SARs and one of the cases provided by the United States are related to the Lebanese-Canadian bank (see case 37 below). While indications of involvement of terrorist organisation in the diamonds trade may be traced in open source information[136] such indication are at this point limited to the cases received from team members[137].

TECHNIQUE: CAPITAL INCREASE TO SUPPORT A TERRORIST NETWORK

Case 36: *Capital increase to finance terrorism*

The Belgian FIU CTIF-CFI, received a disclosure from an auditor regarding company A. He noticed that Mr. X, manager of company A, carried out a capital increase of several million EUR. The auditor found it suspicious that the origin of the funds was unknown. Moreover, company A appeared to be a dormant company.

Apart from a disclosure by the auditor, the notary executing the deed and the bank holding company A's account also disclosed these facts to CTIF-CFI. Through the capital increase by means of a contribution in kind Mr. X obtained a majority interest in company A.

Mr. X was a candidate refugee from the Middle East. Company A was a night shop, which is considered to be a sensitive business with regard to TF. Multiple cash deposits were carried out on company A's account. Mr. X was known to the police for ties with a terrorist organisation. He was suspected of employing illegal foreigners and using the night shop's profits to finance terrorist activities. Part of the night shop's profits was sent to the Middle East to support a terrorist network.

Furthermore, certain elements revealed a link between the invested funds and conflict diamonds of terrorist groups. This reinforced the serious indications of TF.

Predicate offence/s	Terrorist Financing, trade in conflict diamonds

135 FIU sanitized cases, Law enforcement, open source cases / investigation.

136 In April 2003 global witness published a report claiming to present "evidence that confirms that Al-Qaeda has been involved in the rough diamond trade since the 1990s. Firstly in Kenya and Tanzania and then in Sierra Leone and Liberia, where they began to show an interest in diamond trading in 1998, following the crackdown on their financial activities in the wake of the US embassy bombings in Kenya and Tanzania." See Global Witness (2003).
Additional information was published in: Republic Of Liberia Truth And Reconciliation Commission (2009), *pp.* 30.
See also Farah, Douglas (2005): "Diamonds have also been used extensively by Hezbollah and other terrorist groups in the Middle East that have a long tradition of access to diamonds in West Africa ".

137 Two cases were also provided in FATF (2003) typologies report which included a section on diamonds.

Case 36: *Capital increase to finance terrorism*	
Stage of Trade	Wholesale
ML/TF Stage	-
Money/Trade flow	Europe to the Middle East (Money)
Types of financial/trade activities	Cash deposits, capital increase
Sums involved	Millions of EUR
Red flag indicators	■ Unknown origin of funds ■ Use of a dormant company ■ Use of sensitive business (night shop) ■ Multiple cash deposits followed by international transfers ■ Link with terrorist organisation
Source	Belgium (response to collection plan, 2013)

TECHNIQUE: USE OF LEGITIMATE BUSINESSES

Similar to regular ML cases, legitimate businesses are often used as a cover to funnel funds to terrorist organisations. The involved entities are also using money coming from diamonds smuggling or drug trafficking to support these organisations.

Case 38 is an open source case and therefore has few indicators on the *modus operandi*. Although there were indications of terrorist support in the United States, the main subject wasn't convicted for this in Belgium.

Case 37: *Car businesses to transport value*
An investigation by the Drug Enforcement Administration (DEA) and other federal law enforcement agencies discovered a scheme to launder money through the United States financial system and the United States used car market. As part of the scheme, funds are transferred from Lebanon to the United States in order to purchase used cars, which were are shipped to West Africa and sold for cash. Cash proceeds of these car sales are then transferred, along with the proceeds of narcotics trafficking and other crimes, to Lebanon. The cash is often moved through bulk cash smuggling. In 2012, the US District Court-Southern District of New York (SDNY) issued a civil ML complaint and "in rem" forfeiture action involving a number of Lebanese financial institutions and exchange houses. The SDNY civil complaint stated that prior to being identified as an entity of primary ML concern by FinCEN in a Section 311 (of the U.S.A. Patriot Act) Action, Lebanese Canadian Bank (LCB) had poor anti-ML controls and, indeed, knowingly conducted business with Hizballah-controlled entities and individuals and entities linked to, among others, African diamond smuggling, ML, and narcotics trafficking. The SDNY civil complaint also mentioned that the LCB maintained a banking relationship with individuals and entities involved in the African diamond smuggling trade. In all, hundreds of millions of USD a year went through the accounts, held mainly by Shiite Muslim

Case 37: *Car businesses to transport value*	
businessmen in West Africa, many of them known Hezbollah supporters, trading in everything from **rough-cut diamonds** to cosmetics and frozen chicken, according to people with knowledge of the matter in the United States and Europe. The companies appeared to be serving as fronts for Hezbollah to move all sorts of dubious funds, on its own behalf or for others. The system allowed Hezbollah to hide not only the sources of its wealth, but also its involvement in a range of business enterprises.

Source	The United Sates (response to collection plan, 2013) Open source: The New York Times (2011)

Case 38: *Cover companies to transfer money*
The U.S. Department of the Treasury designated Kassim Tajideen and Abd Al Menhem Qubaysi, two Africa-based supporters of the Hezbollah terrorist organisation. Under E.O. 13224. E.O. 13224 targets terrorists and those providing support to terrorists or acts of terrorism by freezing any assets the designees have under US jurisdiction and prohibiting U.S. persons from engaging in any transactions with them. Kassim Tajideen is said to be a financial contributor to Hezbollah who operated a network of businesses in Lebanon and Africa. He has contributed *tens of millions of dollars* to Hezbollah and has sent funds to Hezbollah through his brother, a Hezbollah commander. In addition, Kassim Tajideen and his brothers run cover companies for Hezbollah in Africa. In 2003, Tajideen was arrested in Belgium in connection with fraud, ML, and diamond smuggling. Abd Al Menhem Qubaysi was a Cote d'Ivoire-based Hezbollah supporter and was the personal representative of Hezbollah Secretary-General Hassan Nasrallah. Qubaysi communicated with Hezbollah leaders and has hosted senior Hezbollah officials traveling to Cote d'Ivoire and other parts of Africa to raise money for Hezbollah. Qubaysi played a visible role in Hezbollah activities in

Case 38: ***Cover companies to transfer money***	
Cote d'Ivoire, including speaking at Hezbollah fundraising events and sponsoring meetings with high-ranking members of the terrorist organisation.

Source	Terrorist financing, fraud, ML and diamond smuggling

Canada submitted three cases which were linked to a listed terrorist organisation in Canada. The first case involved several jewellery businesses, some of which were suspected of sending funds to the terrorist organisation. Some of the jewellery businesses were located in Canada, as well as in two foreign jurisdictions (hereafter referred to as Country A and Country B).

The similarity of the business names, and the fact that many were registered and operating at the same address, made it challenging to follow the flow of funds. Some of the businesses ordered funds to the benefit of other jewellery businesses located in Country A and two other jurisdictions.

Another case involved an STR that was reported on a jewellery business that is believed to support a listed terrorist organisation in Canada. Again, this case involved similar jewellery business names registered and operating from the same address. The jewellery business ordered funds from Canada to the benefit of other jewellery entities in Country B.

One final case connecting the diamond industry to potential terrorist financing activities is that of an individual who was intercepted by foreign authorities with diamonds. According to the case, it was suspected that the individual was acting on behalf of a terrorist organisation.

In the framework of a SAR analysis, the United States also submitted several SARs that reported suspected terrorist financing activities, including overall transactions totalling over ***USD 3 billion***. The SARs appear to report newly identified transactions involving activities that occurred as long as 10 years ago involving individuals who have since been designated as terrorists by the US Department of the Treasury, Office of Foreign Assets Control (OFAC). Others reported newly identified transactions involving now-closed Lebanese banks that enabled Hezbollah fundraising transactions.

CHAPTER 10.
MONEY FLOWS RELATING TO SUSPECTED ML/TF RELATED TO THE DIAMONDS INDUSTRY

Some limited information was collected for the study on money flows pertaining to suspected ML/TF, as they relate to the diamond industry. Information is particularly scarce with regard to TF, where flows are typically quite small. Many countries noted that they have reported very few suspicious transactions to their FIUs involving the trade of diamonds and other precious stones.

Some overall trends can be noted, however, and in some countries, typical financial flows can be discerned through sanitised cases and reports from FIUs.

Generally, there has been a trend away from purely cash transactions, likely due to ML/TF requirements in the precious stones sector introduced several years ago. The most commonly used methods of payment by precious stones dealers are cash deposits and national and international transfers. Many countries noted funds transfers to high-risk countries, including those where a significant diamond trade does not exist. Multiple cross-border transfers enable layering of transactions to take place.

Where countries provided information on money flows pertaining to suspected ML/TF as they relate to the diamond industry, it is included below.

Australia did not provide aggregate information on suspected illicit financial flows; however, its case studies included an example whereby funds (primarily resulting from undeclared and untaxed cash from business earnings) were transferred from Australia to Israel under the guise of charitable donations. The transfers also involved the proceeds from the cash sale of diamonds to bank accounts in Israel and Sweden; the accounts were linked to merchants in Israel and Belgium. Another example cited by Australia involved financial flows relating to a money exchange business operating in South-East Asia.

Belgium provided significant analysis on money flows related to ML. A trend was noted whereby diamonds and funds formerly flowed from Africa directly to Antwerp; however, more recently both diamonds and funds transit through the United Arab Emirates. Financial flows in 105 disclosures of cross-border cash movements involving diamonds show that the majority of the funds were physically transported to Belgium from Congo (DRC); Hong Kong, China; Japan; and Thailand. The main countries of destination were France; Guinea; Hong Kong, China; Italy and South Africa. With regard to suspected trafficking of diamond cases in 2011-2012, the majority of funds were transferred internationally to Belgium from accounts from Hong Kong, China; India; Israel; the United Arab Emirates and the United States. Nearly 60% of funds were transferred to United Arab Emirates and Switzerland from Belgium. In other cases of suspected ML related to diamonds (predicate offences besides illicit trafficking of diamonds), the financial flows were mostly transfers in USD sent from India, Israel and Switzerland to the United Arab Emirates. Belgium also noted the

use of numbered[138] accounts in foreign countries (Liechtenstein and Switzerland) to conceal transactions. A major problem is the identification of the actual/principal beneficiary of incoming or outgoing international transfers on the account of diamond companies.

In Canada, diamond money-laundering schemes appear to frequently relate to drug trafficking. Illicit financial flows are most often between Canada and the United States. Other countries include Belgium, Cambodia, China, Israel, Panama and Switzerland.

India reported a relatively large number of sanitised cases (12) in which suspicious transaction reports were received. In these specific cases, Hong Kong, China is a destination for illicit cash flows related to the diamond trade.

Israel reported that international bank transfers were the most common method of payment used. In the case of unusual activity reports (UARs), major financial transfers occurred from Switzerland (28% of the total amount), Cyprus (15%) and Hong Kong, China (13%). Some of the countries sourcing funds (*i.e.,* Cyprus, Panama) do not appear in the customs export data. This means that funds are coming from countries to which diamonds are not exported. According to reports disseminated to law enforcement, major amounts come from Belgium (52%), United States (28%) and Great Britain (15%). Among the reported countries of destination, major amounts are going to China (30%); United States (26%); Hong Kong, China (20%); and Switzerland (10%).

Namibia identified South Africa and ZAR currency transactions as being the most commonly used.

The Netherlands noted that it is a transit country for diamonds into and out of the European Union, because diamonds are transported by airplane and Schiphol airport offers a wider range of destinations. Nonetheless, it had very few cross-border transactions relating to diamonds reported as suspicious.

The Russian Federation only cited examples where the predicate offence involved the smuggling of diamonds, notably from Dubai and Thailand. However, one case pertained to a company specializing in the unauthorised distribution of diamonds, the proceeds of which were transferred to the bank accounts of foreign companies in Israel and Hong Kong, China.

In the United States, diamond money laundering schemes appear to frequently relate to the trafficking of drugs and stolen goods. The United States noted that, based on their SAR analysis, no significant specific trends or patterns appeared to be particularly unique to diamond trading. The examined SARs revealed patterns of incoming and outgoing wire transfers involving multiple and regionally diverse countries that often appeared as points of transaction origin, destination, transit, a suspect's domicile, and/or location of foreign-based financial institution accounts. These include:

- Angola
- Austria
- Botswana

[138] A numbered bank account is a type of bank account where the name of the account holder is kept confidential, and they identify themselves to the bank by means of a code word known only by the account holder and a restricted number of bank employees, thus providing accountholders with a degree of bank privacy in their financial transactions.

- Belgium
- Brazil
- British Virgin Islands
- Canada
- Czech Republic
- China
- India
- Israel
- Latvia
- Lebanon
- Liechtenstein
- Mauritius
- Panama
- Peru
- Portugal
- Russia
- Sierra Leone
- St Vincent and the Grenadines
- Switzerland
- The United Arab Emirates
- The United Kingdom
- The United States

In the United States, diamond money-laundering schemes appear to frequently relate to the trafficking of drugs and stolen goods.

CHAPTER 11.
MAIN FINDINGS

Diamond trade, as an international phenomenon, needed a complete and global analysis to understand and determine ML and TF threats and vulnerabilities related to this unique trade. This report has aimed not only to provide a general overview of the diamond trade with its specific business practices, funding methods and risks, but also seeks to highlight a number of significant issues that require further consideration. The report has identified different issues that require consideration as to the sufficiency of the current measures mitigating new risks (see next chapter for issues for consideration).

In the process of this project, a sample of 17 countries submitted contributions. All contributions have been relevant to the project and have helped to address the questions that were raised at the beginning of this project.

TRADE PRACTICES AND FIGURES

344. Some important changes within the trade practices were identified such as a reduced use of cash, the appearance of new trade centres like China, India and the United Arab Emirates, Botswana becoming a trade centre due to the move of De Beers from London to Gaborone, De Beers no longer being an all-inclusive monopoly opening the diamond industry to more trade actors, an increase in interest from several diamond producing countries in diamond beneficiation, the emergence of synthetic diamonds and the Internet as a new trade platform for diamonds.

345. KP public statistics and other open sources provided a general overview of the trade in rough and polished diamonds. These figures show that almost 80% of the mining activity is concentrated in the Botswana, Canada, Democratic Republic of Congo, Russian Federation, Zimbabwe and that China, after India, is becoming a major cutting and polishing centre. In 2012, Belgium, Israel, Switzerland and the United Arab Emirates were the main trade centres for rough diamonds and the United States had the largest consumer market for polished diamonds (jewellery). What stands out from the figures is the change in the role played by the United Arab Emirates, and its significance in terms of the worldwide rough diamond trade and indications on the role it might have on ML/TF activity.

LEGISLATION AND REGULATION

Diamonds have been recognised by the FATF as vehicles for laundering the proceeds of crime and therefore diamond dealers were included in the definition of Designated Non-Financial Business and Profession (DNFBP). Specific attention goes out to the fact that Recommendation 22 on customer due diligence for DNFBPs and Recommendation 23 on other measures for DNFBPs are only based on cash transactions. All other transactions in which diamond dealers are or could be engaged in are not covered. With regard to Recommendation 32 it can be stated that diamonds are not included in the definition of currency or bearer negotiable instruments. Therefore, countries are not required to have measures in place to detect the physical cross-border transportation of

diamonds through a declaration/disclosure system, even though cases show considerable use of cross-border value transfer via the use of diamonds.

Although specific FATF Recommendations are applicable to diamond dealers, several countries have not yet implemented these in their national AML/CFT legislation. In those countries that do have national AML/CFT regulation on diamond dealers, the overall compliance of the sector is assessed to be medium. Only in a few countries are licences and registration required for business activity in the diamond trade. Although there are supervisory authorities, no sanctions were imposed in the last two years, an indication of the low level of enforcement in the sector.

348. Cross-border transportation of diamonds falls under customs control. There are some major differences between countries, especially on polished stones. In most of the countries there are no specific import export controls on diamonds and none of them have specific AML/CFT requirements where one has to declare diamonds when entering/leaving the country.

FUNDING OF THE TRADE

The trade is primarily funded by financial institutions such as banks. Several countries have specialised diamond banks or designated divisions or branches that diamond dealers must use for doing business and/or that provide financial services to them. In most countries, the banks and credit institutions do not apply special “know your customer” or due diligence procedures to diamond dealers. The main methods of payment used by diamond dealers are wire transfers or electronic funds transfer. The use of cash is still a common method of payment in the diamond business in countries where cash is widely used such as in mining centres like some African and Latin American countries, or in trade centres like Hong Kong, China.

THREATS, VULNERABILITIES AND RISKS

The different and unique characteristics of diamonds and the diamond trade make the industry vulnerable to ML and TF. The diamond supply chain in all of its stages, from production to consumption, can be the gateway to profitability, for laundering proceeds of crime, for ML and for moving proceeds of crime into the financial system. It is important to keep in mind that the complexity of the international diamond trade means that the ML and TF vulnerabilities and risks may differ from one segment of the "pipeline" to another and from one jurisdiction to another. For example whereas mining countries are facing the threat of illegal mining, trade centres are more vulnerable to transfer pricing. Cutting and polishing centres have to be more aware of the fact that diamonds become untraceable. Retailers are faced with other criminals that use their business to launder their proceeds of crime. Nonetheless theft, commingling and smuggling of diamonds can occur at all stages of the trade.

Diamonds can be used to earn, gain or store value, and are easily moved or smuggled. Their low weight, very high value, high durability, exchangeability for other commodities, ability to remain undetected, changeability, unsteady price and the ease in which they can be traded outside the formal banking system are just some of the characteristics that make them vulnerable to ML/TF and other crimes such as theft.

The fact that diamonds are used as an alternative currency by criminals who use them to acquire other goods (such as tobacco, guns, and drugs) is important to note, since diamonds are not included in the concept of cash/currency or a bearer negotiable instrument (FATF Recommendation 32). The emphasis on cash transactions (Recommendation 22) only and the fact that several countries have not yet subjected diamond dealers to AML/CFT legislation causes major vulnerability in international and national legislation. Cases show that criminals are taking advantage of this vulnerability. Few compliance assessments on diamond dealers have been carried out, no fines have been issued and no other AML/CFT civil enforcement actions have taken place in the last two years. Enforcement of the diamond sector is also exposed to a degree of vulnerability due to limited awareness of the sector, lack of evidence to collect and difficult international police cooperation. The low number of successful cases that were reported to judicial authorities or brought before court can be seen as a major vulnerability in the prevention of ML/TF. All these figures show low levels of enforcement which may be the outcome of the complexity of the industry, traditional ethics of trust of within the sector and the lack of sufficient expertise of relevant regulating and law enforcement bodies.

The concerns related to KP certificates are the fact that current enforcement efforts related to diamonds are directed more at ensuring compliance with the KPCS rather than preventing smuggling, fraud, or ML; there is no transparency for controlling officers at the border; the ease with which new KP certificates can be issued by authorities and the requirement of KP certificates only for import and export of rough diamonds alone. In this respect the KP certificate might also serve unintentionally as a ML tool since the existence of the certificate may signify that the source is legitimate overlooking ML/TF considerations. It should be considered that the localization of the beneficiation process may be a possible way to circumvent the purpose of the KP since exports will turn to be more of polished diamonds where KP certificates is not required.

In earlier studies, diamonds were also identified as goods that are more susceptible to TBML due to the difficulty in identifying the true value of the goods. The diamond industry is tremendously vulnerable to TBML primarily because of the high subjectivity in the valuation of diamonds, the ability of diamonds to change their form, the trade-based and global nature of the diamond market, the high value of the product which may facilitate large scale ML/TF and the long production chain involving many actors. In some countries the tariff for customs declarations is based only on carat, which creates a gap within the export/import systems which may be easily exploited for over/under valuation while making it hard to establish whether there is an infringement of customs laws and regulation.

The Internet, being a relatively new trade platform, not only entails vulnerabilities that may be applicable to all sales and purchases on the Internet (fraud with online rough diamond sale) but also create specific vulnerabilities related to KYC/CDD measures. Not only the increased anonymity of the customer but also the fact that almost all payments are facilitated through banking and credit institutions or Internet payment means (which are not covered by FATF Recommendation 22) make it harder to conduct and enforce proper KYC/CDD procedures and conduct investigations if such a case arise. Another upcoming technique is the laundering of stolen diamonds via the 'Darknet', where jewellery with diamonds is sold on the 'silk road' using e-currency such as 'bitcoin'.

With regard to the financing of the trade, several vulnerabilities and risks appear. Advance payments, return shipments, fork transactions, deficiencies in the KYC procedure, the use of cash, consignment agreements and promissory notes create opportunity for ML/TF.

Although cash is diminishing for large-scale business to business (B2B), cash usage still poses a risk for ML/TF in the diamond trade. At retail level, where cash is a frequent means of payment, not all countries have proper AML/CFT legislation to report cash transactions above a specific threshold. Vulnerabilities also arise when diamond trade credit is extended at concessionary terms, thus making it more attractive in comparison to rates of credits in other sectors.

The free and unrecorded circulation of promissory notes, which may take a bearer negotiable instrument form, creates an unofficial and unmonitored "banking system" which provides financing for traders, outside the official banking system, facilitates the transfer of high value assets and makes it possible to avoid KYC procedures and reporting to the FIU with no audit trail of the transaction. Although consignment agreements are a very common trade method, especially in international trade, they may bear some ML/TF risks. These risks are linked to the potential variation of the prices of the diamonds evaluated (over or understated), and to the possibility of fraud committed by the consignee.

RED FLAG & INDICATORS

This report provides red flags and indicators to identify potential ML/TF activity through the trade in diamonds, which are divided into several categories. The first category of indicators is intended for regulated entities and covers many indicators which would perhaps be relevant to other types of financial activities but that should be addressed from a diamond trade perspective and requires a good understanding of the diamonds trade practices. They are related to trade practices, to transactions/financing of the diamond trade, customer profile, use of third parties and the use of missing/suspected/falsified documents. The second category of red flags and indicators is targeted at diamond dealers and jewellers themselves and refers to the sale/purchase of diamonds or jewellery, the customer/supplier, use of third parties and the use of missing/suspected/falsified documents. The last category is aimed at customs officials and gives indicators related to the export and import of diamonds.

CASE STUDIES

The case studies illustrate the ML/TF methods and techniques used in the diamond industry in its various stages. Besides the more conventional cases of ML, this report also provided several sanitised cases where diamonds are used as an alternative currency (for asset movement, storage and protection) and a few cases related to TF. What is of importance is the fact that many cases illustrate that criminals are taking advantage of the vulnerabilities entailed in the trade, many of these vulnerabilities were identified in the relevant sections of this report. It is not possible to ascertain, within the scope of this research, the level of risk posed by the diamonds trade, but the cases presented are an indication of such risk, which may be seen for example in the large volumes of ML the cases present.

In total, 64 cases were received from team members or located in open source analysis conducted as part of the information collection process. An analysis of the means of payment revealed:[139]

a) In 30 cases non-cash payment means were used.

b) In 19 cases cash was used as payment method.

c) In 30 cases there is no indication as to the payment method (many cases involve smuggling and/or the use of diamond as currency).

d) In only 6 cases the only method of payment used was cash.

The cases collected show very large scale money laundering, which spread across jurisdictions involving different trade centres and may even amount to few billions of dollars. One case of "round tripping" shows overvaluation where by the diamonds are imported at a much higher value than their market value and the value in which they were exported. This is one example showing the level in which the price of the diamond might be manipulated in a TBML case. Other cases show large scale smuggling and very large tax fraud and money laundering cases.

Finally, it was noted that in most large scale theft or robbery cases, which may amount to many tens of millions of dollars, the diamonds are almost never found. This shows the ease in which illicit diamonds can be laundered through the diamond trade but also the possible ease in which money may be turned into diamonds and laundered in the same way.

CONNECTION TO TF

Based on the information that was received from all countries involved in the project, experts in the diamond trade and literature review, no hard evidence was found that proved a strong link between the diamond trade and terrorist financing activities. Some indications were found but the risk of misuse of the sector for TF purposes does not seem higher than in other sectors.

MONEY FLOWS

The last section of the report looked at money flows pertaining to suspected ML/TF, as they relate to the diamond industry. Although information was scarce, some trends were noted. There has been a trend away from pure cash transactions and many countries noted funds transfers to high-risk countries, including those where a significant diamond trade does not exist.

139 Some cases feature more than one payment method.

CHAPTER 12.
ISSUES FOR CONSIDERATION – SUGGESTED WAYS TO MITIGATE RISKS TO THE DIAMONDS TRADE

There appear to be a number of issues that could be considered to improve the capacity to mitigate the ML/TF risks associated with the trade in diamonds.

Building a better awareness: Criminals use creative schemes to exploit the diamond sector. Lack of awareness of ML and TF risks associated with diamonds and the trade in diamonds could contribute to the risks of ML/TF posed by the abuse of the trade. This lack of awareness amongst key players about their role in the process of fighting illicit activities is a significant vulnerability, particularly since certain expertise is required to improve understanding and awareness. Understanding the ML/TF risks associated with the trade in diamonds by government bodies and the private sector, including financial institutions, would assist in addressing this vulnerability and taking any needed steps to mitigate the risks. Awareness-raising may prove to be very useful by enhancing enforcement of existing regulation. This would require resources for outreach, training or other cooperative activities, and may result in enhanced information exchange.

FATF Recommendation 22 and 23 are only based on cash transactions. The findings of the reports point to issues that may be considered by the FATF with respect to the extent cash is used in the trade and the risks identified in the research, which are not related to the use of cash.

Some jurisdictions as well as private sector response stated that almost no cash is used, particularly not in international trade. On the one hand this reduces the risk of laundering cash proceeds of crime. On the other hand, since the FATF diamond dealer definition covers only cash-based transactions when a diamond dealer[140] is engaging in a transaction with a customer, then most of the trade in terms of volume (carat) and value (tens or even hundreds of billions of USD) is not covered by AML/CFT requirements. However, the report notes that these parts of the trade are still vulnerable to ML/TF, while the current FATF Recommendations applicable to diamond dealers do not directly address such risks.

AML/CFT duties are dependent on the form of payment which in many cases is not known until a substantial period of time has passed from the day in which the diamonds were sold. Since diamonds themselves can be used in ML and TF schemes, the transaction and the laundering process may be completed with no requirement for CDD or suspicious activity reporting at the time of the transaction.

Consideration should be given by the FATF to broadening AML/CFT duties to non-cash payment means.

FATF Recommendation 32: Countries are currently not required to have measures in place to detect the physical cross-border transportation of diamonds through a declaration/disclosure system. The report noted that diamonds were often moved across borders as part of ML/TF

140 As previously indicated the FATF recommendations applies to DPMS which include diamond dealers.

schemes allowing for the cross-border transfer of very high value. The report also showed the use of diamonds as currency by criminals. While a person who would transfer cash or other negotiable bonds would be required to declare the amounts he is carrying, when transferring the same value by using diamonds he is not required to declare. The FATF may wish to consider including diamonds in a similar manner as cash/currency or as bearer negotiable instrument.

Definition of a diamond dealer: There is no definition given by FATF of a dealer in precious stones (which includes a diamond dealer). This results in different national legislation and interpretation of diamond dealers. Pawn shops and retailers are often not seen as diamond dealers and therefore not under any national AML/CFT legislation and regulation. Consideration should be given to defining a dealer in precious stones including a diamond dealer, which could mitigate the risk of ML/TF.

Enhancing transparency through cooperation with the private sector: Although the sector is specialised and there are barriers to entry, engagement with the private sector during this project has indicated that they are not unwilling or reluctant to cooperate. In general, AML/CFT authorities need a better understanding of legitimate commercial practices for diamonds (including KPCS functions) as well as what they perceive as suspicious, and the measures taken to mitigate the risk.

TBML: A significant risk as shown by some of the cases is large scale TBML through the trade in diamonds. Countries do not always have experts or risk-based control on diamonds import and export. More inspection by expert gemmologists working within or on behalf of customs may mitigate the risks for TBML and narrow the room for price manipulation through international trade.

Availability of information: Information on the diamonds trade was assessed low to medium by the jurisdictions who participated in the project. Most information collected for the project came from FIUs, law enforcement and private sector along with information through investigational analysis by way of statistical accounts. The collection and availability of more complete information by all AML/CFT stakeholders involved in the trade in diamonds would support a more accurate and complete understanding of the ML/TF risks associated with the diamonds trade.

International co-operation: Difficulties in the international exchange of information and the use of tax havens are major obstacles in the detection and prosecution of ML through the trade in diamonds. Since the trade is multi-jurisdictional, involving several countries from mine to market, a multi-jurisdictional cooperation is required to investigate ML/TF cases. International co-operation and information-sharing are key factors in the fight against ML given the international dimension of the market. Countries need to work cooperatively to identify and combat the use of diamonds for ML/TF purposes.

Regulatory level playing field: Given the international character of the trade in diamonds, it is important to encourage a level playing field for AML/CFT regulation. Where there are major discrepancies between jurisdictions, this may attract criminals to conduct their transactions in jurisdictions with low or no AML/CFT regulation on the diamonds trade. For a sector which is mainly based on trust and long-lasting partnerships, the application and enforcement of the AML/CFT legislation and the obligation of diamond dealers to collect identification documents from each client and report suspicious transactions, has a large impact on the competitiveness vis-à-vis diamond dealers in other countries who are not subject to similar obligations. This may have the

adverse effect of diverting the diamonds trade to less regulated jurisdictions, generating higher levels of ML/TF risks associated with the diamonds trade. When analysing the over-all level of risk associated with a particular jurisdiction the FATF may consider the level of risk posed by the local diamond industry.

National risk assessment- With respect to jurisdictions where diamonds trade is a significant part of the economy or where trade volumes are high, relevant national authorities should incorporate the diamonds trade as part of their national risk assessment and impose proportionate AML/CFT measures.

ANNEX 1 – GLOSSARY OF TERMS

Alluvial mine – mines in which diamonds are recovered from deposits such as river bed and ocean floor contrary to a kimberlitic hard rock mine. These are considered to be secondary deposits, *i.e.,* that diamonds from primary kimberlitic mines were washed away. Alluvial mines may spread over huge geographical areas.

Business to Business (B2B) - commerce transactions between businesses, such as between a manufacturer and a wholesaler, or between a wholesaler and a retailer.

Broker – a person mediating between a seller and a buyer, usually for a commission. The level of involvement of the broker may vary between one who only mediates between a buyer and a seller to a broker who perform the sale, receives payment from the buyer and transfers the funds to the seller.

Conflict diamonds – according to the Kimberley process web site a "*conflict diamonds, also known as 'blood' diamonds, are rough diamonds used by rebel movements or their allies to finance armed conflicts aimed at undermining legitimate governments*"[141].

Diamond Bourse – a bourse is the diamond industry term for a diamond exchange centre, located in large cities and providing secure trading environments for diamond dealers. Bourses are self-governing, setting sales standards and arbitration provisions. There are 28 diamond bourses members in the WFDB. In a way, the bourses have developed some "universal diamond trading laws". Disciplinary action in one bourse, which may include membership suspension or even expulsion, will automatically apply in every single diamond bourse in the world. Therefore members of the diamond bourses prefer trading among themselves, as they have comfort in verbal agreements. WFDB commented that the strength of this legal framework also means that the bourses can compel members to, for example, adhere to the Kimberley Process, refrain from mixing natural and synthetic diamonds, enforce the writing of warranties on invoices, etc. Dispute resolution, sometimes involving millions of dollars, is immediate – without a need for court actions. WFDB commented that in virtually every diamond trading country, arbitration decisions by WFDB affiliated bourses are generally automatically confirmed by courts.

Diamond dealer – since the scope was narrowed to diamonds excluding other precious stones the report will in many cases address diamond dealers only. The term refers to a person dealing in rough or polished loose diamonds (unless otherwise specified).

"Diamond pipeline" – a term refers to the whole diamond trade chain from mining to retail level where the diamonds reach the final customer.

Harmonized Commodity Description and Coding System (HS) - An internationally standardised system of names and numbers for classifying traded products. The system was developed and is maintained by the World Customs Organization.

141 See FAQ on the KP web site - www.kimberleyprocess.com/en/faq.

Kimberlitic Mine – named after Kimberley, South Africa where a hard rock pipe was first found. These are hard rock mines where diamonds are located. The diamonds were brought to the surface by magma flowing from deep within the earth[142].

Kimberley Process (KP) – *"The Kimberley Process is an international certification scheme that regulates trade in rough diamonds. It aims to prevent the flow of conflict diamonds, while helping to protect legitimate trade in rough diamonds"*[143].

Kimberley Process certification scheme (KPCS) – an international initiative aimed at preventing conflict diamonds from entering legitimate trade. It seeks to ensure that diamond purchases are not used to finance violence by rebel movements seeking to undermine legitimate governments. The KPCS imposes extensive requirements on its members to certify shipments of rough diamonds as 'conflict-free'. The KPSC also bans trade in rough diamonds with non-participants to reduce the illicit trade in conflict diamonds.

Polished Diamond – a diamond which has been cut and polished from a rough diamond to gain its final shape which will then be used in diamond jewellery.

Loose diamond – cut and polished diamonds which have not yet been set in jewellery.

Mounted diamond – a polished diamond which was set in jewellery such as ring, watch necklace, etc.

Rough Diamond – a diamond in its rough form before being cut and polished.

Synthetic diamonds – man made diamonds which are manufactured by artificial means.

Other precious stones – the term refers to all precious stones apart from diamonds.

Beneficiation –The term has been used to describe the process whereby more stages of the "pipeline" mainly but not limited to cutting and polishing are conducted in the mining country generating additional economic benefits to the mining country[144].
