ANNEX 2
RESPONDENTS TO THE QUESTIONNAIRE

RESPONSES RECEIVED FROM MEMBER STATES AND ASSOCIATE MEMBER STATES:

Australia	Austria	Belgium
Canada	Denmark	Finland
France	Japan	Ireland
Italy	Japan	Netherlands
Norway	Portugal	Spain
Sweden	Switzerland	Turkey
United Kingdom	United States	Bermuda
Curacao	St Vincent & the Grenadines	Trinidad & Tobago
Gibraltar	Jordan	Liechtenstein
Montenegro		

RESPONSES RECEIVED FROM SRBS OR PROFESSIONAL BODIES IN THE FOLLOWING COUNTRIES:

Australia	Austria	Belgium
Canada	Denmark	France
Germany	Ireland	Italy
Japan	Luxembourg	Netherlands
Norway	Portugal	South Africa
Spain	Sweden	Switzerland
United Kingdom	United States	Bermuda
Curacao	Namibia	Saint Vincent & the Grenadines
Trinidad & Tobago	Malawi	Cyprus
Czech Republic	Estonia	Hungary
Montenegro	Poland	Slovakia
Slovenia	Swaziland	

ANNEX 3
DEFINITIONS

Mechanism: An ML/TF mechanism is a system or element that carries out part of the ML/TF process. Examples of ML/TF mechanisms include financial institutions, legal professionals, legal entities and legal arrangements.

Method: In the ML/TF context, a method is a discrete procedure or process used to carry out ML/TF activities. It may combine various techniques, mechanisms and instruments, and it may or may not represent a typology in and of its self.

Scheme: An ML/TF scheme is a specific operation or case of money laundering or terrorist financing that combines various methods (techniques, mechanisms and instruments) into a single structure.

Technique: An ML/TF technique is a particular action or practice for carrying out ML/TF activity. Examples of ML/TF techniques include structuring financial transactions, co-mingling of legal and illegal funds, over and under valuing merchandise, transmission of funds by wire transfer, etc.

Typology: An ML/TF typology is a pattern or series of similar types of money laundering or terrorist financing schemes or methods.

Legal professional: Lawyers, notaries and other independent legal professionals – this refers to sole practitioners, partners, or employed professionals within professional firms. It is not meant to refer to 'internal' professionals that are employees of other types of businesses, nor to professionals working for government agencies, who may already be subject to AML/CFT measures.

Legal professionals are covered by the FATF Recommendations when they prepare for or carry out transactions for their client concerning the following activities:

- buying and selling of real estate
- managing of client money, securities or other assets
- management of bank, savings or securities accounts;
- organisation of contributions for the creation, operation, or management of companies
- creation, operation or management of legal persons or arrangements, and the buying and selling of business entities.

SRB: Self-regulatory body – is a body that represents a profession (*e.g.* lawyers, notaries, other independent legal professionals or accountants), and which is made up of members from the profession, has a role in regulating the persons that are qualified to enter and who practice in the profession, and also performs certain supervisory or monitoring type functions. Such bodies should enforce rules to ensure that high ethical and moral standards are maintained by those practicing in the profession.

ANNEX 4
TYPES OF LEGAL PROFESSIONALS

The Risk Based Approach Guidance for Legal Professionals, produced by FATF, in consultation with the legal sector in 2008, provided high level definitions of the legal professionals in terms of Lawyers and Notaries.[45]

In summary these definitions highlighted the regulated nature of these professions, their important role in promoting adherence to the rule of law, providing impartial and independent legal advice on complex rights and obligations, and/or authenticating documents.

For this typology research, greater focus was on the actual areas of law and specific tasks in which different types of legal professionals provided services, to obtain a clearer understanding of which vulnerabilities may be more relevant to which legal professionals.

The questionnaire sent to SRBs specifically asked for information on whether their members:

- engaged in activities covered by the FATF Recommendations;
- only provided legal and advice and representation;
- held exclusive licences for a particular legal services; and
- held client money

From the many responses received a number of trends were identifiable:

1. Lawyers

   Legal professionals who would fall within the RBA Guidance category of lawyer may actually be referred to in their home country as: Advocate, Advogardo, Attorney, Barrister, Lawyer, Legal Practitioner, Rechtsanwalt, Solicitor, Trial Attorney, etc.[46]

   Between countries however, the exact legal services provided by legal practitioners with the same title and restrictions on their activities also differed.

   In some countries legal professionals within this category were predominantly listed as providing legal advice and representing their clients, often in court, sometimes in negotiations. While in other countries they provided legal advice and assisted their

45 www.fatf-gafi.org/media/fatf/documents/reports/RBA%20Legal%20professions.pdf

46 For example the European Directive to facilitate practice of the profession of a lawyer on a permanent basis in a member state other than that in which the qualification was obtained provides a useful overview of lawyers in the European union. See the CCBE website for more information www.ccbe.eu/index.php?id=94&id_comite=8&L=0

clients with the preparation of documents and carrying out of transactions, as well as representing those clients in court and negotiations.

In many countries legal professionals in this category held an exclusive licence for representation in court, but generally they did not hold an exclusive licence for legal services covered by the FATF Recommendations.[47]

In most countries all legal professionals in this category were able to receive clients directly[48] and were able to hold client money, either in specified accounts or accounts held by their professional body.

Both confidentiality and either legal professional privilege or professional secrecy reportedly applied to many or all of the activities of legal professionals within this category.

2. Notaries[49]

There is a distinction between civil law notaries and common law 'notaries public', with the latter certifying signatures and documents and the former having the status of a qualified legal professional and of public office holders in terms of establishing authentic instruments in the area of preventative justice.[50]

Civil law notaries often have an exclusive licence in relation to their role in the following areas:

1. the law relating to real property, such as the preparation and registering of contracts and/or deeds transferring real property from one party to another.

2. the law relating to legal persons, such as incorporating companies, issuing shares and registering their transfer.

3. the law relating to persons and families, such as the preparation of prenuptial agreements, property agreements following a divorce and drafting wills.

In some countries the notary is appointed to a specific geographical area and it would be atypical of them to undertake notarial work for transactions relating to other geographic areas.

---

47 There are exceptions to this, for example in Bermuda barristers have an exclusive licence in relation to legal work involving the transfer of real property and in Hungary attorneys are the only legal professionals able to undertake legal work relating to real property and the formation of companies

48 An exception to this was found in some common law countries, where a barrister will usually only act for a client who has been referred to them by a solicitor. The barrister is also precluded from holding client funds.

49 In Japan the category of notary is not known, although similar activities are undertaken by Judicial Scriveners and Certified Administrative Procedures Specialists.

50 In addition to the information about the role of civil and common law notaries in the FATF RBA guidance, the Council of Notariats of the European Union provide information on the role of notaries on their website: www.notaries-of-europe.eu/notary-s-role/overview

These legal professionals would occasionally hold client money or facilitate the transfer of a monetary instrument such as a cheque between parties, always in a traceable and recorded way. They would deal with the clients (or an authorised representative) directly, but sometimes on referral from another legal professional.

Confidentiality generally applied to these legal professionals. Some SRBS advised that legal professional privilege or professional secrecy also applied to these legal professionals, but others said that it would not.

ANNEX 5
SCHEDULE OF CASES

Case.	Country / Source	Method	Technique	Source of Illicit Proceeds	Economic Sector(s)	Action by or against legal professional	Red Flags
1	**Australia**	Misuse of Client Account	Transferring funds without providing legal services	Unspecified	Financial Institution	Disciplinary sanction imposed	2, 23, 27
2	**Canada**	Misuse of Client Account	Transferring funds without providing legal services	Illicit Drug Trafficking	Financial Institution	No information	2, 3, 4, 36
3	**United States**	Misuse of Client Account	Transferring funds without providing legal services	Corruption	Financial Institution	Disciplinary sanction imposed	36, 42
4	**Australia**	Misuse of Client Account	Structuring payments	Unspecified	Financial Institution, Real Estate	No information	2, 4, 5
5	**United States**	Misuse of Client Account	Structuring payments	Illicit Drug Trafficking	Financial Institution	Criminal conviction	2, 4, 18
6	**Spain**	Misuse of Client Account	Structuring payments	Fraud	Real Estate	STR filed by legal professional	2, 26
7	**United Kingdom**	Misuse of Client Account	Aborted transactions	Fraud	Company	Disciplinary sanction imposed	3, 34
8	**United Kingdom**	Misuse of Client Account	Aborted transactions	Unspecified	Real Estate	Removed from practice	2, 27, 34

ANNEX 6
ADDITIONAL CASE STUDIES

METHOD: MISUSE OF CLIENT ACCOUNT

TECHNIQUE: TRANSFERRING FUNDS WITHOUT PROVIDING LEGAL SERVICES

Case 50: **Legal professional acts as cash courier and makes international transfers without underlying legal transaction – common law country**

An Australian-based solicitor structured funds to an offshore account in Hong Kong. At times it was believed he actually carried cash to Hong Kong. His colleague, a Hong Kong-based solicitor, arranged for the creation of offshore companies in the British Virgin Islands and bank accounts in Hong Kong to receive structured funds from Australia. These funds were then transferred to other countries by the Hong Kong-based solicitor to hide from authorities or returned to Australia in order to appear legitimate.

Source: Australia (2012) questionnaire response

Case 50 **Red flag indicators:**	• Creation of complicated ownership structures without legitimate or economic reason • U-turn transactions • Use of multiple foreign accounts without good reason

Case 51: **Legal professional participates in u-turn payments to cover up fraud – common law country**

A person in control of a corporation's financial affairs abused this position of trust by defrauding the company. The person authorised and instructed staff to make electronic funds transfers from the company to his bookmakers' accounts. He then instructed the bookmakers to direct excess funds and winnings from their accounts to his account or third party accounts, and instructed bank officers to transfer funds from his accounts internationally.

In order to layer and disguise the fraud, he instructed his lawyer to contact the beneficiary of the original international transfers to return the payments via wire transfers into the lawyer's trust account. Approximately AUD 450 000 was returned in one international transfer to the lawyer's trust account. The lawyer then transferred AUD 350 000 to a church fund in an attempt to further hide the assets. To access these funds the person made structured withdrawals of AUD 9 000 each within a nine day period.

The suspect was charged with fraud-related offences for stealing more than AUD 22 million from the

company. He was sentenced to 14 years imprisonment, with a nine-and-a-half-year non-parole period.

Source: Australia (2012) questionnaire response

Case 51 **Red flag indicators:**	• Use of corporate funds for private expenditure • Use of the client account without an underlying transaction • Structuring of payments

Case 52: **Legal professional processes transfers between companies through client account without provision of legal services – civil law jurisdiction**

A bank disclosed suspicious international transfers to the Belgian FIU. Substantial sums from investment companies from Country A were credited on the third party account of a Belgian law firm to the benefit of the Belgian company X. The third party account was subsequently debited by means of money transfers to a company established in Country B. The total sum of these transactions amounted to several million euros.

The FIU's analysis revealed that the third party account clearly served as a transit account to make the construction less transparent. There was no justification to pass these funds through this third party account given that the Belgian company X already owned several accounts with Belgian banks. Furthermore, the majority of the managing directors of company X resided in Asia and were in no way connected to Belgium, whereas the shares of the company were owned by the investment company in Country A. Company X acted as a front company to cover up the relation between the origin and the destination of the funds.

Tax intelligence obtained by the FIU showed that, because of the intervention of company X, the investment companies from Country A (the clients of the international transfers) could relieve the tax burden for important investments in Country B.

Source: Belgium (2012) questionnaire response

Case 52 **Red flag indicators:**	• Involvement of structures with multiple countries where there is no apparent link to the client or transaction, or no other legitimate or economic reason • Use of the client account without an underlying transaction

Case 53: **Legal professional transfers the proceeds of a fraud through client account and attempts to purchase foreign currency to further disguise the origin of the funds – civil law country**

An exchange office disclosed the purchase of a considerable amount of GBP by a foreigner for the account of company X established in Belgium. The funds for this purchase had been transferred to the exchange office's account at the request of a lawyer with a Belgian bank account. The Unit questioned the bank where the lawyer/client held his account. This revealed that the funds on the account of the exchange office had been transferred to the lawyer's account in order of company Y established abroad. The funds that had been transferred by company Y were used to issue a cheque

to the order of company X.

The Unit was informed by the bank that the transfer order was false. Based on this information the bank countermanded the cheque issued by the lawyer, and further investigation by the Unit showed that company X was managed by a foreign national who had performed the exchange transaction. This transaction for company X's account did not have any known economic justification. Information by the tax administration indicated the company had not made its tax returns for quite some time.

Police intelligence revealed that company X, its managing director and its lawyer were on record for fraud. Part of the proceeds of this fraud was used to finance the purchase of GBP by a foreign national on behalf of company X. The Unit reported this file for financial fraud related money laundering.

Source: Belgium (2012) questionnaire response

Case 53 **Red flag indicators:**	• Involvement of structures with multiple countries where there is no apparent link to the client or transaction, or no other legitimate or economic reason • Use of the client account with no underlying transaction • Use of false documents • The client is known to have convictions for acquisitive crime

Case 54: **Legal professional accepts transfers into client account and acts as cash courier – common law country**

An Ontario-based drug trafficker admitted to police that he purposely used legal trust accounts to help block access to information about the true ownership of the funds in the account. He confessed that he would provide cash to his lawyer, who would then deposit the funds into the law firm's trust account. Every few days, the lawyer would withdraw the money from the trust account and deposit the funds into the various bank accounts controlled by the drug trafficker. This was often done by issuing cheques against the trust account, which would be payable to a company associated with the trafficker. Most cheques were in the amount of CAD 2 000 to avoid suspicion.

The small deposits and withdrawals, combined with the use of cheques issued from his lawyer's trust account, helped to circumvent cash or suspicious transaction declarations at financial institutions.

Source: Schneider, S. (2004)

Case 54 **Red flag indicators:**	• Cash payments not consistent with the client's known legitimate income • Use of the client account with no underlying transaction • Structuring of payments • The client is known to have convictions for acquisitive crime or to be currently under investigation for acquisitive crime

Case 55: **Legal professional uses client account as a banking facility for clients and applies their funds to his personal credit card – common law country**

The South African FIU received several STRs about an attorney who appeared to be abusing his attorney trust facility. The suspicious transactions in the reports pointed out the following:

i) Multiple large sums of money were being deposited into the trust account by different people and companies over a period exceeding two years

ii) These funds were used to make payments to other depositors in South Africa and abroad

iii) Funds from this account were being remitted to foreign countries deemed to be tax havens

iv) Money was transferred to the attorney's personal credit card; his practice expenses were also paid directly from the trust account.

Source: Deloitte (2011)

Case 55 **Red flag indicators:**	• Use of the client account without an underlying transaction • Payment of funds to a high risk country • Possibly disproportionate private funding and/or payments from third parties

Case 56: **Legal professional convicted after transferring funds to a criminal client's mistress – common law country**

In 2008, Mr Krestin, a solicitor was convicted of entering into an arrangement to facilitate money laundering after making a payment of EUR 14 000 euro to his client's mistress. There was no underlying transaction supporting the payment. The solicitor had received a production order relating to the client which outlined allegations of Tax (MTIC) fraud against the client. The first jury had not been able to reach a verdict, and the judge concluded that the second jury must have convicted the solicitor on the basis that he suspected that the funds were the proceeds of crime, rather than that he knew they were. The solicitor was fined GBP 5 000. When his conduct was considered by the Solicitors Disciplinary Tribunal, in light of the sentencing judge's comments he was reprimanded, but allowed to keep practicing as a lawyer, subject to restrictions.

Source: United Kingdom (2012) questionnaire response

Case 56 **Red flag indicators:**	• No underlying transaction for use of the client account • The is known to be currently under investigation of acquisitive crime

Case 57: **Legal professional disperses funds to criminal client's family members and keeps fee – common law country**

Attorney Jamie Harmon accepted the proceeds of the sale of stolen goods from her client, Christian Pantages. Harmon deposited the funds into her attorney trust account and then dispersed the funds

to Pantages and his wife, keeping a fee for herself.

Pantages pleaded guilty to all counts against him and testified against Harmon at trial. Following a guilty verdict on five counts of money laundering, the district court granted Harmon a new trial based on an improper jury instruction. In so doing, the judge expressed concern regarding the difficulties defence counsel face when accepting fees from clients that may be criminal proceeds.

See 2011 WL 7937876, at *5 n.12 (N.D. Cal. Aug. 18, 2011) (denying motion for judgment of acquittal but granting motion for a new trial based on improper jury instruction). The government's appeal of the grant of a new trial is pending.

Source: United States (2012) questionnaire response – United States v Harmon, No. 08-cr-938 (ND Cal)

Case 57 **Red flag indicators:**	• Use of client account without an underlying transaction

Case 58: **Legal professional convicted for creating secret client accounts to transfer the proceeds of fraud – common law country**

Attorney Jonathan Bristol pleaded guilty to conspiracy to commit money laundering for his role in laundering more than $18m in fraud proceeds through two attorney escrow accounts on behalf of Kenneth Starr and his fraudulent investment enterprises. At the time, Bristol was an attorney at a large, international law firm in New York.

Bristol created two attorney escrow accounts, without informing his law firm, into which Starr's investment advisory clients deposited their investment funds. Bristol then transferred the funds to Starr, members of his family, and his entities. Bristol also used the clandestine attorney escrow accounts to pay his law firm on behalf of Starr.

Bristol is currently awaiting sentencing. Following disciplinary action, the Court accepted his resignation for reasons of judicial economy and ordered Bristol's name be immediately struck from the roll of attorneys.

Source: United States (2012) questionnaire response United States v. Bristol, No. 10-cr-1239 (S.D.N.Y.)

Case 58 **Red flag indicators:**	• Use of client account without an underlying transaction • Payment of funds intended for corporate purposes to private accounts • Payments to third parties with no legitimate explanation

Case 59: **Legal professional creates complicated foreign structures and transfers funds through client account while claiming privilege would prevent discovery – common law country**

Attorney David Foster was indicted on charges of money laundering and ultimately pleaded guilty to one count of causing a financial institution to fail to file a currency transaction report. Foster assured undercover agents that their money laundering transactions through his client trust account would be protected by attorney-client privilege. After the funds were deposited in the trust

account, he transferred the money to a corporation and bank accounts in Liechtenstein that he had established. See 868 F. Supp. 213 (E.D. Mich. 1994) (holding that Foster's sentence calculation should be increased because of an enhancement for use of "special skills").

Source: United States (2012) questionnaire response United States v Foster No 93-cr-80141 (Ed Mich)

Case 59 **Red flag indicators:**	• Use of client account without an underlying transaction • Involvement of structures and countries where there is no legitimate reason

TECHNIQUE: STRUCTURING PAYMENTS

Case 60: **Legal professional creates companies, false legal documentation and advises on structuring payments to avoid reporting requirements – common law country**

Attorney George Rorrer was convicted by a jury of conspiracy to commit money laundering. Rorrer helped to invest the drug proceeds of client John Caporale by forming a corporation in the name of the client's wife and arranging a loan from the corporation to another (non-criminal) client, Robin Hawkins. Rorrer then drafted a phony construction-work contract, making the repayment of the loan appear to be payment for construction work performed by the Caporales. Rorrer instructed Hawkins to give the construction receipts to the Caporales to legitimise the payment.

Rorrer also drew up a promissory note, which the wife signed, but did not provide copies of the note to either party. Rorrer advised Hawkins how to deposit the cash loan without triggering reporting requirements. The appeals court upheld Rorrer's conviction but remanded him for resentencing after finding that the district court abused its discretion by not applying a sentencing enhancement based on Rorrer's use of "special skills" (legal skills) in committing the offenses of conviction. See United States v. Robertson, 67 F. App'x 257 (6th Cir. 2003).

Source: United States (2012) questionnaire response United States v. Rorrer, No. 99-cr-139(7) (W.D. Ky.)

Case 60 **Red flag indicators:**	• Significant private funding and the transfers are structured so as to avoid the threshold requirements • The ties between the parties are of a family, employment, corporate or other nature such as to generate doubts as to the real nature or reason for the transaction • Structuring of payments

Case 61: **Legal professional structures payments for property to avoid threshold reporting requirements – common law country**

Attorney Michael Sinko was convicted of conspiracy to commit money laundering and aiding and abetting money laundering. Sinko owned a condominium project that was financed by NOVA Bank, of which Sinko was the outside counsel. John Palmer, who had fraudulently obtained funds from his employer, wished to launder money by buying a condominium from Sinko. Sinko structured the purchase agreement in a way that avoided disclosure of cash payments. See 394 F. App'x 843 (3d

Cir. 2010) (affirming sentence).

Source: United States (2012) questionnaire response United States v. Sinko, No. 07-cr-703 (E.D. Pa.)

Case 61 **Red flag indicators:**	• Structuring of payments • Significant private funding / cash payments disproportionate to known legitimate income

Case 62: **Legal professional structures payments on property purchase and creates false documentation to launder proceeds of crime – common law country**

Defence attorney Victor Arditti advised an undercover agent posing as a cocaine dealer on how to structure cash in order to purchase real estate. Later, Arditti told the agent he would draft documents memorialising a sham loan to legitimise cash drug proceeds and then establish an escrow account to receive the proceeds and then invest it in an Oklahoma oil deal. When the escrow account idea failed to work, Arditti set up a trust account to funnel the drug proceeds to the oil deal, keeping the undercover agent's alias off all bank records.

No trust agreement was prepared, and Arditti had sole signature authority on the account. Subsequent deposits were made to the trust account using cashier's cheques from a Mexican money exchanger. A grand jury indicted Arditti on charges of conspiracy to launder money and to avoid currency reporting requirements. A jury found Arditti guilty on all counts, and the district court denied judgment of acquittal.

Source: United States (2012) questionnaire response United States v. Arditti, 955 F.2d 331 (5th Cir.), cert. denied, 506 U.S. 998 (1992)

Case 62 **Red flag indicators:**	• Structuring of payments • Client with purported convictions for acquisitive crime • Use of complicated structures for no legitimate reasons • Funds received from high risk countries

TECHNIQUE: ABORTED TRANSACTIONS

Case 63: **Legal professional facilitates laundering of the proceeds of mortgage fraud following aborted property transactions – common law country**

In 2010 a solicitor was stuck off after having allowed a large property company to use the client account as a banking facility, when the transactions were suddenly aborted They had also dissipated the funds received from a number of properties, rather than paying out the mortgage on the property.

Source: United Kingdom (2012) questionnaire response

Case 63 **Red flag indicators:**	• Large payments to the client account without an underlying legal transaction • Transaction unexpectedly aborted after funds had been received

	• Transaction were large for the particular practice

METHOD: PURCHASE OF REAL PROPERTY

TECHNIQUE: INVESTMENT OF PROCEEDS OF CRIME IN PROPERTY

Case 64: **Legal professional creates complex structures to purchase property with drug proceeds - common law country**

Suspicious flows of more than USD 2 million were identified being sent in small amounts by different individuals who ordered wire transfers and bank drafts on behalf of a drug trafficking syndicate who were importing 24kg of heroin into Country Z. Bank drafts purchased from different financial institutions in country Y (the drug source country) were then used to purchase real estate in Country Z. A firm of solicitors was also used by the syndicate to purchase the property using the bank drafts that had been purchased overseas after they had first been processed through the solicitor's trust account. Family trusts and companies were also set up by the solicitors.

Source: FATF (2004)

Case 64 **Red flag indicators:**	• Possible structuring of payments • Significant funding disproportionate to the known legitimate income of the client • Involvement of structures and accounts in multiple countries with no legitimate reasons • Use of complicated ownership structures for no legitimate reason

Case 65: **Legal professional instructed in property purchase by a foreign national with multiple third parties contributing to funding – civil law country**

A bank's suspicions were raised after a bank cheque was issued to the order of a notary upon request of an Asian national for purchasing real estate. Analysis of the account transactions showed that the account received several transfers from Asians residing abroad and was known through an investigation regarding a network of Asian immigrants. The analysis showed that the account had been used as a transit account by other Asian nationals for the purchase of real estate.

Source: FATF (2007)

Case 65 **Red flag indicators:**	• Third party funding with no legitimate explanation • Significant levels of private funding which may have been disproportionate to the socio-economic profile of the client

Case 66: **Legal professional makes STR after client attempts to purchase property with cash – civil law country**

A notary did a notification to the FIU on a company, represented by the Managing Director, who had

purchased a property in Belgium. The notary got suspicious when the buyer wished to pay the total price in cash. When the notary refused the Managing Director asked where the nearest bank Agency was. He came back to the Office of the notary with a cheque from the bank after he had run a deposit in cash. The suspicions of the notary were further enhanced when the company which he represented was the subject of a criminal investigation. Research by the FIU revealed that the person was already the subject of a dossier that was been sent by the FIU in connection with illicit drug trafficking. After the notification from the FIU a law enforcement investigation commenced.

Source: Cellule de traitement des information Financieres (2006)

Case 66 **Red flag indicators:**	• Significant amounts of cash not consistent with known legitimate income • The client is currently under investigation for acquisitive crimes

Case 67: **Legal professional acts as a depository institution and then purchases property for client with no known legitimate income – common law country**

A BC man used the proceeds from the sale of cocaine, marijuana and steroids to purchase several homes throughout British Columbia. The trafficker would regularly provide cash to his lawyer who would deposit the funds into his law firm's bank account in amounts averaging CAD 4 000 to CAD 5 000. When the balance of the amount reached a certain level the funds would be applied to the purchase of property (mostly homes used as marijuana grow-ups).

Source: Schneider, S. (2004)

Case 67 **Red flag indicators:**	• Significant private funding and cash not consistent with known legitimate income • Structuring of payments • Transactions not consistent with legitimate socio-economic profile of the client

Case 68: **Legal professional accepts over 130 transactions in 8 months to purchase property for drug trafficker – common law country**

Between January and August 1994, more than 130 transactions were conducted through a trust account of a law firm that represented a drug trafficker in the purchase of a $650,000 home in Toronto. The accused was convicted of drug trafficking and police were also able to prove that the funds used to purchase the property were derived from his illegal activities. During a two week period preceding his purchase of the real estate, the accused provided the law firm with numerous bank drafts obtained from a number of different financial institutions. The vast majority of these bank drafts were between CAD 3 000 and CAD 5 000 in value. The highest amount was CAD 9 000. Between March 17 and March 25, 1994, 76 bank drafts were deposited on behalf of the accused in the law firm's trust account. On March 17 alone, 18 different bank drafts were deposited into the account. The bank drafts were purchased from eight different deposit institutions.

Source: Schneider, S. (2004)

Case 68 **Red flag indicators:**	• Client known to have convictions for acquisitive crime • Structuring of payments • Significant private funding not consistent with known legitimate income • Use of multiple bank accounts and financial institutions for no legitimate reason

Case 69: **Legal professionals co-opted into laundering activity by his brother – common law country**

In 2009, Mr Farid a solicitor was convicted of failing to make a suspicious transaction report after acting in a number of property transactions on behalf of a drug dealer. Mr Farid was introduced to the client by the Mr Farid's brother and a mortgage broker. The mortgage broker had assisted in identity theft to facilitate fraudulent mortgage applications, with the transactions being processed by the solicitor, after large cash deposits were made. Mr Farid was sentenced to 9 months jail and in 2011 the Solicitors Disciplinary Tribunal ordered that he should not be re-employed within a law firm without permission from the regulator.

Source: United Kingdom (2012) questionnaire response

Case 69 **Red flag indicators:**	• Disproportionate amounts of cash • Use of false identities

Case 70: **Legal professional acts as prosecution witness after wrongly assuming funds were clean because they have come from a bank account – common law country**

In 2008/09 an international drug trafficker laundered over GBP 300 000 through bank accounts. This was then paid from the bank via cheque to a solicitor who acted as legal professional in a house purchase, where the house was bought for approximately GBP 450 000 with no mortgage. The solicitor had assumed because the money was transferred from a bank account, the funds had already been checked. The solicitor was not charged and acted as a witness for the police.

Source: United Kingdom (2012) questionnaire response

Case 70 **Red flag indicators:**	• Disproportionate level of private funding not consistent with the known legitimate income

Case 71: **Three legal professionals engage in money laundering through a property transaction for convicted fraudster husband of senior partner – common law jurisdiction**

In March 2006, a law firm acted for a small company in the purchase of a property for GBP 123 000. The director of the company was Mr A, the husband of one of the solicitors and a convicted fraudster. In September 2006, the law firm acted for Mr A who purchased the same property from the company for GBP 195 000. In February 2007, the firm then acted for Mr A's step son who

purchased the same property for GBP 230 000. In December 2006, the small company provided the firm with a payment of GBP 25 000 and GBP 20 000. The amount of GBP 25 000 was noted as covering a shortfall for the property, but there was no shortfall. The amount of £20,000 was said to be a loan to another client, but there were not documents to support the loan. The Solicitors Disciplinary Tribunal considered the conduct of three solicitors in relation to the matter. One was struck off, one was given an indefinite suspension from practice and the other was fined GBP 10 000.

Source: United Kingdom (2012) questionnaire response

Case 71 **Red flag indicators:**	• Director of client was known to have criminal convictions • Rapidly increasing value on the property that was not consistent with the market • Connection between the parties giving rise to questions about the underlying nature of the transaction • Use of client account without underlying transaction

TECHNIQUE: OBSCURING OWNERSHIP – PURCHASING THROUGH INTERMEDIARIES

Case 72: **Legal professional turns a blind eye to false documents when helping partner of drug trafficker buy property with criminal proceeds – civil law country**

In 1995 a notary was found guilty of money laundering as he helped the sexual partner of a drug trafficker, who had been arrested to buy a property and advise her to pay the price with international wire transfers. The court decided that the notary could not have been ignorant of the fact that some documents had been falsified.

Source: Chevrier, E. (2005)

Case 72 **Red flag indicators:**	• Use of false documents • Client known to have close connections with a person under investigation for acquisitive crimes • Use of foreign accounts with no legitimate reason • Significant private funding possibly not consistent with known legitimate income

Case 73: **Legal professional convicted for creating property portfolio for drug trafficking friend – common law country**

Attorney James Nesser was convicted of conspiracy to distribute drugs, conspiracy to launder money, money laundering, and engaging in illegal monetary transactions. Nesser handled property transactions for a client and sometimes social acquaintance Ronald Whethers. Nesser laundered Whethers' drug proceeds through the purchase of a farm, the sham sale of a house, and the masked purchase of another real property. Nesser's conviction on drug conspiracy charges was upheld because the laundering promoted the drug conspiracy and prevented its discovery by concealing the

origin of the proceeds. See 939 F. Supp. 417 (W.D. Penn. 1996) (affirming conviction).

Source: United States (2012) questionnaire response - United States v. Nesser, No. 95-cr-36 (W.D. Penn.)

Case 73 **Red flag indicators:**	• Client known to be involved in criminal activity • There are attempts to disguise the real owner or parties to a transaction • Significant private funding not consistent with known legitimate income

TECHNIQUE: OBSCURING OWNERSHIP – PURCHASE THROUGH A COMPANY OR TRUST

Case 74: **Legal professional assists in creating property investment countries to hide millions derived from fraud**

A director of several industrial companies embezzled several million dollars using the bank accounts of offshore companies. Part of the embezzled funds were then invested in Country Y by means of non-trading real estate investment companies managed by associates of the person who committed the principal offence. The investigations conducted in Country Y, following a report from the FIU established that the creation and implementation of this money laundering channel had been facilitated by accounting and legal professionals – gatekeepers. The gatekeepers had helped organise a number of loans and helped set up the different legal arrangements made, in particular by creating the non-trading real estate investment companies used to purchase the real estate. The professionals also took part in managing the structures set up in Country Y.

Case 74 **Red flag indicators:**	• Creation of complicated ownership structures with no legitimate reason • Involvement of structures with multiple countries with no legitimate reason

Case 75: **Legal professionals help obscure beneficial ownership through complicated international corporate structures – civil law country**

A notary disclosed a real estate purchase by the company RICH, established in an off-shore centre. For this purchase the company was represented by a Belgian lawyer. The payment for the property took place in two stages. Prior to drafting the deed a substantial advance was paid in cash. The balance was paid by means of an international transfer on the notary‘s account.

Analysis revealed the following.

The balance was paid on the notary‘s account with an international transfer from an account opened in name of a lawyer‘s office established in Asia. The principal of this transfer was not the company RICH but a Mr. Wall. Ms. Wall, ex-wife of Mr.Wall resided at the address of the property in question. Police sources revealed that Mr. Wall was known for fraud abroad.

These elements seemed to indicate that Mr. Wall wanted to remain in the background of the

transaction. That is why he used an off-shore company, represented by a lawyer in Belgium and channelled the money through a lawyer's office abroad to launder money from fraud by investing in real estate.

Source: Deloitte (2011)

Case 75 **Red flag indicators:**	• Use of multiple countries, including higher risk countries, without legitimate reason • There are attempts to disguise the real owner or parties to the transaction • Significant amounts of cash and private funding possibly not consistent with the known legitimate income of the client

Case 76: **Legal professional involved in unusual transfers of property without apparent economic or other legitimate justification – civil law country**

A bank reported a person whose account has remained inactive for a long time, but who suddenly was filled with several deposits in cash and international transfers. These funds were then used for the issuance of a cheque to order of a notary for the purchase of a property. Research by the FIU revealed that the ultimate purchaser of the property not was the person involved, but an offshore company. The person concerned had first bought the property in his own name and then left to the listed company by a command statement for the notary. Examination of the dossier revealed that the person who was connected to a bankrupt company, acted as hand to buy property with disadvantage of his creditors. The person concerned also practiced no known professional activity and received state benefits. On these grounds and police intelligence the FIU reported the dossier for money laundering in connection with fraudulent bankruptcy. A judicial inquiry is currently underway.

Source: Cellule de traitement des information Financieres (2006)

Case 76 **Red flag indicators:**	• Involvement of a complicated ownership structure without legitimate reason • Funding not consistent with known legitimate income • There are attempts to disguise the real owner or parties to the transaction • Involvement of foreign countries with no legitimate reason

Case 77: **Legal professional involved in creating complex foreign corporate structure to purchase properties to facilitate laundering – civil law country**

The bank account of a person was credited by substantial transfers from abroad. These funds were used as banking cheques to order of a notary to purchase real estate. The investigation of the FIU revealed that the person had set up a highly complex corporate structure for this investment. Interrogation of the notary and the Constitutive Act of the companies showed that the two holdings companies in Belgium were founded at this notary in Belgium by four foreign companies. Then

those two companies founded two other companies in the real estate sector. Then the intermediary of these two last companies made investments in real estate. This dossier is currently subject of a judicial inquiry.

Source: Cellule de traitement des information Financieres (2006)

Case 77 **Red flag indicators:**	• Use of a complicated ownership structure without legitimate reason • Involvement of multiple countries without legitimate reason

Case 78: **Legal professionals makes STR after unusually high money transfers received from foreign country with no connection to the parties or the transaction – civil law country**

A Russian couple, living in Belgium, controlled the company OIL that was located in Singapore and that was active in the oil and gas sector. A company in the British Virgin Islands was the only shareholder of OIL. On their accounts significant transfers were made regarding OIL. The money was then transferred to accounts on their name in Singapore or withdrawn in cash. The use of foreign accounts and the intervention of off shore companies attracted the attention of the banks. In addition, the couple invested several million euros in immovable property in Belgium. The notary found such substantial investments and that they were paid through transfers from Singapore suspicious. Police source revealed that these stakeholders were heads of a Russian crime syndicate. They practiced no commercial activities in Belgium that could justify the transactions on their accounts. The Belgian financial system was apparently only used for the purpose of money laundering.

Source: Cellule de traitement des information Financieres (2009)

Case 78 **Red flag indicators:**	• Involvement of multiple countries without legitimate reason, including high risk countries • Significant private funding not consistent with the company's economic profile • Complicated ownership structure without legitimate reason

Case 79: **Legal professional used in U-turn property transaction designed to legitimise funds from organised crime – civil law country**

An East European was acting under an alias as the director of a company for which he opened an account with a Belgian bank. Transfers were made to this account from abroad, including some on the instructions of "one of our clients".

The funds were then used to issue a cheque to a notary for the purchase of a property. The attention of the notary was drawn to the fact that some time after the purchase, the company went into voluntary liquidation, and the person concerned bought the property back from his company for an amount considerably above the original price. In this way the individual was able to insert money into the financial system for an amount corresponding to the initial sale price plus the capital gain. He was thus able to use a business account, front company customer, purchase of real estate, cross border transaction and wire transfers to launder money that, according to police sources, came

from activities related to organised crime.

It appeared that the company acted as a front set up merely for the purpose of carrying out the property transaction.

Source: FATF (2007)

Case 79 **Red flag indicators:**	• Sale of property in a non-arm's length transaction (i.e. a director selling to his company) • Resale back to the original seller at a reduced price • There has been an increase in capital from a foreign country, where there is no clear connection

Case 80: **Legal professional makes STR after unusual third party funding of a property purchase**

The FIU received a suspicious transaction report from notary A on one of his clients, person B, a foreigner without an address in Belgium, who in his office had set up a company for letting real estate. The sole manager and shareholder of this company was a family member of B, who also resided abroad. Shortly after its creation the company bought a property in Belgium. The formal property transfer was carried out at notary A's office. The property was paid for through the account of notary A by means of several transfers, not from company X, but from another foreign company about which individual B did not provide any details. The establishment of a company managed by a family member with the aim of offering real estate for let and paid by a foreign company disguised the link between the origin and the destination of the money. Police intelligence revealed that the individual was known for financial fraud. The investment in the property was apparently financed by the fraud.

Source: FATF (2007)

Case 80 **Red flag indicators:**	• Funds received from third parties, in a foreign country, with no legitimate reason • The client is evasive about the source of funds • The transaction is unusual – there is limited connection between the client and the country in which the transaction takes place and the client does not have ownership or formal control over the entity on whose behalf he is conducting the transaction. • The client has convictions for acquisitive crimes

Case 81: **Legal professional makes STR after unusual cash payments made in relation to a property purchase – civil law country**

The company ANDI, managed by Mr. Oxo, sold a property to the company BARA, managed by Mr. Rya, for a significant amount for which the deposit was paid in cash. A large part of the price was also paid in cash. When the notary who had executed the act noticed these transactions he sent a disclosure to the FIU based on article 10bis of the Law of 11 January 1993.

Analysis revealed the following elements:

• The notary deed showed that money for the cheque to the notary was put on the account of the company ANDI by a cash deposit two days before the cheque was issued.

• Information from the bank showed that the company ANDI and Mr. Oxo's personal account were credited by substantial cash deposits. This money was used for, among other things, reimbursing a mortgage loan, and was withdrawn in cash.

• Police sources revealed that Mr. Oxo and Mr. Rya were the subject of a judicial inquiry into money laundering with regard to trafficking in narcotics. They were suspected of having invested their money for purchasing several properties in Belgium through their companies.

All of these elements showed that the cash used for purchasing property probably originated from trafficking in narcotics for which they were on record.

Source: Deloitte (2011)

Case 81 **Red flag indicators:**	• Significant cash deposits • Sale of property in a non-arm's length transaction • Clients currently under investigation for acquisitive crimes

Case 82: **Legal professional receives multiple deposits from various sources for property transaction – civil law jurisdiction**

A company purchased property by using a notary's client account. Apart from a considerable number of cheques that were regularly cashed or issued, which were at first sight linked to the notary's professional activities, there were also various transfers from the company to his account. By using the company and the notary's client account, money was laundered by investing in real estate in Belgium, and the links between the individual and the company were concealed in order to avoid suspicions. Police sources revealed that the sole shareholder of this company was a known drug trafficker.

Source: FATF (2007)

Case 82 **Red flag indicators:**	• The funding appears unusual in terms of multiple deposits being made towards the property purchase over a period • Use of the client account without an underlying transaction • The company only has one shareholder • A beneficial owner has convictions for acquisitive crime

Case 83: **Legal professional assists PEPs to purchase expensive foreign property though a company with a later transfer to a family member without genuine payment – civil law country**

A company is incorporated with a capital stock of EUR 3 050 by a Spanish lawyer, who then creates a general power of attorney over the company for a relative of the Head of State of an African country. Half the stock in the company is then transferred to another national of the same African country, who claims to be a businessman.

The company purchases of a plot of land within an urban development in Spain on which a detached house has been built. The property is valued at EUR 5 700 000, the price being paid through transfers between accounts at the same Spanish credit institution.

The company transfers the recently purchased property, in the following deed, to the relative of the Head of State, specifying the same price as set for the first purchase, while deferring payment of the entire sum.

Source: Spain (2012) questionnaire response

Case 83 **Red flag indicators:**	• The client and beneficial owner have family and personal ties to an individual who holds a public position in a high risk country. • The company makes a significant purchase which is disproportionate to the initial capital in the company and its economic profile • Company funds are used to make a private purchase • The transaction does not make economic sense in that the company divests itself of its largest asset without making a profit and with payment being deferred, • The transfer of the property is a non-arm's length transaction (i.e. company sells to its director)

Case 84: **Legal professional accepts tens of millions of euros from a PEP as a gift to his children to purchase property despite warnings of the corruption risks – civil law country**

Following the payment of a sum of money to the account of a notary's office, a bank sent a STR to the FIU. The STR referred to the payment of several tens of millions credited to the account of the notary. As the transaction appeared unusual, in particular because of the amount, the financial intermediary requested its client to clarify matters. The notary explained that the payment was a gift from a high-ranking government official or president of a country on the African continent to his children residing in Switzerland. The funds were destined for the purchase, via the intermediary of a public limited company yet to be established, of an apartment in the town in question.

As the funds originated from a politically exposed person (PEP), the degree of corruption in the African country in question was assessed as high and the Swiss Federal Banking Commission (SFBC) had issued warnings regarding this country, the financial intermediary reported the case.

Following investigations carried out by the FIU, it became apparent that the extremely high price of the property in question was in no proportion to the normal price for this type of object. Furthermore, open sources revealed that a third country was already carrying out investigations

into corruption and money laundering by the government official in question and members of his family.

Source: Deloitte (2011)

Case 84 **Red flag indicators:**	• Disproportionate private funding given known legitimate income • There are attempts to disguise the real owner or parties to the transaction • The client holds a public position in a high risk country • There is a remarkable high and significant difference between the purchase price and the known value of properties in the area • The client is currently under investigation for acquisitive crimes

Case 85: **Legal professional unaware that funds used to purchase property through a trust were proceeds of crime – common law country**

Between 2004 and 2008 a legal professional who conducted property transactions, assisted the subject by drafting a Deed of Trust and the purchase of a property. The property was bought at a discounted rate by the client and then transferred to third party. No action was taken against the legal professional as the law enforcement agency was unable to prove that legal professional had known or suspected that they were dealing with the proceeds of crime.

Source: United Kingdom (2012) questionnaire response

Case 85 **Red flag indicators:**	• Unusual transaction involving transfer of property at significant undervalue. • Complex property transactions

Case 86: **Legal professional convicted after transferring hotels at undervalue to offshore company – common law country**

In 2010, Mr Wilcock, a solicitor was convicted of failing to make a suspicious transaction report and fined GBP 2 515. He was acting for a client who ran a chain of properties in Southport, England which housed illegal immigrants. He was asked to transfer the ownership of the hotels to an offshore company at a significant undervalue. It was not clear if Mr Wilcock knew his client was being investigated by police at the time of the transaction, but in pleading guilty he acknowledged that he should have been suspicious as to the source of the funds used to purchase the hotels in the first place.

Source: United Kingdom (2012) questionnaire response

Case 86 **Red flag indicators:**	• Significant undervalue • Involvement of complex ownership in a country with which there was limited connection

TECHNIQUE: MORTGAGE FRAUD WITH ANTECEDENT LAUNDERING

Case 87: **Legal professional investigated for acting in unusual property transactions - including selling maid's rooms for 8 times their original value – civil law country**

Judicial investigations are in progress into the facts surrounding credit frauds to the detriment of a bank: 6 fraudulent real estate files of financing were presented to the agency on the basis of the production of false pay slips and false bank statements, for a loss at first estimated esteemed at EUR 505 000.

The first investigations led by the police confirmed that the loan files were presented to the bank systematically by the same client adviser and systematically by the same real estate agent for six different borrowers. They confirmed also that the loss finally amounted to about EUR 5 million as more loans which had deceitfully been obtained by those 6 borrowers were uncovered.

Searches of the offenders' residences led to the discovery of numerous documents, and a lifestyle out of proportion to their legitimate income.

However, the destination of the lent funds could only be partially determined because 5 of the 6 involved borrowers had acquired real property in Luxembourg.

The investigation also identified the complicity of two agents of the defrauded bank and the assistant director of this bank who indicated they let pass at least 9 files which they knew were based on false documents and that the borrowers were involved in the fraud.

The lent funds stemming from frauds allowed the purchase of properties in France and in Luxembourg. All of the purchases involved a single solicitor and his clerk, who were complicit of the organised fraud.

Searches of the office of the notary revealed approximately sixty notarial acts drafted on the basis of falsified documents. The notary recognized that he had failed to make in-depth searches on the buyers. He explained that some requests of his customers were not clear, in particular when he was reselling four maid's rooms in Paris of less than 10 m^2 for EUR 250 000 each while they had been initially bought for EUR 30 000 euro each..

He admitted making two transfers on bank accounts in Luxembourg belonging to two of presumed fraudsters by knowing perfectly that these are French resident and are not supposed to hold of bank accounts in Luxembourg.

He finally confirmed having realised all the notarial acts by having knowledge that the properties were bought on the basis of loans obtained thanks to forgery documents and internal complicities of the bank.

Without the intervention of this notary, this vast swindle would not have been so extensive

The notary is at present being prosecuted for complicity of money laundering and complicity of organised fraud.

Source: France (2012) questionnaire response

Case 87 **Red flag indicators:**	• Use of false documents • There are multiple appearances of the same parties in transactions over a short period of time • There are remarkable and highly significant differences between he

	declared price and the approximate actual values in accordance with any reference which could give an approximate idea of this value or in the judgement of the legal professional • The client holds bank accounts in a foreign country when this is prohibited by law

Case 88: **Legal professional provides a wide range of legal services to three organised crime groups – common law country**

In 2008, Ms Shah a legal executive working within a law firm provided services to three separate Organised Crime Groups (OCGs) by:

facilitating false immigration applications using false or improperly obtained identity documents

securing criminal assets by creating and falsely dating a Deed of Trust on behalf of a subject (who had been sentenced to 14 years imprisonment for drug trafficking) to hide assets from confiscation proceedings

facilitating mortgage fraud and the subsequent disbursement of funds to multiple individuals and companies on behalf of the OCG.

Within a short timeframe, approximately GBP 1 million was paid into the client account from five different mortgage companies, which was then paid out to numerous third parties.

In 2011 Ms Shah was sentenced to five years imprisonment (four years for six counts of fraud and 11 counts of money laundering in relation to the mortgage frauds and subsequent disbursements of funds; and one year for one count of perverting the course of justice in relation to immigration applications).

Source: United Kingdom (2012) questionnaire response

Case 88 **Red flag indicators:**	• Client seeks false or counterfeited documentation • Client is known to have convictions for acquisitive crime

Case 89: **Legal professional facilitates significant property fraud and laundering of the proceeds by ignoring multiple warning signs of fraud and money laundering – common law country**

Between 2009 and 2010 a solicitor acted for sellers in the purchase of a number of properties. Sellers were all introduced to solicitor by a company – these people where engaging in fraud by attempting to sell properties they did not own. Some purchases aborted and funds where then sent to third parties, in other cases the purchaser changed part way through the transaction and the purchase price reduced for no reason. The solicitor did not meet the clients and the dates of birth on the due diligence material provided showed that the person could not have been the same person who owned the property (i.e. they would have been too young to have legally purchased the property). The solicitor received a fine of GBP 5 000 from the Solicitors Disciplinary Tribunal, who noted the fact that solicitor was seriously ill at the time of his failings and did not make a finding of dishonesty.

Source: United Kingdom (2012) questionnaire response

Case 89 **Red flag indicators:**	• Changes in instructions • False identification documents • Unusual reductions in the purchase price.

METHOD: CREATION OF COMPANIES AND TRUSTS

TECHNIQUE: CREATION OF SHELL COMPANIES TO PLACE OR LAYER

Case 90: **Legal professional creates complex multijurisdictional corporate structures to launder funds**

Mr S headed an organisation importing narcotics into country A, from country B. A lawyer was employed by Mr S to launder the proceeds of this operation.

To launder the proceeds of the narcotics importing operation, the lawyer established a web of offshore corporate entities. These entities were incorporated in Country C, where scrutiny of ownership, records and finances was not strong. A local management company in Country D administered these companies. These entities were used to camouflage movement of illicit funds, acquisition of assets and financing criminal activities. Mr S was the holder of 100% of the bearer share capital of these offshore entities. Several other lawyers and their trust accounts were used to receive cash and transfer funds, ostensibly for the benefit of commercial clients in Country A.

When they were approached by law enforcement during the investigation, many of these lawyers cited privilege in their refusal to cooperate. Concurrently, the lawyer established a separate similar network (which included other lawyers' trust accounts) to purchase assets and place funds in vehicles and instruments designed to mask the beneficial owner's identity. The lawyer has not been convicted of any crime in Country A.

Source: FATF (2007)

Case 90 **Red flag indicators:**	• There are attempts to disguise the real owner or parties to the transaction • Use of a complicated ownership structure and multiple countries, including high risk countries, without legitimate reasons • There is only one shareholder of a company • Use of the client account without an underlying transaction

Case 91: **Legal professional creates, dissolves and re-creates corporate entities to assist in laundering the proceeds of large-scale tax evasion – civil law country**

The FIU received a disclosure from a bank on one of its clients, an investment company. This company was initially established in an offshore centre and had moved its registered office to become a limited company under Belgian law. It had consulted a lawyer for this transition.

Shortly afterwards the company was dissolved and several other companies were established taking

over the first company's activities. The whole operation was executed with the assistance of accounting and tax advisors.

The first investment company had opened an account in Belgium that received an important flow of funds from foreign companies. The funds were later transferred to accounts opened with the same bank for new companies. These accounts also directly received funds from the same foreign companies. Part of it was invested on a long-term basis and the remainder was transferred to various individuals abroad, including the former shareholders of the investment company.

The FIU's analysis revealed that the investment company's account and those of its various spin-offs, were used as transit accounts for considerable transfers abroad. The transformation of the investment company into a limited company under Belgian law, shortly followed by the split into several new companies, obscured the financial construction.

The scale of the suspicious transactions, the international character of the construction only partly situated in Belgium, the use of company structures from offshore centres, consulting judicial, financial and fiscal experts, and the fact that there was no economic justification for the transactions all pointed to money laundering related to serious and organised tax fraud, using complex mechanisms or procedures with an international dimension.

Additionally, the managing directors of the investment company had featured in another file that the FIU had forwarded on serious and organised tax fraud. The FIU forwarded this file for money laundering related to serious and organised tax fraud using complex mechanisms or procedures with an international dimension.

Source: Belgium (2012) questionnaire response

Case 91 **Red flag indicators:**	• Creation of complicated ownership structures where there is no legitimate or economic reason, including in high risk countries. • Incorporation and/or purchase of stock or securities of several companies within a short period of time with elements in common and with no logical explanation • There is an increase in capital from foreign countries with limited information as to the connection or basis for the payments.

Case 92: **Legal professional establishes 20 companies for one client on the same day – which are then used to launder the proceeds of organised crime – civil law country**

In a dossier on organised crime, the person concerned was a company director of some twenty companies. Ten of these companies had gone bankrupt. These companies were founded by the same notary. Several suspicious elements led to a notification to the FIU: all companies were founded on the same day, by the same persons and with a very broad social purpose. In addition, these companies had the same address but their company directors live in different countries. This dossier is subject of a judicial inquiry

Source: Cellule de traitement des informations financières (2006)

Case 92 **Red flag indicators:**	• Incorporations of multiple companies in a short period of time with elements in common with no logical explanation • Involvement of individuals from multiple countries as directors of a

	company, without legitimate reason

Case 93: **Legal professionals set up companies which promptly recycled the start up capital to establish new companies to help obscure ownership and layer criminal funds – civil law country**

Several notaries were involved in the setting up of a large number of companies over a number of years. Only the legal minimum of capital was paid up, it was then almost entirely withdrawn in cash and used again to establish new companies. The seat of some companies was also located at the address of an accounting firm and they were led by front men. Several cases showed that the head of the accounting firm himself had raised money for the capital. The established companies were then sold to third parties and used in the context of illegal activities.

Source: Cellule de traitement des informations financières (2009)

Case 93 **Red flag indicators:**	• Incorporation of several companies within a short period of time with elements in common, with no logical explanation • The transaction is unusual in that a company divests itself almost entirely of capital in order to set up other companies.

Case 94: **Junior legal professional involves law firm in laundering proceeds of drug crime – common law country**

A junior lawyer with a Calgary law firm incorporated numerous shell companies in Canada and off-shore on behalf of a client who was involved in a large scale drug importation conspiracy. One shell company incorporated by the lawyer was used to channel more than CAD 6m of funds provided by members of the criminal organisation to other assets. On one occasion the lawyer issued a CAD 7 000 cheque from this shell company to a Vancouver brokerage firm to purchase stock.

Source: Schneider, S. (2004)

Case 94 **Red flag indicators:**	• Incorporation of several companies within a short period of time with elements in common, with no logical explanation, including incorporation in high risk countries • Client is known to have involvement in criminal activity

Case 95: **Three lawyers investigated for establishing companies and purchasing properties on behalf of drug traffickers – common law country**

During one proceeds of crime investigation into three Alberta-based cocaine and marijuana traffickers – Mark Steyne, Pitt Crawley, and George Obsorne – police identified three lawyers who helped the accused establish and operates companies, which were eventually proven to be nothing more than money laundering vehicles.

Documents seized by the RCMP indicated that Becky Sharp acted as legal counsel on behalf of Steyne in the incorporation and preparation of annual returns for Vanity Fair Investments Inc., a public

company in which Steyne and Crawley each held 50 percent voting shares. The corporate address listed for this company was Sharp's law office.

Documents seized by police from the law office of Sharp also showed that she represented Steyne in the purchase of real estate, the title of which was registered in the name of Vanity Fair Investments Inc. Among the documents seized by police were letters from Sharp, addressed to the Vanity Fair Investments, which included certificates of incorporation, bank statements for commercial accounts, and documents showing that Steyne and Crawley were directors and shareholders of the company.

Another lawyer acted on behalf of Steyne and companies he controlled, providing such services as incorporating numbered companies, conducting real estate transactions, purchasing a car wash, and preparing lease agreements between Steyne and the tenants of a home that was used for a marijuana grow operation. Finally, documents seized by police indicated that Majah Dobbin, a partner in a local law firm, acted on behalf of Crawley and Osborne in the incorporation of three other Alberta companies.

Source: Schneider, S. (2004)

Case 95 **Red flag indicators:**	• Use of multiple legal advisors for different businesses without good reasons • Significant funding for companies not consistent with known legitimate income

Case 96: **Legal professional provides office address and acts as director for 17 companies they set up for drug traffickers – common law country**

Public documents seized as part of a police investigation into an international drug trafficking group based in Ontario showed that a Toronto lawyer incorporated 17 different businesses that were eventually traced to members of the crime group. Upon further investigation, police discovered that the office of the law firm was listed as the corporate address for many of the companies. The lawyer was also a director of two of the businesses he helped establish. During their investigation, police learned that two members of this crime group were to go to their lawyer's office —to sign for the new companies. Records obtained from the Ontario Ministry of Consumers and Corporate Relations show that a week later, two limited companies were incorporated listing both as directors.

Source: Schneider, S. (2004)

Case 96 **Red flag indicators:**	• Incorporation of several companies within a short period of time with elements in common, with no logical explanation, including incorporation in high risk countries • Client is known to have involvement in criminal activity

Case 97: **Legal professional creates companies to provide cover story for international travel and movement of funds – civil law country**

A number of Iranian citizens were involved in the incorporation or subsequent purchase of stock in companies. On occasion they attended in person, having travelled from Tehran, while on other occasions they are represented by a German citizen or, more typically, a fellow Iranian citizen resident in Spain.

In 2007 and 2008 Company A was incorporated by an Iranian citizen and the German citizen or by other Iranians citizens acting under their guidance, and the shares of the company were sold to various Iranian citizens, in each transaction for low prices (*e.g.* EUR 25).

In 2009 and 2010 Company B was incorporated directly by Iranian citizens, with the representative or director of the company incorporated either one of the Iranian citizens or the German, appearing in all cases as interpreter.

In both the purchase of stock and the incorporation of companies, the Iranian citizens travel to Spain on occasion, while on other occasions they provide a power of attorney for this purpose executed before a notary in Tehran.

There was no information about the intended business of the companies and the creation of two companies in the same regional area made it unlikely that the companies would be implementing a normal business or economic project. The FIU were of the view that the creation of the companies and involvement of such a wide range of Iranian nationals was to enable them to obtain visas for entry into Spain and therefore to travel through the European Union, for which they receive substantial sums of money, thereby constituting a criminal activity generating funds to be laundered.

Source: Spain (2012) questionnaire response

Case 97 **Red flag indicators:**	• The parties or their representatives are native to and resident in a high risk country and there is no clear connection with the country in which the transaction is happening • A large number of securities are issued at a low price which is not consistent with genuine capital raising purposes • The objects of the company are vague and there appears to be limited commercial viability for both companies

Case 98: **Legal professional assists in creating multijurisdictional web of companies with no legitimate reason for the complexity – civil law jurisdiction**

A Spanish citizen is listed as the director of numerous Spanish limited liability companies with a wide range of corporate purposes (from renewable energies to aquaculture to information technology), although it is not clear whether these companies are genuinely operational.

Within a short space of time these Spanish companies are transferred to recently incorporated Luxembourg-registered companies, for a purchase price of several million euros. Following the transfer of stock, rights issues, involving very considerable sums are performed.

The Luxembourg-registered companies which purchased the stock in the Spanish companies

invested by means of the subscription of corporate stakes in the stock issues of Spanish companies. The foreign purchaser companies were based in Uruguay, Gibraltar, Seychelles, Panama, British Virgin Islands and Portugal. Several of the directors of the purchasing companies are also listed as representatives or directors of some of the transferred companies.

The representatives of the foreign purchaser companies declare that there is no beneficial owner (a natural person with a controlling stake above 25%).

Spanish notaries are required to be involved in all company incorporations and share sales.

Source: Spain (2012) questionnaire response

Case 98 **Red flag indicators:**	• Creation of complicated ownership structures, including multiple countries some of which are high risk, without legitimate reason • Incorporation and/or purchase of stock or securities of several companies within a short period of time with elements in common with no logical explanation. • The company receives an injection of capital which is notably high in comparison with the business size and market value of the company, with no logical explanation.

Case 99: **Legal professional secures banking services for yet to be created companies with significant funds deposited into the accounts and to be transferred between the companies without any apparent underlying economic activity – civil law country**

A lawyer opens bank accounts in the Netherlands in the name of various foreign companies yet to be established. In one of those accounts is deposited an amount of almost 20 million guilders. The intention was that between the accounts of the companies transactions would seem to take place. Per transaction would be a (fictitious) profit of approximately half a million guilders. The bank examines these arrangements and concludes that the lawyer is organising a money laundering scam. The bank refuses further cooperation and sends the money back. The money comes from a large-scale international fraudster.

Source: Netherlands (1996)

Case 99 **Red flag indicators:**	• Involvement of multiple countries without legitimate reason • Significant private funding not consistent with known legitimate income • The transaction is unusual given the amount of profit likely to be generated • Client has been convicted of acquisitive crimes

Case 100: **Legal professional continues to establish corporate entities and conduct share transactions which launder funds despite concerns – civil law country**

Notary Klaas regularly establishes legal entities at the request of client Joep and also conducts share

transactions. Client Joep trades fraudulently in companies. At one point, given the dubious circumstances surrounding the transactions, Klaas consults with a colleague notary who has previously rendered services to Joep. Although they are not able to discover anything suspicious, notary Klaas is left with a 'gut-feeling' that his services are being abused. Klaas does not conduct any deeper investigation into the background of his client and allows himself to be misled on the basis of the documents. He continues to render services without further question. During the police interrogation, Joep states that he used the services of Klaas because the notary worked fast and did not ask tricky questions.

Case 100 **Red flag indicators:**	• Incorporation of multiple companies for a single client, without clear economic justification • Use of multiple legal advisors

Case 101: **Legal professional convicted for allowing client account and personal account to be used by a client engaged in tax fraud – common law country**

In 2002, Mr Hyde, a solicitor assisted a client who had engaged in tax (MTIC) fraud and property development fraud to set up shell companies with off shore accounts, and wittingly allowed his client account and a personal account in the Isle of Man to be used to transfer funds. Over GBP 2m in criminal proceeds were laundered in this way. The solicitor was convicted in 2007 of concealing or disguising criminal property. He was jailed for three and a half years and in 2008 was stuck off.

Source: United Kingdom (2012) questionnaire response

Case 101 **Red flag indicators:**	• Disproportionate amounts of private funding • Complex companies with unnecessary foreign element • Use of client account without underlying transaction • Client known to be involved in criminal activity

Case 102: **Legal professional launders millions through companies for a corrupt PEP due to the mistaken belief that money laundering only involved cash – common law country**

A United Kingdom solicitor who assisted with laundering funds removed from Zambia by a former President. Funds allegedly for defence purposes were transferred through companies which the solicitor had set up, but were then used to fund property purchases, tuition fees and other luxury goods purchases. The solicitor ultimately made a STR and was not prosecuted. The solicitor was also found not to be liable in a civil claim for knowing assistance as dishonesty was not proven. This was on the basis that the claimant did not sufficiently controvert the solicitor's evidence that he had genuinely believed that money laundering only occurred when cash was used and not when money came through a bank. The case related to conduct between 1999 and 2001.

Source: United Kingdom (2012) questionnaire response

Case 102 **Red flag indicators:**	• Client holds a public position in a high risk country • Use of company and government funds to pay for private purchases • There are attempts to obscure the real owners or parties to the transaction

Case 103: **Legal professional convicted for assisting a corrupt PEP to purchase property, vehicles and private jets – common law country**

In 2006, Bhadresh Gohil, a solicitor acted for an African governor. He helped to set up shell companies, transferred funds to foreign accounts, opened bank accounts, purchased property, cars and a private jet for the client. The transactions involved amounts far in excess of the client's income as a governor or other legitimate income. Mr Gohil was convicted in 2010 of entering into arrangements to facilitate money laundering and concealing criminal property and was sentenced to 7 years jail. He was subsequently struck off in 2012. The criminal conviction is currently the subject of an appeal. The governor was convicted of fraud in 2012.

Source: United Kingdom (2012) questionnaire response

Case 103 **Red flag indicators:**	• Client holds a public position in a high risk country • Disproportionate private funding in light of known legitimate income • Use of company and government funds to pay for private purchases

Case 104: **Legal professional prosecuted for allegedly creating companies and otherwise assisting the laundering of the proceeds of drug trafficking – common law jurisdiction**

On November 5, 2012, an indictment was unsealed in the Western District of Texas charging an El Paso attorney, Marco Antonio Delgado, with conspiracy to launder the proceeds of a foreign drug trafficking organization, Cartel de los Valencia (AKA the Milenio Cartel), based in Jalisco, Mexico. Delgado was a principal in his own international law firm, Delgado and Associates, and is alleged to have laundered around USD 2 million, although he reportedly was asked to launder an amount exceeding $600 million.

Between July 2007 and September 2008, Delgado is accused of, among other things: establishing shell companies in the Turks and Caicos for the purpose of laundering drug proceeds; employing couriers to deliver shipments of currency and drawing up fraudulent court documents to provide the couriers with a back story should they be stopped by authorities; arranging a bulk cash smuggling operation unknown to law enforcement while simultaneously "cooperating" with the Government; and attempting to utilize his girlfriend's bank account to launder drug proceeds, although, ultimately, Delgado deposited the funds into his attorney trust account at a U.S. bank.

On February 27, 2013, a second indictment was handed down in the Western District of Texas charging Delgado with wire fraud and money laundering. This prosecution involves a scheme separate and distinct from the drug money laundering above. Here, Delgado defrauded a Nevada company and a Mexican state-owned utility (the *Comision Federal de Electricidad*), in connection a USD 121 million contract to provide heavy equipment and maintenance services for such equipment to a power plant located in Agua Prieta, Sonora, Mexico. FGG Enterprises, LLC ("FGG") is owned and

solely managed by "F.J.G," an unnamed third party. FGG won the contract described above, and payments on the contract were supposed to be directed, by the Mexican utility, through Banco Nacional de Comercio Exterior, to an account owned by FGG at Wells Fargo Bank in El Paso, Texas. Delgado sent a letter to the legal representative of the Mexican utility, instructing the representative to make the payments meant for FGG to a bank account in the Turks and Caicos Islands controlled by Delgado. This letter was sent without the knowledge and consent of F.J.G., the owner of FGG. In total, USD 32 million was wired into the Turks and Caicos account for Delgado's personal enrichment. These funds were subsequently laundered back into the United States to accounts controlled by Delgado.

Furthermore, in a related civil forfeiture action, prosecutors have frozen the proceeds of Delgado's fraud that were sent to the benefit of "Delgado & Associates LLC" from the Mexican utility. The account holding the funds is actually a client account belonging to a local law firm in the Turks & Caicos. The funds belonging to Delgado have been segregated and restrained, as the law firm filed a petition the Turks and Caicos court to modify the initial restraint. Evidently, the legal representatives of Delgado & Associates LLC were unaware that their client account was being used for criminal purposes, as they were informed that the purpose of the Delgado & Associates legal structure was to assist in receiving and disbursing funds related to a client's subcontract to sell turbines to Mexico.

Case 104 **Red flag indicators:**	• Clients are known to be under investigation for acquisitive crimes • Involvement of multiple foreign bank accounts and foreign companies without legitimate reasons • Use of the client account without underlying transactions

Case 105: **Legal professional convicted for setting up a sham company and helping to create a cover story to launder the proceeds of crime – common law country**

In a government sting operation, an undercover agent approached attorney Angela Nolan-Cooper, who was suspected of helping launder criminal proceeds for clients, seeking help in laundering supposed drug proceeds. Nolan-Cooper agreed to help, and did so by establishing a sham entity, a purported production company, and hiding the proceeds in Bahamian bank accounts. Nolan-Cooper told the undercover agent that funnelling his money through a corporation would make it appear legitimate because it would establish a source of income and facilitate filing false tax returns that would legitimise the money.

Nolan-Cooper later arranged for an accountant to help draw up false corporation papers and corporate tax returns, although it appears the conspiracy was intercepted before this could occur. Nolan-Cooper also facilitated the deposit of large sums of cash into a Cayman Island account at the direction of the undercover agent, who told her that he needed the money in that account to complete a drug transaction. Nolan-Cooper entered a conditional plea to multiple counts of money laundering. Upon resentencing on remand, Nolan-Cooper was sentenced to 72 months incarceration and three years' supervised release. See 155 F.3d 221 (3rd Cir. 1998) (affirming denial of motion to dismiss and vacating sentence); see also United States v. Carter, 966 F. Supp. 336 (E.D. Pa. 1997)

(reversing the district court's grant of judgment of acquittal).

Case 105 **Red flag indicators:**	• Involvement of structures and bank accounts in multiple high risk countries with no legitimate reason • Creation of a company whose main purpose is to engage in activities within an industry with which neither the shareholders or the managers have experience or connection • Use of client account without an underlying transaction

Case 106: **Legal professional convicted of setting up companies to launder proceeds of corruption – common law country**

Attorney Jerome Jay Allen pleaded guilty to conspiring to commit money laundering in connection with his assistance in laundering the proceeds of a fraudulent kickback scheme. The scheme involved two employees of a steel processing company who caused their company to overpay commission on certain contracts. A portion of the inflated commission was then funnelled back to the employees through shell companies created by Allen. See United States v. Graham, 484 F.3d 413 (6th Cir. 2007).

Case 106 **Red flag indicators:**	• Source of funds not consistent with known legitimate income • There are attempts to disguise the real owners or parties to the transactions • U-turn transactions

METHOD: MANAGEMENT OF COMPANIES AND TRUSTS

TECHNIQUE: MANAGEMENT OF A COMPANY OR TRUST – CREATION OF LEGITIMACY AND PROVISION OF LEGAL SERVICES

Case 107: **Legal professional involved in managing an offshore company which was laundering the proceeds of a pyramid scheme – civil law country**

In 2004 the A-FIU received several STRs. The reporting entities have mentioned that some suspects were using several bank accounts (personal bank accounts, company bank accounts and bank accounts from offshore companies). After the analysis the A-FIU assumed that the origin of the money is from fraud and pyramid schemes. The A-FIU disseminated the case to a national law enforcement authority and coordinated the case on international level. The A-FIU requested information from abroad (using Interpol channel, Egmont channel and L/O). The results proved that the Austrian lawyer was a co-perpetrator because he was managing an involved offshore company and the bank account of the company. These results were also disseminated to the national law enforcement agency. The investigation revealed approximately 4000 victims with a total damage of app. EUR 20 mil. The public prosecutor's office issued two international arrest warrants. In 2008

four suspects were convicted for breach of trust. Also the lawyer was convicted for breach of trust with a penalty of 3 years.

Case 107 **Red flag indicators:**	• Use of foreign bank accounts and companies without a legitimate reason • Payments made were not consistent with contractual terms

Case 108: **Legal professionals set up companies and accept multiple deposits to launder proceeds of liquor smuggling – hybrid common / civil law country**

A police investigation into Joseph Yossarian, a Quebec liquor smuggler, revealed that he invested money into and eventually purchased a company for which lawyer Pierre Clevingier was the founder, president, director, and sole shareholder. Clevingier was also the comptroller for the company and was listed as a shareholder of three other numbered companies, which police traced to Yossarian. Yet another company, registered in the name of Yossarian's sister, was used as a front for Joseph's investment into a housing development. This company was incorporated by lawyer Robert Heller, who had established other shell companies registered in the name of the sister and used by her brother to launder money. Heller was also involved in transactions relating to companies that he set up for the benefit of Yossarian, including issuing and transferring shares in these companies and lending money between the different companies. Yossarian invested CAD 18 000 in another housing development in Montreal through a company established by Quebec real estate lawyer Albert Tappman. Records seized by police during a search of Tappman's law office established that he had received cash and cheques from Yossarian, including a deposit of CAD 95 000 (CAD 35 000 of which was cash), which he deposited for Yossarian in trust. Police also found copies of two cheques, in the amount of CAD 110 000 and CAD 40 000, drawn on Tappman's bank account, and made payable to the order of a company he created on behalf of Yossarian. Tappman used a numbered company, for which another lawyer was the director and founder, as the intermediary through which Yossarian and others invested in housing developments.

Case 108 **Red flag indicators:**	• Incorporation of several companies in a short period of time with elements in common with no logical reason • Use of multiple legal advisors without legitimate reasons • Significant cash deposits • There are attempts to disguise the real owners of or parties to the transactions • Potential use of a client account without underlying transactions

METHOD: MANAGING CLIENT AFFAIRS AND MAKING INTRODUCTIONS

TECHNIQUE: OPENING BANK ACCOUNTS ON BEHALF OF CLIENTS

Case 109: **Legal professional assists organised criminal to open bank account – civil law country**

A foreigner residing in Belgium was introduced to a bank by a Belgian lawyer's office in order to open an account. This account was then credited by substantial transfers from abroad that were used for purchasing immovable goods. The FIU's analysis revealed that the funds originated from organised crime.

Source: Belgium (2012) questionnaire response

Case 109 **Red flag indicators:**	• Client requires introduction to financial institutions to help secure banking facilities

Case 110: **Legal professional assists foreign PEP to open bank accounts – civil law country**

In a file regarding corruption, a politically exposed person (PEP) was the main beneficial owner of companies and trusts abroad. Accounts in Belgium of these companies received considerable amounts from the government of an African country. The FIU's analysis revealed that the individual had been introduced to the financial institution by a lawyer. It turned out that the lawyer was also involved in other schemes of a similar nature in other judicial investigations.

Source: Belgium (2012) questionnaire response

Case 110 **Red flag indicators:**	• Client holds a public position and is the beneficial owner of multiple companies and trusts in foreign countries • Government funds being used to pay for private or commercial expenses • Client requires introduction to financial institutions to help secure banking facilities

Case 111: **Legal professional assists front company to open bank account – civil law country**

One file regarded a company established in an offshore centre, which was quoted on the stock exchange. Information obtained by the Unit revealed that the stock exchange supervisor had published an official notice stating that the stock of this company had been suspended due to an investigation into fraudulent accounting by this company.

A network of offshore companies was used to intentionally circulate false information regarding this stock in order to manipulate the price. In the meantime a procedure had been initiated by the American stock exchange supervisor to cancel this stock. Information obtained by the Unit revealed that the main stockholder of this company had laundered money from this stock exchange offence by transferring money to an account that he held in a tax haven. In addition, it also became clear that he had called upon a lawyer in Belgium to request opening a bank account in name of a front

company, and to also represent this company in order to facilitate money laundering.

Source: Belgium (2012) questionnaire response

Case 111 **Red flag indicators:**	• Client currently under investigation for acquisitive crime • Involvement of structures with multiple countries, some of which were high risk, without legitimate reason • Client requires introduction to financial institutions to help secure banking facilities

Case 112: **Legal professional convicted for providing laundering services to a criminal group undertaking a Ponzi scheme – common law country**

Six defendants were indicted on 89 counts related to a Treasury bill-leasing Ponzi scheme perpetrated through the corporation K-7. Subsequently, the group's attorney, Louis Oberhauser, was added as a defendant in a superseding indictment. Oberhauser had held some of the invested funds in an attorney trust account designated for K-7 pursuant to an escrow agreement he had drafted. He also had helped to incorporate K-7 and arrange lines of credit on K-7's behalf, as well as entered into contracts with investors on behalf of his law firm that authorized Oberhauser to act on behalf of the investors in entering into a trading program. All defendants excepting Oberhauser and one other co-conspirator pleaded guilty. In a joint trial, the co-conspirator was convicted of 68 counts, and Oberhauser acquitted on 62 of 66 counts and convicted on two counts of money laundering. The district court granted judgment of acquittal, but the appeals court reversed that decision. Oberhauser was sentenced to 15 months' incarceration, two years' supervised release, community service, and restitution in an amount of USD 160 000. *See* 284 F.3d 827 (8th Cir. 2002).

Case 112 **Red flag indicators:**	• Legal professional acting in a potential conflict of interest situation • Client requires introduction to financial institutions to help secure banking facilities

Case 113: **Legal professional convicted after setting up companies, structuring deposits and maintaining the company accounts to launder funds – common law country**

Attorney Luis Flores was convicted of one count of conspiracy to commit money laundering, three counts of money laundering, and one count of structuring currency transactions to avoid reporting requirements. A client approached Flores representing himself to be an Ecuadoran food importer/exporter. Flores opened several corporations for the client and established several business accounts. Flores maintained the accounts for a USD 2,000 weekly salary. Flores held himself out as the president of the corporations and was the only authorized signatory on the corporation accounts. Cash deposits into the accounts always totalled less than USD 10 000. As banks closed accounts due to suspicious activity, Flores would open new accounts. He also laundered cash through brokerages on the black market peso exchange. See 454 F.3d 149 (3rd Cir. 2006) (affirming conviction and 32-month sentence).

Source: United States (2012) questionnaire response United States v. Flores, No. 3:04-cr-21 (D.N.J.)

Case 113 **Red flag indicators:**	• Incorporation of multiple corporations and use of multiple bank accounts within a short space of time where there are elements in common with no logical explanation. • Attorney fees disproportionate to the income of the companies. • Structuring of payments • Client requires introduction to financial institutions to help secure banking facilities

TECHNIQUE: MANAGEMENT OF CLIENT'S GENERAL AFFAIRS THROUGH CLIENT ACCOUNT

Case 114: **Legal professional helps to hide cash from a bankruptcy through a life insurance policy – common law country**

A bankrupt individual used the name of a family member to pay cash into an account and to draw a cheque to the value of the cash. He provided the cheque to a lawyer. The lawyer provided a cheque to the family member for part of the sum and then deposited the remainder of the funds into the person's premium life policy which was immediately surrendered. The surrender value was paid into the family member's account.

Source: Australia (2012) questionnaire response

Case 114 **Red flag indicators:**	• Legal professional involved in a U turn transaction • Provision of financial services not in connection with an underlying transaction • Provision of funds from a third party without legitimate reason • Use of client account without an underlying transaction

Case 115: **Legal professional creates web of fake loans and contracts between companies of which he was a director to launder the proceeds of crime – civil law country**

Company A established abroad, with very vague corporate goals and directors residing abroad, had opened an account with a bank in Belgium. This company had been granted a very large investment loan for purchasing a real estate company in Belgium. This loan was regularly repaid by international transfers from the account of Z, one of company A's directors, who was a lawyer. The money did not originate from company A's activities in Belgium. Furthermore, the loan was covered by a bank guarantee by a private bank in North America. This bank guarantee was taken over by a bank established in a tax haven shortly afterwards. Consequently, the financial structure involved a large number of countries, including offshore jurisdictions. The aim was probably to complicate any future investigations on the origin of the money. Furthermore, company A's account was credited by an international transfer with an unknown principal. Shortly afterwards the money was withdrawn in cash by lawyer Z, without an official address in Belgium. Information from the FIU's foreign counterparts revealed that the lawyer's office of which Z was an associate, was suspected of being involved in the financial management of obscure funds. One of the other directors of company A was known for trafficking in narcotics and money laundering. All of these elements indicated that

company A and its directors were part of an international financial structure that was set up to launder money from criminal origin linked to trafficking in narcotics and organised crime.

Source: Belgium (2012) questionnaire response

Case 115 **Red flag indicators:**	• Investment in immovable property, in the absence of links with the place where the property is located • Funding from a private bank in a country not connected with either the location of the company or the location of the property being purchased • Instruction of a legal professional at a distance from the transaction • Third party funding without apparent legitimate connection and withdrawal of that funding in cash shortly after deposit

Case 116: **Lawyer accepts cash, creates companies and purchases property for drug trafficker – common law country**

While an Alberta-based drug trafficker used numerous law firms to facilitate his money laundering activity, he appeared to have preferred one firm over all the others. On numerous occasions, a partner in this preferred law firm accepted cash from the drug trafficker, which was then deposited by the lawyer for his client, in trust. According to deposit slips seized by police, between August 19, 1999 and October 1, 2000 a total of USD 265 500 in cash was deposited by the lawyer in trust for this client. The funds would then be withdrawn to purchase assets, including real estate and cars. The drug trafficker often used shell and active companies to facilitate his money laundering activities. Documents seized by the RCMP showed that on November 9, 1999, the lawyer witnessed the incorporation a company, of which the drug trafficker was a director. Along with the brother of the lawyer, the drug trafficker was also listed as a director of another company and police later identified cash deposits of USD 118 000 into the legal trust account on behalf of this company. The deposit slips were signed by the lawyer. Funds were also transferred between the various trust account files the lawyer established for this client and his companies. In one transaction under the lawyer‘s signature, USD 83 000 was transferred from this client‘s trust account file to the latter company he incorporated on behalf of this client.

Source: Schneider, S. (2004)

Case 116 **Red flag indicators:**	• Use of multiple legal advisors without legitimate reason • Significant deposits of cash not consistent with known legitimate income • Incorporation of multiple companies without legitimate business purposes • Use of client account without an underlying transaction

Case 117: **Legal professional convicted and removed from practice for laundering the proceeds of fraud through his client account and personal account – common law jurisdiction**

The Louisiana Office of Disciplinary Counsel (ODC) filed a petition to permanently disbar attorney Derrick D.T. Shepherd. In April 2008, a federal grand jury indicted Shepherd, who was then serving as a Louisiana state senator, on charges of mail fraud, conspiracy to commit mail and wire fraud, and conspiracy to commit money laundering. The indictment alleged that Shepherd helped a convicted bond broker launder nearly USD 141 000 in fraudulently generated bond fees, and in October 2008, Shepherd pleaded guilty to the money laundering charge. Shepherd admitted to helping broker Gwendolyn Moyo launder construction bond premiums paid to AA Communications, Inc., long after the company was banned from engaging in the insurance business and its accounts were seized by state regulators. Specifically, in December 2006, Shepherd deposited into his client trust account USD 140 686 in checks related to bond premiums and made payable to AA Communications. He then wrote checks totalling USD 75 000 payable to the broker and her associates. Of the remaining funds, Shepherd transferred USD 55 000 to his law firm's operating account and deposited USD 15 000 into his personal checking account. He then moved USD 8 000 from the operating account back into his client trust account. On December 21, 2006, respondent paid off USD 20 000 in campaign debt from his operating account, writing "AA Communications" on the memo line of the check. To conceal this activity, respondent created false invoices and time sheets reflecting work purportedly done by his law firm on behalf of the Ms. Moyo.

Upon investigating Shepherd for multiple ethical violations, the ODC obtained copies of Shepherd's client trust account statements and determined that he had converted client funds on numerous occasions, frequently to mask negative balances in the account. He also commingled client and personal funds and failed to account for disbursements made to clients.

Shepherd submitted untimely evidence to the Court documenting his "substantial assistance to the government in criminal investigations," but the Court found Shepherd's money laundering, which promoted his co-conspirators' unlawful activity and benefitted him personally, to be reprehensible and deserving of the harshest sanction. Despite Shepherd's contention that his federal conviction was not "final" and his denial of any misconduct, the Court permanently disbarred Shepherd from the practice of law.

Case 117 **Red flag indicators:**	• Client is known to have convictions for acquisitive crime • Client company is engaging in businesses without a relevant licence / having been banned from engaging in that business • Client is unable to access financial services • Use of client account without underlying transactions, contrary to client account rules • Legal professional acting in potential conflict of interest situation – by making payments into personal accounts

Case 118: **Legal professional convicted for helping ex-police officer launder drug money by accepting cash through his client account for the purchase of stocks – common law jurisdiction**

Defence attorney Scott Crawford was convicted of laundering drug proceeds through his escrow account. Patrick Maxwell, an ex-police officer turned drug dealer, wanted to invest his drug proceeds in the stock market, but wanted to avoid suspicion that would arise if he deposited two large amounts of cash in a bank account. A third party would give Maxwell's cash to Crawford, who would then deposit it in his legal practice's escrow account. From that account, Crawford drew cashier's checks payable to Prudential Securities. The checks were then deposited in a brokerage account controlled by Maxwell. See 281 F. App'x 444 (6th Cir. 2008) (affirming 71-month sentence).

Case 118 **Red flag indicators:**	• Significant level of cash deposits not consistent with known legitimate income • Payments via a third party in an attempt to disguise the true parties to the transaction • Use of the client account without an underlying legal transaction

Case 119: **Legal professional convicted of money laundering after safe keeping cash obtained from clients he represented in relation to drug charges – common law country**

Attorney Juan Carlos Elso was convicted of money laundering and conspiracy to launder money by engaging in a transaction designed to conceal the origin of drug proceeds and by conspiring to engage in a financial transaction involving drug proceeds so as to avoid reporting requirements. With respect to the money laundering offense, Elso agreed to launder the proceeds of a former client, who he had represented in a drug case and who had paid attorney and investigator fees in cash. Elso retrieved USD 266 800 in cash from the client's house for safekeeping (in case of search by law enforcement). On the way back to his office with the cash, Elso was stopped and arrested. The conspiracy count was based upon a wire transfer Elso made on behalf of the wife of another former drug client. The wife, who was given USD 200 000 to launder, brought Elso USD 10 000, which he deposited into his law firm's trust account and then wired USD 9 800 to an account affiliated with Colombian drug suppliers. Elso did not file federally required reports in conjunction with this transaction. See 422 F.3d 1305 (11th Cir. 2005) (affirming Elso's conviction and 121-month sentence).

Case 119 **Red flag indicators:**	• Client is known to be under investigation / prosecution for acquisitive crimes • Disproportionate amounts of cash not consistent with known legitimate income • Use of the client account without an underlying legal transaction • Structuring of payments

METHOD: USE OF SPECIALISED LEGAL SKILLS

Case 120: **Legal professional arrested after attempting to clear a drug dealers accounts subject to a power of attorney – civil law jurisdiction**

A drug dealer is in detention. He fears that the Prosecutor/judge will confiscate his bank accounts in Luxembourg. The lawyer also approaches a colleague in Luxembourg and asks him how the relationship between the dealer and the money can be broken. The lawyer obtains a power of attorney over the account and attends the bank to withdraw all of the assets from the bank. The lawyer was arrested in his efforts to retrieve the money from the bank.

Source: The Netherlands (1996)

Case 120 **Red flag indicators:**	• Client is known to be under investigation / have convictions for acquisitive crime • Use of foreign bank accounts without legitimate reasons • A power of attorney is sought for the administration or disposal of assets under conditions which are unusual.

Case 121: **Legal professional prosecuted for allegedly creating a range of entities and accounts to launder proceeds of fraud – common law country**

The predicate offence was fraud involving several persons, one of whom was an attorney-at-law and several companies. The offence was committed during the period 1997 to 2000 and the subjects were arrested and charged in 2002.

The attorney-at-law was instrumental in creating different types of financial vehicles such as loans, bonds, shares, trusteeships and a myriad of personal, business and client accounts to facilitate the illicit activity which started with the loan-back method being used to purchase bonds.

It was alleged that the attorney designed documents and transactions to facilitate the laundering of proceeds of the offence, namely obtaining money by false pretences contrary to section 46 of the Proceeds of Crime Act 2000. This matter is before the Courts of Trinidad and Tobago.

Source: Trinidad & Tobago (2012) questionnaire response

Case 121 **Red flag indicators:**	• Involvement of multiple entities, arrangements and bank accounts with elements in common with no legitimate explanation • Client requires introduction to a financial institution to secure banking facilities

Case 122: **Legal professional accepts large amounts of cash for safekeeping and paying bail from criminals he is defending – common law country**

Between 1993 and 2006 a solicitor, Anthony Blok, acted for a number of clients facilitating money laundering. In one case he entered into negotiations to sell a painting he knew clients had stolen and to have it removed from the arts theft register. In another case he received and paid

GBP 75 000 in cash for bail where he was acting for a client whose only source of income had been fraud and money laundering, and lied as to where the money had come from when asked by investigators. Finally, he had large amounts of unexplained cash in envelopes in the office with the names of clients on them – who he was defending in criminal matters. The Court accepted that if the funds had been for the payment of fees, they should have been banked, and absent any explanation as to the reason for holding those funds, the jury conclude that Mr Blok must have been concealing the proceeds of crime on behalf of the clients. In 2009 Mr Blok was convicted of transferring criminal property, possessing criminal property, entering into an arrangement to facilitate money laundering and failure to disclose, 4 years jail. In 2011 he was stuck off the roll.

Source: United Kingdom (2012) survey response

Case 122 **Red flag indicators:**	• Client is known to be under investigation for acquisitive crimes • The holding of large deposits of money without the provision of legal services • Significant amounts of cash not consistent with known legitimate income levels

Case 123: **Legal professional convicted for assisting in laundering the proceeds of a drug deal found in a safe through a real estate investment company – common law country**

Walter Blair was convicted of laundering drug proceeds obtained from a client. His client had possession of a safe containing the drug proceeds of a Jamaican drug organization. After the head of the organization (who owned the safe) was murdered, Blair helped his client to launder the money by inventing an investment scheme based on the Jamaican tradition of cash-based "partners money," setting up a real estate corporation in the name of the client's son, opening an account in the corporation's name, and obtaining loans on behalf of the corporation to make real estate investments. Blair misrepresented the amount of currency in the safe to his client and retained some of the funds in addition to withholding fees for his legal services. See 661 F.3d 755 (4th Cir. 2011), cert. denied 132 S. Ct. 2740 (2012) (affirming conviction and sentence).

FATF, *Guidance for a Risk-Based Approach: Accounting Profession* (Paris: FATF, 2019)

FATF

GUIDANCE FOR A RISK-BASED APPROACH

ACCOUNTING PROFESSION

JUNE 2019

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

Table of contents

Acronyms

AML/CFT	Anti-money laundering/Countering the financing of terrorism
CDD	Client[1] due diligence
DNFBP	Designated non-financial businesses and professions
FATF	Financial Action Task Force
FIU	Financial intelligence unit
INR.	Interpretive Note to Recommendation
ML	Money laundering
NRA	National Risk Assessment
PEP	Politically Exposed Person
R.	Recommendation
RBA	Risk-based approach
SRB	Self-regulatory body
STR	Suspicious transaction report
TCSP	Trust and company service providers
TF	Terrorist financing

[1] In some jurisdictions or professions, the term "customer" is used, which has the same meaning as "client" for the purposes of this document.

Executive Summary

1. The risk-based approach (RBA) is central to the effective implementation of the FATF Recommendations. It means that supervisors, financial institutions, and professional accountants in public practice (also referred to as "accountants" or "accountancy profession" for the purpose of this Guidance) identify, assess, and understand the money laundering and terrorist financing (ML/TF) risks to which they are exposed, and implement the most appropriate mitigation measures. This approach enables them to focus their resources where the risks are higher.

2. The FATF RBA Guidance aims to support the implementation of the RBA, taking into account national ML/TF risk assessments and AML/CFT legal and regulatory frameworks. It includes a general presentation of the RBA and provides specific guidance for the accountancy profession and for their supervisors. The Guidance was developed in partnership with the profession, to make sure it reflects expertise and good practices from within the industry.

3. The development of the ML/TF risk assessment is a key starting point for the application of the RBA. It should be commensurate with the nature, size and complexity of the business. The most commonly used risk criteria are country or geographic risk, client risk, service/transaction risk. The Guidance provides examples of risk factors under these risk categories.

4. The Guidance highlights that it is the responsibility of the senior management of accountants to foster and promote a culture of compliance as a core business value. They should ensure that accountants are committed to manage ML/TF risks when establishing or maintaining business relationships.

5. The Guidance highlights that accountants should design their policies and procedures so that the level of initial and ongoing client due diligence measures addresses the ML/TF risks they are exposed to. In this regard, the Guidance explains the obligations for accountants regarding identification and verification of beneficial ownership information and provides examples of standard, simplified and enhanced CDD measures based on ML/TF risk.

6. The Guidance has a section for supervisors of the accountancy profession and highlights the role of self-regulatory bodies (SRBs) in supervising and monitoring. It explains the risk-based approach to supervision as well as supervision of the risk-based approach by providing specific guidance on licensing or registration requirements for the accountancy profession, mechanisms for on-site and off-site supervision, enforcement, guidance, training and value of information-exchange between the public and private sector.

7. The Guidance also highlights the importance of supervision of beneficial ownership requirements and nominee arrangements. It underscores how supervisory frameworks can help ascertain whether accurate and up-to-date beneficial ownership information on legal persons and legal arrangements is maintained by the accountants and made available in a timely manner to competent authorities when required.

Section I - Introduction and key concepts

This Guidance should be read in conjunction with the following, which are available on the FATF website: www.fatf-gafi.org.

a) The FATF Recommendations, especially Recommendations 1, 10, 11, 12, 17, 19, 20, 21, 22, 23, 24, 25 and 28 and their Interpretive Notes (INR), and the Glossary.

b) Other relevant FATF Guidance documents such as:

- The FATF Guidance on National Money Laundering and Terrorist Financing Risk Assessment (February 2013)
- FATF Guidance on Transparency and Beneficial Ownership (October 2014)
- FATF Guidance on the Risk-Based Approach for Trust and Company Service Providers (TCSPs) (June 2019)
- FATF Guidance on the Risk-Based Approach for legal professionals (June 2019)

c) Other relevant FATF Reports such as the Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership (July 2018).

Background and context

8. The risk-based approach (RBA) is central to the effective implementation of the revised FATF International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation, which were adopted in 2012[2]. The FATF has reviewed its 2009 RBA Guidance for accountants, in order to bring it in line with the new FATF requirements[3] and to reflect the experience gained by public authorities and the private sector over the years in applying the RBA. This revised version applies to professional accountants in public practice (hereinafter also referred to as "accountants" or "accountancy profession"- see paragraph 16 below). Accountants should also refer to the RBA Guidance for trust and company service providers, when they provide TCSP services.

9. The RBA Guidance for accountants was drafted by a project group comprising FATF members and representatives of the private sector. The project group was co-led by the UK, the United States, the Institute of Chartered Accountants in England and Wales, the International Bar Association and the Society of Trust and Estate Practitioners. Membership of the project group is set out in Annex 4.

10. The FATF adopted this updated RBA Guidance for accountants at its June 2019 Plenary.

2 FATF (2012).

3 The FATF Standards are comprised of the FATF Recommendations, their Interpretive Notes and applicable definitions from the Glossary.

Purpose of the Guidance

11. The purpose of this Guidance is to:

a) Support a common understanding of a RBA for the accountancy profession, financial institutions and designated non-financial businesses and professions (DNFPBs)[4] that maintain relationships with accountants, competent authorities and self-regulatory bodies (SRBs)[5] responsible for monitoring the compliance of accountants with their AML/CFT obligations;

b) Assist countries, competent authorities and accountants in the design and implementation of a RBA to AML/CFT by providing guidelines and examples of current practice, with a particular focus on providing advice to sole practitioners and small firms;

c) Recognise the difference in the RBA for different accountants providing diverse services such as statutory audit, financial and tax advice, insolvency related services, among others;

d) Outline the key elements involved in applying a RBA to AML/CFT related to accountants;

e) Highlight that financial institutions that have accountants as clients should identify, assess and manage the ML/TF risk associated with accountants and their services;

f) Assist countries, competent authorities and SRBs in the implementation of the FATF Recommendations with respect to accountants, particularly Recommendations 22, 23 and 28;

g) Assist countries, SRBs and the private sector to meet the requirements expected of them, particularly under IO.3 and IO.4;

h) Support the effective implementation of action plans of NRAs conducted by countries; and

i) Support the effective implementation and supervision of national AML/CFT measures, by focusing on risks as well as preventive and mitigating measures.

Target audience, status and content of the Guidance

12. This Guidance is aimed at the following audience:

a) Practitioners in the accountancy profession;

b) Countries and their competent authorities, including AML/CFT supervisors of accountants, SRBs, AML/CFT supervisors of banks that rely on the CDD performed by accountants, and Financial Intelligence Units (FIU); and

c) Practitioners in the banking sector, other financial services sectors and DNFPBs that rely on the CDD performed by accountants.

13. The Guidance consists of four sections. Section I sets out introduction and key concepts. Section II contains key elements of the RBA and should be read in conjunction with specific guidance to accountants (Section III) and guidance to

[4] See definition of the term 'Designated Non-Financial Businesses and Professions' in the FATF Glossary.

[5] See definition of the term 'Self-regulatory body' in the FATF Glossary

supervisors of accountants on the effective implementation of a RBA (Section IV). There are four annexes:

a) Beneficial ownership information in relation to a company, trust or other legal arrangements to whom an accountant provides services (Annex 1);

b) Glossary of terminology (Annex 2);

c) Supervisory practices for implementation of the RBA (Annex 3); and

d) Members of the RBA Drafting Group (Annex 4).

14. This Guidance recognises that an effective RBA will take into account the national context, consider the legal and regulatory approach and relevant sector guidance in each country, and reflect the nature, diversity, maturity and risk profile of a country's accountancy profession and the risk profile of individual accountants operating in the sector. The Guidance sets out different elements that countries and accountants could consider when designing and implementing an effective RBA.

15. This Guidance is non-binding and does not overrule the purview of national authorities[6], including on their local assessment and categorisation of the accountancy profession based on the prevailing ML/TF risk situation and other contextual factors. It draws on the experiences of countries and of the private sector to assist competent authorities and accountants to implement applicable FATF Recommendations effectively. National authorities may take this Guidance into account while drawing up their own Guidance for the sector. DNFPBs should also refer to relevant legislation and sector guidance for the country in which an accountant is based.

Scope of the Guidance and key features of the accountancy profession

Scope and Terminology

16. This Guidance is for professional accountants in public practice[7] and is aimed to help them comply with the FATF Recommendations that apply to them. Professional accountant in public practice refers to professional accountants, irrespective of functional classification (for example, audit, tax, advisory or consulting) in a firm or individual practitioners that provide professional services. The nature of services provided (e.g. statutory audit as against other professional services such as financial advice, company services) will determine the scope and depth of due diligence and risk assessment. Professional accountants should also consider their ethical obligations as set out under the Code of Ethics issued by the International Federation of Accountants (IFAC)[8] where relevant.

17. This Guidance is not meant to apply to professional accountants in business, which includes professional accountants employed or engaged in an executive or non-executive capacity in such areas as commerce, industry, service, the public sector, education, the not-for-profit sector, regulatory bodies or professional bodies. Such

6 National authorities should however take the Guidance into account when carrying out their supervisory functions.

7 The term 'accountant' is used interchangeably with 'professional accountant in public practice' throughout this guidance.

8 Handbook of the International Code of Ethics for Professional Accountants issued in 2018.

accountants should refer to their professional code of conduct or other alternative sources of Guidance, on the appropriate action to take in relation to suspected illegal activity by their employer or a third party.

Key features

18. Accountants provide a range of services and activities that vastly differ (e.g. in their methods of delivery and in the depth and duration of the relationships formed with clients, and the size of their operation). This Guidance is written at a high-level to cater for all, and the different levels and forms of supervision or monitoring that may apply. Each country and its national authorities should aim to establish a partnership with its designated non-financial businesses and professions (DNFBP) sector that will be mutually beneficial to combating ML/TF.

19. The roles, and therefore risks, of the different DNFBP and/or professional constituents, including accountants frequently differ. However, in some areas, there are inter-relationships between different DNFBP and/or professional sectors, and between the DNFBPs and financial institutions. For example, businesses or professionals within other DNFBP and/or professional sectors or by financial institutions that may instruct accountants. In some jurisdictions, accountants may also provide trust and company services covered by the FATF Recommendations. For such activities, accountants should refer to the guidance on the risk-based approach for Trust and Company Service Providers (TCSPs).

20. Professional accountants in public practice may provide a wide range of services, to a diverse range of clients. The actual services delivered by accountants may vary between jurisdictions and the examples provided here may not be applicable in every jurisdiction. Services may include (but are not limited to) the following, though not necessarily to the same client. The FATF recommendations apply to specified activities in R.22 (see paragraph 31).

a) Audit and assurance services (including reporting accountant work in initial public offerings);

b) Book-keeping and the preparation of annual and periodic accounts;

c) Tax compliance work;

d) Tax advice;

e) Trust and company services;

f) Internal audit (as a professional service), and advice on internal control and risk management;

g) Regulatory and compliance services, including outsourced regulatory examinations and remediation services;

h) Company liquidation/insolvency/receiver-managers/bankruptcy related services;

i) Advice on the structuring of transactions;

j) Due diligence in relation to mergers and acquisitions

k) Succession advice;

l) Advice on investments and custody of client money; and

m) Forensic accounting.

21. In many countries, accountants are the professionals frequently consulted by many small businesses and individuals when seeking general business advice and a wide range of regulatory and compliance advice. Subject to the codes of professional conduct in the relevant jurisdiction, where services are not within their competence or risk appetite or comfort zone, accountants should refuse the engagement. However, they may advise on an alternate professional advisor (such as a legal professional, notary or trust and company service provider, or another professional accountant).

Vulnerabilities of accounting services

22. Some of the functions performed by accountants that are the most susceptible to the potential launderer include:

a) Financial and tax advice – criminals may pose as individuals seeking financial or tax advice to place assets out of reach in order to avoid future liabilities.

b) Company and trust formation – criminals may attempt to confuse or disguise the links between the proceeds of a crime and the perpetrator through the formation of corporate vehicles or other complex legal arrangements (trusts, for example).

c) Buying or selling of property – criminals may use property transfers to serve as either the cover for transfers of illegal funds (layering stage) or else the final investment of these proceeds after their having passed through the laundering process (integration stage).

d) Performing financial transactions – criminals may use accountants to carry out or facilitate various financial operations on their behalf (e.g. cash deposits or withdrawals on accounts, retail foreign exchange operations, issuing and cashing cheques, purchase and sale of stock, sending and receiving international funds transfers, etc.).

e) Gaining introductions to financial institutions- criminals may use accountants as introducers or intermediaries. This can occur both ways as criminals may use financial institutions to gain introductions to accountants as well.

23. Further, maintenance of incomplete records by clients as revealed during the accounting/bookkeeping services provided by accountants can be an area of higher risk. Also, preparation, review and auditing of financial statements may be susceptible to misuse by criminals where there is a lack of professional body oversight or required use of accounting and auditing standards.

24. Many aspects of this Guidance on applying a RBA to AML/CFT may also apply in the context of predicate offences, particularly for other financial crimes such as tax crimes. The ability to apply the RBA effectively to relevant predicate offences will also reinforce the AML/CFT obligations. Accountants may also have specific obligations in respect of identifying risks of predicate offences such as tax crimes, and supervisors may have a role to play in oversight and enforcement against those crimes. Therefore, in addition to this guidance, accountants and supervisors should have regard to other sources of guidance that may be relevant in managing the risks of predicate offences.

25. Services relating to the formation and management of companies and trusts are seen as being a particular area of vulnerability.

Formation of companies and trusts[9]

26. In some countries, accountants are involved in the formation of a company. While in other countries members of the public are able to register a company themselves directly with the company registry, an accountant's advice is sometimes sought at least in relation to initial corporate, tax and administrative matters.

27. Criminals may seek the opportunity to retain control over criminally derived assets while frustrating the ability of law enforcement to trace the origin and ownership of the assets. Companies and often trusts and other similar legal arrangements are seen by criminals as potentially useful vehicles to achieve this outcome. While shell companies[10], which do not have any ongoing business activities or assets, may be used for legitimate purposes such as serving as a transaction vehicle, they may also be used to conceal beneficial ownership, or enhance the perception of legitimacy. Criminals may also seek to misuse shelf companies[11], which can be formed by accountants, by seeking access to companies that have been 'sitting on the shelf' for a long time. This may be in an attempt to create the impression that the company is reputable and trading in the ordinary course because it has been in existence for many years. Shelf companies can also add to the overall complexity of corporate structures, further concealing the underlying beneficial ownership information.

Management of companies and trusts

28. In some cases, criminals will seek to have accountants involved in the management of companies and trusts in order to provide greater respectability and legitimacy to the company or trust and its activities. In some countries professional rules preclude an accountant from acting as a trustee or as a company director, or require a disclosure of directorship positions to ensure independence and transparency is maintained. This will affect whether any funds relating to activities by the company or trust can go through the relevant accountant's client account.

Acting as nominee

29. Individuals may sometimes have accountants or other persons hold their shares as a nominee, where there are legitimate privacy, safety or commercial concerns. However, criminals may also use nominee shareholders to obscure their ownership of assets. In some countries, accountants are not permitted to hold shares in entities for whom they provide advice, while in other countries accountants regularly act as nominees. Accountants should identify beneficial owners when establishing business relations in these situations. This is important to prevent the unlawful use of legal persons and arrangements, by gaining a sufficient understanding of the client to be able to properly assess and mitigate the potential ML/TF risks associated with the business relationship. Where accountants are asked to act as a nominee, they should understand the reason for this request and ensure they are able

9 The illustrations could also apply to other legal persons and arrangements.

10 A shell company is an incorporated company with no independent operations, significant assets, ongoing business activities, or employees.

11 A shelf company is an incorporated company with inactive shareholders, directors, and secretary, which has been left dormant for a longer period even if a customer relationship has already been established.

to verify the identity of the beneficial owner of the shares and that the purpose appears to be legitimate.

Accountancy services for falsified accounts and tax evasion, misuse of client accounts and of insolvency services

30. Criminals may abuse services provided by accountants to provide a sense of legitimacy to falsified accounts in order to conceal the source of funds. For example, accountants may review and sign off such accounts for businesses engaged in criminality, thereby facilitating the laundering of the proceeds. Accountants may also perform high value financial transactions allowing criminals to misuse accountants' client accounts. Insolvency practice, which may be conducted by certain accountancy professionals also pose a risk of criminals concealing the audit trail of money laundered through a company and transferring the proceeds of crime. Accountancy services may also be used to facilitate tax evasion and VAT fraud.

FATF Recommendations applicable to accountants

31. The basic intent behind the FATF Recommendations as it relates to accounting professionals is consistent with their ethical obligations as professionals, namely to avoid assisting criminals or facilitating criminal activity. The requirements of R.22 regarding customer due diligence, record-keeping, PEPs, new technologies and reliance on third parties set out in R. 10, 11, 12, 15 and 17 apply to accountants in certain circumstances. Specifically, the requirements of R.22 applies to accountants when they prepare for or carry out transactions for their clients concerning the following activities:

a) Buying and selling of real estate;

b) Managing of client money, securities or other assets;

c) Management of bank, savings or securities accounts;

d) Organisation of contributions for the creation, operation or management of companies; and

e) Creating, operating or management of legal persons or arrangements, and buying and selling of business entities.

32. R.23 requires that R.18, 19, 20 and 21 provisions regarding internal AML/CFT controls, measures to be taken with respect to countries that do not or insufficiently comply with the FATF Recommendations, reporting of suspicious activity and associated prohibitions on tipping-off and confidentiality apply to accountants when, on behalf of or for a client, they engage in a financial transaction in relation to the activities described in R.22 above. Section III provides further guidance on the application of R.22 and R.23 obligations to accountants.

33. Countries should establish the most appropriate regime, tailored to address relevant ML/TF risks, which takes into consideration the activities and applicable code of conduct for accountants.

Section II – The RBA to AML/CFT

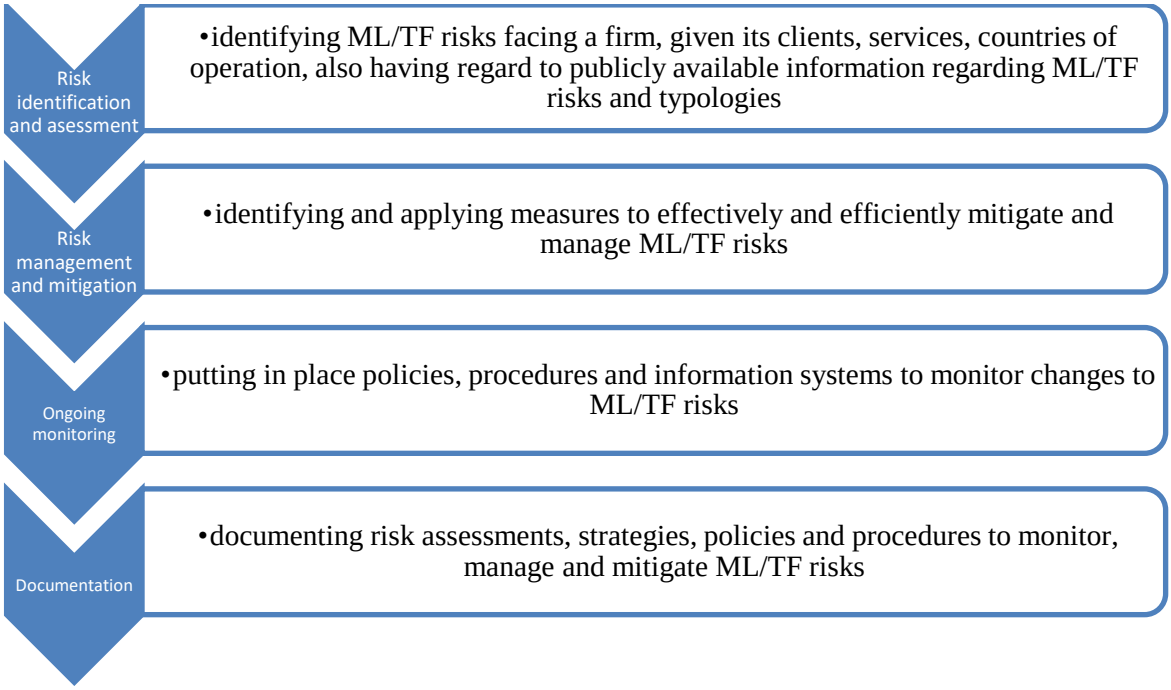
What is the risk-based approach?

34. The RBA to AML/CFT means that countries, competent authorities, DNFBPs, including accountants[12] should identify, assess and understand the ML/TF risks to which they are exposed and take the required AML/CFT measures to effectively and efficiently mitigate and manage the risks.

35. For accountants, identifying and maintaining an understanding of the ML/TF risk faced by the sector as well as specific to their services, client base, the jurisdictions in which they operate and the effectiveness of actual and potential risk controls that are or can be put in place, will require the investment of resources and training. For supervisors, this will also require maintaining an understanding of the ML/TF risks specific to their area of supervision, and the degree to which AML/CFT measures can reasonably be expected to mitigate such risks.

36. The RBA is not a "zero failure" approach; there may be occasions where an accountancy practice has taken reasonable and proportionate AML/CFT measures to identify and mitigate risks, but is still used for ML or TF purposes in isolated instances. Although there are limits to any RBA, ML/TF is a real and serious problem that accountants must address so that they do not, unwittingly or otherwise, encourage or facilitate it.

37. Key elements of a RBA can be summarised as follows:



[12] Including both legal and natural persons, see definition of Designated Non-Financial Businesses and Professions in the FATF Glossary.

The rationale for the new approach

38. In 2012, the FATF updated its Recommendations to keep pace with evolving risk and strengthen global safeguards. Its purposes remain to protect the integrity of the financial system by providing governments with updated tools needed to take action against financial crime.

39. There was an increased emphasis on the RBA to AML/CFT, especially in preventive measures and supervision. Though the 2003 Recommendations provided for the application of a RBA in some areas, the 2012 Recommendations considered the RBA to be an essential foundation of a country's AML/CFT framework.[13]

40. The RBA allows countries, within the framework of the FATF requirements, to adopt a more tailored set of measures in order to target their resources more effectively and efficiently and apply preventive measures that are commensurate with the nature of risks.

41. The application of a RBA is therefore essential for the effective implementation of the FATF Standards by countries and accountants.[14]

Application of the risk-based approach

42. The FATF standards do not predetermine any sector as higher risk. The standards identify sectors that may be vulnerable to ML/TF. The overall risk should be determined through an assessment of the sector at a national level. Different entities within a sector will pose higher or lower risk depending on a variety of factors, including, services, products, clients, geography and the strength of an entity's compliance program.

43. R.1 sets out the scope of application of the RBA as follows:

a) **Who should be subject to a country's AML/CFT regime?** In addition to the sectors and activities already included in the scope of the FATF Recommendations[15], countries should extend their regime to additional institutions, sectors or activities if they pose a higher risk of ML/TF. Countries could also consider exempting certain institutions, sectors or activities from some AML/CFT obligations where specified conditions are met, such as proven low risk of ML/TF and in strictly limited and justified circumstances.[16]

---

13. R.1.

14 The effectiveness of risk-based prevention and mitigation measures will be assessed as part of the mutual evaluation of the national AML/CFT regime. The effectiveness assessment will measure the extent to which a country achieves a defined set of outcomes that are central to a robust AML/CFT system and will analyse the extent to which a country's legal and institutional framework is producing the expected results. Assessors will need to take into account the risks and the flexibility allowed by the RBA when determining whether there are deficiencies in a country's AML/CFT measures, and their importance *(FATF, 2013f).*

15 See Glossary, definitions of "Designated non-financial businesses and professions" and "Financial institutions".

16 See INR.1.

b) **How should those subject to the AML/CFT regime be supervised or monitored for compliance with this regime?** Supervisors should ensure that accountants are implementing their obligations under R.1. AML/CFT supervisors should consider an accountant's own risk assessment and mitigation and acknowledge the degree of discretion allowed under the national RBA.

c) **How should those subject to the AML/CFT regime be required to comply?** The general principle of a RBA is that, where there are higher risks, enhanced measures should be taken to manage and mitigate those risks. The range, degree, frequency or intensity of preventive measures and controls conducted should be stronger in higher risk scenarios. Accountants are required to apply each of the CDD measures under (a) to (d) below[17]: (a) identification and verification of the client's identity; (b) identification and taking reasonable measures to verify the identity of the beneficial owner; (c) understanding the purpose and nature of the business relationship; and (d) on-going monitoring of the relationship. However, where the ML/TF risk is assessed as lower, the degree, frequency and/or the intensity of the controls conducted will be relatively lighter. Where risk is assessed at a normal level, the standard AML/CFT controls should apply.

d) **Consideration of the engagement in client relationships:** Accountants are not obliged to avoid risk entirely. Even if the services they provide to their clients are considered vulnerable to the risks of ML/TF based on risk assessment, it does not mean that all accountants and all their clients or services pose a higher risk when taking into account the risk mitigating measures that have been put in place.

e) **Importance of accountancy services to the overall economy:** Accountants often play significant roles in the legal and economic life of a country. The role of accountants in providing objective assurance regarding the financial status and activity of a business is vital. The risks associated with any type of client group is not static and the expectation is that within a client group, based on a variety of factors, individual clients could also be classified into risk categories, such as low, medium, medium, medium-high or high risk (see section III below for a detailed description). Measures to mitigate risk should be applied accordingly.

Challenges

44. Implementing a RBA can present a number of challenges for accountants in identifying what necessary measures they need to take. A RBA requires resources and expertise, both at a country and sector level, to gather and interpret information on risks, to develop policies and procedures and to train personnel. A RBA is also reliant on individuals exercising sound and well-trained judgement when designing and implementing such policies and procedures. It will also lead to a diversity in practice, although this can result in innovative solutions to address areas of higher risk. On the other hand, accountants may be uncertain as to how to comply with the regulatory

[17] See R.10

framework itself and the accountancy profession may find it difficult to apply an informed approach to RBA.

45. Accountants need to have a good understanding of the risks and should be able to exercise sound judgement. This requires the profession, and the individuals within it, to build expertise through practice and training. If accountants attempt to adopt a RBA without sufficient expertise, or understanding and knowledge of the risks faced by the sector, they may make flawed judgements. Accountants may over-estimate risk, which could lead to wasteful use of resources, or they may under-estimate risk, and thereby creating vulnerabilities.

46. Accountants may find that some staff members are uncomfortable making risk-based judgements. This may lead to overly cautious decisions, or disproportionate time spent documenting the rationale behind a decision. It may also encourage a 'tick-box' approach to risk assessment.

47. Developing sound judgement needs good information, and intelligence sharing by designated competent authorities and SRBs. The existence of good practice guidance, training, industry studies and other available information and materials will also assist the accountants to develop methods to analyse the information in order to obtain risk based criteria. Accountants must be able to access this information and guidance easily so that they have the best possible knowledge on which to base their judgements.

48. The services and products accountants provide to their clients vary and are not wholly of financial nature. The FATF Recommendations apply equally to accountants when they are engaged in a specified activity (see paragraph 31), including obligations related to customer due diligence, reporting of suspicious transactions and associated prohibitions on tipping off, record-keeping, identification and risk management related to politically exposed persons or new technologies, and reliance on other third-party financial institutions and DNFBPs.

Box 1. Particular RBA challenges for accountants

Culture of compliance and adequate resources. Implementing a RBA requires that accountants have a sound understanding of the risks and are able to exercise good professional judgement. Above all, management should recognise the importance of a culture of compliance across the organisation and ensure sufficient resources are devoted to its implementation, appropriate to the size, scale and activities of the organisation. This requires the building of expertise including for example, through training, recruitment, taking professional advice and 'learning by doing'. It also requires the allocation of necessary resources to gather and interpret information on risks, both at the country and institutional levels, and to develop procedures and systems, including ensuring effective decision-making. The process will benefit from information sharing by relevant competent authorities, supervisors and SRBs. The provision of good practice guidance by competent authorities, supervisors and SRBs is also valuable.

Significant variation in services and clients. Accountants may vary substantially in the breadth and nature of services provided and the clients

they serve, as well as the size, focus, and sophistication of the firm and its employees. In implementing the RBA, accounting (and related auditing) professionals should make reasonable judgements for their particular services and activities. Supervisors and SRBs should acknowledge that in a risk-based regime, not all accountants will adopt identical AML/CFT controls. Appropriate mitigation measures will also depend on the nature of the professional's role and involvement. Circumstances may vary considerably between professionals who represent clients directly and those that are engaged for distinct purposes. Where these services involve tax laws and regulations, accounting professionals also have additional considerations related to a country or jurisdiction's permissible means to structure transactions and entities or operations to legally avoid taxes.

Transparency of beneficial ownership on legal persons and arrangements[18]. Accountants may be involved in the formation, management, or administration of legal entities and arrangements, though in many countries any legal or natural person also may be able to conduct these activities. Where professionals do play this "gatekeeper" role, they may be challenged in obtaining and keeping current and accurate beneficial ownership information depending upon the nature and activities of their clientele. Other challenges may arise when taking on new clients with minimal economic activity associated with the legal entity and/or its owners or beneficial owners - such as start-up firms. Finally, whether the source is a public registry or the clientele, there is always potential risk in the correctness of the information, in particular where the underlying information has been self-reported (accountants should refer to the RBA Guidance for TCSPs in this respect). Those risks notwithstanding, from the outset the accountant should seek answers from the immediate client in determining beneficial ownership (having first determined that none of the relevant exceptions to ascertaining beneficial ownership apply, e.g. the client is a publicly listed company). The information provided by the client should then be appropriately confirmed by reference to public registers and other third party sources where possible. This may require further and clarifying questions to be put to the immediate client. The goal is to ensure that the accountant is reasonably satisfied about the identity of the beneficial owner. For more practical guidance on beneficial ownership, refer to the guidance in Box 2.

Risk of criminality. Because of their crucial role in providing a legally required window into the financial health and operations of a firm, accountants should be particularly alert to ML/TF risks posed by the services they provide to avoid the possibility that they may unwittingly commit or become an accessory to the commission of a substantive offence of ML/TF. Accounting (and related auditing) firms must protect themselves from misuse by criminals and terrorists.

18 Reference should also be made to the Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership published in July 2018.

Allocating responsibility under a RBA

49. An effective risk-based regime builds on, and reflects, a country's legal and regulatory approach, the nature, diversity and maturity of its financial sector, and its risk profile. Accountants should identify and assess their own ML/TF risk taking account of the NRAs in line with R.1, as well as the national legal and regulatory framework, including any areas of prescribed significant risk and mitigation measures. Accountants are required to take appropriate steps to identify and assess their ML/TF risks and have policies, controls and procedures that enable them to manage and mitigate effectively the risks that have been identified.[19] Where ML/TF risks are higher, accountants should always apply enhanced CDD, although national law or regulation might not prescribe exactly how these higher risks are to be mitigated (e.g. varying the degree of enhanced ongoing monitoring).

50. Strategies adopted by accountants to mitigate ML/TF risks has to take account of the applicable national legal, regulatory and supervisory frameworks. When deciding the extent to which accountants can decide how to mitigate risk, countries should consider the ability of the sector to effectively identify and manage ML/TF risks as well as the expertise and resources of their supervisors to adequately supervise how accountants manage ML/TF risks and take action to address any failures. Countries may also consider evidence from competent authorities on the level of compliance in the sector, and the sector's approach to dealing with ML/TF risk. Countries whose services sectors are emerging or whose legal, regulatory and supervisory frameworks are still developing, may determine that accountants are not fully equipped to effectively identify and manage ML/TF risk. In such cases, a more prescriptive implementation of the AML/CFT requirements may be appropriate until understanding and experience of the sector is strengthened.[20]

51. Accountants should not be exempted from AML/CFT supervision even where their compliance controls are adequate. However, the RBA allows competent authorities to focus more supervisory resources on higher risk entities.

Identifying ML/TF risk

52. Access to accurate, timely and objective information on ML/TF risks is a prerequisite for an effective RBA. INR.1.3 requires countries to have mechanisms to provide appropriate information on the results of the risk assessments to all relevant competent authorities, SRBs, financial institutions and accountants. Where information is not readily available, for example where competent authorities have inadequate data to assess risks, are unable to share important information on ML/TF risks and threats, or where access to information is restricted by censorship, it will be difficult for accountants to correctly identify ML/TF risk.

53. R.34 requires competent authorities, supervisors and SRBs to establish guidelines and provide feedback to financial institutions and DNFBPs. Such guidelines

[19] R.1 and IN.1.

[20] This could be based on a combination of elements described in Section II, as well as objective criteria such as mutual evaluation reports, follow-up reports or FSAP.

and feedback help institutions and businesses to identify the ML/TF risks and to adjust their risk mitigating programmes accordingly.

Assessing ML/TF risk

54. Assessing ML/TF risk requires countries, competent authorities, including supervisors, SRBs and accountants to determine how the ML/TF threats identified will affect them. They should analyse the information obtained to understand the likelihood of these risks occurring, and the impact that these would have, on the individual accountants, the entire sector and on the national economy. As a starting step, ML/TF risks are often classified as low, medium-low, medium, medium-high and high Assessing ML/TF risk therefore goes beyond the mere gathering of quantitative and qualitative information, without its proper analysis; this information forms the basis for effective ML/TF risk mitigation and should be kept up-to-date to remain relevant.[21]

55. Competent authorities, including supervisors and SRBs should employ skilled and trusted personnel, recruited through fit and proper tests, where appropriate. They should be technically equipped commensurate with the complexity of their responsibilities. Accounting firms/accountants that are required to routinely conduct a high volume of enquiries when on-boarding clients, e.g. because of the size and geographic footprint of the firm may also consider engaging skilled and trusted personnel who are appropriately recruited and checked. Such accounting firms are also likely to consider using the various technological options (including artificial intelligence) and software programs that are now available to assist accountants in this regard.

56. Accounting firms should develop internal policies, procedures and controls, including appropriate compliance management arrangements, and adequate screening procedures to ensure high standards when hiring employees. Accounting firms should also develop an ongoing employee training programme. They should be trained commensurate with the complexity of their responsibilities.

Mitigating and managing ML/TF risk

57. The FATF Recommendations require that, when applying a RBA, accountants, countries, competent authorities and supervisors decide on the most appropriate and effective way to mitigate and manage the ML/TF risk they have identified. They should take enhanced measures to manage and mitigate situations when the ML/TF risk is higher. In lower risk situations, less stringent measures may be applied:[22]

a) Countries may decide not to apply some of the FATF Recommendations requiring accountants to take certain actions, provided (i) there is a proven low risk of money laundering and terrorist financing, this occurs in strictly limited and justified circumstances and it relates to a particular type of accountants or (ii) a financial activity is carried out by a natural or legal person

21 FATF (2013a), paragraph 10. See also Section I D for further detail on identifying and assessing ML/TF risk.

22 Subject to the national legal framework providing for Simplified Due Diligence.

on an occasional or very limited basis such that there is a low risk of ML/TF, according to the exemptions of INR 1.6 are met.

b) Countries and accountants looking to apply simplified measures should conduct an assessment to ascertain the lower risk connected to the category of clients or services targeted, establish a threshold for the lower level of the risks involved, and define the extent and the intensity of the required AML/CFT measures, provided that the specific conditions required for one of the exemptions of INR 1.6 are met. Specific Recommendations set out in more detail how this general principle applies to particular requirements.[23]

Developing a common understanding of the RBA

58. The effectiveness of a RBA depends on a common understanding by competent authorities and accountants of what the RBA entails, how it should be applied and how ML/TF risks should be addressed. In addition to a legal and regulatory framework that spells out the degree of discretion, accountants should deal with the risks they identify. Competent authorities should issue guidance to accountants on meeting their legal and regulatory AML/CFT obligations in a risk-sensitive way. Supporting ongoing and effective communication between competent authorities and the sector is essential.

59. Competent authorities should acknowledge that not all accountants will adopt identical AML/CFT controls in a risk-based regime. On the other hand, accountants should understand that a flexible RBA does not exempt them from applying effective AML/CFT controls with a RBA.

[23] For example, R.22 on Customer Due Diligence.

Section III: Guidance for accountants on implementing a risk-based approach

Risk identification and assessment

60. Accountants should take appropriate steps to identify and assess the risk firm-wide, given their particular client base, that they could be used for ML/TF. This is usually performed as part of the overall client and engagement acceptance processes. They should document those assessments, keep these assessments up to date, and have appropriate mechanisms to provide risk assessment information to competent authorities and supervisors.[24] The nature and extent of any assessment of ML/TF risks should be appropriate to the type of business, nature of clients and size of operations.

61. ML/TF risks can be organised into three categories: (a) country/geographic risk, (b) client risk and (c) transaction/service and associated delivery channel risk[25]. The risks and red flags listed in each category are not exhaustive but provide a starting point for accountants to use when designing their RBA.

62. When assessing risk, accountants should consider all the relevant risk factors before determining the level of overall risk and the appropriate level of mitigation to be applied. Such risk assessment may well be informed by findings of the NRA, the supra-national risk assessments, sectoral reports conducted by competent authorities on ML/TF risks that are inherent in accounting services/sector, risk reports in other jurisdictions where the accountant based in, and any other information which may be relevant to assess the risk level particular to their practice. For example, press articles and other widely available public information highlighting issues that may have arisen in particular jurisdictions. Accountants may well also draw references to FATF Guidance on indicators and risk factors. During the course of a client relationship, procedures for ongoing monitoring and review of the client's risk profile are also important. Competent authorities should consider how they can best alert accountants to the findings of any national risk assessments, the supranational risk assessments and any other information which may be relevant to assess the risk level particular to an accounting practice in the relevant country.

63. Due to the nature of services that an accountant generally provides, automated transaction monitoring systems of the type used by financial institutions will not be appropriate for most accountants. There may be some scope to use artificial intelligence and analytical tools in an audit context to spot unusual transactions. The accountant's knowledge of the client and its business will develop throughout the duration of a longer term and interactive professional relationship (in some cases, such relationships may exist for short term clients as well, e.g. for property transactions). However, although individual accountants are not expected to investigate their client's affairs, they may be well positioned to identify and detect changes in the type of work or the nature of the client's activities in the course of business relationship. Accountants will also need to consider the nature of the risks presented by short-term client relationships that may inherently, but not necessarily

24 Paragraph 8 of INR.1

25 Including products, transactions or delivery channels.

be low risk (e.g. one-off client relationship). Accountants should also be mindful of the subject matter of the professional services (the engagement) being sought by an existing or potential client and the related risks.

64. Identification of the ML/TF risks associated with certain clients or categories of clients, and certain types of work will allow accountants to determine and implement reasonable and proportionate measures and controls to mitigate such risks. The risks and appropriate measures will depend on the nature of the accountant's role and involvement. Circumstances may vary considerably between professionals who represent clients on a single transaction and those involved in a long term advisory relationship.

65. The amount and degree of ongoing monitoring and review will depend on the nature and frequency of the relationship, along with the comprehensive assessment of client/transactional risk. An accountant may also have to adjust the risk assessment of a particular client based upon information received from a designated competent authority, SRB or other credible sources (including a referring accountant).

66. Accountants may assess ML/TF risks by applying various categories. This provides a strategy for managing potential risks by enabling accountants, where required, to subject each client to reasonable and proportionate risk assessment.

67. The weight given to these risk categories (individually or in combination) in assessing the overall risk of potential ML/TF may vary given the size, sophistication, nature and scope of services provided by the accountant and/or firm. These criteria, however, should be considered holistically and not in isolation. Accountants, based on their individual practices and reasonable judgements, will need to independently assess the weight to be given to each risk factor.

68. Although there is no universally accepted set of risk categories, the examples provided in this Guidance are the most commonly identified risk categories. There is no single methodology to apply these risk categories, and the application of these risk categories is intended to provide a suggested framework for approaching the assessment and management of potential ML/TF risks. For smaller firms and sole practitioners, it is advisable to look at the services they offer (e.g. providing company management services may entail greater risk than other services).

69. Criminals use a range of techniques and mechanisms to obscure the beneficial ownership of assets and transactions. Many of the common mechanisms/techniques have been compiled by FATF in the previous studies, including the 2014 FATF Guidance on Transparency and Beneficial Ownership and the 2018 Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership. Accountants may refer to the studies for more details on the use of obscuring techniques and relevant case studies.

70. A practical starting point for accounting firms (especially smaller firms) and accountants (especially sole practitioners) would be to take the following approach. Many of these elements are critical to satisfying other obligations owed to clients, such as fiduciary duties, and as part of their general regulatory obligations:

a) Client acceptance and know your client policies: identify the client (and its beneficial owners where appropriate) and the true "beneficiaries" of the transaction. Obtain an understanding of the source of funds and source of

wealth[26] of the client, where required, its owners and the purpose of the transaction.

b) Engagement acceptance policies: Understand the nature of the work. Accountants should know the exact nature of the service that they are providing and have an understanding of how that work could facilitate the movement or obscuring of the proceeds of crime. Where an accountant does not have the requisite expertise, the accountant should not undertake the work.

c) Understand the commercial or personal rationale for the work: Accountants need to be reasonably satisfied that there is a commercial or personal rationale for the work undertaken. Accountants however are not obliged to objectively assess the commercial or personal rationale if it appears reasonable and genuine.

d) Be attentive to red flag indicators: exercise vigilance in identifying and then carefully reviewing aspects of the transaction if there are reasonable grounds to suspect that funds are the proceeds of a criminal activity, or related to terrorist financing. These cases would trigger reporting obligations. Documenting the thought process by having an action plan may be a viable option to assist in interpreting/assessing red flags/indicators of suspicion.

e) Then consider what action, if any, needs to be taken.

f) The outcomes of the above action (i.e. the comprehensive risk assessment of a particular client/transaction) will dictate the level and nature of the evidence/documentation collated under a firm's CDD/EDD procedures (including evidence of source of wealth or funds).

g) Accountants should adequately document and record steps taken under a) to e).

Country/Geographic risk

71. A client may be higher risk when features of their business are connected to a higher risk country as regards:

a) the origin, or current location of the source of wealth or funds;

b) where the services are provided;

---

[26] The source of funds and the source of wealth are relevant to determining a client's risk profile. The source of funds is the activity that generates the funds for a client (e.g. salary, trading revenues, or payments out of a trust), while the source of wealth describes the activities that have generated the total net worth of a client (e.g. ownership of a business, inheritance, or investments). While these may be the same for some clients, they may be partially or entirely different for other clients. For example, a PEP who receives a modest official salary, but who has substantial funds, without any apparent business interests or inheritance, might raise suspicions of bribery, corruption or misuse of position. Under the RBA, accountants should satisfy themselves that adequate information is available to assess a client's source of funds and source of wealth as legitimate with a degree of certainty that is proportionate to the risk profile of the client.

c) the client's country of incorporation or domicile;

d) the location of the client's major operations;

e) the beneficial owner's country of domicile; or

f) target company's country of incorporation and location of major operations (for potential acquisitions).

72. There is no universally agreed definition of a higher risk country or geographic area but accountants should pay attention to those countries that are:

a) Countries/areas identified by credible sources[27] as providing funding or support for terrorist activities or that have designated terrorist organisations operating within them.

b) Countries identified by credible sources as having significant levels of organized crime, corruption, or other criminal activity, including source or transit countries for illegal drugs, human trafficking and smuggling and illegal gambling.

c) Countries subject to sanctions, embargoes or similar measures issued by international organisations such as the United Nations.

d) Countries identified by credible sources as having weak governance, law enforcement, and regulatory regimes, including countries identified by FATF statements as having weak AML/CFT regimes, in relation to which financial institutions (as well as DNFBPs) should give special attention to business relationships and transactions.

e) Countries identified by credible sources to be uncooperative in providing beneficial ownership information to competent authorities, a determination of which may be established from reviewing FATF mutual evaluation reports or reports by organisations that also consider various co-operation levels such as the OECD Global Forum reports on compliance with international tax transparency standards.

Client risk

73. The key risk factors that accountants should consider are:

a) The firm’s client base includes industries or sectors where opportunities for ML/TF are particularly prevalent.

b) The firm’s clients include PEPs or persons closely associated with or related to PEPs, who are considered as higher risk clients (Please refer to the FATF Guidance (2013) on politically-exposed persons for further guidance on how to identify PEPs).

27 “Credible sources” refers to information that is produced by reputable and universally recognised international organisations and other bodies that make such information publicly and widely available. In addition to the FATF and FATF-style regional bodies, such sources may include, but are not limited to, supra-national or international bodies such as the International Monetary Fund, the World Bank and the Egmont Group of Financial Intelligence Units.

Box 2. Particular considerations for PEPs and source of funds and wealth

If an accountant is advising a PEP client, or where a PEP is the beneficial owner of assets in a transaction, appropriate enhanced CDD is required if a specified activity under R.22 is involved. Such measures include, obtaining senior management (e.g. senior partner, managing partner or CEO) approval before establishing a business relationship, taking reasonable measures to establish the source of wealth and source of funds of clients and beneficial owners identified as PEPs, and conducting enhanced ongoing monitoring on that relationship.

The source of funds and the source of wealth are relevant to determining a client's risk profile. The source of funds is the activity that generates the funds for a client (e.g. salary, trading revenues, or payments out of a trust). Source of funds relates directly to the literal origin of funds to be used in a transaction. This is likely to be a bank account. Generally, this would be evidenced by bank statements or similar. Source of wealth describes the activities that have generated the total net worth of a client (e.g. ownership of a business, inheritance, or investments). Source of wealth is the origin of the accrued body of wealth of an individual. Understanding source of wealth is about taking reasonable steps to be satisfied that the funds to be used in a transaction are not the proceeds of crime.

While source of funds and wealth may be the same for some clients, they may be partially or entirely different for other clients. For example, a PEP who receives a modest official salary, but who has substantial funds, without any apparent business interests or inheritance, might raise suspicions of bribery, corruption or misuse of position. Under the RBA, accountants should satisfy themselves that adequate information is available to assess a client's source of funds and source of wealth as legitimate with a degree of certainty that is proportionate to the risk profile of the client.

Relevant factors that influence the extent and nature of CDD include the particular circumstances of a PEP, PEPs separate business interests and the time those interests prevailed in relation to the public position, whether the PEP has access to official funds, makes decisions regarding the allocation of public funds or public procurement contracts, the PEP's home country, the type of activity that the PEP is instructing the accountant to perform, whether the PEP is domestic or international, particularly having regard to the services asked for, and the scrutiny to which the PEP is under in the PEP's home country.

c) Clients conducting their business relationship or requesting services in unusual or unconventional circumstances (as evaluated taking into account all the circumstances of the client's representation).

d) Clients where the structure or nature of the entity or relationship makes it difficult to identify in a timely manner the true beneficial owner or controlling

interests or clients attempting to obscure understanding of their business, ownership or the nature of their transactions, such as:

i. Unexplained use of shell and/or shelf companies, front company, legal entities with ownership through nominee shares or bearer shares, control through nominee and corporate directors, legal persons or legal arrangements, splitting company incorporation and asset administration over different countries, all without any apparent legal or legitimate tax, business, economic or other reason.

ii. Unexplained use of informal arrangements such as family or close associates acting as nominee shareholders or directors.

iii. Unusual complexity in control or ownership structures without a clear explanation, where certain circumstances, structures, geographical locations, international activities or other factors are not consistent with the accountants' understanding of the client's business and economic purpose.

e) Client companies that operate a considerable part of their business in or have major subsidiaries in countries that may pose higher geographic risk.

f) Clients that are cash (and/or cash equivalent) intensive businesses. Where such clients are themselves subject to and regulated for a full range of AML/CFT requirements consistent with the FATF Recommendations, this will aid to mitigate the risks. These may include, for example:

i. Money or Value Transfer Services (MVTS) businesses (e.g. remittance houses, currency exchange houses, casas de cambio, centros cambiarios, remisores de fondos, bureaux de change, money transfer agents and bank note traders or other businesses offering money transfer facilities);

ii. Operators, brokers and others providing services in virtual assets;

iii. Casinos, betting houses and other gambling related institutions and activities;

iv. Dealers in precious metals and stones

g) Businesses that while not normally cash intensive appear to have substantial amounts of cash.

h) Non-profit or charitable organizations engaging in transactions for which there appears to be no logical economic purpose or where there appears to be no link between the stated activity of the organization and the other parties in the transaction.

i) Clients using financial intermediaries, financial institutions or DNFBPs that are not subject to adequate AML/CFT laws and measures and that are not adequately supervised by competent authorities or SRBs.

j) Clients who appear to be acting on somebody else's instructions without disclosure.

k) Clients who appear to actively and inexplicably avoid face-to-face meetings or who provide instructions intermittently without legitimate reasons and are

otherwise evasive or very difficult to reach, when this would not normally be expected.

l) Clients who request that transactions be completed in unusually tight or accelerated timeframes without a reasonable explanation for accelerating the transaction, which would make it difficult or impossible for the accountants to perform a proper risk assessment.

m) Clients with previous convictions for crimes that generated proceeds, who instruct accountants (who in turn have knowledge of such convictions) to undertake specified activities on their behalf.

n) Clients who have no address, or multiple addresses without legitimate reasons.

o) Clients who have funds that are obviously and inexplicably disproportionate to their circumstances (e.g. their age, income, occupation or wealth).

p) Clients who change their settlement or execution instructions without appropriate explanation.

q) Clients who change their means of payment for a transaction at the last minute and without justification (or with suspect justification), or where there is an unexplained lack of information or transparency in the transaction. This risk extends to situations where last minute changes are made to enable funds to be paid in from/out to a third party.

r) Clients who insist, without adequate justification or explanation, that transactions be effected exclusively or mainly through the use of virtual assets for the purpose of preserving their anonymity.

s) Clients who offer to pay unusually high levels of fees for services that would not ordinarily warrant such a premium. However, bona fide and appropriate contingency fee arrangements, where accountants may receive a significant premium for a successful provision of their services, should not be considered a risk factor.

t) Unusually high levels of assets or unusually large transactions compared to what might reasonably be expected of clients with a similar profile may indicate that a client not otherwise seen as higher risk should be treated as such.

u) Where there are certain transactions, structures, geographical location, international activities or other factors that are not consistent with the accountants' understanding of the client's business or economic situation.

v) The accountants' client base includes industries or sectors where opportunities for ML/TF are particularly prevalent.

w) Clients who are suspected to be engaged in falsifying activities through the use of false loans, false invoices, and misleading naming conventions.

x) The transfer of the seat of a company to another jurisdiction without any genuine economic activity in the country of destination poses a risk of creation of shell companies which might be used to obscure beneficial ownership.

y) The relationship between employee numbers/structure and nature of the business is divergent from the industry norm (e.g. the turnover of a company is unreasonably high considering the number of employees and assets used compared to similar businesses).

z) Sudden activity from a previously dormant client without any clear explanation.

aa) Clients that start or develop an enterprise with unexpected profile or abnormal business cycles or clients that enters into new/emerging markets. Organised criminality generally does not have to raise capital/debt, often making them first into a new market, especially where this market may be retail/cash intensive.

bb) Indicators that client does not wish to obtain necessary governmental approvals/filings, etc.

cc) Reason for client choosing the accountant is unclear, given the firm's size, location or specialisation.

dd) Frequent or unexplained change of client's professional adviser(s) or members of management.

ee) Client is reluctant to provide all the relevant information or accountants have reasonable grounds to suspect that the information provided is incorrect or insufficient.

ff) Clients seeking to obtain residents rights or citizenship in the country of establishment of the accountants in exchange for capital transfers, purchase of property or government bonds, or investment in corporate entities.

74. The clients referred to above may be individuals that are, for example, trying to obscure their own business interests and assets or the clients may be representatives of a company's senior management who are, for example, trying to obscure the ownership structure.

Transaction/Service and associated delivery channel risk

75. Services which may be provided by accountants and which (in some circumstances) risk being used to assist money launderers may include:

a) Use of pooled client accounts or safe custody of client money or assets without justification.

b) Situations where advice on the setting up of legal arrangements may be misused to obscure ownership or real economic purpose (including setting up of trusts, companies or change of name/corporate seat or establishing complex group structures). This might include advising in relation to a discretionary trust that gives the trustee discretionary power to name a class of beneficiaries that does not include the real beneficiary (e.g. naming a charity as the sole discretionary beneficiary initially with a view to adding the real beneficiaries at a later stage). It might also include situations where a trust is set up for the purpose of managing shares in a company with the intention of making it more difficult to determine the beneficiaries of assets managed by the trust.

c) In case of an express trust, an unexplained (where explanation is warranted) nature of classes of beneficiaries and acting as trustees of such a trust.

d) Services where accountants may in practice represent or assure the client's standing, reputation and credibility to third parties, without a commensurate knowledge of the client's affairs.

e) Services that are capable of concealing beneficial ownership from competent authorities.

f) Services requested by the client for which the accountant does not have expertise except where the accountant is referring the request to an appropriately trained professional for advice.

g) Non-cash wire transfers through the use of many inter-company transfers within the group to disguise the audit trail.

h) Services that rely heavily on new technologies (e.g. in relation to initial coin offerings or virtual assets) that may have inherent vulnerabilities to exploitation by criminals, especially those not regulated for AML/CFT.

i) Transfer of real estate or other high value goods or assets between parties in a time period that is unusually short for similar transactions with no apparent legal, tax, business, economic or other legitimate reason.

j) Transactions where it is readily apparent to the accountant that there is inadequate consideration, where the client does not provide legitimate reasons for the transaction.

k) Administrative arrangements concerning estates where the deceased was known to the accountant as being a person who had been convicted of proceeds generating crimes.

l) Services that have deliberately provided, or depend upon, more anonymity in relation to the client's identity or regarding other participants, than is normal under the circumstances and in the experience of the accountant.

m) Use of virtual assets and other anonymous means of payment and wealth transfer within the transaction without apparent legal, tax, business, economic or other legitimate reason.

n) Transactions using unusual means of payment (e.g. precious metals or stones).

o) The postponement of a payment for an asset or service delivered immediately to a date far from the moment at which payment would normally be expected to occur, without appropriate assurances that payment will be made.

p) Unexplained establishment of unusual conditions/clauses in credit arrangements that do not reflect the commercial position between the parties and may require accountants to be aware of risks. Arrangements that may be abused in this way might include unusually short/long amortisation periods, interest rates materially above/below market rates, or unexplained repeated cancellations of promissory notes/mortgages or other security instruments substantially ahead of the maturity date initially agreed.

q) Transfers of goods that are inherently difficult to value (e.g. jewels, precious stones, objects of art or antiques, virtual assets), where this is not common for

the type of clients, transaction, or with accountant's normal course of business such as a transfer to a corporate entity, or generally without any appropriate explanation.

r) Successive capital or other contributions in a short period of time to the same company with no apparent legal, tax, business, economic or other legitimate reason.

s) Acquisitions of businesses in liquidation with no apparent legal, tax, business, economic or other legitimate reason.

t) Power of representation given in unusual conditions (e.g. when it is granted irrevocably or in relation to specific assets) and the stated reasons for these conditions are unclear or illogical.

u) Transactions involving closely connected persons and for which the client and/or its financial advisors provide inconsistent or irrational explanations and are subsequently unwilling or unable to explain by reference to legal, tax, business, economic or other legitimate reason.

v) Situations where a nominee is being used (e.g. friend or family member is named as owner of property/assets where it is clear that the friend or family member is receiving instructions from the beneficial owner) with no apparent legal, tax, business, economic or other legitimate reason.

w) Payments received from un-associated or unknown third parties and payments for fees in cash where this would not be a typical method of payment.

x) Commercial, private, or real property transactions or services to be carried out by the client with no apparent legitimate business, economic, tax, family governance, or legal reasons.

y) Existence of suspicions regarding fraudulent transactions, or transactions that are improperly accounted for. These might include:

   i. Over or under invoicing of goods/services.

   ii. Multiple invoicing of the same goods/services.

   iii. Falsely described goods/services – over or under shipments (e.g. false entries on bills of lading).

   iv. Multiple trading of goods/services.

76. In relation to the areas of risk identified above, accountants may also consider the examples of fraud risk factors listed in International Standard of Auditing 240: The auditor's responsibilities relating to fraud in an audit of financial statements (ISA 240) and the examples of conditions and events that may indicate risks of material misstatement in International Standard of Auditing 315: Identifying and assessing risks of material misstatement through understanding the entity and its environment (ISA315). Even where the accountant is not performing an audit, ISA 240 and ISA 315 provide helpful lists of additional red flags.

Variables that may impact on a RBA and on risk

77. While all accountants should follow robust standards of due diligence in order to avoid regulator arbitrage, due regard should be accorded to differences in practices, size, scale and expertise amongst accountants, as well as the nature of the clients they serve. As a result, consideration should be given to these factors when creating a RBA that complies with the existing obligations of accountants.

78. Consideration should also be given to the resources that can be reasonably allocated to implement and manage an appropriately developed RBA. For example, a sole practitioner would not be expected to devote an equivalent level of resources as a large firm; rather, the sole practitioner would be expected to develop appropriate systems and controls and a RBA proportionate to the scope and nature of the practitioner's practice and its clients. Small firms serving predominantly locally based and low risk clients cannot generally be expected to devote a significant amount of senior personnel's time to conducting risk assessments. In such cases, it may be more reasonable for sole practitioners to rely on publicly available records and information supplied by a client for a risk assessment than it would be for a large firm having a diverse client base with different risk profiles. However, where the source is a public registry, or the client, there is always potential risk in the correctness of the information. Sole practitioners and small firms may be regarded by criminals as more of a target for money launderers than large law firms. Accountants in many jurisdictions and practices are required to conduct both a risk assessment of the general risks of their practice, and of all new clients and current clients engaged in one-off specific transactions. The emphasis must be on following a RBA.

79. A significant factor to consider is whether the client and proposed work would be unusual, risky or suspicious for the particular accountant. This factor must always be considered in the context of the accountant's practice, as well as the legal, professional, and ethical obligations in the jurisdiction(s) of practice. An accountant's RBA methodology may thus take account of risk variables specific to a particular client or type of work. Consistent with the RBA and proportionality, the presence of one or more of these variables may cause an accountant to conclude that either enhanced CDD and monitoring is warranted, or conversely that standard CDD and monitoring can be reduced, modified or simplified. When reducing, modifying or simplifying CDD, accountants should always adhere to the minimum requirements as set out in national legislation. These variables may increase or decrease the perceived risk posed by a particular client or type of work. While the presence of the specific factors referred to in paragraphs 71-76 may tend to increase risk, there are more general client/ engagement-related variables that may add to or mitigate that risk.

80. Examples of factors that may increase risk are:

a) Unexplained urgency of assistance required.

b) Unusual sophistication of client, including complexity of control environment.

c) Unusual sophistication of transaction/scheme.

d) The irregularity or duration of the client relationship. One-off engagements involving limited client contact throughout the relationship may present higher risk.

81. Examples of factors that may decrease risk are:

a) Involvement of adequately regulated financial institutions or other DNFBP professionals.

b) Similar country location of accountants and client.

c) Role or oversight of a regulator or multiple regulators.

d) The regularity or duration of the client relationship. Long-standing relationships involving frequent client contact and easy flow of information throughout the relationship may present less risk.

e) Private companies that are transparent and well-known in the public domain.

f) Accountant's familiarity with a particular country, including knowledge of and compliance with local laws and regulations as well as the structure and extent of regulatory oversight.

Documentation of risk assessments

82. Accountants must always understand their ML/TF risks (for clients, countries or geographic areas, services, transactions or delivery channels). They should document those assessments in order to be able to demonstrate their basis and exercise due professional care and use compelling good judgement. However, competent authorities or SRBs may determine that individual documented risk assessments are not required, if the specific risks inherent to the sector are clearly identified and understood.

83. Accountants may fail to satisfy their AML/CFT obligations, for example by relying completely on a checklist risk assessment where there are other clear indicators of potential illicit activity. Completing risk assessments in a time efficient yet comprehensive manner has become more important.

84. Each of these risks could be assessed using indicators such as low risk, medium risk and/or high risk. A short explanation of the reasons for each attribution should be included and an overall assessment of risk determined. An action plan (if required) should then be outlined to accompany the assessment, and dated. In assessing the risk profile of the client at this stage, reference must be made to the relevant targeted financial sanctions lists to confirm neither the client nor the beneficial owner is designated and included in any of them.

85. A risk assessment of this kind should not only be carried out for each specific client and service on an individual basis, but also to assess and document the risks on a firm-wide basis, and to keep risk assessment up-to-date through monitoring of the client relationship. The written risk assessment should be made accessible to all professionals having to perform AML/CFT duties.

Risk mitigation

86. Accountants should have policies, controls and procedures that enable them to effectively manage and mitigate the risks that they have identified (or that have been identified by the country). They should monitor the implementation of those controls and enhance or improve them if they find the controls to be weak or ineffective. The policies, controls and procedures should be approved by senior management, and the measures taken to manage and mitigate the risks (whether

higher or lower) should be consistent with national requirements and with guidance from competent authorities and supervisors. Measures and controls may include:

a) General training on ML/TF methods and risks relevant to accountants.

b) Targeted training for increased awareness by the accountants providing specified activities to higher risk clients or to accountants undertaking higher risk work.

c) Increased or more appropriately targeted CDD or enhanced CDD for higher risk clients/situations that concentrate on providing a better understanding about the potential source of risk and obtaining the necessary information to make informed decisions about how to proceed (if the transaction/ business relationship can be proceeded with). This could include training on when and how to ascertain, evidence and record source of wealth and beneficial ownership information if required.

d) Periodic review of the services offered by the accountant, and the periodic evaluation of the AML/CFT framework applicable to the accountant and the accountant's own AML/CFT procedures, to determine whether the ML/TF risk has increased.

e) Reviewing client relationships from time to time to determine whether the ML/TF risk has increased.

Initial and ongoing CDD (R.10 and 22)

87. Accountants should design CDD procedures to enable them to establish with reasonable certainty the true identity of each client and, with an appropriate degree of confidence, know the types of business and transactions the client is likely to undertake. Accountants should have procedures to:

a) Identify the client and verify that client's identity using reliable, independent source documents, data or information.

b) Identify the beneficial owner, and take reasonable measures to verify the identity of the beneficial owner, such that accountants are satisfied that they knows who the beneficial owner is. This should include accountants' understanding of the ownership and control structure of the client. This is articulated in the following box

Box 3. Beneficial ownership information obligations (see R.10, R.22 and INR.10)

R.10 sets out the instances where accountants will be required to take steps to identify and verify beneficial owners, including when there is a suspicion of ML/TF, when establishing business relations, or where there are doubts about the veracity of previously provided information. INR.10 indicates that the purpose of this requirement is two-fold: first, to prevent the unlawful use of legal persons and arrangements, by gaining a sufficient understanding of the client to be able to properly assess the potential ML/TF risks associated with the business relationship; and, second, to take appropriate steps to mitigate the

risks. Accountants should have regard to these purposes when assessing what steps are reasonable to take to verify beneficial ownership, commensurate with the level of risk. Accountants should also have regard to the AML/CFT 2013 Methodology Criteria 10.5 and 10.8-10.12.

At the outset of determining beneficial ownership, steps should be taken to identify how the immediate client can be identified. Accountants can verify the identity of a client by, for example meeting the client in person and then verifying their identity through the production of a passport/identity card and documentation confirming his/her address. Accountants can further verify the identity of a client on the basis of documentation or information obtained from reliable, publicly available sources (which are independent of the client).

A more difficult situation arises where there is a beneficial owner who is not the immediate client (e.g. in the case of companies and other entities). In such a scenario reasonable steps must be taken so that the accountant is satisfied about the identity of the beneficial owner and takes reasonable measures to verify the beneficial owner's identity. This likely requires taking steps to understand the ownership and control of a separate legal entity that is the client, and may include conducting public searches as well as by seeking information directly from the client.

Accountants will likely need to obtain the following information for a client that is a legal entity:

a) the name of the company;
b) the company registration number;
c) the registered address and/ or principal place of business (if different);
d) the identity of shareholders and their percentage ownership;
e) names of the board of directors or senior individuals responsible for the company's operations;
f) the law to which the company is subject and its constitution; and
g) the types of activities and transactions in which the company engages.

To verify the information listed above, accountants may use sources such as the following:

a) constitutional documents (such as a certificate of incorporation, memorandum and articles of incorporation/association);
b) details from company registers;
c) shareholder agreements or other agreements between shareholders concerning control of the legal person; and
d) filed audited accounts.

Accountants should adopt a RBA to verify beneficial owners of an entity. It is often necessary to use a combination of public sources and to seek further confirmation from the immediate client that information from public sources is correct and up-to-date or to ask for additional documentation that confirms the beneficial ownership and company structure. The obligation to identify beneficial ownership does not end with identifying the first level of ownership, but requires reasonable steps to be taken to identify the beneficial ownership at each level of the corporate structure until an ultimate beneficial owner is identified.

c) Understand and, as appropriate, obtain information on the purpose and intended nature of the business relationship.

d) Conduct ongoing due diligence on the business relationship. Ongoing due diligence ensures that the documents, data or information collected under the CDD process are kept up-to-date and relevant by undertaking reviews of existing records, particularly for higher-risk categories of clients. Undertaking appropriate CDD may also facilitate the accurate filing of suspicious transaction reports (STRs) to the financial intelligence unit (FIU), or to respond to requests for information from an FIU and the law enforcement agencies.

88. Accountants should design their policies and procedures so that the level of client due diligence addresses the risk of being used for ML/TF by the client. In accordance with the national AML/CFT framework, accountants should design a 'standard' level of CDD for normal risk clients and a reduced or simplified CDD process for low risk clients. Simplified CDD measures are not acceptable whenever there is a suspicion of ML/TF or where specific higher-risk scenarios apply. Enhanced due diligence should be applied to those clients that are assessed as high risk. These activities may be carried out in conjunction with firms' normal client acceptance procedures and should take account of any specific jurisdictional requirements for CDD.

89. In the normal course of their work, accountants are likely to learn more about some aspects of their client, such as their client's business or occupation and/or their level and source of income, than other advisors. This information is likely to help them reassess the ML/TF risk.

90. A RBA means that accountants should perform varying levels of work according to the risk level. For example, where the client or the owner of the controlling interest is a public company that is subject to regulatory disclosure requirements, and that information is publicly available, fewer checks may be appropriate. In the case of trusts, foundations or similar legal entities where the beneficiaries are distinct from the legal owners of the entity, it will be necessary to form a reasonable level of knowledge and understanding of the classes and nature of the beneficiaries; the identities of the settlor, trustees or natural persons exercising effective control; and an indication of the purpose of the trust. Accountants will need to obtain a reasonable level of comfort that the declared purpose of the trust is in fact its true purpose.

91. Changes in ownership or control of clients should lead to review or repeat of client identification and verification procedures. This may be carried out in conjunction with any professional requirements for client continuation processes.

92. Public information sources may assist with this ongoing review (scrutinising transactions undertaken throughout the course of that relationship). The procedures that need to be carried out can vary, in accordance with the nature and purpose for which the entity exists, and the extent to which the underlying ownership differs from apparent ownership by the use of nominees and complex structures.

93. The following box provides a non-exhaustive list of examples of standard, enhanced and simplified CDD:

Box 4. Examples of Standard/Simplified/Enhanced CDD measures (see also INR.10)

Standard CDD

- Identifying the client and verifying that client's identity using reliable, independent source documents, data or information
- Identifying the beneficial owner, and taking reasonable measures on a risk-sensitive basis to verify the identity of the beneficial owner, such that the accountant is satisfied about the identity of beneficial owner. For legal persons and arrangements, this should include understanding the ownership and control structure of the client and gaining an understanding of the client's source of wealth and source of funds, where required
- Understanding and obtaining information on the purpose and intended nature of the business relationship
- Conducting ongoing due diligence on the business relationship and scrutiny of transactions undertaken throughout the course of that relationship to ensure that the transactions being conducted are consistent with the business and risk profile the client, including, where necessary, the source of wealth and funds

Simplified CDD

- Limiting the extent, type or timing of CDD measures
- Obtaining fewer elements of client identification data
- Altering the type of verification carried out on client's identity
- Simplifying the verification carried out on client's identity
- Inferring the purpose and nature of the transactions or business relationship established based on the type of transaction carried out or the relationship established
- Verifying the identity of the client and the beneficial owner after the establishment of the business relationship
- Reducing the frequency of client identification updates in the case of a business relationship
- Reducing the degree and extent of ongoing monitoring and scrutiny of transactions

Enhanced CDD

- Obtaining additional information on the client (e.g. occupation, volume of assets, information available through public databases, internet, etc.), and updating more regularly the identification data of client and beneficial owner
- Carrying out additional searches (e.g. internet searches using independent and open sources) to better inform the client risk profile (provided that the internal policies of accountants should enable them to disregard source documents, data or information, which is perceived to be unreliable)
- Obtaining additional information and, as appropriate, substantiating documentation, on the intended nature of the business relationship
- Obtaining information on the source of funds and/or source of wealth of the client and clearly evidencing this through appropriate documentation obtained
- Obtaining information on the reasons for intended or performed transactions
- Obtaining the approval of senior management to commence or continue the business relationship

- Conducting enhanced monitoring of the business relationship, by increasing the number and timing of controls applied, and selecting patterns of transactions that need further examination
- Requiring the first payment to be carried out through an account in the client's name with a bank subject to similar CDD standards
- Increasing awareness of higher risk clients and transactions, across all departments with a business relationship with the client, including the possibility of enhanced briefing of engagement teams responsible for the client.
- Enhanced CDD may also include lowering the threshold of ownership (e.g. below 25%), to ensure complete understanding of the control structure of the entity involved. It may also include looking further than simply holdings of equity shares, to understand the voting rights of each party who holds an interest in the entity.

Politically exposed persons (PEP) (R.12 and R.22)

94. Accountants should take reasonable measures to identify whether a client is a PEP or a family member or close associate of a PEP. Accountants should also refer to the 2013 FATF Guidance on politically-exposed persons for further guidance on how to identify PEPs.

95. If the client or the beneficial owner is a PEP or a family member or close associate of a PEP, accountants should perform the following additional procedures:

a) obtain senior management approval for establishing (or continuing, for existing clients) such business relationships;
b) take reasonable measures to establish the source of wealth and source of funds[28]; and
c) conduct enhanced ongoing monitoring of the business relationship.

96. Relevant factors that will influence the extent and nature of CDD include the particular circumstances of a PEP, the PEP's role in a particular government/ government agency, whether the PEP has access to official funds, the PEP's home country, the type of work the PEP is instructing the accountant to perform or carry out (i.e. the services that are being asked for), whether the PEP is domestically based or international, particularly having regard to the services asked for, and the scrutiny to which the PEP is under in the PEP's home country.

97. The nature of the risk should be considered in light of all relevant circumstances, such as:

a) The nature of the relationship between the client and the PEP. If the client is a trust, company or legal entity, even if the PEP is not a natural person exercising effective control or the PEP is merely a discretionary beneficiary who has not received any distributions, the PEP may nonetheless affect the risk assessment.

b) The nature of the client (e.g. where it is a public listed company or regulated entity which is subject to and regulated for a full range of AML/CFT requirements consistent with FATF recommendations, the fact that it is

[28] See INR 28.1.

subject to reporting obligations will be a relevant factor, albeit this should not automatically qualify the client for simplified CDD).

c) The nature of the services sought. For example, lower risks may exist where a PEP is not the client but a director of a client that is a public listed company or regulated entity and the client is purchasing property for adequate consideration.

Ongoing monitoring of clients and specified activities (R.10 and 22)

98. Accountants are not expected to scrutinise every transaction that goes through their clients' books and some accounting services are provided only on a one-off basis, without a continuing relationship with the client and without the accountant having access to client's books and/or bank records. However, many of the professional services provided by accountants put them in a relatively good position to encounter and recognise suspicious activities (or transactions) carried out by their clients through their inside knowledge of, and access, to the client's records and management processes and operations, as well as through close working relationships with senior managers and owners. The continued administration and management of the legal persons and arrangements (e.g. account reporting, asset disbursements and corporate filings) would also enable the relevant accountants to develop a better understanding of the activities of their clients.

99. Accountants need to be alert for events or situations which are indicative of a reason to be suspicious of ML/TF, employing their professional experience and judgement in the forming of suspicions where appropriate. An advantage in carrying out this function is the professional scepticism which is a defining characteristic of many professional accountancy functions and relationships.

100. Ongoing monitoring of the business relationship should be carried out on a risk related basis, to ensure that accountants are aware of any changes in the client's identity and risk profile established at client acceptance. This requires an appropriate level of scrutiny of activity during the relationship, including enquiry into source of funds where necessary, to judge consistency with expected behaviour based on accumulated CDD information. As discussed below, ongoing monitoring may also give rise to filing a STR.

101. Accountants should also consider reassessing CDD on an engagement/assignment basis for each client. Well-known, reputable, long-standing clients may suddenly request a new type of service that is not in line with the previous relationship between the client and accountant. Such an assignment may suggest a greater level of risk.

102. Accountants should not conduct investigations into suspected ML/TF on their own but instead file a STR or if the behaviour is egregious they should contact the FIU or law enforcement or supervisors, as appropriate, for guidance. Within the scope of engagement, an accountant should be mindful of the prohibition on "tipping off" the client where a suspicion has been formed. Carrying out additional investigations, which are not within the scope of the engagement should also be considered against the risk alerting a money launderer.

103. When deciding whether or not an activity or transaction is suspicious, accountants may need to make additional enquiries (within the normal scope of the assignment or business relationship) of the client or their records this could typically be done as part of the accountant's CDD process. Normal commercial enquiries, being

made to fulfil duties to clients, may assist in understanding an activity or transaction to determine whether or not it is suspicious.

Suspicious activity/transaction reporting, tipping-off, internal controls and higher-risk countries (R.23)

104. R.23 sets out obligations for accountants on reporting and tipping-off, internal controls and higher-risk countries as set out in R.20, R.21, R.18 and R.19.

Suspicious transaction reporting and tipping-off (R.20, 21 and 23)

105. R.23 requires accountants to report suspicious transactions set out in R.20. Where a legal or regulatory requirement mandates the reporting of suspicious activity once a suspicion has been formed, a report must always be made promptly. The requirement to file a STR is not subject to a RBA, but must be made whenever required in the country concerned.

106. Accountants may be required to report suspicious activities, as well as specific suspicious transaction, and so may make reports on a number of scenarios including suspicious business structures or management profiles which have no legitimate economic rationale and suspicious transactions, such as the misappropriation of funds, false invoicing or company purchase of goods unrelated to the company's business. As specified under INR.23, where accountants seek to dissuade a client from engaging in illegal activity, this does not amount to tipping-off.

107. However, it should be noted that a RBA is appropriate for the purpose of identifying a suspicious activity or transaction, by directing additional resources at those areas that have been identified as higher risk. The designated competent authorities or SRBs may provide information to accountants, which can inform their approach for identifying suspicious activity or transactions, as part of a RBA. Accountant should also periodically assess the adequacy of their system for identifying and reporting suspicious activity or transactions.

108. Accountants should review CDD if they have a suspicion of ML/TF.

Internal controls and compliance (R.18 and 23)

109. In order for accountants to have effective RBA, the risk-based process must be imbedded within the internal controls of the firm and they must be appropriate for the size and complexity of the firm.

Internal controls and governance

110. Strong leadership and engagement by senior management and the Board of Directors (or equivalent body) in AML/CFT is an important aspect of the application of the RBA. Senior management must create a culture of compliance, ensuring that staff adhere to the firm's policies, procedures and processes designed to limit and control risks.

111. The nature and extent of the AML/CFT controls, as well as meeting national legal requirements, need to be proportionate to the risk involved in the services being offered. In addition to other compliance internal controls, the nature and extent of AML/CFT controls will encompass a number of aspects, such as:

a) designating an individual or individuals, at management level responsible for managing AML/CFT compliance;

b) designing policies and procedures that focus resources on the firm's higher-risk, services, products, clients and geographic locations in which their clients/they operate, and include risk-based CDD policies, procedures and processes;

c) ensuring that adequate controls are in place before new services are offered; and

d) ensuring adequate controls for accepting higher risk clients or providing higher risk services, such as management approval.

112. These policies and procedures should be implemented across the firm and include:

a) performing a regular review of the firm's policies and procedures to ensure that they remain fit for purpose;

b) performing a regular compliance review to check that staff are properly implementing the firm's policies and procedures;

c) providing senior management with a regular report of compliance initiatives, identifying compliance deficiencies, corrective action taken, and STRs filed;

d) planning for changes in management, staff or firm structure so that there is compliance continuity;

e) focusing on meeting all regulatory record-keeping and reporting requirements, recommendations for AML/CFT compliance and providing for timely updates in response to changes in regulations;

f) enabling the timely identification of reportable transactions and ensuring accurate filing of required reports;

g) incorporating AML/CFT compliance into job descriptions and performance evaluations of appropriate personnel;

h) providing for appropriate training to be given to all relevant staff;

i) having appropriate risk management systems to determine whether a client, potential client, or beneficial owner is a PEP or a person subject to applicable financial sanctions;

j) providing for adequate controls for higher risk clients and services, as necessary (e.g. additional due diligence, evidencing the source of wealth and funds of a client and escalation to senior management, or additional review and/or consultation);

k) providing increased focus on the accountant/accounting firm's operations (e.g. services, clients and geographic locations) that are more vulnerable to abuse for ML/TF;

l) providing for periodic review of the risk assessment and management processes, taking into account the environment within which the accountant/accounting firm operates and the services it provides; and

m) providing for an AML/CFT compliance function and review programme, as appropriate, given the scale of the organisation and the nature of the accountant's practice.

113. The firm should perform a firm-wide risk assessment that takes into account the size and nature of the practice; the existence of high-risk clients (if any); and the provision of high-risk services (if any). Once completed, the firm-wide risk assessment will assist the firm in designing its policies and procedures.

114. Accountants should consider using proven technology-driven solutions to minimise the risk of error and find efficiencies in their AML/CFT processes. As these solutions are likely to become more affordable, and more tailored to the needs of accountants as they continue to develop, this may be particularly important for smaller firms that may be less able to commit significant resources of time to these activities.

115. Depending on the size of the firm, the types of services provided, the risk profile of clients and the overall assessed ML/TF risk, it may be possible to simplify internal procedures. For example, for sole practitioners, providing limited services to low risk clients, client acceptance may be reserved to the sole owners/proprietors taking into account their business and client knowledge and experience. The involvement of the sole owner/proprietor may also be required in detecting and assessing possible suspicious activities. For larger firms, serving a diverse client base and providing multiple services across geographical locations, more sophisticated procedures are likely to be necessary.

Internal mechanisms to ensure compliance

116. Accountants (at the senior management level) should monitor the effectiveness of internal controls. If accountants identify any weaknesses in those internal controls, improved procedures should be designed.

117. The most effective tool to monitor the internal controls is a regular (typically at least annually) independent (internal or external) compliance review. If carried out internally, a staff member that has a good working knowledge of the firm's AML/CFT internal control framework, policies and procedures and is sufficiently senior to challenge them should perform the review. The person conducting an independent review should not be the same person who designed or implemented the controls being reviewed. The compliance review should include a review of CDD documentation to confirm that staff are properly applying the firm's procedures.

118. If the compliance review identifies areas of weakness and makes recommendations on how to improve the policies and procedures, then senior management should monitor how the firm is acting on those recommendations.

119. Accountants should review/update firm-wide risk assessments regularly and ensure that policies and procedures continue to target those areas where the ML/TF risks are highest.

Vetting and recruitment

120. Accountants should consider the skills, knowledge and experience of staff both before they are appointed to their role and on an ongoing basis. The level of

assessment should be proportionate to their role in the firm and the ML/TF risks they may encounter. Assessment may include criminal records checking and other forms of pre-employment screening such as credit reference checks and background verification (as permitted under national legislation) for key staff positions.

Education, training and awareness

121. R.18 requires that accounting firms/ accountants provide their staff with AML/CFT training. For accountants, and those in smaller firms in particular, such training may also assist with raising awareness of monitoring obligations. The accounting firm's commitment to having appropriate controls in place relies fundamentally on both training and awareness. This requires a firm-wide effort to provide all relevant staff with at least general information on AML/CFT laws, regulations and internal policies.

122. Firms should provide targeted training for increased awareness by the accountant providing specified activities to higher-risk clients and to accountants undertaking higher- risk work. Case studies (both fact-based and hypotheticals) are a good way of bringing the regulations to life and making them more comprehensible. Training should also be targeted towards the role that the individual performs in the AML/CFT process. This could include false documentation training for those undertaking identification and verification duties, or training regarding red flags for those undertaking client/transactional risk assessment.

123. In line with a RBA, particular attention should be given to risk factors or circumstances occurring in accountant's own practice. In addition, competent authorities, SRBs and representative bodies should work with educational institutions to ensure that the relevant curricula address ML/TF risks. The same training should also be made available for students taking courses to train to become accountants.

124. Firms must provide their employees with appropriate AML/CFT training. In ensuring compliance with this requirement, accountants may take account of any AML/CFT training included in entry requirements and continuing professional development requirements for their professional staff. They must also ensure appropriate training for any relevant staff without a professional qualification, at a level appropriate to the functions being undertaken by those staff, and the likelihood of their encountering suspicious activities.

125. The overall risk-based approach and the various methods available for training and education gives accountants flexibility regarding the frequency, delivery mechanisms and focus of such training. Accountants should review their own staff and available resources and implement training programs that provide appropriate AML/CFT information that is:

a) tailored to the relevant staff responsibility (e.g. client contact or administration);

b) at the appropriate level of detail (e.g. considering the nature of services provided by the accountants);

c) at a frequency suitable to the risk level of the type of work undertaken by the accountants; and

d) used to test to assess staff knowledge of the information provided.

Higher-risk countries (R.19 and 23)

126. Consistent with R.19, accountants should apply enhanced due diligence measures (also see paragraph 72 above), proportionate to the risks, to business relationships and transactions with clients from countries for which this is called for by the FATF.

Section IV – Guidance for supervisors

127. R.28 requires that accountants are subject to adequate AML/CFT regulation and supervision. Supervisors and SRBs must ensure that accountants are implementing their obligations under R.1.

Risk-based approach to supervision

128. A risk-based approach to AML/CFT means that measures taken to reduce ML/TF are proportionate to the risks. Supervisors and SRBs should supervise more effectively by allocating resource to areas of higher ML/TF risk. R.28 requires that accountants are subject to adequate AML/CFT regulation and supervision. While it is each country's responsibility to ensure there is an adequate national framework in place in relation to regulation and supervision of accountants, any relevant supervisors and SRBs should have a clear understanding of the ML/TF risks present in the relevant jurisdiction.

Supervisors and SRBs' role in supervision and monitoring

129. According to R.28, countries can designate a competent authority or SRB to ensure that accountants are subject to effective oversight, provided that such an SRB can ensure that its members comply with their obligations to combat ML/TF.

130. A SRB is body representing a profession (e.g. accountants, legal professionals, notaries, other independent legal professionals or TCSPs) made up of member professionals, which has a role (either exclusive or in conjunction with other entities) in regulating the persons that are qualified to enter and who practise in the profession. A SRB also performs supervisory or monitoring functions (e.g. to enforce rules to ensure that high ethical and moral standards are maintained by those practising the profession).

131. Supervisors and SRBs should have appropriate powers to perform their supervisory functions (including powers to monitor and to impose effective, proportionate and dissuasive sanctions), and adequate financial, human and technical resources. Supervisors and SRBs should determine the frequency and intensity of their supervisory or monitoring actions on accountants on the basis of their understanding of the ML/TF risks, and taking into consideration the characteristics of the accountants, in particular their diversity and number.

132. Countries should ensure that supervisors and SRBs are as equipped as a competent authorities in identifying and sanctioning non-compliance by its members.

Countries should also ensure that SRBs are well-informed about the importance of AML/CFT supervision, including enforcement actions as needed.

133. Countries should also address the risk that AML/CFT supervision by SRBs could be hampered by conflicting objectives pertaining to the SRB's role in representing their members, while also being obligated to supervise them. If a SRB contains members of the supervised population, or represents those people, the relevant persons should not continue to take part in the monitoring/ supervision of their practice/firm to avoid conflicts of interest.

134. Supervisors and SRBs should clearly allocate responsibility for managing AML/CFT related activity, where they are also responsible for other regulatory areas

Understanding ML/TF risk

135. The extent to which a national framework allows accountants to apply a RBA should also reflect the nature, diversity and maturity of the sector and its risk profile as well the ML/TF risks associated with individual accountants.

136. Access to information about ML/TF risks is essential for an effective risk-based approach. Countries are required to take appropriate steps to identify and assess ML/TF risks on an ongoing basis in order to (a) inform potential changes to the country's AML/CFT regime, including changes to laws, regulations and other measures; (b) assist in the allocation and prioritisation of AML/CFT resources by competent authorities; and (c) make information available for AML/CFT risk assessments conducted by accountants and the jurisdictions' national risk assessment. Countries should keep the risk assessments up-to-date and should have mechanisms to provide appropriate information on the results to competent authorities, SRBs and accountants. In situations where some accountants have limited capacity to identify ML/TF risks, countries should work with the sector to understand their risks.

137. Supervisors and SRBs should, as applicable, draw on a variety of sources to identify and assess ML/TF risks. These may include, but will not be limited to, the jurisdiction's national risk assessments, supranational risk assessments, domestic or international typologies, supervisory expertise and FIU feedback. The necessary information can also be obtained through appropriate information-sharing and collaboration among AML/CFT supervisors, when there are more than one for different sectors (legal professionals, accountants and TCSPs).

138. These sources can also be helpful in determining the extent to which an accountant is able to effectively manage ML/TF risk. Information-sharing and collaboration should take place among AML/CFT supervisors across all sectors (legal professionals, accountants and TCSPs).

139. Competent authorities may also consider undertaking a targeted sectoral risk assessment to get a better understanding of the specific environment in which accountants operate in the country and the nature of services provided by them.

140. Supervisors and SRBs should understand the level of inherent risk including the nature and complexity of services provided by the accountant. Supervisors and SRBs should also consider the type of services the accountant is providing as well as its size and business model (e.g. whether it is a sole practitioner), corporate

governance arrangements, financial and accounting information, delivery channels, client profiles, geographic location and countries of operation. Supervisors and SRBs should also consider the controls accountants have in place (e.g. the quality of the risk management policy, the functioning of the internal oversight functions and the quality of oversight of any outsourcing and subcontracting arrangements).

141. Supervisors and SRBs should seek to ensure their supervised populations are fully aware of, and compliant with, measures to identify and verify a client, the client's source of wealth and funds where required, along with measures designed to ensure transparency of beneficial ownership, as these are cross-cutting issues that affect several aspects of AML/CFT.

142. To further understand the vulnerabilities associated with beneficial ownership, with a particular focus on the involvement of professional intermediaries, supervisors should stay abreast of research papers and typologies published by international bodies.[29] Useful reference include the Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership published in July 2018.

143. Supervisors and SRBs should review their assessment of accountants' ML/TF risk profiles periodically, including when circumstances change materially or relevant new threats emerge and appropriately communicate this assessment to the profession.

Mitigating and managing ML/TF risk

144. Supervisors and SRBs should take proportionate measures to mitigate and manage ML/TF risk. Supervisors and SRBs should determine the frequency and intensity of these measures based on their understanding of the inherent ML/TF risks. Supervisors and SRBs should consider the characteristics of accountants, particularly where they act as professional intermediaries, in particular their diversity and number. It is essential to have a clear understanding of the ML/TF risks: (a) present in the country; and (b) associated with the type of accountant and their clients, products and services.

145. Supervisors and SRBs should take account of the risk profile of accountants when assessing the adequacy of internal controls, policies and procedures.

146. Supervisors and SRBs should develop a means of identifying which accountants are at the greatest risk of being used by criminals. This involves considering the probability and impact of ML/TF risk.

147. Probability means the likelihood of ML/TF taking place as a consequence of the activity undertaken by accountants and the environment in which they operate. The risk can also increase or decrease depending on other factors:

a) service and product risk (the likelihood that services or products can be used for ML/TF);

b) client risk (the likelihood that clients' funds may have criminal origins);

c) the nature of transactions (e.g. frequency, volume, counterparties);

[29] Such as the FATF, the OECD, the WB, the IMF and the UNODC

d) geographical risk (whether the accountant, its clients or other offices trade in riskier locations); and

e) other indicators of risk are based on a combination of objective factors and experience, such as the supervisor's wider work with the accountant as well as information on its compliance history, complaints about the accountant or about the quality of its internal controls, and intelligence from law enforcement agencies on suspected involvement in financial crimes (including unwitting facilitation). Other such factors may include information from government/law enforcement sources, whistle-blowers or negative news reports from credible media particularly those related to predicate offences for ML/TF or to financial crimes.

148. In adopting a RBA to supervision, supervisors may consider allocating supervised entities sharing similar characteristics and risk profiles into groupings for supervision purposes. Examples of characteristics and risk profiles could include the size of business, type of clients serviced and geographic areas of activities. The setting up of such groupings could allow supervisors to take a comprehensive view of the sector, as opposed to an approach where the supervisors concentrate on the individual risks posed by the individual firms. If the risk profile of an accountant within a grouping changes, supervisors may reassess the supervisory approach, which may include removing the accountant from the grouping.

149. Supervisors and SRBs should also consider the impact, i.e. the potential harm caused if ML/TF is facilitated by the accountant or group of accountants. A small number of accountants may cause a high level of harm. This can depend on:

a) size (i.e. turnover), number and type of clients, number of premises, value of transactions etc.); and

b) links or involvement with other businesses (which could affect the susceptibility to being involved in 'layering' activity, e.g. concealing the origin of the transaction with the purpose to legalise the asset).

150. The risk assessment should be updated by supervisors and SRBs on an ongoing basis. The result from the assessment will help determine the resources the supervisor will allocate to the supervision of accountants.

151. Supervisors or SRBs should consider whether accountants meet the ongoing requirements for continued participation in the profession as well as assessments of competence and of fitness and propriety. This will include whether the accountant meets expectations related to AML/CFT compliance. This will take place both when a supervised entity joins the profession, and on an ongoing basis thereafter.

152. If a jurisdiction chooses to classify an entire sector as higher risk, it should be possible to differentiate between categories of accountants based on factors such as their client base, countries they deal with and applicable AML/CFT controls etc.

153. Supervisors and SRBs should acknowledge that in a risk-based regime, not all accountants will adopt identical AML/CFT controls and that an isolated incident where the accountant is part of an illegal transaction unwittingly does not necessarily invalidate the integrity of the accountant´s AML/CFT controls. At the same time, accountants should understand that a flexible RBA does not exempt them from applying effective AML/CFT controls.

154. Supervisors and SRBs should use their findings to review and update their ML/TF risk assessments and, where necessary, consider whether their approach to AML/CFT supervision and the existing AML/CFT rules and guidance remain adequate. Whenever appropriate, and in compliance with relevant confidentiality requirements, these findings should be communicated to accountants to enable them to enhance their RBA.

Supervision of the RBA

Licensing or registration

155. R.28 requires a country to ensure that accountants are subject to regulatory and supervisory measures to ensure compliance by the profession with AML/CFT requirements.

156. R.28 requires the supervisor or SRB to take the necessary measures to prevent criminals or their associates from being professionally accredited or holding or being the beneficial owner of a significant or controlling interest or holding a management function in an accountancy practice. This can be achieved through the evaluation of these persons through a "fit and proper" test.

157. A licensing or registration mechanism is one of the means to identify accountants to whom the regulatory and supervisory measures, including the "fit and proper" test should be applied. It also enables the identification of the number of accountants for the purposes of assessing and understanding the ML/TF risks for the country, and the action that should be taken to mitigate them in accordance with R.1.

158. Licensing or registration provides a supervisor or SRB with the means to fulfil a "gatekeeper" role over who can undertake the activities specified in R.22. Licensing or registration should ensure that upon qualification, accountants are subject to AML/CFT compliance monitoring.

159. The supervisor or SRB should actively identify individuals and businesses who should be supervised by using intelligence from other competent authorities (e.g. FIUs, company registry or tax authority), information from financial institutions and DNFBPs, complaints by the public, open source information from advertisements and business and commercial registries, or any other sources which indicate that there are unsupervised individuals or businesses providing the activities specified in R.22.

160. Licensing or registration frameworks should define the activities that are subject to licensing or registration, prohibit unlicensed or unregistered individuals or businesses providing these activities and set out measures for both refusing licences or registrations and for removing "bad actors".

161. The terms "licensing" or "registration" are not interchangeable. Licensing regimes generally tend to operate over financial institutions and impose mandatory minimum requirements based upon Core Principles on issues such as capital, governance, and resourcing to manage and mitigate prudential, conduct as well as ML/TF risks on an on-going basis. Some jurisdictions have adopted similar licensing regimes for accountants, generally where accountants carry out trust and corporate services, to encompass aspects of prudential and conduct requirements in managing the higher level of ML/TF risks that have been identified in that sector.

162. A jurisdiction may have a registration framework over the entire DNFBP sector, including accountants or have a specific registration framework for each constituent of a DNFBP. Generally, a supervisor or SRB carries out the registration function.

163. The supervisor or SRB should ensure that requirements for licensing or registration and the process for applying are clear, objective, publicly available and consistently applied. Determination of the licence or registration should be objective and timely. A SRB could be responsible for both supervision and for representing the interests of its members. If so, the SRB should ensure that registration decisions are taken separately and independently from its activities regarding member representation.

Fit and proper tests

164. A fit and proper test provides a possible mechanism for a supervisor or SRB to take the necessary measures to prevent criminals or their associates from owning, controlling or holding a management function in an accountancy practice.

165. In accordance with R.28, the supervisor or SRB should establish the integrity of every beneficial owner, controller and individual holding a management function in an accountancy practice. However, the decisions on an individual's fitness and propriety may also be based upon a range of factors concerning the individual's competency, probity and judgement as well as integrity.

166. In some jurisdictions, a "fit and proper test" forms a fundamental part of determining whether to license or register the applicant and whether on an ongoing basis the licensee or registrant (including its owners and controllers, where applicable) remains fit and proper to continue in that role. The initial assessment of an individual's fitness and propriety is a combination of obtaining information from the individual and corroborating elements of that information against independent credible sources to determine whether the individual is fit and proper to hold that position.

167. The process for determining fitness and propriety generally requires the applicant to complete a questionnaire. The questionnaire could gather personal identification information, residential and employment history, and require disclosure by the applicant of any convictions or adverse judgements, including pending prosecutions and convictions relating to the applicant. Elements of this information should be corroborated to establish the bona fides of an individual. Such checks could include enquiries about the individual with law enforcement agencies and other supervisors, or screening the individual against independent electronic search databases. The personal data collected should be kept confidential.

168. The supervisor or SRB should also ensure on an ongoing basis that those holding or being the beneficial owner of significant or controlling interest in and individuals holding management functions are fit and proper. A fit and proper test should apply to new owners, controllers and individuals holding a management function. The supervisor or SRB should consider re-assessing the fitness and propriety of these individuals arising from any supervisory findings, receipt of information from other competent authorities; or open source information indicating significant adverse developments.

Guarding against "brass-plate" operations

169. The supervisor or SRB should ensure that its licensing or registration requirements require the applicant to have a meaningful physical presence in the jurisdiction. This usually means that the applicant should have its place of business in the jurisdiction. Where the applicant is a legal person, those individuals who form its mind and management, should also be resident in the jurisdiction and be actively involved in the business. A business with only staff who do not possess the professional requirements of an accountant should not be licensed or registered.

170. A supervisor or SRB should consider the ownership and control structure of the applicant to determine that sufficient control over its operation will reside within the business, which it is considering licensing or registering. Factors to take account of could include consideration of where the beneficial owners and controllers reside, the number and type of management functions the applicant is proposing to have in the country, such as directors and managers, including compliance managers, and the calibre of the individuals who will be occupying those roles.

171. The supervisor or SRB should also consider whether the ownership and control structure of accountants unduly hinders its identification of the beneficial owners and controllers or presents obstacles to applying effective supervision.

Monitoring and supervision

172. Supervisors and SRBs should take measures to effectively monitor accountants through on-site and off-site supervision. The nature of this monitoring will depend on the risk profiles prepared by the supervisor or SRB and the connected risk-based approach. Supervisors and SRBs may choose to adjust:

a) the level of checks required to perform their licensing/registration function: where the ML/TF risk associated with the sector is low, the opportunities for ML/TF associated with a particular business activity may be limited, and approvals may be made on a review of basic documentation. Where the ML/TF risk associated with the sector is high, supervisors and SRBs may ask for additional information.

b) the type of on-site or off-site AML/CFT supervision: supervisors and SRBs may determine the correct mix of on-site and off-site supervision of accountants. Off-site supervision may involve analysis of annual independent audits and other mandatory reports, identifying risky intermediaries (i.e. on the basis of the size of the firms, involvement in cross-border activities, or specific business sectors), automated scrutiny of registers to detect missing beneficial ownership information and identification of persons responsible for the filing. It may also include undertaking thematic reviews of the sector, making compulsory the periodic information returns from firms. Off-site supervision alone may not be appropriate in higher risk situations. On-site inspections may involve reviewing AML/CFT internal policies, controls and procedures, interviewing members of senior management, compliance officer other relevant and staff, considering gatekeeper's own risk assessments, spot checking CDD documents and supporting evidence, looking at reporting of ML/TF suspicions in relation to clients and other matters, which may be

observed in the course of an onsite visit and, where appropriate, sample testing of reporting obligations.

c) the frequency and nature of ongoing AML/CFT supervision: supervisors and SRBs should proactively adjust the frequency of AML/CFT supervision in line with the risks identified and combine periodic reviews and ad hoc AML/CFT supervision as issues emerge (e.g. as a result of whistleblowing, information from law enforcement, or other supervisory findings resulting from accountants' inclusion in thematic review samples).

d) the intensity of AML/CFT supervision: supervisors and SRBs should decide on the appropriate scope or level of assessment in line with the risks identified, with the aim of assessing the adequacy of accountants' policies and procedures that are designed to prevent them from being abused. Examples of more intensive supervision could include; detailed testing of systems and files to verify the implementation and adequacy of the accountant's risk assessment, CDD, reporting and record-keeping policies and processes, internal auditing, interviews with operational staff, senior management and the Board of directors and AML/CFT assessment in particular lines of business.

173. Supervisors and SRBs should use their findings to review and update their ML/TF risk assessments and, where necessary, consider whether their approach to AML/CFT supervision and the existing AML/CFT rules and guidance remain adequate. Whenever appropriate, and in compliance with relevant confidentiality requirements, these findings should be communicated to accountants to enable them to enhance their RBA.

174. Record keeping and quality assurance are important, so that supervisors can document and test the reasons for significant decisions relating to AML/CFT supervision. Supervisors should have an appropriate information retention policy and be able to easily retrieve information while complying with the relevant data protection legislation. Record keeping is crucial and fundamental to the supervisors' work. Undertaking adequate quality assurance is also fundamental to the supervisory process to ensure decision-making/sanctioning is consistent across the supervised population.

Enforcement

175. R.28 requires supervisors or SRB to have adequate powers to perform their functions, including powers to monitor compliance by accountants. R.35 requires countries to have the power to impose sanctions, whether criminal, civil or administrative, on DNFPBs, to include accountants when providing the services outlined in R.22(d). Sanctions should be available for the directors and senior management of the firm when an accountant fails to comply with requirements.

176. Supervisors and SRBs should use proportionate actions, including a range of supervisory interventions and corrective actions to ensure that any identified deficiencies are addressed in a timely manner. Sanctions may range from informal or written warning, reprimand and censure to punitive measures (including disbarment and criminal prosecutions where appropriate) for more egregious non-compliance, as identified weaknesses can have wider consequences. Generally, systemic

breakdowns or significantly inadequate controls will result in more severe supervisory response.

177. Enforcement by supervisors and SRBs should be proportionate while having a deterrent effect. Supervisors and SRBs should have (or should delegate to those who have) sufficient resources to investigate and monitor non-compliance. Enforcement should aim to remove the benefits of non-compliance.

Guidance

178. Supervisors and SRBs should communicate their regulatory expectations. This could be done through a consultative process after meaningful engagement with relevant stakeholders, including accountants. This guidance may be in the form of high-level requirements based on desired outcomes, risk-based rules, and information about how supervisors interpret relevant legislation or regulation, or more detailed guidance about how particular AML/CFT controls are best applied. Guidance issued to accountants should also discuss ML/TF risk within their sector and outline ML/TF indicators to help them identify suspicious transactions and activity. All such guidance should preferably be consulted on, where appropriate, and drafted in ways that are appropriate to the context of the role of supervisors and SRBs in the relevant jurisdiction.

179. Where supervisors' guidance remains high-level and principles-based, this may be supplemented by further guidance written by the accountancy profession, which may cover operational and practical issues, and be more detailed and explanatory in nature. Where supervisors cooperate to produce combined guidance across sectors, supervisors should ensure this guidance adequately addresses the diversity of roles that come within the guidance's remit, and that such guidance provides practical direction to all its intended recipients. The private sector guidance should be consistent with national legislation and with any guidelines issued by competent authorities with regard to the accountancy profession and be consistent with all other legal requirements and obligations.

180. Supervisors should consider communicating with other relevant domestic supervisory authorities to secure a coherent interpretation of the legal obligations and to minimise disparities across sectors (such as legal professionals, accountants and TCSPs). Multiple guidance should not create opportunities for regulatory arbitrage. Relevant supervisory authorities should consider preparing joint guidance in consultation with the relevant sectors, while recognising that in many jurisdictions accountants will consider that separate guidance targeted at their profession will be the most appropriate and effective form.

181. Information and guidance should be provided by supervisors in an up-to-date and accessible format. It could include sectoral guidance material, newsletters, internet-based material, oral updates on supervisory visits, meetings and annual reports.

Training

182. Training is important for supervisory staff, and other relevant employees, to understand the accountancy profession and the various business models that exist. In particular, supervisors should ensure that staff are trained to assess the quality of ML/TF risk assessments and to consider the adequacy, proportionality, effectiveness

and efficiency of AML/CFT policies, procedures and internal controls. It is recommended that the training has a practical basis/dimension.

183. Training should allow supervisory staff to form sound judgments about the quality of the risk assessments made by accountants and the adequacy and proportionality of AML/CFT controls of accountants. It should also aim at achieving consistency in the supervisory approach at a national level, in cases where there are multiple competent supervisory authorities or when the national supervisory model is devolved or fragmented.

Endorsements

184. Supervisors should avoid mandating the use of AML systems, tools or software of any third party commercial providers to avoid conflicts of interest in the effective supervision of firms.

Information exchange

185. Information exchange between the public and private sector and within private sector (e.g. between financial institutions and accountants) is important to combat ML/TF. Information sharing and intelligence sharing arrangements between supervisors and public authorities (such as Financial Intelligence Units and law enforcement) should be robust, secure and subject to compliance with national legal requirements.

186. The type of information that could be shared between the public and private sectors include:

a) ML/TF risk assessments;

b) Typologies (i.e. case studies) of how money launderers or terrorist financers have misused accountants;

c) feedback on STRs and other relevant reports;

d) targeted unclassified intelligence. In specific circumstances, and subject to appropriate safeguards such as confidentiality agreements, it may also be appropriate for authorities to share targeted confidential information with accountants as a class or individually; and

e) countries, persons or organisations whose assets or transactions should be frozen pursuant to targeted financial sanctions as required by R.6.

187. Domestic co-operation and information exchange between FIU and supervisors of the accountancy profession and among competent authorities including law enforcement, intelligence, FIU, tax authorities, supervisors and SRBs is also vital for effective monitoring/supervision of the sector. Such co-operation and co-ordination may help avoid gaps and overlaps in supervision and ensure sharing of good practices and findings. Intelligence about active misconduct investigations and completed cases between supervisors and law enforcement agencies should also be encouraged. When sharing information, protocols and safeguards should be implemented in order to protect personal data.

188. Cross border information sharing of authorities and private sector with their international counterparts is of importance in the accountancy profession, taking account of the multi-jurisdictional reach of many accounting firms.

Supervision of Beneficial Ownership requirements and source of funds/wealth requirements

189. The FATF Recommendations require competent authorities to have access to adequate, accurate and timely information on the beneficial ownership and control of legal persons (R.24). In addition, countries must take measures to prevent the misuse of legal arrangements for ML/TF, in particular ensuring that there is adequate, accurate and timely information on express trusts (R.25). Implementation of the FATF Recommendations on beneficial ownership has proven challenging. As a result, the FATF developed a Guidance on Transparency and Beneficial Ownership (2014) to assist countries in their implementation of R.24 and R.25, as well as R.1 as it relates to understanding the ML/TF risks of legal persons and legal arrangements. The FATF and Egmont Group also published the Report on Concealment of Beneficial Ownership in July 2018 which identified issues to help address the vulnerabilities associated with the concealment of beneficial ownership.

190. R.24 and R.25 require countries to have mechanisms to ensure that information provided to registries is accurate and updated on a timely basis and that beneficial ownership information is accurate and current. To determine the adequacy of a system for monitoring and ensuring compliance, countries should have regard to the risk of AML/CFT in given businesses (i.e. if there is a proven higher risk then higher monitoring measures should be taken). Accountants must, however, be cautious in blindly relying on the information contained in registries. It is important for there to be some form of ongoing monitoring during a relationship to detect unusual and potentially suspicious transactions as a result of a change in beneficial ownership as registries are unlikely to provide such information on a dynamic basis.

191. Those responsible for company formation and the creation of legal arrangements fulfil a key gatekeeper role to the wider financial community through the activities they undertake in the formation of legal persons and legal arrangements or in their management and administration.

192. As DNFBPs, accountants are required to apply CDD measures to beneficial owners of legal persons and legal arrangements to whom they are providing advice or formation services. In a number of countries an accountant may be required as part of the process of registering the legal person and will be responsible for providing basic and/or beneficial ownership information to the registry.

193. In their capacity as company directors, trustees or foundation officials etc. of these legal persons and legal arrangement, accountants often represent these legal persons and legal arrangements in their dealings with other financial institutions and DNFBPs that are providing banking or audit services to these types of client.

194. These financial institutions and other DNFBPs may request the CDD information collected and maintained by accountants, who because of their role as director or trustee, will be their principal point of contact with the legal person or legal arrangement. These financial institutions and other DNFBPs may never meet the beneficial owners of the legal person or legal arrangement.

195. Under R.28, countries are to ensure that accountants are subject to effective systems for monitoring and ensuring compliance with AML/CFT requirements, which includes identifying the beneficial owner/s and taking reasonable measures to verify

them. R.24 and R.25, which deal with transparency of beneficial ownership of legal persons and legal arrangements, require countries to have mechanisms for ensuring that adequate, accurate and up-to-date information on these legal entities is available on a timely basis.

196. In accordance with R.28, accountants should be subject to risk-based supervision by a supervisor or SRB covering the beneficial ownership and record-keeping requirements of R.10 and R.11. The supervisor or SRB should have a supervisory framework, which can help in ascertaining that accurate and current basic and beneficial ownership information on legal person and legal arrangements is maintained and will be available on a timely basis to competent authorities.

197. The supervisor or SRB should analyse the adequacy of the procedures and the controls, which accountants have established to identify and record the beneficial owner. In addition, they should undertake sample testing of client records on a representative basis to gauge the effectiveness of the application of those measures and the accessibility of accurate beneficial ownership information.

198. During onsite and offsite inspections, the supervisor or SRB should examine the policies, procedures and controls that are in place for taking on new clients to establish what information and documentation is required where the client is a natural person or legal person or arrangement. The supervisor or SRB should verify the adequacy of these procedures and controls to identify beneficial owners to understand the ownership and control structure of these legal persons and arrangements and to ascertain the business activity. For example, self-declaration on beneficial ownership provided by the client without any other mechanism to verify the information will not be adequate in all cases.

199. Sample testing of records will assist the supervisor or SRB in determining whether controls are effective for the accurate identification of beneficial ownership, accurate disclosure of that information to relevant parties and for establishing if that information is readily available. The extent of testing will be dependent on risk but the records selected should reflect the profile of the client base and include both new and existing clients.

200. The supervisor or SRB should consider the measures the accountants have put in place for monitoring changes in the beneficial ownership of legal person and legal arrangements to whom they provide services to ensure that beneficial ownership information is accurate and current and to determine how timely updated filings are made, where relevant to a registry.

201. During examinations, the supervisor or SRB should consider whether to verify the beneficial ownership information available on the records of accountants with that held by the relevant registry, if any. The supervisor or SRB may also consider information from other competent authorities such as FIUs, public reports and information from other financial institutions or DNFBPs, to verify the efficacy of accountants' controls.

202. Accountants should be subject to risk-based supervision by a supervisor or SRB covering the requirements to identify and evidence the source of funds and source of wealth for higher risk clients to whom they provide services. The supervisor or SRB should have the supervisory framework, which can help in ascertaining that accurate and current information on sources of funds and wealth is properly

evidenced and available on a timely basis to competent authorities. The supervisor or SRB should analyse the adequacy of the procedures and controls that accountants have established to identify and record sources of wealth in arrangements.

Nominee arrangements

203. A nominee director is a person who has been appointed to the Board of Directors of the legal person who represents the interests and acts in accordance with instructions issued by another person, usually the beneficial owner.

204. A nominee shareholder is a natural or legal person who is officially recorded in the register of members and shareholders of a company as the holder of a certain number of specified shares, which are held on behalf of another person who is the beneficial owner. The shares may be held on trust or through a custodial agreement.

205. In a number of countries, accountants act or arrange for other persons (either individuals or corporate) to act as directors. Accountants also act or arrange for other persons (either individuals or corporate) to act as a nominee shareholder for another person as part of their professional services. In accordance with R.24, one of the mechanisms to ensure that nominee shareholders and directors are not misused, is by subjecting these accountants to licensing and recording their status in company registries. Countries may rely on a combination of measures in this respect.

206. There are legitimate reasons for accountants to act as or provide directors to a legal person or act or provide nominee shareholders. These may include the settlement and safekeeping of shares in listed companies where post traded specialists act as nominee shareholders. However, nominee director and nominee shareholder arrangements can be misused to hide the identity of the true beneficial owner of the legal person. There may be individuals prepared to lend their name as a director or shareholder of a legal person on behalf of another without disclosing the identity of the person from whom they will take instructions or whom they represent. They are sometimes referred to as “strawmen”.

207. Nominee directors and nominee shareholders can create obstacles to identifying the true beneficial owner of a legal person, particularly where the status is not disclosed. This is because it will be the identity of the nominee that is disclosed in the corporate records of the legal person held by a registry and in the company records at its registered office. Company law in various countries does not recognise the status of a nominee director because in law it is the directors of the company who are liable for its activities and the directors have a duty to act in the best interest of the company.

208. The supervisor or SRB should be aware that undisclosed nominee arrangements may exist. They should consider whether undisclosed nominee arrangements would be identified and addressed during their onsite and offsite inspections and examination of the policies, procedures, controls and client records of the accountant, including the CDD process and ongoing monitoring by the accountant.

209. An undisclosed nominee arrangement may exists where there are the following (non-exhaustive) indicators:

a) the profile of a director or shareholder is inconsistent with the activities of the company;

b) the individual holds numerous appointments to unconnected companies;

c) a director's or shareholder's source of wealth is inconsistent with the value and nature of the assets within the company;

d) funds into and out of the company are sent to, or received from unidentified third party/ies;

e) the directors or shareholders are accustomed to acting on instruction of another person; and

f) requests or instructions are subject to minimal or no scrutiny and/or responded to extremely quickly without challenge by the individual/s purporting to act as the director/s.

Annex 1: Beneficial ownership information in relation to a trust or other legal arrangements to whom an accountant provides services

1. Taking a RBA, the amount of information that should be obtained by an accountant will depend on whether an accountant is establishing or administering the trust, company or other legal entity or is acting as or providing a trustee or director of the trust, company or other legal entity. In these cases, an accountant will be required to understand the general purpose behind the structure and the source of funds in the structure in addition to being able to identify the beneficial owners and controlling persons. An accountant who is providing other services (e.g. acting as registered office) to a trust, company or other legal entity will be required to obtain sufficient information to enable it to be able to identify the beneficial owners and controlling persons of the trust, company or other legal entity.

2. An accountant that is not acting as trustee may, in appropriate circumstances, rely on a synopsis prepared by other accountants, legal professionals or TCSPs providing services to the trust or relevant extracts from the trust deed itself to enable the accountant to identify the settlor, trustees, protector (if any), beneficiaries or natural persons exercising effective control. This is in addition to the requirement, where appropriate, to obtain evidence to verify the identity of such persons as discussed below.

In relation to a trust

3. An accountant should have policies and procedures in place to identify the following and verify their identity using reliable, independent source documents, data or information (provided that an accountant's policies should enable it to disregard source documents, data or information which are perceived to be unreliable):

i. the settlor;

ii. the protector;

iii. the trustee(s), where the accountant is not acting as trustee;

iv. the beneficiaries or class of beneficiaries; and

v. any other natural person actually exercising effective control over the trust.

Settlor

a) A settlor is generally any person (or persons) by whom the trust is made. A person is a settlor if he or she has provided (or has undertaken to provide) property or funds directly or indirectly for the trust. This requires there to be an element of bounty (i.e. the settlor must be intending to provide some form of benefit rather than being an independent third party transferring something to the trust for full consideration).

b) A settlor may or may not be named in the trust deed. Accountants should have policies and procedures in place to identify and verify the identity of the real economic settlor.

c) An accountant establishing on behalf of a client or administering a trust, company or other legal entity or otherwise acting as or providing a trustee or

director of a trust, company or other legal entity should have policies and procedures in place (using a RBA) to identify the source of funds in the trust, company or other legal entity.

d) It may be more difficult (if not impossible) for older trusts to identify the source of funds, where contemporaneous evidence may no longer be available. Evidence of source of funds may include reliable independent source documents, data or information, share transfer forms, bank statements, deeds of gift or letter of wishes.

e) Where assets have been transferred to the trust from another trust, it will be necessary to obtain this information for both transferee and transferor trust.

Beneficiaries

a) An accountant should have policies and procedures in place, adopting a RBA to enable it to form a reasonable belief that it knows the true identity of the beneficiaries of the trust, and taking reasonable measures to verify the identity of the beneficiaries, such that an accountant is satisfied that it knows who the beneficiaries are. This does not require an accountant to verify the identity of all beneficiaries using reliable, independent source documents, data or information but the accountant should at least identify and verify the identity of beneficiaries who have current fixed rights to distributions of income or capital or who actually receive distributions from the trust (e.g. a life tenant).

b) Where the beneficiaries of the trust have no fixed rights to capital and income (e.g. discretionary beneficiaries), an accountant should obtain information to enable it to identify the named discretionary beneficiaries (e.g. as identified in the trust deed).

c) Where beneficiaries are identified by reference to a class (e.g. children and issue of a person) or where beneficiaries are minors under the law governing the trust, although an accountant should satisfy itself that these are the intended beneficiaries (e.g. by reference to the trust deed) the accountant is not obliged to obtain additional information to identify the individual beneficiaries referred to in the class unless or until the trustees make a distribution to such beneficiary.

d) In some trusts, named individuals only become beneficiaries on the happening of a particular contingency (e.g. on attaining a specific age or on the death of another beneficiary or the termination of the trust period). In this case, an accountant is not required to obtain additional information to identify such contingent beneficiaries unless or until the contingency is satisfied or until the trustees make a distribution to such beneficiary.

e) An accountant who administers the trust or company or other legal entity owned by a trust or otherwise provides or acts as trustee or director to the trust, company or other legal entity should have procedures in place so that there is a requirement to update the information provided if named beneficiaries are added or removed from the class of beneficiaries, or beneficiaries receive distributions or benefits for the first time after the information has been provided, or there are other changes to the class of beneficiaries.

f) An accountant is not obliged to obtain other information about beneficiaries other than to enable an accountant to satisfy itself that it knows who the beneficiaries are or identify whether any named beneficiary or beneficiary who has received a distribution from a trust is a PEP.

Natural person exercising effective control

a) An accountant providing services to the trust should have procedures in place to identify any natural person exercising effective control over the trust.

b) For these purposes "control" means a power (whether exercisable alone or jointly with another person or with the consent of another person) under the trust instrument or by law to:

   i. dispose of or invest (other than as an investment manager or adviser) trust property;

   ii. make or approve trust distributions;

   iii. vary or terminate the trust;

   iv. add or remove a person as a beneficiary or to or from a class of beneficiaries and or;

   v. appoint or remove trustees.

c) An accountant who administers the trust or otherwise act as trustee must, in addition, also obtain information to satisfy itself that it knows the identity of any other individual who has power to give another individual "control" over the trust; by conferring on such individual powers as described in paragraph (b) above.

Corporate settlors and beneficiaries

4. These examples are subject to the more general guidance on what information should be obtained by an accountant to enable it to identify settlors and beneficiaries. It is not intended to suggest that an accountant must obtain more information about a beneficiary that is an entity where it would not need to obtain such information if the beneficiary is an individual.

a) In certain cases, the settlor, beneficiary, protector or other person exercising effective control over the trust may be a company or other legal entity. In such a case, an accountant should have policies and procedures in place to enable it to identify (where appropriate) the beneficial owner or controlling person in relation to the entity.

b) In the case of a settlor that is a legal entity, an accountant should satisfy itself that it has sufficient information to understand the purpose behind the formation of the trust by the entity. For example, a company may establish a trust for the benefit of its employees or a legal entity may act as nominee for an individual settlor or on the instructions of an individual who has provided funds to the legal entity for this purpose. In the case of a legal entity acting as nominee for an individual settlor or on the instructions of an individual, an accountant should take steps to satisfy itself as to the economic settlor of the trust (i.e. the person who has provided funds to the legal entity to enable it to settle funds into the trust) and the controlling persons in relation to the legal entity at the time the assets were settled into trust. If the corporate settlor

retains powers over the trust (e.g. a power of revocation), an accountant should satisfy itself that it knows the current beneficial owners and controlling persons of the corporate settlor and understands the reason for the change in ownership or control.

c) In the case of a beneficiary that is an entity (e.g. a charitable trust or company), an accountant should satisfy itself that it understands the reason behind the use of an entity as a beneficiary. If there is an individual beneficial owner of the entity, an accountant should satisfy itself that it has sufficient information to identify the individual beneficial owner.

Individual and Corporate trustee

a) Where an accountant is not itself acting as trustee, it is necessary for an accountant to obtain information to enable it to identify and verify the identity of the trustee (s) and, where the trustee is a corporate trustee, identify the corporate entity, obtain information on the identity of the beneficial owners of the trustee, and take reasonable measures to verify their identity.

b) Where the trustee is a listed entity (or an entity forming part of a listed group) or an entity established and regulated to carry on trust business in a jurisdiction identified by credible sources as having appropriate AML/CFT laws, regulations and other measures, an accountant should obtain information to enable it to satisfy itself as to the identity of the directors or other controlling persons. An accountant can rely on external evidence, such as information in the public domain, to satisfy itself as to the beneficial owner of the regulated trustee (e.g. the web-site of the body that regulates the trustee and of the regulated trustee itself).

c) It is not uncommon for families to set up trust companies to act for trusts for the benefit of that family. These are typically called private trust companies and may have a restricted trust licence that enables them to act as trustee for a limited class of trusts. Such private trust companies are often ultimately owned by a fully regulated trust company as trustee of another trust. In such a case, an accountant should satisfy itself that it understands how the private trust company operates and the identity of the directors of the private trust company and, where relevant, the owner of the private trust company. Where the private trust company is itself owned by a listed or regulated entity as described above, an accountant does not need to obtain detailed information to identify the directors or controlling persons of that entity that acts as shareholder of the private trust company.

Individual and Corporate protector

a) Where an accountant is not itself acting as a protector and a protector has been appointed, the accountant should obtain information to identify and verify the identity of the protector.

b) Where the protector is a legal entity, an accountant should obtain sufficient information that it can satisfy itself who is the controlling person and beneficial owner of the protector, and take reasonable measure to verify their identity.

c) Where the protector is a listed entity (or an entity forming part of a listed group) or an entity established and regulated to carry on trust business in a jurisdiction identified by credible sources as having appropriate AML/CFT laws, regulations and other measures, an accountant should obtain information to enable it to satisfy itself as to the identity of the directors or other controlling persons. An accountant can rely on external evidence, such as information in the public domain to satisfy itself as to the beneficial owner of the regulated protector (e.g. the web-site of the body that regulates the protector and of the regulated protector itself).

Annex 2: Glossary of terminology

Beneficial Owner

Beneficial owner refers to the natural person(s) who ultimately owns or controls a customer and/or the natural person on whose behalf a transaction is being conducted. It also includes those persons who exercise ultimate effective control over a legal person or arrangement.

Competent Authorities

Competent authorities refers to all public authorities with designated responsibilities for combating money laundering and/or terrorist financing. In particular, this includes the FIU; the authorities that have the function of investigating and/or prosecuting money laundering, associated predicate offences and terrorist financing, and seizing/freezing and confiscating criminal assets; authorities receiving reports on cross-border transportation of currency and bearer negotiable instruments (BNIs); and authorities that have AML/CFT supervisory or monitoring responsibilities aimed at ensuring compliance by financial institutions and DNFBPs with AML/CFT requirements. SRBs are not to be regarded as a competent authorities.

Designated Non-Financial Businesses and Professions (DNFBPs)

Designated non-financial businesses and professions means:

a) Casinos (which also includes internet and ship based casinos).

b) Real estate agents.

c) Dealers in precious metals.

d) Dealers in precious stones.

e) Lawyers, notaries, other independent legal professionals and accountants – this refers to sole practitioners, partners or employed professionals within professional firms. It is not meant to refer to 'internal' professionals that are employees of other types of businesses, nor to professionals working for government agencies, who may already be subject to AML/CFT measures.

f) Trust and Company Service Providers refers to all persons or businesses that are not covered elsewhere under the Recommendations, and which as a business, provide any of the following services to third parties:

- Acting as a formation agent of legal persons;
- Acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- Providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangement;
- Acting as (or arranging for another person to act as) a trustee of an express trust or performing the equivalent function for another form of legal arrangement;

- Acting as (or arranging for another person to act as) a nominee shareholder for another person.

Express Trust

Express trust refers to a trust clearly created by the settlor, usually in the form of a document e.g. a written deed of trust. They are to be contrasted with trusts which come into being through the operation of the law and which do not result from the clear intent or decision of a settlor to create a trust or similar legal arrangements (e.g. constructive trust).'

FATF Recommendations

Refers to the FATF Forty Recommendations.

Legal Person

Legal person refers to any entities other than natural persons that can establish a permanent client relationship with an accountant or otherwise own property. This can include bodies corporate, foundations, anstalt, partnerships, or associations and other relevantly similar entities.

Legal Professional

In this Guidance, the term *"Legal professional"* refers to legal professionals, civil law notaries, common law notaries, and other independent legal professionals.

Politically Exposed Persons (PEPs)

Foreign PEPs are individuals who are or have been entrusted with prominent public functions by a foreign country, for example Heads of State or of government, senior politicians, senior government, judicial or military officials, senior executives of state owned corporations, important political party officials. *Domestic PEPs* are individuals who are or have been entrusted domestically with prominent public functions, for example Heads of State or of government, senior politicians, senior government, judicial or military officials, senior executives of state owned corporations, important political party officials. Persons who are or have been entrusted with a prominent function by an international organisation refers to members of senior management, i.e. directors, deputy directors and members of the board or equivalent functions. The definition of PEPs is not intended to cover middle ranking or more junior individuals in the foregoing categories.

Red Flags

Any fact or set of facts or circumstances which, when viewed on their own or in combination with other facts and circumstances, indicate a higher risk of illicit activity. A *"red flag"* may be used as a short hand for any indicator of risk which puts an investigating accountant on notice that further checks or other appropriate safeguarding actions will be required.

Self-regulatory bodies (SRB)

A *SRB* is a body that represents a profession (e.g. legal professionals, notaries, other independent legal professionals or accountants), and which is made up of members from the profession, has a role in regulating the persons that are qualified to enter and who practise in the profession, and also performs certain supervisory or

monitoring type functions. Such bodies should enforce rules to ensure that high ethical and moral standards are maintained by those practising the profession.

Supervisors

Supervisors refers to the designated competent authorities or non-public bodies with responsibilities aimed at ensuring compliance by financial institutions ("financial supervisors") and/or DNFBPs with requirements to combat money laundering and terrorist financing. Non-public bodies (which could include certain types of SRBs) should have the power to supervise and sanction financial institutions or DNFBPs in relation to the AML/CFT requirements. These non-public bodies should also be empowered by law to exercise the functions they perform, and be supervised by a competent authority in relation to such functions.

Annex 3: Supervisory practices for implementation of the RBA

China

People's Bank of China ("PBC") Conducts Risk Assessment on Accounting Firms in Jiangsu Province. In November 2017, the PBC Suzhou Branch conducted Money Laundering Risk Assessment on nine accounting firms. The assessments revealed that, for the inherent risk of the accounting firms, there are risks of the Certified Public Accountants utilizing the professional nature of their occupation and confidentiality privilege to assist customers in money laundering; failing to identify illicit funds being injected into the corporate's normal business activities when providing services, and providing services to customers on the monitoring lists or from sensitive jurisdiction. In respect of risk control areas, deficiencies were noted among the accounting firms including the unsound internal control system, weak AML awareness of practitioners, lack of capability, unsatisfactory mechanisms for sanction screening and lack of practical cases of suspicious transaction reports. However, as substantial business practitioners and the target clients of the auditing services are mainly corporates (and mostly being the listed companies and foreign enterprises), the overall money laundering risk of accounting firms was not considered high.

Malaysia

AML/CFT Supervisory Practices of Accountants in Malaysia

A. Fit and Proper Requirements – Self-Regulatory Body (SRB)

The accounting profession in Malaysia is regulated by the Malaysian Institute of Accountants (MIA), as the self-regulated body (SRB) under the Accountants Act (AA) 1967. Prior to their admission as MIA members and issuance of Practicing Certificates, they are subject to appropriate market entry controls in which they are required to fulfil the "fit and proper" requirements under the legislation.

B. AML/CFT Risk-based Supervision – Bank Negara Malaysia (BNM)

Under the Anti-Money Laundering, Anti-Terrorism Financing and Proceeds of Unlawful Activities Act 2001 (AMLA), BNM is the designated competent authority for the AML/CFT supervision of the Designated Non-Financial Businesses and Professions (DNFBPs) & Other Financial Institutions in Malaysia, including accountants.

BNM adopts a risk-based approach supervision on accountants, in which the differentiation is guided by the outcome of the National Risk Assessment (NRA) and the application of Risk-Based Supervisory Framework for DNFBPs and Other Financial Institutions (D'SuRF), as follows:

i. National Risk Assessment (NRA) 2017

Malaysia's third iteration of the NRA in 2017 comprising assessment of ML/TF inherent risk and overall control effectiveness had stipulated the accountants' net ML and TF risks as **"MEDIUM HIGH"** and **"MEDIUM"** level, respectively, as exacerbated by the sector's marginal control, as follows:

ML		TF	
Inherent Risk	Medium	Inherent Risk	Low
Control	Marginal	Control	Marginal
Net Risk	Medium High	Net Risk	Medium

ii. Risk-Based Supervisory Framework for DNFBPs and Other Financial Institutions (D'SuRF)

D'SuRF encapsulates end-to-end governance and supervisory process, risk-based application of supervisory tools. In line with the ML/TF rating of the sector and the application of D'SuRF, the frequency and intensity of monitoring on accountants are guided accordingly to include a range of supervisory tools, as follows:

- **On-site Examination**

Firms are selected based on a robust selection process under the D'SuRF, which is in line with the risk profile of the reporting institutions (RIs). The on-site examination is in-depth, with assessments covering the RIs' inherent risk and quality of risk management. In applying RBA, BNM imposes post-onsite follow-up measures for RIs with heightened risks. This includes requiring the RI to submit proposals to BNM on planned measures to rectify any supervisory issues and progress report until full rectification. The D'SuRF sets the deadline for both submissions.

- **Off-site Monitoring and Supervisory Outreach Activities**

Apart from on-site examinations, BNM employs a range of off-site monitoring and supervisory outreach activities, aimed to elevate awareness and guide the implementation of the AMLA requirements by the accountants. These off-site tools are also deployed according to the RBA, whereby the intensity and frequency for accountants is relatively higher compared to other sectors. Among the off-site monitoring, includes the submission of Data and Compliance Reports and internal audit reports. In addition, BNM and the relevant SRBs conduct periodic nationwide AML/CFT outreach and awareness programmes.

Monaco

Monaco completed its first NRA (National Risk Assessment) in 2017 and the accountants were included in the scope (see public NRA report in www.siccfin.mc/en/The-National-Risk-Assessment-NRA). The assessed risk

regarding accountants was rated ML (moderate low) so the accountants were not included in the priority professionals to be inspected on-site. However, since 2016, they are being inspected and about two third of the number of accountants has already been assessed. They are planned to have all been assessed by the end of 2021, the most prominent professional having already been inspected (including the Big four companies).

Considering the small number of accountants in Monaco, no real RBA was used for their supervision and these inspections are aimed to be comprehensive.

FATF

GUIDANCE FOR A RISK-BASED APPROACH
ACCOUNTING PROFESSION

The risk-based approach (RBA) is central to the effective implementation of the revised FATF International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation, which were adopted in 2012.

This guidance highlights the need for a sound assessment of the money laundering and terroist financing risks that accountants face so that the policies, procedures and ongoing customer due diligence measures mitigate these risks.

The FATF developed this guidance with significant input from the profession itself, to ensure that it reflects the experience gained by public authorities and the private sector over the years.

www.fatf-gafi.org | June 2019

Appendix T:

FATF, *Guidance for a Risk-Based Approach: Legal Professionals*
(Paris: FATF, 2019)

FATF

GUIDANCE FOR A RISK-BASED APPROACH

LEGAL PROFESSIONALS

JUNE 2019

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

FATF (2019), *Guidance for a Risk-Based Approach for Legal Professionals,* FATF, Paris, www.fatf-gafi.org/publications/documents/Guidance-RBA-legal-professionals.html

TABLE OF CONTENTS

Acronyms

AML/CFT	Anti-money laundering/Countering the financing of terrorism
CDD	Client[1] due diligence
DNFBP **FIU**	Designated non-financial businesses and professions Financial intelligence unit
INR.	Interpretive Note to Recommendation
ML	Money laundering
MLRO	Money Laundering Reporting Officer
PEP	Politically Exposed Person
R.	Recommendation
RBA	Risk-based approach
SRB **STR**	Self-regulatory body Suspicious transaction report
TCSP **TF**	Trust and company service providers Terrorist financing

[1] In some jurisdictions or professions, the term "customer" is used, which has the same meaning as "client" for the purposes of this document.

Executive Summary

1. The risk-based approach (RBA) is central to the effective implementation of the FATF Recommendations. It means that competent authorities, supervisors and legal professionals should identify, assess, and understand the money laundering and terrorist financing (ML/TF) risks to which legal professionals are exposed, and implement appropriate mitigation measures. This approach enables allocation of resources where the risks are higher.

2. The FATF RBA Guidance aims to support the implementation of the RBA, taking into account national ML/TF risk assessments and AML/CFT legal and regulatory frameworks. It includes a general presentation of the RBA and provides specific guidance for legal professionals and for their supervisors. The Guidance was developed in partnership with the profession, to make sure it reflects expertise and good practices from within the profession.

3. The Guidance acknowledges that legal professionals operate within a wide range of business structures - from sole practitioners to large, multi-national firms and provide a variety of services in different jurisdictions. Given the diversity in scale, activities and risk profile, there is, therefore, no one-size-fits-all approach.

4. The development of the ML/TF risk assessment is a key starting point for the application of the RBA. It should be commensurate with the nature, size and complexity of the law firm. The most commonly used risk criteria are country or geographic risk, client risk and service/transaction risk. The Guidance provides examples of risk factors under these risk categories.

5. The Guidance highlights that it is the responsibility of the senior management of legal professionals to foster and promote a culture of compliance. They should ensure that legal professionals are committed to manage ML/TF risks when establishing or maintaining relationships.

6. The Guidance highlights that legal professionals should design their policies and procedures so that the level of initial and ongoing CDD measures addresses the ML/TF risks to which they are exposed. The Guidance thus explains the obligations for legal professionals regarding identification and verification of beneficial ownership information and provides examples of standard, simplified and enhanced CDD measures based on ML/TF risk.

7. The Guidance has a section for supervisors of legal professionals and highlights the role of self-regulatory bodies (SRBs) in supervising and monitoring. It explains the RBA to supervision as well as supervision of the RBA by providing specific guidance on licensing or registration requirements for the profession, mechanisms for on-site and off-site supervision, enforcement, guidance, training and the value of information-exchange between the public and private sector.

8. The Guidance highlights the importance of supervision of beneficial ownership requirements and nominee arrangements. It underscores how supervisory frameworks can help ascertain whether accurate and up-to-date beneficial ownership information on legal persons and legal arrangements is maintained and made available in a timely manner.

Section 1- Introduction and key concepts

This Guidance should be read in conjunction with the following, which are available on the FATF website: *www.fatf-gafi.org.*

a) The FATF Recommendations, especially Recommendations 1, 10, 11, 12, 17, 19, 20, 21, 22, 23, 24, 25 and 28 and their Interpretive Notes (INR), and the FATF Glossary

b) Other relevant FATF Guidance documents such as:

- The FATF Guidance on National Money Laundering and Terrorist Financing Risk Assessment (February 2013)
- FATF Guidance on Transparency and Beneficial Ownership (October 2014)
- FATF Guidance on the Risk-Based Approach for Trust and Company Service Providers (TCSPs) (June 2019)
- FATF Guidance on the Risk-Based Approach for Accountants (June 2019)

c) Other relevant FATF reports such as:

- FATF Report on Money Laundering and Terrorist Financing: Vulnerabilities of Legal Professionals (June 2013)
- The Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership (July 2018)

Background and context

9. The RBA is central to the effective implementation of the revised FATF International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation, which were adopted in 2012[2]. The FATF has reviewed its 2008 RBA Guidance for Legal Professionals, in order to bring it in line with the new FATF requirements[3] and to reflect the experience gained by public authorities and the private sector over the years in applying the RBA. This revised version applies to legal professionals when they prepare for, or carry out, transactions for their clients concerning certain specified activities[4].

2 FATF (2012).

3 The FATF Standards are comprised of the FATF Recommendations, their Interpretive Notes and applicable definitions from the Glossary.

4 The services provided by legal professionals include those provided by both lawyers and notaries, and these services are included under bullet (e) of the definition of "Designated non-financial businesses and professions" in the FATF Glossary. For details about specified activities of legal professionals under R.22 and other FATF Recommendations applicable to the legal professionals, please refer to paragraph 20 of this Guidance.

10. This Guidance was drafted by a project group comprising FATF members and representatives of the private sector. The project group was co-led by the UK, the United States, the Institute of Chartered Accountants in England and Wales, the International Bar Association and the Society of Trust and Estate Practitioners. Membership of the project group is set out in Annex 5.

11. The FATF adopted this updated RBA Guidance for legal professionals at its June 2019 Plenary.

Purpose of the Guidance

12. The purpose of this Guidance is to:

a) Assist legal professionals in the design and implementation of a RBA to AML/CFT compliance by providing guidelines and examples of current practice, with a particular focus on providing guidance to sole practitioners and small firms*;*

b) Support a common understanding of a RBA for legal professionals, financial institutions and designated non-financial businesses and professions (DNFBPs)[5] that maintain relationships with legal professionals (e.g. through pooled or client accounts or for trust and company accounts) and competent authorities and self-regulatory bodies (SRBs)[6] responsible for monitoring the compliance of legal professionals with their AML/CFT obligations;

c) Outline the key elements involved in applying a RBA to AML/CFT applicable to legal professionals;

d) Assist financial institutions and DNFBPs that have legal professionals as clients in identifying, assessing and managing the ML/TF risk associated with legal professionals and their services;

e) Assist countries, competent authorities and SRBs in the implementation of the FATF Recommendations with respect to legal professionals, particularly R.22, 23 and 28;

f) Assist countries, SRBs and the private sector to meet the requirements expected of them, particularly under IO.3 and IO.4;

g) Support the effective implementation of action plans of national risk assessments (NRAs) conducted by countries; and

h) Support the effective implementation and supervision by countries of national AML/CFT measures, by focusing on risks as well as preventive and mitigating measures.

[5] Including both legal and natural persons, see definition of the term 'Designated Non-Financial Businesses and Professions' in the FATF Glossary.

[6] See definition of the term 'Self-regulatory body' in the FATF Glossary.

Target audience, status and content of the Guidance

13. This Guidance is aimed at the following audience:

a) Legal professionals;

b) Countries and their competent authorities, including AML/CFT supervisors of legal professionals, AML/CFT supervisors of banks that have legal professionals as customers, and Financial Intelligence Units (FIUs); and

c) Practitioners in the banking sector, other financial services sectors and DNFBPs that have legal professionals as customers.

14. The Guidance consists of four sections. Section I sets out introduction and key concepts. Section II contains key elements of the RBA and should be read in conjunction with specific guidance to legal professionals (Section III) and guidance to supervisors of legal professionals on the effective implementation of a RBA (Section IV). There are six annexes on:

a) Beneficial ownership information in relation to a company, trust or other legal arrangements to whom a legal professional provides services (Annex 1);

b) Sources of further information (Annex 2);

c) Glossary of terminology (Annex 3);

d) Supervisory practices for implementation of the RBA (Annex 4);

e) Red flag indicators highlighting suspicious activities or transactions for legal professionals (Annex 5); and

f) Members of the RBA Drafting Group (Annex 6).

15. This Guidance recognises that an effective RBA will take into account the national context, consider the legal and regulatory approach and relevant sector guidance in each country, and reflect the nature, diversity, maturity and risk profile a country's legal professionals and the risk profile of individual legal professionals operating in the sector and their clients. The Guidance sets out different elements that countries and legal professionals could consider when designing and implementing an effective RBA.

16. This Guidance is non-binding and does not overrule the purview of national authorities[7], including on their local assessment and categorisation of legal professionals based on the prevailing ML/TF risk situation and other contextual factors. It draws on the experiences of countries and of the private sector to assist competent authorities and legal professionals to implement effectively applicable FATF Recommendations. National authorities may take this Guidance into account while drawing up their own Guidance for the sector. Legal professionals should also refer to relevant legislation and sector guidance of the country where their clients are based.

[7] National authorities should however take the Guidance into account when carrying out their supervisory functions.

Scope of the Guidance: terminology, key features and business models

Terminology

Legal professionals

17. The FATF Recommendations apply to all legal professionals when they carry out specified transactional activities for third parties (see below) and do not apply to all activities carried out by legal professionals. Most notably, litigation is not a specified activity, and a legal professional representing a client in litigation will not be subject to the FATF Recommendations; unless during the course of such representation the legal professional additionally engages in one or more specified activities, in which case the Recommendations will apply to this specified activity or activities only. The FATF Recommendations do not apply where a person provides legal services 'in-house' as an employee of an entity that does not provide legal services.

18. The legal sector comprises a broad spectrum of practitioners and is not a homogenous group, from one country to another or even within a country. For the purposes of this Guidance, legal professionals include barristers, solicitors and other specialist advocates and notaries. In addition to obligations they may owe through the contracting of their services, legal professionals owe special duties both to their clients (e.g. duties of confidentiality and loyalty), as well as public duties to the legal institutions of their jurisdictions (e.g. through roles such as 'officers of the court'). These duties are designed to assist in the administration of justice and promote the rule of law, and generally set legal professionals apart from other professional advisors. In many jurisdictions, these duties and obligations are enshrined in law, regulations or court rules pursuant to historic and well established practices.

19. Titles given to different legal professionals vary among countries and legal systems, with the same title not always having the same meaning or area of responsibility. Although some common elements may exist based on whether the country has a common law or civil law tradition, even these generalisations will not always hold true. As the range of services provided and carried out by legal professionals is diverse and varies widely from one country to another, it is important to understand the specific roles undertaken by different legal professionals within their respective countries when assessing the AML/CFT obligations of the legal profession sector, as well as how these services interact with those of other professionals. Many legal professionals are required to comply with specific national legislation, rules and regulations adopted by professional associations or other SRBs.

20. R.22 provides that the customer due diligence and record-keeping requirements of the Recommendations apply to legal professionals when they prepare for and carry out certain specified activities for their clients, namely:

a) Buying and selling of real estate;

b) Managing of client money, securities or other assets;

c) Management of bank, savings or securities accounts;

d) Organisation of contributions for the creation, operation or management of companies; and

e) Creation, operation or management of legal persons or arrangements, and buying and selling of business entities.

21. The FATF Recommendations set an international standard, which countries should implement through measures adapted to the circumstances of their particular jurisdictions. In general terms, jurisdictions have closely followed the FATF Recommendations but differences exist and legal professionals need to carefully consider the laws, rules and regulations of the relevant jurisdictions as implemented in such jurisdictions. The overarching concept of the obligations applying to certain specified activities (as set out in paragraph 20) is considered to be common across all jurisdictions.

22. Some legal professionals and law firms may accordingly be able to conclude that based on the services they provide, they do not have any specific AML/CFT obligations as they do not prepare for, or carry out any of the specified activities. Even though specific AML/CFT obligations may not apply to a legal professional or a law firm, it is consistent with the overall ethics and best practices of the profession for all legal professionals to ensure that their services are not being misused, including by criminals. Accordingly, legal professionals and law firms should carefully consider what they need to do to guard against that risk irrespective of the application of specific AML/CFT obligations in order not to be unwittingly involved in ML/TF.

23. Legal professionals provide advisory services and representation to members of society, companies and other entities to

a) understand their increasingly complex legal rights and obligations;

b) facilitate business transactions;

c) assist their clients to comply with laws; and

d) provide access to justice and judicial redress.

24. They may provide these services alone, in collaboration with other independent legal professionals or as partners or as members of a law firm. A firm may consist of a sole practitioner or a few practitioners or thousands of legal professionals spread throughout numerous offices around the globe. There are also alternative business structures in which legal professionals combine with non-legal professionals to form partnerships. Most legal professionals practise alone or with other legal professionals in small firms.

25. Legal professionals include barristers, solicitors and other types of specialist advocates, however called. Typically, these legal professionals represent clients in court and also, in some countries, provide advisory services that might include one of the specified activities in R.22 and, as set forth above, they will therefore need to comply in respect of such services.

26. Services provided globally by legal professionals include advising on clients' financial transactions and legal structures that involve financial or business arrangements. As a result of their regulated status and to assist clients in transactions, legal professionals may also hold clients' funds in designated accounts or agree to act on behalf of clients (e.g. under a power of attorney) in relation to specific aspects of transactions. However, the counselling and advisory roles of legal professionals, especially in an increasing regional and global marketplace, do not generally involve handling funds. Legal professionals frequently work in collaboration with other professional advisors on transactions, such as accountants, TCSPs, escrow agents and title insurance companies and may refer their clients to particular professionals for services. Flows of funds are also often dealt with and facilitated exclusively by financial institutions.

27. The work of legal professionals is fundamental to promoting adherence to the rule of law. Legal professionals are typically regulated by laws, professional standards and codes of ethics and conduct. Breaches of the obligations imposed upon them can result in a variety of sanctions, including civil, contractual, disciplinary and criminal sanctions.

Legal professional privilege and professional secrecy

28. The actions and behaviours discussed in this Guidance are subject to applicable professional privilege and professional secrecy. Privilege/professional secrecy is a protection to the client, and a duty of the legal professional. Privilege (a common law concept existing in jurisdictions such as England and Wales and the United States) and professional secrecy (a civil law concept existing in jurisdictions such as Germany and France) aim to protect client information or advice from being disclosed. Though the two concepts differ in scope and purpose, both are founded on the nearly universal principle of the right of access to justice and the rationale that the rule of law is protected where clients are encouraged to communicate freely with their legal advisors without fear of disclosure or retribution. R.23 and the accompanying INR.23 recognise concepts of privilege and professional secrecy.

29. The degree and scope of legal professional privilege or professional secrecy and the consequences of a breach of these principles vary from one country to another and are determined by the relevant national laws.

30. In some jurisdictions, the protections against non-disclosure may be overridden by the consent or waiver of the client or by express provisions of law. Most jurisdictions seek to balance the right of access to justice and the public interest in investigating and prosecuting criminal activity. Accordingly, legal professional privilege or professional secrecy does not protect a legal professional from knowingly facilitating a client's illegal conduct.[8] Moreover, the protections against non-disclosure may not exist where the "crime/fraud" exception applies. Under the "crime/fraud" exception to privilege, privilege is not created where there is an illegal purpose whether or not the legal professional is aware of the illegality or is complicit in the illegality. The extent of that exception is a matter of national law.

31. Each country needs to determine the matters that would fall under legal professional privilege or professional secrecy. This would normally cover some information that legal professionals receive from or obtain through their clients: (a) in the course of ascertaining the legal position of their clients, or (b) in performing their task of defending or representing their clients in, or concerning judicial, administrative, arbitration or mediation proceedings. There may be cases in which these professionals conduct activities that are clearly covered by the legal privilege (i.e. ascertaining the legal position of their client or defending or representing their client in judicial proceedings) alongside activities that may not be covered by it. In addition, within a single matter, privilege may attach to some but not all communications and advice.

32. A number of the DNFBP sectors, including legal professionals, are already subject to regulatory or professional requirements (including as promulgated by SRBs) that complement AML/CFT measures. For example, by virtue of their professional codes of conduct, many legal professionals are already subject to an obligation to identify their clients

[8] Also see IBA and the secretariat of the OECD: Report of the Task Force on the Role of Lawyers and International Commercial Structures (May 2019): Full Report and Executive Summary.

(e.g. to check for conflict of interest) and the substance of the matter submitted to them by such clients, to appreciate the consequences that their advice may have. If a legal professional provides legal advice to a client that helps the client commit an offence, that legal professional may, depending on the legal professional's state of knowledge, become an accomplice to the offence.

33. This Guidance must be considered in the context of these professional and ethical codes of conduct. In situations where legal professionals are claiming legal professional privilege or professional secrecy, they must be satisfied that the information is protected by the privilege/professional secrecy and the relevant rules. For example, it is important to distinguish between legal advice, which generally is subject to robust protections, and underlying facts, which in many cases are not protected by privilege.

Role of notaries as a legal professional

34. Both civil and common law countries have notaries, but the main difference between them is the roles that they play in their respective jurisdictions. In some common law countries, a notary public is a qualified, experienced practitioner, trained in the drafting and execution of legal documents. In other common law countries, a notary public is a public servant appointed by a governmental body to witness the signing of important documents (such as deeds and mortgages) and administer oaths. Notaries provide legal advice in the context of documenting transactions and legal arrangements, and do not necessarily direct this advice to a specific party. In some common law countries, such as the UK, the notary is no longer required for documenting transactions.

35. Most civil law notaries are members of autonomous legal professions (regulated by law) and qualified public officials, as they are appointed by the State through a selective public competition among law graduates. Civil law notaries, who are bound by an obligation of independence and impartiality with respect to parties to a transaction, must be regarded, in matters of real estate property (conveyancing), family law, inheritance and corporate legal services (e.g. the formation of companies, sale of shares, capital increases, liquidation and dissolution of companies), as practising non-adversarial activities. They act as gatekeepers by drafting and ensuring the legality and certainty of the instruments, and the authenticity of the content of the instrument and in some jurisdictions, also provide a public fiduciary function by performing the role of trusted third parties. Civil law notaries are obliged by law to remain impartial, fair and independent as between the parties they are advising, including bearing in mind any disparity of power between the parties. For this reason, civil law notaries are assigned functions of a public nature as part of their legal assignments and typically do not act for one of the parties in an advisory capacity.

36. In civil law jurisdictions, as notaries are entrusted with public functions, they act as public office holders in accordance with the principles of impartiality, legality, certainty and independence. In these jurisdictions, the involvement of notaries in transactions includes the notaries' responsibility and the specific legal value of the notarial form established by law. This legal framework for civil law notaries ensures a high degree of legal certainty and enhances the traceability and transparency of transactions between the parties. Notarial deeds as authentic instruments are recognised as a particular form of evidence, which is taken to be authoritative and in certain cases, as judicially enforceable as court orders and judgments and, sometimes, are an indispensable step in order to obtain other effects such as *traditio*, right of first refusal, third-party effectiveness and registration in substantive and administrative registries. State powers are therefore effectively delegated to civil law

notaries so that they can assign "public authority" to the authentic instruments they establish and are responsible for. The obligations of fairness and public office mean that services performed by civil law notaries are often very different in nature to the services provided by other legal professionals.

37. Notaries are subject to a duty of professional secrecy, as well as generally being subject to a duty to respect rights to confidentiality. Notaries are the party to interpret these duties in the light of their overarching obligation to ensure the common good and the general interests of society. Therefore, in practice, professional secrecy is not an absolute duty and is often subordinated to the public interest. Notaries may also be required to disclose the contents of their archives and communications in criminal proceedings or when required by law. In the context of ML/TF, notaries are obliged to co-operate with law enforcement, and to disclose all the relevant information to the competent authorities, in accordance with the laws of the jurisdiction. Notification to public authorities of any suspicious transactions should not be considered as an infringement of the notary's duty of professional secrecy. Information received by the civil law notaries in respect of a client and which is being transferred to the competent FIU in conformity with the AML/CFT legislation still remains confidential information.

38. This Guidance does not cover some common law notaries when those notaries perform merely administrative acts such as witnessing or authenticating documents, as these acts are not specified activities.

Services provided by legal professionals and their vulnerabilities for ML/TF

39. Legal professionals provide a vast range of services to a diverse range of clients. For example, services may include (but are not restricted to):

a) Advising on the purchase, sale, leasing and financing of real property;

b) Tax advice;

c) Advocacy before courts and tribunals;

d) Representing clients in disputes and mediations;

e) Advice in relation to divorce and custody proceedings;

f) Advice on the structuring of transactions;

g) Advisory services on regulations and compliance;

h) Advisory services related to insolvency/receiver-managers/bankruptcy;

i) Administration of estates and trusts;

j) Assisting in the formation of entities and trusts;

k) Trust and company services[9];

l) Acting as intermediaries in the trade of citizenship and residency or acting as advisors in residence and citizenship planning;

[9] For such activities, refer also to the guidance on risk-based approach for Trust and Company Service Providers (TCSPs).

m) Providing escrow services and token custody services in connection with legal transactions involving an initial coin offering or virtual assets;

n) Legitimising signatures by confirming the identity of the signatory (in the case of notaries); and

o) Overseeing the purchase of shares or other participations (also in the case of notaries).

40. While some of these services may involve activities that fall within the scope of the specified activities under R.22, not all (e.g. representing clients in disputes and mediations; providing advice in relation to divorce and custody proceedings; or providing advisory services on regulations) will do so. When considering the range of tasks undertaken by legal professionals only specified activities under R.22 are subject to the AML/CFT regime.

41. The specifics of the risk-based processes should accordingly be determined based on the activities undertaken by the legal professional, the ethical and existing supervisory structure for legal professionals and the susceptibility or vulnerability of activities of a legal professional to ML/TF. Firms with offices in multiple jurisdictions should apply a consistent approach across all of its offices with a general compliance tone from the top.

42. A RBA requires legal professionals to mitigate the risks that they face and with due regard to the resources available. Mitigating practices will invariably include initial CDD and ongoing monitoring, as well as a range of internal policies, training and systems to address the vulnerabilities faced in the particular practice setting of the legal professional. This section does not attempt to exhaustively list the mitigating practices that may be employed by legal professionals. For information on ways in which legal professionals might mitigate their vulnerabilities to ML/TF, see "Section 2 – Guidance for Legal professionals and Notaries" and chapters III and IV of the separate publication: "*A Lawyer's Guide to Detecting and Preventing Money Laundering*" published in October 2014 by a collaboration of the International Bar Association, American Bar Association and the Council of Bars and Law Societies of Europe[10].

Client funds

43. Most legal professionals can hold funds of clients. Client accounts are accounts held by legal professionals with a financial institution. In some civil law countries, a professional body holds the funds of clients, rather than legal professionals. For example, in France, where funds are held in CARPA (see Annex 4 "France"). Operating client accounts does not automatically require a legal professional to observe AML/CFT obligations. These obligations apply when the accounts are used in conjunction with a specified activity under R.22.

44. In most countries, legal professionals are required to hold client funds in a separate account with a financial institution and use the funds only in accordance with their client's instructions. In countries where client accounts are used, legal professionals are required to hold client funds separate from their own. The purpose of these accounts is to hold client funds in "trust" for or for a purpose designated by the client. Funds will also be

[10] The full publication is available at: www.ibanet.org/Article/NewDetail.aspx?ArticleUid=f272a49e-7941-42ee-aa02-eba0bde1f144

held or received for payment of costs incurred by the legal professional on behalf of the client. No funds may pass through a client account without being attached to an underlying legal transaction or purpose, and the legal professional is required to account for these funds.

45. The use of client accounts has been identified as a potential vulnerability, as it may be perceived by criminals as a means to either integrate tainted funds within the mainstream financial system or a means by which tainted funds may be layered in such a way to obscure their source, with fewer questions being asked by financial institutions because of the perceived respectability and legitimacy added by the involvement of the legal professional. Legal professionals can seek to limit their exposure to this risk by developing and implementing policies on the handling of funds (e.g. currency value limits) as well as restricting access to the account details of the client account in order to prevent unsanctioned deposits into the client account.

Advising on the purchase and sale of real property

46. Real estate, both commercial and residential, accounts for a high proportion of confiscated criminal assets, demonstrating that this as a clear area of vulnerability. In many countries, legal professionals are either required by law to undertake the transfer of property or their involvement is a matter of tradition, custom or practice. However, the specific role of legal professionals in real estate transactions varies significantly from country to country, or even within countries. In some countries, legal professionals will customarily hold or control (e.g. through a financial institution) and transfer or control the transfer of the relevant funds for the purchase of the real estate assets. In other countries this will be done by other parties, such as a title insurance company or escrow agent. Even if legal professionals are not handling the funds, they will typically be aware of the financial details and in many cases will be in a position to inquire about the transaction where appropriate.

47. Some criminals may seek to invest the proceeds of their crime in real estate without attempting to obscure their ownership of the real estate. Alternatively, criminals may seek to obscure the ownership of real property by using false identities or title the property in the names of family members, friends or business associates, or purchase property through an entity or a trust. Legal professionals should consider carefully who they are acting for at the outset of a real estate transaction, especially where there are multiple parties involved in a transaction. In some cases, legal professionals may also opt to apply specific checks on the settlement destinations of transactions (i.e. performing limited diligence on the seller of real property, when acting for the buyer and the seller and the buyer appear to be related parties).

Formation of companies and trusts[11]

48. In some countries, legal professionals (in civil law jurisdictions this will usually be a notary) must be involved in the formation of a company. In other countries members of the public are able to register a company themselves directly with the company register, in which case a legal professional's advice is sometimes sought at least in relation to initial liability management, corporate, tax and administrative matters.

49. Criminals may seek the opportunity to retain control over criminally derived assets while frustrating the ability of law enforcement to trace the origin and ownership of

[11] The illustrations could also apply to other legal persons and arrangements.

the assets. Companies and often trust and other similar legal arrangements are seen by criminals as potentially useful vehicles to achieve this outcome. While shell companies[12], which do not have any ongoing business activities or assets, may be used for legitimate purposes such as serving as a transaction vehicle, they may also be used to conceal beneficial ownership, or enhance the perception of legitimacy. Criminals may also seek to misuse shelf companies[13] formed by legal professionals by seeking access to companies that have been 'sitting on the shelf' for a long time. This may be in an attempt to create the impression that the company is reputable and trading in the ordinary course because it has been in existence for many years. Shelf companies can also add to the overall complexity of entity structures, further concealing the underlying beneficial ownership information.

Management of companies and trusts

50. In some cases, criminals will seek to have legal professionals involved in the management of companies and trusts in order to provide greater respectability and legitimacy to the company or trust and its activities. In some countries professional rules preclude a legal professional from acting as a trustee or as a company director, or require a disclosure of directorship positions to ensure independence and transparency is maintained. In countries where this is permitted, there are diverse rules as to whether that legal professional can also provide external legal advice or otherwise act for the company or trust. This will determine whether any funds relating to activities by the company or trust can go through the relevant legal professional's client account. In addition, in some countries, the non-legal counsel of a legal professional acting in a business capacity for formation or management of companies or trusts may not be protected by the legal professional privilege.

Acting as nominee

51. Individuals may sometimes have legal professionals or other persons hold their shares as nominees, where there are legitimate privacy, safety or commercial concerns. However, criminals may also use nominee shareholders to obscure their ownership of assets. In some countries, legal professionals are not permitted to hold shares in entities for whom they provide advice, while in other countries legal professionals regularly act as nominees. Legal professionals should identify beneficial owners when establishing business relations in these situations. This is important to prevent the unlawful use of legal persons and arrangements, by gaining a sufficient understanding of the client to be able to properly assess and mitigate the potential ML/TF risks associated with the business relationship. Where legal professionals are asked to act as nominees, they should understand the reason for this request and ensure that they are able to verify the identity of the beneficial owner of the shares and that the purpose is legitimate.

General management of client affairs

52. In some jurisdictions, legal professionals may undertake a range of 'management' activities for clients permitted in limited circumstances by some professional rules. In some European jurisdictions, this is sometimes referred to as 'man of affairs work'.

---

[12] A shell company is an incorporated company with no independent operations, significant assets, ongoing business activities, or employees.

[13] A shelf company is an incorporated company with inactive shareholders, directors, and secretary, which has been left dormant for a longer period even if a customer relationship has already been established.

Situations where a legal professional may be undertaking these activities legitimately may involve a client who has limited capacity to manage his/her own affairs, or in other circumstances where the client has a clear legitimate rationale for seeking the continuing assistance from the legal professional. The legal professional, whether acting pursuant to a court order or a power of attorney, may use his/her client account to undertake transactions, but would more typically use accounts held by the client for whom the legal professional is acting. While ordinarily this type of activity should give the legal professional access to sufficient information to make considered assessments of a client's legitimacy under a RBA, it is possible that criminals will seek to use such ancillary services, in addition to legal services, to minimize the number of advisors and third parties who have access to the client's financial and organizational details. Legal professionals should carefully scrutinize any request to take on additional obligations for a client beyond their primary services and consider the justification of such a request in the totality of the circumstances and its overall legitimacy.

Other services that might indicate ML/TF activity

53. Legal professionals possess a range of specialised legal skills that may be of interest to criminals, in order to enable them to transfer value obtained from criminal activity between parties and obscure ownership. These specialised skills include the creation of financial instruments and arrangements, advice on and drafting of contractual arrangements, and the creation of powers of attorney. In other areas of legal specialisation, such as probate (succession) and insolvency or bankruptcy work, the legal professional may simply encounter information giving rise to a suspicion that the deceased or insolvent individual previously engaged in criminal activity or that parties may be hiding assets to avoid payment to legitimate creditors. Countries differ on how unexpected funds are treated in relation to probate or insolvency cases, in some, a threshold report will be made and the government becomes a super-creditor able to recover the money before any other beneficiary or creditor. Where these circumstances involve legal professionals engaging in a specified activity, legal professionals must carefully consider their AML/CFT obligations. Legal professionals should also consider the ML/TF risk in such circumstances.

54. Many aspects of this Guidance on applying a RBA to AML/CFT may also apply in the context of predicate offences, particularly for other financial crimes such as tax crimes. The ability to apply a RBA effectively to relevant predicate offences will also reinforce the AML/CFT obligations. Legal professionals may also have specific obligations in respect of identifying risks of predicate offences such as tax crimes, and supervisors may have a role to play in oversight and enforcement against those crimes. Therefore, in addition to this Guidance, legal professionals and supervisors should have regard to other sources of guidance that may be relevant in managing the risks of predicate offences.[14]

[14] For example, legal professionals may be subject to mandatory disclosure rules, requiring them to report arrangements that have the hallmarks of tax evasion to the tax authority. Legal professionals may also commit an offence where they facilitate the commission of tax evasion. These initiatives require legal professionals and supervisors to take many of the steps outlined in this Guidance to ensure they fulfil their obligations under applicable law.

Services performed by notaries

Overseeing the purchase of shares or other participations

55. Notaries are often involved in reviewing the documentation for the transfer of shares and/or for transactions that enable participation in a company's equity. It is possible for criminals to use fictitious or misleading accounting methods to distort the apparent value of a company, including by diminishing it in order to hide or obscure transfers of value. Although a notary is generally not responsible for verifying the 'true' value of companies, notaries may encounter information in the course of their duties that is at odds with the presented valuation of a company.

Legitimisation of identities of signatory

56. In certain situations, the intervention of a notary is required to legitimise the execution of a private document. Although this technically relates only to verifying the identity of the signing parties, notarisation can often lend an impression of credibility to the content of the document. Criminals may use this form of notarisation service to lend credibility, in particular, to information contained in such documents that asserts the identity of the owners of assets, thereby potentially hiding its true owners.

Legalisation of old documents

57. In certain situations, the intervention of a notary is required for the legalisation of private documents drafted several years before the time of notarisation. The purpose of this service is to provide certainty in relation to the validity of old documents. Criminals may seek to use such services in relation to documents that falsely assert that transactions occurred many years ago, in circumstances that cannot otherwise be verified.

Opening of safe deposit boxes

58. Notaries may be present at the opening of a safe deposit box held at a bank that is opened in the name of a deceased person. This service is to certify the contents of the safe deposit box. Criminals may fraudulently place contents that were not the property of the deceased person in such a deposit box in order to ensure that the title to this property passes in an apparently legitimate and 'clean' transfer from the estate of the deceased to the same criminal enterprise as the beneficiaries of the estates.

FATF Recommendations applicable to the legal professionals

59. The basic intent behind the FATF Recommendations as it relates to legal professionals is to ensure that their operations and services are not abused for facilitating criminal activities and ML/TF. This is consistent with the role of legal professionals, as guardians of justice and the rule of law namely to avoid knowingly assisting criminals or facilitating criminal activity. The requirements of R.22 regarding CDD, record-keeping, PEPs, new technologies and reliance on third parties set out in R.10, 11, 12, 15 and 17 should apply to legal professionals in certain circumstances.

60. R.22 mandates that the requirements for CDD, record-keeping, PEPs, new technologies and reliance on third parties set out in R. 10, 11, 12, 15 and 17 apply to legal professionals in certain circumstances. R.22 applies to legal professionals when they prepare

for and carry out certain specified activities. Unless legal advice and representation consist of preparing for or carrying out one or more of these specified activities, legal professionals are not subject to the FATF Recommendations. This Guidance has been prepared to assist in situations where legal professionals prepare for and carry out transactions for the clients concerning the specified activities. For example, FATF Recommendations would not be applicable if a legal professional only provides litigation advice or routine advice at legal aid or other legal help clinics.

61. Where more than one law firm or legal professional prepares for or carries out a transaction, each firm or legal professional must comply with the applicable CDD, record-keeping and other AML/CFT obligations. Where permitted, legal professionals may rely on third parties in accordance with R.17 to perform elements (a)-(c) of the CDD measures set out in R.10 or to introduce business. Where not all legal professionals are preparing for or carrying out the transaction, those legal professionals providing advice or services (e.g. a general legal opinion on the applicability of a local law) peripheral to the transaction need not be subject to the AML/CFT obligations.

62. R.23 requires that measures set out in R.18 (Internal controls and foreign branches and subsidiaries), 19 (Higher-risk countries), 20 (reporting of suspicious transactions) and 21(tipping-off and confidentiality) should apply to legal professionals subject to certain qualifications.

63. R.23 applies to legal professionals when they engage in a financial transaction on behalf of a client, in relation to the specified activities under R.22. If legal professionals suspect or have reasonable grounds to suspect that funds are the proceeds of a criminal activity or are related to TF, they should be required to promptly report their suspicions to the FIU. Subject to certain limitations, legal professionals are not required to report their suspicions if the relevant information was obtained in circumstances where they are subject to professional secrecy or legal professional privilege, as recognised by INR.23. The lawyer-client relationship is protected in many countries, including in some instances by constitutional provisions.

64. The FATF Recommendations set the international standards on combating ML and the financing of terrorism and proliferation, which jurisdictions implement taking into consideration their national context including their legal framework. In general terms jurisdictions have closely followed the FATF Recommendations but differences do exist and legal professionals need to carefully consider these differences in their own jurisdictions. The overarching concept of the obligations only applying to certain specified activities is common across all jurisdictions. Section III provides further guidance on the application of obligations in R.22 and R.23 to legal professionals.

65. Even though individual legal professionals or law firms may be able to conclude that specific AML/CFT obligations do not apply to them, ethical standards require them to ensure that their services are not being misused, including by criminals, and they should carefully consider what they need to do to guard against that risk.

66. Countries should establish the most appropriate regime, tailored to address relevant ML/TF risks, which takes into consideration the activities and applicable code of conduct for legal professionals.

Section II- The RBA to AML/CFT

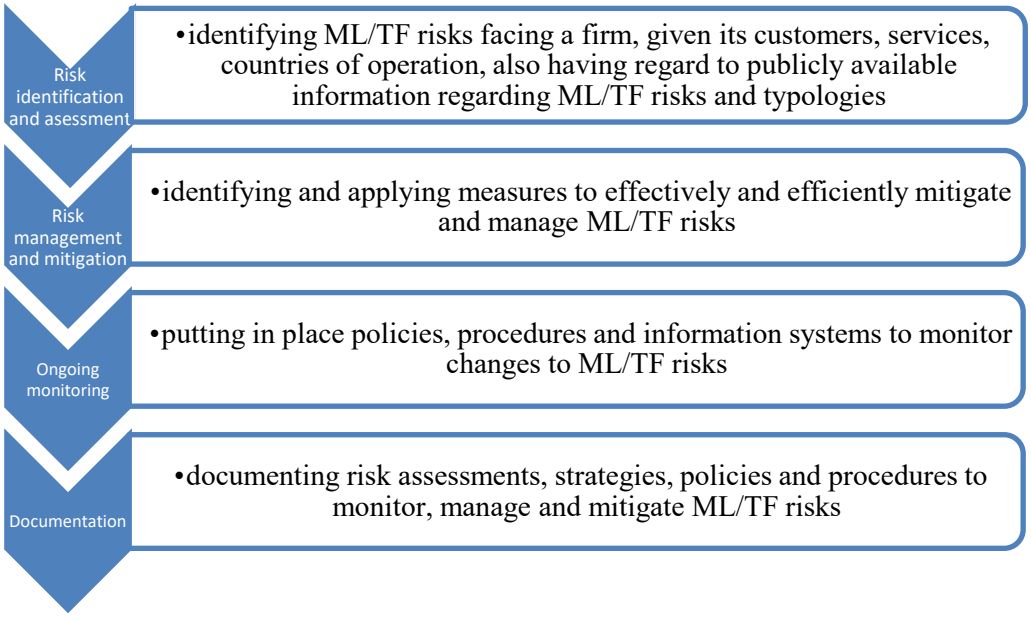
What is the RBA?

67. The RBA to AML/CFT means that countries, competent authorities and DNFBPs, including lawyers, notaries and other legal professionals should identify, assess and understand the ML/TF risks to which they are exposed and take the required AML/CFT measures effectively and efficiently to mitigate and manage the risks.

68. For legal professionals, identifying and maintaining an understanding of the ML/TF risk faced by the sector as well as specific to their services, client base, the jurisdictions where they operate, and the effectiveness of their controls in place, will require the investment of resources and training. For supervisors, this will also require maintaining an understanding of the ML/TF risks specific to their area of supervision and the degree to which AML/CFT measures can reasonably be expected to mitigate such risks.

69. The RBA is not a "zero failure" approach; there may be occasions where a legal professional has taken reasonable and proportionate AML/CFT measures to identify and mitigate risks, but is still used for ML/TF in isolated instances. Although there are limits to any RBA, ML/TF is a real and serious problem that legal professionals must address so that they do not, unwittingly or otherwise, encourage or facilitate it.

70. Key elements of a RBA can be summarised as follows:



The rationale for the RBA

71. In 2012, the FATF updated its Recommendations to keep pace with evolving risk and strengthen global safeguards. Its purposes remain to protect the integrity of the financial system by providing governments with updated tools needed to take action against financial crime.

72. There was an increased emphasis on the RBA to AML/CFT, especially in preventive measures and supervision. Though the 2003 Recommendations provided for the

application of a RBA in some areas, the 2012 Recommendations considered the RBA to be an essential foundation of a country's AML/CFT framework.[15]

73. The RBA allows countries, within the framework of the FATF Recommendations, to adopt a more tailored set of measures in order to target their resources more effectively and efficiently and apply preventive measures that are reasonable and proportionate to the nature of risks.

74. The application of a RBA is therefore essential for the effective implementation of the FATF Standards by countries and legal professionals.[16]

Application of the RBA

75. The FATF standards do not predetermine any sector as higher risk. The standards identify sectors that may be vulnerable to ML/TF. The overall risk should be determined through an assessment of the sector at a national level. Different entities within a sector will pose higher or lower risk depending on a variety of factors, including services, products, customers, geography, preventive measures and the strength of the entity's compliance program.

76. R.1 sets out the scope of application of the RBA as follows:

a) **Who should be subject to a country's AML/CFT regime?**
   - In addition to the sectors and activities already included in the scope of the FATF Recommendations[17], countries should extend their regime to additional institutions, sectors or activities if they pose a higher ML/TF risk. Countries could also consider exempting certain institutions, sectors or activities from some AML/CFT obligations where specified conditions are met, such as proven low risk of ML/TF and in strictly limited and justified circumstances.[18]

b) **How should those subject to the AML/CFT regime be supervised or monitored for compliance with this regime**
   - Supervisors should ensure that legal professionals are implementing their obligations under R.1. AML/CFT supervisors should consider a legal professional's own risk assessment and mitigation and acknowledge the degree of discretion allowed under the national RBA.

c) **How should those subject to the AML/CFT regime be required to comply**
   - The general principle of a RBA is that, where there are higher risks, enhanced measures should be taken to manage and mitigate those risks. The range, degree, frequency or intensity of preventive measures and controls

15 R.1.

16 The effectiveness of risk-based prevention and mitigation measures will be assessed as part of the mutual evaluation of the national AML/CFT regime. The effectiveness assessment will measure the extent to which a country achieves a defined set of outcomes that are central to a robust AML/CFT system and will analyse the extent to which a country's legal and institutional framework is producing the expected results. Assessors will need to take into account the risks and the flexibility allowed by the RBA, when determining whether there are deficiencies in a country's AML/CFT measures, and their importance *(FATF, 2013f).*

17 See FATF Glossary, definitions of "Designated non-financial businesses and professions" and "Financial institutions".

18 See INR.1.

conducted should be stronger in higher risk scenarios. Legal professionals are required to apply each of the following CDD measures[19]: (i) identification and verification of the client's identity; (ii) identification of the beneficial owner and taking reasonable measures to verify the identity of beneficial owner; (iii) understanding the purpose and nature of the business relationship; and (iv) on-going due diligence on the relationship. However, where the ML/TF risk is assessed as lower, the degree, frequency and/or the intensity of the controls conducted will be relatively lighter. Where risk is assessed at a normal level, the standard AML/CFT controls should apply.

d) **Consideration of the engagement in client relationships**
   - Legal professionals are not obliged to avoid risk entirely. Even if the services they provide to their clients are considered vulnerable to ML/TF risks based on risk assessment, it does not mean that all legal professionals and all their clients or services pose a higher risk when taking into account the risk mitigating measures that have been put in place.

e) **Importance of legal professional services to overall economy**
   - Legal professionals often play significant roles in the legal and economic life of a country. The role of legal professionals in supporting the negotiation of business and other agreements is vital. The risks associated with any type of client group are not static and the expectation is that within a client group, based on a variety of factors, individual clients could also be classified into risk categories, such as low, medium-low, medium, medium-high or high risk (see section 3.1 below for a detailed description). Measures to mitigate risk should be applied accordingly.

Challenges

77. Implementing a RBA can present a number of challenges for legal professionals. A RBA requires resources and expertise, both at a country and sector level, to gather and interpret information on risks, to develop policies and procedures and to train personnel. A RBA is also reliant on individuals exercising sound and well-trained judgement when designing and implementing such policies and procedures.

Box 1. Particular RBA challenges for legal professionals

Culture of compliance and adequate resources. Implementing a RBA requires that legal professionals have a sound understanding of the ML/TF risks and are able to exercise good professional judgement. Above all, legal professionals and the leadership of law firms should recognise the importance of a culture of compliance across the organisation and ensure sufficient resources are devoted to its implementation appropriate to the size, scale and activities of the organisation. This requires the building of expertise including, for example, through training, recruitment, taking professional advice and 'learning by doing'. It also requires the allocation of necessary resources to gather and interpret information on ML/TF risks, both at the country and institutional levels, and to develop procedures and systems, including ensuring effective decision-making. The process will

[19] See R.10

benefit from information sharing by relevant competent authorities, supervisors and SRBs. The provision of good practice guidance by competent authorities, supervisors, legal professionals and SRBs is valuable and encouraged.

Significant variation in services and clients. Legal professionals will vary substantially in the breadth and nature of services provided and the clients they serve, as well as the size, focus, geographic reach and sophistication of the firm and its employees. In implementing the RBA, legal professionals should make reasonable judgements for their particular services and activities. This may mean that no two legal professionals and no two firms are likely to adopt the same detailed practices. Legal professionals should thus tailor their RBA based on their unique characteristics and practice profile.

Appropriate mitigation measures will also depend on the nature of the legal professional's role and involvement. Circumstances may vary considerably between professionals who represent clients directly and those who are engaged for distinct purposes. Where these services involve tax laws and regulations, legal professionals also have additional considerations related to a country's or jurisdiction's permissible means to structure transactions and entities or operations to legally avoid and/or minimise taxes.

Transparency of beneficial ownership on legal persons and arrangements. Legal professionals can be involved in the formation, management, or administration of legal entities and arrangements, though in many countries any legal or natural person may be able to perform these activities. Where legal professionals do play this "gatekeeper" role, they may encounter challenges in keeping current and accurate beneficial ownership information depending upon the nature and activities of their client. Other challenges may arise when on-boarding new clients with minimal economic activity associated with the legal entity and/or its owners, controlling persons, or beneficial owners, established in another jurisdiction. Finally, whether the source is a public registry, another third party source, or the client, there is always potential risk in the correctness of the information, in particular where the underlying information has been provided by the client.[20] Those risks notwithstanding from the outset the legal professional should seek answers from the immediate client in determining beneficial ownership (having first determined that none of the relevant exceptions to ascertaining beneficial ownership apply, e.g. the client is a publicly listed company). The information provided by the client should then be appropriately confirmed by reference to public registers and other third party sources where possible. This may require further and clarifying questions to be put to the immediate client. The goal is to ensure that the legal professional is reasonably satisfied about the identity of the beneficial owner. For more practical guidance on beneficial ownership, refer to the guidance in Box 2.

[20] For further information legal professionals can refer to the FATF Guidance on Transparency and Beneficial Ownership.

Risk of criminality. Although the implementation of a RBA should not impair a client's right of access to justice, legal professionals and their firms must be alert to ML/TF risks posed by the services they provide to avoid the possibility that they may unwittingly commit or become an accessory to the commission of a substantive offence of ML/TF. There have been examples of unwitting involvement of or negligence on the part of legal professionals or complicit professionals intentionally enabling the laundering of proceeds of crime. Legal professionals and firms should protect themselves from misuse by criminals and terrorists. This may include restricting the method and source of payments (e.g. cash payments above a monetary threshold, unexplained third party payments) for the services being provided, dictating greater focus on monitoring and reporting of clients and their funds for unusual or suspicious activity.

Interplay between the requirement to comply with AML/CFT obligations and the principle of legal professional privilege and professional secrecy as applicable. Where legal professional privilege does apply, many countries provide exceptions in law that allow legal professionals to make disclosures of suspicion of ML/TF without incurring penalties or liability or breaching ethical obligations and in others to provide an exception to disclosure if the information is directly encompassed by a legitimate claim of privilege. However, legal professionals may be cautious of making disclosures that would otherwise breach privilege or confidentiality rules due to uncertainties in the application of these exceptions, lack of adequate information or training in relation to these rules, the complexities of their clients' situations or a combination of these factors. Criminals may misperceive that legal professional privilege and professional secrecy will delay, obstruct or prevent investigation or prosecution by authorities if they utilise the services of a legal professional. Criminals may also seek out legal professionals (over other non-legal professions) to perform the services listed in R.22 with the specific criminal intent of concealing their activities and identity from authorities through professional privilege/secrecy protections.

Allocating responsibility under a RBA

78. An effective risk-based regime builds on and reflects a country's legal and regulatory approach, the nature, diversity and maturity of its financial sector and its risk profile. Legal professional should identify and assess their own ML/TF risk taking account of the NRAs in line with R.1, as well as the national legal and regulatory framework, including any areas of prescribed significant risk and mitigation measures. Legal professionals are required to take appropriate steps to identify and assess their ML/TF risks and have policies, controls and procedures that enable them to manage and mitigate effectively the risks that have been identified.[21] Where ML/TF risks are higher, legal professionals should always apply enhanced CDD, although national law or regulation might not prescribe exactly how these higher risks are to be mitigated (e.g. varying the degree of enhanced ongoing monitoring).

79. Strategies adopted by legal professionals to mitigate ML/TF risks should take into account the applicable national legal, regulatory and supervisory frameworks. When deciding the extent to which legal professionals can take measures to mitigate risk, countries should consider the ability of the sector to effectively identify and manage ML/TF risks as well as the expertise and resources of their supervisors to adequately supervise and take action to address any failures. Countries may also consider evidence from competent authorities on the level of compliance in the sector, and the sector's approach to dealing with ML/TF risk. Countries whose services sectors are emerging or whose legal and supervisory frameworks are still developing may determine that legal professionals are not fully equipped to effectively identify and manage ML/TF risk. In such cases, a more prescriptive implementation of the AML/CFT requirements may be appropriate until the understanding and experience of the sector is strengthened.[22]

80. Legal professionals should not be exempted from AML/CFT supervision even where their compliance controls are adequate. However, the RBA allows competent authorities to focus more supervisory resources on higher risk entities.

Identifying ML/TF risk

81. Access to accurate, timely and objective information on ML/TF risks is essential for an effective RBA. INR.1.3 requires countries to have mechanisms to provide appropriate information on the results of the risk assessments to all relevant competent authorities, financial institutions and legal professionals. Where information is not readily available, for example where competent authorities have inadequate data to assess risks, are unable to share relevant information on ML/TF risks and threats, or where access to information is restricted by censorship or data protection provisions, it will be difficult for legal professionals to correctly identify ML/TF risk.

82. R.34 requires competent authorities, supervisors and SRBs to establish guidelines and provide feedback to financial institutions and DNFBPs. Such guidelines and feedback help institutions and businesses to identify the ML/TF risks and to adjust their risk mitigating programmes accordingly.

---

21 R.1 and IN.1.

22 This could be based on a combination of elements described in Section II, as well as objective criteria such as mutual evaluation reports, follow-up reports or Financial Sector Assessment Program (FSAP) evaluations.

Assessing ML/TF risk

83. Assessing ML/TF risk requires countries, competent authorities and legal professionals to determine how the ML/TF threats identified will affect them. They should analyse the information to understand the likelihood of these risks occurring, and the impact that these would have, on the individual legal professionals, the entire sector and on the national economy. As a starting step, ML/TF risks are often classified as low, medium-low, medium, medium-high and high. Assessing ML/TF risk goes beyond the mere gathering of quantitative and qualitative information, without its proper analysis; this information forms the basis for effective ML/TF risk mitigation and should be kept up-to-date to remain relevant.[23]

84. Competent authorities, including supervisors and SRBs should employ skilled and trusted personnel, recruited through fit and proper tests, where appropriate. They should be technically equipped commensurate with the complexity of their responsibilities. Legal professionals and law firms that are required to routinely conduct a high volume of enquiries when on-boarding clients, e.g. because of the size and geographic footprint of the firm, may also consider engaging skilled and trusted personnel who are appropriately recruited and checked. Such law firms are also likely to consider using the various technological options (including artificial intelligence) and software programs that are now available to assist law firms in this regard.

85. Law firms should develop internal policies, procedures and controls, including appropriate compliance management arrangements, and adequate screening procedures to ensure high standards when hiring employees. Law firms should also develop an ongoing employee training programme. They should be trained commensurate with the complexity of their responsibilities.

Mitigating and managing ML/TF risk

86. The FATF recommendations require that when applying a RBA, legal professionals should appropriately mitigate and manage the risks that they identify. Mitigating practices will invariably include initial and ongoing CDD, internal policies, training, and procedures to address the vulnerabilities faced in the legal professional's particular context. Legal professional should take enhanced measures to manage the ML/TF risks identified. This section does not attempt to exhaustively list the mitigating practices that may be employed by legal professionals. Instead, it provides select examples to illustrate how legal professionals might choose to address particular risks under the RBA.[24]

87. The FATF Recommendations require that, when applying a RBA, legal professionals, countries, competent authorities and SRBs decide on the most appropriate and

---

[23] FATF (2013a), paragraph 10. See also Section I D for further detail on identifying and assessing ML/TF risk. Also refer to The FATF Guidance on National Money Laundering and Terrorist Financing Risk Assessment (February 2013).

[24] For information on ways in which legal professionals might mitigate their ML/TF vulnerabilities, see Section 2 of this Guidance and chapters III and IV of the separate publication: "A Lawyer's Guide to Detecting and Preventing Money Laundering" published in October 2014 by a collaboration of the International Bar Association, American Bar Association and the Council of Bars and Law Societies of Europe.

effective way to mitigate the ML/TF risk they have identified. They should take enhanced measures to manage and mitigate situations when the ML/TF risk is higher. In lower risk situations, less stringent measures may be applied:[25]

a) Countries may decide not to apply some of the FATF Recommendations requiring DNFBPs to take certain actions, provided (i) there is a proven low risk of money laundering and terrorist financing, this occurs in strictly limited and justified circumstances and it relates to a particular type of DNFBP or (ii) a financial activity is carried out by a natural or legal person on an occasional or very limited basis such that there is a low risk of ML/TF, according to the exemptions of INR 1.6.

b) Countries looking to apply simplified measures should conduct an assessment to ascertain the lower risk connected to the category of clients or services, establish a threshold for the lower level of the risks involved, and define the extent and the intensity of the required AML/CFT measures, provided that the specific conditions required for one of the exemptions of INR 1.6 are met. Specific Recommendations set out in more detail how this general principle applies to particular requirements.[26]

Developing a common understanding of the RBA

88. The effectiveness of a RBA depends on a common understanding by competent authorities and legal professionals of what the RBA entails, how it should be applied and how ML/TF risks should be addressed. In addition to a legal and regulatory framework that spells out the degree of discretion, legal professionals should deal with the risks they identify. Following a consultative process, competent authorities should issue RBA guidance to legal professionals on meeting and managing their legal and regulatory AML/CFT obligations. Supporting ongoing and effective communication between competent authorities and legal professionals is essential.

89. Competent authorities should acknowledge that not all legal professionals will adopt identical AML/CFT controls in a risk-based regime. On the other hand, legal professionals should understand that a RBA does not exempt them from applying effective AML/CFT controls.

25. Subject to the national legal framework providing for Simplified CDD.
26 For example, R.22 on CDD.

Section III – Guidance for legal professionals

Risk identification and assessment

90. Potential ML/TF risks faced by legal professionals will vary according to many factors including the activities undertaken by them, the type and identity of the client, and the nature and origin of the client relationship. When applying the RBA, legal professionals and firms should bear in mind that specified activities have been found to be more susceptible to ML/TF activities because they involve the movement or management of client assets; this susceptibility may be heightened when these activities are conducted on a cross-border basis. These specified activities include:

a) buying and selling of real estate;

b) managing of client money, securities or other assets;

c) management of bank, savings or securities accounts;

d) organisation of contributions for the creation, operation or management of companies; and

e) creating, operating or management of legal persons or arrangements and buying and selling of business entities.

91. Although a client's right of access to advice and justice should not be adversely affected by the implementation of the RBA, legal professionals and their firms must remain alert to ML/TF risks posed by the services they provide to avoid unwittingly committing or becoming an accessory to the commission of a ML/TF offence. Legal professionals and law firms must protect themselves from unwitting involvement in ML/TF; such involvement not only presents reputational risk to the individuals concerned, the law firm and the legal profession at large, it is also unacceptable for the legal profession to allow itself to be misused by criminals.

92. Legal professionals should perform a risk assessment of the client at the inception of a client relationship. Such risk assessment may well be informed by findings of the NRA, the supra-national risk assessments, sectoral reports conducted by competent authorities on ML/TF risks that are inherent in legal services/sector, risk reports in other jurisdictions where the legal professional is based, and any other information which may be relevant to assess the risk level particular to their legal practice. For example, press articles and other widely available public information highlighting issues that may have arisen in particular jurisdictions. Legal professionals may also draw references to FATF Guidance on indicators and risk factors[27]. During the course of a client relationship, procedures for ongoing monitoring and review of the client/transactional risk profile are also important. Competent authorities should consider how they can best alert legal professionals to the findings of any national risk assessments, the supra-national risk assessments and any other information that may be relevant to assess the risk level particular to a legal practice in the relevant country.

93. Due to the nature of services that a legal professional generally provides, automated transaction monitoring systems of the type used by financial institutions will not be appropriate for most legal professionals. The legal professional's knowledge of the client

[27] FATF Report on Vulnerabilities in the Legal Sector (2013), Chapters 4 and 5.

and its business will develop throughout the duration of a longer term and interactive professional relationship (in some cases, such relationships may exist for short term clients as well, e.g. for property transactions). Although individual legal professionals are not expected to investigate their client's affairs, they may be well positioned to identify and detect changes in the type of work or the nature of the client's activities in the course of the business relationship. Legal professionals should consider the nature of the risks presented by short-term client relationships that may inherently, but not necessarily be low risk (e.g. one-off client relationship involving simple transactions). Legal professionals should also be mindful of the subject matter of the professional services (the engagement) being sought by an existing or potential client and the related risks.

94. Identification of the ML/TF risks associated with certain clients or categories of clients, and certain types of work will allow legal professionals to determine and implement reasonable and proportionate measures and controls to mitigate such risks. The risks and appropriate measures will depend on the nature of the legal professional's role and involvement. Circumstances may vary considerably between professionals who represent clients in a single transaction, those involved in a long term advisory relationship and those who are engaged for distinct and discrete purposes including, for example, civil law notaries and local counsel engaged in a specific jurisdiction within a transaction.

95. The amount and degree of ongoing monitoring and review will depend on the nature and frequency of the relationship, along with the comprehensive assessment of client/transactional risk. A legal professional may also have to adjust the risk assessment of a particular client based upon information received from a designated competent authority, SRB or other credible sources (including a referring legal professional).

96. Legal professionals may assess ML/TF risks by applying various categories. This provides a strategy for managing potential risks by enabling legal professionals, where required, to subject each client to reasonable and proportionate risk assessment.

97. The most commonly-used risk categories are:

a) country or geographic risk;

b) client risk; and

c) risk associated with the particular service offered.

98. The weight given to these risk categories (individually or in combination) in assessing the overall risk of potential ML/TF may vary given the size, sophistication, nature and scope of services provided by the legal professional and/or law firm. These criteria, however, should be considered holistically and not in isolation. Legal professionals, based on their individual practices and reasonable judgements, will need to independently assess the weight to be given to each risk factor.

99. Although there is no universally accepted set of risk categories, the examples provided in this Guidance are the most commonly identified risk categories. There is no single methodology to apply these risk categories and the application of these risk categories is intended to provide a suggested framework for approaching the assessment and management of potential ML/TF risks. For smaller law firms and sole practitioners, it is advisable to look at the services they offer (e.g. providing company management services may entail greater risk than other services).

100. Criminals deploy a range of techniques and mechanisms to obscure the beneficial ownership of assets and transactions. Many of the common

mechanisms/techniques have been compiled by FATF in the previous studies, including the 2014 FATF Guidance on Transparency and Beneficial Ownership and the 2018 Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership. Legal professionals may refer to the studies for more details on the use of obscuring techniques and relevant case studies.

101. A practical starting point for law firms (especially smaller firms) and legal professionals (especially sole practitioners) would be to take the following approach. Many of these elements are critical to satisfying other obligations owed to clients, such as fiduciary duties, and as part of their general regulatory obligations:

a) **Client acceptance and know your client policies**: identify the client and its beneficial owners and the true "beneficiaries" of the transaction. Obtain an understanding of the source of funds and source of wealth of the client where required, its owners and the purpose of the transaction.

b) **Engagement acceptance policies:** understand the nature of the work. Legal professionals should know the exact nature of the service that they are providing and have an understanding of how that work could facilitate the movement or obscuring of the proceeds of crime. Where a legal professional does not have the requisite expertise, the legal professional should not undertake the work.

c) **Understand the commercial or personal rationale for the work:** legal professionals need to be reasonably satisfied that there is a commercial or personal rationale for the work undertaken. Legal professionals however are not obliged to objectively assess the commercial or personal rationale if it appears reasonable and genuine.

d) **Be attentive to red flag indicators:** exercise vigilance in identifying and then carefully reviewing aspects of the transaction if there are reasonable grounds to suspect that funds are the proceeds of a criminal activity, or related to terrorist financing. Subject to qualifications set forth in this Guidance, these cases would trigger reporting obligations. Documenting the thought process may be a viable option to assist in interpreting/assessing red flags/indicators of suspicion.

e) **Then consider what action, if any, needs to be taken and have an action plan:** the outcomes of the above action (i.e. the comprehensive risk assessment of a particular client/transaction) will dictate the level and nature of the evidence/documentation collated under a firm's CDD/EDD procedures (including evidence of source of wealth or funds).

f) **Documentation:** legal professionals should adequately document and record steps taken under a) to e).

Country/Geographic risk

102. There is no universally agreed definition by competent authorities, SRBs or legal professionals that prescribes whether a particular country or geographic area (including the country within which the legal professional practices) represents a higher risk. Country risk, in conjunction with other risk factors, provides useful information on ML/TF risks. Geographic risks of ML/TF may arise in a variety of circumstances, including from the

domicile of the client, the location of the transaction or the source of the wealth or funds. Factors that are generally agreed to place a country in a higher risk category include:

a) Countries/areas identified by credible sources[28] as providing funding or support for terrorist activities or that have designated terrorist organisations operating within them.

b) Countries identified by credible sources as having significant levels of organised crime, corruption, or other criminal activity, including source or transit countries for illegal drugs, human trafficking and smuggling and illegal gambling.

c) Countries subject to sanctions, embargoes or similar measures issued by international organisations such as the United Nations.

d) Countries identified by credible sources as having weak governance, law enforcement, and regulatory regimes, including countries identified by FATF statements as having weak AML/CFT regimes, and in relation to which financial institutions (as well as DNFBPs) should give special attention to business relationships and transactions.

   Countries identified by credible sources to be uncooperative in providing beneficial ownership information to competent authorities, a determination of which may be established from reviewing FATF mutual evaluation reports or reports by organisations that also consider various co-operation levels such as the OECD Global Forum reports on compliance with international tax transparency standards.[29]

Client risk

103. Determining the potential ML/TF risks posed by a client or category of clients is critical to the development and implementation of an overall risk-based framework. Based on their own criteria, law firms and legal professionals should seek to determine whether a particular client poses a higher risk and the potential impact of any mitigating factors on that assessment. Application of risk variables may mitigate or exacerbate the risk assessment. Categories of clients whose activities may indicate a higher risk include:

a) PEPs and persons closely associated with or related to PEPs, are considered as higher risk clients (Please refer to the FATF Guidance (2013) on PEPs for further guidance on how to identify PEPs).

---

[28] "Credible sources" refers to information that is produced by reputable and universally recognised international organisations and other bodies that make such information publicly and widely available. In addition to the FATF and FATF-style regional bodies, such sources may include, but are not limited to, supra-national or international bodies such as the International Monetary Fund, the World Bank and the Egmont Group of Financial Intelligence Units.

[29] www.oecd-ilibrary.org/taxation/global-forum-on-transparency-and-exchange-of-information-for-tax-purposes-peer-reviews_2219469x

Box 2. Particular considerations for PEPs and source of funds and wealth

If a legal professional is advising a PEP client, or where a PEP is the beneficial owner of assets in a transaction, appropriate enhanced CDD is required if a specified activity under R.22 is involved. Such measures include, obtaining senior management (e.g. senior partner, managing partner or executive partner) approval before establishing a business relationship, taking reasonable measures to establish the source of wealth and source of funds of clients and beneficial owners identified as PEPs, and conducting enhanced ongoing monitoring on that relationship.

The source of funds and the source of wealth are relevant to determining a client's risk profile. The source of funds is the activity that generates the funds for a client (e.g. salary, trading revenues, or payments out of a trust). Source of funds relates directly to the economic origin of funds to be used in a transaction. This is likely to be received via a bank account. Generally, this would be evidenced by bank statements or similar documentation showing from where funds in an account originated such as receipt of salary. Source of wealth describes the activities that have generated the total net worth of a client (e.g. ownership of a business, inheritance, or investments). Source of wealth is the origin of the accrued body of wealth of an individual. Understanding source of wealth is about taking reasonable steps, commensurate with risk to be satisfied that the funds to be used in a transaction appear to come from a legitimate source.

While source of funds and wealth may be the same for some clients, they may be partially or entirely different for other clients. For example, a PEP who receives a modest official salary, but who has substantial funds, without any apparent business interests or inheritance, might raise suspicions of bribery, corruption or misuse of position. Under the RBA, legal professionals should satisfy themselves that adequate information is available to assess a client's source of funds and source of wealth as legitimate with a degree of certainty that is reasonable and proportionate to the risk profile of the client.

Relevant factors that influence the extent and nature of CDD include the particular circumstances of a PEP, PEPs separate business interests and the time those interests prevailed in relation to the public position, whether the PEP has access to official funds, makes decisions regarding the allocation of public funds or public procurement contracts, the PEP's home country, the type of activity that the PEP is instructing the legal professional to perform or carry out, whether the PEP is domestic or international, particularly having regard to the services asked for, and the scrutiny to which the PEP is under in the PEP's home country.

If a PEP is otherwise involved with a client, then the nature of the risk should be considered in light of all relevant circumstances, such as:

a) the nature of the relationship between the client and the PEP: If the client is a trust, company or legal entity, even if the PEP is not a natural person exercising effective control or the PEP is merely a discretionary

beneficiary who has not received any distributions, the PEP may nonetheless affect the risk assessment.

b) the nature of the client (e.g. where it is a public listed company or regulated entity who is subject to and regulated for a full range of AML/CFT requirements consistent with FATF Recommendations, the fact that it is subject to reporting obligations will be a relevant factor.

c) the nature of the services sought. For example, lower risks may exist where a PEP is not the client but a director of a client that is a public listed company or regulated entity and the client is purchasing property for adequate consideration. Higher risks may exist where a legal professional is involved in the movement or transfer of funds/assets, or the purchase of high value property or assets.

b) Clients conducting their business relationship or requesting services in unusual or unconventional circumstances (as evaluated taking into account all the circumstances of the client's representation).

c) Clients where the structure or nature of the entity or relationship makes it difficult to identify in a timely manner the true beneficial owner or controlling interests or clients attempting to obscure understanding of their business, ownership or the nature of their transactions, such as:

   i. Unexplained use of shell and/or shelf companies, front company, legal entities with ownership through nominee shares or bearer shares, control through nominee and corporate directors, legal persons or legal arrangements, splitting company formation and asset administration over different countries, all without any apparent legal or legitimate tax, business, economic or other reason.

   ii. Unexplained use of informal arrangements such as family or close associates acting as nominee shareholders or directors.

   iii. Unusual complexity in control or ownership structures without a clear explanation, where certain circumstances, structures, geographical locations, international activities or other factors are not consistent with the legal professionals' understanding of the client's business and economic purpose.

d) Client companies that operate a considerable part of their business in or have major subsidiaries in countries that may pose higher geographic risk.

e) Clients that are cash (and/or cash equivalent) intensive businesses. Where such clients are themselves subject to and regulated for a full range of AML/CFT requirements consistent with the FATF Recommendations, this will aid to mitigate the risks. These may include, for example:

   i. Money or Value Transfer Services (MVTS) businesses (e.g. remittance houses, currency exchange houses, casas de cambio, centros cambiarios, remisores de fondos, bureaux de change, money transfer agents and bank note traders or other businesses offering money transfer facilities).

ii. Operators, brokers and others providing services in virtual assets.

iii. Casinos, betting houses and other gambling related institutions and activities.

iv. Dealers in precious metals and stones.

f) Businesses that while not normally cash intensive appear to have substantial amounts of cash.

g) Businesses that rely heavily on new technologies (e.g. online trading platform) may have inherent vulnerabilities to exploitation by criminals, especially those not regulated for AML/CFT.

h) Non-profit or charitable organizations engaging in transactions for which there appears to be no logical economic purpose or where there appears to be no link between the stated activity of the organization and the other parties in the transaction.

i) Clients using financial intermediaries, financial institutions or legal professionals that are not subject to adequate AML/CFT laws and measures and that are not adequately supervised by competent authorities or SRBs.

j) Clients who appear to be acting on somebody else's instructions without disclosing the identity of such person.

k) Clients who appear to actively and inexplicably avoid face-to-face meetings or who provide instructions intermittently without legitimate reasons and are otherwise evasive or very difficult to reach, when this would not normally be expected.

l) Clients who request that transactions be completed in unusually tight or accelerated timeframes without a reasonable explanation for accelerating the transaction, which would make it difficult or impossible for the legal professionals to perform a proper risk assessment.

m) Clients with previous convictions for crimes that generated proceeds, who instruct legal professionals (who in turn have knowledge of such convictions) to undertake specified activities on their behalf.

n) Clients who have no address, or who have multiple addresses without legitimate reasons.

o) Clients who have funds that are obviously and inexplicably disproportionate to their circumstances (e.g. their age, income, occupation or wealth).

p) Clients who change their settlement or execution instructions without appropriate explanation.

q) Clients who change their means of payment for a transaction at the last minute and without justification (or with suspect justification), or where there is an unexplained lack of information or transparency in the transaction. This risk extends to situations where last minute changes are made to enable funds to be paid in from/out to a third party.

r) Clients who insist, without reasonable explanation, that transactions be effected exclusively or mainly through the use of virtual assets for the purpose of preserving their anonymity.

s) Clients who offer to pay unusually high levels of fees for services that would not ordinarily warrant such a premium. However, bona fide and appropriate contingency fee arrangements, where legal professionals may receive a significant premium for a successful representation, should not be considered a risk factor.

t) Unusually high levels of assets or unusually large transactions compared to what might reasonably be expected of clients with a similar profile may indicate that a client not otherwise seen as higher risk should be treated as such.

u) Where there are certain transactions, structures, geographical location, international activities or other factors that are not consistent with the legal professional's understanding of the client's business or economic situation.

v) The legal professional's client base includes industries or sectors where opportunities for ML/TF are particularly prevalent[30].

w) Clients who apply for residence rights or citizenship in a jurisdiction in exchange for capital transfers, purchase of property or government bonds, or investment in corporate entities in that jurisdiction.

x) Clients who are suspected to be engaged in falsifying activities through the use of false loans, false invoices, and misleading naming conventions.

y) The relationship between employee numbers/structure and nature of the business is divergent from the industry norm (e.g. the turnover of a company is unreasonably high considering the number of employees and assets compared to similar businesses).

z) Client seeking advice or implementation of an arrangement that has indicators of a tax evasion purpose, whether identified as the client's express purpose, in connection with a known tax evasion scheme or based on other indicators from the nature of the transaction.

aa) The transfer of the seat of a company to another jurisdiction without any genuine economic activity in the country of destination poses a risk of creation of shell companies that might be used to obscure beneficial ownership.

bb) Sudden activity from a previously dormant client without clear explanation.

cc) Client that start or develop an enterprise with unexpected profile or abnormal business cycles or client that enters into new/emerging markets. Organised criminality generally does not have to raise capital/debt, often making them first into a new market, especially where this market may be retail/cash intensive.

[30] See the FATF Report on Money Laundering and Terrorist Financing: Vulnerabilities of Legal Professionals (June 2013).

dd) Indicators that client does not wish to obtain necessary governmental approvals/filings.

ee) Reason for client choosing the firm is unclear, given the firm's size, location or specialisation.

ff) Frequent or unexplained change of client's professional adviser(s) or members of management.

gg) The client is reluctant to provide all the relevant information or legal professionals have reasonable suspicion that the provided information is incorrect or insufficient.

hh) Clients seeking to obtain residents rights or citizenship in the country of establishment of the legal professional, in exchange for capital transfers, purchase of property or government bonds, or investment in corporate entities.

Transaction/Service risk

104. An overall risk assessment of a client should also include determining the potential risks presented by the services offered by a legal professional, given the nature of such services, noting that legal professionals provide a broad and diverse range of services. The context of the services being offered or delivered is always fundamental to a RBA. Any one of the factors discussed in this Guidance alone may not itself constitute a high-risk circumstance but the factors should be considered cumulatively and holistically. When determining the risks associated with the provision of services related to specified activities, consideration and appropriate weight should be given to such factors as:

a) Services where legal professionals, effectively acting as financial intermediaries, handle the receipt and transmission of funds through accounts they control in the act of facilitating a business transaction.

b) Services that allow clients to deposit/transfer funds through the legal professional's trust account that are not tied to a transaction for which the legal professional is performing or carrying out activities specified in R.22.

c) Services where the client may request financial transactions to occur outside of the legal professional's trust account (the account held by the legal professional for the client) (e.g. through the firm's general account and/or a personal or business account held by the legal professional himself/herself).

d) Services where legal professionals may in practice represent or assure the client's standing, reputation and credibility to third parties, without a commensurate knowledge of the client's affairs.

e) Services that are capable of concealing beneficial ownership from competent authorities.[31]

[31] For further details on the difficulties presented by arrangements which conceal beneficial ownership see joint FATF and Egmont group report "Vulnerabilities Linked to the Concealment of Beneficial Ownership" published in July 2018.

f) Services requested by the client for which the legal professional does not have expertise excepting where the legal professional is referring the request to an appropriately trained professional for advice.

g) Services that rely heavily on new technologies (e.g. in relation to initial coin offerings or virtual assets) that may have inherent vulnerabilities to exploitation by criminals, especially those not regulated for AML/CFT.

h) Transfer of real estate or other high value goods or assets between parties in a time period that is unusually short for similar transactions with no apparent legal, tax, business, economic or other legitimate reason.[32]

i) Payments received from un-associated or unknown third parties and payments in cash where this would not be a typical method of payment.

j) Transactions where it is readily apparent to the legal professional that there is inadequate consideration, especially where the client does not provide legitimate reasons for the amount of the consideration.

k) Administrative arrangements concerning estates where the deceased was known to the legal professional as being a person who had been convicted of proceeds generating crimes.

l) The use of shell companies, companies with ownership through nominee shares or bearer shares and control through nominee and corporate directors without apparent legal, tax, business, economic or other legitimate reason.[33]

m) Situations where advice on the setting up of legal arrangements may be misused to obscure ownership or real economic purpose (including changes of name/corporate seat or on establishing complex group structures). This might include advising in relation to a discretionary trust that gives the trustee discretionary power to name a class of beneficiaries that does not include the real beneficiary (e.g. naming a charity as the sole discretionary beneficiary initially with a view to adding the real beneficiaries at a later stage). It might also include situations where a trust is set up for the purpose of managing shares in a company with the intention of making it more difficult to determine the beneficiaries of assets managed by the trust.[34]

n) Services that have deliberately provided, or depend upon, more anonymity in relation to the client's identity or regarding other participants, than is normal under the circumstances and in the experience of the legal professional.

o) Settlement of default judgments or alternative dispute resolutions is made in an atypical manner (e.g. if satisfaction of a settlement or judgment debt is made too readily).

---

[32] See the FATF Typologies report Money Laundering and Terrorist Financing through the Real Estate Sector.

[33] See also the FATF typologies report "The Misuse of Corporate Vehicles, including Trust and Company Service Providers" published 13 October 2006.

[34] See also the FATF typologies report "The Misuse of Corporate Vehicles, including Trust and Company Service Providers" Annex 2 on trusts, for a more detailed description of "potential for misuse" of trusts.

p) Use of virtual assets and other anonymous means of payment and wealth transfer within the transaction without apparent legal, tax, business, economic or other legitimate reason.

q) Transactions using unusual means of payment (e.g. precious metals or stones).

r) The postponement of a payment for an asset or service delivered immediately to a date far from the moment at which payment would normally be expected to occur, without appropriate assurances that payment will be made.

s) Unexplained establishment of unusual provisions in credit arrangements that do not reflect the commercial position between the parties. Arrangements that may be abused in this way might include unusually short/long amortisation periods, interest rates materially above/below market rates, or unexplained repeated cancellations of promissory notes/mortgages or other security instruments substantially ahead of the maturity date initially agreed.

t) Transfers of goods that are inherently difficult to value (e.g. jewels, precious stones, objects of art or antiques, virtual assets), where this is not common for the type of client, transaction or with the legal professional's normal course of business, such as a transfer to a corporate entity, or generally without any appropriate explanation.

u) Successive capital or other contributions in a short period of time to the same entity with no apparent legal, tax, business, economic or other legitimate reason.

v) Acquisitions of businesses in liquidation with no apparent legal, tax, business, economic or other legitimate reason.

w) Power of representation given in unusual conditions (e.g. when it is granted irrevocably or in relation to specific assets) and the stated reasons for these conditions are unclear or illogical.

x) Transactions involving closely connected persons and for which the client and/or its financial advisors provide inconsistent or irrational explanations and are subsequently unwilling or unable to explain by reference to legal, tax, business, economic or other legitimate reason.

y) Legal persons that, as a separate business, offer TCSP services should have regard to the TCSP Guidance,[35] even if such legal persons are owned or operated by legal professionals. Legal professionals, however, who offer TCSP services should have regard to this Guidance, and should consider customer or service risks related to TCSPs such as the following:

    i. Unexplained delegation of authority by the client through the use of powers of attorney, mixed boards and representative offices.

    ii. Provision of registered office facilities and nominee directorships without proper explanations.

    iii. Unexplained use of discretionary trusts.

[35] See the FATF Guidance on the Risk-Based Approach for Trust and Company Service Providers, published in July 2019

iv. In the case of express trusts, an unexplained relationship between a settlor and beneficiaries with a vested right, other beneficiaries and persons who are the object of a power.

z) In the case of an express trust, an unexplained (where explanation is warranted) nature of classes of beneficiaries

aa) Services where the legal professional acts as a trustee/director that allows the client's identity to remain anonymous.

bb) Situations where a nominee is being used (e.g. friend or family member is named as owner of property/assets where it is clear that the friend or family member is receiving instructions from the beneficial owner), with no apparent legal, tax, business, economic or other legitimate reason.

cc) Unexplained use of pooled client accounts or safe custody of client money or assets or bearer shares, where allowed, without justification.

dd) Commercial, private, or real property transactions or services to be carried out by the client with no apparent legitimate business, economic, tax, family governance, or legal reasons.

ee) Suspicion of fraudulent transactions or transactions which are improperly accounted for. These might include:

i. Over or under invoicing of goods/services.

ii. Multiple invoicing of the same goods/services.

iii. Falsely described goods/services

iv. Over or under shipments (e.g. false entries on bills of lading).

v. Multiple trading of goods/services.

Variables that may influence risk assessment

105. While all legal professionals should follow robust standards of due diligence in order to avoid regulator arbitrage, due regard should be accorded to differences in practices, size, scale and expertise amongst legal professionals, as well as the nature of the clients they serve. As a result, consideration must be given to these factors when creating a RBA that complies with the existing obligations of legal professionals. Certain notaries, for example, are subject to an array of duties as public officeholders. By contrast, legal professionals do not have such extensive public duties, but are nearly universally subject to duties of professional secrecy and an obligation to uphold their clients' rights of legal professional privilege to their communications. Legal professionals with distinct "public" roles within national legal systems should carefully consider the interaction of their particular duties with the RBA outlined in this Guidance.

106. The particular responsibilities, status and role of the legal professional will, in general, have a significant influence on what is appropriate for risk assessment. For example, in many civil law jurisdictions, notaries do not represent parties to a contract and are not intermediaries. They are obliged to be impartial and independent, advising both parties bearing in mind any disparity of power between them. Notaries carry duties as public office holders. These duties will influence the scope of what the notary must do to assess the ML/TF risk and how to act based on that assessment. Notaries should be conscious of the

respectability they can add to documents, and the value this can add to those whose motives are nefarious.

107. Consideration should be given to the resources that can be reasonably allocated to implement and manage an appropriately developed RBA. For example, a sole practitioner would not be expected to devote an equivalent level of resources as a large firm; rather, the sole practitioner would be expected to develop appropriate systems and controls and a RBA proportionate to the scope and nature of the practitioner's practice and its clients. Small firms serving predominantly locally based and low risk clients cannot generally be expected to devote a significant amount of senior personnel's time to conducting risk assessments. It may be more reasonable for sole practitioners to rely on publicly available records and information supplied by a client for a risk assessment than it would be for a large law firm having a diverse client base with different risk profiles. However, where the source is a public registry, or the client, there is always potential risk in the correctness of the information. Sole practitioners and small firms may also be regarded by criminals as more of a target for money launderers than large law firms. Legal professionals in many jurisdictions and practices are required to conduct both a risk assessment of the general risks of their practice, and of all new clients and current clients engaged in one-off specific transactions. The emphasis must be on following a RBA.

108. A significant factor to consider is whether the client and proposed work would be unusual, risky or suspicious for the particular legal professional. This factor must be considered in the context of the legal professional's practice, as well as the legal, professional, and ethical obligations in the jurisdiction(s) of practice. A legal professional's RBA methodology may thus take account of risk variables specific to a particular client or type of work. Consistent with the RBA and proportionality, the presence of one or more of these variables may cause a legal professional to conclude that either enhanced CDD and monitoring is warranted, or conversely that standard CDD and monitoring can be reduced, modified or simplified. When reducing, modifying or simplifying CDD, legal professionals should always adhere to the minimum requirements as set out in national legislation. These variables may increase or decrease the perceived risk posed by a particular client or type of work and may include:

a) The nature of the client relationship and the client's need for the legal professional to prepare for or carry out specified activities.

b) The level of regulation or other oversight or governance regime to which a client is subject. For example, a client that is a financial institution or legal professional regulated in a country with a satisfactory AML/CFT regime poses less risk of ML/TF than a client in an industry that has ML/TF risks and yet is unregulated for ML/TF purposes.

c) The reputation and publicly available information about a client. Legal persons that are transparent and well known in the public domain and have operated for a number of years without being convicted of proceed generating crimes may have low susceptibility to money laundering. This may not be the case where such a legal person is in financial distress or in a situation of liquidation/insolvency.

d) The regularity, depth or duration of the client relationship may be a factor that lowers or heightens risk (dependant on the nature of the relationship).

e) The familiarity of the legal professional with a country, including knowledge of local laws, regulations and rules, as well as the structure and extent of regulatory oversight, as the result of a legal professional's own activities.

f) The proportionality between the magnitude or volume and longevity of the client's business and its legal requirements, including the nature of services sought.

g) Subject to other factors (including the nature of the services and the source and nature of the client relationship), providing limited legal services in the capacity of a local or special counsel may be considered a low risk factor. This may also, in any event, mean that the legal professional is not "preparing for" or "carrying out" a transaction for a specified activity identified in R.22.

h) Significant and unexplained geographic distance between the legal professional and the location of the client where there is no nexus to the type of activity being undertaken.

i) Where a prospective client has instructed the legal professional to undertake a single transaction-based service (as opposed to an ongoing advisory relationship) and one or more other risk factors are present.

j) Where the legal professional knows that a prospective client has used the services of a number of legal professionals for the same type of service over a relatively short period of time.

k) Risks that may arise from non-face-to-face relationships and could favour anonymity. Due to the prevalence of electronic communication between legal professionals and clients in the delivery of legal services, non-face-to-face interaction between legal professionals and clients would not be considered a high risk factor on its own. The treatment of non-face-to-face communications should always be subject to the approach taken by legislation and regulators in the relevant jurisdiction.

l) The nature of the referral or origin of the client. A prospective client may contact a legal professional in an unsolicited manner or without common or customary methods of introduction or referrals, which may indicate increased risk. By contrast, where a prospective client has been referred from another trusted source or a source regulated for AML/CFT purposes (e.g. from another legal professional), the referral may be considered a mitigating risk factor.

m) The structure of a client or transaction. Structures with no apparent legal, tax, business, economic or other legitimate reason may increase risk. Legal professionals often design structures (even if complex) for legitimate legal, tax, business, economic or other legitimate reasons, in which circumstances there may not be an indicator of increased risk of ML/TF. Legal professionals should satisfy themselves of a reasonable need for such complex structures in the context of the transaction.

n) Trusts that are pensions may be considered lower risk.

Documentation of risk assessments

109. Several jurisdictions mandate various documentation requirements in connection with AML/CFT.[36] Legal professionals must always understand their ML/TF risks (for clients, countries or geographic areas, services, transactions or delivery channels). They should document those assessments to be able to demonstrate their basis. However, competent authorities or SRBs may determine that individual documented risk assessments are not required, if the specific risks inherent to the sector are clearly identified and understood.[37]

110. Legal professionals may fail to satisfy their AML/CFT obligations, for example by relying completely on a checklist risk assessment where there are other clear indicators of potential illicit activity. Completing risk assessments in a time efficient yet comprehensive manner has become more important as legal professionals are now obliged in various jurisdictions to conduct a documented risk assessment for each client and share it with supervisory authorities when required.

111. A documented risk assessment may cover a range of specific risks by breaking them down into the three common categories highlighted above: (a) geographic risks, (b) client-based risks and (c) service-based risks. These three risk categories have been identified and explained in the guide: "*A Lawyer's Guide to Detecting and Preventing Money Laundering*".[38] The guide also provides graphic illustrations and case studies of how to assess risk under these three categories. In practice, risk factors could be categorised differently in different jurisdictions. However, all relevant risk factors should be considered.

112. Each of these risks could be assessed using indicators such as low risk, medium risk and/or high risk. A short explanation of the reasons for each attribution should be included and an overall assessment of risk determined. An action plan[39] (if required) should then be outlined to accompany the assessment and dated. Action plans can help identify potential red flags, facilitate risk assessment and decide on CDD measures to be applied. A simple template of risk assessment may be as below, for instance:

Geographic risk	Client-based risk	Service-based risk
Low/medium/high risk	Low/medium/high risk	Low/medium/high risk
Explanation	Explanation	Explanation
Overall assessment: Low/Medium/High risk		
Action plan		

113. A risk assessment of this kind should not only be carried out for each specific client and service on an individual basis, as required, but also to assess and document the risks on a firm-wide basis, and to keep risk assessment up-to-date through monitoring of the

[36] For example, the European Union law places an obligation on legal professionals working in an AML-regulated service to document risk assessments and ensure they are kept up to date (Article 8 of the Fourth Anti-Money Laundering Directive (EU) 2015/849).

[37] Paragraph 8 of INR.1

[38] A Lawyer's Guide to Detecting and Preventing Money Laundering, is a collaborative publication of the International Bar Association, the American Bar Association and the Council of Bars and Law Societies of Europe, published in October 2014.

[39] "Action plans" are described in some jurisdictions as the "document your thought process" form.

client relationship. The written risk assessment should be made accessible to all professionals having to perform AML/CFT duties. Proper safeguards should be put in place to ensure privacy of clients.

114. Where legal professionals are involved in longer term transactions, risk assessments should be undertaken at suitable intervals across the life of the transaction, to ensure no significant risk factors have changed in the intervening period (e.g. new parties to the transaction, new sources of funds etc.). See [3.4.2] *Ongoing monitoring of clients and special activities.*

115. A final risk assessment should be undertaken before a transaction has completed, allowing time for any required STR to be filed and any authority to move or transfer assets to be obtained from law enforcement (in countries where this is applicable).

Risk management and mitigation

116. Identification and assessment of the ML/TF risks associated with certain clients or categories of clients, and certain types of work will allow legal professionals to determine and implement reasonable and proportionate measures and controls to mitigate such risks. The risks and appropriate measures will depend on the nature of the legal professional's role and involvement. Circumstances may vary considerably between professionals who represent clients directly and those who are engaged for distinct purposes including, for example, civil law notaries. In high risk scenarios, legal professionals must consider the extent to which they might be involved in unwittingly enabling the substantive offence of ML/TF by providing a legal service even with the application of enhanced CDD measures. Under such scenario, legal professionals should consider not to provide services or establish/continue business relationship with the client.

117. Legal professionals should implement appropriate measures and controls to mitigate the potential ML/TF risks for those clients that, as the result of a RBA, are determined to be higher risk. These measures should be tailored to the specific risks faced, both to ensure the risk is adequately addressed and to assist in the appropriate allocation of finite resources for CDD. Paramount among these measures is the requirement to train legal professionals and appropriate staff to identify and detect relevant changes in client activity by reference to risk-based criteria. These measures and controls may include:

a) General training on ML/TF methods and risks relevant to legal professionals.

b) Targeted training for increased risk awareness by the legal professionals providing specified activities to higher risk clients or to legal professionals undertaking higher risk work.

c) Increased or more appropriately targeted CDD or enhanced CDD for higher risk clients/situations that concentrate on providing a better understanding about the potential source of risk and obtaining the necessary information to make informed decisions about how to proceed (if the transaction/ business relationship can be proceeded with). This could include training on when and how to ascertain evidence and record source of wealth and beneficial ownership information if required.

d) Periodic review of the services offered by the legal professional and/or law firm, and the periodic evaluation of the AML/CFT framework applicable to the law firm or legal professional and the law firm's own AML/CFT procedures, to

determine whether the ML/TF risk has increased and adequate controls are in place to mitigate those increased risks.

e) Reviewing client relationships on a periodic basis to determine whether the ML/TF risk has increased.

Initial and ongoing CDD (R.10 and 22)

118. CDD measures should allow a legal professional to establish with reasonable certainty the true identity of each client. The legal professional's procedures should apply in circumstances where a legal professional is preparing for or carrying out[40] the specified activities listed in R.22 and include procedures to:

a) Identify and appropriately verify the identity of each client on a timely basis.

b) Identify the beneficial owner, and take reasonable measures to verify the identity of the beneficial owner on risk-sensitive basis such that the legal professional is reasonably satisfied that it knows who the beneficial owner is. The general rule is that clients should be subject to the full range of CDD measures, including the requirement to identify the beneficial owner in accordance with R.10. The purpose of identifying beneficial ownership is to ascertain those natural persons who exercise effective influence or control over a client, whether by means of ownership, voting rights or otherwise. Legal professionals should have regard to this purpose when identifying the beneficial owner. They may use a RBA to determine the extent to which they are required to verify the identity of beneficial owner, depending on the type of client, business relationship and transaction and other appropriate factors in accordance with R.10 and INR.10 as articulated in the following box. This information is in many circumstances critical to helping legal professionals avoid conflicts of interest with other clients.

Box 3. Beneficial ownership information obligations (see R.10, R.22 and INR.10)

R.10 sets out the instances where legal professionals will be required to take steps to identify and verify beneficial owners, including when there is a suspicion of ML/TF, when establishing business relations, or where there are doubts about the veracity of previously provided information. INR.10 indicates that the purpose of this requirement is two-fold: first, to prevent the unlawful use of legal persons and arrangements, by gaining a sufficient understanding of the client to be able to properly assess the potential ML/TF risks associated with the business relationship; and, second, to take appropriate steps to mitigate the risks. Legal professionals should have regard to these purposes when assessing what steps are reasonable to take to verify beneficial ownership, commensurate with the level of risk.[41]

At the outset of determining beneficial ownership, steps should be taken to identify how the immediate client can be identified. Legal professionals can

[40] See paragraphs 17-22 above for further information on when a legal professional would or would not be considered engaged in "preparing for" or "carrying out" transactions for clients, and hence when the requirements of R.22 would apply.

[41] For more information and guidance relating to beneficial ownership information please refer to AML/CFT 2013 Methodology Criteria 10.5 and 10.8-10.12.

verify the identity of a client by, for example meeting the client in person and then verifying their identity through the production of a passport/identity card and documentation confirming his/her address. Legal professionals can further verify the identity of a client on the basis of documentation or information obtained from reliable, publicly available sources (which are independent of the client).

A more difficult situation arises where there is a beneficial owner who is not the immediate client (e.g. in the case of companies and other entities). In such a scenario reasonable steps must be taken so that the legal professional is satisfied about the identity of the beneficial owner and takes reasonable measures to verify the beneficial owner's identity. This likely requires taking steps to understand the ownership and control of a separate legal entity that is the client and may include conducting public searches as well as by seeking information directly from the client. Legal professionals will likely need to obtain the following information for a client that is a legal entity:

a) the name of the company;
b) the company registration number;
c) the registered address and/ or principal place of business (if different);
d) the identity of shareholders and their percentage ownership;
e) names of the board of directors or senior individuals responsible for the company's operations;
f) the law to which the company is subject and its constitution; and
g) the types of activities and transactions in which the company engages.

To verify the information listed above, legal professional may use sources such as the following:

a) constitutional documents (such as a certificate of incorporation, memorandum and articles of incorporation/association);
b) details from company registers;
c) shareholder agreement or other agreements between shareholders concerning control of the legal person; and
d) filed audited accounts.

Legal professionals should adopt a RBA to verify beneficial owners of an entity. It is often necessary to use a combination of public sources and to seek further confirmation from the immediate client that information from public sources is correct and up-to-date or to ask for additional documentation that confirms the beneficial ownership and company structure.

The obligation to identify beneficial ownership does not end with identifying the first level of ownership, but requires reasonable steps to be taken to identify the beneficial ownership at each level of the corporate structure until an ultimate beneficial owner is identified.

c) Obtain appropriate information to understand the client's circumstances and business depending on the nature, scope and timing of the services to be provided including, where necessary, the source of funds of the client. This

information may be obtained from clients during the normal course of their instructions to legal professionals.

d) Conduct ongoing CDD on the business relationship and scrutiny of transactions throughout the course of that relationship to ensure that the transactions being conducted are consistent with legal professional's knowledge of the client, its business and risk profile, including where necessary, the source of funds. Ongoing due diligence ensures that the documents, data or information collected under the CDD process are kept up-to-date and relevant by undertaking reviews of existing records, particularly for higher-risk categories of clients. Undertaking appropriate CDD may also facilitate the accurate filing of STRs to an FIU where required, or to respond to requests for information from an FIU and law enforcement agencies.

119. The starting point is for legal professionals to assess the risks that the client may pose taking into consideration any appropriate risk variables (and any mitigating factors) before making a final determination to accept the client, reject the client, or request additional information. In many situations and in many jurisdictions this risk assessment is required to be documented and kept in the client's file. The legal professional should review this file as necessary, especially in a situation where the client looks to engage in a one-off or atypical transaction or where new red flags arise. The legal professional's risk assessment should inform the overall approach to CDD and appropriate verification. Legal professionals should reasonably determine the CDD requirements appropriate to each client, which may include:

a) **Standard CDD:** A standard level of CDD, generally to be applied to all clients to whom specified services are provided.

b) **Simplified CDD:** The standard level being reduced after consideration of appropriate risk variables, and in recognised lower risk scenarios, such as:

   i. Publicly listed companies traded on certain exchanges (and their majority owned subsidiaries). Although it should not be assumed that all publicly listed companies will qualify for simplified CDD, for example appropriate levels of reporting to the market will be a factor to take into account, as well as geographic risk factors.

   ii. Financial institutions and other businesses and professions (domestic or foreign) subject to an AML/CFT regime consistent with the FATF Recommendations.

   iii. Public administration or enterprises (other than those from countries that are being identified by credible sources as having inadequate AML/CFT systems, being the subject of sanctions, embargos or similar measures issued by the United Nations, having significant levels of corruption or other criminal activity or providing funding or support for terrorist activities, or having designated terrorist organisations operating within their country).

c) **Enhanced CDD:** An increased level of CDD for those clients that are reasonably determined by the legal professional to be of higher risk. This may be the result of the client's business activity, ownership structure, particular service offered including work involving higher risk countries or defined by applicable law or regulation as posing higher risk.

120. Where the legal professional is unable to comply with the applicable CDD requirements, they should not carry out the transaction nor commence business relations, or should terminate the business relationship and consider filing an STR in relation to the client.

121. A RBA means that legal professionals should perform varying levels of work according to the risk level. For example, where the client or the owner of the controlling interest is a public company that is subject to regulatory disclosure requirements, and that information is publicly available, fewer checks may be appropriate. In the case of trusts, foundations or similar legal entities where the beneficiaries are distinct from the legal owners of the entity, it will be necessary to form a reasonable level of knowledge and understanding of the classes and nature of the beneficiaries; the identities of the settlor, trustees or natural persons exercising effective control; and an indication of the purpose of the trust. Legal professionals will need to obtain a reasonable level of comfort that the declared purpose of the trust is in fact its true purpose.

122. The following box provides a non-exhaustive list of examples of standard, enhanced and simplified CDD:

Box 4. Examples of Standard/Simplified/Enhanced CDD measures (see also INR.10)

Standard CDD

- Identifying the client and verifying that client's identity using reliable, independent source documents, data or information
- Identifying the beneficial owner, and taking reasonable measures on a risk-sensitive basis to verify the identity of the beneficial owner, such that the legal professional is satisfied about the identity of beneficial owner. For legal persons and arrangements, this should include understanding the ownership and control structure of the client and gaining an understanding of the client's source of wealth and source of funds, where required
- Understanding and obtaining information on the purpose and intended nature of the business relationship
- Conducting ongoing due diligence on the business relationship and scrutiny of transactions undertaken throughout the course of that relationship to ensure that the transactions being conducted are consistent with the business and risk profile of the client, including, where necessary, the source of wealth and funds

Simplified CDD

- Limiting the extent, type or timing of CDD measures
- Obtaining fewer elements of client identification data
- Altering the type of verification carried out on client's identity
- Simplifying the verification carried out on client's identity

- Inferring the purpose and nature of the transactions or business relationship established based on the type of transaction carried out or the relationship established
- Verifying the identity of the client and the beneficial owner after the establishment of the business relationship
- Reducing the frequency of client identification updates in the case of a business relationship
- Reducing the degree and extent of ongoing monitoring and scrutiny of transactions

Enhanced CDD

- Obtaining additional client information, such as the client's reputation and background from a wider variety of sources before the establishment of the business relationship and using the information to inform the client risk profile
- Carrying out additional searches (e.g. internet searches using independent and open sources) to better inform the client risk profile (provided that the internal policies of legal professionals should enable them to disregard source documents, data or information, which is perceived to be unreliable)
- Where appropriate, undertaking further searches on the client or beneficial owner to specifically understand the risk that the client or beneficial owner may be involved in criminal activity
- Obtaining additional information about the client's source of wealth or funds involved to seek to ensure they do not constitute the proceeds of crime. This could include obtaining appropriate documentation concerning the source of wealth or funds
- Seeking additional information and, as appropriate, substantiating documentation, from the client about the purpose and intended nature of the transaction or the business relationship
- Increasing the frequency and intensity of transaction monitoring.
- Enhanced CDD may also include lowering the threshold of ownership (e.g. below 25%), to ensure complete understanding of the control structure of the entity involved. It may also include looking further than simply holdings of equity shares, to understand the voting rights of such holders.

Ongoing monitoring of clients and specified activities (R.10 and 23)

123. The degree and nature of ongoing monitoring by a legal professional will depend on the type of legal professional, and if it is a law firm, the size and geographic 'footprint' of the law firm, the ML/TF risks that the law firm has identified and the nature of the specified activity and services provided. In many instances, client information must already be monitored in this fashion to satisfy legal professionals' other obligations (e.g. legal, professional, or ethical) to both their clients and as part of their general regulatory

obligations. For example, legal professionals may need to have a full and up-to-date understanding of their clients' business to fully satisfy fiduciary duties towards their clients. In some jurisdictions, ethical or professional obligations may require a legal professional to discontinue their representation of a client on learning/knowing certain adverse information or in case of reasonable grounds to suspect that the client is involved in an ML/TF offence. Monitoring is often best achieved by individuals having contact with the client (either face-to-face or by other means of communication).

124. Ongoing monitoring of the business relationship should be carried out on a risk related basis, to ensure that legal professionals are aware of any changes in the client's identity and risk profile established at client acceptance. This requires an appropriate level of scrutiny of activity during the relationship, including enquiry into source of funds where necessary, to judge consistency with expected behaviour based on accumulated CDD information.

125. In larger law firms serving clients with a wide range of operations, legal professionals with regular contact with the client may be narrowly focused on one aspect of the client's business and/or need for specific advice. In these circumstances, it may be more effective to have screening processes and tools to identify potential risks that are generic to the client's overall business, and that can then be flagged for the attention of legal professionals who have the most client contact. However, monitoring does not require legal professionals to function as, or assume the role of, a law enforcement or investigative authority vis-a-vis the client. It rather refers to maintaining awareness throughout the course of work for a client to the possibility of ML/TF activity and/or changes in the clients activities/personnel and/or other changing risk factors.

126. Monitoring of these advisory relationships cannot be achieved solely by reliance on automated systems and whether any such systems would be appropriate will depend in part on the nature of a legal professional's practice and resources reasonably available to the legal professional. For example, a sole practitioner would not be expected to devote an equivalent level of resources as a large law firm; rather, the sole practitioner would be expected to develop appropriate monitoring systems and a RBA proportionate to the scope and nature of the practitioner's practice. A legal professional's advisory relationships may well be best monitored by the individuals having direct client contact being appropriately trained to identify and detect changes in the risk profile of a client. Where appropriate this should be supported by systems, controls and records within a framework of support by the firm (e.g. tailored training programs appropriate to the level of staff responsibility, the role each staff member plays in the AML/CFT process at the firm and the types and volumes of clients and transaction for which the firm provided services).

127. Legal professionals should assess the adequacy of any systems, controls and processes on a periodic basis. Monitoring programs should fall within the system and control framework developed to manage the risk of the firm. Certain jurisdictions may require that the results of the monitoring be documented.

128. The civil law notaries do not generally represent parties to a contract and therefore must maintain a fair position with regard to any duty to both parties.

Suspicious transaction reporting, tipping-off, internal control and higher-risk countries (R.23)

129. R.23 sets out obligations for legal professionals on reporting and tipping-off, internal controls and higher-risk countries as set out in R.20, R.21, R.18 and R.19.

Suspicious transaction reporting and tipping-off (R.20, R.21 and 23)

130. R.23 requires legal professionals to report suspicious transactions set out in R.20, when on behalf of, or for a client, they engage in a financial transaction in relation to the activities described in R.22. Subject to certain limitations, such reporting is not required if the relevant information is directly encompassed within a legitimate claim of professional secrecy or legal professional privilege. Legal professionals should be alert to these obligations in addition to separate requirements in their jurisdictions regarding tipping-off. These obligations, where they apply, can carry serious penalties when not properly complied with. As specified under INR.23, where legal professionals seek to dissuade a client from engaging in illegal activity, this does not amount to tipping-off.

131. Where a legal or regulatory requirement mandates the reporting of suspicious activity once a suspicion has been formed, a report must always be made promptly and, therefore, a RBA for the reporting of the suspicious activity under these circumstances is not applicable. STRs are not part of risk assessment, but rather reflect a response mechanism – typically to an FIU or SRB once a suspicion has been formed. Legal professionals have an obligation not to facilitate illegal activity, so if there are suspicions, they could contact their FIU or SRB for guidance, obtain independent legal advice, if necessary and do not provide services to that person/company and report the transaction or the attempted transaction. Legal professionals may be asked to advise a client on the client's own obligation to report suspicious activity. In doing so, the legal professional may become aware of the subject matter giving rise to the suspicion. In these circumstances, the legal professional will need to consider whether it should file an STR where required. In the context of an international law firm, which may have a global Money Laundering Reporting Officer (MLRO), where a reportable suspicion arises in relation to a client, the MLRO need not necessarily make a report to the FIU in each jurisdiction where a client has a relationship but, rather, in the jurisdictions with a nexus to the matter giving rise to the suspicion.

Internal controls (R.18 and 23)

132. Legal professionals differ significantly from financial institutions in terms of size. By contrast to most financial institutions, a significant number of legal professionals have only a few staff. This limits the resources that small businesses and professions can dedicate to the fight against ML/TF. For a number of legal professionals, a single person may be responsible for the functions of front office, back office, reporting, and senior management. This dimension of a legal professional's practice environment should be taken into account in designing a risk-based framework for internal controls systems. INR.18 specifies that the type and extent of measures to be taken for each of its requirements should be appropriate having regard to the size, nature and risk profile of the business.

133. The risk-based process must be a part of the internal controls of the legal professional or law firm. Legal professionals operate within a wide range of differing business structures, from sole practitioners to large, multi-national partnerships. In smaller legal practices, legal professionals' businesses tend to have a flat management structure and

accordingly, most or all of the principals (or partners) of the firm hold ultimate management responsibility. In other organisations, legal professionals employ corporate style organisational structures with tiered management responsibility. In both cases the principals or the managers are ultimately responsible for ensuring that the organisation maintains an effective internal control structure; regardless of the size of the legal practice, legal professionals are generally responsible for the actions of their partners and staff. Engagement by the principals and managers in AML/CFT is an important aspect of the application of the RBA since such engagement reinforces a culture of compliance, ensuring that staff adheres to the legal professional's policies, procedures and processes to manage effectively ML/TF risks.

134. The nature and extent of the AML/CFT controls, as well as meeting national legal requirements, need to be proportionate to the risk involved in the services being offered. In addition to other compliance internal controls, the nature and extent of AML/CFT controls will encompass a number of aspects, such as:

a) the nature, scale and complexity of a legal professional's business.

b) the diversity of a legal professional's operations, including geographical diversity.

c) the legal professional's client, service and activity profile.

d) the degree of risk associated with each area of the legal professional's operations.

e) the services being offered and the frequency of client contact (either by face-to-face meetings or by other means of communication).

135. Subject to the size and scope of the legal professional's organisation, the framework of risk-based internal controls should:

a) have appropriate risk management systems to determine whether a client, potential client, or beneficial owner is a PEP;

b) provide for adequate controls for higher risk clients and services as necessary (e.g. additional due diligence, obtaining information on the source of wealth and funds of a client, escalation to senior management or additional review and/or consultation by the legal professional or within a law firm);

c) provide increased focus on a legal professional's operations (e.g. services, clients and geographic locations) that are more vulnerable to abuse for ML/TF;

d) provide for periodic review of the risk assessment and management processes, taking into account the environment within which the legal professional operates and the services it provides;

e) designate personnel at an appropriate level who are responsible for managing AML/CFT compliance;

f) provide for an AML/CFT compliance function and review programme as appropriate given the scale of the organisation and the nature of the legal professional's practice;

g) inform the principals of compliance initiatives, identified compliance deficiencies and corrective action taken;

h) provide for programme continuity despite changes in management or employee composition or structure;

i) focus on meeting all regulatory measures for AML/CFT compliance, including record-keeping requirements and provide for timely updates in response to changes in regulations;

j) implement risk-based CDD policies, procedures and processes, including review of client relationships from time to time to determine the level of ML/TF risks;

k) provide for adequate supervision and support for staff activity that forms part of the organisation's AML/CFT programme;

l) incorporate AML/CFT compliance into job descriptions of relevant personnel;

m) for legal professionals that share a common arrangement in some way (e.g. alliances of law firms), to the extent possible, provide a common control framework;

n) adhere to country specific legislative requirements (such as residence requirements);

o) provide for policies and procedures to ensure staff awareness of STR filing requirements; and

p) implement a documented program of ongoing staff AML/CFT awareness and training.

136. Same measures and controls may often address more than one of the risk criteria identified, and it is not essential that a legal professional establish specific controls targeting each risk criterion.

137. Legal professionals should consider using reputable technology-driven solutions to minimise the risk of error and find efficiencies in their AML/CFT processes. As these solutions are likely to become more affordable, and more tailored to the legal profession as they continue to develop, this may be particularly important for smaller law firms that may be less able to commit significant resources of time to these activities. Under R.17, the ultimate responsibility for CDD measures should remain with legal professionals relying on the technology-driven solutions utilized.

138. At larger law firms, senior management should have a clear understanding of ML/TF risks to manage the affairs of the law firm and to ensure adequate procedures are put in place to identify, manage, control and mitigate risks effectively. The RBA to AML/CFT needs to be embedded in the culture of law firms and the legal profession generally.

Internal mechanisms to ensure compliance

139. Legal professionals (and where relevant senior management and the board of directors (or equivalent body)) should monitor the effectiveness of internal controls. If they identify any weaknesses in those internal controls, improved procedures should be designed.

140. The most effective tool to monitor the internal controls is a regular (typically at least annually) independent (internal or external) compliance review. If carried out internally, a staff member who may have a good working knowledge of the law firm's AML/CFT internal control framework, policies and procedures and is sufficiently senior to

challenge them should perform the review. The person conducting an independent review should not be the same person who designed or implemented the controls being reviewed. The compliance review should include a review of CDD documentation to confirm that staff are properly applying the law firm's procedures.

141. If the compliance review identifies areas of weakness and makes recommendations on how to improve the policies and procedures, then senior management should monitor how the law firm is acting on those recommendations.

142. Legal professionals should review their firm-wide risk assessments regularly and make sure that policies and procedures continue to target those areas where the ML/TF risks are highest.

Vetting and recruitment

143. Legal professionals should consider the skills, knowledge and experience of staff for AML/CFT both before they are appointed to their role and on an ongoing basis. The level of assessment should be proportionate to their role in the firm and the ML/TF risks they may encounter. Assessment may include criminal records checking and other forms of pre-employment screening such as credit reference checks and background verification (as permitted under national legislation) for key staff positions.

Education, training and awareness

144. R.18 requires that legal professionals provide their staff with AML/CFT training. For legal professionals, and those in smaller law firms in particular, such training may also assist with raising awareness of monitoring obligations, and may also satisfy some jurisdictions' continuing legal education obligations. A legal professional's commitment to having appropriate controls in place relies fundamentally on both training and awareness. This requires a firm-wide effort to provide all relevant legal professionals with at least general information on AML/CFT laws, regulations and internal policies.

145. Firms should provide targeted training for increased awareness by the legal professionals providing specified activities to higher risk clients or to legal professionals undertaking higher risk work. Training should also be targeted towards the role that individual legal professionals perform in the AML/CFT process. This could include false documentation training for those undertaking identification and verification duties, or training regarding red flags for those undertaking client/transactional risk assessment.

146. Training is not necessarily resource-intensive and it can take many forms. Training can include group study where one member of staff outlines to other staff, relevant guidance, credible sources of information on legal sector risk or firm policies and/or provides regular email updates.

147. Case studies (both fact-based and hypotheticals) are a good way of bringing the regulations to life and making them more comprehensible. Legal professionals must also be alert to the interaction with, and importance of legal professional privilege and professional secrecy in relation to AML/CFT laws in their particular jurisdictions.[42] Likewise, legal professionals should be aware of the scope of application of the legal professional

[42] See also the FATF Report on Vulnerabilities in the Legal Sector (2013), Chapter 4 "ML Typologies".

privilege and professional secrecy in their jurisdictions, i.e. the cases and scenarios that fall under its application and those outside its scope.

148. In line with a RBA, particular attention should be given to risk factors or circumstances occurring in the legal professional's own practice. In addition, competent authorities, SRBs and representative bodies for both common and civil law notaries and law societies should work with educational institutions to ensure that the curriculum addresses ML/TF risks. The same training should also be made available for students taking courses to train to become legal professionals. For example, law societies and bar associations should be encouraged to produce jurisdiction-specific guidance based on this Guidance (such as the ABA's Voluntary Good Practices Guidance), offer continuing legal education programs on AML/CFT and the RBA and large law firms should be encouraged to conduct in-house training programs on AML/CFT and the RBA.

149. The overall RBA and the various methods available for training and education gives legal professionals flexibility regarding the frequency, delivery mechanisms and focus of such training. Legal professionals should review their own staff and available resources and implement training programs that provide appropriate AML/CFT information that is:

a) tailored to the relevant staff responsibility (e.g. client contact or administration);

b) at the appropriate level of detail (e.g. considering the nature of services provided by the legal professional);

c) at a frequency suitable to the risk level of the type of work undertaken by the legal professional; and

d) used to assess staff knowledge of the information provided.

Higher-risk countries (R.19 and 23)

150. Consistent with R.19, legal professionals should apply enhanced CDD measures (also see box in paragraph 102 above), proportionate to the risks, to business relationships and transactions with clients from countries for which this is called for by the FATF.

Section IV- Guidance for supervisors

151. The RBA to AML/CFT aims to develop prevention or mitigation measures, which are commensurate with the risks identified. This applies to the way supervisory authorities allocate their resources. R.28 requires that legal professionals are subject to adequate AML/CFT regulation and supervision. Supervisors and SRBs have different roles across jurisdictions and this section should be read in the context of what is applicable for a specific jurisdiction. Whichever model of supervision (i.e. by a designated supervisor or a SRB) is adopted by a country, it should be effective.

152. In many jurisdictions, supervisors and SRBs take an active role in identifying ML/TF risks and may take a direct approach to regulating legal professionals' obligatory responsibilities both generally and with regards to AML/CFT. Supervisors or SRBs should identify the particularities of the sector, assess its risks, controls and procedures in order to efficiently allocate its resources. In particular, supervisors for legal professionals should clearly allocate responsibility for managing AML/CFT related activity, where they are also responsible for other regulatory areas.

153. Although a country may have a legal framework that does not fully accommodate the supervision of legal professionals in the manner described in this Section, the supervision of legal professionals in that country should nonetheless include as a minimum:

a) A requirement that legal professionals perform risk assessment at firm, client and transactional level.

b) A requirement that legal professionals perform appropriate risk-based CDD.

c) Procedures that ensure the system for licensing legal professionals prevents criminals from becoming legal professionals.

d) Procedures determined to ensure prompt investigation of legal professional misuse of client/ trust funds or alleged involvement in ML/TF schemes.

e) A requirement that legal professionals complete periodic continuing legal education in CDD and AML/CFT topics.

f) A requirement that legal professionals report suspicious transactions, comply with tipping-off and confidentiality requirements, internal controls requirements and higher-risk countries requirements.

g) A requirement that legal professionals adequately document risk assessment, CDD and other AML related decisions and processes undertaken.

Risk-based approach to supervision

154. R.28 requires that legal professionals are subject to adequate AML/CFT regulation and supervision for monitoring compliance. A RBA to AML/CFT means that the measures taken to reduce ML/TF are proportionate to the risks. Supervisors and SRBs should supervise more effectively by allocating resources to areas of higher ML/TF risk. While it is each country's responsibility to ensure there is an adequate national framework in place in relation to regulation and supervision of legal professionals, any relevant supervisors and

SRBs should have a clear understanding of the ML/TF risks present in the relevant jurisdiction.[43]

Supervisors and SRBs' role in supervision and monitoring

155. Countries can ensure that legal professionals are subject to effective oversight through the supervision performed by a SRB, provided that such an SRB can ensure that its members comply with their obligations to combat ML/TF. A SRB is a body representing a profession (e.g. legal professionals, notaries, other independent legal professionals, accountants or TCSPs) that has a role (either exclusive or in conjunction with other entities) in regulating the persons who are qualified to enter and practise in the profession. A SRB also may perform supervisory or monitoring functions (e.g. to enforce rules to ensure that high ethical and moral standards are maintained by those practising the profession).

156. Supervisors and SRBs should have appropriate powers to perform their supervisory functions (including powers to monitor and to impose effective, proportionate and dissuasive sanction), and adequate financial, human and technical resources. Supervisors and SRBs should determine the frequency and intensity of their supervisory or monitoring actions on a RBA, taking into account inherent ML/TF risks in the legal sector, and mitigation by legal professionals and their firms.

157. Countries should ensure that supervisors and SRBs are equipped in identifying and sanctioning non-compliance by its members. Countries should also ensure that SRBs are well-informed about the importance of AML/CFT supervision, including enforcement actions as needed.

158. Supervisors and SRBs should clearly allocate responsibility for managing AML/CFT related activity, where they are also responsible for other regulatory areas. Countries should also address the risk that AML/CFT supervision by SRBs could be hampered by conflicting objectives pertaining to the SRB's role in representing their members, while also being obligated to supervise them. If a SRB contains members of the supervised population, or represents those people, the relevant person should not continue to take part in the monitoring/ supervision of their practice/law firm to avoid conflicts of interest. This institutional conflict may be particularly relevant when it comes to enforcement, including sanctions, which should be sufficient to have a deterrent effect and also remove the benefits of non-compliance.

Background: national frameworks and understanding ML/TF risk- the role of countries

159. Countries should ensure that the extent to which a national framework allows legal professionals to apply a RBA should also reflect the nature, diversity and maturity of the sector, and its risk profile as well the ML/TF risks associated with individual legal professionals.

160. Access to information about ML/TF risks is essential for an effective RBA. Countries are required to take appropriate steps to identify and assess ML/TF risks on an ongoing basis in order to (a) inform potential changes to the country's AML/CFT regime, including changes to laws, regulations and other measures; (b) assist in the allocation and prioritisation of AML/CFT resources by competent authorities; and (c) make information

[43] See INR 28.1.

available for AML/CFT risk assessments conducted by legal professionals and the jurisdiction's national assessment of risk. Countries should keep the risk assessments up-to-date and should have mechanisms to provide appropriate information on the results to competent authorities, SRBs and legal professionals.[44] In situations where some legal professionals have limited capacity to identify ML/TF risks, countries should work with the sector to understand their risks.

161. Supervisors and SRBs should, as applicable draw on a variety of sources to identify and assess ML/TF risks. These may include, but will not be limited to, the jurisdiction's national risk assessments, supra-national risk assessments, domestic or international typologies and supervisory expertise, as well as FIU feedback. The necessary information can also be obtained through appropriate information-sharing and collaboration among AML/CFT supervisors, when there are more than one for different sectors (legal professionals, accountants and TCSPs).

162. Competent authorities may also consider undertaking a targeted sectoral risk assessment to get a better understanding of the specific environment in which legal professionals operate in the country and the nature of services provided by them.

163. Supervisors and SRBs should understand the level of inherent risk including the nature and complexity of services provided by the legal professional. Supervisors and SRBs should also consider the type of services the legal professional is providing as well as its size and business model (e.g. whether it is a sole practitioner), corporate governance arrangements, financial and accounting information, delivery channels, client profiles, geographic location and countries of operation. Supervisors and SRBs should also consider the controls legal professionals have in place (e.g. the quality of the risk management policy, the functioning of the internal oversight functions and the quality of oversight of any outsourcing and subcontracting arrangements). Supervisors should note that under the RBA, particularly in the legal profession sector, given their diversity in scale, functions and number, there may be valid reasons for differences among risks and controls. There is therefore no one-size-fits-all approach. In evaluating the adequacy of their RBA, supervisors should take into consideration the circumstances of these differences.

164. Supervisors and SRBs should seek to ensure that their supervised populations are fully aware of, and compliant with measures to identify and verify a client, the client's source of wealth and funds where required, along with measures designed to ensure transparency of beneficial ownership, as these are cross-cutting issues that affect several aspects of AML/CFT.

165. To further understand the vulnerabilities associated with beneficial ownership, with a particular focus on the involvement of professional intermediaries, supervisors should stay abreast of research papers published by international bodies.[45] Useful reference include the Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership published in July 2018.

166. Supervisors and SRBs should review their assessment of legal professionals' ML/TF risk profiles periodically, including when circumstances change materially or relevant new threats emerge and appropriately communicate this assessment to the legal professional community.

---

[44] See INR 1.3.

[45] Such as the FATF, the OECD, the WB, the IMF and the UNODC.

Mitigating and managing ML/TF risk

167. Supervisors and SRBs should take proportionate measures to mitigate and manage ML/TF risk. Supervisors and SRBs should determine the frequency and intensity of these measures based on their understanding of the inherent ML/TF risks. Supervisors and SRBs should consider the characteristics of the legal professionals, particularly their role as professional intermediaries. It is essential to have a clear understanding of the ML/TF risks: (a) present in the country; and (b) associated with the type of legal professionals and their clients, products and services.[46]

168. Supervisors and SRBs should take into account the risk profile of legal professionals when assessing the adequacy of internal controls, policies and procedures.[47]

169. Supervisors and SRBs should develop a means of identifying which legal professionals or classes of legal professionals are at the greatest risk of being used by criminals and communicate those findings to the legal professionals. This involves considering both the probability and impact of ML/TF risk.

170. Probability means the likelihood of ML/TF taking place as a consequence of the activity undertaken by legal professionals and the environment in which they operate. The risk can also vary depending on other factors:

a) service and product risk (the likelihood that products or services can be used for ML/TF);

b) client risk (the likelihood that clients' funds may have criminal origins);

c) nature of transactions (e.g. frequency, volume and counterparties);

d) geographical risk (whether the legal professional, its clients or other offices perform specified activities in riskier locations); and

e) other indicators of risk are based on a combination of objective factors and experience, such as the supervisor's wider work with the legal professional as well as information on legal professional's compliance history, complaints about the legal professional or about the quality of the legal professional's internal controls. Other such factors may include information from government/law enforcement sources, whistle-blowers or negative news reports in credible media, particularly those related to predicate offences for ML/TF or to financial crimes.

171. In adopting a RBA to supervision, supervisors may consider allocating supervised entities sharing similar characteristics and risk profiles into groupings for supervision purposes. Examples of characteristics and risk profiles could include the size of business, type of clients serviced and geographic areas of activities. The setting up of such groupings could allow supervisors to take a comprehensive view of the sector, as opposed to an approach where the supervisors concentrate on the individual risks posed by the individual firms. If the risk profile of a legal professional within a grouping changes, supervisors may reassess the supervisory approach, which may include removing the firm from the grouping.

[46] See INR 28.2.
[47] See INR 28.3

172. Supervisors and SRBs should also consider the impact, (i.e. the potential harm caused) if the legal professional or firm facilitates, unwittingly or otherwise, ML/TF. A small number of legal professionals may cause a high level of harm, including reputational harm to the profession. This can depend on:

a) size (i.e. turnover), number and type of clients, number of office locations, value of transactions, and

b) links or involvement with other businesses (which could affect the susceptibility to being involved in 'layering' activity, e.g. concealing the origin of the transaction with the purpose to legalise the asset).

173. Supervisors and SRBs should update the risk assessment on an ongoing basis. The result from the assessment will help determine the resources the supervisor will allocate to the supervision of the legal professionals.

174. Supervisors or SRBs should consider whether legal professionals meet the ongoing requirements for continued participation in the profession as well as assessments of competence and of fitness and character. This will include whether the legal professional meets expectations related to AML/CFT compliance. This will take place both when a supervised entity joins the profession, and on an ongoing basis thereafter.

175. If a jurisdiction chooses to classify an entire sector as higher risk, it should be possible to differentiate among categories of legal professionals based on various factors such as their client base, countries they deal with and applicable AML/CFT controls. Other determinative factors may include (a) whether the legal professional conducts litigation or transactional business; (b) whether the clients of the legal professional's firm are in the private or public sector; or (c) whether the legal professional's business is internationally or domestically focused.

176. Supervisors and SRBs should acknowledge that in a risk-based regime, not all legal professionals will adopt identical AML/CFT controls and that an isolated incident where the legal professional is part of an illegal transaction unwittingly does not necessarily invalidate the integrity of a legal professional's AML/CFT controls. At the same time, legal professionals should understand that a flexible RBA does not exempt them from applying effective AML/CFT controls.

Supervision of the RBA

Licensing or Registration

177. R.28 requires a country to ensure that regulated entities including legal professionals are subject to regulatory and supervisory measures to ensure compliance by the profession with AML/CFT requirements.

178. R.28 requires the supervisor or SRB to take the necessary measures to prevent criminals or their associates from being professionally accredited or holding or being the beneficial owner of a significant or controlling interest in an accredited legal professional entity (where this is permitted under national law and regulations) or holding a management function in a legal professional entity. This may be achieved through the evaluation of these persons through a "fit and proper" test.

179. A licensing or registration mechanism is one of the means to identify legal professionals to whom the regulatory and supervisory measures, including the "fit and

proper" test should be applied. It also enables the identification of the population of legal professionals, for the purposes of assessing and understanding the ML/TF risks for the country, and the action that should be taken to mitigate them in accordance with R.1. Not all jurisdictions take this approach, and the application and precise objectives of licensing and registration differ among the jurisdictions that do use these mechanisms.

180. Licensing or registration provides a supervisor or SRB with the means to fulfil a "gatekeeper" role over who can enter a profession in which many individuals will be required to undertake the specified activities set forth in R.22. Not all accredited legal professionals who are appropriately licensed or registered may be performing the specified activities under R.22. There is no requirement for separate licensing or registration of legal professionals on the basis of their practice areas under the FATF Recommendations. Supervisors and SRBs should ensure that their supervisory efforts are directed at legal professionals whose practices involve the specified activities under R.22. Licensing or registration should also ensure that upon qualification, legal professionals are subject to AML/CFT compliance monitoring.

181. As appropriate, the supervisor or SRB should actively identify individuals and businesses who should be supervised by using intelligence from other competent authorities (e.g. FIUs, company registry, or tax authority), information from financial institutions and DNFBPs, complaints by the public and open source information from advertisements and business and commercial registries, or any other sources that indicates that there are unsupervised individuals or businesses providing the specified activities under R.22.

182. Licensing or registration frameworks should define the activities that are subject to licensing or registration, prohibit unlicensed or unregistered individuals or businesses providing these activities and set out measures for both refusing licences or registrations and for removing "bad actors".

183. The terms "licensing" or "registration" are not interchangeable. Licensing regimes generally tend to operate over financial institutions and impose mandatory minimum requirements based upon Core Principles on issues such as capital, governance, and resourcing to manage and mitigate prudential, conduct as well as ML/TF risks on an on-going basis. Some jurisdictions have adopted similar licensing regimes for legal professionals, generally where legal professionals carry out trust and corporate services, to encompass aspects of conduct requirements in managing the higher level of ML/TF risks that have been identified in that sector.

184. A jurisdiction may have a registration framework over the entire DNFBP sector, including legal professionals or have a specific registration framework for each constituent of a DNFBP. Generally, a supervisor or SRB carries out the registration function.

185. The supervisor or SRB should ensure that requirements for licensing or registration and the process for applying are clear, objective, publicly available and consistently applied. Determination of the licence or registration should be objective and timely. A SRB could be responsible for both supervision and for representing the interest of its members. The SRB should ensure that registration decisions are taken separately and independently from its activities regarding member representation.

Fit and proper tests

186. A fit and proper test provides a possible mechanism for a supervisor or SRB to take the necessary measures to prevent criminals or their associates from owning, controlling or holding a

management function in a legal professional. Such tests are used in relation to legal professionals in some jurisdictions and may be used by supervisors or SRBs to ensure compliance with AML/CFT requirements.

187. In accordance with R.28, the supervisor or SRB should establish the integrity of every beneficial owner, controller and individual holding a management function in a legal professional.

188. In some jurisdictions, a "fit and proper test" forms a fundamental part of determining whether to license or register the applicant and whether on an ongoing basis the licensee or registrant (including its owners and controllers, where applicable) remains fit and proper to continue in that role. The initial assessment of an individual's fitness and propriety is a combination of obtaining information from the individual and corroborating elements of that information against independent credible sources to determine whether the individual is fit and proper to hold that role.

189. The process for determining fitness and propriety generally requires the applicant to complete a questionnaire. The questionnaire could gather personal identification information, residence and employment history, and require disclosure by the applicant of any convictions or adverse judgements, including pending prosecutions and convictions. Elements of this information should be corroborated to establish the bona fides of an individual. Such checks could include enquiries about the individual with law enforcement agencies and other supervisors, or screening the individual against independent electronic search databases. The personal data collected should be kept confidential.

190. The supervisor or SRB should also ensure that on an ongoing basis that those holding or being the beneficial owner of significant or controlling interest in and individuals holding management functions are fit and proper. A fit and proper test should apply to new owners, controllers and individuals holding a management function. The supervisor or SRB should consider reviewing the fitness and propriety of these individuals arising from any supervisory findings, receipt of information from other competent authorities; or open source information indicating significant adverse developments.

Guarding against "brass-plate" operations

191. The supervisor or SRB should ensure that its licensing or registration requirements require the applicant to have a meaningful relationship with the country. Depending on the circumstances, a business with only staff who do not possess the professional requirements of a legal professional might not be licensed or registered.

192. A supervisor or SRB should consider the ownership and control structure of the applicant to make a licensing or registration decision, where applicable. Factors to take into account could include consideration of where the beneficial owners and controllers reside and the type and quality of its management, including directors, managers and compliance officers.

193. The supervisor or SRB should consider whether the ownership and control structure of law firms unduly hinders its identification of the beneficial owners and controllers or presents obstacles to applying effective supervision.

Monitoring and supervision

194. Supervisors and SRBs should take measures to effectively monitor legal professionals providing specified legal services through on-site and off-site supervision. The nature of this monitoring will depend on the risk profiles prepared by the supervisor or SRB and the connected risk-based approach. Supervisors and SRBs may choose to adjust:

a) the level of checks required to perform their licensing/registration function: where the ML/TF risk associated with the sector is low, the opportunities for ML/TF associated with a particular business activity may be limited, and approvals may be made on a review of basic documentation. Where the ML/TF risk associated with the sector is high, supervisors and SRBs may ask for additional information.

b) the type of on-site or off-site AML/CFT supervision: supervisors and SRBs may determine the correct mix of on-site and off-site supervision of legal professionals. Off-site supervision may involve analysis of annual independent audits and other mandatory reports, identifying risky intermediaries (i.e. on the basis of the size of the firms, involvement in cross-border activities, or specific business sectors), automated scrutiny of registers to detect missing beneficial ownership information and identification of persons responsible for the filing. It may also include undertaking thematic reviews of the sector, making compulsory the periodic information returns from firms. Off-site supervision alone may not be appropriate in higher risk situations. On-site inspections may involve reviewing AML/CFT internal policies, controls and procedures, interviewing members of senior management, compliance officer and other relevant staff, considering gatekeeper's own risk assessments, spot checking CDD documents and supporting evidence, looking at reporting of ML/TF suspicions in relation to clients, legal professionals and other matters, which may be observed in the course of an on-site visit and where appropriate, sample testing of reporting obligations.

c) the frequency and nature of ongoing AML/CFT supervision: supervisors and SRBs should proactively adjust the frequency of AML/CFT supervision in line with the risks identified and combine periodic reviews and ad hoc AML/CFT supervision as issues emerge (e.g. as a result of whistleblowing, information from law enforcement, or other supervisory findings resulting from legal professionals' inclusion in thematic review samples).

d) the intensity of AML/CFT supervision: supervisors and SRBs should decide on the appropriate scope or level of assessment in line with the risks identified, with the aim of assessing the adequacy of legal professionals' policies and procedures that are designed to prevent them from being abused. Examples of more intensive supervision could include: detailed testing of systems and files to verify the implementation and adequacy of the legal professionals' risk assessment, CDD, reporting and record-keeping policies and processes, internal auditing, interviews with operational staff, senior management and the Board of Directors and AML/CFT assessment in particular lines of business.

195. Supervisors and SRBs should use their findings to review and update their ML/TF risk assessments and, where necessary, consider whether their approach to AML/CFT supervision and the existing AML/CFT rules and guidance remain adequate. Whenever

appropriate, and in compliance with relevant confidentiality requirements, these findings should be communicated to legal professionals to enable them to enhance their RBA.

196. Record keeping and quality assurance are important, so that supervisors can document and test the reasons for significant decisions relating to AML/CFT supervision. Supervisors should have an appropriate information retention policy and be able to easily retrieve information while complying with the relevant data protection legislation. Record keeping is crucial and fundamental to the supervisors' work. Undertaking adequate quality assurance is also fundamental to the supervisory process to ensure decision-making/sanctioning is consistent across the supervised population.

Enforcement

197. R.28 requires supervisors or SRB to have adequate powers to perform their functions, including powers to monitor compliance by legal professionals. R.35 requires countries to have the power to impose sanctions, whether criminal, civil or administrative, on DNFBPs, to include legal professionals when providing the services outlined in R.22(d). Sanctions should be available for the directors and senior management of the firm when a legal professional fails to comply with requirements.

198. Supervisors and SRBs should use proportionate actions, including a range of supervisory interventions and corrective actions to ensure that any identified deficiencies are addressed in a timely manner. Sanctions may range from informal or written warning, censure and reprimand to punitive measures (including disbarment and criminal prosecutions where appropriate) for more egregious non-compliance, as identified weaknesses can have wider consequences. Generally, systemic breakdowns or significantly inadequate controls will result in more severe supervisory response.

199. Enforcement by supervisors and SRBs should be proportionate while having a deterrent effect. Supervisors and SRBs should have (or should delegate to those who have) sufficient resources to investigate and monitor non-compliance. Enforcement should aim to remove the benefits of non-compliance.

Guidance

200. Supervisors and SRBs should communicate their regulatory expectations. This should be done through a consultative process after meaningful engagement with relevant stakeholders, including legal professionals. This guidance may be in the form of high-level requirements based on desired outcomes, risk-based rules, and information about how supervisors interpret relevant legislation or regulation, or more detailed guidance about how particular AML/CFT controls are best applied. This could include guidance to clarify the interpretation and application of professional privilege and secrecy principle in the context of the nature of services provided by legal professionals.

201. Guidance issued to legal professionals should also discuss ML/TF risk within their sector and outline ML/TF indicators (i.e. red flags) and methods of risk assessment to help them identify suspicious transactions and activity. All such guidance should preferably be consulted on, where appropriate, and drafted in ways that are appropriate to the context of the role of supervisors and SRBs in the relevant jurisdiction.

202. Where supervisors' guidance remains high-level and principles-based, this may be supplemented by further guidance written by the legal profession, which may cover operational and practical issues, and be more detailed and explanatory in nature. Training

events may also provide an effective means to ensure legal professionals awareness and compliance with AML/CFT responsibilities. Where supervisors cooperate to produce combined guidance across sectors, supervisors should ensure this guidance adequately addresses the diversity of roles that come within the guidance's remit, and that such guidance provides practical direction to all its intended recipients. The private sector guidance should be consistent with national legislation and with any guidelines issued by competent authorities with regard to the legal profession and be consistent with all other legal requirements and obligations.

203. Supervisors should consider communicating with other relevant domestic supervisory authorities to secure a coherent interpretation of the legal obligations and to minimise disparities across sectors (such as legal professionals, accountants and TCSPs). Multiple guidance should not create opportunities for regulatory arbitrage. Relevant supervisory authorities should consider preparing joint guidance in consultation with the relevant sectors, while recognising that in many jurisdictions legal professionals will consider that separate guidance targeted at the legal profession will be the most appropriate and effective form.

204. Information and guidance should be provided by supervisors in an up-to-date and accessible format. It could include sectoral guidance material, findings of thematic reviews, training events, newsletters, internet-based material, oral updates on supervisory visits, meetings and annual reports.

Training

205. Supervisors and SRBs should ensure that their staff, and other relevant employees are trained to assess the quality of ML/TF risk assessments and to consider the adequacy, proportionality, effectiveness, and efficiency of the AML/CFT policies, procedures and internal controls. It is recommended that the training has a practical basis/dimension. Supervisory staff should recognise that in implementing the RBA, legal professionals should make reasonable judgements for their particular services and activities. This may mean that no two legal professionals and no two firms are likely to adopt the same detailed practices.

206. Training should allow supervisory staff to form sound judgments about the quality of the risk assessments made by legal professionals and the adequacy and proportionality of AML/CFT controls of legal professionals. It should also aim at achieving consistency in the supervisory approach at a national level, in cases where there are multiple competent supervisory authorities or when the national supervisory model is devolved or fragmented.

Endorsements

207. Supervisors should avoid mandating the use of AML/CFT systems, tools or software of any third party commercial providers to avoid conflicts of interest in the effective supervision of firms.

Information exchange

208. Supervisors should encourage the information exchange between the public and private sector and within private sector (e.g. between financial institutions and legal professionals) is important for combating ML/TF. Information sharing and intelligence sharing arrangements between supervisors and public authorities (such as Financial

Intelligence Units and law enforcement), where applicable should be robust, secure and subject to compliance with national legal requirements.

209. The type of information that could be shared between the public and private sectors include:

a) ML/TF risk assessments;

b) Typologies (i.e. case studies) of how money launderers or terrorist financers have misused legal professionals;

c) feedback on STRs and other relevant reports;

d) targeted unclassified intelligence. In specific circumstances, and subject to appropriate safeguards such as confidentiality agreements, it may also be appropriate for authorities to share targeted confidential information with legal professionals as a class or individually; and

e) countries, persons or organisations whose assets or transactions should be frozen pursuant to targeted financial sanctions as required by R.6.

210. Domestic co-operation and information exchange between FIU and supervisors of legal professionals and among competent authorities including law enforcement, intelligence, FIU, tax authorities, supervisors and SRBs is also important for effective monitoring/supervision of the sector. Such co-operation and co-ordination may help avoid gaps and overlaps in supervision and ensure sharing of good practices and findings. Such intelligence should also inform a supervisor's risk-based approach to supervisory assurance. Intelligence about active misconduct investigations and completed cases between supervisors and law enforcement agencies should also be encouraged where appropriate. When sharing information, protocols and safeguards should be implemented in order to protect personal data.

211. Cross border information sharing of authorities and private sector with their international counterparts is of importance in the legal sector, taking into account the multi-jurisdictional reach of many legal professionals.

Supervision of beneficial ownership and source of funds/wealth requirements

212. The FATF Recommendations require competent authorities to have access to adequate, accurate and timely information on the beneficial ownership and control of legal persons (R.24). In addition, countries must take measures to prevent the misuse of legal arrangements for ML/TF, in particular ensuring that there is adequate, accurate and timely information on express trusts (R.25). Implementation of the FATF Recommendations on beneficial ownership has proven challenging. As a result, the FATF developed the *FATF Guidance on Transparency and Beneficial Ownership* to assist countries in their implementation of R.24 and R.25, as well as R.1 as it relates to understanding the ML/TF risks of legal persons and legal arrangements. The FATF and Egmont Group also published the Report on Concealment of Beneficial Ownership in July 2018 which identified issues to help address the vulnerabilities associated with the concealment of beneficial ownership.

213. R.24 and R.25 require countries to have mechanisms to ensure that information provided to registries is accurate and updated on a timely basis and that beneficial ownership information is accurate and current. To determine the adequacy of a system for monitoring and ensuring compliance, countries should have regard to the risk of

AML/CFT in given businesses (i.e. if there is a proven higher risk then higher monitoring measures should be taken). Legal professionals must, however, be cautious in blindly relying on the information contained in registries. Ongoing monitoring is important during a relationship to detect unusual and potentially suspicious transactions as a result of a change in beneficial ownership, as registries are unlikely to provide such information on a dynamic basis.

214. Those responsible for company formation and the creation of legal arrangements fulfil a key gatekeeper role to the wider financial community through the activities they undertake in the formation of legal persons and legal arrangements or in their management and administration. The guidance in relation to beneficial ownership information in this section is intended for legal professionals who are involved in such arrangements by acting in the capacity of a formation agent, company director, company secretary, office for service, nominee or other similar capacity.

215. Legal professionals are also required to undertake and document adequate risk assessment of clients/transactions to fully understand the nature of the underlying clients' business activity. Evidence could include business plans/governance documents, financial statements and company registry filings.

216. As DNFBPs, legal professionals are required to apply CDD measures to beneficial owners of legal persons and legal arrangements to whom they are providing advice or formation services. In some countries, a legal professional may be required for registering a legal person and will be responsible for providing basic and/or beneficial ownership information to the registry. A number of countries have notarial systems where a notary will attest to the accuracy of registry filings.

217. In their capacity as company directors, trustees or foundation officials of these legal persons and legal arrangements, legal professionals often represent these legal persons and legal arrangements in their dealings with other financial institutions and DNFBPs that are providing banking or audit services to these types of client.

218. These financial institutions and other DNFBPs may request the CDD information collected and maintained by legal professionals, who because of their role as director or trustee, will act as the principal point of contact with the legal person or legal arrangement. These financial institutions and other DNFBPs may never meet the beneficial owners of the legal person or legal arrangement.

219. Under R.28, countries should ensure that legal professionals are subject to effective systems for monitoring and ensuring compliance with AML/CFT requirements, which includes identifying the beneficial owner/s and taking reasonable measures to verify them. R.24 and R.25, which deal with transparency of beneficial ownership of legal persons and legal arrangements, require countries to have mechanisms for ensuring that adequate, accurate and up-to-date information is available on a timely basis on these legal entities.

220. In accordance with R.28, legal professionals should be subject to risk-based supervision by a supervisor or SRB covering the beneficial ownership and record-keeping requirements of R.10 and R.11. The supervisor or SRB should have the supervisory framework, which can help in ascertaining that accurate and current basic and beneficial ownership information on legal persons and legal arrangements is maintained and will be available on a timely basis to competent authorities.

221. The supervisor or SRB should analyse the adequacy of the procedures and the controls, which legal professionals have established to identify and record the beneficial owner. In addition, they should undertake sample testing of client records on a representative basis to gauge the effectiveness of the application of those measures and the accessibility of accurate beneficial ownership information.

222. During on-site and offsite inspections, the supervisor or SRB should examine the policies, procedures and controls that are in place for on-boarding of new clients to establish what information and documentation is required where the client is a natural person or legal person or arrangement. The supervisor or SRB should verify the adequacy of these procedures and controls to identify beneficial owners to understand the ownership and control structure of these legal persons and arrangements and to ascertain the business activity. For example, self-declaration on beneficial ownership provided by the client without any other mechanism to verify the information may not be adequate in all cases.

223. Sample testing of records will assist the supervisor or SRB in determining whether controls are effective for the accurate identification of beneficial ownership, accurate disclosure of that information to relevant parties and for establishing if that information is readily available. The extent of testing will be dependent on risk but the records selected should reflect the profile of the client base and include both new and existing clients.

224. The supervisor or SRB should consider the measures the legal professional has put in place for monitoring changes in the beneficial ownership of legal persons and legal arrangements to whom they provide services to ensure that beneficial ownership information is accurate and current and to determine how timely updated filings are made, where relevant to a registry.

225. During examinations, the supervisor or SRB should consider whether to verify the beneficial ownership information available on the records of the legal professional with that held by the relevant registry, if any. The supervisor or SRB may also consider information from other competent authorities such as FIUs, public reports and information from other financial institutions or DNFBPs, to verify the efficacy of the legal professional's controls.

Sources of funds and wealth

226. Legal professionals should be subject to risk-based supervision by a supervisor or SRB covering the requirements to identify and evidence the source of funds and source of wealth for higher risk clients to whom they provide services. The supervisor or SRB should have the supervisory framework, which can help in ascertaining that accurate and current information on sources of funds and wealth is properly evidenced and available on a timely basis to competent authorities. The supervisor or SRB should analyse the adequacy of the procedures and the controls, which legal professionals have established to identify and record sources of wealth in arrangements.

Nominee arrangements

227. A nominee director is a person who has been appointed to the Board of Directors of the legal person who represents the interests and acts in accordance with instructions issued by another person, usually the beneficial owner.

228. A nominee shareholder is a natural or legal person who is officially recorded in the register of members and shareholders of a company as the holder of a certain number of specified shares, which are held on behalf of another person who is the beneficial owner. The shares may be held on trust or through a custodial agreement.

229. In a number of countries, legal professionals act or arrange for another person (either an individual or corporate) to act as a director and act or arrange for another person (either an individual or corporate) to act as a nominee shareholder for another person as part of their professional services. In accordance with R.24, one of the mechanisms to ensure that nominee shareholders and directors are not misused is by subjecting these legal professionals to licensing and recording their status in company registries. Countries may rely on a combination of measures in this respect.

230. There are legitimate reasons for a legal professional to act as or provide directors to a legal person or act or provide nominee shareholders. These may include the settlement and safekeeping of shares in listed companies where post traded specialists act as nominee shareholders. However, nominee director and nominee shareholder arrangements can be misused to hide the identity of the true beneficial owner of the legal person. There may be individuals prepared to lend their name as a director or shareholder of a legal person on behalf of another without disclosing the identity of the person from whom they will take instructions from or whom they represent. They are sometimes referred to as "strawmen".

231. Nominee directors and nominee shareholders can create obstacles to identifying the true beneficial owner of a legal person, particularly where the status is not disclosed. This is because it will be the identity of the nominee that is disclosed in the corporate records of the legal person held by a registry and in the company records at its registered office. Company law in various countries does not recognise the status of a nominee director because in law it is the directors of the company who are liable for its activities and the directors have a duty to act in the best interest of the company.

232. The supervisor or SRB should be aware that undisclosed nominee arrangements may exist. They should consider whether undisclosed nominee arrangements would be identified and addressed during their on-site and offsite inspections and examination of the policies, procedures, controls and client records of the legal professional, including the CDD process and ongoing monitoring by the legal professional.

233. An undisclosed nominee arrangement may exist where there are the following (non-exhaustive) indicators:

a) the profile of a director or shareholder is inconsistent with the activities of the company;

b) the individual holds numerous appointments to unconnected companies;

c) a director's or shareholder's source of wealth is inconsistent with the value and nature of the assets within the company;

d) funds into and out of the company are sent to, or received from unidentified third party/ies;

e) the directors or shareholders are accustomed to acting on instruction of another person; and

f) requests or instructions are subject to minimal or no scrutiny and/or responded to extremely quickly without challenge by the individual/s purporting to act as the director/s.

Annex 1: Beneficial ownership information in relation to a trust or other legal arrangements to whom a legal professional provides services

1. Taking a RBA, the amount of information that should be obtained by the legal professional will depend on whether the legal professional is establishing or administering the trust, company or other legal entity or is acting as or providing a trustee or director of the trust, company or other legal entity. In these cases, a legal professional will be required to understand the general purpose behind the structure and the source of funds in the structure in addition to being able to identify the beneficial owners and controlling persons. A legal professional who is providing other services (e.g. acting as registered office) to a trust, company or other legal entity will be required to obtain sufficient information to enable it to be able to identify the beneficial owners and controlling persons of the trust, company or other legal entity.

2. A legal professional that is not acting as trustee may, in appropriate circumstances, rely on a synopsis prepared by another legal professional or accountant or TCSP providing services to the trust or relevant extracts from the trust deed itself to enable the legal professional to identify the settlor, trustees, protector (if any), beneficiaries or natural persons exercising effective control. This is in addition to the requirement, where appropriate, to obtain evidence to verify the identity of such persons as discussed below.

In relation to a trust

3. As described above, depending on the services being provided to the trust, a legal professional should have policies and procedures in place to identify the following and verify their identity using reliable, independent source documents, data or information (provided that the legal professional's policies should enable it to disregard source documents, data or information that are perceived to be unreliable) as described in more detail below:

i. the settlor;

ii. the protector;

iii. the trustee(s), where the legal professional is not acting as trustee;

iv. the named beneficiaries or class of beneficiaries, and

v. any other natural person actually exercising effective control over the trust.

Settlor

a) A settlor is generally any person (or persons) by whom the trust is made. A person is a settlor if he or she has provided (or has undertaken to provide) property or funds directly or indirectly for the trust. This requires there to be an element of bounty (i.e. the settlor must be intending to provide some form of benefit rather than being an independent third party transferring something to the trust for full consideration).

b) A settlor may or may not be named in the trust deed. Legal professionals should have policies and procedures in place to identify and verify the identity of the real economic settlor.

c) A legal professional establishing on behalf of a client or administering a trust, company or other legal entity or otherwise acting as or providing a trustee or director of a trustee, company or other legal entity should have policies and procedures in place (using a RBA) to identify the source of funds in the trust, company or other legal entity.

d) It may be more difficult (if not impossible) for older trusts to identify the source of funds, where contemporaneous evidence may no longer be available. Evidence of source of funds may include reliable independent source documents, data or information, share transfer forms, bank statements, deeds of gift or letter of wishes.

e) Where assets have been transferred to the trust from another trust, it will be necessary to obtain this information for both transferee and transferor trust.

Beneficiaries

a) Legal professionals should have policies and procedures in place, adopting a RBA to enable them to form a reasonable belief that they know the true identity of the beneficiaries of the trust, and taking reasonable measures to verify the identity of the beneficiaries, such that the legal professionals are satisfied that they know who the beneficiaries are. This does not require the legal professional to verify the identity of all beneficiaries using reliable, independent source documents, data or information but the legal professionals should at least identify and verify the identity of beneficiaries who have current fixed rights to distributions of income or capital or who actually receive distributions from the trust (e.g. a life tenant).

b) Where the beneficiaries of the trust have no fixed rights to capital and income (e.g. discretionary beneficiaries), legal professionals should obtain information to enable them to identify the named discretionary beneficiaries (e.g. as identified in the trust deed).

c) Where beneficiaries are identified by reference to a class (e.g. children and issue of a person) or where beneficiaries are minors under the law governing the trust, although legal professionals should satisfy themselves that these are the intended beneficiaries (e.g. by reference to the trust deed), they are not obliged to obtain additional information to verify the identity of the individual beneficiaries referred to in the class unless or until the trustees determine to make a distribution to such beneficiary.

d) In some trusts, named individuals only become beneficiaries on the happening of a particular contingency (e.g. on attaining a specific age or on the death of another beneficiary or the termination of the trust period). In this case, a legal professional is not required to obtain additional information to verify the identity of such contingent beneficiaries unless or until the contingency is satisfied or until the trustees decide to make a distribution to such a beneficiary.

e) A legal professional who administers the trust or company or other legal entity owned by a trust or otherwise provides or acts as trustee or director to the trustee, company or other legal entity should have procedures in place so that there is a requirement to update the information provided if named beneficiaries are added or removed from the class of beneficiaries, or beneficiaries receive distributions or benefits for the first time after the

information has been provided, or there are other changes to the class of beneficiaries.

f) A legal professional is not obliged to obtain other information about beneficiaries other than to enable the legal professional to satisfy itself that it knows who the beneficiaries truly are or identify whether any named beneficiary or beneficiary who has received a distribution from a trust is a PEP.

Natural person exercising effective control

a) A legal professional providing services to the trust should have procedures in place to identify any natural person exercising effective control over the trust.

b) For these purposes "control" means a power (whether exercisable alone or jointly with another person or with the consent of another person) under the trust instrument or by law to:

   i. dispose of or invest (other than as an investment manager) trust property;

   ii. direct, make or approve trust distributions;

   iii. vary or terminate the trust;

   iv. add or remove a person as a beneficiary or to or from a class of beneficiaries; and/or

   v. appoint or remove trustees.

c) A legal professional who administers the trust or otherwise acts as trustee must, in addition, also obtain information to satisfy itself that it knows the identity of any other individual who has power to give another individual "control" over the trust; by conferring on such individual powers as described in paragraph (b) above.

Corporate settlors and beneficiaries

4. These examples are subject to the more general guidance on what information should be obtained by the legal professional to enable it to identify settlors and beneficiaries. It is not intended to suggest that a legal professional must obtain more information about a beneficiary that is an entity where it would not need to obtain such information if the beneficiary is an individual.

   a) In certain cases, the settlor, beneficiary, protector or other person exercising effective control over the trust may be a company or other legal entity. In such a case, a legal professional should have policies and procedures in place to enable it to identify (where appropriate) the beneficial owner or controlling person in relation to the entity.

   b) In the case of a settlor which is a legal entity, a legal professional should satisfy itself that it has sufficient information to understand the purpose behind the formation of the trust by the entity. For example, a company may establish a trust for the benefit of its employees or a legal entity may act as nominee for an individual settlor or on the instructions of an individual who has provided funds to the legal entity for this purpose. In the case of a legal entity acting as nominee for an individual settlor or on the instructions of an individual, the legal professional should take steps to satisfy itself as to the identity of the economic settlor of the trust (i.e. the person who has provided funds to the

legal entity to enable it to settle funds into the trust) and the controlling persons in relation to the legal entity at the time the assets were settled into trust. If the corporate settlor retains powers over the trust (e.g. a power of revocation), the legal professional should satisfy itself that it knows the current beneficial owners and controlling persons of the corporate settlor and understands the reason for the change in ownership or control.

c) In the case of a beneficiary which is an entity (e.g. a charitable trust or company), a legal professional should satisfy itself that it understands the reason behind the use of an entity as a beneficiary. If there is an individual beneficial owner of the entity, the legal professional should satisfy itself that it has sufficient information to identify the individual beneficial owner.

Individual and Corporate trustee

a) Where a legal professional is not itself acting as trustee, it is necessary for the legal professional to obtain information to enable it to identify and verify the identity of the trustee (s) and, where the trustee is a corporate trustee, identify the corporate entity, obtain information on the identity of the beneficial owners of the trustee, and take reasonable measures to verify their identity.

b) Where the trustee is a listed entity (or an entity forming part of a listed group) or an entity established and regulated to carry on trust business in a jurisdiction identified by credible sources as having appropriate AML/CFT laws, regulations and other measures, the legal professional should obtain information to enable it to satisfy itself as to the identity of the directors or other controlling persons. The legal professional can rely on external evidence, such as information in the public domain, to satisfy itself as to the beneficial owner of the regulated trustee (e.g. the website of the body that regulates the trustee and of the regulated trustee itself).

c) It is not uncommon for families to set up trust companies to act for trusts for the benefit of that family. These are typically called private trust companies and may have a restricted trust licence that enables them to act as trustee for a limited class of trusts. Such private trust companies are often ultimately owned by a fully regulated trust company as trustee of another trust. In such a case, the legal professional should satisfy itself that it understands how the private trust company operates and the identity of the directors of the private trust company and, where relevant, the owner of the private trust company. Where the private trust company is itself owned by a listed or regulated entity as described above, the legal professional does not need to obtain detailed information to identify the directors or controlling persons of that entity that acts as shareholder of the private trust company.

Individual and Corporate protector

a) Where a legal professional is not itself acting as a protector and a protector has been appointed, the legal professionals should obtain information to identify and verify the identity of the protector.

b) Where the protector is a legal entity, the legal professional should obtain sufficient information that it can satisfy itself who is the controlling person and beneficial owner of the protector, and take reasonable measure to verify their identity.

c) Where the protector is a listed entity (or an entity forming part of a listed group) or an entity established and regulated to carry on trust business in a jurisdiction identified by credible sources as having appropriate AML/CFT laws, regulations and other measures, the legal professional should obtain information to enable it to satisfy itself as to the identity of the directors or other controlling persons. The legal professional can rely on external evidence, such as information in the public domain to satisfy itself as to the beneficial owner of the regulated protector (e.g. the website of the body that regulates the protector and of the regulated protector itself).

Annex 2: Sources of further information

1. Various sources of information exist that may help governments and legal professionals in their development of a RBA. Although not an exhaustive list, this Annex highlights a number of useful web-links that governments and legal professionals may wish to draw upon. They provide additional sources of information, and further assistance might also be obtained from other information sources such as AML/CFT assessments.

Legislation and Court Decisions

2. The rulings by the ECJ of June 26th, 2007 by the Belgium Constitution Court of January 23rd 2008 and the French Conseil d'État of April 10th, 2008 confirmed that AML/CFT regulation cannot require or permit the breach of the legal professional's duty of professional secrecy when performing the essential activities of the profession.

3. The Court of First Instance in the Joined Cases T-125/03 &T-253/03 Akzo Nobel Chemicals Ltd and Akcros Chemicals Ltd v Commission of the European Communities has restated the ruling in the AM&S case that professional secrecy "meets the need to ensure that every person must be able, without constraint, to consult a legal professional whose profession entails the giving of independent legal advice to all those in need of it (AM&S, paragraph 18). That principle is thus closely linked to the concept of the legal professional's role as collaborating in the administration of justice by the courts (AM&S, paragraph 24).

4. In Judgement of the Court (Grand Chamber) of 26 June 2007 in Case C-305/05 in a question referred for a preliminary ruling, the Court holds that "the obligations of information and of cooperation with the authorities responsible for combating money laundering [...] and imposed on legal professionals by Article 2a(5) of Directive 91/30848, account being taken of the second subparagraph of Article 6(3)49 thereof, do not infringe the right to a fair trial as guaranteed by Article 6 of the Convention for the Protection of Human Rights and Fundamental Freedoms and Article 6(2) EU". The Court reaches this conclusion by considering that: (i) obligations of information and cooperation apply to legal professionals only in so far as they advise their client in the preparation or execution of certain transactions; (ii) as soon as the legal professional acting in connection with a transaction is called upon for assistance in defending the client or in representing him before the courts, or for advice as to the manner of instituting or avoiding judicial proceedings, that

[48] Article 2a(5) of Directive 91/308 listed the specified transactional activities in whose performance legal professionals were to be considered as obliged entities.

[49] According to which "Member States shall not be obliged to apply the obligations laid down in paragraph 1 to notaries, independent legal professionals, auditors, external accountants and tax advisors with regard to information they receive from or obtain on one of their clients, in the course of ascertaining the legal position for their client or performing their task of defending or representing that client in, or concerning, judicial proceedings, including advice on instituting or avoiding proceedings, whether such information is received or obtained before, during or after such proceedings".

legal professional is exempt from the obligations of information and cooperation, regardless of whether the information has been received or obtained before, during or after the proceedings. An exemption of that kind safeguards the right of the client to a fair trial; (iii) the requirements relating to the right to a fair trial do not preclude the obligations of information and cooperation from being imposed on legal professionals acting specifically in connection with the specified activities, in cases where the second subparagraph of Article 6(3) of that directive does not apply, where those obligations are justified by the need to combat money laundering effectively, in view of its evident influence on the rise of organised crime"[50].

5. **Michaud v. France case of 6 December 2012**. This case concerned the obligation on French legal professionals to report their suspicions regarding possible ML activities by their clients. Among other things, the applicant, a member of the Paris Bar and the Bar Council, submitted that this obligation, which resulted from the transposition of European directives, was in conflict with Article 8 of the European Convention on Human Rights, which protects the confidentiality of lawyer-client relations.

6. The European Court of Human Rights in its judgement held that there had been no violation of Article 8 of the Convention. While stressing the importance of the confidentiality of lawyer-client relations and of legal professional privilege, it considered, however, that the obligation to report suspicions pursued the legitimate aim of prevention of disorder or crime, since it was intended to combat ML and related criminal offences, and that it was necessary in pursuit of that aim. The Court held that the obligation to report suspicions, as implemented in France, did not interfere disproportionately with legal professional privilege, since legal professionals were not subject to the above requirement when defending litigants and the legislation had put in place a filter to protect professional privilege, thus ensuring that legal professionals did not submit their reports directly to the authorities, but to the president of their Bar association.

7. Directive (EU) 2015/849 (AMLD) provides:

   - Art. 2 AMLD: 1. This Directive shall apply to the following obliged entities: […] (3) the following natural or legal persons acting in the exercise of their professional activities: […] (b) notaries and other independent legal professionals, where they participate, whether by acting on behalf of and for their client in any financial or real estate transaction, or by assisting in the planning or carrying out of transactions for their client concerning the: (i) buying and selling of real property or business entities; (ii) managing of client money, securities or other assets; (iii) opening or management of bank, savings or securities accounts (iv) organisation of contributions necessary for the creation, operation or management of companies; (v) creation, operation or management of trusts, companies, foundations, or similar structures;

8. Art. 34(2): "Member States shall not apply the obligations laid down in Article 33(1) to notaries, other independent legal professionals, auditors, external accountants and tax advisors ***only to the strict extent that such exemption*** relates to information that they receive from, or obtain on, one of their clients, in the course of ascertaining the legal position of their client, or performing their task of

[50] http://curia.europa.eu/juris/liste.jsf?language=en&num=C-305/05

defending or representing that client in, or concerning, judicial proceedings, including providing advice on instituting or avoiding such proceedings, whether such information is received or obtained before, during or after such proceedings"[51].

9. In the United States there is a "crime-fraud" exception to attorney-client privilege. See, e.g. Am. Law Institute, Restatement of the Law Third, Restatement of the Law Governing Lawyers §82 Client Crime or Fraud (2000). As the U.S. Supreme Court observed, "[i]t is the purpose of the crime-fraud exception to the attorney-client privilege to assure that the 'seal of secrecy' … between legal professional and client does not extend to communications 'made for the purpose of getting advice for the commission of a fraud.'" *United States v. Zolin*, 491 U.S. 554, 562 (1989) (internal citation omitted). Before determining whether this exception applies, there must be a showing of "a factual basis adequate to support a good faith belief by a reasonable person that *in camera* review of the materials may reveal evidence to establish a claim that the crime-fraud exception applies." *Id.* at 572. Under case law in the U.S. further developing this principle, the crime-fraud exception can apply even where the attorney acts innocently—"the lawyers' innocence does not preserve the attorney-client privilege against the crime-fraud exception. The privilege is the client's, so it is the client's knowledge and intentions that are of paramount concern to the application of the crime-fraud exception; the attorney need know nothing about the client's ongoing or planned illicit activity for the exception to apply." *United States v. Chen*, 99 F.3d 1495, 1504 (9th Cir. 1996) (internal quotations omitted). Under these principles, persons (both legal and natural) have been obliged to disclose pursuant to subpoenas or other legal process factual information that otherwise would have been subject to attorney-client privilege. *See, e.g. In re Grand Jury*, 705 F.3d 133, 155-61 (3d Cir. 2012).

Annex 3: Glossary of terminology

Beneficial Owner

Beneficial owner refers to the natural person(s) who ultimately owns or controls a customer and/or the natural person on whose behalf a transaction is being conducted. It also includes those persons who exercise ultimate effective control over a legal person or arrangement.

Competent Authorities

Competent authorities refers to all public authorities with designated responsibilities for combating money laundering and/or terrorist financing. In particular, this includes the FIU; the authorities that have the function of investigating and/or prosecuting money laundering, associated predicate offences and terrorist financing, and seizing/freezing and confiscating criminal assets; authorities receiving reports on cross-border transportation of currency and bearer negotiable instruments (BNIs); and authorities that have AML/CFT supervisory or monitoring responsibilities aimed at ensuring compliance by financial institutions and DNFBPs with AML/CFT requirements. SRBs are not to be regarded as a competent authorities.

Core Principles

Core Principles refers to the Core Principles for Effective Banking Supervision issued by the Basel Committee on Banking Supervision, the Objectives and Principles for Securities Regulation issued by the International Organization of Securities Commissions, and the Insurance Supervisory Principles issued by the International Association of Insurance Supervisors.

Designated Non-Financial Businesses and Professions (DNFBPs)

Designated non-financial businesses and professions means:

a) Casinos (which also includes internet and ship based casinos).

b) Real estate agents.

c) Dealers in precious metals.

d) Dealers in precious stones.

e) Lawyers, notaries, other independent legal professionals and accountants – this refers to sole practitioners, partners or employed professionals within professional firms. It is not meant to refer to 'internal' professionals that are employees of other types of businesses, nor to professionals working for government agencies, who may already be subject to AML/CFT measures.

f) Trust and Company Service Providers refers to all persons or businesses that are not covered elsewhere under the FATF Recommendations, and which as a business, provide any of the following services to third parties:

   - Acting as a formation agent of legal persons;
   - Acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;

- Providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangement;
- Acting as (or arranging for another person to act as) a trustee of an express trust or performing the equivalent function for another form of legal arrangement;
- Acting as (or arranging for another person to act as) a nominee shareholder for another person.

Express Trust

Express trust refers to a trust clearly created by the settlor, usually in the form of a document e.g. a written deed of trust. They are to be contrasted with trusts that come into being through the operation of the law and that do not result from the clear intent or decision of a settlor to create a trust or similar legal arrangements (e.g. constructive trust).

FATF Recommendations

Refers to the FATF 40 Recommendations.

Legal Person

Legal person refers to any entities other than natural persons that can establish a permanent client relationship with a legal professional or otherwise own property. This can include bodies corporate, foundations, anstalt, partnerships, or associations and other relevantly similar entities.

Legal Professional

In this Guidance, the term *"Legal professional"* refers to lawyers, civil law notaries, common law notaries, and other independent legal professionals.

Politically Exposed Persons (PEPs)

Foreign and *domestic PEPs* are individuals who are or have been entrusted by a foreign country or domestically with prominent public functions, for example Heads of State or of government, senior politicians, senior government, judicial or military officials, senior executives of state owned corporations, important political party officials. Persons who are or have been entrusted with a prominent function by an international organisation refers to members of senior management, i.e. directors, deputy directors and members of the board or equivalent functions. The definition of PEPs is not intended to cover middle ranking or more junior individuals in the foregoing categories.

Red Flags

Any fact or set of facts or circumstances that, when viewed on their own or in combination with other facts and circumstances, indicate a higher risk of illicit activity. A *"red flag"* may be used as a short hand for any indicator of risk that puts an investigating legal professional on notice that further checks or other appropriate safeguarding actions will be required. The mere presence of a red flag indicator is not necessarily a basis for a suspicion of ML or TF, as a client may be able to provide a legitimate explanation. Red flag indicators should assist legal professionals in applying a risk-based approach to their CDD requirements. Where there are a number

of red flag indicators, it is more like4ly that a legal professional should have a suspicion that ML or TF is occurring.

Self-regulatory body (SRB)

A *SRB* is a body that represents a profession (e.g. legal professionals, notaries, other independent legal professionals or accountants), and which is made up of members from the profession, has a role in regulating the persons who are qualified to enter and who practise in the profession, and also performs certain supervisory or monitoring type functions. Such bodies should enforce rules to ensure that high ethical and moral standards are maintained by those practising the profession.

Supervisors

Supervisors refers to the designated competent authorities or non-public bodies with responsibilities aimed at ensuring compliance by financial institutions ("financial supervisors") and/or DNFBPs with requirements to combat money laundering and terrorist financing. Non-public bodies (which could include certain types of SRBs) should have the power to supervise and sanction financial institutions or DNFBPs in relation to the AML/CFT requirements. These non-public bodies should also be empowered by law to exercise the functions they perform, and be supervised by a competent authority in relation to such functions.

Annex 4: Supervisory practices for implementation of the RBA

Ireland

AML/CFT Compliance Monitoring in Ireland

The Law Society of Ireland is the educational, representative and regulatory body of the solicitors' profession in Ireland. In addition to the statutory functions it exercises under the Solicitors Acts, the Society is also the competent authority for the monitoring of solicitors for the purposes of compliance with Ireland's anti-money laundering and counter-terrorist financing laws under the Criminal Justice (Money Laundering and Terrorist Financing) Act 2010 as amended.

The Society uses a risk-based system when choosing firms for inspection in addition to conducting a number of random inspections. For many years, firms have been chosen for inspection on the basis of pre-determined risk factors which trigger an accounts inspection. These risk factors include:

- complaints by the public
- previous investigation experience
- the contents of the firm's annual reporting accountant's report
- delays in complying with filing obligations in relation to accountants reports and practicing certificates
- professional indemnity insurance issues
- judgement debts
- media reports
- notifications of concern by government authorities including An Garda Síochána and the Revenue Commissioners

AML/CFT compliance checks are carried out in conjunction with the Society's financial regulation of solicitors' firms. When AML/CFT deficiencies are discovered, targeted standalone checks are implemented until any deficiencies are satisfactorily removed. The process available to compel compliance and used in the past is outlined below.

- If a solicitor fails to implement procedures to combat ML/TF, a report is submitted to the Regulation of Practice Committee who will require the solicitor to provide it with a copy of their new written AML/CFT procedures and evidence that those procedures have been communicated to all staff and will be implemented in full.
- Where it is suspected that a solicitor has committed a substantive offence of ML/TF or failed to fulfil reporting obligations, the matter is referred to the Money Laundering Reporting Committee of the Law Society for appropriate action.
- The experience of the Law Society to date has been that the failure to implement AML/CFT procedures tends to reflect a failure of the solicitor to implement satisfactory procedures to ensure compliance with the

Solicitors Act, in particular the provisions of the Solicitors Accounts Regulations. When a solicitor fails to implement satisfactory procedures to ensure compliance with the Solicitors Accounts Regulations and with the Solicitors (ML and TF) Regulations, the Society will re-investigate the firm until such time that satisfactory procedures have been put in place. If the solicitor does not implement satisfactory procedures, the matter may be referred to the Solicitors Disciplinary Tribunal.

- If it comes to the attention of the Law Society that a solicitor has been engaged in dishonesty particularly in relation to clients' monies (which may occur in parallel with activity suspected to be related to ML/TF), a number of sanctions can be applied, including:
  - An application to the President of the High Court for an Order immediately suspending that solicitor from practice.
  - An application for an Order that no bank shall make any payment from any bank account held by that solicitor or under that solicitor's control.
  - An application for an Order that any documents held by the solicitor be immediately delivered to the Law Society or its nominee.
- In addition to supervision, the Law Society also engages in a range of other AML/CFT outreach and engagement activities including:
  - Awareness raising via a dedicated AML web resource hub, eZine articles, Gazette and email alerts
  - The development of AML Guidance Notes - these are comprehensive notes covering all AML/CFT obligations and ML/TF risks, which follow a question and answer format for ease of reference. They also contain a dedicated chapter providing a non-exhaustive list of indicators of potential suspicious circumstances.
  - In November 2018, supplementary guidance was provided to solicitors to help with new obligations which transpose 4AMLD. Topics covered include how to conduct a Business Risk Assessment, update Policies, Controls and Procedures, and carry out Customer Risk Assessments and 4AMLD changes to CDD measures.
  - Tailored guidance via an Anti-Money Laundering Helpline. This helpline receives queries from solicitors about AML on a daily basis and provides real-time specific guidance. The helpline provides a vital confidential support service to solicitors when navigating potential red flags and deciding whether or not to proceed with a legal service. The Society's guidance is to document their thought process with a particular emphasis on the risk of committing the substantive offence of money laundering should they provide a legal service which may exhibit red flags. In this way, the service can help prevent unwitting facilitation of money laundering by solicitors.
  - AML Education is provided to trainee solicitors attending qualifying courses in the Law Society. In addition, for qualified solicitors, AML modules feature on the Law Society's Diploma and CPD courses. Throughout 2017, for example, the Society delivered extensive AML training across the country and online through a total of 9 seminars with 2 379 attendees.

- CPD Regulations 2015 (S.I. No. 480/2015) require firms to appoint an AML Compliance Partner (failure to do so will mean that each partner in the firm will be designated as an AML Compliance Partner). The AML Compliance Partner must annually undertake a minimum of 3 hours training in regulatory matters, of which at least 2 hours shall be accounting and AML compliance. Training during 2017 has had a measurable impact on the awareness of solicitors of their AML obligations and ML/TF risks evidenced by increased demand for AML guidance in the days following an AML seminar.

France

The CARPA is a verification and regulation system under the responsibility of the Bar Council in France. It applies to all handling of funds received by lawyers on behalf of their clients. It conducts verification under the authority of the Chairman of the Bar Council and has a role in the fight against ML/TF. TRACFIN, the French FIU has an interest in the CARPA, guaranteeing the traceability of all financial flows. The rules of the CARPA system are as follows:

Any handling of funds made by a lawyer must be related to a legal or judicial act.

Any handling of funds made by a lawyer on behalf of his clients must be routed through CARPA (with the sole exception that trusts do not enter into the scope of intervention of CARPA in the current state of the law).

The bank account is opened in the name of CARPA, in which the funds received by the lawyers are deposited on behalf of their clients.

A lawyer cannot receive funds or give instructions to pay them to the beneficiaries without the prior verification of CARPA exercised under the authority and the responsibility of the Bar Council and of the Chairman of the Bar Council. The verifications concern, in particular:

i. the nature and the description of the case;

ii. the origin of the funds;

iii. the destination of the funds;

iv. the actual beneficiary of the transaction; and

v. the connection between the financial payment and the legal or judicial transaction carried out by the lawyer in the framework of his professional activity.

CARPA can reject a transaction if it cannot verify the above elements.

The CARPA is not a financial institution and is backed by a bank. As the CARPA is under the authority of the Bar Council and the Chairman of the Bar Council, lawyers have the obligation to provide the necessary explanations for the CARPA to operate without being able to rely upon professional secrecy (which would apply if they were dealing with a bank). The controls thus exercised by the CARPA on the one hand and by its bank

on the other intersect in a complementary way with regard to professional secrecy.

Malaysia

AML/CFT Supervisory Practices of Legal Professionals in Malaysia

A. Fit and Proper Requirements – Self-Regulatory Bodies (SRBs)

In Malaysia, the legal professionals are regulated under the Legal Profession Act 1976, Advocate Ordinance Sabah 1953 and Advocate Ordinance Sarawak 1953, respectively. Prior to admission to the Bar, they are subject to appropriate market entry controls in which they are required to fulfil the "fit and proper" requirements under their respective governing legislation. Practising certificates will be subsequently issued by the High Court of Malaya and High Court of Sabah and Sarawak in conjunction with the respective SRBs for legal professionals, i.e. Bar Council Malaysia (BC) and Sabah Law Society (SLS) as the SRBs, as well as Advocates Association of Sarawak (AAS).

B. AML/CFT Risk-based Supervision – Bank Negara Malaysia (BNM)

Under the Anti-Money Laundering, Anti-Terrorism Financing and Proceeds of Unlawful Activities Act 2001 (AMLA), BNM is the designated supervisory authority for the AML/CFT supervision of the Designated Non-Financial Businesses and Professions (DNFBPs) & Other Financial Institutions in Malaysia, including legal professionals.

BNM adopts a risk-based approach supervision on legal professionals, in which the differentiation is guided by the outcome of the National Risk Assessment (NRA) and the application of Risk-Based Supervisory Framework for DNFBPs and Other Financial Institutions (D'SuRF), as follows:

i. National Risk Assessment (NRA) 2017

Malaysia's third iteration of the NRA in 2017 comprising assessment of ML/TF inherent risk and overall control effectiveness had stipulated the legal professionals' net ML and TF risks as **"MEDIUM HIGH"** and **"MEDIUM"** level, respectively, as exacerbated by the sector's marginal control, as follows:

ML		TF	
Inherent Risk	Medium	Inherent Risk	Low
Control	Marginal	Control	Marginal
Net Risk	Medium High	Net Risk	Medium

ii. Risk-Based Supervisory Framework for DNFBPs and Other Financial Institutions (D'SuRF)

D'SuRF encapsulates end-to-end governance and supervisory process, risk-based application of supervisory tools. In line with the ML/TF rating of the sector and the application of D'SuRF, the frequency and intensity of monitoring on legal professionals are guided accordingly to include a range of supervisory tools, as follows:

On-site Examination

Firms are selected based on a robust selection process under the D'SuRF, which is in line with the risk profile of the reporting institutions (RIs). The on-site examination is in-depth, with assessments covering the RIs' inherent risk and quality of risk management.

In applying RBA, BNM imposes post-onsite follow-up measures for RIs with heightened risks. This includes requiring the RI to submit proposals to BNM on planned measures to rectify any supervisory issues and progress report until full rectification. The D'SuRF sets the deadline for both submissions. The follow-up measures have been imposed on a number of legal firms selected for on-site examination, highlighting the higher risk of the sector and consistent with the most recent NRA results.

Off-site Monitoring and Supervisory Outreach Activities

Apart from on-site examinations, BNM employs a range of off-site monitoring and supervisory outreach activities, aimed to elevate awareness and guide the implementation of the AMLA requirements by legal professionals. These off-site tools are also deployed according to the RBA, whereby the intensity and frequency for the legal professions is relatively higher compared to other sectors. Among the off-site monitoring, includes the submission of Data and Compliance Reports and internal audit reports. In addition, BNM and the relevant SRBs conduct periodic nationwide AML/CFT outreach and awareness programmes.

Spain

General Council of the Notariat of Spain – Money Laundering Centralised Prevention Body

On 28/12/2005 the Spanish General Council of the Notariat established, pursuant to Ministerial Order 2963/2005, of 20 September 2005, regulating the Centralised Prevention Body, a body specialising in the self-regulation of notarial organisation, as permitted by the INR.23 "*Countries may allow lawyers, notaries, other legal professionals and independent accountants to send their STRs to their appropriate self-regulatory organisations, provided that there are adequate forms of cooperation between these organisations and the FIU*."

This Body takes on certain obligations in the name of notaries:

- Transaction's analysis.

- Communication of suspicious transactions to the FIU.
- Preparation of sector risk analysis
- Preparation of risk-based AML/TF Internal Policies and Procedures.
- Definition of risk indicators for the notarial sector.
- Training of notaries and employees.
- Supervision of the fulfilment of AML/CTF obligations by notaries.

It intersects between the FIU and notaries, with the generic mission of intensifying collaboration between the notariat and authorities in fight against ML/TF. It has drawn up guides, manuals, FAQ documents, best practice documents; prepared in-house databases to improve the application of CDD at notary offices; resolved more than 7 000 consultations from notary offices; designed on-line training programmes; developed in-person training courses for notaries and employees; established a single matrix of common risk indicators; conducted a sectoral risk analysis; implemented remote supervision of all notary offices and in-person supervision at over 80 notarial practices, among other activities.

The AML system used by Spain's notaries represents a considerable advance for Public Authorities, which thanks to its implementation now have access to:

- A new source of valuable information: notarial indexes (a single database with information on all the public instruments and policies notarised and witnessed in the country). This information, processed in an integrated and automated manner to detect potential ML/TF operations
- A body with AML specialists operating the database, who manage the database, analyse and report to the FIU high-risk operations on behalf of notaries and who can analyse not only the transactions of each notary office (as would be the case if there were no centralised body) but all notary offices together.

The system also offers advantages for notaries, who can delegate the management of (and in practice are relieved from) some of their duties (analysing and, where applicable, reporting operations with evidence of ML/TF, training, internal procedures, etc.) to a team of experts working on their behalf.

General Council of the Notariat of Spain – Practices for Due Diligence: Beneficial Ownership Database

On 24 March 2012, the General Council of the Notariat resolved to set up the "Beneficial Ownership Database" ("Base de Datos de Titular Real", or "BDTR") personal data filing system, and in compliance with data protection regulations published this resolution in the Official State Gazette on 28 April 2012.

The resolution allowed for information to be accessed:

- By notaries, as they are subject to AML obligations.
- By the Executive Service of the Commission for the Prevention of Money Laundering and Monetary Offences (Spanish FIU) to fulfil the tasks entrusted to the Service.
- By the court, taxation, law enforcement and administrative authorities responsible for the prevention and investigation of money laundering.
- By other parties subject to Prevention of Money Laundering Act 10/2010, of 28 April 2010, on the terms set out therein.

Article 6 of Royal Decree 304/2014, of 5 May, approving the Regulation of Prevention of Money Laundering and Terrorist Financing Act 10/2010, of 28 April, established in Spanish law that "*for fulfilment of the obligation to identify and verify the identity of the beneficial owner established in this article, the parties subject to this Act may access the database of beneficial ownership of the General Council of the Notariat …*"

As a result, not only notaries but also all parties subject to AML requirements may consult the BDTR to facilitate compliance with Due Diligence obligations. This thus allows the FIU and Law Enforcement Agencies to obtain information on owners with a percentage of less than 25% (full corporate regime) at Spanish private limited liability companies, on any given date. They may also request information on which companies a natural person owns (reverse beneficial ownership) on any given date.

Two levels of information quality is ensured:

- Information based on a statement to a public official (foreign companies, foundations, associations, Spanish corporations).
- Information verified in accordance with the sale and purchase transaction of the shares of Spanish Private Limited Liability Companies.

The General Council of the Notariat has established agreements with associations of parties subject to AML obligations (banks, savings banks, investment firms, auditors, lawyers, lottery agencies, credit institutions,

casinos, etc.) and has provided the information called for in more than 2 000 000 requests made to these applicants.

UK

Supervisory Approach of the Solicitors Regulation Authority

The Solicitors Regulation Authority (SRA) regulates solicitors and their firms, as well as other lawyers and non-lawyer managers working in law firms across England and Wales. The SRA also regulates those working as registered European lawyers or registered foreign lawyers. The SRA seeks to protect the public by ensuring that solicitors meet high standards and by acting when risks are identified. With regards to the Money Laundering Regulations, two thirds of firms that the SRA supervises (67%) offer services that fall within scope, the two main categories being acting as an independent legal professional or acting as a trust or company services provider

There are significant barriers to entry to the profession. Requirements include having a qualifying law degree, followed by the Legal Practice Course and then a two-year period of recognised training incorporating the Professional Skills Course. Character and suitability test is also conducted before admission to the roll of solicitors. The SRA requires firms to obtain approval of owners and managers. Firms are required to have Compliance Officers of Legal Practice (COLPs) and Compliance Officers of Financial Administration (COFAs) approved by the SRA. They should have sufficient seniority and independence. Firms are also required to declare whether they are doing work within scope of the Money Laundering Regulations. Those firms in scope of the Regulations must submit an additional application form to declare any individual who is applying to register as a beneficial owner, officer or manager (BOOM).

Risk-based approach

The SRA carries out both qualitative and quantitative risk assessment of how the regulated community is exposed to ML/TF. Each firm is given a risk rating, which informs the supervisory approach of the SRA. Supervisory activities fall into two broad categories: i) reactive work (responding to concerns and breaches); and ii) proactive work (e.g. engaging with firms to prevent breaches, identify potential breaches, explore risks, enhance risk understanding and provide evidence of poor and good behaviours). The SRA uses the information/intelligence that it receives to build a firm's profile. The assessment takes into account the specific breach alleged, the severity of the allegation, the quality of the information and their ability to investigate. Information is coded and then RAG rated (red, amber or green, with red being the most severe). Reports received are risk assessed and conduct matters are created for

matters assessed as high or medium. Those with an AML/CFT angle often leads to an onsite investigation where the main issues are considered, and a fact-based report produced.

Enforcement: The SRA has a number of enforcement tools. This includes letter of advice, finding and warning, reprimand, severe reprimand and rebuke, based on the gravity of violation. The SRA also has powers to impose fines on individuals and firms. In cases of serious misconduct, the SRA can refer a case to the Solicitors Disciplinary Tribunal, which can impose higher fines and also has powers to suspend or strike off. The SRA has the power to disqualify individuals from involvement in specific roles in certain types of firms. It can also prosecute for information offences or acting as a bogus firm and can revoke authorisations or withdraw approvals. The SRA can also prevent non-lawyers from working within legal businesses.

US

Fit and Proper requirements: Lawyers[53] in the United States

The discussion below describes the fit and proper requirements in the US, which is the country with the largest number of lawyers subject to an alternative supervisory system.

The highest court of the state in which a lawyer is licensed is responsible for adopting the version of the Model Rules of Professional Conduct applicable in that state and for enforcing the duties of lawyers under those rules. State bar associations or independent agencies created by court rules serve as licensing, regulatory, and disciplinary agencies of the court.

The US system regulates lawyers throughout their careers and includes rigorous controls on lawyers. These controls begin with the rules on the bar admission and are designed, among other things, to prevent criminals from becoming or controlling lawyers and to detect effectively any breaches that might occur.

Entry Requirements: Legal education in the US is a post graduate program, not an undergraduate program and most US jurisdictions require their bar examination applicants to have attended an ABA-approved law school. The US has a unified legal profession, which means that US lawyers who perform "transactional" legal work need to be licensed by state supreme courts and their disciplinary agencies, as do those lawyers who litigate cases in front of a court tribunal. As part of the mandatory licensing process, prospective lawyers are subject to a series

[53] The term "Lawyers" is intentionally used in this discussion of the situation in the US as opposed to legal professionals as the requirements described do not extend to all legal professionals within the US.

of requirements to ensure they possess the necessary character and fitness to sit for the bar examination and to practice law. Applicants to US law schools need to disclose any criminal convictions or other encounters with the legal system.

Ongoing Requirements: US lawyers must renew their licenses annually. The requirements for renewal include mandatory compliance with rules of professional conduct, mandatory rules about accounts involving client funds, and additional rules that vary from state to state and include matters such as mandatory continuing education requirements, random audits of client trust accounts, and programs designed to identify and assist lawyers with substance abuse and mental health issues. US lawyers have mandatory obligations to report wrongdoing by other lawyers and failure to comply subject a lawyer to discipline. Many states require lawyers to self-report criminal convictions to the lawyer disciplinary agency.

Annex 5: Examples of Red flags highlighting suspicious activities or transactions for legal professionals[54]

a) The transaction is unusual, e.g.:
   - the type of operation being notarised is clearly inconsistent with the size, age, or activity of the legal entity or natural person acting;
   - the transactions are unusual because of their size, nature, frequency, or manner of execution;
   - there are remarkable and highly significant differences between the declared price and the approximate actual values in accordance with any reference which could give an approximate idea of this value or in the judgement of the legal professional;
   - legal person or arrangement, including NPOs, that request services for purposes or transactions, which are not compatible with those declared or not typical for those organisations.
   - the transaction involves a disproportional amount of private funding, bearer cheques or cash, especially if it is inconsistent with the socio-economic profile of the individual or the company's economic profile.

b) The customer or third party is contributing a significant sum in cash as collateral provided by the borrower/debtor rather than simply using those funds directly, without logical explanation.

c) The source of funds is unusual:
   - third party funding either for the transaction or for fees/taxes involved with no apparent connection or legitimate explanation;
   - funds received from or sent to a foreign country when there is no apparent connection between the country and the client;
   - funds received from or sent to high-risk countries.

d) The client is using multiple bank accounts or foreign accounts without good reason.

e) Private expenditure is funded by a company, business or government.

f) Selecting the method of payment has been deferred to a date very close to the time of notarisation, in a jurisdiction where the method of payment is usually included in the contract, particularly if no guarantee securing the payment is established, without a logical explanation.

g) An unusually short repayment period has been set without logical explanation.

h) Mortgages are repeatedly repaid significantly prior to the initially agreed maturity date, with no logical explanation.

[54] See also the Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership, July 2018, Annex E – Indicators of concealed beneficial ownership.

i) The asset is purchased with cash and then rapidly used as collateral for a loan.

j) There is a request to change the payment procedures previously agreed upon without logical explanation, especially when payment instruments are suggested that are not appropriate for the common practice used for the ordered transaction.

k) Finance is provided by a lender, either a natural or legal person, other than a credit institution, with no logical explanation or economic justification.

l) The collateral being provided for the transaction is currently located in a high-risk country.

m) There has been a significant increase in capital for a recently incorporated company or successive contributions over a short period of time to the same company, with no logical explanation.

n) There has been an increase in capital from a foreign country, which either has no relationship to the company or is high risk.

o) The company receives an injection of capital or assets in kind that is excessively high in comparison with the business, size or market value of the company performing, with no logical explanation.

p) There is an excessively high or low price attached to the securities transferred, with regard to any circumstance indicating such an excess (e.g. volume of revenue, trade or business, premises, size, knowledge of declaration of systematic losses or gains) or with regard to the sum declared in another operation.

q) Large financial transactions, especially if requested by recently created companies, where these transactions are not justified by the corporate purpose, the activity of the customer or the possible group of companies to which it belongs or other justifiable reasons.

Annex 6: Members of the RBA Drafting Group

FATF Members and observers	Office	Country/Institution

Concealment of Beneficial Ownership

July 2018

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

The goal of the Egmont Group of Financial Intelligence Units (Egmont Group) is to provide a forum for financial intelligence unites (FIUs) around the world to improve cooperation in the fight against money laundering and the financing of terrorism and to foster the implementation of domestic programs in this field.

For more information about the Egmont Group, please visit the website: **www.egmontgroup.org**

EXECUTIVE SUMMARY

1. Criminals employ a range of techniques and mechanisms to obscure their ownership and control of illicitly obtained assets. Identifying the true beneficial owner(s) or individual(s) exercising control represents a significant challenge for prosecutors, law enforcement agencies, and intelligence practitioners across the globe. **Schemes designed to obscure beneficial ownership often employ a "hide-in-plain sight" strategy**, leveraging global trade and commerce infrastructures to appear legitimate. However, visibility does not equate to transparency, and many of the tools that were designed to encourage business growth and development, such as limited liability corporations and nominee directorship services, can be used to facilitate money laundering, tax evasion, and corruption. The globalisation of trade and communications has only increased this threat, and countries now face the challenge of enforcing national laws in a borderless commercial environment.

Legal arrangements – refers to express trusts or other similar legal arrangements.
Legal persons – refers to any entities other than natural persons that can establish a permanent customer relationship with a financial institution or otherwise own property.

2. This joint FATF Egmont Group report takes a global view assessing how legal persons, legal arrangements and professional intermediaries can help criminals conceal wealth and illicit assets. The purpose of the report is to help national authorities including FIUs, financial institutions and other professional service providers in understanding the nature of the risks that they face.

3. Analysis of 106 case studies demonstrates that **legal persons, principally shell companies, are a key feature in schemes designed to disguise beneficial ownership**, while **front companies and bearer shares** are less frequently exploited.

4. **Individuals and groups seeking to conceal the ownership of assets are most likely to exercise control over those assets via a combination of direct and indirect control**, rather than strictly one or the other. In a majority of cases, the beneficial owner used a combination of layering and direct ownership chains, as well as professional intermediaries and third parties exercising control on their behalf. In a limited number of cases, the beneficial owner exercised *only* indirect control and rarely retained direct control through a complicated structure without involving an intermediary. This demonstrates that, in many cases, the beneficial owner will maintain some level of direct control in a scheme, but will rarely do so without also involving an intermediary or "straw man" (informal

Shell company – incorporated company with no independent operations, significant assets, ongoing business activities, or employees.
Front company – fully functioning company with the characteristics of a legitimate business, serving to disguise and obscure illicit financial activity.
Shelf company –incorporated company with inactive shareholders, directors, and secretary and is left dormant for a longer period even if a customer relationship has already been established.

nominee shareholders and directors, such as spouses, children, extended family, and other personal or business associates).

5. **Nominee directors and shareholders, particularly informal nominees (or "straw men"), are a key vulnerability**, and were identified in a large majority of case studies assessed for this report. The role of the nominee, in many cases, is to protect or conceal the identity of the beneficial owner and controller of a company or asset. A nominee can help overcome jurisdictional controls on company ownership and circumvent directorship bans imposed by courts and government authorities. While the appointment of nominees is lawful in most countries, the ongoing merits of this practice are questionable in the context of the significant money laundering and terrorist financing vulnerabilities associated with their use.

Specialist and professional intermediaries

6. **The use of specialists and professional intermediaries is a key feature** of schemes designed to conceal beneficial ownership, particularly in cases where the proceeds of crime are significant. The majority of the case studies involved professional intermediaries. While it was not always explicitly stated in the case studies, approximately half of all intermediaries involved were assessed as having been complicit in their involvement. This demonstrates that complicity is not necessary to facilitate a scheme designed to obscure beneficial ownership, and that **professionals can be unwitting or negligent in their involvement**. This serves to highlight the importance of effective regulation of designated non-financial businesses and professions, and the need for increased awareness amongst professional service sectors. Nevertheless, law enforcement experience in some jurisdictions indicates that professional intermediaries are more likely to be complicit than unwittingly involved in money laundering cases.

- In the case study sample available for this report, **trust and company service providers (TCSPs)** represented the highest proportion of professional intermediaries involved in the establishment of legal persons, legal arrangements, and bank accounts. The TCSP sector was also significantly more likely to provide nominee, directorship, and other company management services to their clients, provide services to other professionals on behalf of third-party clients, and provide services to clients based internationally. However, despite their significant involvement in the establishment and management of these arrangements, TCSPs appear less likely to be the architect of schemes designed to obscure beneficial ownership. TCSPs that were assessed as having been complicit in their involvement were more likely to have been wilfully blind than fully complicit, or may have also provided legal, accounting, or other financial services. This suggests that the role of TCSPs is more likely to be transactional in nature, operating at the behest of a client or other intermediary, who are often based in another country. It also demonstrates that, **while TCSPs appear to be less likely to be the masterminds of schemes designed to obscure beneficial ownership**, **the services provided by TCSPs are vulnerable to exploitation by criminals and other professional intermediaries involved in these schemes**.

- **Accounting professionals** were the least represented sector in the cases analysed for this report; however, they were significantly more likely to be complicit in their involvement when compared to legal professionals and TCSPs. The accounting profession demonstrated the least direct involvement in the establishment of legal persons, legal arrangements, or banking relationships, which suggests that the key role of the accounting profession in the construction of schemes designed to disguise beneficial ownership is the provision of expert advice. Accounting professionals represented the highest proportion of scheme designers and promoters in the case studies, and were more likely to promote their own scheme to prospective clients than to simply facilitate a scheme designed by their client. They were also the only professional sector that was not identified as having provided services to another professional intermediary on behalf of a third-party client. **It is likely that the financial acumen of the accounting profession, and the ease with which accountants can identify suspicious financial activities, limit their vulnerability to being unwittingly exploited to facilitate the concealment of beneficial ownership**. It also suggests that criminals and complicit professionals may be unwilling to involve an accounting professional unless their complicity can be assured in advance.
- In comparison to other professional intermediary sectors, **the role of legal professionals in the facilitation of schemes designed to disguise beneficial ownership, varies depending on the situation.**
    - Legal professionals were more involved in the establishment of legal persons, legal arrangements, and bank accounts when compared with accountants, but less so when compared to TCSPs. The same was also true for the provision of nominee and directorship services.
    - Lawyers were the most likely of the three professions to be involved in the acquisition of real estate as a means of laundering the proceeds of crime and obscuring beneficial ownership.
    - Legal trust accounts and client accounts were also more frequently used as a means of disguising beneficial ownership, although the accounting profession also exhibited a similar proportion of this concealment technique. Legal professional privilege was also identified as a barrier to the successful recovery of beneficial ownership information.
    - In the case studies analysed for this report, where legal professionals were involved, there were a number of cases where legal professionals appeared to be unwitting or negligent in their involvement. This suggests that, despite their reasonably high level of involvement in the establishment of legal persons and arrangements, **legal professionals are not sufficiently aware of their inherent money laundering and terrorism financing vulnerabilities**. It is likely that this is exacerbated by the low level of regulation imposed on legal professionals in many countries.

7. Analysis indicates that **the services of both lawyers and accountants are rarely required to facilitate the same money laundering scheme – the involvement of one is typically sufficient**. TCSPs were present in almost all cases

that involved intermediaries from multiple sectors, and few cases demonstrated the use of both a lawyer and an accountant. Of the cases that involved multiple intermediaries from the same sector, the TCSP sector represented the overwhelming majority of these instances. When multiple TCSPs were exploited in a single scheme, almost all of the cases involved TCSPs in multiple jurisdictions. This reflects the role of TCSPs in establishing and managing local companies on behalf of foreign clients. Conversely, in instances where multiple legal or accounting professionals were used, most cases involved the use of multiple lawyers/accountants in the same jurisdiction, and most of these intermediaries were unwittingly involved. This suggests that, in instances where multiple lawyers or accountants are utilised to facilitate a scheme, criminal clients may be attempting to avoid suspicion by limiting their engagements with any single professional.

8. A lack of awareness and education of money laundering (ML)/ terrorist financing (TF) risks among professionals inhibits the identification of ML/TF red flags. This increases their vulnerability to being exploited by clients seeking to misuse otherwise legitimate services for ML/TF purposes. The case studies for this report identified that only four intermediaries involved in these schemes identified and reported suspicious activity in line with the FATF Standards. All of these cases were from countries that regulate designated non-financial businesses and professions (DNFBPs) under an anti-money laundering/counter-terrorist financing (AML/CFT) legal framework.

Anti-money laundering obligations and supervision

9. Seventeen per cent of jurisdictions that participated in the FATF's Horizontal Study of supervision and enforcement of beneficial ownership obligations do not impose any AML/CFT obligations or AML/CFT supervision on any DNFBPs whatsoever, despite this being a requirement of the FATF Standards. In some cases, this is the result of resistance to regulation from the relevant sectors or professions; in other cases, it may represent an "unfinished" aspect of the AML/CFT system which has not yet been implemented. The lack of supervision in these countries is a major vulnerability, and **professionals operating in countries that have not implemented appropriate regulations for DNFBPs represent an unregulated "back-door" into the global financial system**.

10. A country with a weak AML/CFT regime will exacerbate the vulnerabilities of legal persons, legal arrangements, and professional intermediaries. Key requirements of the FATF Standards, such as Immediate Outcomes 4 and 5, and Recommendations 10, 11, 12, 22, 23, 24, 25 and 28, amongst others, all relate to the risk profile of legal persons, arrangements, and intermediaries in a given jurisdiction. However, other inter-jurisdictional variables, such as trade and finance routes, are also influential with respect to the vulnerabilities and challenges associated with beneficial ownership. These vulnerabilities differ across jurisdictions and therefore cannot be definitively assessed at a global level. Competent authorities, financial institutions and DNFBPs should be mindful of the jurisdictional vulnerabilities that affect their country/business when assessing risk.

11. Schemes designed to obscure beneficial ownership often rely on a "hide in-plain-sight" strategy. This significantly impairs the ability of financial institutions, professional intermediaries, and competent authorities to identify suspicious

activities designed to obscure beneficial ownership and facilitate crime. At the same time, the FATF Standards and, by extension, much of the global AML/CFT infrastructure, centre upon the identification and reporting of suspicious activities by financial institutions and DNFBPs. Many of the case studies analysed for this report identified that information held by financial institutions was invaluable to the investigation of crime, and those countries that require the reporting of other transactions (such as threshold and cross-border transactions) indicated that these threshold-based reports were instrumental to the identification of irregular financial activities.

12. As the global economy becomes increasingly interconnected, and the sovereignty of financial borders dissipates, it is important to ensure that authorities have access to the appropriate information required to effectively deliver their mandate, whether it be suspicious transaction reporting submitted by reporting entities or other types of information, such as threshold and cross-border reporting. Furthermore, the FATF standards provide scope for countries to use several mechanisms to enable timely access to beneficial ownership information, and some countries have recently implemented, or are currently implementing, registers of beneficial ownership information as a mechanism to enable them to do so. Systems combining one or more approaches to ensure availability and accuracy of basic and beneficial ownership information may be more effective than systems that rely on a single approach. Some jurisdictions consider the availability of beneficial ownership registers assist competent authorities access up-to-date and accurate information, including for verifying information obtained from other sources.

Issues for consideration

13. As a result of the analysis and consultations that underpin it, this report identifies a number of issues to help address the vulnerabilities associated with the concealment of beneficial ownership, including:

- Consideration of the role of nominees including measures that may limit their misuse.
- The need for regulation of professional intermediaries in line with the FATF Standards, and the importance of efforts to educate professionals on ML and TF vulnerabilities to enhance awareness and help mitigate the vulnerabilities associated with the concealment of beneficial ownership.
- Further work to identify possible solutions or measures to prevent the misuse of legal professional privilege (LPP) to conceal beneficial ownership information, including through the provision of enhanced training and guidance material for legal professionals.
- Ensuring financial intelligence units have access to the widest possible range of financial information.
- Increased sharing of relevant information and transaction records to support global efforts to improve the transparency of beneficial ownership.
- Further work to understand what can be done to improve the quality and timeliness of the cross-border sharing of information, including through mutual legal assistance.

- Ensuring, for countries that make use of registers of beneficial ownership, and for all countries' company registers, that there is sufficient resource and expertise associated with their maintenance. This is to ensure that the information recorded in the register is adequate, accurate, and up-to-date, and can be accessed in a timely manner.
- The need for countries to consider and articulate the vulnerabilities and threats relating to domestic and foreign legal persons and arrangements, the domestic and foreign intermediaries involved in their establishment, and the means by which criminals may exploit them to facilitate ML and other criminality.

14. A broad theme underlying all of these issues is information, including possible ways to improve the reliability, access and mechanisms to share that information more effectively at domestic and international levels. In some instances, these issues aim to inform responses by individual governments in taking further action; other issues identify areas for further research and engagement.

INTRODUCTION

15. Over the past three decades, the dramatic convergence of international trade and global financial systems, as well as the rise of the internet and other forms of communication technologies, has opened new opportunities for criminals to misuse company and business structures to conceal anomalous financial flows and criminality. Far from operating in a shady, hidden criminal economy, criminals disguise their activities as legitimate corporate trade to hide illicit funds within the enormous volume of transactions that cross the globe every day. However, visibility does not equate to transparency, and criminals use a multitude of tools, including shell companies[1], trusts, other legal arrangements, nominees, and professional intermediaries, to conceal the true intent of their activities and beneficial ownership[2] associated with them.

16. The ownership and control of illicit assets, and the use of legal structures to conceal them, has been the subject of increased global attention in recent years. The leak of confidential information from two large international law firms responsible for the establishment of complex international corporate structures in 2015 and 2017[3] has increased public awareness of the way in which legal structures can be used to conceal wealth and illicit assets.

17. The ability of countries to prevent the misuse of legal persons and legal arrangements, and the ways in which they are being misused, have been the subject of numerous discussion papers and research projects over the last decade or longer. Studies have been published by international bodies, including the Organisation for Economic Co-operation and Development (OECD), the World Bank, the United Nations Office on Drugs and Crime, and the Financial Action Task Force (FATF). Collectively, these reports provide a wealth of knowledge on the abuse of corporate structures to facilitate corruption and money laundering; however, the FATF and Egmont Group of Financial Intelligence Units (Egmont Group) identified the need for further analysis of the vulnerabilities associated with beneficial ownership, with a particular

Legal arrangements – refers to express trusts or other similar legal arrangements.
Legal persons – refers to any entities other than natural persons that can establish a permanent customer relationship with a financial institution or otherwise own property.

See also Section 1.

1 For the purpose of this paper, "shell companies" are considered to be companies that are incorporated but which have no independent operations, significant assets, ongoing business activities, or employees.

2 'Beneficial ownership' or 'beneficial owner' refers to the natural person(s) who ultimately owns or controls a customer and/or the natural person on whose behalf a transaction is being conducted. It also includes those persons who exercise ultimate effective control over a legal person or arrangement. See also the section 'Definition of Beneficial Owner'.

3 From Panama-based law firm Mossack Fonseca, in 2015, and Bermuda-based law firm, Appleby, in 2017.

focus on the involvement of professional intermediaries, to guide global responses. This report attempts to address that need.

18. The publication takes a macro-level, global view of inherent vulnerabilities and is designed to support further risk analysis by governments, financial institutions, and other professional service providers. In undertaking further risk analysis, countries and private sector professionals should consider how the geopolitical and economic environment, as well as their own risk mitigation strategies, will affect the vulnerabilities associated with legal structures and the intermediary sectors that facilitate their formation and management.

METHODOLOGY

19. This project was co-sponsored by the FATF and Egmont Group. The project drew upon the unique and complementary capabilities of the FATF and Egmont Group to try to better understand the vulnerabilities linked to the concealment of beneficial ownership and the misuse of professional service providers. Led by Australia, Germany and France, the project team included experts from: Argentina, Canada, India, Israel, Italy, the Netherlands, New Zealand, the Russian Federation, Singapore, Switzerland, the United Kingdom, the United States, the Asia Pacific Group (APG) members, Bangladesh and Nepal, the Secretariat of the Inter-Governmental Action Group Against Money Laundering in West Africa (GIABA), the Group of International Finance Centre Supervisors (GIFCS), the Middle East and North Africa FATF-style regional body (MENAFATF) member, Egypt, the Committee of Experts on the Evaluation of Anti-Money Laundering Measures and the Financing of Terrorism (MONEYVAL), the International Monetary Fund (IMF), the OECD Global Forum on Transparency and Exchange of Information for Tax Purposes (OECD Global Forum), the World Bank, and the FATF Training and Research Institute (FATF TREIN).

20. In preparing this report, the project team analysed typologies studies, intelligence assessments, mutual evaluation reports, and academic reports published by a range of academics, international bodies, and governments. A detailed list of the public sources used is included in Annex A. In addition to these public reports, the project leads analysed intelligence reports produced by financial intelligence units (FIUs), criminal intelligence and law enforcement agencies, and other competent authorities to identify emerging trends and methods being exploited by criminals. In many cases, these reports are not available publicly, and only desensitised information has been used in this report.

21. An intelligence exchange workshop was conducted during the FATF Joint Experts Meeting, which was hosted by the Russian Federation in Moscow in April 2017, during which 13 delegations[4] presented case studies and intelligence insights relating to the concealment of beneficial ownership. A session was also held with the private sector, including representatives from banks, law societies, and TCSPs, which helped the project team to better understand their practices and challenges with regard to issues of beneficial ownership.

22. As part of a process of targeted private sector consultation, the project team sought comments from 12 international organisations and associations representing a spectrum of the private sector with a particular interest in the topic. The organisations represented global financial institutions, DNFBPs, data providers, FinTech and RegTech firms, and non-government organisations. The project team received comments from the Financial Transparency Coalition; the Institute of International Finance; the International Banking Federation; the International Federation of Accountants; the International RegTech Association; the International

[4] These 13 were Indonesia, Italy, Israel, Kyrgyz Republic, the Netherlands, Poland, Russia, Spain, Sudan, Switzerland, Venezuela, Europol, and the European Commission.

Union of Notaries; the Society of Trust and Estate Practitioners; the Wolfsberg Group; and from the International Bar Association's Anti-Money Laundering and Sanctions Expert Working Group. These comments included additional information on vulnerabilities, additional risk indicators, and methods for identifying beneficial ownership.

23. The primary sources of information for this report were the case studies[5] provided by FATF, the Egmont Group, and FSRB members. FATF TREIN undertook an analysis of the 106 case studies and typologies submitted by 34 jurisdictions. This is a relatively small sample of countries, and is weighted towards a few jurisdictions that provided a larger number of cases[6]. FATF TREIN's analysis was limited to the information known to the competent authorities and the information then communicated in the case summaries. In some cases, information relating to the money laundering scheme (the predicate offence or the location of the ultimate beneficial owner) was apparently not known by the competent authorities. In other cases, the information was not communicated in the case summary (for example, the type of legal person) or was anonymised (for example, the jurisdiction from which services were provided).

24. Despite these inherent limitations in the data, the case descriptions are substantially more detailed than those that can be found in recently published Mutual Evaluation Reports (MERs). Additionally, the cases, where the dates were identified, were generally recent, ranging from 2010 to 2017. The average sum of money laundered in each case, across all cases reviewed for this report, was in excess of USD 500 million.

25. This report has focused on the vulnerabilities and techniques of misuse associated with the concealment of beneficial ownership posed by legal persons, legal arrangements, and the professional intermediaries commonly involved in their establishment. It does not cover the threats posed by criminals and how these may differ among predicate offences, how different predicate offences may affect the methods used to obscure the beneficial owner, or the consequences associated with the residual risk. The report considers common techniques used by criminals to conceal beneficial ownership, and the environmental characteristics that contribute to the vulnerabilities posed by these legal structures and intermediaries. No effort has been made to provide a definitive list of high-risk jurisdictions based on these environmental risks, as numerous variables specific to particular jurisdictions make such a task untenable on a global level.

Horizontal Study of Enforcement and Supervision

26. In 2016-17, the FATF undertook a horizontal study on the enforcement and supervision of beneficial ownership obligations. The purpose of the study was to understand how beneficial ownership requirements were being supervised, in

[5] The case studies provided by law enforcement agencies and FIUs are focused on the various techniques, trends and methods used by criminals to conceal beneficial ownership.

[6] For example, the Netherlands submitted 19 cases for analysis, while Egypt submitted eight and Australia and the United States both submitted seven.

particular among key gatekeeper professions such as lawyers and TCSPs, as well as the role of registries in establishing and managing companies. The Horizontal Study was based on a survey of 64 jurisdictions, including 23 FATF members, who volunteered to provide information. The results of this analysis are attached at Annex B to this report and, where relevant, references to that study are provided throughout the publication.

DEFINITION OF BENEFICIAL OWNER

27. The FATF standards define "beneficial owner" as the "*natural person(s) who ultimately*[7] *own(s) or* control*(s) a customer and/or the natural person on whose behalf a transaction is being conducted. It also includes those persons who exercise ultimate effective control over a legal person or arrangement*"[8] [9]. This definition differs from the definitions of "beneficiary" and "beneficiaries", which can include both natural and legal persons and arrangements, and often relate to:

- the recipients of charitable, humanitarian, or other types of assistance through the services of an NPO[10], or
- the person(s) entitled to the benefit of a trust arrangement[11] or insurance policy[12].

28. The distinction between "beneficial owner" and "beneficiary" relies on the concept of "ultimate" control or benefit, which refers to the *natural person* who ultimately controls or benefits from an asset or transaction through direct or indirect means. Importantly, a "beneficial owner" must always be a natural person, as a legal person cannot exert "ultimate" control over an asset. This is due to the fact that legal persons are always controlled, directly or indirectly, by natural persons. Therefore, while a legal person or arrangement can be the beneficiary of an asset or transaction, determining the beneficial owner requires the discovery of the natural person(s) who ultimately control or benefit from the legal person or arrangement.

29. The concept of ultimate benefit and control is also central to distinguishing "beneficial" ownership from "legal" ownership. The legal owner of an asset is the natural or legal person or arrangement that holds the legal title of that asset; however, legal ownership is not always essential in order to exert control over, or benefit from, an asset, particularly when the asset is held in trust or owned by a legal person. It is therefore essential to determine the natural person who controls an asset, rather than the legal owner of that asset.

30. Determining ultimate control can be problematic, and is often the principal challenge of determining beneficial ownership. In the context of a company, control can be exerted by shareholders, directors, and senior management. While shareholders are generally considered to exert the greatest level of control over a

---

7 Reference to "ultimately owns or controls" and "ultimate effective control" indicates situations in which ownership/control is exercised through a chain of ownership or by means of control other than direct control.

8 This definition should also apply to beneficial owner of a beneficiary under a life or other investment-linked insurance policy.

9 FATF, 2012a: p. 113.

10 *Ibid,* p. 59.

11 *Ibid,* p. 113.

12 *Ibid,* p. 62.

company, due to their ability to dismiss directors and other senior staff and because they stand to benefit from the profits of the company, the role of directors and senior management cannot be overlooked. In the context of trusts, the trustee exerts control over an asset but is legally bound to act in the interests of the beneficiary, who generally cannot exercise any control over the trust. The settlor and protector of the trust may also continue to exert some level of control or influence over the trust, despite having relinquished legal ownership of the asset to the trustee for the benefit of the beneficiary. This can complicate any efforts to determine who should be considered the beneficial owner and can necessitate further efforts to determine the true nature of the trust relationship.

31. Control can also be exerted via third parties, including professional intermediaries, family members, associates, nominees, and other natural persons who have been recruited or coerced to act on behalf of the ultimate beneficial owner. The use of nominees and other third parties can complicate efforts to identify the ultimate beneficial owner of an asset or transaction, as the beneficial owner may not be recorded in formal company or trust records in many jurisdictions. While it is important for competent authorities to have the ability to understand the identity of the natural person controlling an asset, it is also important for competent authorities to understand who benefits from it.

32. Further guidance on the definition of "beneficial owner" is available in the *FATF Guidance on Transparency and Beneficial Ownership*[13].

13 FATF, 2014: p. 8.

STRUCTURE OF THE REPORT

33. The report is divided into four sections, which are designed to analyse the separate aspects that contribute to the concealment of beneficial ownership. The sections are arranged as follows:

- **Section 1** briefly outlines the **main characteristics of various legal persons and arrangements**. By analysing the case studies provided in support of this report, as well as the experiences of law enforcement agencies and FIUs in various countries, this section of the report provides an overview of the general features and functions of legal persons and arrangements that make them vulnerable to misuse for the purposes of concealing beneficial ownership.
- **Section 2** provides an overview of the **methods and techniques** commonly used to conceal beneficial ownership. The purpose of this section is to analyse how beneficial ownership is disguised using a range of legal structures, intermediaries, and fraudulent activities. The following three key methods are assessed in this section: generating complex ownership and control structures, obscuring the relationship between the asset and the beneficial owner, and falsifying activities. These methods can involve a range of techniques, the assessment of which will form a foundation for the assessment of vulnerabilities associated with legal persons, arrangements, and intermediaries in later sections of the report.
- **Section 3** analyses key **professional intermediary sectors** involved in the establishment and management of legal persons and arrangements, namely the legal, accounting, and TCSP sectors, and is the focus of this report. This section provides an overview of the principal role of these intermediary sectors in the establishment of legal structures, the services they provide that are commonly exploited by criminals, and other features which make these professionals vulnerable to exploitation. The purpose of this assessment is to determine how professional intermediaries are being exploited, wittingly and unwittingly, to affect schemes and methods designed to obscure beneficial ownership in order to inform risk assessments and mitigation strategies.
- **Section 4** provides an overview of key **environmental vulnerabilities**, including jurisdictional vulnerabilities and vulnerable business practices, which contribute to the vulnerabilities associated with the legal persons, legal arrangements, and professional intermediaries assessed in the rest of the report. The section does not attempt to provide a definitive list of high-risk jurisdictions, as jurisdictional risks will differ from country to country. Rather, the purpose of this section is to support risk analysis activities performed by FIUs, financial services providers, and professional intermediaries.

34. In analysing the main characteristics leading to misuse of legal persons and legal arrangements, the inherent vulnerabilities associated with professional intermediaries, and the environmental vulnerabilities that may facilitate their

appearance, this report identifies a number of issues for consideration. A broad theme underlying these issues is information, including possible ways to improve the reliability, access and mechanisms to share that information more effectively at domestic and international levels. In some instances, these issues for consideration aim to inform responses by individual governments in taking further action; other issues identify areas for further research and engagement.

SECTION 1 — MISUSE OF LEGAL PERSONS AND ARRANGEMENTS

35. Legal persons and arrangements play an important role in global commerce and trade, and are the cornerstone of modern economies. For the most part, legal persons and arrangements serve legitimate, lawful, and meaningful purposes. However, the unique legal status of legal persons and arrangements also lend themselves to complex schemes designed to conceal the true beneficial owners and, in many respects, concealing the real reason for holding assets and conducting related transactions. Legal persons can lend legitimacy to unlawful activities, hide the involvement of key stakeholders and controlling parties, and generally frustrate criminal investigations domestically and internationally. Whilst acknowledging the legitimate role of legal persons and arrangements, this section will briefly introduce the characteristics of various types of legal persons and arrangements, and how they are exploited to facilitate crime and conceal beneficial ownership.

36. It is important to note that the information in this section is designed to assist financial institutions and professional intermediaries in analysing risk. It is not intended to suggest that any particular form of legal person or arrangement to be considered high-risk or low-risk by default. Private sector entities are encouraged to apply a risk-based approach to customers and transactions on a case-by-case basis.

Legal persons

37. Seen from a global perspective, there are numerous different kinds of legal persons that exist under a multitude of different company laws, making it difficult for law enforcement to trace assets held by legal persons across numerous countries. Legal persons, specifically companies, are prominent features of most schemes and structures designed to obscure beneficial ownership. Almost all of the cases analysed for this report involved at least one company. The separation of legal and natural personalities offered by companies is a key feature influencing this popularity.

38. Given the broad range of legal persons in existence across the globe, an analysis of the similarities and differences among forms of legal persons would have exceeded the scope of this project. Furthermore, most of the case studies did not provide specific insights into the types and legal peculiarities of the legal persons used in the money laundering schemes. As such, the report has focused on broader characteristics of legal persons, and has not endeavoured to assess all of the specific forms available. One of the factors that might contribute to a higher frequency of misuse of a particular type of legal person is the absence of accurate and up-to-date information on its ownership and management, which, as evidenced by the Horizontal Study[14], remains a challenge in many jurisdictions.

39. A categorization of legal persons must differentiate between partnerships on the one hand and corporations or capital companies, in the sense of trading

[14] See, in particular, Question 3 of the Horizontal Study at Annex B.

companies, on the other. In a general **partnership**, ownership and control are exercised by all partners specified in the partnership contract. In that regard, the ability to misuse a general partnership to disguise beneficial ownership is significantly reduced, as management is exercised immediately by the partners and there is no legal segregation between the natural persons and an independent legal person. The same can be said of general partners of a limited partnership; however, limited partners can benefit from a certain degree of anonymity by acting solely as an investing partner regardless of their actual role in the partnership. However, due to their limited liability, limited partners generally have only limited control over the partnership.

40. In contrast to partnerships, the capital participation of shareholders is the focus of **capital companies**, not their "personality". Unlike partnerships, capital companies are always a separate legal entity, and are often controlled and owned through shares, which can be transferred and sold regularly without affecting the existence of the capital company itself. The hybrid construction of limited liability companies (LLCs) (or private company limited by shares (LTD)) and foundations differ from capital companies and are outlined in further detail below.

41. The main feature of a company is the strict separation of the natural person investing in and owning the company by shares and the legal personality of the company itself. A company's legal personality allows it to conduct business and own assets under its own name, assuming all rights and being liable for all debts and obligations it enters into. This legal structure allows a natural person to take part in business without disclosure of their personal identity[15]. Even though shareholders own the company, usually they are not actively involved in management functions, but instead elect or appoint a board of directors to manage the company in a fiduciary capacity[16].

42. Private companies, such as **limited liability companies** (LLC)[17], are restricted in different ways (they may have a limited number of shareholders, require notarization for the transfer of shares, etc.) depending on the jurisdiction in which they are established. LLCs combine elements of partnerships and companies. While differing slightly from country to country, the primary concepts are the same. Unlike publicly traded companies, they do not offer their interests to the public, and are therefore generally subject to less stringent reporting and oversight regimes. Shares in a limited liability company cannot be publicly offered and traded, and

15 Securities laws may provide for transparency to a certain degree, such as through notification requirements for stock-listed companies if the shareholder exceeds a certain amounts of shares.

16 Van der Does de Willebois, E. et al. (2011: p. 162) claim that companies are the most misused corporate vehicle documented in the study. While the study focuses on corruption, it discusses in detail how corporate vehicles can be used to disguise of ownership and control.

17 The term "limited liability company" here is intended to encompass the various forms of this kind of company in several jurisdictions (e.g. LLC in US; Pvt Ltd. in UK, Ireland, India, Hong Kong; GmbH in Germany, Austria, Liechtenstein; BV in the Netherlands; SARL in France).

often some limitations apply to the transfer of shares. While members can manage a LLC directly, this function is usually performed by managers or directors. The governing rules on ownership and control rights are determined by a contract, which may not be publicly available. The contract gives the members a high degree of freedom in determining the division of ownership and control among the members,[18] thus allowing latitude to exploit nominees and obscure true ownership and control arrangements in order to obscure beneficial ownership.

43. **Foundations** are separate legal entities with no owners or shareholders and are generally managed by a board of directors. Foundations are generally restricted to the provision of a service for public benefit, although several jurisdictions allow foundations to be established to fulfil private purposes (private foundations[19]). Safeguards usually exist to ensure that a foundation is sufficiently independent from its founder; however, foundations are vulnerable to exploitation for money laundering purposes, particularly when laws allow the founder to exert control over the foundation. Only a small number of the cases analysed for this report involved the use of a foundation.

44. As previously stated, this report has not drawn any specific conclusions on the vulnerabilities of specific forms of legal person, as cases provided did not contain sufficient information on the types of legal persons used in financial crimes to allow conclusions to be drawn. However, it can be stated that almost all of the cases analysed for this report involved the use of a company, which indicates that these vehicles are significantly attractive for misuse. Furthermore, only a small number of cases involved a foundation, and a very small number of the case studies involved a partnership to obscure beneficial ownership.

45. A range of characteristics have been identified which allow legal persons to be exploited by criminals to conceal beneficial ownership. Many of these – including the use of shell, shelf[20] [21], and front companies[22], the construction of complex chains

18 Van der Does de Willebois, E. et al., 2011: p. 164.

19 Private foundations pursue not-for-profit activities on behalf of their members or founders. The structure can be found in many countries including Germany, Bulgaria, Panama, the Netherlands, and Sweden. A private foundation is usually funded by an individual or small group of individuals. It has legal personality by virtue of a written act and through recognition of its status by the supervisory authority. The initial registration of a foundation established to fulfil private purposes is usually faster and less demanding than the process required for a public foundation. Accounting requirements are also more straightforward, and maintenance and administration costs also tend to be lower.

20 For the purpose of this paper, a "shelf company" is considered to be an incorporated company that has inactive shareholders, directors, and secretary and is left dormant for a longer period even if a customer relationship has already been established.

21 As *shelf companies* can also be considered a type of *shell company*, particularly following their sale or transfer of ownership, it is possible that jurisdictions referred to former shelf companies as shell companies when providing case studies.

22 For the purpose of this paper, a "front company" is considered to be a fully functioning company with all the characteristics of a legitimate business, which ultimately serves to disguise and obscure the illicit financial activity being conducted. Front companies are often cash intensive businesses.

of ownership using multiple legal persons, the splitting of assets and company administration across different countries, and the use of formal and informal nominees – have been analysed in Sections 2 and 4 of this report.

Legal arrangements

46. One way to translate a fiduciary relationship into a legal agreement, especially in common law countries, is the settlement of a trust. Although there is no universal definition, from a functional point a view a trust can be said to separate the legal property, administration, and economic benefit of an asset[23].

47. **Trusts** can be used to achieve varying objectives, including:

- transferring the administration of an asset to a third party to organise an inheritance
- protecting assets for children, classes of family members or vulnerable adults
- managing in common an asset for a pool of corporations (like syndicated loans in corporate banking, where a lead lender originates and administrates the loan for the other secondary lenders, who are only signing the loan agreement)
- financing charity through an intermediary gathering funds
- investing money with the view to finance an important expense in the future (e.g. education fees or retirement).

48. While trusts are sometimes a source of misunderstanding between common law and civil law experts, they have spread across countries of both legal traditions. Although they have a long and established history under common law, they are a more ambiguous concept in civil law countries; however, it is worth noting that similar "trust-like" legal arrangements exist in some civil law countries, presenting the same structure or functions, like the "*fiducie*" in some civil law countries (although this latter type of legal arrangement cannot be used to facilitate a legacy)[24].

---

[23] The FATF Recommendations makes use of Article 2 of the Hague Convention on the Law Applicable to Trusts and on their Recognition (the Hague Trust Convention) when considering how to define a trust. Key characteristics of a trust according to the Hague Trust Convention include the separation of the assets from the trustee's estate, the title of the assets stand in the name of the trustee or in the name of another person on behalf of the trustee, and the provision of power to the trustee to manage the assets in accordance the terms of the trust.

[24] Trusts developed in common law countries, but it is important to note that civil law countries which do not recognize trusts have often put in place different mechanisms to fulfil the same functions as trusts. For instance, from a European perspective, one can consider that the widely developed "life insurance" contract uses the same principles as a trust, where a settlor asks a trustee to administer funds on behalf of a third party (the beneficiary).

49. The Horizontal Study found that 60% of responding jurisdictions provided for the creation of trusts or other similar legal arrangements under their domestic laws[25]. A further 21% of responses were from jurisdictions which are not the source of law for legal arrangements, but which give some recognition to foreign legal arrangements and permit foreign legal arrangements to be created or administered by gatekeepers or others within their jurisdiction (e.g. under the Hague Trust Convention). Finally, 19% of responses indicated they do not recognise (e.g. in courts or in their tax system) any legal arrangements, whether based on domestic or foreign law.

50. Apart from the intent to separate legal and beneficial ownership, it is not clear precisely why criminals exploit trusts in money laundering schemes. There may be a multiplicity of reasons which will vary on a case-by-case basis. Criminals may exploit the secrecy provisions inherent in certain legal arrangements to prevent competent authorities from exerting authority to unravel the true ownership structure. This is particularly likely when schemes involve a foreign trust. Indeed, the use of foreign trusts might convey risks of unlawful practices owing to criminals making the most of the differing treatment of these legal arrangements by tax authorities and of the potential lack of coordination between them. From the cases analysed for this report, criminals used foreign jurisdictions in broadly the same proportions when establishing legal persons and legal arrangements.

51. The complexity and expense of establishing legal arrangements may limit their use when compared to the prolific exploitation of legal persons by criminals. The benefits associated with the use of legal arrangements, principally the separation of legal and beneficial ownership, might not be sufficiently significant to merit the additional investment when compared to the cost, availability and characteristics of legal persons. The relative frequency of the use of legal arrangements in the cases analysed for this report (approximately one-quarter of all cases) may be due to the fact that many of the cases involved sophisticated predicate offences that yielded significant proceeds and thus warranted the additional investment.

25 See, in particular, Question 2 of the Horizontal Study at Annex B.

SECTION 2 — TECHNIQUES USED TO OBSCURE BENEFICIAL OWNERSHIP

52. Criminals employ a range of techniques and mechanisms to obscure the beneficial ownership of assets and transactions. Many of the common mechanisms/techniques have been compiled by FATF in previous studies, including the 2014 *FATF Guidance on Transparency and Beneficial Ownership*. According to the FATF guidance report[26] beneficial ownership information is commonly obscured through the use of:

- shell companies[27], especially in cases where foreign ownership is spread across jurisdictions
- complex ownership and control structures
- bearer shares and bearer share warrants
- unrestricted use of legal persons as directors
- formal nominee shareholders and directors where the identity of the nominator is undisclosed
- informal nominee shareholders and directors, such as close associates and family
- trusts and other legal arrangements which enable a separation of legal ownership and beneficial ownership of assets
- intermediaries in forming legal persons, including professional intermediaries.

53. Additional techniques and mechanisms which were not explored in the FATF's previous guidance include the use of shelf companies[28] and front companies[29], misleading naming conventions, false loans and invoices, and declaring numerous beneficiaries. Overall, the key techniques used by criminals to obscure beneficial ownership can be categorised within three broad methods:

26 FATF, 2014: p. 6.

27 For the purpose of this paper, "shell companies" are considered to be companies that are incorporated but which have no independent operations, significant assets, ongoing business activities, or employees.

28 For the purpose of this paper, a "shelf company" is considered to be an incorporated company that has inactive shareholders, directors, and secretary and is left dormant for a longer period even if a customer relationship has already been established.

29 For the purpose of this paper, a "front company" is considered to be a fully functioning company with all characteristics of a legitimate business that is usually cash intensive.

- **generating complex ownership and control structures** through the use of legal persons and legal arrangements, particularly when established across multiple jurisdictions
- **using individuals and financial instruments to obscure the relationship between the beneficial owner and the asset**, including bearer shares, nominees, and professional intermediaries, and
- **falsifying activities** through the use of false loans, false invoices, and misleading naming conventions.

54. These methods and techniques are outlined in greater detail below in order to contextualise the role of legal persons, arrangements, and professional intermediaries in disguising beneficial ownership.

Generating complex ownership and control structures

55. A key method used to disguise beneficial ownership involves the use of legal persons and arrangements to distance the beneficial owner from an asset through complex chains of ownership. Adding numerous layers of ownership between an asset and the beneficial owner in different jurisdictions, and using different types of legal structures, can prevent detection and frustrate investigations.

56. More than half of the case studies submitted in support of this report made use of complicated ownership structures, whereby control was affected through a combination of direct and indirect control. These complex structures were achieved through the establishment of chains of ownership, which often involved a number of legal persons and arrangements across multiple countries, distancing the beneficial owner from the assets of the primary corporate vehicle. In only a small number of cases did the beneficial owner retain legal ownership through a complicated structure without using an intermediary. The Russian case study below (Case Study 88) demonstrates how complex ownership structures, involving numerous foreign companies and bank accounts, were used to disguise the beneficial ownership of embezzled public funds and other proceeds of crime.

57. There are few restrictions on the establishment of chains of ownership within and across jurisdictions.[30] Legal persons are allowed to own shares in companies established in any country, while many countries also allow legal persons to be registered as the directors of companies. Shell companies and front companies feature prominently in most complex structures identified by FIUs and other competent authorities, while trusts and other legal arrangements are less frequently identified.

58. Complex ownership and control structures are not, in and of themselves, unlawful. Often, these corporate structures serve legitimate purposes and facilitate a wide range of commercial activities, entrepreneurial ventures, and the management of personal finances. Advances in communications technology, ease of travel, and other effects of globalisation are increasing the accessibility of global finance and business centres to all population segments, beyond large corporations and high net

30 Van der Does de Willebois, E. et al., 2011: p. 53.

worth individuals. Complex ownership structures can simplify business transactions for companies that regularly trade transnationally, provide services to international clients, or conduct parts of a company's operations (such as manufacturing or research and development) in another country. Often complex control structures are used by family businesses, by government-owned or operated public or commercial business ventures, and by publicly traded companies to structure their affairs. In these instances, a financial institution, legal/accounting professional, or other service provider will be in a position to readily ascertain the beneficial ownership of the structure. These structures are generally transparent to relevant authorities and present minimal vulnerabilities for disguising beneficial ownership.

59. Despite the legitimacy of many complex ownership and control structures, these structures can also be used to obscure beneficial ownership, avoid taxation obligations, conceal wealth, and launder the proceeds of crime. Complex structures are also used in fraudulent investment schemes, phoenix activity[31], false invoicing, and other types of fraud. The majority of case studies that involved tax evasion, fraudulent investment schemes and fraud as predicate offences also utilised complex structures to conceal beneficial ownership.

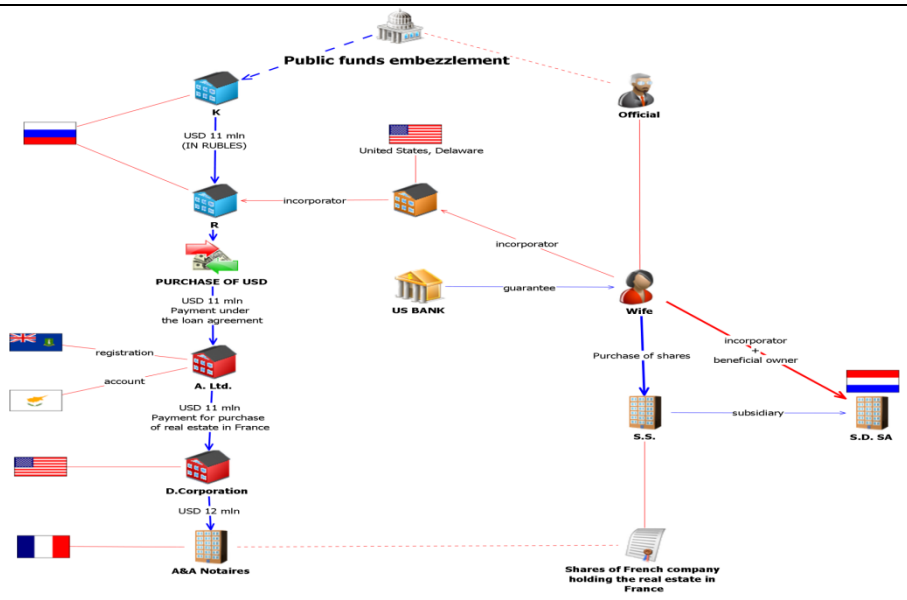
60. The use of numerous legal persons or arrangements within a single legal structure, as well as the use of numerous bank accounts and nominee directors, can significantly impair efforts by FIUs, other competent authorities, and financial institutions to identify and verify the beneficial owner. This is further frustrated when legal ownership structures span numerous jurisdictions. Despite concerted efforts by many countries to improve the sharing of financial intelligence and company information, mutual legal assistance and other forms of bilateral or multilateral information requests are often slow to action or complicated by various legal hurdles. Law enforcement agencies and FIUs report that, following lengthy information-sharing processes with international counterparts, the information received often demonstrates that the company of interest is owned by another legal person or arrangement in another country. The Horizontal Study demonstrated that there are considerable challenges in ensuring accurate and up-to-date information on legal persons in many jurisdictions[32]. As a result, the greater the number of companies and countries involved in a corporate structure, the greater the challenges associated with discovering the ultimate beneficial owner in a timely manner.

31 Illegal phoenix activity is the creation of a new company to continue the business of a company that has been deliberately liquidated to avoid paying its debts, including taxes, creditors and employee entitlements.

32 See, in particular, Question 3 of the Horizontal Study at Annex B.

Case Study 88 – Russia

Embezzled public funds worth RUB 300 million (Russian rubles) (USD 11 million) were transferred from the account of Company K to the account of Company R. Company R, a Delaware corporation, was owned and managed by the Russian wife of the suspect, a state official. The same day, Company R transferred USD 11 million as a loan to an account of Company A (BVI) held by a Cypriot bank. Company A then transferred more than USD 11 million to the Company D (US) to purchase real estate in France. Company D transferred more than USD 12 million to a French Notaries Bureau. Information from the FIU of Luxembourg showed that one of the US banks acted as a guarantor for the suspect's wife in a transaction to purchase of shares of a French company – and the holder of the real estate. The transaction was conducted via an S.S. company – a French subsidiary of a Luxembourg S.D. SA., incorporated and owned by the same individual. Analysis showed that these two chains were interrelated and the real estate was purchased with the proceeds of public funds embezzled for the benefit of the state official's wife.



Shell and Shelf Companies

61. The 2014 *FATF Guidance on Transparency and Beneficial Ownership* defined **shell companies** to be "*companies that are incorporated but which have no significant operations or related assets*"[33]. The FATF's 2013 report, *Money Laundering and Terrorist Financing Vulnerabilities of Legal Professionals*, used a similar definition[34] in its description of the use of shell companies as a technique to place or layer illicit funds. As outlined in the 2013 report, shell companies can serve

33 FATF, 2014: p. 6.

34 FATF, 2013: p. 55.

legitimate purposes, such as serving as a transaction vehicle for company mergers or protecting a corporate name from being used by another party.

62. Despite their legitimate uses, shell companies are the most common type of legal person used in schemes and structures designed to obscure beneficial ownership. Of the case studies analysed for this report, more than half specifically referred to the use of shell companies; however, it is likely that the actual figure is higher, as many countries are likely to have referred to legal persons in a general sense, rather than specifying the nature of the company involved. Shell companies can be used in complex structures involving the distribution of assets across multiple companies in multiple jurisdictions. When these structures are used for illicit purposes, money may flow through multiple layers of shell companies before finally being withdrawn in cash or transferred to its final destination internationally. Of the cases that included shell companies, the majority included a corporation located in a foreign jurisdiction.

63. Shell companies can be difficult to detect, as their incorporation is often no different from companies formed for other purposes; however, there are a number of characteristics and indicators that may indicate that a company is a shell, including the use of only a post-box address, a lack of personnel (or only a single person as a staff member), and a lack of payments in taxes and/or social benefit payments. Furthermore, many shell companies do not have a physical presence, and are geographically anchored through the use of TCSPs and nominee directors whose role in the management and direction of the shell company is limited. This is a particular problem with shell companies and presents a meaningful vulnerability that should be considered when doing business with companies that exhibit characteristics of being a shell company.

64. The use of shell companies in complex corporate structures designed to disguise beneficial ownership is a consistent and enduring technique used by criminal groups, corrupt individuals, and complicit professionals. The increased availability of shell companies to foreign nationals, which has been made possible by the growth of global communications and the convergence of international trade markets, has exacerbated this issue.

65. As with shell companies, **shelf companies** serve legitimate purposes. In theory, shelf companies allow investors, or people planning a new undertaking, the possibility of securing a company structure within hours to serve a time-sensitive need. Where shelf companies have already been in operation for a number of years, the new owner can use this history to help secure business relationships or lines of credit; some shelf companies may already have established customer relationships with financial institutions, facilitating access to the international financial system.

66. When the shelf company is sold, the inactive shareholders transfer their shares to the purchaser, and the directors submit their resignations. As part of the transfer, the purchaser may receive the company's credit history, if it is available. Occasionally, the company directors will continue to function as nominees, particularly when the shelf company is established and sold by a TCSP. In these cases, the only apparent change in the company is a change of ownership. However, the change of ownership will only be apparent if it is properly recorded in company registries. This is often "overlooked" in cases where shelf companies are used to disguise beneficial ownership. Law enforcement agencies and FIUs have reported

that the failure to properly record the change of ownership following the sale of a shelf company is a concern.

67. Despite the theoretical use of shelf companies in the concealment of beneficial ownership, only two of the case studies analysed for this report included specific references to the use of shelf companies. The prevalence of shelf companies in schemes designed to obscure beneficial ownership is, therefore, unknown. It is possible that the use of shelf companies to obscure beneficial ownership is higher than demonstrated in the case studies in this report, as some shelf companies are likely to have been referred to as "shell companies" in the case studies. It is also likely that the value of shelf companies resides predominantly in the pre-existence of nominee directors and shareholders. Though convenient, many TCSPs will offer nominee services to newly established shell companies, making shelf companies less necessary.

Case Study 19 – Ecuador
Public officials in Ecuador, along with relatives and individuals connected to law firms, created a series of shelf companies in several countries for the purpose of receiving bribe payments. The bribe payments were effected through individuals with links to companies that provide goods and services to a public institution in the oil sector. To send the payments, and to hide the real beneficiaries of the transfers, the suppliers created companies in Panama, Hong Kong, British Virgin Islands, Bahamas, Uruguay, and the US.

Case Study 26 – Egypt
The accused created six British Virgin Island shell companies and used the bank accounts of these shell companies to launder the proceeds of crime of a total amount of more than EGP 1 billion (Egyptian pounds). The predicate offence was "illegal earning". The six shell companies all had a nominee shareholder.

Front company

68. A "front company" is a fully functioning company, with assets, income, expenses. It also exhibits other characteristics associated with the operation of a legitimate business. Any functioning company can be a front company, but the most common form of front company is one that operates in the customer service industry (such as a restaurant, night club, or salon) as these businesses commonly handle cash. Front companies can be exploited to launder the proceeds of crime through the integration of illegitimate funds with legitimate income, often by disguising the illegitimate funds as cash sales made during the course of business. When this is done, these funds can then be deposited into the company's bank account and used by the beneficial owner (if the beneficial owner is also the business owner) or they may pay false expenses in order to transfer the money to the true beneficial owner. Unlike many money laundering operations, where criminals attempt to conceal their illicit wealth and may also attempt to avoid paying

tax on that wealth, criminals who use front companies will occasionally pay company tax on the illicit income to further legitimise the wealth. One case study from Australia (Case Study 2) demonstrates how a front company was used to disguise the proceeds of crime as employee salary payments through the use of a transport company and a third-party salary payment service provider.

69. While front companies have obvious applications to the concealment of illicit wealth more generally, they also conceal the beneficial ownership of that wealth at the placement stage of the laundering process. In the normal course of business, company income is essentially the transfer of money and value from one beneficial owner (the customer) to a second beneficial owner (the business owner). When a front company is used to launder illicit wealth, the "customer" is often the business owner or a close associate. However, company records will record the transfer as having originated from a customer interaction, thereby concealing the business owner or associate as the originating beneficial owner. Over a quarter of the case studies submitted in support of this report involved the use of front companies.

70. Front companies are not always cash-intensive businesses. With today's digitised and transnational economy, front companies can take the form of anything that is expected to generate income from multiple sources. Front companies can also be established to commit fraud, where the company appears to offer a service or perform a function that it does not offer or perform in order to defraud investors and embezzle public funds, or to obscure the beneficial owner of an asset as part of a complex ownership structure, as demonstrated by one case from the US (Case Study 99 below).

71. Financial institutions have also identified instances where informal nominees are solicited by crime groups to establish front companies as a means of circumventing due diligence, money laundering controls or sanctions[35]. This situation arises when a crime group, which is already operating a company, seeks to access the financial system by arranging for an employee to set up an otherwise legitimate operating company in another jurisdiction, where that employee may or may not be an owner of the new company, but does control it typically as an officer. In this situation, the due diligence performed on the new company would not typically identify the indirect connection to the original company, which is hidden, and the new company would act as a front company by engaging in transactions and accessing the financial system in a way that the hidden company could not.

72. While front companies were less prevalent than shell companies in the case studies, it does appear that the use of front companies is a popular technique for the concealment of beneficial ownership and illicit wealth[36]. Although front companies are occasionally directly owned and operated by the beneficial owner, their steady stream of legitimate income serves to conceal the beneficiary of the income itself. For this reason, criminals will continue to exploit front companies to conceal beneficial ownership and integrate illicit wealth.

35 See section 3 for further information.

36 Over a quarter of the case studies submitted in support of this report involved the use of front companies.

Case Study 2 – Australia

An Australian drug syndicate used multiple money laundering methods to launder more than AUD 1 million worth of proceeds of crime. Trust accounts, a front company, high-value goods and real estate were used to launder the profits from cannabis sales. The syndicate also misused the services of two professional facilitators (an accountant and solicitor) to facilitate its criminal activity.

One of the four money laundering methods utilised by the syndicate involved the transfer of illicit wealth to syndicate members in the guise of legitimate wage earnings. The syndicate members employed a company that specialised in processing wages to pay them a wage from their new transport company. Members of the syndicate deposited the cash proceeds of the cannabis sales into the transport company's account. From this account the funds were transferred to the wage processing company. The wage processing company then paid these funds to the syndicate members, seemingly as legitimate wages. Syndicate members were paid an annual wage of around AUD 100 000.

Case Study 99 – United States

U.S. authorities identified front companies used to conceal the ownership of certain U.S. assets by Bank Melli, which was previously designated by US authorities for providing financial services to entities involved in Iran's nuclear and ballistic missile program. Bank Melli was also subject to a call for enhanced vigilance in UNSCR 1803. The Department of Justice (DOJ) obtained the forfeiture of substantial assets controlled by the Government of Iran. These assets included a 36-story office tower in Manhattan at 650 5th Avenue having an appraised value of more than USD 500 million, other properties, and several million dollars in cash. The ownership of the office tower was split between Bank Melli (40%) and the Alavi Foundation (60%), which provided services to the Iranian government, such as transferring funds from the office tower to Bank Melli.

Splitting company incorporation and asset administration over different countries

73. The ability of legal persons to establish and administer banking relationships in different countries is another vulnerability commonly exploited to obscure beneficial ownership. Keeping accounts abroad is an important and legitimate aspect of conducting business in an international market; however it is often difficult for banks to conduct robust customer due diligence on foreign companies. Moreover, the splitting of assets and company incorporation can impede investigation of the business objective of the company and its ownership and control structure, the purpose of transactions, and, most notably, the clarification of the company´s beneficial owner.

74. A large number of cases involved the splitting of company incorporation and asset administration over different countries. In most cases, shell companies were

used to open bank accounts in foreign jurisdictions. In some instances, several accounts were opened in different countries for companies incorporated in foreign jurisdictions, enabling rapid movement of funds over numerous frontiers. This impedes law enforcement efforts to trace the assets.

Case Study 76 – Netherlands
International company A headquartered in The Netherlands paid corruption funds to a government employee via letter box companies. An international company was registered in an international jurisdiction, with a government employee listed as the beneficial owner but with nominee shareholders and directors. Payments were made via a Dutch bank account of a subsidiary of the international company to an account of the international company in Estonia and via an enterprise registered in Hong Kong, after which these funds were paid into bank accounts in a foreign jurisdiction and from there to a Luxembourg bank account of the international company. Bribes were also paid to charities that were directly associated with government employees. In order to account for the bribes, false invoices were entered in the accounting records.

Trusts and other legal arrangements

75. Trusts and other legal arrangements can be used to enhance anonymity by adding an additional layer of complexity through the separation of the legal and beneficial ownership of an asset. In a trust, the legal title and control of an asset are separated from the equitable interests in the asset. This means that different persons might own, benefit from, and control the trust, depending on the applicable trust law and the provisions of the document establishing the trust (for example, the trust deed). In some countries, trust law allows for the settlor and beneficiary (and sometimes even the trustee) to be the same person. Trust deeds also vary and may contain provisions that affect where ultimate control over the trust assets lies, including clauses under which the settlor reserves certain powers - such as the power to revoke the trust and have the trust assets returned, as was possibly the initial intention of the corrupt individual in the Cayman Islands case below (Case Study 14). Other vulnerable features include directed trust arrangements, general or special powers of appointment exercisable by the settlor, and loans repayable on demand to the trust (by the settlor or others). Trusts and other legal arrangements were identified in approximately one-quarter of the case studies analysed for this report. Most of the examples involved common law express trusts, with two making use of a civil law *fiducie*.

76. The enhanced anonymity offered by trusts and trust-like legal arrangements can provide significant benefits to a criminal operation, and can present challenges to financial transparency. The ability to separate legal ownership from beneficial ownership presents a range of challenges for authorities and service providers seeking to determine beneficial ownership; it can also pose a number of risks to the criminals who utilise them. Legal arrangements require the criminal to relinquish legal ownership and control of the asset to a trustee to manage the benefit (or title) of the asset. The introduction of a trustee may pose a vulnerability to the criminal

operation, for instance if the trustee is not complicit, or if control over the trustee is not guaranteed.

77. Whereas the situation of criminals setting up a complex structure involving multiple trusts seems relatively rare (Case Study 42, below, provides one rare circumstance), the combination of a trust interacting with at least one company appears more frequently in the case studies. Almost all of the cases that involved the use of a legal arrangement also involved a company or other legal person. This demonstrates that trusts and similar legal arrangement are rarely used in isolation to hold assets and obscure beneficial ownership, but generally form part of a wider scheme; it might also show that schemes that only involve a trust may be more difficult for authorities to identify. The interaction of the trust with other legal persons adds an additional layer of complexity and helps frustrate efforts to discover beneficial ownership. As further demonstrated by the outcomes of the Horizontal Study[37], information on legal arrangements is rarely available, or is subject to significant challenges with regard to its relevance and accuracy. Case Study 13 from the Cayman Islands (included below), is a good example of this method being used to generate complexity through transfers between a company and a trust.

78. In the cases analysed for this report, legal arrangements were rarely found to hold the actual proceeds of crime. Their role in most schemes was to build additional layers of complexity and further anonymise transactions. When chosen as part of a multi-level ownership structure, trusts appear to enter a company's shareholder register in place of the beneficial owner, thereby disguising the beneficial owner of the shares. Approximately half of the cases that involved a legal arrangement also involved shares, which was proportionally higher when compared to the entire sample population. One case study from Australia (Case Study 2) involved a crime syndicate that created bank accounts held in trust, as well as investment companies, as part of its money laundering scheme, and instructed an accountant to use cash from the proceeds of cannabis sales to purchase shares in the name of the trust accounts and investment companies. The purpose of the trust in this arrangement was to further distance the assets (the shares) from the beneficial owners.

79. Although not as common as the use of legal persons, the frequency of the use of trusts and other legal arrangements is not insignificant. It is possible that, despite the benefits associated with trusts and other legal arrangements, which offer significant opportunities to enhance anonymity by providing a partition between the legal and beneficial ownership of the property, the complexity and expenses associated with establishing and managing a legal arrangement may make them less attractive to criminals. It is also possible that the use of legal arrangements may increase the difficulty of investigating and identifying the beneficial owner, thereby explaining their relatively low prevalence in the case study sample.

[37] See, in particular, Questions 2 and 3 of the Horizontal Study.

Case Study 42 – Italy

The Nucleo Polizia of Milan conducted a preventive seizure of funds traceable to a single family, which were held in the Channel Islands, for a total value of EUR 1.3 billion. The assets were concealed through a complex network of trusts. Multiple trust accounts hid the beneficiaries of assets consisting of public debt securities and cash. The investigation established that between 1996 and 2006 the subjects placed their assets in Dutch and Luxembourg companies through complex corporate operations and by transferring them to different trusts in the Channel Islands. Subsequently, the funds were legally repatriated through a tax amnesty in December 2009. The investigation identified chartered accountants who had, over time, facilitated the concealment of funds through trusts with the aim of facilitating laundering and reinvestment.

Case Study 13 – Cayman Islands

Mr. A established a Cayman Islands revocable trust, with himself as settlor and a local TCSP acting as trustee. Mr. A also arranged for the incorporation of a Cayman Islands company known as 'Company B', with the local TCSP also acting as the registered office.

The TCSP became aware of allegations relating to Mr. A and his involvement in an oil and gas contract scam which also involved members of a foreign government. Over a two-year period, the TCSP reported that the trust and underlying company had received numerous transfers of funds and property from what was now deemed to be questionable sources, which in turn heightened its suspicions and prompted an STR. An analysis of the trust accounts revealed outgoing funds to individuals named in numerous media reports who allegedly took part in the kickback scandal. In response to a request, the foreign jurisdiction confirmed that Mr. A was being investigated for money laundering and corruption of government officials.

Using individuals and financial instruments to obscure the relationship between the beneficial owner and the asset

80. In addition to the generation of complex ownership and control structures, criminals often employ additional techniques to further obscure the relationship between them and their assets. As a methodology, obscuring the relationship between the beneficial owner and an asset differs from the generation of complex ownership and control structures in that, rather than aiming to create distance via legal complexity, it attempts to create a false or misleading picture of the true ownership and control structure. Techniques most often used to achieve this include the use of formal and informal nominees and professional intermediaries. Other techniques, such as the use of bearer shares and the declaration of numerous beneficiaries, have also been identified, but appear to be less common.

Bearer shares and bearer share warrants

81. Bearer shares are company shares that exist in certificate form and are legally owned by the person that has physical possession of the bearer share certificate at any given time. Ownership and control of bearer shares can be exchanged anonymously between parties by way of physical exchange alone, as no record of the exchange needs to be documented or reported.

82. Due to the inability to accurately ascertain and monitor the owner of a bearer share at any given time, determining beneficial ownership of legal persons controlled by bearer shares is nearly impossible. For this reason, bearer shares and bearer share warrants have historically been recognised as posing a significant money laundering risk, particularly in relation to the concealment of beneficial ownership. This risk is reflected in Recommendation 24 of the FATF Standards, which requires member countries to take measures to prevent the misuse of bearer shares and bearer share warrants.

83. In most jurisdictions, bearer shares have been reformed or eliminated altogether through the dematerialisation of the bearer share certificate into a computerised register or ledger of shares. Even in jurisdictions where bearer shares are still permitted by law, the financial sector has taken measures to limit their effectiveness, often by requiring them to be placed into trust prior to the commencement of a client relationship. Other jurisdictions have implemented measures that require an intermediary to facilitate the transfer of bearer shares to make the transfer lawful[38]. As a result, the prevalence and use of bearer shares and bearer share warrants have markedly declined in recent years. Of the case studies submitted in support of this report, only four involved the use of bearer shares. However, this may also be due to the immense challenge of identifying the beneficial owner of bearer shares, the near impossibility of which may limit the number of cases involving their use.

Formal nominee shareholders and directors

84. A nominee shareholder is the registered owner of shares held for the benefit of another person. A nominee director is a director appointed to the board of a company to represent the interests of his/her appointer on that board. Legally, nominees are responsible for the operation of the company, and accept the legal

[38] Of the 50 jurisdictions assessed against the 2012 FATF Recommendations at April 2018, 45 jurisdictions either do not have bearer shares or bearer share warrants in circulation, or do not have them in existence. Five jurisdictions do not have restrictions on bearer shares but it is unclear whether there are bearer shares and/or bearer share warrants in circulation. Among the 45 jurisdictions, 17 prohibit bearer shares and/or bearer share warrants, 15 require existing bearer shares and/or share warrants to be converted into registered shares where they exist, five require them to be held with a regulated financial institution or professional intermediary, two require shareholders with a controlling interest to notify the company and the company to record their identity, one country has a range of the previously mentioned options and five do not have bearer shares and/or bearer share warrants.

obligations associated with company directorship or ownership in the country in which the company is incorporated. However, in some cases a nominee may hold the position of director or shareholder in name only on behalf of someone else. These arrangements may be controlled by a trust arrangement or civil contract between the nominee and actual director or shareholder.

85. The use of nominee shareholders and directors is a common phenomenon that occurs in most countries. In some countries there is also formal recognition in law of certain scenarios in which nominee arrangements are permitted (such as in relation to publicly traded companies). Nominees are utilised in a number of scenarios, including to shield the nominator from public disclosure requirements or to meet legal requirements of the country in which the company is incorporated (such as requirements for companies to have a director residing domestically). A range of service providers are known to offer **formal nominee services**, including legal and accounting professionals, TCSPs, and professional nominees (people who rent their identification information to companies for nominee purposes only, but provide no additional services to the company). The vulnerabilities associated with the provision of nominee services by lawyers, accountants and TCSPs are outlined in greater detail in Section 3 of this report. One New Zealand case study (Case Study 81 below) demonstrates how a TCSP provided nominee directorship services for over 1 000 companies registered in New Zealand on behalf of foreign clients. Authorities suspect that at least 73 of these companies facilitated crimes in foreign jurisdictions, including the smuggling of illegal goods, arms smuggling, tax fraud, investment fraud and money laundering.

86. While the use of nominees is lawful (or at least not unlawful) in most jurisdictions, nominees have been used to disguise ownership and control, or to circumvent laws designed to manage foreign business ownership and foreign trade. FIUs and law enforcement agencies also report the use of nominee services by known criminals and individuals who have been prohibited from serving as a director of a company due to previous malfeasance. As a result, the availability and use of formal nominee services are vulnerable to exploitation for the purposes of disguising beneficial ownership. Of the case studies analysed for this report, just under half of the cases involved formal nominees. The presence of nominee directors and shareholders in company records can also affect law enforcement investigations by delaying the identification of the beneficial owner, or by creating false links between companies that share nominees.

87. These vulnerabilities are reflected in Recommendation 24 of the FATF standards, which states that countries should take measures to prevent the misuse of nominee shares and nominee directors.

Case Study 81 – New Zealand

Companies registered in New Zealand by a Vanuatu-based TCSP operated by New Zealand citizens were suspected of acting as shell companies that facilitated crime in foreign jurisdictions. The TCSP acted as nominee shareholders and provided nominee directors who resided in jurisdictions such as Vanuatu, Panama and the Seychelles.

The TCSP also provided a New Zealand-based nominee director to satisfy the legal requirement to have a New Zealand resident director and address. In the case of Company A, the employee recruited to act as a director likely had no knowledge of the activities taking place, as they had no previous involvement in any of the TCSP activities.

By 2010, the TCSP had registered approximately 2 000 companies in New Zealand on behalf of clients in foreign jurisdictions. The address, in Auckland, was used as the registered office for most of the companies. Authorities suspect that at least 73 of these companies facilitated crimes in foreign jurisdictions, included the smuggling of illegal goods, arms smuggling, tax fraud, investment fraud and money laundering.

Informal Nominee Shareholders and Directors

88. Informal nominee shareholders and directors perform the same function as formal nominee service providers; however, their connection with the true director, shareholder, or beneficial owner is often of a personal, rather than of a professional, nature. Informal nominees identified by law enforcement commonly include spouses, children, extended family, business associates (who are being controlled by the actual owner or controller of the company), and other personal associates otherwise unrelated to the beneficial owner's business interests. Indeed, the relationship between an informal nominee and the actual owner or controller of a company or shares can vary significantly. Law enforcement agencies and FIUs have reported instances where foreign students and tourists have been convinced or coerced into establishing companies on behalf of third parties, sometimes in exchange for nominal payments or other personal benefits. These individuals are recorded as directors or controlling shareholders of these companies; however, they are rarely involved in the operation of the company post-formation. Of the case studies analysed for this report, just under half involved informal nominees.

89. Unlike formal nominee arrangements, informal nominee arrangements will rarely be governed by a contractual agreement. Furthermore, while formal nominees will always seek to insulate themselves from the activities of the legal person or arrangement, informal nominees are more likely to profess to be the beneficial owner of the legal person or arrangement in an effort to maintain the fiction created by the true beneficial owner. For this reason, informal nominees are often referred to as "straw" or "front" men. One Russian case study (Case Study 87 below) demonstrates how the ownership of companies used to facilitate fraud against a government contract was passed from the suspect (Mr. X.) to a number of different "straw men", including Mr. X's daughter. At least one of the informal

nominees received a salary in return; however, they did not perform the role of a professional nominee and were unaware of the activities of the company. The purpose of passing ownership of the companies to informal nominees was to further distance the companies from Mr. X, who was related to the man responsible for the project in the public department.

90. There are significant risks associated with acting as an informal nominee, as they are ultimately legally responsible for the activities of the company and will often lack the resources or expertise required to distance themselves from any legal obligations or repercussions. Furthermore, informal nominees are unable to utilise protections such as client confidentiality or legal professional privilege, which are available to some formal service providers. As a result, informal nominees are more susceptible to law enforcement investigations. That being said, informal nominees who have never previously come to law enforcement attention or whose association with the true beneficial owner or controller is indirect (e.g. not a relative or business associate) are often difficult to identify by financial institutions and some competent authorities.

91. A related phenomenon reported by some law enforcement agencies is the use of stolen identities to establish legal persons. In these instances, the victim of the identity theft is ostensibly an informal nominee for the legal person, albeit without their knowledge or consent. Law enforcement agencies have also identified situations where companies have been registered to informal nominees who have previously sold their identification details to a third party. These informal nominees are often incentivised to sell their identification details due to financial hardship. In these instances, the informal nominee also has no visibility of the company their details are recorded against; however, they may not necessarily be *victims* of identity fraud. One New Zealand case study (Case Study 80 below) demonstrates how bank accounts held in the names of students were used to receive laundered funds from foreign bank accounts to purchase properties. Another New Zealand case (Case Study 77) demonstrates how lower-income individuals can be manipulated into selling their identification information to professional money launderers, who then use them to establish companies and bank accounts.

92. While the cases analysed for this report demonstrated an approximately equal distribution between the use of formal and informal nominees, law enforcement and FIU experience indicates that criminals, particularly those with limited resources, will favour the use of informal nominees rather than formal nominee service providers. Often these informal nominees are family members, particularly spouses, who are frequently complicit with the beneficial owner's criminal activities. The reliance on familial nominees may stem from the ease with which the true beneficial owner can control and manage their activities.

Case Study 77 – New Zealand

A New Zealand shell company was set up by a New Zealand TCSP based in Vanuatu. The shell company was registered on behalf of an unknown overseas client and nominees were used to hide the identity of the beneficial owners. The actual business of the shell company was not apparent and was not indicated by the company name. The address listed on the companies' register was the same virtual office in Auckland as the TCSP. The nominee director resided in Seychelles, and the nominee shareholder was a nominee shareholding company owned by the TCSP. The nominee shareholding company was itself substantially a shell company and had been used as the nominee shareholder for hundreds of other shell companies registered by the TCSP.

News reports indicated that a power of attorney document transferred the directorship to a Russian national who had sold his passport details, with a bank account opened in Latvia. When journalists from the Organised Crime and Corruption Reporting Project (OCCRP) made contact with the Russian national, the man revealed he was unaware of the New Zealand company or its bank accounts. His identity, which he had sold, had been used without his knowledge. Furthermore, a former officer of the Russian tax police told journalists that hundreds of law firms specialise in establishing ready-made shell companies for their clients, who want to remain anonymous. Usually, these law firms rely on disadvantaged individuals who sell them passport details for approximately USD 100–300.

Trade transactions were conducted with several Ukrainian companies including a state-owned weapons trader. The contracts were then cancelled after the funds had been transferred and refunds were made to different third-party international companies. Transactions were also made with three other New Zealand shell companies registered by the same TCSP, using the same nominee director, nominee shareholder and virtual office address as the shell company. News reports indicated that all four shell companies had been involved in laundering USD 40 million for the Sinaloa drug cartel based in Mexico.

Case Study 80 – New Zealand

Shell companies based in Panama, Belize, and the UK with nominee shareholders and directors were used to open Latvian bank accounts to conduct hundreds of millions of dollars' worth of international payments. The majority of transactions were payments being made on behalf of Vietnamese entities for imported goods, or payments to Vietnamese expats living overseas on behalf of purportedly Vietnam-based senders. This distinct Vietnamese connection indicated the accounts might have been controlled or administered from within Vietnam. New Zealand bank accounts, which were held by students or by fruit wholesalers and exporters, were used to receive funds

transferred from bank accounts in Latvia, Cambodia and China. More than 15 New Zealand properties were purchased with the funds, all of which were facilitated through New Zealand law firms. Information suggested that the Latvian accounts were also being "topped up" by other shell company bank accounts based in international jurisdictions, indicating a co-ordinated layering process being undertaken.

Case Study 87 – Russia

A state customer concluded contracts on research work and the development of a special software with Contractor #1 and Contractor #2. Analysis of financial transactions showed that these contractors did not conduct any research activities themselves, but transferred budgetary funds to subcontractors with real scientific laboratories among them. The majority of funds from Contractor #1 was sent to its subcontractor, who channelled funds to a shadow financial scheme consisting of multiple layers of shell companies. The funds were finally withdrawn in cash. The majority of funds from Contractor #2 was sent to a real estate company that invested these funds into its business activity, acquired luxury cars and granted zero-interest rate loans to a number of individuals.

Analysis of ownership data, address registry information, an air tickets booking database, financial transactions and law enforcement data showed that Contractor #2 was previously owned by Mr. X, before the ownership was passed to straw men uninvolved with the scheme. The real estate company was formerly owned by Mr. X, before the ownership was transferred to his daughter. Contractor #1 was owned by straw men who had no idea about the company's business activities and received instructions from Mr. X. These straw men received a "salary" from the company's account. The director of the state customer's department responsible for research activities was a brother of Mr. X. A daughter of the state customer department's director acquired expensive real estate using cash that was deposited in advance in her account. The woman who had joint flights with Mr. X acquired expensive real estate using cash that was in advance deposited into her account in advance.

Declaring Numerous Beneficiaries

93. In some instances, the declaration of numerous beneficiaries on one account is used to confuse financial institutions and conceal the true nature of transactions undertaken through that account. FIUs and financial institutions have reported cases where large numbers of customers have been declared as beneficiaries on a single bank account in such a way that the bank has difficulty establishing which transaction was made on behalf of which beneficiary. In the instances where this has occurred, it is unclear whether the controller of the transactions was listed as a beneficiary. Regardless, the use of a single account to co-mingle transactions from a large number of beneficiaries poses a challenge when determining the ultimate

beneficial owner, and when attempting to follow the chain of suspicious transactions.

Case Study 38 – Israel

This scheme was used to hide funds from social engineering fraud and other criminal offenses. The cover story for the criminal offenses was international trade – funds from merchants in Europe and the US that were sending payments to suppliers in East Asia. The suspect, the owner of a registered MSB, operated a second, unregistered MSB. The suspect used several natural persons as his contact points in East Asia, who in turn contacted local TCSPs for the purpose of setting up international companies and opening bank accounts. Local straw-men were registered as the shareholders of the new international companies established for the scheme. In addition, shareholders were registered based on passports provided by the suspect's contact persons mentioned above. The registered addresses of the companies were in East Asia. Bank accounts were opened in the same East Asia countries where the offices were located.

Some of the funds were transferred to Israel to an account opened by the suspect. More than 60 beneficiaries were declared to the bank as beneficiaries, in such a way that the bank had difficulty in establishing which transaction was made on behalf of which beneficiary. The funds were sent from the companies set up by the suspect but the receiving bank did not know that these companies were actually under the suspects' control.

Use of Professional Intermediaries in Forming and Managing Legal Persons and Arrangements

94. The use of specialists and professional intermediaries, including lawyers, accountants, and TCSPs, is a key feature of the money laundering and broader organised crime environment. Professional service providers significantly enhance the capacity of criminals to engage in sophisticated money laundering schemes to conceal, accumulate and move volumes of illicit wealth. As a result, professional intermediaries have been assessed as posing a high money laundering risk in most countries.

95. The vulnerabilities posed by professional intermediaries are outlined in greater detail in Section 3 of this report.

Falsifying activities

96. Unlike the generation of complex ownership and control structures and the concealment of the relationship between the beneficial owner and an asset, which can serve both legitimate and illicit purposes, some techniques used to hide beneficial ownership are purely criminal. These techniques are designed to falsify activities to commit a crime via deception. The use of false loans and invoices to fraudulently disguise the beneficial ownership of a transaction is the most common

of these techniques, but others, such as the manipulation of company prospectuses and annual reports, have also been identified, though infrequently.

Use of False Loans and Invoices

97. A common means of disguising the beneficial owner of wealth and assets is through the use of false loans. This method, which is often referred to as a "loan-back" or "round-robin" scheme, principally involves money being sent to companies which are owned or controlled by, or on behalf of, the same individual, and returned in the guise of a loan. These schemes generally operate following two key steps:

- *Payment of business invoices*: the individual or business pays an invoice or series of invoices to a company (which is often located in another country) that is controlled/beneficially owned by them, or to an associate or professional intermediary operating on their behalf. The funds may be sent via numerous legal persons in the guise of legitimate business transactions, but will ultimately pool in the account of an international company that is operating in the interests of the beneficial owner of the company that paid the initial invoice. The purpose of this stage is to reduce the taxable income of the originating company or individual by increasing their (seemingly legitimate) business expenses.
- *Third-party loan*: once the funds have been pooled in the accounts of the international company, they are returned to the original company/individual, or a close family relation (commonly a spouse or child) or associate, in the form of a private loan. Occasionally these loans will be accompanied by false loan documents, but often the loan is recorded only in the description of the bank transfer. The purpose of this step is to return the wealth to the beneficial owner in a manner that is exempt from income taxation.

98. Loan-back schemes can involve the payment of interest, which may be used as a further means of channelling money into international bank accounts and reducing domestic tax obligations (as demonstrated in Case Study 7 from Australia). These schemes do not have to involve interest payments – there may be no actual obligation for the beneficial owner to repay the false loan. Regardless of the mechanics of the loan arrangement, the scheme serves the purpose of disguising the fact that the lender and borrower are beneficially owned by the same natural person.

99. Loan-back schemes are sometimes promoted and facilitated by professional service providers. In these instances, the international company used in the loan structure is controlled by the scheme promoter, who receives a portion of the laundered funds as payment for facilitating the scheme. This also serves the purpose of separating the beneficial ownership of the funds and decreasing the likelihood of detection. One case study from Australia (Case Study 6 below) demonstrates one such scheme operated by an Australian accountant via companies controlled by him or his associates in Hong Kong and the BVI.

Case Study 6 – Australia
Investigating authorities identified that suspect A operated an import business in Australia and was a participant in a tax evasion scheme operated by an accountant. Suspect A and his wife were directors and shareholders of an Australian company (company 1). Suspect A was also a director and shareholder of another Australian company (company 2). An associate of suspect A was the co-director of company 2. Authorities identified that the accountant controlled company 3, which was registered in Hong Kong and operated a bank account in Australia. This company was used to issue false invoices to companies 1 and 2. Over a five-and-a-half-year period company 3 issued false invoices to companies 1 and 2 for supposed "brokering services." Suspect A paid the false invoices, which totalled more than AUD 2 million, by directing companies 1 and 2 to pay company 3. The funds paid to company 3, less the accountant's 10% fee, were returned to suspect A and individuals associated with him.

Manipulation of a company´s prospectus, annual report etc.

100. While identity fraud is a common typology for natural persons to disguise their true identity, it is also possible to disguise the true activity and purpose of legal persons. One of the cases analysed for this report (Case Study 14) demonstrated how the manipulation of the financial status of a company through the inclusion of false and misleading information in the company prospectus and annual report allowed it to qualify for a listing on the stock exchange in the country of registration. While this measure was intended to improve the reputation and the economic activities of the company, it also led to a situation in which that company may have been subject to reduced customer due diligence obligations. Many AML/CFT regimes allow simplified due diligence measures for corporate entities that are listed on organised and regulated markets, since they are already subject to certain transparency requirements. Therefore, the ability for criminals to list a company on a stock exchange in a manipulative way can support future activities designed to obscure beneficial ownership, including the use of the company as a "front company".

Case Study 14 – Cayman Islands
The managing director of an overseas company issued a prospectus which contained misleading and false information within the company's annual report. He overstated the company's group revenue by 275%. This information was provided to that country's securities commission as part of the company's proposal for listing on their stock exchange. The managing director established a revocable trust and underlying company in the Cayman Islands. He then opened an overseas bank account in the name of the Cayman Islands company for which he held the power of attorney, allowing him to trade in the account. This

structure was devised to hide the managing director's trading in the overseas company and to hide assets derived from his illegal activities. The Cayman Islands company held over USD 1 million in this bank account. The Financial Reporting Authority (FRA) made an onward disclosure to the FIU of the foreign national's home country. The foreign national has been charged in his home country with three counts of providing misleading and false information.

SECTION 3 — VULNERABILITIES OF PROFESSIONAL INTERMEDIARIES

101. Professional intermediaries, including lawyers, accountants, and TCSPs, play an important role in modern society. For the most part, these professionals operate with integrity and in accordance with national and international laws. However, the reputation of these professional intermediaries also makes them the target of criminals and corrupt actors, and may result in some professionals becoming involved in the concealment of beneficial ownership for criminal purposes, either through coercion or corruption, or through negligence or a failure to identify suspicious activities. This section provides an overview of the vulnerabilities of professional intermediaries, and how they are exploited to conceal beneficial ownership.

102. The use of specialists and professional intermediaries, including lawyers, accountants, and TCSPs, is a key feature of the money laundering and broader organised crime environment. Criminals use professionals to obtain specialist advice and skills in complex financial, business, company, and tax matters to disguise the true ownership or source of their assets. Operating through or behind a professional adviser provides a veneer of legitimacy to criminal activities and, where complex structures are established, creates distance between criminal entities and their illicit wealth. The majority of the case studies analysed for this report involved a professional intermediary.

103. Although there are unique elements to each jurisdiction's legal system, the broad description of the role of professional intermediaries can be divided into four general categories[39]:

- systems in which legal persons can be established without the involvement of professional intermediaries
- systems in which professional intermediaries (other than notaries) are required
- notarial systems
- systems in which the company registrar tests the accuracy of filings or takes on the CDD obligations of the professional intermediary.[40]

104. Criminals may employ the services of numerous professional intermediaries simultaneously, with each professional playing a separate but crucial role in the criminal enterprise. Of the case studies submitted in support of this report, more than one-third involved the use of more than one professional services sector, and a similar number of cases involved multiple intermediaries in the same sector. Of the cases that involved more than one professional intermediary, TCSPs represented the

39 As assessed in the Horizontal Study at Annex B; see in particular Question 1.

40 Hybrids of these systems are also possible.

large majority of cases, while legal professionals (including civil notaries) were also common; however, the representation of accounting professionals in cases involving numerous professional intermediaries was rare.

105. Of the cases that involved multiple intermediaries from the same sector, the TCSP sector represented the overwhelming majority of these instances. When multiple TCSPs were exploited in a single scheme, almost all of the cases involved TCSPs in multiple jurisdictions. This is reflective of the role of TCSPs in establishing and managing local companies on behalf of foreign clients. Conversely, in instances where multiple legal or accounting professionals were used, the majority of cases involved the use of multiple lawyers/accountants in the same jurisdiction. Additionally, approximately half of the cases involved unwitting or negligent intermediaries. This indicates that, in instances where multiple lawyers or accountants are utilised to facilitate a scheme, it is likely that the criminal clients are attempting to avoid suspicion by limiting their engagements with any single professional. However, the small number of cases available makes it difficult to make a definitive assessment.

106. The increasingly global nature of organised crime and the finance sector has driven demand for the advice and services of professional intermediaries who can operate across, or have professional connections within, numerous international jurisdictions. As a result, criminal groups have been known to be connected with multiple intermediaries across multiple countries. Analysis of the case studies identified that a majority of intermediaries were operating on behalf of international clients.

107. The FATF Standards require DNFBPs, including lawyers, notaries, accountants, and TCSPs, to perform CDD, maintain CDD and transaction records, and submit suspicious transaction reports. These obligations came into effect when the standards were revised in 2003; however, many countries have not yet implemented them in law[41]. Of those countries that have implemented obligations on DNFBPs, many have not implemented those obligations effectively via appropriate supervision and monitoring[42]. This was also confirmed by the findings of the Horizontal Study[43]. As such, professional intermediaries are often subject to limited AML/CFT obligations.

41 Of the 50 jurisdictions that have been assessed against the 2012 FATF Recommendations at April 2018, 34 jurisdictions have major or moderate shortcomings in their measures for Recommendation 22 on DNFBPs' applying customer due diligence, and 30 have major or moderate shortcomings for Recommendation 23 on the other measures that DNFBPs need to take, including the reporting of suspicious transactions. 36 jurisdictions have major or moderate shortcomings in their mechanisms for regulating and supervising DNFBPs under Recommendation 28.

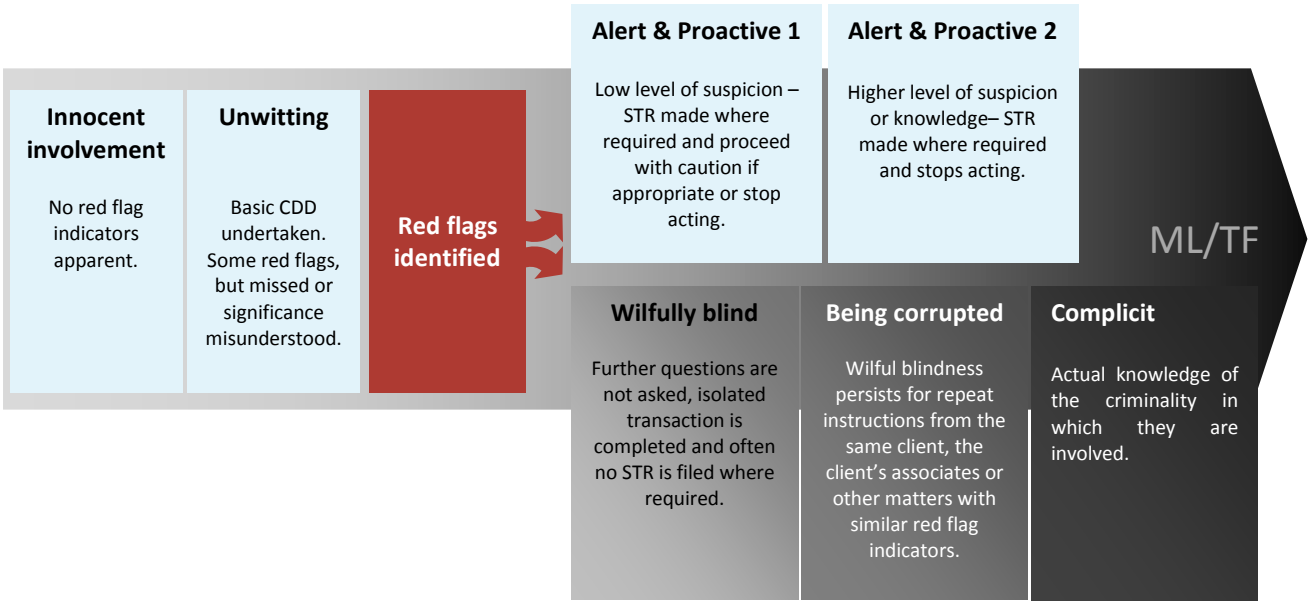
42 Of the 11 jurisdictions that have been assessed as having minor or no shortcomings in their mechanisms for regulating and supervising DNFBPs, 8 are not supervising, monitoring and regulating DNFBPs appropriately.

43 See, in particular, Questions 4-6 of the Horizontal Study at Annex B.

Continuum of complicity

108. In its 2013 report, *Money Laundering and Terrorist Financing Vulnerabilities of Legal Professionals*, the FATF assessed that the involvement of legal professionals in money laundering could not be described simply as either "complicit" or "unwitting", but tended to follow a continuum from "innocent involvement" to "complicit" (see Figure 1, below). [44]

Figure 1. **FATF Assessment of the Involvement of Legal Professional in ML/TF**[45]



109. This "**continuum of complicity**" can be equally applied to all professional intermediary sectors, and is not unique to the legal profession.

110. While it is widely acknowledged[46] [47] [48] that professional intermediaries can act as enablers of money laundering and terrorism financing, little is understood about how these intermediaries are sourced or recruited, and the degree to which intermediaries are innocently, negligently or complicity involved. It is likely that this intelligence gap is exacerbated by various factors, including:

---

44 FATF, 2013: p. 5.

45 Of the 11 jurisdictions that have been assessed as having minor or no shortcomings in their mechanisms for regulating and supervising DNFBPs, 8 are not supervising, monitoring and regulating DNFBPs appropriately.

46 Van der Does de Willebois, E. et al., 2011.

47 ACIC, 2017.

48 OECD, 2001.

- The limited AML/CFT obligations imposed on DNFBPs in many countries due to partial compliance or non-compliance with Recommendations 22 and 23, as well as the ineffective implementation of AML/CFT obligations in some countries.
- A reluctance by professional intermediaries to comply with their AML/CFT obligations due to perceived conflicts with their duty to their client, or their obligations to protect client confidentiality and legal professional privilege.
- The fact that professional intermediaries are often not the primary targets of law enforcement investigations, and details pertaining to their activities are not universally recorded on law enforcement indices.

111. This means that, despite the role of professional facilitators in enabling serious and organised crime, it is not possible to accurately quantify the degree to which they are involved, or their level of complicity, with any certainty. This report has analysed the case studies provided by 34 participating countries, and has attempted to draw conclusions on the complicity of professional intermediaries based on the information provided.

112. Approximately one-third of all cases were assessed as involving a complicit professional intermediary. Of the cases where intermediaries were assessed as being complicit, the majority were assessed as having designed the scheme themselves and promoted it to potential clients (predominantly as an effective tax minimisation method). In these instances, the professional intermediary was often the subject of the primary investigation.

113. Of the three professional sectors analysed, the accounting profession was most likely to be complicit in their involvement in schemes designed to conceal beneficial ownership. Moreover, both legal and accounting professionals were more likely to be the designer of the scheme, rather than simply a complicit intermediary in a scheme designed by another party or the client themselves. However, unlike accounting professionals, legal professionals were more likely to be unwittingly or wilfully blind in their involvement in the scheme. It is likely that the financial acumen of the accounting profession, and the ease with which accountants can identify suspicious activities indicative of money laundering or other financial criminality, may limit their unwitting involvement in these schemes. It may also be indicative of the nature of the case studies provided, which often involved the predicate offences of tax evasion and fraud, many of which were orchestrated by corrupt professionals.

114. The value and utility of an intermediary's professional services to a money laundering scheme is not strictly contingent on the complicity of the intermediary. An innocent, unwitting or negligent intermediary can be as valuable as a complicit intermediary if their services result in a desirable outcome for their criminal client. This is particularly true in the context of disguising beneficial ownership, as many of the services offered by professional intermediaries, such as the establishment of legal persons and arrangements, are commonplace and not necessarily indicative of corruption or criminality. Law enforcement agencies in some jurisdictions observed that more money laundering related investigations involved complicit professional intermediaries relative to unwitting intermediaries.

OVERVIEW OF COMMONLY EXPLOITED INTERMEDIARIES

115. This section provides an overview of the legal, accounting, and TCSP sectors. The purpose of this information is to contextualise the sectors commonly exploited by criminals to establish complex ownership structures and otherwise assist in the concealment of beneficial ownership information.

Legal Professionals

116. The legal sector is a large and multifaceted industry that provides a range of services to a broad spectrum of clients. Despite the presence of large domestic and multinational law firms in some countries, the legal sector is principally characterised by small business enterprises. Sole practitioners or partnerships with minimal additional non-partner staff represent the majority of the legal sector in most countries. This low level of market share concentration is in contrast to the banking sector, which is often dominated by a smaller number of large domestic and international banks.

117. While large and medium-sized law firms will offer a broad range of services, most law firms specialise in only one service segment, such as commercial law, personal legal services, or criminal law. Often, law firms that specialise in large-scale and international commercial law will employ a higher number of non-partner staff due to the complexity and resource intensive nature of large corporate issues. However, the choice to offer specialised services often does not preclude a law firm from providing services in other areas of law[49]. As such, firms which specialise in personal and family law matters may also be involved in commercial law matters and the establishment of companies and businesses.

118. The legal sector has historically demonstrated a low level of industry globalisation, with a majority of law firms servicing local clientele. This reflects the small-business nature of the sector and the desire of clients to deal with a local law firm. However, greater access to information and communication technologies, as well as an increasing market for transnational legal services has prompted large law firms to expand into the global market to pursue growth opportunities. Many major law firms are actively pursuing strategies to merge or establish relationships with international law firms to increase their presence in key international markets.

119. The legal sector in most countries is required to maintain a membership with a professional body, such as a law society or bar association. These professional bodies impose strict rules and codes of conduct on their members, and often serve as self-regulating bodies in countries where legal professionals are subject to AML/CFT oversight. Rules imposed by professional bodies operate in addition to

[49] Some exceptions exist in countries where lawyers are subject to more than one model of licencing or industry oversight.

overarching legislative obligations, and can result in severe financial or professional sanctions if breached.

120. The notarial sector differs from the legal sector in many countries, particularly civil law countries. In some civil law countries, notaries do not represent parties to a contract and are not intermediaries in the same sense as legal professionals. Many notaries do not maintain long-term client relationships, and instead are obliged to be impartial and independent, advising the parties of a contract on equal terms. Unlike legal professionals in private practice, many notaries carry duties as public office holders. These obligations of fairness and the public office duties will influence the scope of what the notary must do to assess the risk of money laundering.

Role in the Establishment and Management of Legal Persons and Arrangements

121. Legal representation is commonly sought in most countries to facilitate the establishment of companies and other legal persons and arrangements. In cases where legal representation is not strictly required, their legal expertise will often be engaged as a precautionary measure to ensure the lawful establishment of a legal person or arrangement, particularly in instances where a foreign jurisdiction is involved.

122. Large law firms that operate across numerous jurisdictions play an important role in the establishment of legal persons in one country of operation on behalf of a client in another country of operation. Often, multinational law firms will seek to establish branches, merge with existing firms, or establish agent relationships with smaller firms in financial hubs and trade centres. As such, they offer opportunities to facilitate the development of transnational company structures in support of legitimate global business ventures. It is also possible for their expertise in setting up cross-border structures to be utilised to conceal the beneficial ownership of illicit assets.

123. In the absence of an international presence, law firms will utilise professional associations and global alliance networks to effectively operate across international borders. These networks of otherwise independent law firms enable clients to seamlessly access the services of affiliated law firms in international markets. While formal membership-based alliances often operate under an association code of conduct, this does not necessarily include a compulsory AML/CFT compliance program, and not every member firm will be subject to AML/CFT regulation (see footnote 40 and 41).

124. Of the case studies analysed for this report, one-third specifically referred to the involvement of legal professionals (including notaries)[50]. It is likely that some of the case studies involving TCSPs actually involved lawyers or TCSPs with legal

[50] Of the cases that involved legal professionals, 25 cases referred to the involvement of lawyers, five referred to the involvement of notaries, and four referred to the involvement of both.

qualifications. The use of the term TCSP as a catch-all term for professionals involved in company establishment has been identified as a possible reporting issue throughout this project.

125. Where the involvement and activities of legal professionals could be assessed, the majority were found to have been working on behalf of a direct client. A small number were assessed as providing services to another professional intermediary on behalf of a third-party client.

Accountants

126. Like the legal sector, the accounting sector is a large industry that provides services and advice to a range of clients. The range of services offered by the accounting sector is more focused in comparison to the legal sector, with audit, tax, and advisory services representing the vast majority of business.

127. The accountancy sector has a moderate level of industry globalisation due to the presence of large multinational accounting firms. The level of globalisation is increasing through the acquisition of smaller firms by larger multinationals. However, despite the industry globalisation being more pronounced than the legal sector, and the larger market share held by large multinational accounting firms, the accounting sector, like the legal service sector, is characterised by small enterprises and sole proprietors.

128. The majority of accounting enterprises, including sole proprietors and enterprises employing fewer than 20 people, typically service individuals or small businesses, while the large multinational firms tend to service large companies and public sector authorities.

129. Much like the legal sector, accounting professionals who join an accredited accounting body are governed by a code of ethics. However, unlike the legal sector, accounting professionals in many countries are not required to maintain a membership to any independent oversight body[51]. As a result of this dynamic, and the significant number of sole proprietors in operation, it is difficult to monitor the accounting sector's awareness of AML/CFT risks and its adherence to AML/CFT obligations. Like the legal sector, FIUs and regulatory bodies where they perform a supervisory function face a number of challenges in accurately and effectively supervising the sector.

Role in the Establishment and Management of Legal Persons and Arrangements

130. The primary role of accounting professionals in the establishment of legal persons and arrangements is the provision of expert advice on business structures, asset management, and taxation obligations domestically and internationally. In many countries, accountants are the first professional consulted by small businesses

[51] For example see the Mutual Evaluation reports of Andorra, Bahamas, Bhutan, Denmark, Ireland, Mexico and Slovenia, available from www.fatf-gafi.org.

and individuals when seeking general business advice and advice on regulatory and compliance matters. Where services are not within their competence, accountants advise on an appropriate source of further assistance, or procure the services of an appropriate professional on behalf of their client.

131. In most countries, accountants are authorised to establish companies on behalf of their clients; however, the majority of accounting firms only provide services to established businesses, or advise on proposed business structures, and will not become directly involved in the establishment of legal persons themselves. This is largely due to the small nature of most accounting firms, and the low level of globalisation that these firms exhibit. Those accounting firms that do offer company establishment services are also likely to maintain a significant financial management role in the company, including being a signatory on accounts held by that company. Analysis of the role of accounting professionals in the case studies identified that only one was involved in the establishment of legal persons or arrangements in their own country of operation, and three were involved in the establishment of legal persons in a foreign jurisdiction.

132. As with the legal sector, accounting firms that operate across multiple jurisdictions generally leverage their global presence to offer company establishment and management services. However, the number of accounting firms with a global footprint is low in comparison to the legal sector, and, as a result, smaller firms often rely on professional associations and alliance networks to service transnational clients. Alternatively, small firms will act as an intermediary between clients and service providers based in overseas jurisdictions, including accountants, lawyers, and TCSPs. The majority of accounting professionals identified in the case studies were assessed as having facilitated international activities on behalf of their client.

133. Due to the contractual nature of trusts and other legal arrangements, accountancy professionals are rarely relied upon to establish a trust. Accounting professionals will advise clients on trust arrangements and may assist clients by acting as a settlor, trustee, or protector of a trust arrangement. Unlike the legal sector, the accounting sector places few restrictions on accountants maintaining these positions in a legal arrangement. However, in the case studies provided in support of this project, only one accountant offered directorship/trustee services to their client.

134. The accounting profession was the least represented sector in the cases analysed for this report. It is likely that some case studies referred to accountants as a TCSP, or that only the TCSP was recorded in the case study despite the involvement of other intermediaries, which has been identified as a possible reporting issue throughout this project. In cases where an accounting professional was identified, almost half involved both accounting professionals and professionals from another intermediary sector (such as the legal and TCSP sectors); a small number involved multiple accounting professionals in one scheme.

135. All accounting professionals identified in the case studies were assessed as working on behalf of a direct client. This indicates that accounting professionals are

less likely to be approached by other intermediaries to fulfil a scheme designed to conceal beneficial ownership.

136. The expertise of accounting professionals means that most practitioners will be capable of identifying suspicious and high-risk activities conducted by their clients. As a result, accounting professionals are less susceptible to innocent and unwitting exploitation relative to legal professionals and TCSPs. Law enforcement agencies, FIUs, and other competent authorities have identified numerous instances in which accounting professionals have been complicit in criminality, or have orchestrated fraudulent investment or tax avoidance schemes. Analysis of the case studies identified that a significant majority of accounting professionals were complicit in their involvement, and over half were responsible for designing and promoting the scheme as a means of minimising their clients' taxation obligations.

Trust and Company Service Providers

137. In comparison to the legal and accounting sectors, the TCSP sector (excluding legal and accounting professionals who provide company formation and management services) is difficult to describe or quantify. The TCSP sector varies significantly across jurisdictions. In some countries, the TCSP sector is robust and well-established, exhibiting some of the characteristics of other highly regulated industry sectors, including government registration, professional body oversight, and AML/CFT regulation. In other countries, the role of TCSPs is less clearly defined, and government and industry oversight is less robust. Company formation and trust services are provided by a range of market participants from numerous sectors, including the finance, legal, and accounting sectors, as well as stand-alone service providers that specialise in these services, but that do not offer financial, legal, or accounting services.

138. The FATF standards defines *"trust and company services providers"* to include any service provider that carries out transactions for a client concerning the following activities:

- acting as a formation agent of legal persons
- acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons
- providing a registered office, business address or accommodation, correspondence, or administrative address for a company, a partnership or any other legal person or arrangement
- acting as (or arranging for another person to act as) a trustee of an express trust or performing the equivalent function for another form of legal arrangement
- acting as (or arranging for another person to act as) a nominee shareholder for another person.

139. Much of the literature available on TCSPs encapsulates all service providers who provide the above services, regardless of whether they represent their core

business or an ancillary service only. For the purposes of this report, the terms "TCSP" and "TCSP sector" exclude professionals operating in the legal and accounting sectors. Input provided to this report by the Group of International Finance Centre Supervisors (GIFCS) demonstrates that, in countries with a highly active and well-established TCSP sector, the market is dominated by a large number of small businesses with no significantly large players dominating the sector. A relatively small proportion of TCSPs operating in these jurisdictions are accounting or legal firms or subsidiaries of an accounting or legal firm.

140. As a sector, TCSPs are particularly well established and defined in low-tax jurisdictions, such as those that are members of GIFCS, where they play a far more active role in company establishment and management. The majority of GIFCS members require their TCSPs and underlying shareholder controllers and key persons (director, partner, Money Laundering Reporting Officer (MLRO), and compliance officer) to be fit and proper. In determining this, authorities consider integrity, competence (including mandatory requirements for key persons occupying executive roles in the TCSP to hold a relevant professional qualification and undertake continuous personal development) and financial soundness. Other GIFCS members strongly encourage key persons occupying executive roles to hold relevant qualifications. The requirement to hold a professional qualification does not generally apply to a shareholder controller unless they are occupying a director, manager or compliance role in the TCSP, although they would be subject to all other aspects of the aforementioned fit and proper test. These requirements mirror some of the requirements imposed on other professional intermediary sectors, such as the legal and accounting sectors, and could serve as a valuable model for professionalising the TCSP sector in countries where the sector is less clearly defined.

Role in the Establishment and Management of Legal Persons and Arrangements

141. Due to the varying nature of the international TCSP sector, the degree of involvement of TCSPs in the establishment of legal persons and arrangements differs across jurisdictions. In most countries, the role of TCSPs is limited to the incorporation and registration of a company or other legal person and does not extend to the provision of strategic business or financial advice. TCSPs were identified in over one-third of the case studies analysed for this report, and represented the largest proportion of professional intermediaries involved in the cases. TCSPs were also more likely to be involved in cases involving multiple professional intermediaries. However, it is likely that this number includes other professionals (legal and accounting) which have been referred to broadly as TCSPs.

142. TCSPs provide a low-cost means of engaging in international business sectors, often providing services to international clients or other international professional service providers on behalf of foreign nationals. While legal and accounting professionals also offer these services, the lower fees associated with TCSPs make them a useful resource for small to medium-sized businesses. In comparison to other sectors, the TCSP sector appears to exhibit a very low level of market globalisation, with most TCSPs providing services only in the country in which they operate. The majority of TCSPs involved in the case studies were

assessed as providing services to customers based in an overseas jurisdiction, and were involved in establishing legal persons and/or arrangements locally.

143. In addition to establishing legal persons and arrangements, some TCSPs offer complete company packages, which include company incorporation and registration, as well as bank accounts in the country of incorporation. More than half of TCSPs were assessed as having opened bank accounts on behalf of their clients, most of whom resided overseas. In these instances, TCSPs perform an intermediary service between the client and a financial institution, and will be responsible for facilitating CDD activities. Most TCSPs also offer trustee, protector, directorship, and virtual/registered office services, particularly in jurisdictions that require companies to appoint a domestic resident as a director. Almost all of the TCSPs identified in the case studies provided directorship, trustee, nominee, or virtual office services to their client.

144. In recent years, TCSPs have taken advantage of the online environment to offer services to clients virtually, without the need for face-to-face engagement. While some of these TCSPs require clients to meet with an intermediary in their country of residence to complete CDD obligations, many others rely only on documentation provided virtually by the client. The provision of online and virtual services makes the effectiveness of AML/CFT activities more challenging, in particular the ability for TCSPs to accurately perform CDD to identify the ultimate beneficial owner of the legal person or arrangement.

145. TCSPs are also commonly involved in the establishment or administration of legal persons and arrangements on behalf of other professional service providers, particularly those operating in another jurisdiction or on behalf of foreign clients. One-third of the case studies specifically referred to TCSPs providing services to other professional intermediaries (lawyers and accountants) on behalf of third-party clients. Furthermore, analysis of the cases identified that approximately half of the TCSPs involved were unwitting in their involvement. This suggests that the role of TCSPs is more likely to be transactional in nature, operating at the behest of a client or other intermediary, and that TCSPs are less likely to be the masterminds of schemes designed to obscure beneficial ownership. TCSPs that were assessed as having been complicit in their involvement were more likely to have been wilfully blind than fully complicit, or may have been wrongly classified as a TCSP.

Other Intermediaries

146. Due to its focus on legal persons and arrangements, this report has predominantly analysed the services offered by lawyers, accountants, and TCSPs; however, other intermediaries are also known to be involved in activities designed to obscure beneficial ownership. Law enforcement and private sector representatives reported the existence of "full service" real estate firms, which provide a full range of intermediary functions, including creating shell and shelf companies, providing corporate officers, closing transactions with lawyers, and identifying properties (price range, risk profiles, etc.). These firms reportedly work with developers to enable fraud where strong early sales are essential to generating additional financing. Detailed analysis of this phenomenon was not possible in this

report; however, real estate professionals who provide any of the services covered in section XI of this report would face similar vulnerabilities as other professional intermediaries.

147. In addition to the professional intermediaries listed above, FIUs and law enforcement authorities have identified other intermediaries who are not professional service providers, and who do not perform services as described in recommendation 22 of the FATF Standards, but who are nonetheless involved in assisting clients with the establishment of complex legal structures. These individuals, who are sometimes referred to as "business finders", are often responsible for finding other professional intermediaries capable of (and willing to) establish the legal persons and arrangements necessary to achieve their client's desired legal structure. Due to their role as an intermediary between a client and a third-party professional, they are not actively involved in the formation of a legal person, and are therefore outside of the regulated population as described under Recommendation 22 of the FATF standards.

148. The role of these "business finders" is not well understood. Law enforcement experience of these business finders relates principally to individuals who cater specifically to criminal clients – in other words, professional money laundering facilitators whose role in the establishment of legal structures is specifically designed to facilitate criminality. Whether business finders (excluding the professional intermediaries referenced above) play a role in legitimate corporate activities is unknown; however, experience indicates that it is unlikely or questionable at best. Of the case studies analysed for this report, approximately 20% were assessed as having involved a professional money launderer who performed tasks similar to a professional intermediary (see Case Study 38 for one particular example).

149. This report has not sought to assess the vulnerabilities of these other intermediaries due to the lack of available information; however, it is assessed that these *non-professional* intermediaries pose a vulnerability to other professional intermediaries who may be engaged by them to perform services on behalf of a client. This vulnerability is heightened in national systems where such non-professional intermediaries have the ability to create legal persons and arrangements without the involvement of a professional intermediary.

OVERVIEW OF VULNERABILITIES

150. This section provides an overview of the vulnerabilities associated with the practices and services offered by professional intermediaries which are commonly exploited by criminals to conceal beneficial ownership. The vulnerabilities assessed in this section have been drawn from the case studies analysed for this report and from the experiences of FIUs, law enforcement agencies, and regulatory authorities. The key vulnerabilities that are assessed in this section are:

- establishing legal persons and arrangements
- establishing and selling shelf companies
- providing directorship, trustee, virtual office, and mailbox services
- facilitating transactions through trust accounts or client accounts
- facilitating the purchase or sale of real property
- client advocacy and brokerage services
- providing services to clients and intermediaries domiciled internationally
- providing advice on tax compliance and tax minimisation
- legal professional privilege and client confidentiality
- limited AML/CFT obligations or insufficient awareness and compliance.

151. The list of vulnerabilities assessed in this report is not intended to be exhaustive, and represents the more commonly exploited vulnerabilities exhibited by professional intermediaries.

Establishing legal persons and arrangements

152. It is common practice for professional intermediaries to advise clients on company formation, corporate structures, and asset management. The purpose of this advice will often centre on protecting wealth and assets from high-risk business activities, and minimising taxation obligations to the greatest extent lawfully possible. These services are particularly attractive to criminals, who are known to actively seek the advice of complicit and unwitting professionals to protect illicit assets and evade taxation obligations through the concealment of beneficial ownership.

153. Some countries require legal professionals (principally notaries) to incorporate and register companies. However, many jurisdictions do not have such a requirement, and companies can be established by engaging directly with the relevant public authority. In countries where legal representation is not necessary, professional intermediaries are often employed to:

- provide expert advice on the most appropriate company structure to meet the needs of the client

- explain and/or facilitate the process, which can be confusing for most small to medium business owners
- enhance respectability and perceptions of legitimacy and trustworthiness.

154. The case example (Case Study 100) below demonstrates how the services of a legal professional were exploited to enhance the apparent legitimacy of a corporate structure used to facilitate a loan-fraud pyramid scheme. In this case, the legal representative was likely to have been complicit.

155. As a result of their expertise and role in the establishment of companies and other legal persons, professional intermediaries are vulnerable to being involved, knowingly or unwittingly, in facilitating complex money laundering schemes. The majority of cases that involved companies and other legal persons were facilitated by a professional intermediary. Professional service providers who offer company establishment services in major global trade and finance hubs are vulnerable to exploitation from international clients or professionals seeking company establishment services in that country.

156. Professional service providers will often be involved in the establishment of trusts and other legal arrangements due to the legal nature of the contracts between settlor, trustee, and beneficiary. Of the cases that involved legal arrangements, almost all involved professional intermediaries. Noting the manner in which trusts can be established using legal persons as trustees in place of a natural person, it is possible for trust arrangements to be established in such a way that the professional service provider never engages directly with the ultimate beneficial owner of the assets held in trust. This, in conjunction with strict confidentiality laws that can be applied to trust arrangements[52], makes professional service providers who offer trust establishment services vulnerable to exploitation for the purpose of disguising the beneficial ownership information of laundered proceeds of crime.

Case Study 100 – United States
In this case, an individual organised a loan-fraud pyramid scheme to falsely inflate the sales and revenues of his company. His company served as a front to generate loans. The scheme involved his wife and son. The defendants created numerous legal entities, including trusts, corporations, and LLCs to open bank accounts to manage the illicit funds and conceal the ownership and involvement in the scheme. The defendants used the help of a legal professional (attorney) to create a number of legal entities, and diverted loans for the company for private benefit, including gems and jewellery. The attorney also set up trusts on behalf of the individual and their family, and helped to sell jewellery held in those trusts. The individual provided false documents purporting to show that the jewellery was a gift of deed into the trust. The trusts provided an air of legitimacy and a cover story to explain the

[52] Van der Does de Willebois, E. et al., 2011: p. 168.

fraud, and as a result, USD 2.8 million from the sale of the jewellery was wired into the trust's brokerage account. Subsequently, USD 200 000 was later moved from the trust checking account into an account opened for a different trust. This transfer was facilitated using the address of the attorney, who was by this time deceased.

Establishing and selling shelf companies

157. Professional intermediaries, such as corporate law practices and TCSPs, will occasionally establish and hold shelf companies in anticipation of a future need. In these instances, the professional intermediary or its employees are recorded as nominee directors or shareholders of the company. While the ease and speed with which companies can be incorporated has, to a large degree, limited the need for legal and accounting professionals to establish and hold shelf companies for future use, TCSPs continue to sell shelf companies. This is particularly true for online TCSPs and TCSPs in major international finance and business hubs. The simplicity associated with purchasing an established shelf company suits virtual transactions and small- to medium-sized business clients with less complex corporate and financial structures. However, shelf companies can be used for any purpose, and can form part of large and complex business structures.

158. In addition to offering readymade legal persons, many TCSPs will establish bank accounts registered to the shelf company, which are retained by the shelf company following its sale. This practice can complicate CDD activities performed by the financial institutions. Approximately one-third of professional intermediaries identified in the case studies were assessed as opening bank accounts on behalf of their clients, most of whom were located in a foreign jurisdiction.

159. The case study below demonstrates how criminals specifically targeted shelf companies to facilitate their fraudulent scheme. It is likely that the corporate history of the shelf companies was desired by the criminal to lend legitimacy to the fraud, which may have been diminished if newly created companies had been used. The case also demonstrates the manner in which the shelf companies were sold by nominee directors along with pre-established bank accounts.

Case Study 104 – United States

The defendants engineered a conspiracy to sell fraudulent renewable energy credits through the use of shell and shelf companies in the US in order to fraudulently receive renewable energy tax credits from the US government for renewable fuels never produced, and to launder those illicit proceeds for their own benefit. Among their ill-gotten gains from these proceeds were real estate, boats, cars, watches, and gold. During the course of their investigation, law enforcement determined that the defendant directed a network of his professional contacts to purchase shelf companies throughout the US, to serve as purported purchasers of renewable fuel and purported sellers of feedstock. The use of shelf companies was discovered by interviewing the

nominees who had opened bank accounts on behalf of those companies and through search warrants executed on a number of the businesses.

Directorship, trustee, virtual office, and mailbox services

160. In addition to establishing legal persons on behalf of clients, many professional service providers, particularly TCSPs, offer directorship, virtual office and mailbox services. These services allow the legal person to maintain a physical footprint in a country, and can distance the legal person from other assets and activities controlled by the beneficial owner. As a result, these services are vulnerable to exploitation for the purpose of disguising the true controllers and beneficial owners of a legal person, its assets, and its transactions. Nominee directors and virtual offices are common features in many complex legal structures that FIUs and other competent authorities have identified as being involved in money laundering, tax evasion, investment fraud, and other criminality. Analysis of the case studies used for this report identified that approximately half of the professional intermediaries provided directorship services to their clients. TCSPs represented the large majority of intermediaries involved in the provision of these services, and were often assessed as providing services to other professional intermediaries on behalf of third-party clients.

161. Nominee directors can be formal or informal, and criminals have been known to recruit people with no criminal history to perform these roles, or who agree for their details to be recorded in these positions. Instances of identity theft for the purposes of filling nominee director roles have also been identified; however, these activities pose a risk to criminal groups, and professional service providers that offer these services are an attractive and low-risk alternative.

162. By providing directorship and virtual office services, professional intermediaries may unwittingly facilitate money laundering services and deal in the proceeds and instruments of crime. Even in instances where the professional service provider does not take an active role in the company, which is often the case, the nominee director is at risk of prosecution or other penalty as a result of crimes performed by the legal entity. A majority of professional intermediaries who provided directorship services in the case studies were assessed as being unwittingly involved.

163. Some countries require legal persons to maintain an active presence in the country where they are registered. This is generally achieved through a requirement for a resident of the country to be appointed as a director of the company, or for the company to maintain a physical presence in the country, or both. Professionals operating within these jurisdictions, that offer directorship and virtual office services will be more vulnerable to exploitation from overseas clients than those operating in countries without these requirements. A large majority of professional intermediaries who provided directorship services in the assessed cases were providing services to clients based overseas. One case study (Case Study 78), included below, demonstrates how a foreign client of a TCSP appointed a domestic-based national as a nominee director to meet the country's requirements to have a

resident as director. The nominee director had little knowledge of the activities of the companies.

164. In addition to offering directorship and nominee services, some professional service providers offer **trustee services** to domestic and international clients for trusts established under domestic law. In some countries, professional rules prohibit legal professionals from acting as a trustee. In these countries, the role of the legal profession would be limited to providing professional advice on the contract that underpins the trust arrangement.

165. In most countries trustees are not required to register the existence of, or beneficiary of, a trust arrangement, while in other countries they are expressly prohibited from doing so under law. Trustees are also required to act on behalf of the interests of the beneficiaries. This means that, when dealing with matters relating to the trust, they must consider the interests of the beneficiary over their own.

166. Professional service providers who offer trustee services are at risk of becoming the effective legal owner of criminal assets[53], and of dealing with the proceeds of crime. Only strict due diligence measures, for the settlor, the beneficiary, and the asset in trust, can assist professionals in avoiding this form of exploitation.

Case Study 78 – New Zealand

A New Zealand law firm was linked to clients who had been implicated, arrested or convicted of a myriad of offences including embezzlement, bribery, corruption, tax evasion, and money laundering. This law firm set up its business basis in New Zealand, and worked for overseas clients using its in-depth knowledge of New Zealand tax, trust and company law.

The companies and partnerships were set up by this New Zealand law firm, who routinely used its employees as nominee directors and shareholders, with the beneficial owners (who were sometimes offenders and their associates) not publicly named. Furthermore, often a chain of companies was established, with one company the shareholder of another, which was the shareholder of another, which added complexity to the structure, and further removed the beneficial owner from the assets. Sometimes a New Zealand (shell) company was used as a trustee of the trust.

The companies involved were usually all shell companies with nominee directors, shareholders, and addresses. The companies, partnerships and trusts comprised the complex structures established by this New Zealand law firm, which can be used to hide and protect wealth. Furthermore, sometimes entities were set up

[53] In a trust, the title of assets stands in the name of the trustee (or in the name of a person acting on behalf of the trustee), although they constitute a separate fund and are not part of the trustee's own estate (see Article 2 of the Hague Convention).

internationally by this New Zealand law firm's business associates in other countries, which were added to the structures, further increasing the complexity and decreasing the ability and efficiency of detecting crime and hidden wealth. If suspicions did arise and a person with such a structure was investigated, there was a convoluted audit trail that would have been arduous to trace. There were strong indications that criminals have had structures set up by this New Zealand law firm with evidence that some of these structures have been used by criminals to hide assets.

A NZ-based employee was also named as a director to satisfy the legal requirement to have a New Zealand resident director and address; however, the beneficial owner of the company was not identified in every instance.

Facilitating transactions through trust accounts or client accounts

167. Professional service providers, particularly law firms and larger accounting firms, often maintain and operate a trust account to facilitate financial transactions on behalf of clients, hold funds in escrow, or receive payment for services rendered. In most countries, these trust accounts are highly regulated to prevent misappropriation of client funds; however, this oversight often falls short of AML/CFT considerations, and professional trust accounts continue to pose a money laundering vulnerability globally.

168. It is not uncommon for some professionals to facilitate transactions, including cash transactions, on behalf of their client. Analysis of the case studies identified where this had occurred. This service is attractive to criminals seeking to obscure the beneficiary of cash transactions, as it places the burden of integrating the cash into the regulated finance sector on the legal professional (via the law firm's trust or client account). This has the dual effect of:

- leveraging the credibility and reputation of the legal profession to reduce any potential suspicion associated with the cash deposit
- distancing the client and any associates or third parties from the AML/CFT controls of the financial sector.

169. Furthermore, the involvement of an intermediary in a financial transaction between two parties can disrupt a chain of transactions and obscure the relationship between the two parties. As a result, it can be difficult to ascertain the beneficial owner of funds that are transferred through trust or client accounts, especially if the transaction involves a clustering or structuring of transactions, or the transaction occurs over a protracted period of time. This vulnerability is increased when a lawyer allows funds to be placed in the firm's trust or client account when no legal services are performed or expected to be performed. The cases below demonstrate how the trust accounts of law firms and accounting practices were used to achieve this aim.

Case Study 102 – United States

Individual 1, a U.S. citizen and resident of Belize, incorporated more than 5 000 shell companies in Belize and the West Indies to facilitate numerous securities and tax fraud schemes. Individual 2, a dual U.S. and Canadian citizen, was the secret owner of an international broker-dealer and investment management company based in Panama City, Panama, and Belize City, Belize. There were 3 interrelated schemes: 1) fraudulent stock promotion and price manipulation; 2) circumventing capital gains taxes under the Foreign Account Tax Compliance Act (FATCA); 3) laundering more than USD 250 million in profits through unidentifiable debit cards and attorney escrow accounts.

Individual 2 used the services of a US-based lawyer to launder the more than USD 250 million generated through his stock manipulation of a number of U.S. companies – directing the fraud proceeds to five law firm accounts and transmitting them back to members of the scheme and its co-conspirators. These concealment schemes also enabled Individual 2 to evade reporting requirements to tax authorities.

Case Study 3 – Australia

Managers at a university and directors of construction companies were complicit in a fraudulent invoice scheme. The managers approved inflated invoices for maintenance work to be carried out by the construction companies, as well as invoices for work that was never undertaken. The profits from the fraud were used to purchase racehorses and property. The managers at the university were repaid with kickbacks or direct shares in racehorses. Accounting firms, which were undertaking international transfers on behalf of the suspects, sent money to many countries, including New Zealand, Canada, Hong Kong and the US. A large proportion of the funds were sent to companies linked to the horse racing industry. The accounting firms also received international transfers from various overseas entities that were similar in value to the amounts the firms had sent overseas initially. The majority of these transfers originated from Hong Kong. The authorities suspected that the accounting firms were laundering the funds on behalf of the suspects as part of a professional money laundering syndicate.

Facilitating the purchase or sale of real property

170. Real estate property is a highly attractive medium for laundering the proceeds of crime. Unlike other high-value assets, the real estate market in most countries has demonstrated a strong resilience to economic fluctuations, and has generally appreciated in value in most high-density cities. Real estate generally represents a relatively safe medium for storing illicit wealth, and the sale of the asset offers a legitimate rationale for the receipt of large volumes of wealth. Furthermore, the purchase of real estate property offers a convenient and legitimate excuse for acquiring mortgage loans, including from private lenders, and for the receipt of

regular and ongoing payments in the guise of rental income. Both of these are common money laundering methods (refer to Section 2 for further analysis on the use of false loans to obscure beneficial ownership). Approximately one-third of the case studies analysed for this report involved the acquisition of real estate, and most of these cases involved the use of a professional intermediary to execute the purchase.

171. In some jurisdictions, legal professionals are required to facilitate real estate transactions. In countries where legal representation is not required by law, it is common practice for professional service providers to be employed to assist in the conveyancing of the property as a precaution due to the high value of the asset. As a result, professionals will often be responsible for identifying and reporting the vendor and/or purchaser of the land and property titles to relevant government authorities. This makes the professional intermediary vulnerable to exploitation by individuals seeking to disguise the beneficial owner of the real estate asset. Cases analysed for this report demonstrated the following methods used to conceal the beneficial owner of real estate assets:

- purchase of assets through intermediaries, such as companies, trusts, family members, associates, or other complicit third parties who have no criminal record (Case Study 2)
- use of a false name or fraudulent identification information (Case Study 101).

172. In some instances, the beneficial owner of the real estate asset will not be involved in its purchase at all, and will instead direct a third party to make the purchase. This method is difficult to detect, and requires the professional intermediary to be vigilant and aware of their ML/TF risks in order for them to detect the activity. One Australian case study (Case Study 2) demonstrates how an individual suspect to an investigation purchased a property in the name of a family member and used the proceeds of crime to pay down a mortgage loan. The solicitor involved provided conveyancing services in relation to the property, and was thereby responsible for registering the purchase with the relevant government authorities. Furthermore, the solicitor acted as an intermediary for loan repayments, which further distanced the beneficial owner from the asset and associated loan.

Case Study 2 – Australia
An Australian drug syndicate used multiple money laundering methods to launder more than AUD1 million worth of proceeds of crime. One method involved a syndicate member purchasing a property worth more than AUD700 000 in a family member's name. The property purchase was financed using a mortgage. Over a two-month period the syndicate member paid more than AUD320 000 in 16 cash deposits to their solicitor (who provided conveyancing services and acted on behalf of the syndicate member in the transaction) to pay off the mortgage on the property. These cash payments were the proceeds of crime.

Client advocacy and brokerage services

173. In addition to providing business advice to clients and facilitating the formation of legal persons and arrangements, professionals will often offer client advocacy and brokerage services. This can include introducing clients to banks and other financial service providers, and opening accounts and seeking loans on their clients' behalf. As a result, the professional becomes an intermediary between the client and the regulated finance sector, and takes on the responsibility of providing banks with the requisite information to meet their CDD obligations. Analysis of the case studies used in this report identified that, in these particular examples, many professional intermediaries facilitated the establishment of banking relationships on behalf of their clients.

174. In countries where financial institutions are permitted to rely on third parties to perform CDD on the customer[54], professional intermediaries are vulnerable to exploitation for the purposes of disguising beneficial ownership and control. While the ultimate responsibility for conducting CDD should remain with a financial institution during a third-party reliance arrangement, criminals will still seek to use the reputation of professional intermediaries to convince the financial institution of the legitimacy of a false or misleading identity or ownership and control structure. One US case study (Case Study 101 below) demonstrates how a complicit professional used their role as a professional intermediary to frustrate and overcome the CDD activities of financial institutions to attain fraudulent loans.

175. Occasionally, professional service providers maintain some level of control over some or all of their clients' banking accounts. This allows them to manage the financial affairs of their clients in a timely manner, perform accurate bookkeeping, and facilitate transactions on their clients' behalf. To achieve this, professionals are listed as signatories to their clients' accounts, thereby allowing them to act in their clients' interests, but without their clients' direct involvement. This is standard practice for in-house accountants and lawyers (those who work solely for a company or public sector authority), but also occurs when professionals service a number of small to medium-sized businesses as an outsourced professional on an ongoing and regular basis. It is not common for professionals who offer only occasional services to a client to maintain control over the clients' accounts.

176. Managing a client's accounts places the professional at a heightened risk of facilitating money laundering or terrorism financing; however, the service presents a lower risk of obscuring beneficial ownership, provided the transaction is not conducted through an account opened in the name of the professional or their firm and appropriate CDD measures are conducted by the professional and subsequently by the financial institution.

177. In addition to introducing clients to financial institutions, professional service providers will, when necessary, introduce their client to other professional service providers, including other lawyers, accountants, TCSPs, real estate agents,

54 See Recommendation 17 of the FATF Standards.

mortgage brokers and financial advisers. Occasionally, the professional will act on their client's behalf and seek specialist advice or services for their client. This is especially true for those legal professionals who have professional relationships with professionals in other countries. This poses the same risks as those associated with being a client advocate or intermediary. Analysis of the case studies identified that a number of professional intermediaries performed services for another intermediary on behalf of a third-party client.

178. Professionals who receive facilitation requests from international professionals working on behalf of international clients are at a heightened risk of facilitating money laundering and obscuring beneficial ownership information due to the challenges associated with properly verifying the identity and motives of the client and beneficial owner. One Israeli case study (Case Study 39 below) demonstrates how law firms contacted foreign TCSPs to establish companies and bank accounts on behalf of local clients. In this case, the CDD activities of the foreign bank, and the TCSP, would have been inhibited by the numerous layers of professional intermediaries between the client and end service provider and increased the likelihood of incorrectly identifying the true beneficial owner.

179. Furthermore, an unwitting professional may not be in a position to judge the complicity of a corrupt international professional, and may naively trust the legitimacy of the request based on their own professional ethics and morality. This may place them at risk of unwittingly committing a domestic crime on behalf of an international criminal syndicate and may compromise their domestic reputation and professional standing.

Case Study 39 – Israel
This scheme was used to hide the proceeds of fraud conducted through foreign exchange and binary options trades. Local companies attracted foreign investors and presented themselves as legitimate foreign exchange and binary trading platforms. Private companies, Israeli representatives of foreign banks and law firms set up foreign companies abroad by contacting TCSPs located in international jurisdictions. The latter established shell companies in the international jurisdictions. The service provided by the foreign TCSPs also included opening bank accounts in favour of the shell companies in other countries. After the companies were established, the TCSPs were not involved in their management nor in any related activity. In some cases, the suspects used the companies as a vehicle to launder money and in other cases they sold the companies to third parties for a profit.

Case Study 101 – United States
The defendant operated a mortgage broker business and several other companies that owned and managed real estate. He used nominee accounts, shell corporations and other schemes to conceal his ownership. The scheme involved

the purchase of properties owned by entities that the defendant controlled through an employee. The purchases were financed through loans. In connection with the loan applications, the defendant and others submitted fraudulent information related to the financial position of the borrower/purchaser, fraudulent appraisals that overstated the value of the collateral, and other documents that contained other material misrepresentations. The subject would "sell" commercial property owned by an entity he controlled to another entity that he controlled at highly elevated prices. The purchases were financed through fraudulent loan applications and through the submission of fraudulent documents. Also, the defendant altered invoices directed to one of the entities by inflating the cost of the work listed on the original invoices to make it falsely appear as though improvements had been made to the properties serving as collateral for the loans.

Providing services to clients and intermediaries domiciled internationally

180. Professional service providers are vulnerable to exploitation from clients and intermediaries domiciled internationally. As most professionals specialise in establishing and managing legal persons and arrangements within their own country of operation, it is common for international clients and intermediaries to seek their services to facilitate activities in that country. Analysis of the case studies identified that the majority of professional intermediaries were providing services to clients based in another country. In some cases, the relationship between a professional service provider and an international client will be short-term and transactional in nature; however, some professionals, particularly TCSPs, will provide ongoing company and trust management services, particularly if domestic laws require resident directors or trustees. The majority of professional intermediaries who provided services to clients based overseas were also providing directorship, trustee, nominee, or virtual office services.

181. Due to the transnational nature of these customer relationships, professionals that service international clients are vulnerable to deception and fraud perpetrated by criminal clients, complicit foreign professionals, or unwitting intermediaries. This vulnerability is common to all service providers that interact with international clients, and professional intermediaries and financial institutions require sophisticated CDD capabilities to accurately identify beneficial ownership, particularly in the absence of face-to-face engagement with clients. Most professional intermediaries who provided services to clients based overseas were assessed as being unwittingly or negligently involved in the scheme. One Panamanian case study (Case Study 85 below) demonstrates how a smaller TCSP failed to conduct enhanced due diligence on their overseas client and relied on the due diligence performed by the financial institution that referred the customer to them. The trust, managed by the TCSP, was used to collect the proceeds of corruption and illicit enrichment.

182. Criminals will seek to use the services of professionals with domestic and international contacts and associates in order to facilitate international business activity, including the establishment of companies and bank accounts in other countries. Some professionals, particularly in countries that apply strict regulations

to DNFBP sectors, have developed international networks of trusted intermediaries on whom they rely for CDD activities. Although these measures are likely to mitigate some of the vulnerabilities associated with transnational client relationships, they rely on the trusted intermediary having the capabilities necessary to perform accurate CDD to discover the ultimate beneficial owner, and remaining honest throughout the transaction (i.e. not being complicit or wilfully negligent when dealing with suspicious clients). As the professional only has limited control or oversight of the activities of their trusted intermediaries, and retains the risk associated with their activities, the vulnerability to the professional remains.[55]

183. One Guernsey case study (Case Study 36 below) demonstrates how a Guernsey TCSP was exploited by a foreign client to administer a company used to facilitate market manipulation. Over the five-year period of their involvement, the TCSP was unaware of the fraudulent nature of the business' operations, and had not raised any suspicious matters with Guernsey authorities.

Case Study 36 – Guernsey
During a two-year investigation (2014-2016), the US Commodity Futures Trading Commission (CFTC) launched an investigation into UK national Mr. X Doe for market manipulation. It came to the attention of Guernsey Financial Services Commission that a TCSP provider (TCSP B) administered a corporate structure for the benefit of Mr. X Doe. Over a five-year-period Mr. X Doe made approximately GBP 32 million (British pounds). The purported legitimate business was futures dealing. Prior to Guernsey TCSP B's involvement, it was administered by a Cayman Island Company. The Guernsey TCSP, which was licensed for AML/CFT, identified that Mr. X Doe was under investigation and co-operated with the Guernsey AML/CFT authorities.

Case Study 85 – Panama
The purported legitimate purpose of the scheme was the development and construction of real estate, based on small investors who injected capital. The funds provided by the settlor or third-party adherents were derived from illegal activities (corruption of public servants and illicit enrichment). The scheme involved a BVI company with nominee directors, ultimately controlled by a PEP, who was a client of a bank that had a relationship with the TCSP. The TCSP set up a real estate trust to receive money and assets that come from the business of the settlor and "investors." The assets received were invested in a real estate project, with the same assets given as a warranty to the bank that was financing 60% of the real estate project. The ultimate beneficial owner of the real estate project was the son of the PEP.

[55] See also Recommendation 22 (FATF, 2012a)

The trustee did not conduct extensive due diligence and relied on the due diligence performed by the bank that referred the client, since both the client and the trustee maintained a business relationship with the bank.

Providing advice on tax compliance

184. A key role of many professional service providers, particularly accounting and legal professionals, is to provide advice to individuals and businesses on how to maximise profits and minimise costs. This often includes advising clients on lawful means of minimising their taxable liabilities.

185. This service and professional expertise in this area is vulnerable to exploitation from individuals and legal persons seeking to disguise beneficial ownership to avoid taxation obligations - otherwise referred to as revenue and taxation fraud or tax evasion. However, due to their knowledge of tax law, the risk of innocently or unwittingly providing advice on, or facilitating of tax evasion schemes is reduced.

186. The experiences of law enforcement agencies, FIUs, and other competent authorities have identified a high level of involvement from professionals in tax evasion schemes. These schemes have often involved complex transnational company structures, fraudulent trade and false invoicing, and *phoenixing activities* to disguise beneficial ownership of assets and income. Many case studies involved tax evasion as a predicate offence, most of which involved professional intermediaries – principally legal or accounting professionals – the majority of whom were assessed as being complicit in their involvement. Criminals actively target complicit professionals to assist with tax evasion, and are willing to pay lucrative fees as motivation for their complicity.

187. Furthermore, almost all complicit intermediaries involved in tax evasion cases were also assessed as being the designer and/or promoter of the scheme. In situations where the professional intermediary has designed and promoted an illegal tax minimisation scheme to prospective clients, it is possible that the beneficial owner will not be aware of the illegality of the scheme. This poses a significant vulnerability to unwitting beneficial owners as well as the broader reputation of professional services sectors. While no cases specifically identified the involvement of unwitting beneficial owners, a number of cases focused on the corrupt activities of professional service providers themselves, rather than their clients (the beneficial owners). The Australian case study below demonstrates how a complicit accountant exploited their knowledge of tax laws in multiple jurisdictions to facilitate tax evasion on behalf of their clients.

Case Study 5 – Australia

This "round robin" scheme aimed to make funds movements appear as payments to other parties while, in reality, the funds ultimately returned to the original beneficiary. The suspects transferred funds from their companies' accounts to the bank accounts of companies in New Zealand. The New Zealand companies

and bank accounts were controlled by a Vanuatu-based accountant, who was a signatory to the bank accounts. The payments were falsely described in the companies' records as "management and consultancy fees," with false invoices that matched amounts paid to the New Zealand bank accounts. No evidence was available to show that any consulting work had been carried out. The false expense payments were claimed as deductible expenses in the tax returns of companies X, Y and Z, thereby fraudulently reducing the companies' taxable income and taxes owed. The accountant then transferred the funds under the guise of international "loans" through a series of round-robin international transactions, through accounts held in the name of companies owned and operated by the accountant. The accountant transferred the funds into the personal bank accounts of the suspects in Australia. The funds were transferred via an overseas company controlled by the accountant, separate to the companies in New Zealand that received the funds originally. In order to disguise the funds being transferred back into Australia as loans, false documents were created purporting to be international loan agreements with a foreign lender, which are not assessed as income and have no tax liability.

Legal professional privilege and client confidentiality

188. Legal professionals are subject to a range of ethical obligations, which differ from country to country, but which generally adhere to a core set of professional rules. These include: independence from the State; acting with honesty, integrity and fairness; duty to act in the client's interest; and the maintenance of client confidentiality and legal professional privilege (LPP).[56] These ethical obligations are aimed at ensuring fair and equitable access to justice, and ensuring probity and integrity across the profession. Some law societies and regulatory bodies consider that these codes of conduct and professional rules prevent legal professionals from being knowingly involved in money laundering or terrorism financing; however, some of these obligations can be vulnerable to criminal exploitation. FIUs and other competent authorities have reported the use of LPP and client confidentiality to protect the disclosure of the identity of the beneficial owner of assets, which frustrates criminal investigations.

189. LPP generally does not extend to all communications between a lawyer and their client, and often stops short of commercial advice (although this can differ between countries). Communications that do not meet the relevant national definition of LPP (if available) are considered to be protected by legal confidentiality, which is not absolute and is limited in certain key areas.

190. LPP and client confidentiality play an important role in the legal system; however, the initial application of these protections often rests with the legal professional rather than an independent third party. Subsequently, there is no clear and consistent interpretation or application of these protections amongst legal professionals, despite case law and the release of guidance and interpretive notes by

[56] International Bar Association. (2011). IBA International Principles on Conduct for the Legal Profession.

regulatory bodies. Furthermore, LPP is considered to belong to the client, and can only be waived at the direction of the client or if the legal professional is being used to commit a criminal offence. It is an offence in many countries for a legal professional to breach LPP, often punishable by professional sanctions or a criminal charge. Due to varying interpretations, the protections afforded to LPP, and the significant personal and professional consequences for breaching LPP, legal professionals can take a conservative approach to the application of LPP.

191. LPP and client confidentiality can be exploited by complicit legal professionals who are seeking to delay an investigation. However, the general caution with which legal professionals deal with LPP means that any legal professional can unwittingly conceal criminality using it. The case study below involves a Dutch investigation into the activities of a TCSP and civil-law notary involved in establishing structures designed by an international law firm known to be involved in the establishment of structures designed to obscure beneficial ownership. Multiple legal professionals from numerous countries were involved in the establishment of these structures, and have asserted privilege in order to delay or frustrate the investigation. Dutch authorities were required to verify the rights of these legal professionals via mutual legal assistance requests, which can be a time-consuming process.

192. Law enforcement agencies and FIUs have reported that LPP is regularly exploited by complicit legal professionals to frustrate and hinder investigations. Due to the nature of LPP, claims of privilege need to be reviewed prior to being overturned, even if the grounds for LPP are questionable from the beginning. Regardless of the rules associated with LPP in most countries, the subjective nature of LPP will continue to pose a challenge. Other challenges associated with LPP and gathering evidence in relation to legal professionals have previously been reported by the FATF[57]. These challenges may explain a lower proportion of case studies involving legal professionals submitted for this report, and the lack of evidence of complicity cited in those case studies.

193. During the consultation phase with key private sector stakeholders, some private sector representatives highlighted that LPP training offered to legal professionals can often be inadequate unless the legal professional specialises in litigation where LPP is frequently considered. It is likely that legal professionals involved in tax, private client, corporate, or estate planning matters may rarely be required to consider or employ LPP. It has been suggested that the low level of training, coupled with a lack of practical application by some lawyers, leads to the development of broad and conservative approaches to LPP. Enhanced training and guidance in this area may assist to reduce this vulnerability over time.

[57] Obtaining records held by DNFBPs, the uncertainty of the scope of privilege, difficult and time-consuming processes for seizing legal documents, and a lack of access to client account information can present challenges in the evidence-gathering process. Law enforcement agencies are required by law to have strong evidence from the outset to demonstrate that LPP/secrecy should be removed. Claims of LPP could impede and delay the investigation (FATF, 2013: pp. 30–33).

194. While client confidentiality is a common principle among accounting professionals, it generally does not prohibit the disclosure of information that is permitted to be, or required to be, disclosed under law. As a result, it is less vulnerable to exploitation. However, in some countries, accounting professionals afford their clients LPP, or a form of privilege that closely resembles LPP. Additionally, some accounting professionals also hold legal qualifications, and operate as solicitors in law firms to provide expert advice on taxation and company law. Accounting professionals working at the behest of lawyers may also be subject to LPP. Accounting professionals who are subject to LPP obligations face similar vulnerabilities as their counterparts in the legal sector.

Case Study 71 – Netherlands
A criminal investigation into a Dutch TCSP was instigated on account of the systematic failure to notify unusual transactions and money laundering. This was presumed to involve the facilitation of fake transactions on behalf of foreign clients to ensure, for example, the assets or property of those clients were scarcely taxed, or funds parked were transferred by means of fake transactions to another jurisdiction. This was carried out by means of complicated well-considered structures with companies and trusts in various countries for which instructions were given by a financial service provider and were also discussed in this way by the suspect with the Dutch civil-law notary. Dutch entities were part of these complicated structures. The same applied for the Dutch foundations registered at an international address. The structure sometimes consisted of eight different entities, in various countries. The suspect reportedly did not know in several cases the identity of the actual beneficiaries of the companies that he incorporated.

Limited AML/CFT obligations or insufficient awareness and compliance

195. Internationally, there has generally been an increase in the effective application of risk-based measures by financial institutions to prevent ML and TF[58]. As a result, the risk of detection for those seeking to exploit financial institutions for ML and TF purposes has increased. In contrast, the implementation of AML/CFT obligations to DNFBPs has been slower, with many jurisdictions yet to fully implement Recommendations 22 and 23[59].

196. FIUs, law enforcement agencies, and other competent authorities report that the primary environmental vulnerability that continues to effect the concealment of beneficial ownership is the lack of regulatory obligations to collect, disclose, and make available information regarding beneficial ownership across the globe.

[58] See the outcomes of the latest round of Mutual Evaluation Reports conducted by the FATF available at www.fatf-gafi.org.

[59] *Ibid.*

197. One of the most significant findings of the FATF's Horizontal Study is that 17% of jurisdictions that responded do not impose any AML obligations or AML supervision on professional intermediaries whatsoever, despite this being a requirement of FATF Recommendations 22, 23 and 28. In some cases, this is partly the result of resistance to regulation from the relevant sectors or professions (e.g. these groups work to prevent the enactment of laws or regulations which would impose such obligations or to mount constitutional challenges to such laws once passed). In other cases, it may represent an "unfinished" aspect of the AML/CFT system which has not yet been implemented. See Section 4 for further analysis of jurisdictional vulnerabilities associated with the lack of AML/CFT obligations for DNFBPs.

198. Combatting ML and TF requires an awareness of established and emerging ML/TF risks and typologies. Professionals who are not subject to AML/CFT obligations are more vulnerable to ML/TF exploitation than their regulated counterparts in other countries due to the lower level of awareness and understanding of ML/TF threats.[60] Analysis of the case studies identified that less than 10% of intermediaries involved in these schemes identified and reported a suspicious matter to a supervisory body. All of these cases were from countries that regulate DNFBPs, suggesting that the effectiveness of supervision of DNFBPs in the countries where they are regulated needs improvement.

199. In many countries, the authority to submit a suspicious transaction report is limited to businesses and professional service providers who are expressly regulated under that country's AML/CFT legislation. In these instances, the inability for unregulated professionals to voluntarily report a suspicious matter to the FIU or self-regulating body (SRB)[61] is an additional vulnerability, as it may limit how an unregulated professional can respond to a suspicious request.

200. The vulnerability posed by reduced AML/CFT obligations is greater for small professional firms and firms that do not operate in international markets. Larger multinational firms are more likely to be attuned to money laundering vulnerabilities and may have robust AML/CFT measures in place, particularly if they are subject to AML/CFT regulation in one or more of their countries of operation.

201. In countries where AML/CFT legislation has been applied to DNFBPs, FIUs and supervisory bodies have expressed concern regarding the standard of compliance exhibited by the sector, and the level of reporting, which sometimes appears low in comparison to the size and activities of the sector. One Dutch case

60 ACC, 2015: p. 83.

61 A self-regulatory body is a body that represents a profession (e.g. lawyers, notaries, other independent legal professionals, or accountants), and which is made up of members from the profession. It also plays a role in regulating the persons that are qualified to enter and who practice in the profession, and performs certain supervisory or monitoring type functions. Such bodies should enforce rules to ensure that high ethical and moral standards are maintained by those practicing in the profession. See, in particular, Question 5 of the Horizontal Study at Annex B.

study (Case Study 71 above) provides an example of systematic non-compliance by a Dutch TCSP, which was exploited by foreign clients to facilitate tax evasion. Whether the level of compliance exhibited by legal professionals in some countries is indicative of an unwillingness to comply, or a limited understanding of their AML/CFT risks, has not been assessed. However, compliance and awareness of AML/CFT risks within some professions is considered by FIUs and other competent authorities to be a vulnerability[62]. Another Dutch case study (Case Study 66 below) demonstrate how a lack of awareness of ML and TF risks amongst professional service providers facilitated money laundering and other criminality. In both cases, professionals involved in managing companies and promoting investment schemes on behalf of their clients failed to identify indicators of criminality or conduct sufficient due diligence on their customers. These failures were not due to a lack of regulatory obligations, but rather insufficient awareness within the TCSPs of their risks and/or inadequate measures to detect high-risk activities. The effectiveness of supervision of DNFBPs and the extent to which DNFBPs are applying their obligations (where they exist) has been a consistent challenge for countries throughout the current round of FATF Mutual Evaluations[63].

Case Study 66 – Netherlands
The case involves funds derived from extortion. The suspect created legal constructs made up of parent companies registered in a low tax jurisdiction with few or no or scarcely any obligations to keep administrative and accounting records. The suspect used a coded bank account in Switzerland to further conceal the money laundering activity. TCSPs managed the companies. According to the public prosecutor: "*the refinement also included the use of persons and trust companies who/which from the nature of their profession should have noticed what was going on and should have had alarm bells going off in their heads. However, no one saw reason to flag any concerns*."

62 HM Treasury, 2015.

63 See www.fatf-gafi.org.

SECTION 4 — ENVIRONMENTAL VULNERABILITIES

202. Aside from the main characteristics leading to the misuse of legal persons and legal arrangements, and the inherent vulnerabilities associated with the professional intermediaries involved in their establishment, a number of environmental vulnerabilities can affect the overall risks posed by these legal structures and the service providers that support their creation and operation. These environmental vulnerabilities include jurisdiction-specific vulnerabilities, such as AML/CFT regulations and trade and commercia trends, and vulnerable business practices, including online client interactions. These vulnerabilities are outlined in greater detail below.

Jurisdictional vulnerabilities

203. The availability of beneficial ownership information varies significantly between different countries. Despite a renewed focus on the importance of timely and accurate beneficial ownership information by key bodies such as the FATF, Egmont Group, and OECD Global Forum, as well as the G20 and UK Anti-Corruption Summit, many countries have not taken sufficient steps to enhance the transparency of beneficial ownership through the effective implementation of the FATF Standards. This is reflected in the aggregated results for the fourth-round of mutual evaluations completed to date, which demonstrate that most countries assessed at the time of the drafting of this report had demonstrated low or moderate levels of effectiveness and technical compliance against key recommendations relevant to beneficial ownership.[64] This increases the difficulties and costs associated with conducting due diligence, particularly for small businesses (such as the majority of professional intermediaries), and makes it harder for professionals and financial institutions to identify patterns and indicators of criminality.

204. In parallel, the FATF has undertaken a Horizontal Study of enforcement and supervision of beneficial ownership obligations of FATF and FSRB members. The Horizontal Study demonstrated that, even where professional intermediaries are subject to AML/CFT requirements, supervisory mechanisms remain weak due to capacity issues and the lack of a consistent approach for different types of professions. Enforcement actions are also rare[65]. The results of the Horizontal Study are located at Annex B of this report.

205. Aside from considerations of the effectiveness of regulatory, enforcement, and supervisory measures in a given country, consideration should also be given to whether the country in which the legal person or arrangement is established, or the country in which the legal person or arrangement has an active bank accounts, is a common international trade or financial centre and/or a low-tax jurisdiction. These geographic vulnerabilities are outlined in greater detail below.

64 FATF (2018).

65 See, in particular, Questions 5 and 6 of the Horizontal Study.

Trade and Financial Centres

206. As this report has demonstrated, there are a number of reasons why criminals seek to exploit legal persons and arrangements to disguise beneficial ownership. One of the primary benefits offered by legal persons is the opportunity to disguise transactions as legitimate business and trade activities. In particular, legal persons can facilitate trade-based money laundering (TBML) typologies, including those that do not result in the actual movement of goods, or which purport to involve the provision and/or acquisition of services to or from other international businesses. The Israeli case study below (Case Study 40) demonstrates how companies in international jurisdictions (including one in a major South-East Asian trading hub) were used to facilitate TBML through false invoicing.

207. In order to leverage domestic and international trade and finance trends, criminals will often establish legal persons and bank accounts in cities that are considered to be major regional and global trade and financial centres. These trade and financial centres can be loosely defined as any city which:

- can be considered an epicentre of regional or international trade
- is known to accommodate regional headquarters of major international businesses, consultancy firms, and/or financial institutions
- is home to a cluster of national and internationally significant financial services providers, such as banks, investment managers, or stock exchanges.

208. Establishing legal persons in these trade and financial centres serves to:

- legitimise the legal person as a seemingly high-functioning and active business
- legitimise the transactions between two or more legal persons as lawful trade
- conceal the unlawful transactions made by, or to, the legal persons behind the vast number and value of genuine transactions occurring across the same trade and finance channel.

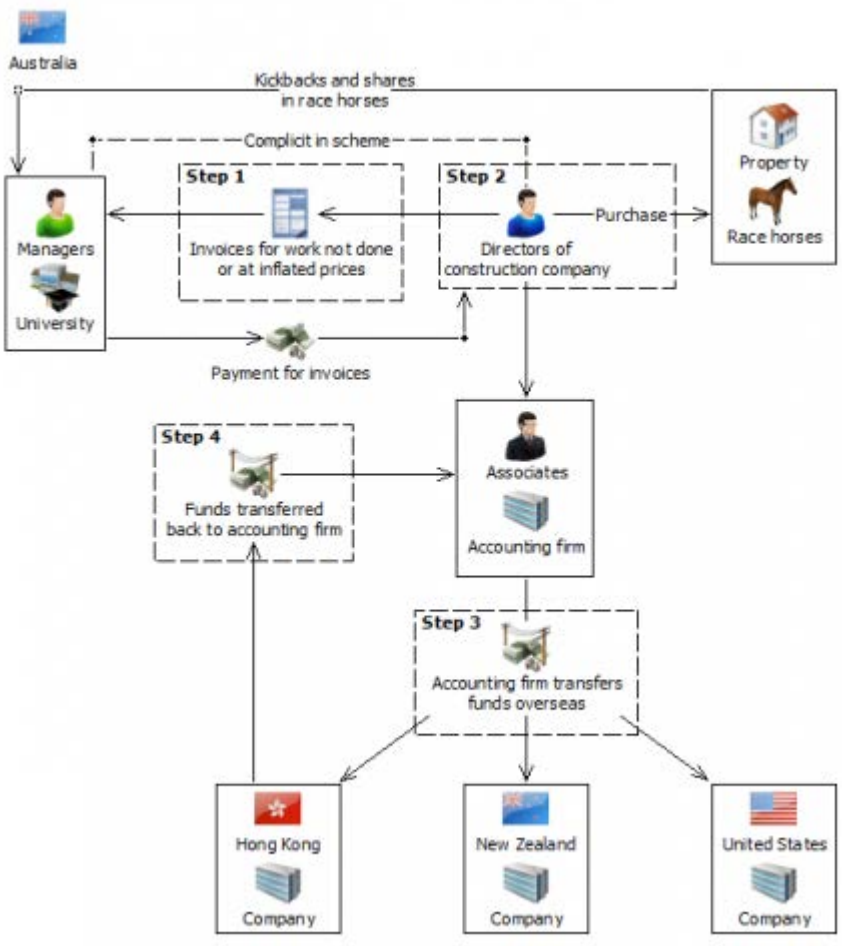
209. As a result of the value and popularity of legal persons incorporated in global and regional trade and financial centres to facilitate criminality and the concealment of beneficial ownership, these entities are likely to represent a greater vulnerability compared to legal persons established in other countries or cities. This jurisdictional vulnerability is unique for each country, and is based on the trade and finance corridors that most affect the economy and society of that country. In the Australian case below (Case Study 3), the accounting firm that facilitated the fraud on behalf of the two university managers utilised companies in Hong Kong, the US, and Canada to launder the proceeds under the guise of legitimate business transactions. These countries represent major trading and finance hubs in the Australian context.

210. Due to the unique nature of this jurisdictional vulnerability, this report has not sought to list highly-vulnerable cities or countries. FIUs, other competent authorities, and financial institutions are best placed to identify high-risk money laundering corridors specific to their economy, and should use this information to assess the vulnerability posed by legal persons operating or transacting along these corridors. Furthermore, countries and cities that are themselves major trade and

finance centres should be aware of their vulnerabilities as possible jurisdictions of choice for international criminals.

Case Study 3 – Australia

Managers at a university and directors of construction companies were complicit in a fraudulent invoice scheme. The managers approved inflated invoices for maintenance work to be carried out by the construction companies, as well as invoices for work that was never undertaken. The profits from the fraud were used to purchase racehorses and property. The managers at the university were repaid with kickbacks or direct shares in racehorses. Accounting firms, which were undertaking international transfers on behalf of the suspects, sent money to many countries including New Zealand, Canada, Hong Kong, and the USA. A large proportion of the funds were sent to companies linked to the horse racing industry. The accounting firms also received international transfers from various overseas entities that were similar in value to the amounts the firms had sent overseas initially. The majority of these transfers originated from Hong Kong. The authorities suspected that the accounting firms were laundering the funds on behalf of the suspects as part of a professional money laundering syndicate.



Case Study 40 – Israel

This case involved a fraudulent tax scheme designed to evade paying tax generated from international trade and a ML infrastructure that was used to hide the illegally gained funds. The suspects used a TCSP to register and operate two international shell companies (Company A and Company B) to create the false appearance that the revenues from their international trading did not belong to the local Israeli company which they controlled, to avoid tax. The two companies traded with each other exclusively and did not have any other source of income. Company A (foreign shell company) transferred significant funds to company C (local company) using the cover of a "consulted fee"/ "service commission". Only this commission, which was less than half of the real income, was reported to the tax authority in Israel. Thus, ultimately, the suspects paid taxes only on a small part of their income.

Low-Tax Jurisdictions

211. A number of jurisdictions across the globe have implemented favourable tax conditions, including very low or even nil corporate or income tax rates, or other tax incentives designed to appeal to foreign investors.[66] These are characteristics associated with many offshore financial centres (OFCs)[67]. International research has demonstrated that the decision by a jurisdiction to offer favourable tax concessions, even marginal concessions, can stimulate investment and result in overall benefits to the jurisdiction (despite the obvious reduction in direct corporate taxes).[68] These low-tax jurisdictions attract foreign investment, not only because income earned locally is taxed at favourable rates, but also because it makes it possible to facilitate the avoidance of taxes that might otherwise have to be paid to other countries.[69]

212. FIUs, law enforcement, and other competent authorities regularly identify criminals using legal persons and bank accounts established in low-tax jurisdictions. Many of the case studies included in this report demonstrated this trend, and over half of the cases analysed involved a transfer of funds via companies or accounts held in low-tax jurisdictions. Many case studies, however, were not specific when referring to international jurisdictions (many simply referred to "offshore jurisdictions" to refer to jurisdictions outside of the reporting country's national boundaries). This prevalence may also be a result of selection bias, whereby

66 Dharmapala, D. & Hines, J., 2009: p. 1058.

67 Defined as countries or jurisdictions with financial centres that contain financial institutions that deal primarily with non-residents, in foreign currency on a scale out of proportion to the size of the host economy, jurisdictions where non-resident owned or controlled institutions play a significant role within the centre and where the institutions in the centre may gain from tax benefits not available to those outside the centre. See the OECD Glossary on Statistics (www.stats.oecd.org).

68 Dharmapala, D. & Hines, J., 2009: pp. 1058-1068.

69 *Ibid:* p. 1060.

participating countries chose cases for submission based on the involvement of certain jurisdictions. Regardless, it is likely that criminals will continue to target low-tax jurisdictions due to the favourable return on investment made possible by tax concessions and the ease with which companies and bank accounts can be established in some of these jurisdictions by foreign nationals.

213. It is important to note that many OFCs are actively involved in global efforts to combat money laundering and tax evasion, including via the FATF, Egmont Group, and the OECD Global Forum. Many of the jurisdictions that are members of the OECD Global Forum are signatories to the two internationally agreed standards on the exchange of information for tax purposes: the *Exchange of Information on Request* (EOIR) and *Automatic Exchange of Information for Tax Purposes* (AEOI). Some OFCs commenced the automatic exchange of information in 2017, while others are expected to commence the exchange of information by September 2018.

214. Due to the degree to which OFCs are exploited by criminals to conceal wealth and beneficial ownership, legal persons established in these jurisdictions, particularly those indicative of being shell companies, can pose a vulnerability to other jurisdictions. Whilst OFCs are vulnerable, they should not be viewed as a collective, but on an individual basis.

Case Study 43 – Italy

This case related to an investigation into a transnational criminal organisation active in money-laundering and that perpetrated crimes in Italy. It was triggered by STRs concerning financial flows from a company in the British Virgin Islands channelled through a Swiss bank and sent to an Italian legal person to be used for a refurbishment of a real estate unit which had a value of EUR 9 million. The investigation resulted in the charging of a chartered account for money laundering. The search of the individual's office resulted in the seizure of documents pertaining to a high number of off-shore vehicles which were established on behalf of wealthy national clients. The subsequent investigations led to the discovery that around EUR 800 million had been moved between Italy and international accounts.

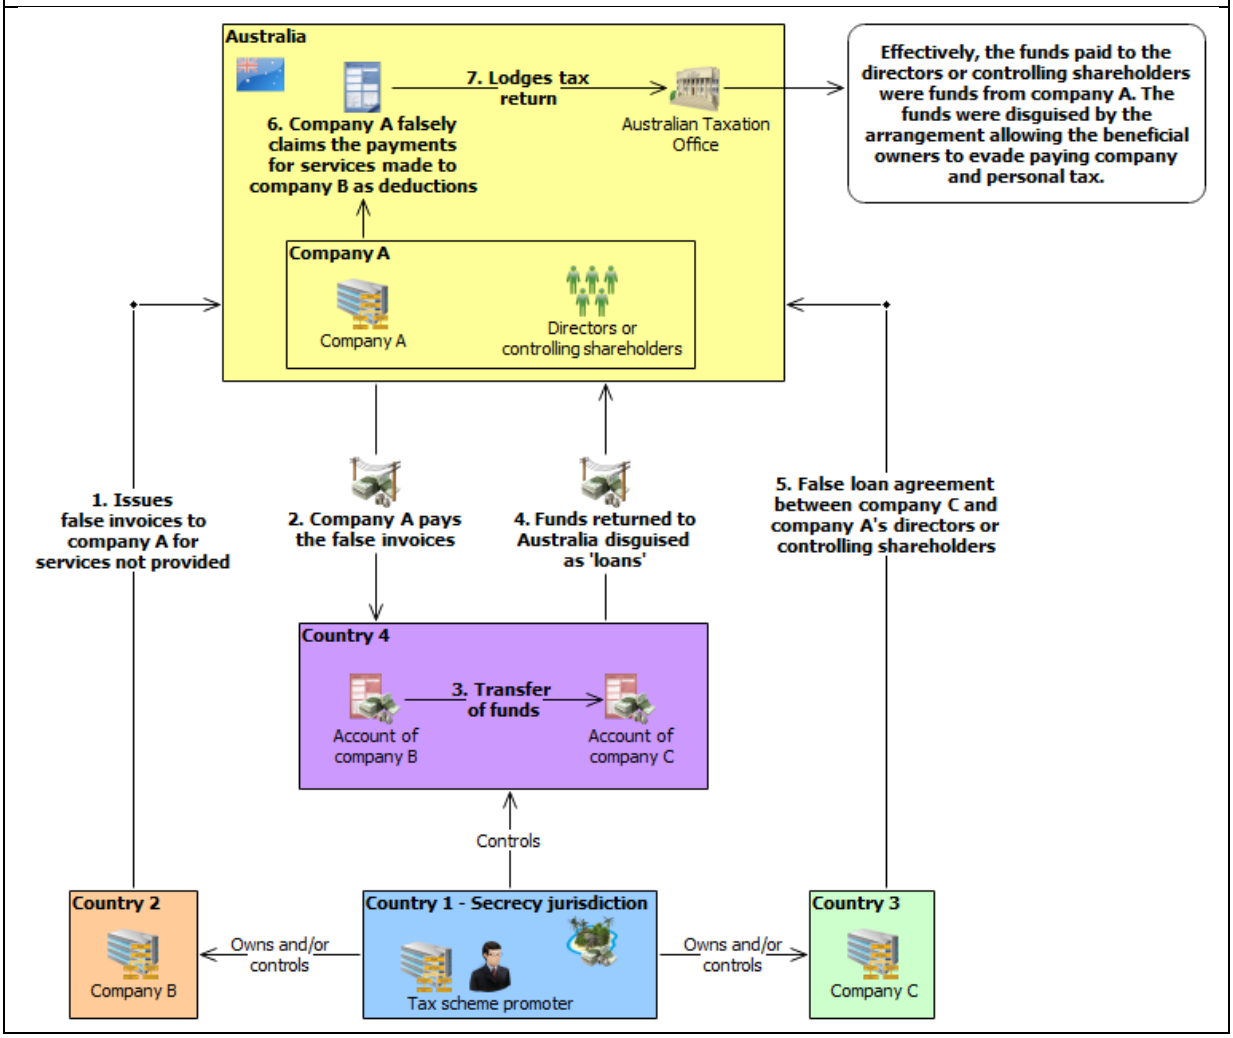
Case Study 68 – Netherlands

This case was an investigation into Dutch suspects for filing incorrect tax returns, money laundering and forgery. During the investigation, it was identified that funds had been transferred through a numbered account in Switzerland in the name of a financial service provider in Panama. Shortly thereafter, very similar amounts were debited from the account, under a false description, to the credit of the Dutch suspects.

A financial service provider facilitated this by providing the Dutch suspects with the opportunity to conceal these cash flows from third parties. The invoices for the services provided were paid to the financial service provider via the account in Switzerland.

Case Study 8 – Australia

Project Wickenby identified the use of false invoices and loans in illegal international arrangements. The scheme involved an Australian company (company A) which entered into an agreement with a tax scheme promoter based in a tax secrecy jurisdiction (country 1). The promoter benefited from the confidentiality and privacy offered in the tax secrecy jurisdiction. The tax scheme promoter owned and/or controlled two international companies (company B and C). Control may have involved the use of a trust or the use of third parties; for example, a relative or associate may act as the director of the international companies. Company B provided consultancy and/or management services and is incorporated in country 2. Company C provided a financial service (as a lender of money, for example) and was incorporated in country 3. Companies B and C held bank accounts in country 4. The promoter controls and operates these accounts.



Vulnerable business practices

215. In analysing the role of professional intermediaries in the concealment of beneficial ownership, this report has focused on a range of business practices that make these professional intermediaries more vulnerable to exploitation. These vulnerable business practices are most commonly performed by professional intermediaries, and contribute to the risks posed to, and by, those professions. Of these vulnerable business practices, the provision of online and virtual services is one exhibited by many businesses across a wide range of industry sectors, including the professional intermediary and finance and banking sectors. Due to its ubiquitous nature, it has been addressed separately as an environmental vulnerability below.

Online and Virtual Services

216. The ability to disguise beneficial ownership is exacerbated by the provision of online and virtual services to clients and banking customers. Many professional service providers and financial institutions have implemented business practices and client tools designed to simplify client interactions by reducing or removing the need for face-to-face interactions. These services leverage the pervasive nature of the online marketplace and meet the expectations of modern consumers, who largely expect that everything can be purchased, sold, or otherwise transacted online. Online services are therefore likely to become more prevalent over the course of the digital age.

217. The ability to establish companies, business banking relationships and move money virtually in the absence of direct face-to-face contact with a professional service provider or financial institution can increase the risk of these entities facilitating illicit activity; whether identity fraud or common money laundering typologies such as smurfing[70] and cuckoo smurfing[71]. Similarly, the ability to establish companies and move funds in this way can help facilitate the concealment of beneficial ownership information. Many financial institutions have implemented measures to verify the identity of clients in the absence of face-to-face engagement, and governments are establishing or exploring tools and resources to support these efforts, including document verification services and formal virtual identities. However, despite these measures, reliance on documentation provided by a customer in the absence of face-to-face engagement can enable the use of fraudulent documentation or help enable informal nominees to act as representatives without the knowledge of professionals or financial institutions. As a result, online and virtual services are vulnerable to exploitation by criminals, and financial institutions

70 The term “Smurfing” is given to the practice of using multiple individuals or accounts to perform transactions so as to avoid suspicion or currency reporting requirements.

71 The term “cuckoo smurfing” originated in Europe because of similarities between this typology and the activities of the cuckoo bird. Cuckoo birds lay their eggs in the nests of other species of birds which then unwittingly take care of the eggs believing them to be their own. In a similar manner, the perpetrators of this money laundering typology seek to transfer wealth through the bank accounts of innocent third parties. (AUSTRAC Website: www.austrac.gov.au/typologies-2008-methodologies, cited 25 January 2018).

and professional service providers need to be conscious of individuals and intermediaries that may be manipulating these facilities.

218. In addition to the challenges of conducting CDD in a virtual environment, the use of internet banking services to facilitate transactions further exacerbates these issues by allowing unknown individuals to control bank accounts anonymously. FIUs and other competent authorities have reported that criminals will often coerce "straw men" to establish bank accounts for use by the criminal at a later time. Once accounts are established, and following the CDD activities conducted by the financial institution, these "straw men" will hand over the account details, including internet banking login details and passwords to the criminal. This effectively disguises the beneficial owner of the account and allows the controller to circumvent CDD obligations altogether.

219. The Israeli case study below demonstrates how the provision of online services allowed a suspect to establish companies and open bank accounts abroad using identification information provided by third-party straw men. It also demonstrates how the availability of foreign online banking platforms allows unknown third parties (in this case, the suspect) to circumvent the due diligence measures of financial institutions located abroad and actively control foreign accounts opened by unrelated individuals. The case study also shows that authentic identification documents, such as a lawful passport, can be easily used in foreign jurisdictions by third parties in the absence of face-to-face interaction, as document verification controls are only designed to verify the authenticity of the document, and not whether the document belongs to the person opening the account.

220. Some financial institutions and RegTech firms have implemented, or are developing, CDD measures that harness modern technologies to enhance customer identification in a virtual environment. These measures include:

- capturing metadata from client interactions, such as internet protocol (IP) addresses and geolocation data
- using in-built cameras from mobile phones, tablets, laptops, and automatic teller machines (ATMs) to capture the customer's image (with the customer's knowledge and consent) for verification against other identity documents, and
- utilising biometric identifiers, including facial recognition and fingerprint scanning technologies.

221. These developments have the potential to significantly reduce the vulnerabilities associated with the provision of online and virtual services. However, the expense and sophistication of these CDD systems is likely to limit their implementation in the short term, and the vast majority of professional service providers and smaller financial institutions will continue to be vulnerable to exploitation and the challenges associated with identifying beneficial ownership in a virtual environment.

Case Study 38 – Israel

This scheme was used to hide funds from social engineering fraud and other criminal offenses. The cover story for the criminal offences was international trade – funds from merchants in Europe and the US sending payments to suppliers in East Asia. The suspect, an owner of a registered MSB, operated a second, unregistered MSB. The suspect used several natural persons as his contact points in East Asia which in turn contacted local company service providers for the purpose of setting up international companies and opening bank accounts. Local straw men were registered as the shareholders of the new international companies established for the scheme. Shareholders were registered based on passports provided by the suspect's contact persons mentioned above. The registered addresses of the companies were in East Asia. Bank accounts were opened in the same East-Asian countries where the offices were located.

Immediately after opening the bank accounts, the suspect received the sole means to control them, i.e. an electronic token with the passwords for online activities. In order to establish creditability and credit history, some accounts were activated as low-volume activity accounts, while others were used for high-volume transactions. In case the bank had questions about the nature of the transactions, the questions were sent to the suspect by the straw men and were returned to the bank by them.

Use of Third-Party CDD and Identity Verification

222. There are a range of third-party service providers who specialise in providing support to identity verification and customer due diligence services to corporate clients, such as sanctions lists and other adverse information, and information on company ownership. These services can be an important part of a robust and effective CDD program, and can improve the ability of a financial institution or DNFBP to assess customer risk and verify a customer's identity (although it should be noted that responsibility for CDD measures remains with the financial institution or DNFBP in context of outsourcing or agency relationships, in accordance with FATF Recommendation 17).

223. Despite the value of these services, some major financial institutions have reported, via the Wolfsberg Group, that the information provided by third-party service providers can be out-of-date or incomplete. This has the potential to frustrate CDD activities, including the verification of beneficial ownership and related ML/TF risk assessments due to the provision of inaccurate information. These major financial institutions have only been able to identify the deficiencies in the information provided by third-party service providers due to their own CDD and financial intelligence capabilities. However, if smaller financial institutions who do not have well established CDD mechanisms rely on third-party service providers to support their CDD efforts, they may not be aware of the inaccuracy of the

information being provided, resulting in a vulnerability in cases when the information is inaccurate.

224. Due to the expense of establishing and maintaining a robust and effective in-house CDD and financial intelligence capabilities, most financial institutions and professional service providers will continue to rely heavily on the services provided by third parties. The reason why the information stored by third-party service providers is sometimes deficient is not understood, and may be symptomatic of the enormous challenges associated with collecting relevant and contemporary information on a global scale. While the advent of virtual identities may improve this situation in the future, there may be opportunities for this information resource to be improved.

Reliance on introduced business

225. Financial institutions and DNFBPs can also rely on other regulated financial institutions and DNFBPs to carry out the CDD process in certain circumstances, which are set out in Recommendation 17. In many cases, this will involve a financial institution relying on a lawyer or TCSP, which is providing company formation services and also seeking to open bank accounts on behalf of the newly created company. If the requirements for reliance set out in Recommendation 17 are not properly applied, then a financial institution's CDD can be compromised by a negligent or complicit DNFBP which it relies on, undermining their ability to accurately identify beneficial ownership or suspicious activities indicative of efforts to disguise ownership and control.

SECTION 5 — CONCLUSIONS AND ISSUES FOR CONSIDERATION

226. Schemes designed to obscure beneficial ownership often employ a "hide in-plain-sight" strategy, leveraging global trade and commercial infrastructures to appear legitimate. However, visibility does not equate to transparency, and many of the tools that were designed to encourage business growth and development, such as limited liability corporations and nominee directorship services, are now also being exploited to facilitate money laundering. The globalisation of trade and communications has only increased this threat, and countries now face the challenge of enforcing national laws in a borderless commercial environment.

227. This report has analysed open-source research, public intelligence reports, classified intelligence holdings, and public and private sector experience and expertise to compile a comprehensive overview of the main characteristics and vulnerabilities that lead to the misuse of legal persons and arrangements, and the exploitation of professional intermediaries, to conceal beneficial ownership. Much of what this report has identified confirms key principles and concepts reported in the canon of literature available on the subject of beneficial ownership. This suggests that the vulnerabilities associated with the concealment of beneficial ownership are enduring, or increasing, despite ongoing efforts to combat money laundering and terrorism financing. These key findings are outlined in detail in the Executive Summary.

228. The FATF Recommendations require competent authorities to have access to adequate, accurate and timely information on the beneficial ownership and control of legal persons (Recommendation 24). In addition, countries must take measures to prevent the misuse of legal arrangements for money laundering and terrorist financing - in particular ensuring that there is adequate, accurate and timely information on express trusts (Recommendation 25). Implementation of the FATF recommendations on beneficial ownership has proven challenging for countries. As a result, the FATF developed the *FATF Guidance on Transparency and Beneficial Ownership* to assist countries in their implementation of Recommendations 24 and 25, as well as Recommendation 1 as it relates to understanding the ML/TF risks of legal persons and legal arrangements.

229. This section includes a series of issues for consideration that may, alongside the conclusions of the study, support the effective implementation of these two FATF Recommendations including by outlining areas of further potential work to reduce the barriers faced by law enforcement and increase the accuracy and/or availability of beneficial ownership information.

230. This report shows that limited liability companies (and similar companies in various jurisdictions) are more vulnerable to misuse for the concealment of beneficial ownership than other types of legal persons. This is due to the ease with which they can be established, and the manner in which they are often used to generate complex legal ownership structures. Moreover, the availability and use of nominee directors and shareholders (both formal and informal) appear to exacerbate the risks despite the FATF Standards requiring measures to prevent their misuse. Nominees have been identified as a central enabler of indirect ownership chains. Given the vulnerabilities associated with the use of nominees,

further study into the role that professional nominees play is merited to better understand the costs and benefits associated with allowing the practice, and to identify the best means to tackle their misuse. Any further study in this area may benefit from also having the expertise of other international organisations that have a wider view of global economics than the FATF, which is focused on combatting money laundering and terrorist financing.

Issue for Consideration 1
Given the vulnerabilities associated with use of nominees, individual countries and the FATF, working with the broader global community may wish to consider measures to limit their misuse.

231. The use of specialists and professional intermediaries is a key feature of schemes designed to conceal beneficial ownership. The majority of case studies analysed for this report involved professional intermediaries. While it was not always explicitly stated in the case studies, approximately half of all cases were assessed as involving a complicit professional intermediary (gatekeepers were determined to be complicit if, on the basis of the case summary provided, they appeared to have had a role in designing the scheme, knew of the scheme's illegal nature, or were charged with a crime). This demonstrates that although complicity may be a factor, it is not strictly necessary when facilitating a scheme designed to obscure beneficial ownership, and that some professionals are unwitting or negligent in their involvement. This also serves to highlight the importance of effective regulation and education of DNFBPs, and the need for increased AML/CFT awareness amongst professional services sectors. The FATF's *Horizontal Study of Supervision and Enforcement of Beneficial Ownership Obligations* identified that a number of countries do not impose any AML/CFT obligations or supervision on any DNFBPs, despite this being a requirement of the FATF Standards. Professional intermediaries operating outside of an AML/CFT regulatory regime represent a "back-door" through which illicit wealth can enter the regulated banking and finance sector. This places the AML/CFT programs of financial institutions at risk and detracts from the overall effectiveness of national and international AML/CFT regimes, and should be addressed as a matter of priority through the effective implementation of relevant FATF standards.

232. A key part of ensuring effective implementation is the need for ongoing dialogue between competent authorities and DNFBPs. Government authorities should work closely with private sector bodies to educate professionals of their vulnerabilities to ML/TF activity, and the underlying threats that may seek to exploit these vulnerabilities, and allow professionals to share emerging risks drawing on their experience. Gateways have been established in many countries to enable the sharing of information between law enforcement and regulated entities, and countries could consider how these avenues of information exchange could be used to enhance risk awareness amongst professional intermediary sectors.

Issue for Consideration 2
The regulation of professional intermediaries under AML/CFT law[72], and efforts to educate professionals of their money laundering and terrorism financing threats and vulnerabilities[73], will help mitigate the vulnerabilities associated with the concealment of beneficial ownership.

233. The Horizontal Study identified a lack of consistency in the approach to supervision when different types of professional intermediaries are supervised by different bodies (self-regulating bodies), even if the intermediaries are performing essentially similar functions (such as company formation). While many jurisdictions have established various forums to facilitate co-operation and risk awareness among SRBs and other competent authorities, the results of the Horizontal Study suggests that this does not necessarily lead to a coherent approach in supervision.

234. TCSPs play an important role in facilitating the establishment and management of legal persons, particularly in circumstances where the beneficial owner resides in a foreign jurisdiction. From a regulatory standpoint, the TCSP sector is less clearly defined or understood in many countries when compared to the legal and accounting sectors. As a result, authorities in many countries face challenges in regulating and educating TCSPs on their ML/TF risks. Conversely, some countries, particularly low-tax jurisdictions, have well-established and regulated TCSP sectors, and have implemented a range of measures to enhance the AML/CFT regulation of TCSPs, including integrity, competence, and financial soundness tests. These measures are a good means of professionalising the TCSP sector, and countries with TCSP sectors that are not as well-defined should consider implementing similar measures domestically.

235. Law enforcement and FIUs have reported that LPP can be exploited by complicit legal professionals to frustrate and hinder investigations. This issue has also been reported in previous FATF reports, including the 2013 report on *Money Laundering and Terrorism Financing Vulnerabilities of Legal Professionals*[74], and the 2014 guidance on *Transparency and Beneficial Ownership*[75]. Due to the nature of LPP, claims of privilege need to be reviewed prior to being overturned, even if the grounds for LPP are questionable from the beginning. Regardless of the rules associated with LPP in most countries, the subjective nature of LPP will continue to pose a challenge due to the potential for its inconsistent application, and the difficulties that it can cause competent authorities undertaking financial investigations. Private sector representatives have highlighted that LPP training offered to legal professionals can often be inadequate unless the legal professional specialises in litigation where it is frequently considered. It has been suggested that the low level of training, coupled with a lack of practical application by some legal

72 In accordance with Recommendations 22, 23, and 28 of the FATF Standards

73 In accordance with Recommendation 34 of the FATF Standards

74 FATF, 2013: p. 23.

75 FATF, 2014: p. 38.

professionals leads to the development of broad and conservative approaches to LPP. Enhanced training and guidance in this area may assist to reduce this vulnerability over time; however, countries are encouraged to work with the legal profession to determine the best means of addressing this problem, and to provide greater clarity on the scope and parameters of LPP so as to limit the extent to which it is inadvertently misused resulting in the impediment of financial investigations. Further consideration of possible solutions is merited.

Issue for Consideration 3
Further work to identify possible solutions or measures to prevent the misuse of LPP to conceal beneficial ownership information, including through the provision of enhanced training and guidance material for legal professionals, could be considered.

236. When investigating cases involving a concealed beneficial owner, FIUs and other competent authorities confirmed that traditional financial institutions, namely banks, were the primary source of information required to identify and confirm beneficial ownership and control. The wealth of information held by the private sector is substantial, and crucial to the identification of money laundering and broader criminality. In comparison, the information held by many FIUs is limited to suspicious transaction reports, and many FIUs are not capable of independently analysing other sources of information such as cross-border financial flows, without requesting further information from financial institutions. Those FIUs that receive a broader set of reports, including cross-border wire transfer and threshold cash transaction reports, have reported the importance of those reports and their value in tracing money flows and identifying beneficial ownership information. Consideration should be given to possible measures to increase the breadth and depth of information available to FIUs.

Issue for Consideration 4
FIUs should have access to the widest possible range of financial information. Consideration of possible measures to increase the breadth and depth of information available to FIUs is merited.

237. Further to the need for FIUs to have greater independent access to account and transaction information, the direct sharing of information and intelligence, in real time, between competent authorities and private sector partners, cannot be understated. This includes the sharing of transaction records, as well as information collected through customer due diligence. The significant body of work conducted by the FATF, the Egmont Group, and other international bodies on information sharing already attests to the value of effective information sharing. Information sharing between public and private sectors is an essential means of enhancing the transparency of beneficial ownership. Additionally, the information that is exchanged through established mechanisms, such as the Automatic Exchange of Information (AEOI) and the Exchange of Information on Request (EOIR) for Tax

Purposes, has the potential to significantly enhance the law enforcement visibility of asset ownership in other jurisdictions. However, privacy protections may limit the extent to which this information can be used for law enforcement and financial intelligence purposes.

Issue for Consideration 5
Increased sharing of relevant information and transaction records would benefit global efforts to improve the transparency of beneficial ownership. Further consideration of possible ways to enhance this information sharing is merited.

238. As a result of the transnational nature of most schemes designed to disguise beneficial ownership, it is often not possible for FIUs and other competent authorities to have direct and independent access to the information necessary to discover and prove beneficial ownership. In addition to a range of information sharing mechanisms available to competent authorities, mutual legal assistance has been identified as a key tool in most major investigations that involve a transnational corporate structure or international financial flows. However, many law enforcement and intelligence practitioners have also reported that delays in mutual legal assistance requests are one of the issues that most significantly inhibits an investigation. While it is acknowledged that the ability of a country to respond to a mutual legal assistance request is dependent on the resources available in that country and the operational demands of its law enforcement agencies, it is evident that more can be done to improve the quality and timeliness of mutual legal assistance responses. FATF Recommendations 36-40 require countries to implement formal and informal mechanisms for sharing information on ML/TF and predicate offences. Further study to understand what can be done to improve international co-operation, including MLA, is merited.

Issue for Consideration 6
Further research should be undertaken to understand what can be done to improve the quality and timeliness of the cross-border sharing of information, including through mutual legal assistance.

239. In recent years, increased media attention given to the role of opaque ownership structures in tax evasion, money laundering, and corruption schemes[76] has prompted a range of responses from governments across the globe, including the consideration and development of centralised registers of beneficial ownership. Other registries, such as corporate registries (centralised or not) which hold information on beneficial ownership, are also being implemented or enhanced. These registries are among several mechanisms for countries to consider under the

[76] Principally as a result of the leak of confidential documents from two large law firms involved in the creation of complex international corporate structures: Panama-based law firm Mossack Fonseca (2015), and Bermuda-based law firm, Appleby (2017).

FATF standards to support the identification and verification of beneficial ownership. Multiple sources of information can be used simultaneously by competent authorities for intelligence and investigative activities, and the FATF Standards state that it is very likely that countries will need to utilise a combination of mechanisms to ensure law enforcement authorities have access to adequate, accurate and timely information on the beneficial owner of legal persons. It is also possible that, if correctly monitored and supervised, registers of beneficial ownership could support CDD efforts by financial institutions and professional intermediaries. However, in designing and implementing such repositories of beneficial ownership information, governments should be conscious of the need to ensure that beneficial ownership information is accurate, up-to-date and readily available to competent authorities and the private sector. A register of information, whether it contains beneficial ownership or any other type of company information, is only as valuable as the quality and accuracy of the information held. This report has outlined the myriad measures used by criminals to conceal beneficial ownership, including the use of formal and informal nominees, and it is expected that many of these techniques could be adapted to circumvent beneficial ownership registers or attempt to diminish their utility.

Issue for Consideration 7
Countries that make use of registers of beneficial ownership information should consider the resourcing and expertise requirements associated with their maintenance to ensure that the information recorded in the register is adequate, accurate, and up-to-date, and can be accessed in a timely manner. This is also true for the maintenance and supervision of company registries.

240. The ability to establish companies, open bank accounts, and move money virtually in the absence of direct face-to-face contact with a professional service provider or financial institution is a growing vulnerability. The Horizontal Study confirms that direct on-line incorporation of companies using various forms of digital identity is permitted by a number of jurisdictions[77]. Many financial institutions have implemented measures to verify the identity of clients in the absence of face-to-face engagement, and governments are establishing or exploring tools and resources to support these efforts; however, the provision of services in the absence of face-to-face engagement is a vulnerability commonly exploited by criminals. Technological innovations, particularly in the fields of digital identification and information sharing, will likely be an important element in future solutions to this challenge. The private sector has identified some emerging measures that may be highly valuable in conducting CDD, and countries may wish to consider how these initiatives might be harnessed to improve the transparency of business transactions. The FATF and Egmont Group are both increasingly engaged with the private sector and these engagements may lead to the identification of additional measures to improve transparency in the future.

77 See, in particular, Question 1 of the Horizontal Study at Annex B.

241. To meet the challenges posed by opaque beneficial ownership arrangements, governments, financial institutions, and professional intermediaries need to clearly understand the vulnerabilities, threats, and overall risks associated with legal persons and arrangements. It is therefore essential for governments to maintain a robust, contemporary, and publicly accessible assessment of ML and TF risks affecting their jurisdiction. The FATF Standards require countries to understand the risks that they face, including having mechanisms to assess the money laundering and terrorist financing risks associated with different types of legal person created in their country. These national risk assessments should not be limited to the risks identified within a jurisdiction's borders, but should also carefully analyse transnational threats and vulnerabilities. By maintaining an ongoing and publicly accessible risk assessment, governments will nurture and inform risk assessments conducted by financial institutions and professional service providers operating in their jurisdiction. This report, and others like it, may be useful in informing these assessments.

Issue for Consideration 8
The FATF Recommendations require jurisdictions to assess the money laundering and terrorist financing risks associated with different types of legal persons created in their country. It would be beneficial for these assessments to carefully consider and articulate the vulnerabilities and threats relating to domestic and foreign legal persons and arrangements, the domestic and foreign intermediaries involved in their establishment, and the means by which criminals may exploit them to facilitate money laundering and other criminality.

242. The concealment of beneficial ownership is a significant vulnerability for money laundering activity in every country around the world. For this reason, it will continue to pose a major challenge to the FATF and Egmont communities. Continued globalisation, the digitisation of commerce, trade, and financial and professional services, and increased access to opaque legal vehicles, are all enduring challenges that will affect the availability of information on the beneficial owner. There is no one solution or panacea for this problem; rather, the global endeavour to enhance transparency will require numerous iterative and interrelated solutions, and the continued will of governments, private organisations and the public to implement them.

ANNEX B. HORIZONTAL STUDY: ENFORCEMENT AND SUPERVISION OF BENEFICIAL OWNERSHIP OBLIGATIONS

1. Two sets of questions were circulated to FATF delegations and delegations from the FATF-style regional bodies in seeking information on the creation and maintenance of legal persons and arrangements and the supervision and enforcement of maintenance and beneficial ownership requirements.

Question 1: What businesses or professions in your jurisdiction are engaged in the formation and/or maintenance of legal persons or legal arrangements?

2. This question was meant to elicit information on the composition, size and importance of the gatekeeper sectors in each jurisdiction, as well as the roles gatekeepers play in formation of legal persons and arrangements. The information provided demonstrates that, generally speaking, many of the same types of gatekeepers can be involved in the formation of both legal persons and legal arrangements (to the extent legal arrangements are available).

3. Despite the involvement of the same types of intermediaries, the processes for forming legal persons and arrangements are, in most cases, quite different. Accordingly, this paper will address them separately. The following information will address company formation, while formation of legal arrangements will be addressed under Question 2.

4. The information provided by members describes a range of processes for company formation and the role of gatekeepers in those processes. Although there are unique elements to each jurisdiction's system, the descriptions could be divided into four general categories:

- systems where gatekeepers are not necessarily required
- systems in which gatekeepers (other than notaries) are required
- notarial systems
- systems in which the Registrar tests the accuracy of filings or takes on the customer due diligence (CDD) obligations of a gatekeeper.

5. Hybrids of these systems are also possible. Each main type of system is described below.

Gatekeepers Optional

6. In almost half (29 of 64) of the responses received to this question, jurisdictions indicate that gatekeepers are available, but not required for company formation. This includes a variety of systems: some jurisdictions clearly indicated that any member of the public may form a company, but that it is often facilitated by gatekeepers. The UK indicates that, while anyone may register a company, in practice, approximately 75% of companies are formed by gatekeepers. In some jurisdictions, gatekeepers are optional in most circumstances, but required for others, as noted in the next category. Six jurisdictions indicated that the services of a

gatekeeper were available, but did not indicate whether such services were required or how frequently they are used in practice.

Gatekeepers Required

7. In sixteen jurisdictions, intervention by a gatekeeper (other than a notary or government employee) is required to form a legal person in most, if not all, cases. This category includes some jurisdictions with unique characteristics. For example, four jurisdictions only require intervention by a gatekeeper to form "offshore" companies or corporate vehicles (companies or trusts) that were perceived as posing higher risk. The entities in question were designed specifically for the purposes of international activities targeting non-resident customers, in the first place, and as such were probably deemed by the legislators as requiring strengthened measures, such as mandatory involvement of a professional intermediary. In some instances, there is no oversight to make sure that the companies that are restricted to certain activities upon creation (e.g. international holding companies) do not subsequently conduct other activities. However, the main incentive to register them in the correct manner would be preferential tax treatment. Two jurisdictions require involvement of a gatekeeper only to form limited liability companies.

8. The concept of risk-based approach to company formation mechanisms could be subject to closer consideration in future, but the following is one such example.

Box 1. Singapore's Registered Filing Agents and Registered Qualified Individuals

Since 2015, Singapore has had measures in place to ensure that an individual who wishes to form a legal entity on behalf of another person in the course of business must be registered with Accounting and Corporate Regulatory Authority (ACRA) as a Registered Qualified Individual (RQI). Firms or companies that provide such services must register as Registered Filing Agents (RFA) and act through at least one RQI. In this way, members of the public acting on their own behalf (generally considered to be lower risk) retain free access to company registration while gatekeepers are required to register and made subject to anti-money laundering / countering the financing of terrorism (AML/CFT) obligations - regardless of any professional status or registration which they may already hold. Since creation of legal persons is performed online via ACRA's electronic transaction system, this system only allows RQIs of RFAs and individuals to create legal persons and file documents. An individual must use his SingPass, which is a personal access code issued to Singaporeans and permanent residents permitting entry to online government services, to access ACRA's electronic transaction system. Foreigners who do not hold a SingPass have to engage the services of RFAs to create and register legal persons with ACRA. This approach prevents the creation of legal persons by people unauthorised to do so.

The approach taken by Singapore in imposing this requirement to register is in addition to the usual approach of applying AML/CFT obligations to specific

classes of designated non-financial businesses and professions (DNFBPs) (e.g. lawyers, accountants, etc.). For instance, lawyers and accountants who perform FATF defined activities remain to be supervised by the respective regulators/specialised regulatory bodies. At the same time, a firm, whether it is a corporate service provider (CSP) firm, law firm or accountancy firm, will need to be registered with ACRA. RFAs need to provide information on its entity name, registered office address, nature of business and the personal details of the professional Registered Qualified Individuals (RQI) they wish to appoint to assist it. RQIs, in turn, need to provide his or her personal details qualifications. A CSP firm will not be permitted to be registered as a RFA if any of its beneficial owners, directors, partners or managers has been convicted of criminal offences or if they are undischarged bankrupts. An individual will not be permitted to be registered as a RQI, if he has been convicted of a criminal offence (especially those related to fraud and dishonesty) or if he is an undischarged bankrupt. In addition to that, ACRA will also check background information on the legal owners, beneficial owners, directors, partners and managers of RFAs, and RQIs looking at their previous conduct and compliance history.

Notarial Systems

9. Thirteen of the responding jurisdictions report use of a notarial system for company formation. Notarial systems generally entail an attestation of registry filings by a notary who is vested with public office and responsible directly to a government ministry. Such systems are found almost exclusively in civil law jurisdictions and entail a high degree of formality in the company formation process. Understandably, such an approach may not be appropriate for every jurisdiction; however, FATF members have assessed these systems as some of the most effective systems for implementation of beneficial ownership (BO) obligations.

Box 2. Spain's and Italy's notarial system

In their 4th Round mutual evaluations, Spain and Italy were both assessed as having systems that are substantially effective. In both jurisdictions, notaries are public officials, and are subject to AML/CFT obligations under each jurisdiction's AML/CFT legal framework. Duly executed notarial acts are presumed to be valid, self-authenticating, self-executing, and are considered probative. The involvement of a notary is required at the company formation stage, as well as subsequently to validate and ensure accuracy of information reflected in the business register and authenticate changes in ownership.

The effectiveness of Spain's notarial system is enhanced by the implementation of a Beneficial Ownership Database. The Beneficial Ownership Database became operational in March 2014, and was made available to competent authorities in April of the same year. It builds upon the information available in the Single Computerised Index by aggregating the information on beneficial ownership and on transfers of shares. For each company, the database offers two levels of information: (i) the beneficial ownership information obtained by the individual

notary in the conduct of the normal CDD requirements (i.e. the declaration of beneficial ownership which, if at least one risk indicator is met, includes a copy of the beneficial owner's ID document); and (ii) For private limited liability companies (*Sociedades de Responsabilidad Limitada*, which represent some 92% of all legal persons and 96% of new incorporations in Spain) the beneficial ownership information is obtained through aggregating the information on the successive transfers of shares. Since notaries are required to be involved in these transfers, this information is always verified and updated twice monthly.

Registry with Oversight Functions

10. Findings from other FATF research suggest that systems combining one or more approaches to ensuring availability and accuracy of basic and beneficial ownership information are often more effective than systems that rely on a single approach. In 21 jurisdictions, one of the systems referred to above is complemented by a Registry with some level of oversight function, including verification of completeness or accuracy of filings, conducting CDD in certain cases, or cross-checking information against other government databases. Two of these jurisdictions have notarial systems, including Spain, as discussed above. In six jurisdictions, gatekeepers (other than notaries) are required. Thirteen of the jurisdictions fall into the category where gatekeepers are optional.

Box 3. Guernsey's and Jersey's Registrars

Guernsey and Jersey are both jurisdictions in which intervention by a fully regulated and supervised gatekeeper in company formation is mandatory for most company formations (although optional for local residents). However, in both jurisdictions, the Registrar performs the CDD functions of gatekeepers when there is no gatekeeper involved in company formation or administration.

Box 4. UK's Companies House

In the UK, Companies House is part of the Government Agencies Intelligence Network. Although Companies House does not conduct CDD or verify information, it does conduct data analysis to identify suspicious activity and patterns of behaviour, which it then shares with relevant law enforcement agencies. Suspicious activity and patterns of behaviour are identified through a variety of mechanisms. These include:

1. following receipt of a complaint from a third party informing the Registrar that their details (either name, date of birth and/or home address) has been used without consent,
2. contact from Law enforcement/Government agencies regarding suspicions over a single company, and

3. other intelligence that suggests suspicious activity. This could include a single credit card or email address being used to incorporate many companies, which on the surface are unconnected.

Internal investigations utilising non-public data (such as email address, IP address where available and credit/debit card details) can result in the linking of a single suspicious company to tens or hundreds of companies. It should be noted, that there is no automatic feed for this information which leads the Registrar to take action.

Online registry systems

11. Some jurisdictions permit their residents to use different forms of digital identity to incorporate companies directly online, without any intermediaries. Modalities of those digital identities vary: they can be based on tokens, passwords, SMS, or biometric authentication. The basic idea is that an in-person identification takes place only once, either through a government authority or an authorised agent, such as a bank or a post office, on the basis of valid ID papers and/or biometrical data. Once the digital identity is created, it is centrally stored and can be used to access services provided by various public and private sector entities. This information in some cases may not be updated after the initial issuance and the person may be held responsible for keeping the details of access to their digital identity confidential and bears responsibility for how it is used, e.g. use of another person's identify can be a criminal offence in and of itself. On one hand this system has advantages such as simplifying formalities and providing more security (it is almost impossible to falsify a digital ID).However, on the other hand it raises concerns relating to the higher risks of identity theft and misuse by straw men, particularly where insufficient safeguards are in place.

Question 2: Describe the legal requirements for the formation of legal arrangements (whether under domestic or foreign law).

12. In February 2017, the FATF decided that the scope of this project should be expanded to include trusts. Accordingly, this question sought information specific to the formation of trusts and other similar arrangements, whether those trusts or arrangements were created under domestic law or under foreign law. 60% of responses were from jurisdictions whose domestic law provides for the creation of trusts or other similar legal arrangements. A further 21% of responses were from jurisdictions which are not the source-of-law for legal arrangements, but which give some recognition to foreign legal arrangements and permit foreign legal arrangements to be created or administered by gatekeepers or others within their jurisdiction (e.g. under the Hague Trust Convention). Finally, 19% of responses indicate they do not recognise (e.g. in courts or in their tax system) any legal arrangements, whether based on domestic or foreign law.

13. Among the 52 jurisdictions that allow for creation of trusts or similar legal arrangements under domestic or foreign law, almost 54% did not provide any information as to whether registration is required. In the same group, 46% did not provide information regarding implementation of beneficial ownership obligations. Although the information received may be sufficient to recognize some general

patters, a sample this small may not be sufficient to draw any conclusions as to best practices.

14. Among those 24 jurisdictions that provided information on registration of legal arrangements, 29% require registration of trusts. Another 29% do not require registration. The largest percentage, 42% require registration of trusts only when certain criteria are met. Those criteria include generation of taxable income or making taxable distributions, real property included as a trust asset, or when the trust is a foreign trust. It should be noted that trusts might be registered as some other type of business entity if the jurisdiction does not allow for the creation of trusts under its legislation.

15. Regarding implementation of beneficial ownership requirements, 27 jurisdictions provided information. Of those, 52% impose beneficial ownership obligations by applicable statute. Another 26% rely on a combination of common law and statutory requirements, while 22% rely solely on common law trustee obligations for availability of beneficiary information.

Box 5. Jersey's requirements for professional trustees

An interesting example of imposing beneficial ownership obligations by statute was provided in information from Jersey. In Jersey, any person who, by way of business (regardless of underlying profession), acts as or fulfils or arranges for another to act as or fulfil the function of trustee of an express trust conducts a regulated activity and is subject to AML obligations. Similar to the formation of legal persons in Singapore, this system uses an activity-based approach which avoids reference to any particular profession and the unintended imposition of AML obligations on members of those professions whose day to day activities are not at risk for abuse for illicit purposes.

Box 6. New Zealand' regime for foreign trusts

Another example was provided by New Zealand. Since February 2017 it has been implementing a new regime whereby foreign trusts (defined as a trust to which a settlor has never been resident in New Zealand) with a New Zealand resident trustee must register with Inland Revenue Department. Trustees are required to update any changed details within 30 days of becoming aware of the change. Furthermore, the regim**e requires annual returns to be filed, updating details, attaching financial sta**tements and providing details of new settlors and beneficiaries who receive a distribution from the trust. Where a New Zealand resident trustee fails to comply with their obligations they may cease to receive the tax exemption for foreign sourced income and may be subject to prosecution. The reason for this new regime was responding to the publications by international bodies and media reports which identified foreign trusts as being misused in criminal schemes. In order to address the risks, authorities took measures to enhance oversight of those entities.

16. Almost 20% of jurisdictions responding indicated that trusts of any kind are not allowed in the jurisdiction. Of those 12 jurisdictions, five are identified by either an OECD Global Forum Peer Review Report or other open source information as having a legal framework in place that specifically allows for legal arrangements. This raises several further questions, including the need to clarify what is meant when jurisdictions say that trusts are "not allowed" and exploring the potential reasons why tax authorities and AML/CFT authorities from the same jurisdiction might have a different understanding of the answer to that question.

17. As noted, very little information was provided regarding specific legal requirements to form trusts. This issue could be reviewed in more depth to consider whether any conclusions may be drawn as to best practices. In the information that was provided, some of the approaches to trust formation may potentially help to address common challenges in implementing effective measures to prevent the misuse of legal arrangements. These approaches could be reviewed in more depth, as a basis for more detailed description and analysis in the final Horizontal Study. These include in particular registration of trusts when certain criteria are met; Jersey's approach to imposing beneficial ownership obligations on trustees; and the need to clarify what is meant when jurisdictions say that trusts are "not allowed" and issues related thereto.

Question 3: What are the legal requirements for maintenance of legal persons and arrangements and how is compliance with those requirements monitored?

18. Maintenance of legal persons and arrangements, i.e. requirements for annual returns, accounts, reporting changes in control or ownership, etc., is important to ensuring that basic and beneficial ownership information remains accurate and up-to-date. Information on monitoring compliance was originally sought as part of first questionnaire (question 2(e)). However, little information specific to this issue was received. In February 2017, the FATF expanded the scope of this project to seek information on the legal requirements for maintenance of legal persons and arrangements, as well as the systems in place for monitoring compliance.

19. Unfortunately, a gap in the information on these issues still exists. In 53% of responses received, no information was provided regarding requirements for maintenance of legal persons. For maintenance of legal arrangements, no information was provided in 46% of responses. Likewise, the majority of responses received (64%) did not provide any information on monitoring compliance with maintenance requirements. Nevertheless, a third round of information gathering would delay this study excessively, so we have sought to reach conclusions based on the incomplete responses received. This does mean the conclusions on this issue are less well-evidenced than on other questions. In the paragraphs that follow, statistics reflect only the responses that provided relevant information. Also, some jurisdictions may impose more than one of the following measures; the categories are not mutually exclusive.

Legal Persons

20. The most common requirement of maintenance of legal persons is filing of annual returns (other than tax returns), certification or accounts. This requirement

applies in 53%of responses received (17 of 32). Notification of changes is the next most common at 37.5% (12 of 32). In 1% of responses (3 of 32), jurisdictions indicated that there are no requirements for maintenance of legal persons other than those imposed by any applicable AML/CDD obligations.

Legal Arrangements

21. In the case of legal arrangements, other than those to which common law obligations apply, there seem to be either no requirements or minimal requirements for maintenance. Only 9 of 23 responding jurisdictions impose any maintenance requirement for legal arrangements. Three of those require notification of changes in beneficial ownership or control. It is more often the case (in 14 of 23 jurisdictions) that there is no maintenance requirement at all. Based on these figures, availability of accurate and up-to-date information on legal arrangements depends almost entirely on the gatekeepers and non-professional trustees (or equivalent), with little or no role for public-sector registries. To the extent that gatekeepers are involved in the formation of legal arrangements, this finding underscores the importance of effective supervision to ensure compliance with CDD obligations.

Ongoing Monitoring of Compliance with Maintenance Requirements

22. Twenty-five jurisdictions provided information regarding mechanisms to monitor compliance with requirements to maintain legal persons or arrangements. Among these jurisdictions, the most common mechanism for ongoing monitoring of compliance with those requirements is oversight by the registry. Some registries have automated systems to monitor deadlines for filing annual returns or certifications. In other cases, registries cross-check their information with data held by other authorities (e.g. with tax authorities) to ensure veracity. Finally, some registries conduct sample testing or targeted audits to verify the accuracy of information on selected legal persons (or arrangements). Such mechanisms are reported by 40% of jurisdictions responding to this question (10 of 25). Only slightly fewer, 9 of 25, report monitoring by the AML supervisor or prudential regulator as an element of compliance inspections. However, 24% of jurisdictions responding to this question report they do not monitor for compliance at all.

Box 7. Belgium's beneficial ownership registry

To address these and other issues, Belgium is implementing a beneficial ownership registry, which is expected to be operational by 2018. When this registry is in place, there will be two types of automated controls: one will cross check "obligated entities" against the entities that actually provide beneficial ownership information; the other will cross check the beneficial ownership database against other government databases (primarily within the Ministry of Finance) to verify data quality. These cross checking systems will be monitored by a dedicated data miner and compliance will be enforced by a special unit of the Treasury.

23. According to information gathered for this Study, ten of the responding jurisdictions (15.6%) either have, or will have by the end of 2018, a beneficial ownership registry system.

24. Although the information is incomplete, the responses provided indicate serious weaknesses in measures designed to ensure that basic and beneficial ownership information remains accurate and up-to-date.

Question 4: Describe how agencies responsible for AML/CFT supervision of gatekeepers (whether government agency or SRB) assess compliance with beneficial ownership obligations.

25. There is insufficient information - either from the questionnaire responses or from mutual evaluation reports - to set out a general picture of how authorities or SRBs are assessing compliance with these specific obligations. It is possible, nevertheless, to describe certain common elements that might not, however, be present in every case. In most cases, the supervision combines both desk-based reviews and on-site inspections. Desk-based reviews involve analysis of annual independent audit reports and other mandatory reports, identifying risky intermediaries (i.e. on the basis of the size of the firms, involvement in cross-border activities, or specific business sectors), automated scrutiny of registers to detect missing beneficial ownership information and identify the gatekeeper responsible for the filing. On-site inspections involve reviewing internal policies, controls and procedures, gatekeeper's own risk assessments, spot checking CDD documents and supporting evidence, sample testing of reporting obligations. Some national supervisors, as well as SRBs, mandate independent auditors to perform on-site inspections on their behalf.

26. Delegations could consider whether this is an issue on which more information is needed (e.g. in the course of any further projects following the Horizontal Study, or as part of a risk-based approach(RBA) guidance for gatekeeper professions).

Question 5: How are the businesses or professions engaged in the formation and/or maintenance of legal persons or legal arrangements regulated and supervised?

27. Pursuant to Recommendation (R.)28, the categories of DNFBPs who act as gatekeepers should be subject to effective systems for monitoring and ensuring compliance with AML/CFT requirements. In other words, they should be subject to effective supervision. This question was meant to elicit information on the types of supervisory regimes in place for gatekeepers and the roles played by those supervisors. The most startling finding is that 17% of jurisdictions that responded do not impose upon their gatekeepers any AML obligations or AML supervision whatsoever, despite this being a requirement of R.22, R.23 and R.28. In some cases, such as the US and Canada, this is the result of resistance to regulation from the relevant sectors or professions (e.g. to prevent the enactment of laws or regulations which would impose such obligations, or to mount constitutional

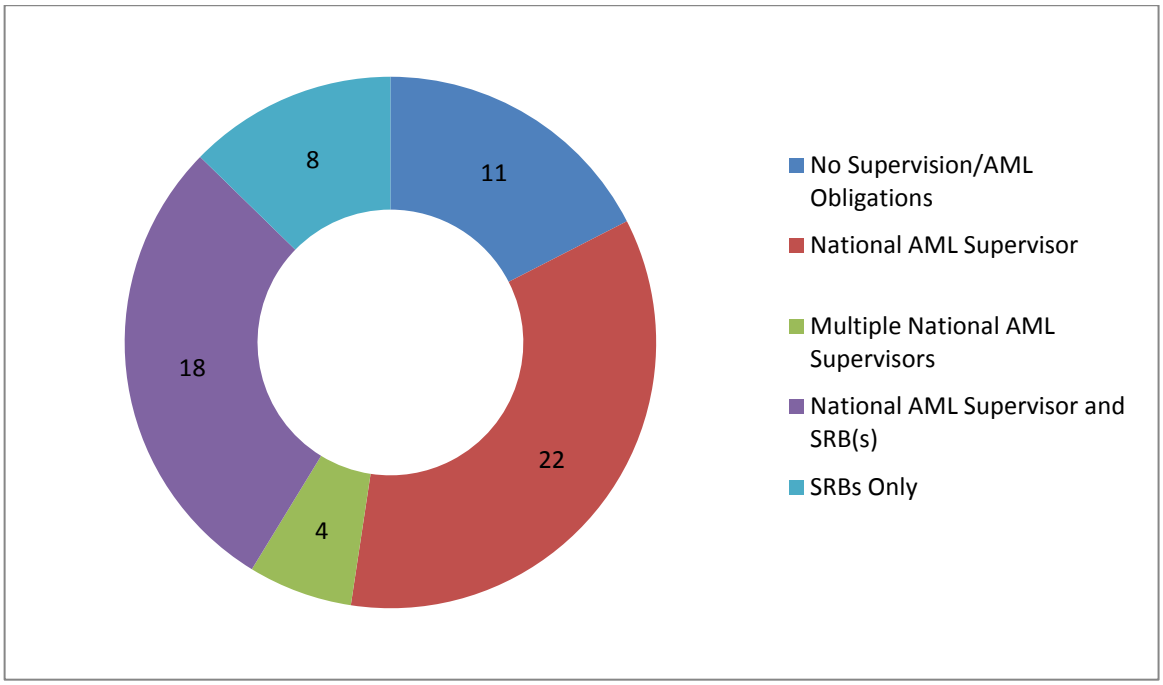
17% of jurisdictions that responded do not impose upon their gatekeepers any AML obligations or AML supervision whatsoever, despite this being a requirement of R.22, R.23 and R.28

challenges to such laws). In other cases, it may represent an "unfinished" aspect of the AML/CFT system which has not yet been implemented.

28. The information provided by members who do impose supervision describes a variety of arrangements for supervision of gatekeepers. Although there are variations in each category and unique elements to each jurisdiction's system, the descriptions could be divided into the following four general categories:

- national AML supervisor
- multiple national AML supervisors
- a national supervisor for one or more gatekeeping sector and one or more Self-regulating bodies (SRBs) for others
- SRBs only for all gatekeepers.

Figure 1. Gatekeeper Supervision Models
Breakdown of responses by jurisdictions participating in the survey



National AML Supervisor

29. In 42% of the jurisdictions that responded (22 of 64), there is a single authority for supervision of AML/CFT obligations. These authorities are often a Central Bank or Monetary Authority, Financial intelligence unit (FIU), or Financial Services Commission. The majority of jurisdictions that report such a regime, (12 of 22) are considered by the IMF to be "offshore financial centres".

30. Interestingly, 77% of jurisdictions using this supervisory model (17 of 22) reported cases of supervision or enforcement - the highest level of any other supervisory model. This fact, combined with the high number of offshore financial centres represented in this category is consistent with the findings of the Trust and

Company Service Provider Project conducted in connection with the book The Puppet Masters. This project entailed two audit studies involving the solicitation of offers for shell companies from a range of trusts and company service providers (TCSPs). The data were supplemented with in-depth interviews conducted with TCSPs. This approach was designed to test regulatory compliance in various jurisdictions. The project revealed that 94% of responses provided by gatekeepers in international financial centres, or tax havens, were compliant with the relevant AML/CFT framework, including collection of CDD information and refusal of suspicious business. Only 25.5% of gatekeepers in OECD countries provided compliant responses.

Multiple National Supervisors

31. In these jurisdictions, supervision of gatekeeper sectors is divided among government agencies such as FIUs, Central Banks, and Financial Services Authorities. The relatively small group (at 6% of respondents) makes it hard to conclude whether the fact that only two of the four jurisdictions report any enforcement action is a substantial concern. Nevertheless, the question of domestic co-operation where there are multiple government agencies tasked with AML supervision and presents an issue could be reviewed in more depth.

National supervisor and one or more SRBs

32. In 29% of participating jurisdictions (18 of 64), AML supervision of gatekeeper professions is divided between a government agency one or more self-regulating bodies (SRBs). In this supervisory model, 61% of jurisdictions (11 of 18) do not report any supervisory or enforcement action.

SRBs only for all gatekeepers

33. In this supervisory model, there is no national authority for AML oversight of gatekeepers – all the gatekeeper sectors are supervised by SRBs. Jurisdictions reporting this supervisory model comprise 13% of the sample. Five of the eight jurisdictions in this category (63%) do not report any supervision or enforcement action.

Supervision by SRBs

34. In the 26 jurisdictions where SRBs are tasked with supervision of AML/CFT obligations, lawyers are supervised only by SRBs in every jurisdiction but one. In 16 of those 26 jurisdictions (64%), no enforcement actions were reported. Seven jurisdictions reported active supervision of lawyers by an SRB.

35. For those jurisdictions, where gatekeepers are supervised by SRBs, no discernible patterns could be identified with regard to how this supervision is performed, due to a wide variety of approaches. It is even more difficult to draw conclusions which approach turns out to be more effective without a proper assessment. It is possible, however, to provide some general observations:

- There is a lack of consistent approach to supervision when different types of professional intermediaries are supervised by different bodies even if these intermediaries are performing essentially similar functions (e.g. company

formation). In other words, supervisory approach is often based on what type of profession intermediaries belong to, rather on what type of operations they perform in practice. Although many jurisdictions established various forums which facilitate co-operation and risk awareness among SRBs and competent authorities (especially FIUs), this does not seem to lead to coherent approach in supervision.

- Most of the SRBs especially those that cover lawyers and notaries are independent and do not seem to be subject to supervision/monitoring by a competent authority (as noted in the definition of "Supervisors" in the FATF Glossary), however in some cases competent authorities have a role, e.g. in appointing employees. There are two jurisdictions where SRBs are under direct supervision of competent authorities, and one jurisdiction where SRB is legally a governmental body. Another jurisdiction is in the process of creating of an umbrella organisation to oversee and facilitate activities of SRBs.

Box 8. Switzerland's national oversight of SRBs

An example where SRBs are supervised by a single national AML/CFT supervisor was provided by Switzerland. The legislator has mandated responsibility to the SRBs for AML/CFT supervision and FINMA (national supervisor) is tasked with supervising implementation. SRBs are structures which must be recognised by FINMA. This requires that they issue regulations (approved by FINMA) specifying the due diligence obligations with which their affiliates must comply, that they oversee compliance with these rules and that they ensure that the persons and bodies they instruct to carry out controls are independent and professionally qualified. If an SRB fails to meet with these conditions, FINMA can issue a warning and then withdraw its recognition.

36. Resources available to SRBs for inspections are limited. There are different models to deal with that: eight SRBs indicated that they hire independent experts with appropriate professional background who work solely for the SRB, two SRB rely on the staff of the peer members to supervise each other, three SRBs outsource their inspection functions to established auditing companies, and there might be combinations of the above;

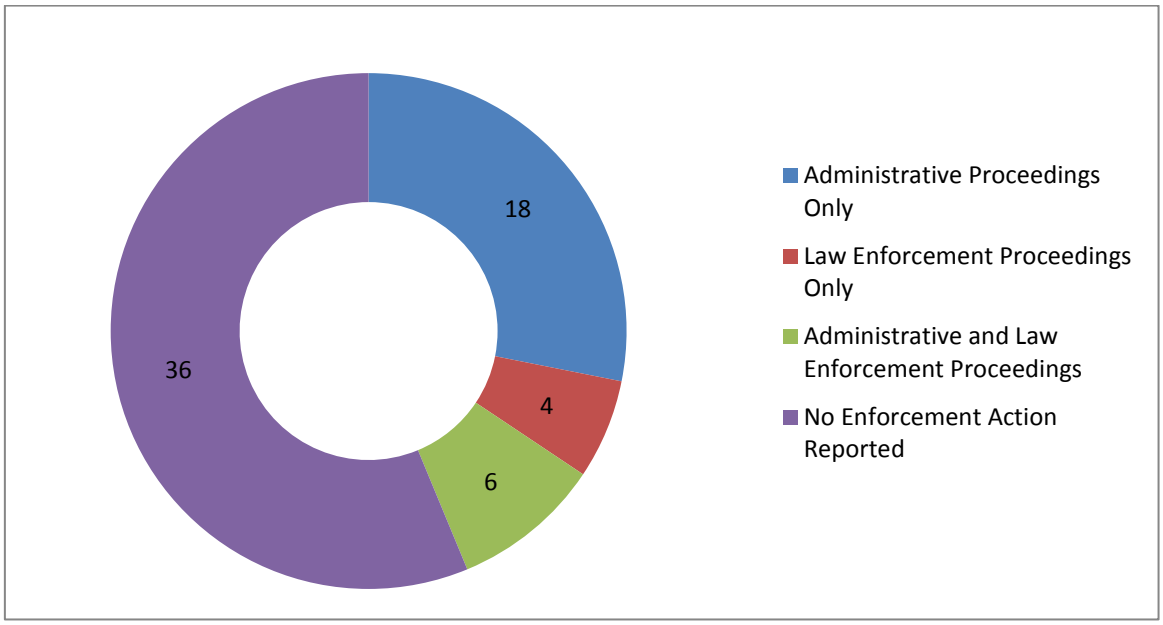
- Seven SRBs take proactive approach with regard to identifying breaches of compliance (i.e. during the on-site, and not after a complaint or a law enforcement investigation), however, that seems to be related to overall obligations, rather than those related to AML/CFT, or BO in particular.
- Application of RBA with regard to professional intermediaries is not widespread, and even in that case it is not always based on ML/TF risk factors. One jurisdiction indicated that all lawyers and notaries undergo an inspection on an annual basis, and auditors at least on a 6-years basis.

- Supervisory actions are very rare (as highlighted below), although most SRBs have the appropriate tools at their disposal (warnings, monetary penalties, disqualifications).

Question 6: Cases of supervisory and enforcement actions.

Figure 2. Enforcement Models

Breakdown of responses by jurisdictions participating in the survey



37. This question was meant to elicit information regarding the approach to oversight taken in each jurisdiction – whether beneficial ownership obligations are enforced by administrative supervisory action, or by law enforcement authorities. It was hoped that, upon review of this information, some conclusions might be drawn as to best practices, but the information provided is not sufficient for that purpose. Nonetheless, some emerging issues may be considered for further targeted information gathering.

38. No supervisory or enforcement actions were reported in 56% of responding jurisdictions. In three jurisdictions, this is attributed to newly enacted legislation that had not yet been implemented. Some jurisdictions specified that AML enforcement action had been taken, but none specific to beneficial ownership obligations. As noted previously, 17% of respondents do not impose upon their gatekeepers any AML obligations or AML supervision. As such, there could be no enforcement action to report. Other jurisdictions may have found it difficult to provide meaningful information in the questionnaire format.

39. Among the responses that did provide information on enforcement mechanisms, the most commonly reported is administrative enforcement taken by AML supervisors. Eighteen of the 28 jurisdictions reporting enforcement action (64%) rely on supervisors to enforce beneficial ownership requirements. In many cases, information provided includes sanitized case studies.

Box 9. BVI's list of sanctions imposed

In the case of the British Virgin Islands (BVI), a table was provided which listing examples of AML/CFT breaches related to beneficial ownership and the sanctions imposed – administrative penalties ranging from USD 440 000 to USD 5 000. The BVI also included a link to the supervisor's website, where a comprehensive listing of enforcement actions and sanctions applied could be accessed by any member of the public.

Box 10. Jersey's FSC and Registry

Another interesting sample of enforcement actions was provided by Jersey, where both the AML supervisor and the Registry perform complementary functions. The Jersey Financial Services Commission (JFSC) reports using enforcement tools such as formal remediation plans with regular monitoring and reporting by the TCSP; issuing directions to safeguard assets, prevent the take on of new business or transfer of existing business, appointing independent co-signatories to review and approve certain business activities and transactions. Jersey also reports using its supervisory powers to issue public statements and ban individuals from working in the financial services industry. The Companies Registry will not incorporate or register an entity if it does not have sufficient information. Applications are placed on hold until such time as information is provided. Failure to provide information is noted and this information is shared by the Companies Registry with the supervision and enforcement units of the JFSC.

40. In ten of the 28 jurisdictions that reported enforcement action, law enforcement proceedings may be used to enforce beneficial ownership requirements. In four of the ten jurisdictions, law enforcement proceedings are the only available remedy; in the other six jurisdictions, authorities may take administrative or law enforcement proceedings.

Box 11. Liechtenstein and Croatia

In Liechtenstein and Croatia, the AML supervisor initiates legal proceedings when weaknesses are identified during compliance inspections. In Liechtenstein, the AML supervisor identified weaknesses in establishing and corroborating the source of wealth of the beneficial owner and the source of funds held by the legal person or arrangement in question and brought the matter to the attention of the courts. In some instances, monetary fines were imposed by the court upon the responsible senior management member. In Croatia, the AML supervisor filed misdemeanour proceedings for violation of beneficial ownership, CDD, and risk assessment obligations.

Box 12. Latvia

Latvia reports that, in the period from 2013 to 2015, five criminal cases were initiated on grounds of non-provision of information and provision of false information regarding ownership of resources and the true beneficiary. Of these five cases, two have been submitted for prosecution and one case is under review by the court. No information was provided regarding the outcome of these cases.

Box 13. Spain and the US

Information provided by Spain and the US describes cases where police followed illicit financial flows to gatekeepers who were complicit in setting up networks of shell companies to launder proceeds of drug trafficking, political corruption, fraud, and tax evasion.

41. Although the sample is quite small, there seems to be a pattern in the way law enforcement proceedings are taken. Some jurisdictions have AML supervisors who initiate court proceedings to penalize weaknesses found during compliance inspections. Other jurisdictions, like Spain and the US, do not use criminal proceedings to enforce preventative measures like beneficial ownership obligations. Rather, legal proceedings are limited to cases of complicit actors actively engaged in money laundering.

42. Some of the approaches to enforcement of beneficial ownership obligations noted above are interesting and may potentially help to address common challenges in implementing effective measures to prevent the misuse of legal persons. These could be reviewed in more depth, as a basis for more detailed description and analysis in the final Horizontal Study. These include in particular the exercise of administrative supervisory powers and its impact on compliance; Jersey's approach of using both the AML Supervisor and Companies Registry to enforce beneficial ownership obligations; and the role of law enforcement in enforcing preventative measures. The lack of reported information on enforcement gives rise to questions that should also be considered for further information gathering.

ANNEX C. CASE SUMMARIES

Case Study 1 - Argentina	
A complex corporate structure, with Company G 95% owned by Mr. A and 5% by Mr. B. Company G purchased a power generator from Company K, owned by Company R in the Cayman Islands. Company R was linked to Panamanian Foundation P, which had Mr. A and his spouse as beneficiaries. Company G leased the generator to Company E, receiving amounts cleared by Company L. The funds were drawn against Company K's bank account, and Company G made payments to K to settle a debt. The funds were credited to the accounts of Companies S, T and R. The simulation of commercial operations introduced funds of dubious origin to the financial system, hiding the true beneficiary.	
Indicators	• Declared income which is inconsistent with their assets, transactions or lifestyle • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement regularly sends money to low-tax jurisdictions or international trade or finance centres • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Financial activities and transactions inconsistent with the corporate profile • False invoices created for services not carried out • Falsified paper trail • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification • Loans are received from private third parties without any supporting loan agreements, collateral or regular interest repayments • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 2 - Australia	
An Australian drug syndicate used multiple money laundering methods to launder more than AUD1 million worth of proceeds of crime. Trust accounts, a "front" company, high-value goods and real estate were used to launder the profits from cannabis sales. The syndicate also misused the services of two "professional facilitators" (an accountant and solicitor) to facilitate its criminal activity. The syndicate made significant profits by purchasing bulk amounts of cannabis in one state and then selling the drugs in another state. As a cover for its illicit activities, the syndicate established what appeared to be a transport company. The syndicate purchased a truck and rented a warehouse in the name of the company and used these to traffic the cannabis interstate.	
Indicators	• No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or a withdrawal, which is anomalous, or inconsistent with the company's profile • Transaction involves a professional intermediary without due cause or apparent justification • Transaction involves the use of multiple large cash payments to pay down a loan or mortgage

Case Study 3 – Australia	
Managers at a university and directors of construction companies were complicit in a fraudulent invoice scheme. The managers approved inflated invoices for maintenance work to be carried out by the construction companies, as well as invoices for work that was never undertaken. The fraud profits were used to purchase racehorses and property. The managers at the university were repaid with kickbacks or direct shares in racehorses. Accounting firms, which were undertaking international transfers on behalf of the suspects, sent money to many countries, including New Zealand, Canada, Hong Kong and the US. A large proportion of the funds were sent to companies linked to the horse racing industry. The accounting firms also received international transfers from various overseas entities that were similar in value to the amounts the firms had sent overseas initially. The majority of these transfers originated from Hong Kong. Authorities suspected that the accounting firms were laundering the funds on behalf of the suspects as part of a professional money laundering syndicate.	
Indicators	• Financial activities and transactions inconsistent with their customer profile • Declared income which is inconsistent with their assets, transactions or lifestyle

	• Transaction appears cyclical • Transaction involves a professional intermediary without due cause or apparent justification

Case Study 4 – Australia	
Suspect declared minimal income to the tax office while living a luxurious lifestyle, and was identified as having disguised income derived from securities trading. The criminal investigation revealed that the suspect created several international companies which, on paper, were owned by a stichting (a foundation in which the identity of the beneficial owner is not yet publicly available) in the Netherlands. The suspect sold securities below market value to the international companies to reduce Australian tax liability. The suspect later arranged for the shares to be sold via his international companies at market value. The proceeds of the sales were returned to the suspect in Australia disguised as loans from international companies. Over two years, the suspect arranged 15 international funds transfer to send funds from international companies under his control based in Switzerland to his Australia-based company.	
Indicators	• Financial activities and transactions inconsistent with their customer profile • Declared income which is inconsistent with their assets, transactions or lifestyle • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • Loans are received from private third parties without any supporting loan agreements, collateral or regular interest repayments • Funds are unusual in the context of the client or customer's profile • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 5 – Australia
The "Round Robin" scheme aimed to make funds movements appear as payments to other parties while, in reality, the funds ultimately returned to the original beneficiary. The suspects transferred funds from their companies' accounts to the bank accounts of companies in New Zealand. The New Zealand companies and bank accounts were controlled by a Vanuatu-based accountant, who was a signatory to the bank accounts. The payments were falsely described in the companies' records as "management and consultancy fees," with false invoices that matched amounts paid to the New Zealand bank accounts. No evidence was available to show that any consulting work had been carried out. The false expense payments were claimed as deductible expenses in the tax returns of

companies X, Y and Z, thereby fraudulently reducing the companies' taxable income and taxes owed. The accountant then transferred the funds under the guise of international "loans" through a series of round robin international transactions, through accounts held in the name of companies owned and operated by the accountant. The accountant transferred the funds into the personal bank accounts of the suspects in Australia. The funds were transferred via an overseas company controlled by the accountant, separate to the companies in New Zealand that received the funds originally. In order to disguise the funds being transferred back into Australia as loans, false documents were created purporting to be international loan agreements with a foreign lender, which are not assessed as income and have no tax liability.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • False invoices created for services not carried out • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • Legal Person pays no taxes, superannuation, retirement fund contributions or social benefits • Loans are received from private third parties without any supporting loan agreements, collateral or regular interest repayments • Transaction appears cyclical • Transaction involves a professional intermediary without due cause or apparent justification • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 6 – Australia

Investigating authorities identified that suspect A operated an import business in Australia and was a participant in a tax evasion scheme operated by an accountant. Suspect A and his wife were directors and shareholders of an Australian company (company 1). Suspect A was also a director and shareholder of another Australian company (company 2). An associate of suspect A was the co-director of company 2. Authorities identified that the accountant controlled company 3, which was registered in Hong Kong and operated a bank account in Australia.

This company was used to issue false invoices to companies 1 and 2. Over a five-and-a-half-year period company 3 issued false invoices to companies 1 and 2 for supposed "brokering services." Suspect A paid the false invoices, which totalled more than AUD2 million, by directing companies 1 and 2 to pay company 3. The

	funds paid to company 3, less the accountant's 10% fee, were returned to suspect A and individuals associated with him.
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • False invoices created for services not carried out • Falsified paper trail • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Simple banking relationships are established using professional intermediaries • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • Client is both the ordering and beneficiary customer for multiple international funds transfers • Loans are received from private third parties without any supporting loan agreements, collateral or regular interest repayments • Transaction appears cyclical • Transaction involves the two-way transfer of funds between a client and a professional intermediary for similar sums of money • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners • Transaction involves a professional intermediary without due cause or apparent justification • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 7 – Australia
Individuals A and B were family members who owned and controlled a group of Australia-based companies that undertook motor vehicle repairs and sold automotive products. Individuals A and B received advice from an accountant about the purported benefits of international superannuation funds, and as a result Individual A established a superannuation fund in Samoa with a Samoa-based company acting as fund trustee. Company 1, controlled by Individuals A and B, contributed AUD 200 000 to the fund, which was then returned back to Company 1 disguised as a loan. The superannuation contribution was claimed as a tax deduction. Individuals A and B also entered into a secondary loan agreement on behalf of company 1 with the Samoa-based private bank. This second loan arrangement remained in place for more than 10 years and was later transferred

to other companies in the group. Companies controlled by Individuals A and B made "interest payments" by way of international funds transfer, which were then returned back to the companies as further loans. To further complicate the loan arrangement, another Australian organisation was introduced to the transaction activity. This organisation was unrelated to the main group of companies and was described as a charitable organisation. The organisation facilitated the transfer of funds between the bank's New Zealand subsidiary and the Australian group of companies.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement regularly sends money to low-tax jurisdictions or international trade or finance centres • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Focused on aggressive tax minimisation strategies • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Client is both the ordering and beneficiary customer for multiple international funds transfers • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification • Loans are received from private third parties without any supporting loan agreements, collateral or regular interest repayments • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Transaction appears cyclical • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 8 – Australia
Illegal international arrangements are an established way of evading tax, laundering funds and concealing beneficial ownership. Project Wickenby identified the use of false invoices and loans in illegal international arrangements. The scheme involved an Australian company (company A) which enters into an agreement with a tax scheme promoter based in a tax secrecy jurisdiction (country 1). The promoter benefits from the confidentiality and privacy offered in the tax secrecy jurisdiction. The tax scheme promoter owns and/or controls two international companies (company B and C). Control may involve the use of a trust

or the use of third parties; for example, a relative or associate may act as the director of the international companies. Company B provides consultancy and/or management services and is incorporated in country 2. Company C provides a financial service (as a lender of money, for example) and is incorporated in country. Companies B and C hold bank accounts in country 4. The promoter controls and operates these accounts.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement regularly sends money to low-tax jurisdictions or international trade or finance centres • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • False invoices created for services not carried out • Falsified paper trail • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification • Loans are received from private third parties without any supporting loan agreements, collateral or regular interest repayments • Transaction appears cyclical • Transaction involves a professional intermediary without due cause or apparent justification • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 9 – Belgium	
International transfer from the account of a foreign foundation to an account in Belgium of one of the ultimate beneficial owners of the foundation, followed by attempt to repatriate a significant amount. Limited tax adjustment declaration and remaining uncertainty about the origin of the assets gave rise to a suspicion of fiscal fraud, evasion of inheritance tax and attempted money laundering.	
Indicators	• Client is reluctant or unable to explain their source of wealth/funds • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Focused on aggressive tax minimisation strategies • Correct documents not filed with the tax authority

	• Falsified paper trail • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 10 – Belgium	
Natural persons repatriated to Belgium funds originating from accounts in a foreign jurisdiction in the name of two Stiftung and an AG corporation with address in that jurisdiction and a Ltd. corporation with its address in another jurisdiction, as well as in the name of trustees of a trust in that jurisdiction. The repatriated funds were used for various payments and purchases. Inadequate justification of the source of funds led to a suspicion of serious fiscal fraud.	
Indicators	• Client is reluctant or unable to explain their source of wealth/funds • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Focused on aggressive tax minimisation strategies • Correct documents not filed with the tax authority • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 11 – Bolivia	
Multiple money orders originated from the same geographic area in Spain, sent by individuals and corporations to straw men nominees (often related) in the same geographic area in Bolivia. The purpose of the transfers was declared as the construction and purchase of properties through a local company. Funds were also sent to USD accounts in two financial institutions held by a money exchange house. The MSB's bank accounts also received international money orders from two companies with the same UK address. The straw men nominees and the MSB's bank accounts transferred money to a separate group of individuals, which included a partner in the MSB business. These individuals deposited the funds in case into local currency bank accounts before sending the funds on as electronic transfers to individuals residing in the Brazil-Bolivia border area.	
Indicators	• Registered at an address that is also listed against numerous other companies or legal arrangements • Legal person or arrangement conducts a large number of transactions with a small number of recipients • Bank balance of close to zero, despite frequent incoming and outgoing transactions • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • No real business activities undertaken • Legal Person pays no taxes, superannuation, retirement fund contributions or

	social benefits • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile • Funds are unusual in the context of the client or customer's profile • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client

Case Study 12 - Canada	
A publicly-listed company's common stock was part of a fraud affecting the market price of their security that involved numerous stock promoters in Canada and elsewhere who manipulated the stock price by making misleading representations and/or omissions. It is alleged that the proceeds, of up to USD 20 million, were then laundered through offshore banks. The US SEC provided information that established the flow of shares from Serbian nominees, through intermediary international business companies. These shares were effectively in bearer form having been signed over by the seed shareholders at the time of issue. An opinion letter was written by a US based securities lawyer that allowed these shares to trade and a subsequent reverse merger was completed immediately after the free-trading shares were anonymised and immediately before a prolific series of paid promotions were carried out. Canadian investigators were unable to prove and confirm identities behind real owners of the international business companies, which held control of the free trading shares. Additional investigative challenges included the inability to access information from offshore jurisdictions with regards to pertinent documentation used to obscure beneficial ownership of intermediary international business companies. Canadian investigators encountered refusal from Serbian nominees to co-operate and provide witness statements on several occasions.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Nominee owners and directors • Transaction involves the transfer of bearer shares in an off-market sale

Case Study 13 – Cayman Islands
Mr. A established a Cayman Islands revocable trust, with himself as settlor and a local TCSP acting as trustee. Mr. A also arranged for the incorporation of a Cayman Islands company known as 'Company B', with the local TCSP also acting as the

	registered office. The TCSP became aware of allegations relating to Mr. A and his involvement in an oil and gas contract scam which also involved members of a foreign government. Over a two-year period, the TCSP reported that the trust and underlying company had received numerous transfers of funds and property from what was now deemed to be questionable sources, which in turn heightened its suspicions and prompted an STR. An analysis of the trust accounts revealed outgoing funds to individuals named in numerous media reports who allegedly took part in the kickback scandal. In response a request, the foreign jurisdiction's confirmed that Mr. A was being investigated for money laundering and corruption of government officials.
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Under investigation or have known connections with criminals • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Funds are unusual in the context of the client or customer's profile

Case Study 14 – Cayman Islands	
	The managing director of an overseas company issued a prospectus which contained misleading and false information within the company's annual report. He overstated the company's group revenue by 275%. This information was provided to that country's securities commission as part of the company's proposal for listing on their stock exchange. The managing director established a revocable trust and underlying company in the Cayman Islands. He then opened an overseas bank account in the name of the Cayman Islands company for which he held the Power of Attorney, allowing him to trade in the account. This structure was devised to hide the managing director's trading in the overseas company and to hide assets derived from his illegal activities. The Cayman Islands company held over USD 1 million in this bank account. The Financial Reporting Authority (FRA) made an onward disclosure to the FIU of the foreign national's home country. The foreign national has been charged in his home country with three counts of providing misleading and false information.
Indicators	• Falsified paper trail • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Bank accounts in multiple international jurisdictions without good reason • Repeat transaction, and the executing customer is a signatory to the account, but is not listed as having a controlling interest in the company or assets

Case Study 15 – China	
The suspect used the identity of his close relatives and company employees to establish eight shell companies while maintaining actual control over these companies. He fabricated false documents and sales contracts to fraudulently obtain financing from six banks. Additionally, the suspect defrauded 3 state-owned enterprises through financing and false trading by utilizing illegal financial institutions such as underground banks. The suspect transferred the money into his private accounts for personal use and the repayment of personal debt.	
Indicators	• False invoices created for services not carried out • Falsified paper trail • Family members with no role or involvement in running the business are listed as beneficial owners of legal persons or arrangements • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification • Transaction is executed from a business account but appears to fund personal purchases, including the purchase of assets or recreational activities that are inconsistent with the company's profile • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners

Case Study 16 – China	
Suspect A used his influence as the manager of an enterprise to help Company X to win a tender bid and receive dividends in proportion to capital stock held. Company X was owned by Suspect A, B, and C. After Company X won the tender bid, Suspect B took over control of the company. Suspect A asked Suspect B to open an offshore account for him in Hong Kong, and transfer funds under the guise of a housing purchase. The offshore companies and accounts were opened in the name of Suspect B's wife and sisters, respectively. After depositing a portion of the funds, the accounts were transferred to Suspect A's control. Suspect A then fled and Suspect B asked the vice president of Company X to transfer funds to the Hong Kong accounts held in his family members' names. The money was then transferred back to China through underground banks and distributed to five new domestic bank accounts in the name of an employee of Company X.	
Indicators	• Director or controlling shareholder(s) cannot be located or contacted • Legal person or arrangement regularly sends money to low-tax jurisdictions

	or international trade or finance centres or international trade or finance centres • Multiple bank accounts without good reason • Family members with no role or involvement in running the business are listed as beneficial owners of legal persons or arrangements • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Transaction is a business transaction that involves family members of one or more of the parties without a legitimate business rationale • Transaction appears cyclical • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre or international trade or finance centre

Case Study 17 – China	
A low-ranking official A, who worked for a local government department, took advantage of his position to obtain privileges and contracts for CC Company, and received bribery payments from the manager of CC Company in return. A also arranged for his cousin to work for CC Company and for his sister and wife to keep the company books. A positioned himself as a dormant shareholder, claiming money from the principal as profit sharing. A also installed his daughter as a shareholder of CC Company without equity.	
Indicators	• Director or controlling shareholder(s) does not appear to have an activity role in the company • Family members with no role or involvement in running the business are listed as beneficial owners of legal persons or arrangements • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction is a business transaction that involves family members of one or more of the parties without a legitimate business rationale • Transaction involves the transfer of shares in an off-market sale

Case Study 18 – Croatia
Croatian Company A received funds from Company B (incorporated in a financial centre), which were used to invest in real estate on Croatian coast. The founder of

Company A was another Croatian company, the founders of which were citizens of Country D. The funds of foreign Citizen K (citizen of Country D) were suspected to originate from bribery in Country D, and were sent to the account of Company B, which then transferred funds as loan to the account of Company A. The ownership structure of Company A involved another Croatian company and 4 other citizens of Country D, but based on intelligence there is reason to suspect that beneficial owner of Company A is Citizen K.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification

Case Study 19 – Ecuador	
Public officials along with relatives and individuals connected to law firms created a series of companies in several countries for the purpose of receiving bribe payments. The bribe payments were effected through individuals with links to companies that provide goods and services to a public institution in the oil sector. To send the payments, and to hide the real beneficiaries of the transfers, the suppliers created companies in Panama, Hong Kong, British Virgin Islands, Bahamas, Uruguay, and the US.	
Indicators	• Client is reluctant or unable to explain their source of wealth/funds • Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Long period of inactivity following incorporation, followed by a sudden and unexplained increase in financial activities • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement regularly sends money to low-tax jurisdictions or international trade or finance centres • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Relationships with foreign professional intermediaries in the absence of genuine business transactions in the professional's country of operation • There is a discrepancy between the supposed wealth of the settlor and the object of the settlement. • False invoices created for services not carried out • Employees of professional intermediary firms acting as nominee directors or shareholders • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense

	• Nominee owners and directors • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 20 – Egypt	
The scheme involved making investments in different fields through legal persons without clear economic purpose to launder funds obtained from the appropriation of public funds. It lasted 18 years and laundered EGP 300 million. It involved an Egyptian shareholding company and another company located abroad with unclear legal structure. The legal entity was managed by the primary suspect's sons, and the directors, shareholders and board of directors were nominees.	
Indicators	• There is a discrepancy between the supposed wealth of the settlor and the object of the settlement. • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors

Case Study 21 – Egypt	
The scheme involved real estate investment, the management of securities and portfolios investment and real estate marketing. Over the course of 5 years, the suspects received EGP 50 million for the purposes of real estate investment but stole the funds. Money was transferred and cash deposits made across eight legal persons with nominee shareholders and boards of directors, and one sole proprietorship.	
Indicators	• There is a discrepancy between the supposed wealth of the settlor and the object of the settlement. • Nominee owners and directors • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile

Case Study 22 – Egypt
14 companies and 8 Egyptian persons working in the tourism sector laundered EGP 42 million over the course of 3 years. The suspect used his official position to embezzle funds and invested the proceeds to top-up the capital of his companies before transferring the money abroad. The suspect's family members acted as

front people.	
Indicators	• Client is reluctant or unable to explain their source of wealth/funds • Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise

Case Study 23 – Egypt	
The scheme involved the reclamation of agriculture lands, trading, marketing and acting as agents for other brands, and trading in medical tools. It operated over the course of 15 years and involved four legal persons and 18 natural persons. EGP 17 million of funds originating from a foreign predicate offense were laundered by co-mingling in Egyptian joint-stock companies with the suspect's relatives used as front people. The shareholders and board members were nominees, and a lawyer was involved in the scheme.	
Indicators	• Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Nominee owners and directors • funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client.

Case Study 24 – Egypt	
A financial consultancy firm misappropriated investment funds. The funds were transferred using three companies to bank and securities accounts in overseas jurisdictions. Over the course of four years, the suspects laundered EGP 21 million, USD 4 million & EUR 68 thousand. The funds were collected by the firm for a declared purpose of investing them, yet they were actually misappropriated.	
Indicators	• There is a discrepancy between the supposed wealth of the settlor and the object of the settlement. • funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client.

Case Study 25 – Egypt	
The scheme involved the misappropriation of a company's funds by one of its employees. The predicate offense took place in a foreign jurisdiction. The company operated in construction, real estate development and import-export activities in Egypt. The funds were laundered by co-mingling the proceeds of crime with the capital of 8 legal persons (partnerships and Egyptian joint-stock companies). The shareholders and some of the partners were nominees.	
Indicators	• Nominee owners and directors • funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client.

Case Study 26 – Egypt	
The accused created six British Virgin Island shell companies and used the bank accounts of these shell companies to launder the proceeds of crime of a total amount of more than EGP 1 billion. The predicate offence was "illegal earning". The six shell companies all had a nominee shareholder.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre • Nominee owners and directors.

Case Study 27 – Egypt	
The scheme laundered the proceeds of illegal forex exchange through two exchange houses over the course of 10 years. The Chairmen and boards of directors of both legal persons were professional nominees. EGP 70 million originated from the predicted offence were laundered through establishing companies.	
Indicators	• Nominee owners and directors including formal nominees

Case Study 28 – Europol
Complicit facilitators set up shell companies and bank accounts. Banks in two EU countries facilitated the formation of shell companies (in EU, Belize, BVI and Panama) and registered bank employees as fake directors. Those bank accounts were controlled via Internet banking by criminals. Independent agents acting as

company service providers registered and administered those companies. A variety of OCGs used this network, on some ad-hoc basis for specific periods of time.	
Indicators	• Under investigation or have known connections with criminals • Registered at an address that is also listed against numerous other companies or legal arrangements • Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Bank balance of close to zero, despite frequent incoming and outgoing transactions • Bank accounts in multiple international jurisdictions without good reason • Employees of professional intermediary firms acting as nominee directors or shareholders • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise

Case Study 29 – Europol	
An organised crime group linked to the "Camorra" was involved in the transport of large amounts of drugs to Italy. Individuals from the crime group performed transactions on behalf of others, moving funds through company and foundation bank accounts. Those middlemen operated multiple bank accounts, exploiting products such as loans and stock market trading. Trade-based money laundering was also used to conceal the criminal funds by buying/selling companies, vehicles and jewellery.	
Indicators	• Under investigation or have known connections with criminals • Multiple bank accounts without good reason • Bank accounts in multiple international jurisdictions without good reason • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense

Case Study 30 – Europol
A non-EU organised crime group used offshore shell companies, controlled by various professional straw men, offering substantial loans with high interest rates and deferred payment loans and mortgages for property investments. Companies investing in Spain belonged to the same crime group.

Indicators	• Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Multiple bank accounts without good reason • Bank accounts in multiple international jurisdictions without good reason • Nominee owners and directors including formal nominees • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification • Loans are received from private third parties without any supporting loan agreements, collateral, or regular interest repayments

Case Study 31 - Fiji	
Mr. X used two shell companies to launder the money he had fraudulently obtained from his business partner Mr. Z. Mr. X set up a fake real estate company to facilitate the purchase and transferred the funds to another shell company and to his wife. The funds were then used to acquire property under their names.	
Indicators	• Legal person or arrangement receives large sums of capital funding quickly following incorporation/formation, which is spent or transferred elsewhere in a short period of time without commercial justification • False invoices created for services not carried out • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Transaction is a business transaction that involves family members of one or more of the parties without a legitimate business rationale

Case Study 32 – Fiji	
This case involved fraudulent activities conducted by Mr. X, an accountant at a Fijian resort. Mr. X altered the resort's cheques written to the resorts' creditors. A shell company was established to conceal the fraudulently converted funds. Some of the cheques that were fraudulently converted were altered and deposited into the bank account of the shell company. The remaining cheques were issued to other family members and associates of Mr. X. The laundered proceeds were used to purchase six motor vehicles, a private property and cash. The vehicles were registered under Mr. X's and others' names, whereas the property was registered under Mr. X's mother's name, and later transferred to one of his associates.	
Indicators	• Financial activities and transactions inconsistent with the corporate profile • Multiple bank accounts without good reason • Nominee owners and directors including informal nominees, such as children,

	spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Transaction is a business transaction that involves family members of one or more of the parties without a legitimate business rationale • Transaction is executed from a business account but appears to fund personal purchases, including the purchase of assets or recreational activities that are inconsistent with the company's profile • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile

Case Study 33 – Ghana	
A charity (Charity A) undertaking humanitarian work for orphans, war victims and disasters began operation in Ghana in 2016, but had been working with other partners 15 years. Charity A received three remittances totalling over USD 1 million from Charity B. The economic purpose of the funds was not indicated. Enhanced due diligence by the financial institution identified that Charity B was a wing of an UN-designated terrorist group.	
Indicators	• There is a discrepancy between the supposed wealth of the settlor and the object of the settlement. • Designated persons or groups

Case Study 34 – Gibraltar	
Company X listed as a subsidiary of company Y which received funds from an energy company deal. Company Z (managed by a licensed TCSP) owned company X. The scheme involved two regulated TCSPs acting as nominee shareholders. The directors had also been provided by the TCSP, but resigned less than four years after incorporation. The underlying client had also been a director. The company secretary (also a licensed TCSP) incorporated and administered the company, and provided the registered office. The supervisor obtained information being sought by the LEA using formal powers and disclosed this under a statutory gateway as being necessary for the prevention and detection of crime.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Resignation and replacement of directors or key shareholders shortly after incorporation • Nominee owners and directors including formal nominees

Case Study 35 – Gibraltar	
Two companies used to present what was suspected to be misleading picture of the firm's true financial position. The scheme used nominee shareholders (licensed TCSPs). Corporate director used for one director, company secretary for both, as well as provision of registered office facilities.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Falsified records or counterfeited documentation • Nominee owners and directors including formal nominees

Case Study 36 – Guernsey	
During a two-year investigation (2014-2016), the US Commodity Futures Trading Commission (CFTC) launched an investigation into UK national Mr. X Doe for market manipulation. It came to the attention of Guernsey Financial Services Commission that a TCSP provider (TCSP B) administered a corporate structure for the benefit of Mr. X Doe. Over a five-year period Mr. X Doe made approximately GBP 32 million. The purported legitimate business was futures dealing. Prior to Guernsey TCSP B's involvement, it was administered by a Cayman Island Company. The Guernsey TCSP, which was licensed for AML/CFT, identified that Mr. X Doe was under investigation and co-operated with the Guernsey AML/CFT authorities.	
Indicators	• Under investigation or have known connections with criminals • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre

Case Study 37 – Guernsey	
Persons A and B were married residents of Guernsey, and purported to be TCSPs but were unregistered. Person A was the subject of an investigation by the IRS, while the TCSP's Client C was under investigation by the FBI. It was identified that Client C was operating a "boiler room" fraud. Investigations suggested that Person A was providing nominee directors for the shell companies used by Client C in execution of his fraud. The FBI identified that significant funds of Client C had moved through an account that Person A's company, Company D, held in Hong Kong. Company D was incorporated in Niue with Person A the sole registered Director and Person B the Secretary. Persons A and B were connected to organised crime groups via the "business facilities" they provided, including acting as nominee directors.	
Indicators	• Under investigation or have known connections with criminals • Prohibited from holding a directorship role in a company or operating a TCSP

	• Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Falsified paper trail • Nominee owners and directors including formal nominees • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 38 – Israel	
This scheme was used to hide funds from social engineering fraud and other criminal offenses. The cover story for the criminal offenses was international trade – funds from merchants in Europe and the US that were sending payments to suppliers in East Asia. The suspect, the owner of a registered MSB, operated a second, unregistered MSB. The suspect used several natural persons as his contact points in East Asia, who in turn contacted local TCSPs for the purpose of setting up international companies and opening bank accounts. Local straw-men were registered as the shareholders of the new international companies established for the scheme. In addition, shareholders were registered based on passports provided by the suspect's contact persons mentioned above. The registered addresses of the companies were in East Asia. Bank accounts were opened in the same East Asia countries where the offices were located. Some of the funds were transferred to Israel to an account opened by the suspect. More than 60 beneficiaries were declared to the bank as beneficiaries, in such a way that the bank had difficulty in establishing which transaction was made on behalf of which beneficiary. The funds were sent from the companies set up by the suspect but the receiving bank did not know that these companies were actually under the suspects' control.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement conducts a small number of high-value transactions with a small number of recipients • Legal person or arrangement receives large sums of capital funding quickly following incorporation/formation, which is spent or transferred elsewhere in a short period of time without commercial justification • Simple banking relationships are established using professional intermediaries • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Only a post-box address • Legal person does not have a physical presence

Case Study 39 – Israel	
This scheme was used to hide the proceeds of fraud conducted through foreign exchange and binary options trades. Local companies attracted foreign investors and presented themselves as legitimate foreign exchange and binary trading platforms. Private companies, Israeli representatives of foreign banks and law firms set up foreign companies abroad by contacting TCSPs located in international jurisdictions. The latter established shell companies in the international jurisdictions. The service provided by the foreign TCSPs also included opening bank accounts in favour of the shell companies in other countries. After the companies were established, the TCSPs were not involved in their management nor in any related activity. In some cases, the suspects used the companies as a vehicle to launder money and in other cases they sold the companies to third parties for a profit.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Multiple bank accounts without good reason • Bank accounts in multiple international jurisdictions without good reason • Simple banking relationships are established using professional intermediaries • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise

Case Study 40 – Israel	
This case involved a fraudulent tax scheme designed to evade paying tax generated from international trade and a ML infrastructure that was used to hide the illegally gained funds. The suspects used a TCSP to register and operate two international shell companies (Company A and Company B) to create the false appearance that the revenues from their international trading did not belong to the local Israeli company which they controlled, to avoid tax. The two companies traded with each other exclusively and did not have any other source of income. Company A (foreign shell company) transferred significant funds to company C (local company) using the cover of a "consulted fee"/ "service commission". Only this commission, which was less than half of the real income, was reported to the tax authority in Israel. Thus, ultimately, the suspects paid taxes only on a small part of their income.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Bank balance of close to zero, despite frequent incoming and outgoing transactions • Bank accounts in multiple international jurisdictions without good reason • Correct documents not filed with the tax authority • False invoices created for services not carried out

	• Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Corporation has no personnel • Transaction is a repeat transaction between parties over a contracted period of time • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners

Case Study 41 – Israel	
The scheme involved underground banking - the suspects provided money services such as check clearing, currency exchange, international transfers and loans. These activities of the "bank" and its customers were unregistered and concealed. The investigation showed that the "customers" of the "underground bank" provided illegally gained cash, then, depending on the type of service, the transfers were registered and declared as diamond export/import or the selling and buying of diamonds locally. The funds were laundered by the underground bank's "managers" through the guise of diamond trade using false declarations and fictitious export/import diamond documentation. The "customers" of the "underground bank" used the diamond dealers' accounts to transfer money without reporting it to the authorities. The total sums laundered amount to hundreds of millions of USD.	
Indicators	• Discrepancy between purchase and sales invoices • Falsified paper trail

Case Study 42 – Italy	
The *Nucleo Polizia* of Milan conducted a preventive seizure of funds traceable to a single family, which were held in the Channel Islands, for a total value of EUR 1.3 billion. The assets were concealed through a complex network of trusts. Multiple trust accounts were hiding the beneficiaries of assets consisting in public debt securities and cash. The investigation established that between 1996 and 2006 the subjects placed their assets in Dutch and Luxembourgian companies through complex corporate operations and by transferring them to different trusts in the Channel Islands. Subsequently, the funds were legally repatriated through a tax amnesty in December 2009. The investigation identified chartered accountants who had over time facilitated the concealing of funds through trusts with the aim of facilitating laundering and reinvestment.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction

	or international trade or financial centre • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense

Case Study 43 – Italy	
This case related to an investigation into a transnational criminal organisation active in money-laundering and that perpetrated crimes in Italy. It was triggered by STRs concerning financial flows from a company in the British Virgin Islands channelled through a Swiss bank and sent to an Italian legal person to be used for a refurbishment of a real estate unit which had a value of EUR 9 million. The investigation resulted in the charging of a chartered account for money laundering. The search of the individual's office resulted in the seizure of documents pertaining to a high number of off-shore vehicles which were established on behalf of wealthy national clients. The subsequent investigations led to the discovery that around EUR 800 million had been moved between Italy and international accounts.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre

Case Study 44 – Italy	
The Nucleo Polizia Tributaria of Milan conducted a money laundering inspection at a professional office providing "chartered accountants services", aimed at verifying compliance with money laundering regulations. The investigation was conducted mainly through a series of databases/registries and enabled to establish how a joint stock company active in the real estate sector, owned by two companies based in Cyprus and Austria, had made a considerable investment in Milan (approx. EUR 8 million). Two years after the buyer had not proceeded to complete the works as planned. A money laundering inspection was carried out against the professional office and it was found to be the custodian of the books of accounts as well as the domicile of the joint stock company previously targeted. A senior partner was found to be borrowing considerable funds via credit institutions from a company based in a high-risk jurisdiction.	
Indicators	• Legal person or arrangement incorporated/formed in a jurisdiction that is considered to pose a high money laundering or terrorism financing risk • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Multiple bank accounts without good reason • Bank accounts in multiple international jurisdictions without good reason

Case Study 45 – Italy	
An anti-money laundering inspection for compliance into a TCSP led to the investigation. The case involved the acquisition of a well-known Italian transport company. It involved a trustee mandated in the name of a foreign company with no specified ownership. Documents obtained showed that several files on trustee registrations indicated offenses committed by the legal representative. The TCSP served to screen the transfer of funds to Italy that were illegally generated and concealed abroad. The investigation into beneficial ownership of the foreign company helped to link investigated persons to considerable financial assets that were fraudulently transferred abroad and used to purchase the transport company.	
Indicators	• Client is reluctant or unable to explain the identity of the beneficial owner • Multiple bank accounts without good reason • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense

Case Study 46 – Italy	
A trust structure was setup for the son of Mr. X, a client of a UK law firm. The trust structure was set up to hold funds illegally diverted from an Italian company run by Mr. X. The scheme consisted of a BVI company owned by an Irish company. The BVI company, in turn, owned 100% of a Luxembourg company. The Luxembourg company would receive money from the Italian company from fictitious sales. The director of the Irish company was a partner of the same UK law firm. The director of the BVI company was another partner of the same UK Law Firm. A close associate of Mr. X had a power of attorney in the BVI company. The shares of the Irish company were held in trust for Mr. X's son (beneficial owner of the trust) by a TCSP in Jersey connected to the same UK law firm. Using such scheme there was no apparent link between the funds diverted from the Italian company and the beneficial owner of such funds. The only link was the trust.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Employees of professional intermediary firms acting as nominee directors or shareholders • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense. • Nominee owners and directors

Case Study 47 – Italy	
Mr. D and Mr. S were involved in the top management of two Italian hospital corporations: the SR Foundation and the SM Foundation. These foundations were carrying out commercial operations outside their normal course of business to facilitate the illegal transfer of money from the Foundations to Mr. D and Mr. S to pay bribes to Mr. F, a PEP. The illegal commercial operations were carried out through various foreign corporate vehicles, which were managed by a Swiss trust fiduciary. The suspects were charged with conspiracy, money laundering, corruption and embezzlement.	
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Relationships with foreign professional intermediaries in the absence of genuine business transactions in the professional's country of operation • Financial activities and transactions inconsistent with the corporate profile • False invoices created for services not carried out • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense or which do not make commercial sense • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Transaction is a repeat transaction between parties over a contracted period of time • Transaction is executed from a business account but appears to fund personal purchases, including the purchase of assets or recreational activities that are inconsistent with the company's profile • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre or international trade or finance centre

Case Study 48 – Italy
A designated person was found to be in possession of assets and economic resources located in Italy. Bank records indicated the individual owned 100% of a Cyprus-based company and the tax register verified the date, place of birth and current tax residency in Italy. The Italian Official Register revealed the listed

individual owned 50% of a limited liability company based in Rome (whose corporate purpose is the purchase and construction of buildings and building complexes owned by the same company) through the aforementioned Cypriot company. The tax register revealed a 2012 tax return of the designated individual showing income from real estate, which exactly matched that of the Cypriot company, and a tax return for the Rome-based company showing a turnover of EUR 502 731 and taxable income totalling EUR 3 405. The designated individual owned shares or stakes in several companies based in Russia and Cyprus, including two banks and the mentioned Cypriot company. The designated individual, the Cypriot company and the Roman company were also found to own several properties located in various Italian provinces. As such, the designated individual was the holder of assets and economic resources in his own name or otherwise available through corporate vehicles that had been under freezing orders since 2014.	
Indicators	• Foreign nationals with no significant dealings in the country in which they are procuring professional or financial services • Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or finance centre • Focused on aggressive tax minimisation strategies • Designated persons or groups • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense or which do not make commercial sense • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client

Case Study 49 – Jersey	
The main fraudulent activity centred on a software business based in the suspect's home country. The business sold its intellectual property rights to an Irish company which in turn transferred them to a BVI company. The business then entered into license and distribution agreements with the BVI company, which enabled it to sell and distribute the software and accordingly it continued its business activities as before. The resulting license and distribution fees paid to the BVI company resulted in a significant reduction in its taxable income. All 3 entities were owned and controlled by same person ("X"). It is alleged that X operated a scheme whereby the company made fraudulent claims and omissions by claiming deductions resulting from "sham" license and distribution arrangements. X established a trust structure with underlying companies using a Jersey based financial service provider. It is alleged these entities were involved in the scheme as conduits for funds transfers or for holding assets derived from the scheme.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre

	• Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense. • Transaction involves licensing contracts between corporations owned by the same individual

Case Study 50 – Latvia	
Foreign national Mrs V opened an account in a Latvian bank B, and received USD 3 827 000 and EUR 208 000 shortly thereafter from foreign Company M. Company M had received the funds from foreign Companies R and W. Public information revealed that Companies M and W had the same shareholder – an offshore legal entity, whereas the beneficiaries of Companies M and W presented at the bank were two other individuals, which raised concerns of a scheme to obscure beneficial ownership. Mrs V transferred USD 2 980 000 USD to Individuals E, O and A to accounts at foreign Bank F, stating the purpose of transaction as a gift to grandchildren. At the same time Mrs V transferred USD 840 000 to her own account at foreign Bank F. All beneficiaries had the same address, which suggested that Mrs V was residing in a country different from that on bank CDD records. The sum of USD 220 000 was further received in Mrs V's account from Individual L, and further transfers of USD 300 000 were initiated to Individuals A and E. Bank B made an EDD request, and according to documents received on behalf of Mrs V electronically, Mrs V had sold two paintings to Individual B for USD 220 000 using Individual L as an intermediary, but the signatures on the agreement appeared digitally embedded. Individual A presented himself at Bank B claiming to be a grandchild of Mrs V, who he claimed to be deceased but could not provide a death certificate. The FIU confirmed with Mrs V's country of residence that she was deceased and that transactions since the date of death had been performed by third parties. The FIU issued an order to freeze USD 350 000 in Mrs V's accounts.	
Indicators	• Client is reluctant or unable to explain why they are conducting their activities in a certain manner • Foreign nationals with no significant dealings in the country in which they are procuring professional or financial services • Transactions which appear strange given an individual's age • Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Falsified paper trail • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client

Case Study 51 –Mexico	
A network of 42 shell companies with different lines of business was dismantled, with companies located in Mexico and others abroad. The network was created to offer money laundering services to criminal organizations through a group of independent agents who contact customers to offer the said services, charging a fee from between 1 and 5% the amount of the funds operated.	
Indicators	• Previous conviction for fraud, tax evasion, or serious crimes • Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Financial activities and transactions inconsistent with the corporate profile • Fabricated corporate ownership records • False invoices created for services not carried out • Falsified paper trail • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 52 – Mexico	
Four shell companies requested from the Mexican Tax Administration Service (SAT) the refund of the Value Added Tax, from non-existent operations carried out in 2008 and 2009. In total, 26 companies participated in the simulation of transactions, and 48 individuals were part of the scheme as partners, administrators, and legal representatives. Part of the illegally obtained resources were sent to bank accounts in the U.S., and later used to make transfers to accounts in Las Vegas, Nevada. These accounts were held by Casinos and by individuals who carried out gambling activities.	
Indicators	• Financial activities and transactions inconsistent with the corporate profile • Bank accounts in multiple international jurisdictions without good reason • False invoices created for services not carried out • Falsified paper trail • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate

	wealth or income • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client

Case Study 53 – Namibia	
Namibian national A (as sole owner) registered two close corporations using false national identity documents. Subsequently, A opened bank accounts at two local banks for each of these corporations. The bank accounts at one bank were active, while those at the other bank remained dormant resulting in their closure. A authorised foreigners B and C to manage the said accounts. B and C used online banking channels to make huge inward and outward transfers on the two corporate accounts. Funds had been transferred from foreign jurisdiction SA to Namibia and then immediately re-routed to other foreign jurisdictions, including back to SA from where the funds had emanated. The transfers started with relatively small amounts quickly grew larger. The funds were generally withdrawn in less than 48 hours after deposit.	
Indicators	• Signatory to company accounts without sufficient explanation • Declared income which is inconsistent with their assets, transactions or lifestyle • Registered at an address that does not match the profile of the company • Legal person or arrangement conducts a large number of transactions with a small number of recipients • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Bank balance of close to zero, despite frequent incoming and outgoing transactions • Financial activities and transactions inconsistent with the corporate profile • Multiple bank accounts without good reason • Falsified records or counterfeited documentation • Fabricated corporate ownership records • Falsified paper trail • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • Transaction is a repeat transaction between parties over contracted period of time • Transaction appears cyclical • Transaction involves complicated transaction routings without sufficient explanation or trade records

Case Study 54 – Namibia	
The case involved two Namibians and three Chinese subjects. The subjects registered two Proprietary Limited companies as well as a Namibian close corporation. Subsequently they opened nine bank accounts at five local banks, with one Chinese and two Namibians directors/shareholders as signatories on the accounts. The entities and individuals received significant deposits and transfers derived from Namibian accounts and transferred to a foreign jurisdiction.	
Indicators	• Legal person or arrangement conducts a small number of high-value transactions with a small number of recipients • Legal person or arrangement receives large sums of capital funding quickly following incorporation/formation, which is spent or transferred elsewhere in a short period of time without commercial justification • Financial activities and transactions inconsistent with the corporate profile • Multiple bank accounts without good reason • Correct documents not filed with the tax authority • Legal Person pays no taxes, superannuation, retirement fund contributions or social benefits • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client

Case Study 55 – Namibia	
Mr. X declared that he is involved in taxi business. Analysis confirmed that X made regular large cash deposits into two accounts, followed immediately by large cheque withdrawals to other businesses and accounts of his close corporations and relative. The corporate entity's activities, as registered with the registrar of close corporations, include retail, mining, construction and fishing. Withdrawals from this account were exclusively electronic transfers. The account also received monthly funds from various individuals, as well as large-value of electronic transfers from a company in South Africa in the account of a Namibian Registered Trust. Analysis established that X owns several high value properties in Namibia and South Africa, which were purchased in cash. Some of these properties were registered under legal entities. Mr. X was found guilty of drug dealing.	
Indicators	• Transactions which appear strange given an individual's age • Previous conviction for fraud, tax evasion, or serious crimes • Signatory to company accounts without sufficient explanation • Financial activities and transactions inconsistent with their customer profile • Legal person or arrangement conducts a large number of transactions with a small number of recipients

	• Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Bank balance of close to zero, despite frequent incoming and outgoing transactions • Multiple bank accounts without good reason • Transaction is a business transaction that involves family members of one or more of the parties without a legitimate business rationale • Transaction is executed from a business account but appears to fund personal purchases, including the purchase of assets or recreational activities that are inconsistent with the company's profile • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client

Case Study 56 – Namibia	
An STR was filed on Y on suspicion that he might be involved in illegal diamond dealing and using a business bank account to co-mingle proceeds of crime with legitimate income. Analysis revealed that Y is the sole member close corporation with its principle business "manufacturing, recycling and cleaning". Substantial sums were deposited into the business account, with most deposits from electronic funds transfers originating from several individuals in America and in Asia. Y withdrew the funds in cash. Analysis revealed that Y presented himself as an authorized diamond dealer in Namibia to foreign buyers online.	
Indicators	• Long period of inactivity following incorporation, followed by a sudden and unexplained increase in financial activities • Bank balance of close to zero, despite frequent incoming and outgoing transactions • Financial activities and transactions inconsistent with the corporate profile • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile • Funds are unusual in the context of the client or customer's profile

Case Study 57 – Namibia
This case involves subjects and entities using the electronic banking system to channel proceeds of crime to foreign jurisdictions. Funds deposited into close corporations and subject's personal account and then structurally withdrawn in the foreign jurisdiction under the pretext that it is business related funds. Subject 1, a Chinese national, opened a personal bank account and registered a

close corporation (Entity 1) that also opened accounts with three different financial institutions. Subject 1 further "assisted" a Namibian woman 1 to open personal accounts at the same three financial institutions. He also "assisted" her to register four close corporations in her name (Entities 2-5) and opened accounts with one of the financial institutions. Subject 1 assisted other Namibian women 2 and 3 to open bank accounts with two of the financial institutions. Subject 1 controlled the ATM cards of Entities 1-5 and accounts in name of Namibian women 1 and 2, to the extent that he was transacting on them. Namibian woman 3 did not pick up her ATM cards and when requested by the bank to explain why she opened accounts, she disappeared and could not be traced. The funds deposited or transferred into the accounts of Namibian women 1-3 and entities 2-5 were from Subject 1, whilst the funds into Subject 1's accounts were from Chinese owned entities.	
Indicators	• Client is reluctant to provide personal information. • Client is reluctant or unable to explain their business activities and corporate history • Actively avoiding personal contact without sufficient justification • Refuse to co-operate or provide information, data, and documents usually required to facilitate a transaction • Transactions which appear strange given an individual's age • Registered at an address that does not match the profile of the company • Director or controlling shareholder(s) does not appear to have an active role in the company • Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Bank balance of close to zero, despite frequent incoming and outgoing transactions • Multiple bank accounts without good reason • Disinterested in the structure of a company they are establishing • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile

Case Study 58 – Netherlands
Mr. B, a Dutch taxpayer, had put money in a Jersey trust and had not declared this to the tax authorities. Mr. B did not state in his income tax returns that he was involved in a trust and intentionally answered a tax questionnaire incorrectly or incompletely concerning his involvement in the trust. The court found that Mr. B

intentionally provided incorrect information to a public servant of the Netherlands Tax and Customs Administration, resulting in too little tax being levied.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Focused on aggressive tax minimisation strategies • Correct documents not filed with the tax authority • Falsified records or counterfeited documentation

Case Study 59 – Netherlands	
The Suspect, a doctor, received payments from the pharmaceutical industry with which he did business. The amount of this payment varied per contract. These payments, which can be considered income, were not paid into one of the suspect's Dutch bank accounts, but into Luxembourg numbered accounts in the name of a foundation. The suspect never declared the balances of these Luxembourg bank accounts in his income tax returns.	
Indicators	• Multiple bank accounts without good reason • Bank accounts in multiple international jurisdictions without good reason • Focused on aggressive tax minimisation strategies • Correct documents not filed with the tax authority • Transaction involves a numbered account • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 60 – Netherlands	
This tax evasion scheme consisted of sending false invoices from a company incorporated by the suspect in the BVI to the Dutch company, to create the illusion that services have been provided to the Dutch company. The Dutch company pays this invoice to the company in the BVI which results in a reduction in the turnover and profit because more costs have been incurred. From the BVI the amounts received were paid into the private bank accounts of the suspect and co-suspect in Cyprus who were able to access those accounts in the Netherlands by means of a debit/credit card. Funds were used by the suspect to finance real estate.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • False invoices created for services not carried out. • No real business activities undertaken • Client is both the ordering and beneficiary customer for multiple

	international funds transfers • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 61 – Netherlands	
The FIU received a notification from a financial institution in respect of an international transfer to a foreign company in Italy. The beneficial owner of this company appeared to be the ex-wife of the client. This client regularly transferred money from his private account but also from his business account to the account of his ex-wife and her businesses. By means of the "loan agreements" the money was deposited again into the bank account of the client. On the basis of this information the notification was declared suspicious and forwarded to the investigation teams.	
Indicators	• Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification • Transaction is a business transaction that involves family members of one or more of the parties without a legitimate business rationale

Case Study 62 – Netherlands	
A civil-law notary filed an STR that indicates a house purchase was financed with a loan from an Andorran company. The Netherlands FIU subsequently requested further information on this company from Andorra. The UBO of this company appeared to be the same person as the purchaser of the house. On the basis of this information, the notification was declared suspicious and forwarded to the investigation teams.	
Indicators	• Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification

Case Study 63 – Netherlands	
A Dutch target company received loans from a Swiss TCSP with a bank account in Montenegro, under the description of "repayment loan". This Swiss TCSP is also the sole shareholder of the Dutch target company. The received money was subsequently re-loaned again via a subsidiary of the Swiss TCSP in Moldavia to the UBO in The Netherlands. The Dutch target company was also used by other clients of the Swiss TCSP. The Dutch target company received loans from the Swiss TCSP and subsequently re-loaned these funds to operational companies in Italy and England, which were managed by the UBOs. The account in Montenegro of the Swiss TCSP was topped up by a Swiss bank account in the name of the UBO of the Dutch target company. The FIU suspects that this manner of re-loaning one's own money via this Swiss TCSP is also used by other persons.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Client is both the ordering and beneficiary customer for multiple international funds transfers • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification

Case Study 64 – Netherlands	
This case concerns a criminal investigation into money laundering and the purchase and financing of premises and apartment rights in the Netherlands by two Liechtenstein trusts. The ultimate beneficial owners and the source of funds for the purchase and financing of the real estate are shielded by the use of these trusts and by a number of facilitators. The purchase involves a total of almost EUR 2 million in purchase (costs) and financing of the real estate which is presumably derived from drug trafficking. The two trusts have their registered office in Liechtenstein and the persons who represent the trusts are family members of the suspects.	
Indicators	• Under investigation or have known connections with criminals • Registered at an address that is also listed against numerous other companies or legal arrangements • Financial activities and transactions inconsistent with the corporate profile • Correct documents not filed with the tax authority • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Client is both the ordering and beneficiary customer for multiple international funds transfers

	• Transaction is a business transaction that involves family members of one or more of the parties without a legitimate business rationale • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners • Transaction involves a professional intermediary without due cause or apparent justification

Case Study 65 – Netherlands	
A Dutch investment fund invested money deposited by investors in foreign life insurance policies. The investors participated in a trust that had become owner of the life insurance policies. After the death of the insured (third parties), the insurance would pay out to the fund that in turn would pay out to the investors. The risk that the original holder of the life insurance policy would live longer than the agreed maturity (the longevity risk) was re-insured. The re-insurers took over the policy from the trust fund and the investors received from the re-insurer an amount that was equivalent to the death benefit value of the policy. All deposits, EUR 175 million, went through the foreign accounts of the trust companies. It appears that only a limited part was invested in the promised second-hand life insurance policies. A large part was immediately channelled to the bank accounts of the suspect and the trustee.	
Indicators	• Unusually large number of beneficiaries and other controlling interests • Bank accounts in multiple international jurisdictions without good reason • Funds are unusual in the context of the client or customer's profile

Case Study 66 – Netherlands	
The case involves funds derived from extortion. The suspect created legal constructs made up of parent companies registered in a low tax jurisdiction with few or no or scarcely any obligations to keep administrative and accounting records. The suspect used coded bank account in Switzerland to further conceal the money laundering activity. TCSPs managed the companies.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Bank accounts in multiple international jurisdictions without good reason • Transaction involves a numbered account

Case Study 67 – Netherlands
A medium-sized Dutch company sent double invoices - one invoice from the Dutch company to which payments were made in the Dutch account and are also properly declared to the Netherlands Tax and Customs Administration. The

second email/false invoice was to be paid into a numbered account in Switzerland that is in the name of a fictitious company. When Dutch and Swiss relations improved, the Swiss bank advised the client to incorporate a Panamanian company and deposit the funds into numbered accounts in Cyprus in the name of two Panamanian S.A.s over which the directors of the Dutch company exercise control.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Multiple bank accounts without good reason • Bank accounts in multiple international jurisdictions without good reason • Falsified records or counterfeited documentation • Double invoicing between jurisdictions • False invoices created for services not carried out. • Transaction involves a numbered account

Case Study 68 – Netherlands	
This case was an investigation into Dutch suspects for filing incorrect tax returns, money laundering and forgery. During the investigation, it was identified that funds had been transferred through a numbered account in Switzerland in the name of a financial service provider in Panama. Shortly thereafter, very similar amounts were debited from the account, under a false description, to the credit of the Dutch suspects. A financial service provider facilitated this by providing the Dutch suspects with the opportunity to conceal these cash flows from third parties. The invoices for the services provided were paid to the financial service provider via the account in Switzerland.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Transaction involves the two-way transfer of funds between a client and a professional intermediary for similar sums of money • Transaction involves a numbered account • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 69 – Netherlands
A Panamanian Private Foundation was founded by a Panamanian company which is affiliated to Mossack Fonseca. The Foundation Council is another corporation, and the beneficiary is Mr. E, the director and sales advisor of a Netherlands TCSP.

The registered agent is X Legal Services. The Panamanian Private Foundation has opened a bank account in Cyprus. This is a very large criminal investigation, which also includes an investigation into the persons who made use of the structure offered by the TCSP.	
Indicators	• Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Focused on aggressive tax minimisation strategies • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors including formal nominees

Case Study 70 – Netherlands	
Mr. and Mrs. X acted as directors of a Dutch holding company and a Dutch operating company, as well as the founders of a Unit Foundation and the beneficial owners in an Offshore Investment Holding Company. It appears that agreements for the provision of directorship and/or nominee shareholder services have been drawn up. The invoices of the Offshore Investment Holding Company list several services performed for the corporation including the opening of a bank account. No amount is charged for management services. An employee of the Dutch TCSP has signing powers for the Offshore Investment Holding Company's bank account. Mr. and Mrs. X determine whether funds are paid from the underlying companies to the Offshore Investment Holding Company and on to the Unit Foundation. As a result, it can be argued that the employee in Cyprus only carried out the wishes of Mr. and Mrs. X and that they are the de facto managers of the Offshore Investment Holding Company.	
Indicators	• Requests the formation of complex company structure without sufficient business rationale • Agreements for nominee directors and shareholders • Employees of professional intermediary firms acting as nominee directors or shareholders • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors including formal nominees • No real business activities undertaken • Transaction involves a professional intermediary without due cause or apparent justification

Case Study 71 – Netherlands	
A criminal investigation into a Dutch TCSP was instigated on account of the systematic failure to notify unusual transactions and money laundering. This was presumed to involve the facilitation of fake transactions on behalf of foreign clients to ensure, for example, the assets or property of those clients were scarcely taxed, or funds parked were transferred by means of fake transactions to another jurisdiction. This was carried out by means of complicated well-considered structures with companies and trusts in various countries for which instructions were given by a financial service provider and were also discussed in this way by the suspect with the Dutch civil-law notary. Dutch entities were part of these complicated structures. The same applied for the Dutch foundations registered at an international address. The structure sometimes consisted of eight different entities, in various countries. The suspect reportedly did not know in several cases the identity of the actual beneficiaries of the companies that he incorporated.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Relationships with foreign professional intermediaries in the absence of genuine business transactions in the professional's country of operation • Focused on aggressive tax minimisation strategies • Requests the formation of complex company structure without sufficient business rationale • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Transaction involves a professional intermediary without due cause or apparent justification

Case Study 72 – Netherlands	
The owner of a TCSP posed as a "Business Lawyer" but was not registered as a lawyer. The clients reportedly paid remuneration for the trust services, which were (partially) paid into the suspect's account in three different international jurisdictions. A TCSP in an international jurisdiction was also reportedly used. The suspect evaded tax on these amounts for a number of years. The suspect also committed immigration fraud by putting clients on the payroll of one of his companies to draw up false employment contracts and/or salary slips. Ownership of the shares of the Dutch companies was often veiled by means of foundations and foreign company structures via a low tax jurisdiction. Dutch companies appear to have been mainly used as a means of channelling money. In addition, the suspect reportedly laundered money in the purchase of real estate intended for himself, his family or for clients of the TCSP.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre

	• Legal person or arrangement regularly sends money to low-tax jurisdictions or international trade or finance centres • Frequent payments to foreign professional intermediaries. • Multiple bank accounts without good reason • Bank accounts in multiple international jurisdictions without good reason • Focused on aggressive tax minimisation strategies • Interested in foreign company formation, particularly in jurisdictions known to offer low-tax or secrecy incentives, without sufficient commercial explanation • Correct documents not filed with the tax authority • False invoices created for services not carried out • Falsified paper trail

Case Study 73 – Netherlands	
A Dutch company has business transactions with two Ukrainian companies. On account of the strict rules in Ukraine, international legal constructs are created to continue doing business. The Dutch company delivers goods to the Ukrainian companies. However, the cash flow goes through a Panamanian entity with a bank account in Latvia. It subsequently appears that there is a discrepancy between the purchase and sales invoices and that this "surplus" remaining in the Latvian bank account.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Discrepancy between purchase and sales invoices • Transaction involves complicated routings without sufficient explanation or trade records

Case Study 74 – Netherlands	
A company registered in the BVI with an account in Switzerland transfers money via a Dutch bank account to a company registered in Cyprus with a Latvian bank account. The UBOs of both companies are Russian. STRs are submitted because of the use of (false) invoices which were not based on any fair consideration. This regularly occurs in what is referred to as the VAT carrousel fraud.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • False invoices created for services not carried out

Case Study 75 – Netherlands	
This South American investigation focused on persons whose tax profile did not correspond to the amounts paid into their accounts in foreign countries or their spending. Corruption funds were allegedly paid to the suspects via the Dutch company, which company was managed by a Legal Consultancy Agency registered in a low tax jurisdiction. The Dutch company was also reportedly registered in an international jurisdiction. The funds paid ended up in Luxembourg accounts in the name of the suspects which were later converted to numbered accounts.	
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Financial activities and transactions inconsistent with their customer profile • Bank accounts in multiple international jurisdictions without good reason • Transaction involves a numbered account

Case Study 76 – Netherlands	
International company A with its headquartered in The Netherlands paid corruption funds to a government employee via letter box companies. An international company was registered in an international jurisdiction, with a government employee registered as the beneficial owner but with nominee shareholders and directors. Payments were made via a Dutch bank account of a subsidiary of the international company to an account of the foreign company in Estonia and via an enterprise registered in Hong Kong, after which these funds were paid into bank accounts in an international jurisdiction and from there to a Luxembourg bank account of the international company. Bribes were also paid to charities that were directly associated with government employees. In order to account for the bribes, false invoices were entered in the accounting records.	
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Bank accounts in multiple international jurisdictions without good reason • False invoices created for services not carried out • Nominee owners and directors including formal nominees • Transaction involves complicated routings without sufficient explanation or trade records

Case Study 77 – New Zealand	
A New Zealand shell company was set up by a New Zealand TCSP based in Vanuatu. The shell company was registered on behalf of an unknown overseas client and nominees were used to hide the identity of the beneficial owners. The actual business of the shell company was not apparent and was not indicated by the company name. The address listed on the companies' register was the same virtual office in Auckland as the TCSP. The nominee director resided in Seychelles, and the nominee shareholder was a nominee shareholding company owned by the TCSP. The nominee shareholding company was itself substantially a shell company and had been used as the nominee shareholder for hundreds of other shell companies registered by the TCSP. News reports indicated that a power of attorney document transferred the directorship to a Russian national who had sold his passport details, with a bank account opened in Latvia. When journalists from the Organised Crime and Corruption Reporting Project (OCCRP) made contact with the Russian national, the man revealed he was unaware of the New Zealand company or its bank accounts. His identity, which he had sold, had been used without his knowledge. Furthermore, a former officer of the Russian tax police told journalists that hundreds of law firms specialise in establishing ready-made shell companies for their clients, who want to remain anonymous. Usually, these law firms rely on disadvantaged individuals who sell them passport details for approximately USD100-300. Trade transactions were conducted with several Ukrainian companies including a state-owned weapons trader. The contracts were then cancelled after the funds had been transferred and refunds were made to different third-party international companies. Transactions were also made with three other New Zealand shell companies registered by the same TCSP, using the same nominee director, nominee shareholder and virtual office address as the shell company. News reports indicated that all four shell companies had been involved in laundering USD40 million for the Sinaloa drug cartel based in Mexico.	
Indicators	• Foreign nationals with no significant dealings in the country in which they are procuring professional or financial services • Registered under a name that does not indicate the activity of the company • Registered at an address that does not match the profile of the company • Registered at an address that is also listed against numerous other companies or legal arrangements • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • There is a discrepancy between the supposed wealth of the settlor and the object of the settlement. • Discrepancy between purchase and sales invoices • Fabricated corporate ownership records • False invoices created for services not carried out • Falsified paper trail

	• Agreements for nominee directors and shareholders • Employees of professional intermediary firms acting as nominee directors or shareholders • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors including formal nominees • Address of mass registration • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • Corporation has no personnel • Legal person does not have a physical presence • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 78 – New Zealand

A New Zealand law firm was linked to clients who had been implicated, arrested or convicted of a myriad of offences including embezzlement, bribery, corruption, tax evasion, and money laundering. This law firm sets up its business basis in New Zealand, and worked for overseas clients using its in-depth knowledge of New Zealand tax, trust and company law.

The companies and partnerships were set up by this New Zealand law firm, who routinely used its employees as nominee directors and shareholders, with the beneficial owners (who were sometimes offenders and their associates) not publicly named. Furthermore, often a chain of companies was established, with one company is the shareholder of another, which was the shareholder of another, which added complexity to the structure, and further removed the beneficial owner from the assets. Sometimes a New Zealand (shell) company was used as a trustee of the trust.

The companies involved were usually all shell companies with nominee directors, shareholders, and addresses. The companies, partnerships and trusts comprised the complex structures established by this New Zealand law firm, which can be used to hide and protect wealth. Furthermore, sometimes entities were set up internationally by this New Zealand law firm's business associates in other countries, which were added to the structures, further increasing the complexity and decreasing the ability and efficiency of detecting crime and hidden wealth. If

	suspicions did arise and a person with such a structure was investigated, there was a convoluted audit trail that could be arduous to trace. There were strong indications that criminals have structures set up by this New Zealand law firm with evidence that some of these structures have been used by criminals to hide assets. A NZ-based employee was also named as a director to satisfy the legal requirement to have a New Zealand resident director and address; however, the beneficial owner of the company was not identified in every instance.
Indicators	• Previous conviction for fraud, tax evasion, or serious crimes • Under investigation or have known connections with criminals • Registered at an address that is also listed against numerous other companies or legal arrangements • Director or controlling shareholder(s) does not appear to have an activity role in the company • Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors including formal nominees • Address of mass registration • No real business activities undertaken • Exclusively facilitates transit transactions and does not appear to generate wealth or income • Legal person has no personnel • Legal person does not have a physical presence

Case Study 79 – New Zealand
Assets believed to be acquired using proceeds of crime allegedly linked with the settlor of these trusts. Some of these structures were set up via a NZ TCSP. None of assets are held directly by the trustees of the trusts – but via various US domestic and foreign entities. It appears all activities were US based with orders against US entities indirectly owned via overseas companies. The scheme involved two trusts, four companies, with nominee directors and shareholders employed by a law firm. This complex structure prevented law enforcement from obtaining beneficial ownership information by establishing a complex web of shell companies and trusts.

Indicators	• Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Agreements for nominee directors and shareholders • Employees of professional intermediary firms acting as nominee directors or shareholders • Nominee owners and directors including formal nominees • Address of mass registration

Case Study 80 – New Zealand	
Shell companies based in Panama, Belize, and the UK with nominee shareholders and directors have been used to open Latvian bank accounts to conduct hundreds of millions of dollars' worth of international payments. The majority of transactions are payments being made on behalf of Vietnam entities for imported goods, or payments to Vietnamese expats living overseas on behalf of purportedly Vietnam-based senders. This distinct Vietnamese connection indicates the accounts may be controlled or administered from within Vietnam. New Zealand bank accounts were used to receive funds transferred from bank accounts in Latvia, Cambodia and China. The New Zealand accounts are either accounts held by students or by fruit wholesalers and exporters. More than 15 NZ properties have been purchased with funds from the Latvian bank accounts. These property transactions have been undertaken through NZ law firms. Information suggests that the Latvian accounts are also being "topped up" by other shell company bank accounts based in international jurisdictions, indicating a co-ordinated layering process being undertaken.	
Indicators	• Declared income which is inconsistent with their assets, transactions or lifestyle • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Financial activities and transactions inconsistent with the corporate profile • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds are unusual in the context of the client or customer's profile • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre

Case Study 81 – New Zealand	
Companies registered in New Zealand by a Vanuatu-based TCSP operated by New Zealand citizens were suspected of acting as shell companies that facilitate crime in foreign jurisdictions. The TCSP acted as nominee shareholders and provided nominee directors who resided in jurisdictions such as Vanuatu, Panama and the Seychelles – in the case of Company A, the employee recruited to act as a director likely had no knowledge of the activities taking place, as they had no previous involvement in any of the TCSP activities. Crimes include smuggling of illegal goods, arms smuggling, tax fraud, investment fraud and money laundering. Company A was one company set up by the TCSP, which leased the plane that was caught smuggling arms. 73 companies registered in New Zealand by the TCSP were suspected of acting as shell companies which facilitated crime in foreign jurisdictions. Crimes included the smuggling of illegal goods, arms smuggling, tax fraud, investment fraud and money laundering.	
Indicators	• Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Falsified paper trail • Agreements for nominee directors and shareholders • Employees of professional intermediary firms acting as nominee directors or shareholders • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors including formal nominees • Address of mass registration

Case Study 82 – Norway	
Seven Norwegian citizens, in different combinations, were the owners of four small Norwegian IT-companies. They were approached by a major Norwegian company (listed on the stock exchange) that wanted to buy shares of all the companies. The price offered was much higher than the share capital in the companies (their input value for taxation). In response to this, the owners established new companies in offshore jurisdictions and sold their shares to those companies with a minimum of profit. The newly established companies then immediately resold the shares to the actual buyer in Norway. The sales profits were realized abroad with no tax.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement conducts a small number of high-value transactions with a small number of recipients • Legal person or arrangement receives large sums of capital funding quickly following incorporation/formation, which is spent or transferred elsewhere

	in a short period of time without commercial justification • Focused on aggressive tax minimisation strategies • Transaction appears cyclical • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners • Transaction involves the transfer of shares in an off-market sale • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre.

Case Study 83 – Norway	
The CEO of a large Norwegian company transferred significant sums of money to several companies, claiming that this represented payment for services (consultancy fees etc.). Investigation proved that no services were delivered and that the CEO was the beneficial owner of the companies.	
Indicators	• False invoices created for services not carried out • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners

Case Study 84 – Norway	
The suspect was the head of a shipping company, and committed breach of trust by buying ships and equipment intended for the company through a structure of companies that was ultimately under his control. The suspect then sold the assets to the company at an inflated price. He simultaneously committed fraud against the banks that were financing the ships, by alleging the ships were bought at marked price. Although beneficial ownership was determined, legal challenges remain in confiscating assets frozen in foreign bank accounts that were not party to the criminal case.	
Indicators	• Inflated asset sales between entities controlled by the same beneficial owner • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners

Case Study 85 – Panama	
The purported legitimate purpose of the scheme was the development and construction of real estate, based on small investors who injected capital. The funds provided by the settlor or third-party adherents were derived from illegal activities (corruption of public servants and illicit enrichment). The scheme involved a BVI company with nominee directors, ultimately controlled by a PEP who was a client of a bank that had a relationship with the TCSP. The TCSP set up a real estate trust to receive money and assets that come from the business of the settlor and "investors." The assets received were invested in a real estate project, with the same assets given as a warranty to the bank that was financing 60% of the real state project. The ultimate beneficial owner of the real estate project was the son of the PEP. The trustee did not conduct extensive due diligence and relied on the due diligence performed by the bank that referred the client, since both the client and the trustee maintained a business relationship with the bank.	
Indicators	• Client is reluctant or unable to explain their source of wealth/funds • Client is reluctant or unable to explain the nature of their business dealings with third parties • Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • There is a discrepancy between the supposed wealth of the settlor and the object of the settlement. • Falsified paper trail • Nominee owners and directors including formal nominees • An asset is purchased with cash and then used as collateral for a loan within a short period of time

Case Study 86 – Peru
This case concerns a Peruvian PEP, his wife, his mother-in-law and other individuals close to him following the purchase of properties. Two mortgages were paid in advance using funds from a Costa Rican company that had been established only six months before instructions were given for the wire transfers. The loan was paid in just four months by the offshore company, despite the financial loss incurred. The Peruvian authorities established the origin of the funds to be corrupt activities performed by the PEP during his administration. The purchase of a luxury property by the mother-in-law of the PEP, who did not have the economic capacity to make this purchase, led to the opening of a case at the FIU and the issuance of SARs by reporting entities.

Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Financial activities and transactions inconsistent with their customer profile, • Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement receives large sums of capital funding quickly following incorporation/formation, which is spent or transferred elsewhere in a short period of time without commercial justification • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • A loan or mortgage is paid off ahead of schedule, incurring a loss

Case Study 87 – Russia

A state customer concluded contracts on research work and the development of a special software with Contractor #1 and Contractor # 2. Analysis of financial transactions showed that these contractors did not conduct any research activities themselves, but transferred budgetary funds to subcontractors with real scientific laboratories among them. The majority of funds from Contractor #1 was sent to its subcontractor, who channelled funds to a shadow financial scheme consisting of multiple layers of shell companies. The funds were finally withdrawn in cash. The majority of funds from Contractor # 2 was sent to a real estate company that invested these funds into its business activity, acquired luxury cars and granted zero-interest rate loans to a number of individuals.

Analysis of ownership data, address registry information, an air tickets booking database, financial transactions and law enforcement data showed that Contractor #2 was previously owned by Mr. X, before the ownership was passed to straw men uninvolved with the scheme. The real estate company was formerly owned by Mr. X, before the ownership was transferred to his daughter. Contractor #1 was owned by straw men who had no idea about the company's business activities and received instructions from Mr. X. These straw men received a "salary" from the company's account. The director of the state customer's department responsible for research activities was a brother of Mr. X. A daughter of the state customer department's director acquired expensive real estate using cash that was deposited in advance in her account. The woman who had joint flights with Mr. X acquired expensive real estate using cash that was in advance deposited into her account in advance.

Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • False invoices created for services not carried out • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Nominee owners and directors including informal nominees, such as children,

	spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Loans are received from private third parties without any supporting loan agreements, collateral, or regular interest repayments • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile • Transaction involves the use of multiple large cash payments to pay down a loan or mortgage

Case Study 88 – Russia	
Embezzled public funds worth RUB 300 million (11 million USD) were transferred from the account of Company K to the account of Company R. Company R, a Delaware corporation, was owned and managed by the Russian wife of the suspect, a state official. The same day, Company R transferred USD 11 million as a loan to an account of Company A (BVI) held by a Cypriot bank. Company A then transferred more than USD 11 million to the Company D (US) to purchase real estate in France. Company D transferred more than USD 12 million to a French Notaries Bureau. Information from the FIU of Luxembourg showed that one of the US banks acted as a guarantor for the suspect's wife in a transaction to purchase of shares of a French company – and the holder of the real estate. The transaction was conducted via an S.S. company – a French subsidiary of a Luxembourg S.D. SA., incorporated and owned by the same individual. Analysis showed that these two chains were interrelated and the real estate was purchased with the proceeds of public funds embezzled for the benefit of the state official's wife.	
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification • Transaction is occurring between two or more parties that are connected without an apparent business or trade rationale • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile

	• Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client

Case Study 89 – Serbia	
Four transfers from the account of agricultural cooperative "U.B." were made to the account of legal person "P.I.P.H", totalling approximately EUR 200 000. Funds in foreign currency totalling EUR 178 630 were purchased from this money immediately after it was deposited, and after that transferred to the account of Delaware Company M. The account of Company M was held with a bank in Cyprus. The stated purpose of the transactions was payment on basis of trade in goods. Furthermore, there was a transfer from the same account of "P.I.P.H" to the account of Delaware Company S, in the amount EUR 75 175. Company S's account was with a bank in a foreign country. The stated basis for the transfer was payment for trade in goods. Investigation established that this was the case of black market trade. The funds accumulated from trade in goods were transferred to accounts of six legal persons from Serbia (it is suspected that these are front companies). The funds were afterwards transferred to accounts of legal persons abroad and then further to accounts of numerous Chinese citizens assumed to be the real beneficial owners of the goods sold in Serbia.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Corporation maintains a bank balance of close to zero, despite frequent incoming and outgoing transactions • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction involves the transfer of shares in an off-market sale • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client

Case Study 90 – Serbia
Members of an organized crime group devised a scheme involving Serbian banks, with the intention to legalize drug trafficking proceeds through purchasing a company's shares. One of the features of the scheme was the structuring of transactions to avoid reporting transactions to the FIU. The organized crime group found 42 individuals, who agreed to pay deposits into their own accounts, in the amounts below the threshold of EUR 15 000, declaring them their savings. Subsequently, these persons stated that they agreed to have their money used to acquire a company providing services in hospitality industry. At the same time, the organized crime group took over profitable private companies in Serbia, with large capital turnover through accounts, which were performing well and whose owners were ready to sell them.

Indicators	• Under investigation or have known connections with criminals • Falsified records or counterfeited documentation • Finance is provided by a lender, including either a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification • Transaction involves the purchase of high-value goods in cash

Case Study 91 – Slovenia	
EUR 4 million was transferred from a Slovenian company to a Liechtenstein TCSP's account at a Liechtenstein's bank under the guise of "construction consulting." MLA was used to identify the beneficial owner of TCSP, and the FIU identified that another Liechtenstein TCSP with the same trustee had opened a bank account in a Slovenian bank, though the trustee declared himself to be the beneficial owner. A bank statement allowed authorities to identify the beneficial owner as named by the trustee when opening the account. A deal was made with three suspects and authorities retrieved the embezzled assets and levied a penalty of more than EUR 1 million.	
Indicators	• Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client

Case Study 92 – Switzerland	
A lawyer, who had already been convicted of document falsification and misappropriation, hid stolen bearer shares in accounts opened in the name of offshore companies. The bearer shares had been sold and registered shares of the same company had been bought with the proceeds and transferred to other accounts in different jurisdictions. With effective domestic and international co-operation, the suspect was arrested and extradited to Switzerland and is now in prison. Assets in the amount of more than CHE 50 million (Swiss Francs) could also be blocked in all five countries.	
Indicators	• Under investigation or have known connections with criminals • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Multiple bank accounts without good reason • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Transaction appears cyclical

	• Transaction involves the transfer of bearer shares in an off-market sale • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client

Case Study 93 – Switzerland	
An operational coal mining company paid out EUR 800 million to their owner, a Dutch NV over a period of four years. The financial intermediary came across information that there was an ongoing prosecution of the Dutch NV and its owner in a third country and filed a STR for misappropriation of funds. The documentation held by the Swiss financial intermediary showed that this Dutch NV was owned by Mr. A, a citizen of another European country. Over a time period of 10 years CHF 3.5 billion was transferred through a large and complicated structure of 32 companies in different countries including the British Virgin Islands and the Netherlands. The Swiss financial intermediary's documentation identified the beneficial owner of almost all of the companies as Mr. A.	
Indicators	• Foreign nationals with no significant dealings in the country in which they are procuring professional or financial services • Under investigation or have known connections with criminals • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or finance centre • Legal person or arrangement regularly sends money to low-tax jurisdictions or international trade or finance centres or international trade or finance centres • Legal person or arrangement conducts transactions with international companies without sufficient corporate or trade justification • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense or which do not make commercial sense • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners • Transaction involves complicated transaction routings without sufficient explanation or trade records • Funds involved in the transaction are sent to, or received from, a low-tax jurisdiction or international trade or finance centre or international trade or finance centre

Case Study 94 – Switzerland
A Swiss financial intermediary filed a SAR after a deposit of USD 2 million was made into the account of Company A by Company B who is a wholly owned

subsidiary of C Holding. The beneficial owner of company A, Mr. X, justified the incoming funds as being the result of services provided by Company A under a contract between companies A and B. The nature of these services was purported to be the provision business contacts, acquiring potential clients, and negotiation of terms and conditions. Shortly after the deposit, two transfers of USD 1 million were made to two other companies of which Mr. X and Mr. Y –both high-ranking executives of the Dutch company C Holding - were the beneficial owners. The annual report of the Dutch company did not include any information about compensation to Mr. X and Mr. Y. The financial intermediary therefore suspected money laundering and dishonest business management to the disadvantage of the shareholders of company C Holding.	
Indicators	• The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction involves two legal persons with similar or identical directors, shareholders, or beneficial owners • Transaction involves complicated transaction routings without sufficient explanation or trade records

Case Study 95 – Trinidad and Tobago	
The case concerns a US citizen who created a complex scheme to avoid payment of taxes on income earned from a business operated in Trinidad and Tobago. The scheme included the involvement of gatekeepers, multiple individuals and legal structures and use of money remitters. The suspect, "Blackjack", earned millions of dollars over the period 2009-2011 from a Trinidad and Tobago Private Members' Club (similar to a casino). Blackjack took action to conceal his income and assets from the IRS by using unreported bank accounts in Trinidad and Tobago to deposit personal income; using US bank accounts in the names of his New Jersey business entities to receive income from the casino; using those business entities to pay for personal expenses; transferring income from the casino directly to vendors in the US for personal expenses; and directing the casino employees to send cash through wire transfers to individuals in New Jersey who then collected the cash on his behalf.	
Indicators	• Financial activities and transactions inconsistent with the corporate profile • Focused on aggressive tax minimisation strategies • Correct documents not filed with the tax authority • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Transaction is executed from a business account but appears to fund personal purchases, including the purchase of assets or recreational activities that are inconsistent with the company's profile • Funds are sent to, or received from, a jurisdiction that is considered to pose a high money laundering or terrorism financing risk

Case Study 96 – Turkey	
The fuel obtained from fuel smuggling was sold through the petrol stations under the control of organised crime. Person A, who is the beneficial owner and the leader of the organisation, disguised his ownership by transferring control of the petrol stations to close associates and by carrying out transactions using cash and straw men.	
Indicators	• Client is reluctant or unable to explain the identity of the beneficial owner • Director or controlling shareholder(s) cannot be located or contacted • Bank balance of close to zero, despite frequent incoming and outgoing transactions • Falsified paper trail • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise

Case Study 97 – Turkey	
A group of persons create and operate websites to provide illegal betting over the internet. In order to hide their identity, these persons use natural persons and shell companies to open bank accounts, and withdraw or transfer the deposited funds. The natural persons are aged around 30, are not registered as taxpayers and do not have social security records, live in different cities, and are generally unemployed, housewives or minimum wage workers. The straw men are paid a certain amount of money for the use of their accounts. The intermediary accounts are changed constantly. The sums collected in the bank accounts of those persons are withdrawn in cash from the banks or from ATMs, transferred to the bank accounts of persons/companies established for this purpose, or transmitted to an offshore corporation.	
Indicators	• Financial activities and transactions inconsistent with their customer profile • Correct documents not filed with the tax authority • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Transaction is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile

Case Study 98 – Ukraine	
The money laundering scheme of former high-ranking officials of Ukraine was conducted via Ukrainian banking institutions and foreign banks. A number of non-resident companies (mostly registered in Panama, Cyprus, BVI, UK and Belize) linked by constituent-officials and business relations invested a considerable amount of funds in Ukraine (bought internal government bonds, transferred significant amounts of funds to deposit accounts in Ukraine and made contributions to the authorised capital of Ukrainian enterprises). According to the analysis of information on IP-addresses used to access business accounts, all the investments were managed from one management centre.	
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Multiple bank accounts without good reason • Bank accounts in multiple international jurisdictions without good reason • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client • Funds are sent to, or received from, a foreign country when there is no apparent connection between the country and the client

Case Study 99 – United States	
US authorities identified front companies used to conceal the ownership of certain US assets by Bank Melli, which was previously designated by the US authorities for providing financial services to entities involved in Iran's nuclear and ballistic missile program. Bank Melli was also subject to a call for enhanced vigilance in UNSCR 1803. The Department of Justice (DOJ) obtained the forfeiture of substantial assets controlled by the Government of Iran. These assets included a 36-story office tower in Manhattan at 650 5th Avenue having an appraised value of more than USD 500 million, other properties, and several million dollars in cash. The ownership the office tower was split between Bank Melli (40%) and the Alavi Foundation (60%), which provided services to the Iranian government, such as transferring funds from the office tower to Bank Melli.	
Indicators	• Legal person or arrangement incorporated/formed in a jurisdiction that is considered to pose a high money laundering or terrorism financing risk • Correct documents not filed with the tax authority

	• Designated persons or groups • Funds are sent to, or received from, a jurisdiction that is considered to pose a high money laundering or terrorism financing risk

Case Study 100 – United States	
An individual organised a loan-fraud pyramid scheme to falsely inflate the sales and revenues of his company. His company served as a front. The scheme involved his wife and son. The defendants created numerous legal entities, including trusts, corporations/LLCs to open bank accounts to manage the illicit funds and conceal the ownership and involvement in the scheme. The defendants used the help of a legal professional (attorney) to create a number of legal entities, and diverted loans for the company for private benefit, including gems and jewellery. The attorney involved helped to sell the jewellery (which was an asset of the trust). The address of the attorney (then deceased) was used to move money from two different accounts. The investigation obtained legitimate financial records from third parties via subpoena as corporate records held by the organisation were found to be fabricated. The assets held by the defendant were identified by interviewing third parties to determine the true ownership. Additional information was obtained via the interview of tax return preparer. Standard financial investigative techniques were used to identified several trusts/trustees and legal persons.	
Indicators	• Multiple bank accounts without good reason • Correct documents not filed with the tax authority • Discrepancy between purchase and sales invoices • Fabricated corporate ownership records • Family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • Transaction is executed from a business account but appears to fund personal purchases, including the purchase of assets or recreational activities that are inconsistent with the company's profile • Transaction involves a professional intermediary without due cause or apparent justification

Case Study 101 – United States
The defendant operated a mortgage broker business and several other companies that owned and managed real estate. He used nominee accounts, shell

Case Study 101 – United States	
corporations and other schemes to conceal his ownership. The scheme involved the purchase of properties owned by entities that the defendant controlled through an employee. The purchases were financed through loans. In connection with the loan applications, the defendant and others submitted fraudulent information related to the financial position of the borrower or purchaser, fraudulent appraisals that overstated the value of the collateral, and other documents that contained other material misrepresentations. The subject would "sell" commercial property owned by an entity he controlled to another entity that he controlled at highly elevated prices. The purchases were financed through fraudulent loan applications and through the submission of fraudulent documents. Also, the defendant altered invoices directed to one of the entities by inflating the cost of the work listed on the original invoices to make it falsely appear as though improvements had been made to the properties serving as collateral for the loans.	
Indicators	• Falsified records or counterfeited documentation • Inflated asset sales between entities controlled by the same beneficial owner • Nominee owners and directors including informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise • No real business activities undertaken

Case Study 102 – United States	
Individual 1, a US Citizen and resident of Belize, incorporated more than 5 000 shell companies in Belize and the West Indies to facilitate numerous securities and tax fraud schemes. Individual 2, a dual US and Canadian citizen, was the secret owner of an international broker-dealer and investment management company based in Panama City, Panama, and Belize City, Belize. There were 3 inter-related schemes: 1) fraudulent stock promotion and price manipulation; 2) circumventing capital gains taxes under the Foreign Account Tax Compliance Act (FATCA); 3) laundering more than USD 250 million in profits through unidentifiable debit cards and attorney escrow accounts. Individual 2 used the services of aUS-based lawyer to launder the more than USD 250 million generated through his stock manipulation of a number of US companies – directing the fraud proceeds to five law firm accounts and transmitting them back to members of the scheme and its co-conspirators. These concealment schemes also enabled Individual 2 to evade reporting requirements to tax authorities.	
Indicators	• Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Correct documents not filed with the tax authority • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense

	• Nominee owners and directors • Transaction involves a professional intermediary without due cause or apparent justification • Transaction involves the transfer of shares in an off-market sale

Case Study 103 – United States	
A Honduran PEP allegedly solicited and accepted USD 2.08 million in bribes from a Honduran technology company, in exchange for prioritising and expediting payments under a USD 19 million contract with the government agency to organise and digitise state records. The technology company allegedly sent wire transfers through another company to the PEP totalling approximately USD 2.08 million through an affiliate company located in Panama, which was owned by nominees. The bribe proceeds were then allegedly laundered into the United States and used to acquire real estate in the New Orleans area. Certain properties were titled in the name of companies controlled by the PEP's brother in an effort to conceal the illicit source of the funds as well as the beneficial ownership. One company used to hold title was a used-car dealership, and the other was a shell company which at one point counted the PEP among its members. Most of the real properties allegedly acquired with bribe proceeds were titled in the names of the companies.	
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Legal person or arrangement incorporated/formed in a low-tax jurisdiction or international trade or financial centre • Legal person or arrangement regularly sends money to low-tax jurisdictions or international trade or finance centres • Nominee owners and directors • Transfer of real property from a natural to a legal person in an off-market sale

Case Study 104 – United States
The defendants engineered a conspiracy to sell fraudulent renewable energy credits through the use of shell and shelf companies in the United States in order to receive renewable energy tax credits from the US government for renewable fuels never produced, and to launder those illicit proceeds for their own benefit. Among their ill-gotten gains from these proceeds were various assets including real estate, boats, cars, watches, and gold. During the course of their investigation, law enforcement determined that the defendant directed a network of his professional contacts to purchase shelf companies throughout the United States, to serve as purported purchasers of renewable fuel and purported sellers of feedstock. The use of shelf companies was

discovered by interviewing the nominees who had opened bank accounts on behalf of those companies and through search warrants executed on a number of the businesses.	
Indicators	• Long period of inactivity following incorporation, followed by a sudden and unexplained increase in financial activities • Multiple bank accounts without good reason • Falsified paper trail • Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense • Nominee owners and directors

Case Study 105 – United States	
The US Department of the Treasury's Office of Foreign Assets Control (OFAC) designated a foreign PEP under the Foreign Narcotics Kingpin Designation Act for playing a significant role in international narcotics trafficking, with a straw man also designated for providing material assistance, financial support, or goods or services in support of and acting on behalf of the PEP. In addition, OFAC designated shell companies tied to the straw man that were used to hold real estate.	
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Designated persons or groups • No real business activities undertaken

Case Study 106 – Vatican	
In this case, Company A incorporated in the Caribbean was entitled to issue bearer shares. Company A was managed by a branch of an international bank registered in the same country whose headquarters is registered in Europe. A South American politically exposed person was appointed as authorised signatory for an account held by company A at the headquarters of the bank. The same PEP was under investigation for racketeering, corruption, and ML. This individual appears to be the beneficial owner of company A. The company attempted a wire transfer of EUR 1 000 0000 from the bank headquarters to a charitable entity in a branch of another European bank. The charitable entity refused the transaction and reported the case to the domestic authorities. Shortly after the attempted transfer, Company A was dissolved.	
Indicators	• Politically exposed persons, or have familial or professional associations with a person who is politically exposed • Under investigation or have known connections with criminals • Legal person or arrangement incorporated/formed in a low-tax jurisdiction

	or international trade or financial centre • The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client

ANNEX D. SOURCES OF INFORMATION AND TECHNIQUES TO DISCOVER BENEFICIAL OWNERSHIP

OVERVIEW

1. During the development of this report, a range of techniques to discover beneficial ownership was identified. However, due to the nature of the analysed case studies, which generally involved active law enforcement investigations, the identified techniques centred primarily on traditional law enforcement capabilities and tools. As such, the tools and techniques available to financial institutions, professional intermediaries, and intelligence agencies to reliably identify and verify beneficial ownership prior to forming a suspicion and commencing a formal investigation are more difficult to ascertain and describe.

2. This is somewhat unsurprising. As this report has demonstrated, the concealment of beneficial ownership information is the cornerstone of many money laundering and terrorism financing schemes, and proving beneficial ownership presents one of the greatest challenges for financial institutions and competent authorities. However, some simple tools are available to financial institutions and competent authorities to assist in the identification of high-risk or suspicious customers and activities. These are outlined in this Annex.

SOURCE OF INFORMATION TO ASSIST IN THE IDENTIFICATION OF BENEFICIAL OWNERSHIP

3. In its 2014 guidance paper on *Transparency and Beneficial Ownership*[78], the FATF outlined some mechanisms and sources for obtaining beneficial ownership information of legal persons, including: company registries, financial institutions, DNFBPs, the legal person itself, and other national authorities, such as tax authorities or stock exchange commissions. These mechanisms are outlined in greater detail in that guidance report; however, the focus of the guidance report is on the implementation of policy initiatives to improve transparency of beneficial ownership, rather than on investigative techniques, and may therefore be of limited value to financial institutions and competent authorities.

4. Analysis of the case studies provided in support of this report identified the following common sources of information used to identify beneficial ownership:

Banks and financial institutions

5. Banks were the most common source of information used by competent authorities to identify beneficial ownership, and were involved in over half of the investigations analysed. Financial institutions represent a key source of information

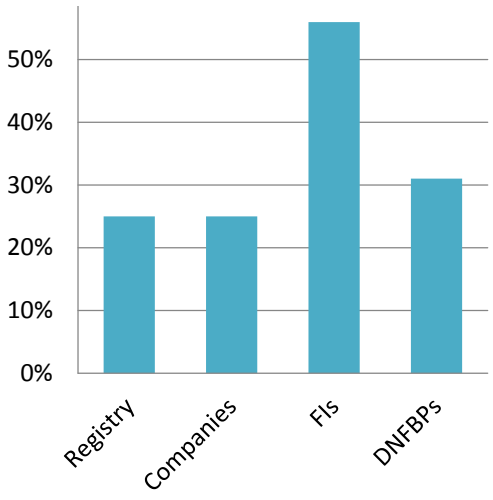
[78] FATF, 2014: p.18

for FIUs and competent authorities; however, there is limited ability for financial institutions to leverage the information held by other financial institutions. Information held by banks also relies on the quality of the information provided by a client. This is particularly relevant for the sharing of suspicions and risk profiles between banks, or within multi-national banks. Further work is being conducted globally to improve private-private and public-private information sharing to alleviate this issue.

Professional intermediaries

6. In approximately one-third of cases, information was provided by DNFBPs. Information held by professional intermediaries can be extensive; however, in countries where DNFBPs are not obliged to conduct CDD, the information held by professionals may not be reliable. Furthermore, the presence of LPP and client confidentiality can inhibit efforts to obtain information from intermediaries.

Figure 3. Sources of beneficial ownership information



Companies and company registries

7. Beneficial ownership information held by companies and in company registries were used in only one-quarter of cases. In many cases, these registries were general property or corporate registries, rather than beneficial ownership registries. However, many of the cases included in the sample predate the work being done globally in this area.

Traditional law enforcement techniques

8. In one-quarter of cases, beneficial ownership was not known, the source of beneficial ownership information was not disclosed, or beneficial ownership was not discovered using information held under Recommendations 24 and 25. Often, in these cases, beneficial ownership was determined through surveillance.

9. Analysis of the case studies demonstrated that competent authorities and law enforcement can more easily obtain accurate beneficial ownership from financial institutions than from DNFBPs. Banks featured in 90% of cases, and were a source of beneficial ownership in over half the case studies. While 76% of cases included some type of DNFBP, in only one third did DNFBPs act as a source of beneficial ownership information for authorities – perhaps due to issues of complicity, legal professional privilege, or simply a lack of implementation of beneficial ownership record-keeping requirements in these sectors.

10. Other sources of beneficial ownership include:

Registers of Beneficial Ownership

11. In recent years, and particularly after the *Anti-Corruption Summit* held in London in 2016, many countries have implemented, or commenced work to implement, registers of beneficial ownership. In countries where they have been implemented, registers of beneficial ownership will contain useful information relevant to determining true beneficial ownership and control. However, care should be taken to analyse the veracity of the information held on registers of beneficial ownership, as it is often self-reported and rarely vetted by a central administrating body.

Shareholder register

12. In some instances, particularly in jurisdictions that require companies to actively collect such information up front, shareholder registers will contain sufficient information to identify controlling interests in a company. However, many criminals will seek to limit their exposure by concealing their share ownership. In these instances, the shareholder register may indicate other controlling persons (natural or legal) who may be acting on behalf of the beneficial owner, or may be controlled by the beneficial owner.

Commercial databases

13. A large number of commercial databases are available to law enforcement in developing their investigations and to financial institutions in identifying risk. Use of these databases provides a quick means of obtaining a wide variety of useful information and leads. A lack of information on commercial databases can be an indicator of the use of a shell or a shelf corporation. This information, along with other investigative techniques can be an effective tool to unravel the legal arrangement of an entity.

Professional nominees

14. As discussed in this report, some countries require all legal persons incorporated under domestic laws to maintain a physical presence in that country. In some instances, these countries also require a domestic national to serve as a director or controlling shareholder of the company. Many professional intermediaries, particularly TCSPs, offer nominee directorship and company management services to foreign clients to assist in meeting these legal requirements. These professional nominees will often maintain records of their customer, and while these records may not prove true beneficial ownership and control, they will assist in tracing and unravelling the broader control structure of the company.

MECHANISMS AVAILABLE TO COMPETENT AUTHORITIES

15. While there is a range of information sources available to assist in the identification of beneficial ownership, the reliability of some of these sources is often questionable. In order to fully unravel complicated ownership structures and prove ownership and control (and thereby prove criminality where relevant) law

enforcement and competent authorities require access to a broader range of intelligence and evidence collection capabilities. The key capabilities relevant to the identification and verification of beneficial ownership are outlined below.

Mutual legal assistance

16. Mutual legal assistance is the cornerstone of most major investigations that involve a transnational corporate structure or international financial flows. However, many law enforcement and intelligence practitioners have reported that delays in mutual legal assistance requests are one of the key inhibiters in an investigation. Therefore, while the information available via mutual legal assistance is often invaluable, it is not necessarily a quick or easy solution to unravelling opaque transnational ownership structures.

Intelligence disclosures and sharing

17. In addition to mutual legal assistance, which is often used to exchange information for evidentiary purposes, FIUs and competent authorities will regularly exchange information with international partners for intelligence purposes only. These intelligence exchanges can be spontaneous or subsequent to a request, and can greatly assist FIUs to understand the ownership and control of complex international structures, or the financial activities of those structures.

Taxation databases

18. Taxation databases are a useful means of identifying indicators of criminality and schemes designed to obscure beneficial ownership. By comparing previous tax assessments to bank statements, financial transactions, assets, and the lifestyle of an individual, it is possible to identify anomalous financial activities. Further investigation often uncovers dubious control structures or corporate dealings designed to conceal beneficial ownership.

Asset disclosure databases

19. Many countries require public officials to disclose their assets on publicly accessible databases. These databases can be a useful tool to gauge the wealth and asset holdings of public officials, and can assist in identifying anomalous financial activities. Furthermore, the absence of an asset that is clearly controlled by the official, their family, or their corporate interests from the registry may be an indication of efforts to conceal their ownership of the asset.

Subpoenas for information

20. Subpoenas are often coercive in nature, and are generally used to compel the recipient to provide the required information. However, they can also offer a range of protections and indemnities to the recipient. For this reason, subpoenas are often used in situations where a competent authority and financial institution are working collaboratively on an investigation, despite the fact that the financial institution is a willing party to the investigation.

Covert surveillance

21. Most law enforcement and intelligence agencies have access to covert surveillance capabilities, including telecommunication interception and physical surveillance. These techniques can be used to identify connections between associates and identify control over assets or companies.

Informants and witnesses

22. Some intelligence and law enforcement agencies have the capability to coerce witnesses to give information or documents relating to an investigation. Often, these capabilities can only be utilised in certain limited circumstances, and the information gathered from these witnesses can often be used for intelligence purposes only (not evidence). However, these capabilities can be highly valuable in dissecting and understanding complicated corporate structures designed to conceal beneficial ownership and frustrate investigations.

Search Warrants

23. Search warrants are a standard law enforcement capability; however, they are an overt and intrusive capability that immediately announces law enforcement's interests and investigation into a person or company. For this reason, search warrants are often used towards the end of an investigation, rather than at the commencement. While search warrants are valuable evidence gathering tools, and can assist in proving beneficial ownership in court, they may have limited value in identifying beneficial ownership in the early stages of an investigation.

Multi-agency task forces

24. It is rare that any single agency has all of the information and capabilities required to unravel, understand, and prosecute complicated money laundering schemes designed to obscure beneficial ownership. Often, law enforcement agencies, intelligence agencies, taxation authorities, securities regulators, and other competent authorities are all required to successfully discover, understand and disrupt complex transnational schemes. Multi-agency task forces are a useful mechanism to co-ordinate investigative efforts, share information, and reduce duplication. The presence of a standing taskforce within a country allows for the quick deployment of resources and capabilities in response to emerging threats and opportunities.

Tools to identify potential efforts to obscure beneficial ownership

25. In addition to the sources of information described above, law enforcement and private sector have identified a number of novel approaches to collecting information relevant to the identification of risk indicators. In most cases, these tools are not suitable to discovering true beneficial ownership and control; however, they may reveal anomalous activities and indices that could assist in recognising high-risk individuals and companies. These tools are outlined below:

IP addresses

26. Many financial institutions and law enforcement agencies have begun to collect and analyse the Internet Protocol (IP) address of customers involved in a transaction. As the majority of financial transactions are now conducted online, the collection of IP address information can provide valuable insights into who is ordering a transaction, and where that transaction is being ordered from. It is likely that careful analysis of IP address information could identify situations where control is being exerted by an unknown third party, where control shifts from one person to another, where control of a domestic account is being exerted by a foreign influence, or where a person may be seeking to conceal their IP through the use of a virtual private network (VPN).

27. Furthermore, analysis of IP addresses collected by a financial institution may identify commonalities and control nexuses, where a single IP address is responsible for transaction requests for multiple accounts, customers, and beneficial owners. Instances of repeat IP addresses across numerous accounts may be indicative of a professional nominee, professional intermediary, or professional money launderer, and these accounts may deserve close monitoring.

Online maps and street-level images

28. Online maps and street-level images (such as those developed by Google and other search engines) are readily available online for a significant proportion of countries across the globe. These capabilities can serve a range of useful purposes, including the verification and analysis of addresses provided by customers and clients. In the past, service providers and financial institutions were often limited in their ability to critically analyse the address of an individual or company, particularly when engaging with customers and companies based in a foreign country. Today, a simple search of a company address has significant analytical potential.

29. By analysing the location of an address provided by a customer or company, as well as the physical appearance of that address from the street (where images are available), it is often possible to identify anomalies indicative of a shell company or an attempt to conceal the customer's true identity. Anomalies may include:

- the location is inconsistent with the financial profile of the customer
- the location is inconsistent with business profile of the company
- the physical appearance of the address is inconsistent with the size and nature of the company
- the address is a post box.

30. Addresses that appear anomalous may warrant enhanced due diligence and closer monitoring.

Media reporting

31. A number of cases analysed for this report involved financial institutions and professional intermediaries that identified suspicious transactions as a result of media reporting. Media reporting is a useful means of identifying potential

corruption, high-value government contracts, and high-profile corporate activities. While media reporting is not an indication of suspicious activities, it may assist in the identification of anomalous or high-risk activities.

32. Some media reporting is more specific and incriminating. In recent years, global consortiums of journalists, such as the International Consortium of Investigative Journalists, have undertaken widespread investigations into corruption, tax evasion, and money laundering. In two key instances[79], the investigations released leaked documents relating to the establishment of complex corporate structures and companies in low-tax jurisdictions by law firms on behalf of high-wealth individuals. While these leaked documents are not evidence of criminality or wrong-doing, they may be indicative of risk, and may warrant close consideration from a risk analysis perspective.

33. It is important to consider the source of the media reporting when assessing the validity and reliability of the information. Not all media sources are reliable, and care should be taken to validate or verify any intelligence derived from open sources.

Techniques to identify potential efforts to obscure beneficial ownership

34. There is a broad range of analytical techniques available to identify activities and trends indicative of the concealment of beneficial ownership, and of money laundering more broadly. This report will not attempt to list all such techniques; however, some key techniques identified by FIUs, competent authorities, and private sector representatives have been included below:

Identifying the beneficial owners of legal arrangements

35. Identifying the beneficial ownership of legal arrangements can pose significant challenges due to the number of actors that can exercise control or benefit from the arrangement. When considering the beneficial ownership of a trust, asking the following key questions may assist financial institutions and professional intermediaries to better understand key features of the arrangement:

- Who is the real settlor and what is the real source of funds?
- Who are the real beneficiaries i.e. for whose benefit are the trust assets managed?
- What is the trust's governance system and who are the real "natural persons exercising effective control"?

36. Seeking copies or extracts of tax or legal advice on the formation of the trust or an explanation from current advisers as to the purpose behind the formation of the trust will assist in answering some of these questions. Where such advice is not available, it may be possible to draw inferences from background information, although this can be less reliable.

[79] The 2015 leak of confidential documents from Panama-based law firm Mossack Fonseca, and the 2017 leak from Bermuda-based law firm, Appleby.

In the absence of the ability to identify BO, identify senior management personnel

37. As explained previously, beneficial ownership must involve some level of ultimate control, whether direct or indirect control. While the beneficial owner of a company may not be visible, the management structure is generally easier to ascertain. By analysing the directors and senior management of a company, it may be possible to discern whether one of them is the ultimate beneficial owner. Conversely, analysis of the activities and financial dealings of the management personnel may identify a third party exerting control from outside of the company.

In the absence of the ability to identify BO, identify individuals with control over transaction accounts/power of attorney

38. As with identifying the director and senior management of a company, identifying individuals who exert control over financial transaction accounts, or who have power of attorney over the company, may assist in identifying the beneficial owner. Although more difficult to discern, individuals with control over transaction accounts, and those with power of attorney, often have the power to exert control over a company or its finances. While many of these individuals will be employed in legitimate finance and legal areas of larger companies, those with no apparent connection to the company, or who are seemingly employed in unrelated areas of the company, could potentially be the beneficial owner of the company.

Search existing records for the same addresses or telephone numbers

39. As identified in this report, numerous professional intermediaries, particularly TCSPs, provide directorship and company management services to their clients. A key indicator of this activity is the use of a mailbox service for multiple clients. As a result, large numbers of shell companies, particularly those with foreign beneficial owners, will be registered to the same address and telephone number. By identifying commonly used addresses and numbers, it is possible to identify companies that utilise a directorship or company management service. It may also indicate the use of professional nominees, and the fact that the company is a shell company.

40. Companies that are established and managed by TCSPs will often share the same bulk address. Additionally, these TCSPs will often establish banking relationships for their clients at the same financial institutions. Analysis of customer databases by these financial institutions is likely to identify commonly used addresses and telephone numbers indicative of bulk company incorporation and management. These customers may warrant enhanced due diligence to ensure that beneficial ownership and control details are recorded correctly.

Meet high-risk clients face-to-face

41. One of the findings of this report has been that the increased use of internet communications and the decrease in face-to-face client interactions have exacerbated challenges associated with identifying and proving beneficial ownership and control. This is largely due to the ease with which individuals can conceal their identity in the absence of face-to-face interactions. While governments and FinTech companies are investing significant resources to improve identification

processes in the digital age, including the provision of document verification systems and digital identities, the lack of face-to-face interactions will continue to pose a vulnerability to CDD and KYC processes.

42. One solution is to increase face-to-face interactions with high-risk clients or customers, including through the use of publicly available video-conference facilities. By meeting with the client directly, the financial institution can verify their identity against photographic identification documentation and better understand the level of control they exert over the company or assets involved. It is likely that even a brief discussion with a client about their activities and business dealings will allow the financial institution to identify indicators of the use of nominee directors and indirect control by a third party.

Analysis of cross-border wire transfers

43. The regular and proactive analysis of cross-border wire transfers is often instrumental in identifying true ownership and control structures. Those FIUs that receive cross-border wire transfer reports have reported the importance of those reports and their value in tracing money flows and identifying likely beneficial ownership. Financial institutions have direct and unfettered access to cross-border wire transfer information, and are therefore ideally placed to identify anomalous money flows on a global scale. Indicators of suspicious activities indicative of an attempt to conceal beneficial ownership are outlined in Annex E to this report.

Additional resources

44. For more examples of, and ideas on, the use of technology to verify beneficial ownership, see the Tax Justice Network's *Technology and Online Beneficial Ownership Registries: Easier to create companies and better at preventing financial crimes* report[80] and the FATF 2014 guidance on *Transparency and Beneficial Ownership*.[81]

ANNEX E. INDICATORS OF CONCEALED BENEFICIAL OWNERSHIP

During the development of the report on the vulnerabilities associated with the concealment of beneficial ownership, 106 case studies were submitted by the FATF and Egmont Group members. Through the analysis of these case studies, as well as discussions with financial intelligence units (FIUs), competent authorities, and the private sector, a range of indicators of the concealment of beneficial ownership was identified. These risk indicators are summarised below. It is important to note that this list is not exhaustive, and other indicators may be identified.

Indicators about the client or customer

1. The client is reluctant to provide personal information.
2. The client is reluctant or unable to explain:
    - their business activities and corporate history
    - the identity of the beneficial owner
    - their source of wealth/funds
    - why they are conducting their activities in a certain manner
    - who they are transacting with
    - the nature of their business dealings with third parties (particularly third parties located in foreign jurisdictions).
3. Individuals or connected persons:
    - insist on the use of an intermediary (either professional or informal) in all interactions without sufficient justification
    - are actively avoiding personal contact without sufficient justification
    - are foreign nationals with no significant dealings in the country in which they are procuring professional or financial services
    - refuse to co-operate or provide information, data, and documents usually required to facilitate a transaction
    - are politically exposed persons, or have familial or professional associations with a person who is politically exposed
    - are conducting transactions which appear strange given an individual's age (this is particularly relevant for underage customers)
    - have previously been convicted for fraud, tax evasion, or serious crimes
    - are under investigation or have known connections with criminals
    - have previously been prohibited from holding a directorship role in a company or operating a Trust and company service provider (TCSP)
    - are the signatory to company accounts without sufficient explanation

- conduct financial activities and transactions inconsistent with their customer profile
- have declared income which is inconsistent with their assets, transactions, or lifestyle.

4. Legal persons or legal arrangements:

- have demonstrated a long period of inactivity following incorporation, followed by a sudden and unexplained increase in financial activities
- describe themselves as a commercial business but cannot be found on the internet or social business network platforms (such as LinkedIn, XING, etc.)
- are registered under a name that does not indicate the activity of the company
- are registered under a name that indicates that the company performs activities or services that it does not provide
- are registered under a name that appears to mimic the name of other companies, particularly high-profile multinational corporations
- use an email address with an unusual domain (such as Hotmail, Gmail, Yahoo, etc.)
- are registered at an address that does not match the profile of the company
- are registered at an address that cannot be located on internet mapping services (such as Google Maps)
- are registered at an address that is also listed against numerous other companies or legal arrangements, indicating the use of a mailbox service
- where the director or controlling shareholder(s) cannot be located or contacted
- where the director or controlling shareholder(s) do not appear to have an active role in the company
- where the director, controlling shareholder(s) and/or beneficial owner(s) are listed against the accounts of other legal persons or arrangements, indicating the use of professional nominees
- have declared an unusually large number of beneficiaries and other controlling interests
- have authorised numerous signatories without sufficient explanation or business justification
- are incorporated/formed in a jurisdiction that is considered to pose a high money laundering or terrorism financing risk
- are incorporated/formed in a low-tax jurisdiction or international trade or finance centre
- regularly send money to low-tax jurisdictions or international trade or finance centre

- conduct a large number of transactions with a small number of recipients
- conduct a small number of high-value transactions with a small number of recipients
- regularly conduct transactions with international companies without sufficient corporate or trade justification
- maintain relationships with foreign professional intermediaries in the absence of genuine business transactions in the professional's country of operation
- receive large sums of capital funding quickly following incorporation/formation, which is spent or transferred elsewhere in a short period of time without commercial justification
- maintain a bank balance of close to zero, despite frequent incoming and outgoing transactions
- conduct financial activities and transactions inconsistent with the corporate profile
- are incorporated/formed in a jurisdiction that does not require companies to report beneficial owners to a central registry
- operate using accounts opened in countries other than the country in which the company is registered
- involve multiple shareholders who each hold an ownership interest just below the threshold required to trigger enhanced due diligence measures.

5. There is a discrepancy between the supposed wealth of the settlor and the object of the settlement.

6. Individuals, legal persons and/or legal arrangements:

- make frequent payments to foreign professional intermediaries
- are using multiple bank accounts without good reason
- are using bank accounts in multiple international jurisdictions without good reason
- appear focused on aggressive tax minimisation strategies
- are interested in foreign company formation, particularly in jurisdictions known to offer low-tax or secrecy incentives, without sufficient commercial explanation
- demonstrate limited business acumen despite substantial interests in legal persons
- ask for short-cuts or excessively quick transactions, even when it poses an unnecessary business risk or expense
- appear uninterested in the structure of a company they are establishing
- require introduction to financial institutions to help secure banking facilities

- request the formation of complex company structures without sufficient business rationale
- have not filed correct documents with the tax authority
- provide falsified records or counterfeit documentation
- are designated persons or groups
- appear to engage multiple professionals in the same country to facilitate the same (or closely related) aspects of a transaction without a clear reason for doing so.

7. Examination of business records indicate:

- a discrepancy between purchase and sales invoices
- double invoicing between jurisdictions
- fabricated corporate ownership records
- false invoices created for services not carried out
- falsified paper trail
- inflated asset sales between entities controlled by the same beneficial owner
- agreements for nominee directors and shareholders
- family members with no role or involvement in the running of the business are listed as beneficial owners of legal persons or arrangements
- employees of professional intermediary firms acting as nominee directors and shareholders
- the resignation and replacement of directors or key shareholders shortly after incorporation
- the location of the business changes frequently without an apparent business justification
- officials or board members change frequently without an appropriate rationale.

8. Complex corporate structures that do not appear to legitimately require that level of complexity or which do not make commercial sense.

9. Simple banking relationships are established using professional intermediaries.

Indicators of shell companies

10. Nominee owners and directors:

- formal nominees (formal nominees may be “mass” nominees who are nominated agents for a large number of shell companies)
- informal nominees, such as children, spouses, relatives or associates who do not appear to be involved in the running of the corporate enterprise.

11. Address of mass registration (usually the address of a TCSP that manages a number of shell companies on behalf of its customers)

12. Only a post-box address (often used in the absence of professional TCSP services and in conjunction with informal nominees)

13. No real business activities undertaken

14. Exclusively facilitates transit transactions and does not appear to generate wealth or income (transactions appear to flow through the company in a short period of time with little other perceived purpose)

15. No personnel (or only a single person as a staff member)

16. Pays no taxes, superannuation, retirement fund contributions or social benefits

17. Does not have a physical presence.

Indicators about the transaction

18. The customer is both the ordering and beneficiary customer for multiple outgoing international funds transfers

19. The connections between the parties are questionable, or generate doubts that cannot be sufficiently explained by the client

20. Finance is provided by a lender, whether a natural or a legal person, other than a known credit institution, with no logical explanation or commercial justification

21. Loans are received from private third parties without any supporting loan agreements, collateral, or regular interest repayments

22. The transaction:

- is occurring between two or more parties that are connected without an apparent business or trade rationale
- is a business transaction that involves family members of one or more of the parties without a legitimate business rationale
- is a repeat transaction between parties over a contracted period of time
- is a large or repeat transaction, and the executing customer is a signatory to the account, but is not listed as having a controlling interest in the company or assets
- is executed from a business account but appears to fund personal purchases, including the purchase of assets or recreational activities that are inconsistent with the company's profile
- is executed from a business account and involves a large sum of cash, either as a deposit or withdrawal, which is anomalous, or inconsistent with the company's profile

- appears cyclical (outgoing and incoming transactions are similar in size and are sent to, and received from, the same accounts, indicating that outgoing funds are being returned with little loss) (aka "round-robin" transactions)
- involves the two-way transfer of funds between a client and a professional intermediary for similar sums of money
- involves two legal persons with similar or identical directors, shareholders, or beneficial owners
- involves a professional intermediary without due cause or apparent justification
- involves complicated transaction routings without sufficient explanation or trade records
- involves the transfer of real property from a natural to a legal person in an off-market sale
- involves the use of multiple large cash payments to pay down a loan or mortgage
- involves a numbered account
- involves licensing contracts between corporations owned by the same individual
- involves the purchase of high-value goods in cash
- involves the transfer of (bearer) shares in an off-market sale
- a loan or mortgage is paid off ahead of schedule, incurring a loss
- includes contractual agreements with terms that do not make business sense for the parties involved
- includes contractual agreements with unusual clauses allowing for parties to be shielded from liability but make the majority of profits at the beginning of the deal
- is transacted via a digital wallet.

23. The funds involved in the transaction:

- are unusual in the context of the client or customer's profile
- are anomalous in comparison to previous transactions
- are sent to, or received from, a foreign country when there is no apparent connection between the country and the client, and/or
- are sent to, or received from, a low-tax jurisdiction or international trade or finance centre
- are sent to, or received from, a jurisdiction that is considered to pose a high money laundering or terrorism financing risk.

24. An asset is purchased with cash and then used as collateral for a loan within a short period of time.

25. Unexplained use of powers of attorney or other delegation processes (for example, the use of representative offices).

26. Unexplained use of express trusts, and/or incongruous or unexplained relationships between beneficiaries (or persons who are objects of a power) and the settlor.

27. Unexplained or incongruous classes of beneficiaries in a trust.

Concealment of Beneficial Ownership

Legal persons, legal arrangements and professional intermediaries play important roles in facilitating business growth and development. But, they can also be misused, providing criminals with structures that help them conceal the proceeds of crime.

This joint FATF-Egmont Group study looks at the mechanisms and techniques that can be used to obscure the ownership and control of illicitly obtained assets, drawing on over 100 case studies, the experiences of law enforcement experts, the outcomes of FATF Mutual Evaluation Reports, and the insights provided by academic reports and other studies.

The report aims to raise awareness with national authorities, financial institutions and other professional service providers about the risks involved.

Money Laundering Using Trust and Company Service Providers

October 2010

THE FINANCIAL ACTION TASK FORCE (FATF)

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering and terrorist financing. Recommendations issued by the FATF define criminal justice and regulatory measures that should be implemented to counter this problem. These Recommendations also include international co-operation and preventive measures to be taken by financial institutions and others such as casinos, real estate dealers, lawyers and accountants. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

EXECUTIVE SUMMARY

1. Trust and Company Service Providers (TCSPs) play a key role in the global economy as financial intermediaries, providing an important link between financial institutions and many of their customers. They provide often invaluable assistance to clients in the management of their financial affairs and can therefore significantly impact transactional flows through the financial system.

2. There have been a number of studies over the years which highlight the use of legal persons and legal arrangements to facilitate money laundering. Little information is available at the current time with regard to the use of such structures in the financing of terrorism but this does not mean that such vehicles have not or cannot be used in this regard. Therefore, although the research provided will centre on the role that TCSPs have played with regard to combating money laundering, it is hoped that this report will be of value in relation to the fight against both money laundering and terrorist financing.

3. TCSPs are often involved in some way in the establishment and administration of most legal persons and arrangements; and accordingly in many jurisdictions they play a key role as the gatekeepers for the financial sector. This report provides a number of case studies which demonstrate that TCSPs have often been used, wittingly or unwittingly, in the conduct of money laundering activities. The following factors are borne out by the case studies as contributing to the crime of money laundering:-

- Weak or ineffective Anti-Money Laundering/Counter-Terrorism Financing (AML/CFT) frameworks in some jurisdictions, in areas which can impact the operation of TCSPs;
- The presence in the TCSP sector of persons that are willing to get involved in or to perpetrate criminal activities; and
- The proliferation of TCSPs whose management/staff do not have the required expertise, knowledge or understanding of key matters that are relevant to the operation of their business, such as their clients' affairs. This lack of knowledge and skill can promote and facilitate illegal activities.

4. In this regard, it is important to note that a number of jurisdictions have chosen not to recognise or put in place an AML/CFT supervisory framework for the TCSP sector because of the nature of their legal systems. However, there are still persons in those jurisdictions that are carrying out, as a business, the activities that can be attributed to this sector. Other jurisdictions have had difficulty in developing an appropriate oversight regime for TCSPs due to various complexities related to the number and type of persons carrying out the related services. These issues have resulted in potentially important gaps in the global network to address the money laundering risks associated with this sector.

5. The FATF has already established standards which apply to this sector. In addition there are other bodies that have done significant work in this area and have developed some key principles and guidelines that can positively impact the operation of TCSPs. Notwithstanding, consideration should be given to additional work to enhance the international requirements that apply to TCSPs, so that jurisdictions can implement more effective AML/CFT measures in relation to their TCSP sectors.

CHAPTER 1: INTRODUCTION AND BACKGROUND

1.1 Introduction

6. Over the last five years, a number of important studies have been conducted that have explored issues relating to the misuse of corporate vehicles for illicit purposes including money laundering and terrorist financing. Despite the considerable body of work in this area, there remains a need for further research into the operation, regulation and supervision of TCSPs; the challenges caused by the illegal use of TCSPs; and the ineffective implementation of the international AML/CFT requirements relating to TCSPs.

7. This typologies research project will therefore evaluate the effectiveness of the practical implementation of the Financial Action Task Force Forty Recommendations and Nine Special Recommendations (the FATF 40 + 9 Recommendations) as they relate to TCSPs. The FATF Recommendations relating to beneficial ownership information, governance and transparency will also be used to determine what is necessary to ensure there is effective cooperation between agencies and jurisdictions. Currently, as part of the preparation for the 4th Round of country evaluations, the FATF is assessing and clarifying Recommendations 33 and 34 in order to determine how the important purposes of these Recommendations can be most effectively achieved. The key findings from this typology study will be fed into these discussions. In addition, consideration will be given to whether the international standards relating to the oversight and operation of TCSPs should contain some of the requirements imposed regarding oversight of financial institutions.

1.2 Need for Typology

8. There has been an increasing international focus on the misuse of legal vehicles and, more specifically, the use of TCSPs to help facilitate this misuse. In recent years, the use of complex multi-jurisdictional legal structures has continued to cause concern for many international organisations, governments and national regulatory authorities. The international bodies which are often seeking to exert pressure for more transparency in the formation and administration of legal vehicles include the G20, the Financial Stability Forum (FSF), the European Commission, the International Organisation of Securities Commissions (IOSCO) and the Organization for Economic Co-operation and Development (OECD). The need for enhanced effective international cooperation in this regard has also been frequently highlighted.

9. By way of background and for the purposes of this project, the term 'Trust and Company Service Providers' has the meaning used by the FATF[1] and thus includes **all** those persons and entities that, on a professional basis, participate in the creation, administration and management of trusts and corporate vehicles. There are a considerable number of jurisdictions, both large and small, with sizeable TCSP sectors and many are still grappling with how to best exercise effective control over the activities of TCSPs. It is important to note that there are also many jurisdictions that do not specifically classify TCSPs as a separate and distinct sector. However, in these jurisdictions trust and company services may well be provided by lawyers and other professionals, who may be regulated.

10. Whilst the majority of TCSPs appear to be established for legitimate purposes, it is clear from the research that some TCSPs are being used, unwittingly or otherwise, to help facilitate the

[1] As defined in FATF Recommendation 12 and the Glossary to the FATF 40+9 Recommendations.

misuse of trust and corporate vehicles. Criminal organisations and individuals may use TCSPs to assist with illicit activities by seeking professional services and advice on the most appropriate vehicles or jurisdictions to use to further their ill-intended agendas. This potential for misuse of TCSPs has contributed to the extension of the scope of the FATF 40 + 9 Recommendations to lawyers, accountants and other TCSPs. The changes relate particularly to Recommendation 5, which addresses customer due diligence and record-keeping; and Recommendations 33 and 34, which address transparency of legal persons and arrangements.

11. Although a number of jurisdictions do license and regulate TCSPs, there are no internationally agreed "fit and proper" requirements[2] imposed on the providers of these services. Further, other than the requirements set out by the FATF, the Offshore Group of Banking Supervisors is the only body which has done work to develop standards for the establishment and overall operation of these entities to enhance their integrity, transparency and effectiveness, particularly with regard to addressing money laundering and terrorist financing. Their work will be discussed later in this report.

1.3 Scope

12. The overarching aim of this project is to consider, with the support of cases, how the effectiveness of the FATF and other international standards, as applied to the TCSPs, can be enhanced. The project will seek to evaluate:

i. The role of TCSPs in the detection, prevention and prosecution of money laundering and terrorist financing;

ii. The effectiveness of the FATF 40 + 9 Recommendations as they apply to TCSPs; and

iii. The potential need for additional international requirements or sector-specific international standards for TCSPs.

13. The following are key issues that need to be addressed:

i. Assessment of the adequacy and role that the information, required from TCSPs in accordance with the FATF 40 + 9 Recommendations, plays in combating money laundering and terrorist financing.

ii. Determination of the difficulties experienced by TCSPs in obtaining the FATF required information from clients and the steps that need to be taken to overcome these difficulties.

iii. Assessment of the national and international cooperation issues ensuring and/or enhancing access to and exchange of, in particular, information on beneficial owners.

iv. Evaluation of the following standard-setting related questions:

   a. How can the FATF Recommendations and guidance more effectively address the role of TCSPs in the combating of money laundering and terrorist financing?

---

[2] As referred to in the interpretative note of FATF Recommendation 23: www.fatf-gafi.org/document/28/0,3343,en_32250379_32236920_33988956_1_1_1_1,00.html#Interpretative_Note_to_r_23

b. Is there a need for an international standard for TCSPs to address issues such as the "fit and proper" prerequisite and other minimum requirements (*e.g.*, Systems and Controls, Corporate Governance, Authorization criteria)?

v. Assessment of what steps can and should be taken to ensure effective implementation of the international requirements.

14. Other benefits which may result from the project include:

- Addressing concerns about the impact of the operation of TCSPs on Money Laundering and Terrorist Financing;
- Enhancing the framework under which TCSPs operate; and
- Broadening the knowledge and understanding of TCSPs more generally.

1.4 Methodology

15. This typology is in essence a follow up to the October 2006 FATF Typologies Study on "The Misuse of Corporate Vehicles, including Trust and Company Service Providers" that highlights the vital role that beneficial ownership information can play in the detection and prevention of the misuse of corporate vehicles. Other studies in this area were also taken into consideration, and they are discussed in further detail below.

16. Between late September and early October 2009, a Concept Note regarding the proposed TCSP typologies exercise was developed. During the 30th Plenary Meeting of the Caribbean Financial Action Task Force (CFATF) in October 2009, the Concept Note was distributed to delegates to encourage discussion and garner support for the initiative. At the FATF/CFATF Joint Typologies meeting held in the Cayman Islands in November 2009, representatives from Belgium, Belize, Bermuda, CFATF, the Cayman Islands, the Channel Islands, Italy, the Netherlands, the Netherlands Antilles, St. Vincent and the Grenadines, the United States of America, the British Virgin Islands, as well as an industry representative from the TCSP sector in one of these jurisdictions, all attended and participated in a workshop focussed on the TCSP sector. During the workshop, the TCSP Project Working Group was created with the objective of conducting research and preparing a report on money laundering and terrorist financing using TCSPs. The following jurisdictions joined the working group and contributed to the study: Bermuda (as project Chair), the British Virgin Islands, the Cayman Islands, Jersey, the Netherlands Antilles, and the United States of America. During the course of the study, the project working group also received assistance from Austria, the World Bank, Guernsey and the Offshore Group of Banking Supervisors (OGBS). The secretariats of both the FATF and CFATF provided invaluable assistance and support throughout the various stages of the project.

17. As the starting point for the research project, the Project Working Group agreed that questionnaires would be developed and circulated to FATF and CFATF members, requesting that they provide relevant information on their TCSP sectors. In particular, information was sought on the breadth and scope of the services provided by this sector; the legislative framework vis-à-vis corporate vehicles; the nature of regulatory and AML/CFT supervision and monitoring for this sector, if any; and any problems being encountered by the sector in fulfilling mandated requirements. Most importantly, questionnaire respondents were required to provide case studies demonstrating either the misuse of TCSPs for AML/CFT purposes, or their importance in stemming the money laundering and financing of terrorism (ML/FT) tide.

18. The questionnaire was designed in two formats: a long-form, comprehensive version and a short-form, streamlined version. It was envisaged that by using two versions of the questionnaire, the Project Working Group would be able to broaden its sample in efforts to capture a wider audience.

Given this, the long form was sent to all thirty (30) CFATF member jurisdictions, the United Kingdom Crown Dependencies, the United Kingdom, the United States of America, Canada, Australia, Switzerland, Ireland and Singapore. The short-form was sent to other members of the FATF that are not listed above and CFATF observer organisations.

19. Responses have been received from thirty-seven (37) jurisdictions representing some of the membership of both CFATF and the FATF, as well as other FATF Style Regional Bodies (FSRB). Twenty-two (22) jurisdictions provided information using the long form questionnaire and fifteen (15) answered the short form questionnaire.

20. The Project Working Group wishes to thank the FATF and CFATF Secretariats and all those who participated in and contributed to this study.

1.5 Structure and Nature of the Sector

21. The FATF 40 + 9 Recommendations refer to TCSPs as being persons and businesses that, by way of business, provide any of the following services to third parties:

- Acting as a formation agent of legal persons;
- Acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- Providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangements;
- Acting as (or arranging for another person to act as) a trustee of an express trust;
- Acting as (or arranging for another person to act as) a nominee shareholder for another person.

22. TCSPs are categorized in the FATF Methodology as Designated Non-Financial Businesses and Professions (DNFBPs). Countries are therefore required under Recommendation 24 to ensure that this class of business is subject to effective systems for monitoring and is compliant with AML/CFT measures. TCSPs are often subsidiaries of banks, financial services businesses, law or accountancy firms; but they may also be single person stand-alone operations. In some jurisdictions TCSPs carry out a broad range of corporate services, but this may account for only a portion of the primary business of the entity. The variety and scope in the nature of the business and the structural makeup of TCSPs contribute to variations in the degree of regulation of corporate vehicles from jurisdiction to jurisdiction. A few jurisdictions regulate TCSPs in a manner similar to the internationally recognized and required prudential regulation of financial institutions. However, it has previously been found that a majority of jurisdictions still do not regulate or in any way supervise the operation of TCSPs[3], despite the fact that lawyers and other professionals are providing trust and company services. For example, in almost all jurisdictions lawyers will be involved in the formation of foreign companies for clients. The same is true for trusts, as lawyers or other professionals within the jurisdiction may well be engaged in the administration of trusts, even if the jurisdiction does not recognize this. However, there may be no barrier in such jurisdictions to a resident professional acting as a trustee for a trust

[3] OGBS (2004)

established under the law of a jurisdiction that does recognize trusts.[4] Given this, the effectiveness of the FATF Recommendations and guidance (as they apply to TCSPs) can be challenging to measure.

1.6 Overview of previous work

23. The FATF has issued guidance on the risk based approach for legal professionals, accountants and other TCSPs.[5] Other work has been carried out on matters pertaining to TCSPs by various groups and individuals. As can be seen below from the summaries of a few studies done in this area, many issues remain unresolved today. This project will seek to provide a timely follow-up to some of the key outstanding issues which are outlined below, as well as addressing some of the concerns expressed by the G20, and others, relating to international cooperation and the prevention of the misuse of TCSPs and AML/CFT efforts more generally.

1.6.1 OECD: Behind the Corporate Veil – Using Corporate Entities for Illicit Purposes, 2001

24. In May 2000, the Financial Stability Forum (FSF) asked the Organisation for Economic Co-operation and Development (OECD) to undertake the drafting of a report to develop mechanisms to reduce the vulnerability of corporate vehicles being misused for illicit purposes. The OECD Steering Group on Corporate Governance drafted this report which was submitted to the OECD Ministers, G-7 Finance Ministers and FSF. The report was recognised at the May 2001 OECD annual meeting. The paper stated that in order to develop mechanisms to prevent the misuse of corporate vehicles, supervisors and law enforcement authorities should ensure that they are able to obtain, on a timely basis, information on the beneficial ownership and control of corporate vehicles and to share that information with foreign authorities.

1.6.2 FATF: The Misuse of Corporate Vehicles, Including Trust and Company Service Providers, 2006

25. One of the more recent studies, the October 2006 FATF Typologies Study on "The Misuse of Corporate Vehicles, including Trust and Company Service Providers", highlights the vital role that beneficial ownership information can play in the detection and prevention of the misuse of corporate vehicles. This study led to the following conclusions:

- The level of misuse of corporate vehicles could be significantly reduced if the information regarding the ultimate beneficial owner, knowledge of the source of assets and the business objective of the company or a trust within a structure were readily available to the authorities that might need it.
- It matters less who maintains the required information, provided that the information on beneficial ownership exists, that it is complete and up-to-date and that it is available to competent authorities.
- Company registers are an important source of information on legal ownership. Legal ownership information held by other public entities such as filings with financial regulatory authorities or stock exchanges should also be accurate and current.
- Individuals and corporate vehicles have legitimate expectations of privacy and business confidentiality in their affairs and, from the information obtained through the survey, it is evident that jurisdictions adopt different approaches to protect legitimate privacy interests.

---

4 FATF (2006)

5 FATF (2008a, 2008b, 2008c)

- Certain of the arrangements and practices however, including the absence of appropriate regulation/supervision, would appear to contribute to the potential for corporate vehicle misuse by making it very difficult, and perhaps even impossible, for the authorities to identify beneficial owners and controllers.

- There is a need to strike a balance between the need for robust regulation and/or supervision to prevent corporate vehicle misuse and the need to avoid unnecessary restrictions on legitimate business.

26. The findings also indicated that in order to provide a more robust framework for the prevention of money laundering and terrorist financing in the area of TCSPs, there are various matters which need to be explored in greater depth. In particular:

- Are the existing AML/CFT standards as a whole adequate to discourage the misuse of corporate vehicles?

- Are the specific FATF Recommendations 12, 16 and 24 sufficient as a basis for dealing with the issue of corporate vehicle misuse?

- What more can be done to ensure that adequate, accurate and timely information on the beneficial ownership and control of legal persons/legal arrangements may be obtained or accessed in a timely fashion by competent authorities?

- What can be done to ensure that those engaged in the formation and administration of corporate vehicles are "fit and proper"? Is there a need for an international standard for TCSPs or professionals engaged in providing trust and company services?

- What steps can and should be taken to ensure that the actions of those engaged in the formation and administration of corporate vehicles are properly monitored or subject to investigation as necessary?

- Should TCSPs be regulated or should there be enhanced regulation of such service providers, including lawyers and accountants where they offer similar services?

- Should existing corporate governance standards (such as the OECD Principles) be extended to include factors relating to the role of TCSPs, lawyers and accountants in relation to the potential misuse of corporate vehicles?

- Should guidance in other forms be produced – for example risk assessment check lists – to help the competent authorities focus their risk-based approaches in relation to the different types of misuse of legal persons and legal arrangements?

- Where should beneficial ownership information be held?

- What more needs to be done to enhance the effectiveness of company registers and other publicly available information?

- Is there any practical action that needs to be or can be taken, to enhance the information publicly available in respect of legal arrangements?

27. With this current typologies exercise being undertaken, many of these findings and questions will be examined in greater detail.

1.6.3 OGBS: Trust and Company Service Providers: Statement of Best Practice, 2002

28. The Offshore Group of Banking Supervisors' (OGBS) working group consisted of representation from France, Italy, Netherlands, the United Kingdom, FATF, the International Monetary Fund, OECD and the OGBS. This group acknowledged and agreed that inclusion of TCSPs in the regulatory net is important to the effectiveness of financial services regulation as regards AML and CFT, given that TCSPs are intermediaries and introducers of businesses to institutions that handle/manage funds or assets.

29. The group's Statement of Best Practice,[6] which was completed in September 2002, highlighted that the same degree of regulation was not necessarily appropriate for those TCSPs that do not engage in the management of client funds. These types of TCSPs were described as carrying out "lower risk" business, which, it was suggested, may justify a lighter touch being applied. Lower risk business includes business that consists solely of:

- Company, partnership formation;
- Provision of registered office or business address;
- Providing corporate services, not including discretionary services, to local trading companies.

30. The document also addresses the core areas of regulatory concern and suggests best practices for licensees in the following areas:

i. Fitness and propriety of individuals that are involved in managing assets/funds;

ii. Structure and established controls for a TCSP;

iii. Requirements for TCSPs to know their customer per the Basel Committee's CDD paper[7] of October 2001;

iv. Proper business conduct;

v. Maintenance of financial soundness by the TCSP;

vi. Proper systems and procedures to ensure such financial integrity; and

vii. Storing and accessing information to accommodate easy, unimpeded sharing of information, including transactional information, with relevant authorities.

31. The document also highlighted some best practice considerations, namely that jurisdictions should have to:

i. Establish safeguards for clients when the TCSPs, for whatever reason, are no longer able to conduct business;

ii. Utilize auditors and give them the necessary statutory protections to report breaches of relevant legislation or other material concern;

iii. Conduct regular independent reviews of TCSPs; and

---

6 Attached as Annex IV

7 Basil Committee on Banking Supervision (2001)

iv. Ensure that TCSPs are caught by **national** AML legislation.

1.6.4 OGBS: Securing Effective Exchange of Information and Supervision, 2004

32. At the meeting of the OGBS Trust and Company Service Providers Working Group held on the 8th January 2003, it was agreed that a paper should be prepared to address the following matters relating to TCSP business:-

- Existing restrictions on the flow of information;
- The necessary gateways for effective consolidated supervision; and
- Whether information exchange should be restricted to information on the TCSPs rather than their clients.

33. Studies by the Working Group concluded that there were significant restrictions on the flow of information in this sector. The restrictions arise for a number of reasons springing largely from:

- A lack of a universally accepted and understood definition of what constitutes trust and corporate services;
- The very diverse range of ownership and control of the entities that might be carrying out the activities of TCSPs; and
- According to the nature of that ownership and control, a correspondingly diverse range of regulatory controls and oversights which may already be in place. These range from (in the case of activity carried out by a bank) full consolidated supervision, to (in the case of the activity carried out by an independent small company) no supervisory oversight at all in most jurisdictions globally.

34. The Working Group concluded that such restrictions led to ineffective co-operation, representing a significant weakness in the global defences against money laundering and the financing of terrorism, as well as a genuine lack of customer protection in respect of the sector's clients.

35. The overriding recommendation by the Working Group was the call for regulation of this sector to be introduced. In the absence of such regulations, the Working Group stated that responsibility should be allocated to a competent authority to ensure such TCSPs are monitored for compliance with anti-money laundering legislation and legislation designed to combat the financing of terrorism. The competent authority should preferably be one with gateways to exchange information with regulators of this sector in other jurisdictions.

1.7 Current complementary work

36. As stated by the FATF President Paul Vlaanderen in October 2009,[8] there are currently three transparency related issues already under review within the FATF. *"The first issue relates to **customer due diligence** obligations and **beneficial ownership**. One of the main principles of the FATF standards is the obligation for financial institutions to identify their customers and underlying beneficial owners. The FATF is revisiting its recommendations to consider whether the current standard still is the best tool for providing maximum customer transparency. This question of customer due diligence is closely related to the second issue, that deals with the transparency of **legal persons and legal arrangements**. The review of the recommendations dealing with this topic will seek*

[8] At the XVI Caribbean Financial Action Task Force (CFATF) Council of Ministers Meeting, Willemstad, Curaçao, Netherlands Antilles

to improve the transparency of such persons and arrangements. That should provide authorities with better and more timely access to beneficial ownership information. Finally, ***financial institution secrecy laws and cross-border exchange of information*** *will also be looked at. The FATF will examine whether certain types of laws may inhibit the implementation of the FATF recommendations."* The FATF is actively reviewing the scope of Recommendations 33 and 34 which state that countries should take measures to prevent the unlawful use of legal persons/legal arrangements by money launderers. Results and recommendations from this typologies exercise may assist in that undertaking.

1.8 The Project

37. This typologies exercise will draw from the research and conclusions that were made in the previous work and literature referred to above. In the chapters which will follow, the role of the TCSP industry will be examined, in relation to the detection, prevention and prosecution of money laundering. This will be done through analysing the jurisdictions' responses to the questionnaire as well as the case studies obtained from various sources. Additionally, key findings and observations related to the money laundering vulnerabilities of the TCSP sector will be extrapolated from the information provided by the various sources. In concluding, issues for further consideration will be presented which it is hoped will help to reduce the use of TCSPs for money laundering purposes.

CHAPTER 2: ANALYSIS OF QUESTIONNAIRE RESPONSES

38. This section of the report will focus on the jurisdictions' responses to the questionnaires, and will summarise and analyse the information provided. It is evident from the responses, that the jurisdictions that participated in this research project have adopted varying approaches to protecting their TCSP sectors from the money laundering and terrorism financing threat. The decision by any jurisdiction to subject its TCSP sector to any form of legislation is dependent on the type and sophistication of the business conducted within the sector, and also on the jurisdiction's risk tolerance and priority ranking. Notwithstanding, wherever TCSPs operate it is expected that some level of vulnerability to the risk of money laundering and terrorism financing is also likely to exist. This section therefore aims to ascertain the following from the responses to the questionnaire:

i. The definition of TCSP in different jurisdictions

ii. The types of services generally provided by TCSPs;

iii. The persons who act as TCSPs;

iv. The use of TCSPs for incorporation/registration of a company;

v. Licensing requirements for and supervision of TCSPs;

vi. The information that TCSPs are required to maintain;

vii. ML/FT vulnerabilities faced by TCSPs;

viii. The role played by TCSPs in the detection and investigation of ML/FT; and

ix. The adequacy of international standards pertaining to TCSPs.

39. As previously mentioned, jurisdictions provided responses to either a long form or a short form questionnaire.[9] The more comprehensive long form questionnaire had a total of 33 questions comprised in six parts. Part A required background information related to the responding jurisdiction; Part B required details on the TCSP sector within each jurisdiction; while Part C required information on the oversight or regulation of this sector for AML/CFT purposes. Part D required jurisdictions to indicate what type of information and other requirements, if any, apply to their TCSP sectors, while Part E required case studies as well as information and statistics on suspicious activity reporting and investigations relating to AML/CFT in the TCSP sector. Part F required jurisdictions to provide their views on the adequacy and role of international standards in relation to this sector and on whether or not additional standards or a purpose-created international body was necessary for TCSPs. The short form questionnaire did not require any information on the areas covered by Parts C, D and E of the long form, but did require the jurisdictions that responded to this version of the questionnaire to give some information about the definition of TCSP in their laws, this being the first question in Part B in the long form version. The short form questionnaire also covered all the questions addressed in Part F of the long form version.

9 See Annex III - Questionnaire

2.1 Definition of TCSP

40. Jurisdictions were asked to give the definition of TCSP provided for under their legislation. Thirty-six jurisdictions responded to this question. Of that number, five jurisdictions indicated that their legislation recognised and defined the specific concept of TCSPs,[10] and, for the most part, the definitions were consistent with or exact duplications of the definition of the term found within the FATF Methodology. Sixteen jurisdictions indicated that while there was no specific definition for TCSP per se, their laws did recognise and distinguish the sector by virtue of the types of services provided by them[11]. While the essential features of the FATF definition of TCSP are for the most part present in the definition of the services provided by specified sectors in the sixteen 16 responding jurisdictions, there are cases where the definitions either expand on or restrict the scope of services covered. For instance, in one jurisdiction in addition to the FATF-defined services, the definition of 'regulated fiduciary services' includes acting as executor of a will or administrator for an estate;[12] and in another jurisdiction, 'company management business' includes corporate services involving the control of the whole or substantial part of the assets of a company.[13] On the other hand, in another jurisdiction, the definition of 'TCSP' did not refer to the provision of directorial and secretarial services, nor did it refer to the provision of nominee shareholder services.[14]

41. Among the jurisdictions that define by reference to the services, certain terms and concepts were common within their laws, namely: trust business/trust company/trust service provider[15]; registered agents[16]; and company management business/service.[17]

42. Of the remaining 15 jurisdictions, 7 respondents indicated that while TCSPs are not recognised or regulated under their laws as a separate business sector, nevertheless lawyers, accountants and notaries or fiduciaries in some cases carry out the services identified in the FATF definition of TCSPs in the jurisdictions.[18] Two of the respondents identified trust services as the only TCSP-type service recognised under the laws in their jurisdictions, and that only certain financial institutions were permitted to act as trustees.[19] Two jurisdictions specified that no provisions were

12 GG

13 KY

14 BG

15 AI, BS, BM, VG, KY, JP, JE, NL, AN, VC and US. In LI they have what is called 'trust enterprises'. It should be noted that though the terms 'trust company' and 'trust service provider' are used in the laws of NL and AN respectively, these businesses essentially operate as company service providers as the concept of 'trusts' is not known in NL and AN law. It should be noted, however, that the Dutch regime recognizes the trustee services provided by Dutch TCSPs to foreign trusts.

16 VC and US

17 AI, VG and BS

18 AU, BE, CA, DO, HK, MO and CH. It should be noted however, that the corporate service business referred to by DO involved law firms buying and selling companies incorporated in foreign jurisdictions; while trusts are not known to DO law. In CH, some fiduciaries carry out TCSP services, and the class of professionals that make up this group is dependent on the specific services that they offer, whether it be administrative, trust or payment services. It should be noted that it is not possible to set up a trust under CH law

19 GT and MX

made under their laws for TCSPs, but did not clarify whether the services were being provided within other sectors.[20] Four of the respondents did not provide sufficient information for analytical purposes.

43. From these responses, it can be seen that the majority of jurisdictions have attempted to make some provision within their laws for TCSPs, whether by adopting the FATF terminology and definition, or by extracting from the Methodology the services that are relevant to the business carried on in their jurisdictions and making specific provisions for the persons and entities that provide those services. Either approach has merit depending on the individual circumstances in each jurisdiction, but a more tailored approach may be more suitable to address the specific sectoral features in respective jurisdictions. In the case of one jurisdiction,[21] although TCSP is defined and regulated under the law as if it is a discrete sector, that jurisdiction's response to a later question in the questionnaire indicates that the term, "TCSP", does not always fit with practice in that jurisdiction. This is demonstrated by the fact that some of the TCSP services, particularly in the area of trusts, are offered only as an ancillary activity to the business of many firms; and because trusts have such wide-ranging uses in that jurisdiction, a very wide range of professions and companies will be involved in some way in trust business.

44. While the tailored approach may be more attractive for many jurisdictions, variations in the approach to defining the sector in different jurisdictions may also result in a confusing array of laws governing an international industry that is becoming increasingly more globalised, as TCSPs in different countries engage in business overseas or court foreign clients.

2.2 Services generally provided by TCSPs

2.2.1 Common types of TCSP businesses found in jurisdictions

45. Responses to the questionnaire show that the services provided by TCSPs vary from jurisdiction to jurisdiction. The nature, size and complexity of the economies of respective jurisdictions affect the type of services that are provided by the TCSP sector. Jurisdictions were therefore asked to classify and rank their TCSP sector based on whether or not they carried out solely trust business or corporate services business or a mixture of both. Twenty-one jurisdictions responded to this question, and, from their answers, it is evident that the most prevalent TCSPs are those that carry on both trust business and corporate services business. This class of TCSP business ranked as the most prevalent in nine jurisdictions.[22] TCSPs that provide only corporate services are ranked as the next most common type of TCSP business, with six respondents ranking them as the most common TCSP business in their jurisdiction.[23] The third most common TCSP businesses are those that are licensed financial institutions or are subsidiaries or branches of local or foreign financial institutions which are also permitted to carry on TCSP business. Three jurisdictions ranked this type of TCSP business as the most prevalent.[24] There were a few jurisdictions where it was most common for TCSP to carry out only Trust business, and TCSP Business to be provided by only licensed financial institutions, or by other professionals such as lawyers and accountants.

2.2.2 Services provided by TCSPs

46. By reference to the TCSP services as defined in the FATF Methodology, jurisdictions were asked to indicate whether or not TCSPs provided these types of services and to provide some statistics

---

20 LV and NP

21 GB

22 AI, VG, KY, CA, GG, HN, JE, CH and TC

23 BS, BM, NL, AN, LC and US

24 GT, PA and VE

on the number of TCSPs within the jurisdictions to provide the respective services listed. Twenty-one jurisdictions responded to this question. TCSP's provide various services and this is evidenced by the responses received to the questionnaire.[25]

47. In the majority of jurisdictions some type of TCSP business in the jurisdiction provides variants of all of the above services,[26] but there are two respondent jurisdictions where only the trust related service is recognised as being provided in those jurisdictions, and then only by financial institutions.[27]

2.3 Persons who can act as TCSPs

48. Jurisdictions were asked whether there were any limitations on the types of persons who could carry on TCSP business by reference also to the categories of service provided. Eighteen jurisdictions responded to this question, indicating that Corporations, Accountants, Lawyers and non-professional individuals were the persons providing these services. In some cases, the jurisdiction also required the person in question to be licensed or otherwise duly authorised to carry on the business. The table below provides an overview of the information received and indicates not only how many jurisdictions use the above-noted entities as TCSP's, but also indicates the types of TCSP business that the respective entities provide.

49. The responses indicated that in some jurisdictions the various entities were subject to specified conditions in order to act as TCSPs. Therefore, they had to either be licensed pursuant to domestic legislation; registered with a relevant supervisory authority under ML regulations; or have a trust license or dispensation. Additionally, the other entities that were able to act as TCSP's included: licensed and unlicensed individuals and partnerships; natural persons with trust licenses or dispensations; authorized persons; trust companies; and consultants. The table below provides a comprehensive breakdown of the information.

Who can act in capacity of: (yes or no)	**Jurisdictions allowing Corporations to be TCSPs**	**Jurisdictions allowing Accountants to be TCSPs**	**Jurisdictions allowing Lawyers to be TCSPs**	**Jurisdictions allowing Others to be TCSPs**
TCSP: Incorporating a Company	**16** (**6** of these require licence /other form of authorisation)	**10** (**3** of these require licence/other form of authorisation)	**12** (**4** of these require licence/ other form of authorisation)	**7**[a]
TCSP: providing Company Administration/Corporate Services Business	**16** (**7** of these require licence /other form of authorisation)	**11** (**3** of these require licence/ other form of authorisation)	**12** (**4** of these require licence/ other form of authorisation)	**6**[b]
TCSP: acting as a Trustee	**15** (**6** of these require licence/other form of authorisation)	**11** (**3** of these require licence/other form of authorisation)	**12** (**4** of these require licence/ other form of authorisation)	**6**[c]

25 See Annex I – Table 1

26 With the exception of the jurisdictions mentioned in footnote 27below; and NL and AN, as trusts cannot be formed under Dutch or AN law.

27 GT and HN

Who can act in capacity of: (yes or no)	Jurisdictions allowing Corporations to be TCSPs	Jurisdictions allowing Accountants to be TCSPs	Jurisdictions allowing Lawyers to be TCSPs	Jurisdictions allowing Others to be TCSPs
TCSP: providing Trust Administration Services/ Trust Business	**15** (**7** of these require licence/other form of authorisation)	**9** (**3** of these require licence /other form of authorisation)	**11** (**4** of these require licence/ other form of authorisation)	**6**[d]

Table notes:

a. These included: - partnerships or individuals (one required they be licensed); consultants; licensed individuals; natural persons that have a trust license or dispensation; managers; persons authorized by FSA; and one Jurisdiction allowed any individual to incorporate a company.

b. These included: - licensed partnerships or individuals; consultants; licensed individuals; natural persons that have a trust license or dispensation; managers; persons authorized by FSA; and one jurisdiction had no specific requirements to be a company service provider.

c. These included: - licensed partnerships or individuals; trust companies and consultants; individuals; any individual or company; managers; and persons authorized by FSA.

d. These entities included: - licensed partnerships or individuals; trust companies and consultants; individuals; only banks; managers; persons authorized by FSA.

2.4 Use of a TCSP for incorporation/registration of a company

50. Jurisdictions were asked to provide information on their incorporation process and specifically to address whether TCSPs are required to be used to incorporate a company or whether this can be done by direct central registration. Sixteen jurisdictions gave relevant responses to this question, and from this it is evident that jurisdictions tend to adopt one of two alternate routes to incorporation.

Route 1: TCSPs are required in the incorporation process of all companies; and

Route 2: Direct central registration is available as an option even though TCSPs may also be used.

51. As highlighted in the table below, a larger number of jurisdictions, as an option, allow for incorporation by direct registration, while only five jurisdictions by law mandate incorporation of all companies by a TCSP. Direct central registration is typified by the direct approach to the authorities during the incorporation process by the individuals who are forming their own companies.

	Route 1 **TCSP Required for Company Incorporation**	Route 2 **Direct Central Registration for Company Incorporation is available as an option**
Number of Jurisdictions	**5**	**11**
Jurisdictions	AI, VG, GG, LC, VC	BS, BM, CA, KY, JE, NL, AN, CH, TC, GB and US

52. It is interesting to note that the five jurisdictions that mandate the involvement of TCSPs in the incorporation process are all jurisdictions that impose licensing requirements on TCSPs, which are also subjected to prudential and AML/CFT supervision. Further, some of the jurisdictions that allow direct central registration of companies as an option require a TCSP to be used in the incorporation of an international business company (IBC). However, for those jurisdictions, local companies that are not classed as IBCs or exempt companies can be registered without the involvement of a TCSP. Like the jurisdictions that adopt Route 1 as their required means of incorporation, these jurisdictions also operate a licensing and prudential supervision regime for all TCSPs.

53. In one jurisdiction, although direct central registration is an option and no TCSP is required to be involved in the incorporation of any type of company, the practice in the jurisdiction is that 99% of all companies incorporated are done using a TCSP, with additional scrutiny being carried out by a regulatory body. Furthermore, the authorities automatically subject applications that do not come from TCSPs to a higher level of review.[28]

54. In two jurisdictions where TCSPs are not required for the incorporation of companies, it was noted that notaries have to be involved in some way. However, it is not in the capacity of a person providing TCSP services but more for the purpose of notarising required documents. In one of these jurisdictions, although TCSPs are not separately defined and supervised as a discrete sector, it was recognised that lawyers and other professionals carry out the services and they are all subject to AML laws. In the other, "Trust Offices" are defined and regulated as a separate sector providing corporate services; and companies, partnerships and natural persons can be permitted to act as Trust Offices.

55. In another major financial centre, direct central registration is the norm and is done at a state, rather than at a federal, level. However, in the states where there appears to be a proliferation of 'registered agents' providing corporate registration services to clients, the concept of 'commercial registered agents' has been developed, which recognises such persons or entities that have numerous clients[29] on whose behalf they act as registered agents. In these states it is therefore likely that TCSPs have a higher frequency of involvement in the corporate registration process.

2.5 Licensing and Supervision of TCSPs

56. Eighteen out of twenty of those who responded to this section of the questionnaire indicated that TCSPs are required to be licensed in their jurisdiction. However, a closer review of the responses revealed that in some jurisdictions where licensing is required, the licences do not pertain specifically to the provision of the TCSP services. Additionally, some jurisdictions require licensing and regulation of trust service providers but there are no licensing requirements for corporate service providers.[30] In some jurisdictions, only financial service intermediaries and banks[31] that are licensed under separate legislation are allowed to provide services akin to those described by the FATF as being provided by TCSPs, in particular trust services.

57. In jurisdictions that choose to directly licence TCSPs, these are subject to fit and proper assessment and ongoing prudential supervision. Such fit and proper tests are applied to directors, senior officers, shareholders and other connected persons. In relation to the ongoing supervision of TCSPs in countries that have licensing criteria, most respondents indicated that those entities are also subject to onsite supervision to ensure compliance.

58. In jurisdictions that have chosen to licence TCSPs, the implementation of licensing and regulation of TCSPs appears to have had marginal impact on the number of TCSPs operating in the jurisdiction. Statistical data provided indicates that in most cases, there was not a noticeable decline in the number of TCSPs after the introduction of licensing requirements or regulation to this sector. However, a few respondents did indicate that the introduction of regulation of TCSPs may have inspired consolidation within the sector, whereby the smaller operators exited or were taken over by larger TCSPs. Respondents have also indicated that a positive result of the regulation of TCSPs is the

29 In the US, in the state of DE a commercial registered agent represents more than 50 legal entities. In the state of WY the minimum number is 10.

30 BM and US

31 Of the respondents to the question on whether TCSPs are subject to licensing requirements, 5 of the 23 respondents indicated this is only so where the institution is a financial institution or Bank, meaning that they were licensed under banking legislation.

improvement in the quality of information now available to competent authorities from TCSPs. That is, better information is available to facilitate exchange of information and international cooperation with other regulators and law enforcement agencies.

59. In many jurisdictions lawyers, accountants and other such professionals provide the TCSP services as defined by the FATF. In relation to this class of TCSP, the responses to the questionnaire show that, in many jurisdictions, the licensing and/or authorization and oversight of these persons generally come within the purview of their respective professional bodies.

60. The FATF requirements stipulate that designated non-financial businesses and professions (DNFBP) should be subjected to effective mechanisms for the prevention of money laundering and terrorism financing. As TCSPs come within the FATF's definition of DNFBPs, jurisdictions are required to apply the requirements in the FATF's Recommendations 5, 6, 8, 11, 13, 15 and 21 to the TCSP sector. The questionnaire therefore required jurisdictions to indicate whether TCSPs are subject to any AML/CFT legislation and requirements and, if so, to provide some details of this. Twenty respondents addressed this question and of that number, 18 indicated that TCSPs, by whatever definition, are subject to AML/CFT requirements.[32] In the remaining two jurisdictions, only trust service providers are subjected to the AML/CFT requirements.[33] In one of the two jurisdictions, it was indicated that all persons in business, including CSPs, are subject to various currency transaction reporting requirements and are prohibited from engaging in transactions with persons and countries identified on a terrorist list; but there are no specific AML/CFT requirements applied to CSPs in that jurisdiction as contemplated by the relevant FATF Recommendations.[34] In the other jurisdiction the only AML/CFT obligation imposed on CSPs relates to suspicious activity reporting, as all persons in a business, profession, trade or employment are subject to the requirement to report suspicious transactions to the national FIU.

61. Where TCSPs are subject to AML/CFT legislation, this should include penalties for non-compliance. All the responding jurisdictions, with one exception, reported that a variety of criminal penalties, including fines, were available to be imposed for breaches of the legislation by TCSPs. Additionally, those jurisdictions that have licensing criteria for TCSPs, also have additional regulatory mechanisms for dealing with regulatory breaches or issues of compliance identified at TCSPs. The administrative penalties span a range from minor to serious, with the ultimate penalty being licence revocation.

62. Jurisdictions were also asked to indicate whether TCSPs are subject to ongoing monitoring and supervision and if so to name the competent authority responsible for carrying out this function. Details on the nature and requirements of ongoing monitoring and supervision were also requested. There were 20 respondents to this question, 15 of whom indicated that full prudential supervision, including AML/CFT monitoring, of TCSPs is conducted on an ongoing basis in their jurisdictions. This type of supervision involves both onsite and off-site inspections; consultations with management; review of audited or other financial statements; and review of records and policies and procedures. One jurisdiction carries out AML/CFT supervision only. There are four jurisdictions which differentiate between trust service providers and company service providers for ongoing monitoring and supervision purposes, in that trust service providers, being licensed, are subjected to both prudential and AML/CFT supervision and monitoring in all four jurisdictions. However, the

34 US did indicate in the introductory remarks in their response that trust companies are licensed to provide certain fiduciary services and for AML/CFT purposes were classified as banks. The remainder of their response was directed at addressing the CSP sector.

company service providers in one jurisdiction are not supervised at all;[35] in two jurisdictions they are licensed and only subjected to AML/CFT supervision;[36] and in the other case, in two regions of that jurisdiction[37] they are subjected to some level of conduct of business review.[38]

63. Table 2 of Annex I provides details of the jurisdictions' responses to the questions pertaining to licensing and ongoing monitoring and supervision.

2.6 Information required to be gathered by TCSPs

2.6.1 What information is required of TCSPs?

64. The FATF Recommendations 33 and 34 stipulate that jurisdictions should take measures to prevent the unlawful use of legal persons/legal arrangements by money launderers. Jurisdictions are also required to ensure that there is adequate, accurate and timely information on the beneficial ownership and control of legal persons; and in the case of legal arrangements or express trusts, adequate, accurate and up-to-date information on the settlor, trustee and beneficiaries should be obtained in a timely manner and made available in a timely fashion to competent authorities.

65. The jurisdictions were asked to indicate whether beneficial ownership information is required to be disclosed to competent authorities at the time of all company formations; and whether information on settlors and beneficiaries is required to be disclosed to competent authorities at the time of all trust formations. The questionnaire also called for information on whether the terms 'beneficial ownership', settlors' and 'beneficiaries' are defined in the laws of the responding jurisdictions. Twenty jurisdictions responded to these questions with seven of them requiring automatic disclosure of beneficial ownership information to competent authorities at the time of company formation[39]; and another eight not requiring such disclosure.[40] One jurisdiction has adopted a unique approach,[41] in that all of its companies are required to obtain consent from the regulator to issue shares and admit members; and this is only one of three methods used by the regulator to capture this information. This process involves disclosure to the regulator of the ownership and control structure of the company, which the regulator will then verify before granting consent. This process is also applicable whenever a company seeks to change ownership, unless the company is administered by a TCSP, in which event the need for consent is waived but the TCSP is required to capture and verify the information themselves.

66. Among the jurisdictions that had no requirement for the disclosure of such information to the authorities at the time of incorporation, six [42] required TCSPs to obtain this information, verify its accuracy, retain it in their records, update the information periodically and make the information available to competent authorities upon request. From the responses it can be seen that the majority of jurisdictions mandated that this information be disclosed at the time of incorporation either to a

41 JE

42 VG, GT, GG, VC, TC and GB

competent authority or to a TCSP. Within these jurisdictions that required the capture of beneficial ownership information by either method, provisions were made in their laws to define or describe the terms relevant for an appropriate understanding of beneficial ownership.

67. In relation to trusts, only one jurisdiction indicated that it had a Registrar of Trusts, to whom disclosure had to be made of the beneficial ownership information pertaining to all trusts, including information on the settlor and beneficiary.[43] This necessitated the filing of the trust deed or settlement with the Registrar and included the filing of any resolution that resulted in changes being made to the ownership and beneficial interest in the trust. Fourteen jurisdictions indicated that they had no central registry for trusts and that therefore no information on the beneficial ownership details of trusts was required to be automatically disclosed to a competent authority. However, this information was required to be maintained by TCSPs in 12 of these 14 jurisdictions.

68. Nineteen jurisdictions indicated that under AML/CFT and/or other regulatory laws, TCSPs are required to request information on beneficial ownership, as well as information on settlors and beneficiaries of trusts and to conduct CDD, verification and record retention in relation to such information and to make this information available to competent authorities upon request.[44] Many of these jurisdictions also require TCSPs to request information from their clients on their source of funds and the nature of the business undertaken by them; and such information is required to be maintained and kept up-to-date. In this regard, 16 jurisdictions require TCSPs to capture information on source of funds; 17 jurisdictions require TCSPs to capture information on the nature of the business being undertaken; and 16 of these jurisdictions require TCSPs to keep the required information up-to-date.

69. Jurisdictions were also asked whether TCSPs were experiencing any difficulties in obtaining the FATF required information from clients. Ten [45] of the 29 respondents to this question indicated that TCSPs in their jurisdictions experienced no difficulties in this regard. Of the respondents that indicated that there was some degree of difficulty, four [46] highlighted problems related to trusts, three[47] noted difficulties connected to obtaining information from long-standing clients and one advised of difficulties in identifying PEPs.[48] Other issues raised were:

- client confidentiality and professional relationship conflicts;
- clients unwillingness to provide information out of legitimate fears of identity theft;
- obtaining sufficient detail about the intended purpose and/or activities of a proposed legal person or legal arrangement;
- lack of statutory record-keeping and CDD requirements for TCSPs, and absence of legal backing for TCSPs to obtain the required information;
- lack of awareness and full knowledge by TCSPs of their obligations; and

48 BG

- the unwilling attitude of some TCSPs under supervision and the need to threaten the possibility of imposing Cease and Desist Orders to get the relevant information.

70. Whatever approach is adopted by the jurisdiction and regardless of the attendant difficulties in obtaining the required information, a matter of signal importance in the capture and maintenance of beneficial ownership information is the accuracy of the information and whether or not it is current. Jurisdictions that supervise TCSPs and subject them to periodic onsite and offsite inspections, stand a better chance of ensuring that TCSPs take appropriate steps to verify and update the information that is subjected to the record-keeping requirements; thereby assuring a higher quality of information available for disclosure and international exchange.

2.6.2 The Adequacy of the Information Requirements

71. Jurisdictions were asked to provide an assessment of the adequacy and role in AML/CFT efforts of the information required from TCSPs in accordance with the FATF Recommendations. The majority of respondents to this question expressed the view that the information captured by TCSPs plays an essential role in the efforts to effectively combat money laundering and terrorist financing. The fact that TCSPs can alert authorities to suspicious activity through filing Suspicious Activity Reports (SARs), as well as the fact that they can provide detailed information on beneficial ownership and the source of funds, in circumstances where competent authorities require this information to assist in enquiries about suspected money laundering activity, are both powerful tools in the AML/CFT arsenal. One respondent highlighted the fact that the information available to TCSPs is not only a tool for the authorities in combating money laundering and terrorist financing, but also beneficial for the TCSPs themselves in creating risk profiles of clients to assist them in determining whether to commence business relationships or terminate them, as well as to assess what level of CDD and monitoring of those client accounts ought to take place.

72. In relation to the question on the adequacy of the information, most jurisdictions were of the view that the information required to satisfy the FATF requirements is adequate to meet the needs of combating money laundering and terrorist financing. While a few respondents did express concern about the limitations of the information available through TCSPs, these limitations for the most part appeared to be a result of non-compliance or less than full compliance with the FATF requirements rather than an inadequacy in the requirements themselves.

2.7 Vulnerabilities faced by TCSPs

73. The questionnaire required respondents to give their opinions on what constitutes the greatest threats to money laundering and terrorist financing in their jurisdictions. Eighteen jurisdictions responded to this question, providing a diverse array of perspectives on the issue. Aside from two jurisdictions, both of which indicated a significant minimisation of AML/CFT risk to their TCSP sectors[49], the remaining 16 respondents provided input on the areas of potential weakness for TCSPs. An area of weakness that seems to concern several jurisdictions pertains to customer due diligence and the reliability of information obtained on customers/clients/beneficial owners. In this regard, there is also concern that lack of resources for TCSPs to access intelligence tools such as World-Check and C6; as well as inadequate training for TCSP employees, both contribute to weakness in the verification of know your customer (KYC) documents and information. Another resource issue pertains to smaller TCSP businesses, in that they often do not have the capacity to fully apprise themselves of their obligations under AML/CFT legislation. Several jurisdictions[50] also

[49] BS indicated that the reduction in ML/FT risk resulted from the application to the TCSP sector of the same AML/CFT obligations to which the prudentially regulated sectors are subjected. GT indicated that the minimisation of ML/FT risk to trust providers results from the fact that only banks and financial companies are permitted to act as trustees.

[50] BM, LC, VC, GB and VE

expressed concern about the ability of TCSPs to gather reliable information on individuals and beneficial owners of companies and trusts, thereby leaving them open to be abused or misused by criminals.

74. The area of training was also cited as another potential area of vulnerability for TCSPs, in that inadequacy in the training of TCSP staff to assist them to more effectively conduct CDD and verification of CDD information; and to enable them to more readily identify how vehicles are structured for use in supporting both ML and TF schemes, has the potential to greatly reduce a TCSP's ability to effectively vet clients and circumvent risky schemes. As an adjunct to the training issue, a point was raised in respect of the probity and character of TCSP employees, in that the TCSP and the jurisdiction as a whole can be more vulnerable to ML/TF where employees misrepresent the level of skill or competence they have in relation to AML/CFT matters; or they deliberately flout AML/CFT policies, procedures and obligations. It was also suggested that TCSPs may be undermined by their inability to maintain up to date information on international actions to sanction individuals, companies or countries. This, of course, is a burgeoning area of concern given the increasing spate of international sanctions applied to individuals and entities in countries where terrorist financing and proliferation financing in particular are deemed to be significant threats.[51]

75. It was also suggested that another great challenge faced by TCSPs relates to their ability to effectively conduct ongoing monitoring of the business activities of underlying businesses and arrangements. It is often difficult enough for TCSPs to do due diligence and monitoring for their clients in relation to the primary business conducted by them; it is therefore easy to see how going beneath that surface to vet secondary or ancillary businesses can potentially pose even greater problems. Another potential challenge for many TCSPs results from their involvement in international business in various jurisdictions, all of which have varying standards on AML/CFT. It is understandable how this unlevel playing field can mystify and undermine TCSPs trying to navigate through this uneven terrain.

76. One jurisdiction suggested that TCSPs are vulnerable in complex or difficult cases where they are unable to fully understand the purpose or activities of wider structures with which they are involved. Such transactions will require more tenacious checks for information on both the clients and the wider purpose and structure of the scheme, beyond the confines of the TCSP's direct involvement. But even this can pose resource challenges and raise questions as to how wide the net for information ought to be cast.

77. Several jurisdictions also identified a number of red-flag indicators where TCSPs may be utilised in money laundering schemes:[52]

- Transactions that utilise complex and opaque legal entities and arrangements;
- Cases of corruption where the company paying the bribe to secure a contract or the person brokering a contract will seek to secure a successful outcome by utilising a TCSP to operate a trust with the funds held on deposit for the benefit of the person approving the contract;
- The use of foreign private foundations that operate in jurisdictions with secrecy laws;

---

51 Referring in particular to UNSC Resolution 1737 (2006) and its associated UNSC Resolutions up to and including UNSCR 1929 (2010) pertaining to IR; and UNSC Resolution 1267 (1999) and the resulting associated UNSC Resolutions up to and including UNSCR 1904(2009) pertaining to Al'Qaida and the Taliban.

52 CA, JE, NL, AN and US

- The use by prospective clients of nominee agreements to hide from the TCSP the beneficial ownership of client companies;
- Clients who allow TCSPs to have full discretionary authority over the client's accounts may entice unethical TCSP principals or employees to conduct unauthorised/illegal transactions from these accounts;
- The carrying out of intercompany loan transactions and/or multijurisdictional wire transfers;
- The operation of virtual offices overseas which provide TCSP services;
- The formation by TCSPs of shell companies that can then be used by money launderers.

2.8 TCSP's role in detection and investigation of Money Laundering

78. The questionnaire required jurisdictions to provide information on whether or not TCSPs are required to file SARs and to give statistics on the number of SARs filed by the sector between the years 2006 and 2009. An important gauge of the significance of TCSPs in detecting money laundering or terrorist financing was the request for information on the percentage of total SARs that was represented by TCSP filings for that period. Twenty of 21 responding jurisdictions indicated that TCSPs in their jurisdictions were required to file SARs.[53] For the jurisdiction that answered in the negative, this would only apply to their company service providers, because trust companies are classified as banks and would therefore be subject to the same reporting obligations as banks.[54]

79. In relation to statistics, the same 20 jurisdictions responded to this query, with 13 of them being able to provide statistics for the relevant period[55]. One jurisdiction was distinct, in that its TCSP sector accounted for between 71% to 84% of the SAR filings in that jurisdiction for the relevant period.[56] This may be an indicator of the relative importance of this sector in that economy, when compared to the banking sectors in most other jurisdictions which generally account for the largest percentage of SARs filed. Only two of the responding jurisdictions indicated that no SARs were filed for this period but no explanation was provided for why this was likely to be so. Four jurisdictions provided no statistics on TCSP-filed SARs[57], with at least one of them[58] indicating that they were unable to answer given the fact that the majority of TCSPs are not standalone firms and it was impossible to distinguish between the SARs filed under their TCSP functions and those under their other functions. See Table 3 in Annex I for a compilation of these statistics.

---

53 AI, BS, BM, VG, CA, KY, GT, GG, HN, JE, NL, AN, PA, LC, VC, CH, TC, GB and VE. HK, in responding to the short form questionnaire, also volunteered this information in response to another question. In subsequent correspondence JP also indicated that trust companies are also required to file SARs under their law.

54 The US prefaced its response to the questionnaire by indicating that trust companies are licensed to provide certain fiduciary services and for AML/CFT purposes were classified as banks. The remainder of their response was directed at addressing the CSP sector.

55 AI, BM, VG, KY, GG, HN, HK, JE, NL, AN, CH, TC and VE. CH gave aggregate statistics for number of SARs attributed to fiduciaries and legal professionals, with the proviso that there was no way of telling what proportion of the number related exclusively to TCSP activity.

56 VG

57 BS, CA, PA and GB

58 GB

80. Respondents also provided information on the typical subject areas of TCSP SAR filings in their jurisdictions. The following is a sampling of these responses:

- Unusually large transactions;
- Suspected fraud offences;
- Suspected politically exposed persons;
- Suspected securities fraud;
- Suspected tax offences;
- Suspected corruption;
- Suspected money laundering;
- Subject of transaction name appearing on international database;
- Subject of transaction suspected of involvement in international fraud;
- Trust account opened which then receives multiple cash deposits;
- Trust accounts opened with high amounts that are inconsistent with customer profile;
- Trust accounts opened with funds originating from foreign banks;
- Opening of trust accounts for civil projects, the representatives of which are people with criminal records or are alleged fraudsters;
- Multiple trusts accounts opened with the same beneficiary; and
- Natural persons who open multiple trust accounts with different businesses declared upon each opening.

81. In respect of the level of cooperation received from TCSPs when competent authorities follow up on SARs or conduct ML investigations, 12 jurisdictions reported having no difficulties with their TCSPs in this regard.

82. In general, responding jurisdictions appeared to be of the view that TCSPs can play a significant role in the detection and investigation of money laundering offences which take place within their domain. Through case studies and otherwise, some jurisdictions confirmed their positive involvement. TCSPs act as intermediaries both as introducers of business to other institutions and as entities responsible for handling and managing assets. As gate keepers to the financial sector, they are uniquely placed to observe the behaviour and activities of their clients, enquire into their background and business activities, collect due diligence information and evaluate the rationale of prospective and ongoing business. One jurisdiction has taken the unique approach of encouraging its TCSP sector to establish and maintain "Declined Business Logs"[59]; examination of which has satisfied the authorities there that numerous cases had been turned away, which more than likely would have involved financial crime. This is an encouraging sign that regulation of the sector and implementation of

[59] In GG this practice started after the introduction of AML/CFT regulation in 2001

measures such as this can have a positive impact on reducing crime and in providing signals of this trend to both the authorities and practitioners/service providers.

83. The role of TCSPs in detection and investigation is twofold. Firstly, they must implement effective due diligence measures to capture accurate information on clients and beneficial owners, to enable competent authorities to expeditiously obtain key information during an investigation or enquiry. Secondly, TCSPs' proper fulfilment of their duty to file SARs is equally important as they have the earliest opportunity to identify suspect schemes and arrangements. It has been suggested that not only do these obligations assist in the detection of money laundering and other crimes but can also operate to mitigate the risk of a TCSP being misused in this way. Where detailed information is obtained on the individuals who are to own and control a company, or are to settle and benefit from a trust; and a service provider has a full understanding of the service they are to provide and why they are to provide it, this should serve to mitigate the risk that any company formed or trust settled will be used for illicit purposes.

84. Jurisdictions provided several case studies to demonstrate the role played by TCSPs in detecting money laundering schemes. These will be discussed in Chapter 3.

2.9 Adequacy of international standards pertaining to TCSPs

85. Jurisdictions were asked whether the FATF Recommendations and guidance need to more effectively address the role of TCSPs in AML/CFT efforts. Thirty jurisdictions responded, with 11 of them responding in the negative and one providing a non-applicable response. The minority view seemed to coalesce around the notion that the existing FATF Recommendations and guidance are adequate and that the measures to enhance effectiveness had to take place at the jurisdictional level. One of the reasons given for this latter view was that, at the jurisdictional level, company formation, trust law and AML/CFT controls vary considerably as a result of the differences in legal traditions in each jurisdiction.

86. Varied replies from the remaining 18 respondents provide some insight into the areas of concern of the individual jurisdictions. The suggestions provided in these responses are outlined below.

i. The FATF guidance on the relevant Recommendations should be more specifically tailored to TCSP activities to ensure that TCSPs have clear and unambiguous direction on what is required of them. Additionally, updated Recommendations and guidance should more comprehensively capture the role of TCSPs.

ii. The FATF should give strong consideration to extending the "fit and proper" requirements to TCSPs. This is necessary because considerable expertise is required to understand business structures and their intended purposes; as well as to conduct effective vetting of owners. It is important to ensure that the persons carrying out senior roles in TCSPs therefore have the relevant experience, knowledge and good character. This type of requirement applied to senior executives and board members of TCSPs will help to ensure that a positive AML/CFT compliance culture will start in the Board room and executive offices and filter down to the persons who carry out the day to day interface with clients and operation of the services.

iii. Recognising the international and fiduciary nature of many trust companies, in particular, extending the FATF requirements regarding branches and subsidiaries to the TCSP sector would also be beneficial.

iv. The FATF should give consideration to reclassifying TCSPs as financial services businesses as this better reflects the risks involved in the TCSP business.[60] This will give due value to the efforts of jurisdictions that require TCSPs to operate within a regulated environment. As currently classified in the Methodology within the DNFBP grouping, many jurisdictions do not get credit for the AML/CFT measures applied in the regulation of the TCSP sector as examiners are not allowed to weigh the ratings to take account of this fact.

v. Ongoing work in the context of the development of the FATF's 4th Round Methodology should clarify the beneficial owners' requirement under Recommendations 5, 33 and 34, as well as the meaning of 'beneficiary'. In particular, should 'beneficiary' be understood to cover identification only of classes of beneficiaries or specific individuals?

vi. It would be helpful to have some guidance on the persons to be identified in the case of legal persons and arrangements that are not companies and trusts. In particular, who are the persons on which CDD is to be done in the case of 'foundations'?

vii. Consideration should be given to requiring the imposition of an obligation to centralise the records of trusts.[61]

viii. Allowance should be made to enable financial institutions to apply reduced or simplified CDD measures under Recommendation 5 to relationships established with trust company businesses.

ix. Further guidance is required in the FATF Methodology to bring clarity to the conflict between legal professional privilege and the obligation to report suspicious transactions. The FATF should conduct a study on this issue and provide more sophisticated guidance for jurisdictions to follow.[62]

87. Jurisdictions were also asked whether there appeared to be a need for the establishment of an international body dedicated solely to TCSPs; and whether there is a need for the development of international standards specifically for TCSPs to address issues such as fitness and propriety, systems and controls, corporate governance, authorisation and information sharing. There were 34 respondents to these questions providing an illuminating array of viewpoints.

88. The majority[63] of respondents were of the view that no international governing body for TCSPs is necessary. It is necessary to note however, that among this group are respondents whose views on this are informed by the fact that in their jurisdictions the trust sector and, in some cases, other TCSP activities are carried out primarily by financial institutions, all of which are already well overseen by recognised specialist international standards bodies.[64] The other 19 jurisdictions that are against the idea of a new international body are generally of the view that the FATF alongside the

---

60 This suggestion was put forward by VG, KY and GG, all of which operate full licensing regimes with supervision of TCSPs.

61 This suggestion comes from HN in which only specified banks are authorized to carry out trust business.

62 This is a suggestion from MO which expressed concern over the ongoing conflict between the requirement to file SARs and professional codes of conduct requiring lawyers to protect clients' information.

63 Twenty-two out of 34 respondents.

64 HN, GT and PA. MO also made a similar point indicating that a dedicated international body for TCSPs could therefore result in duplication of the work of Basel and others.

other international bodies that provide standards in the areas of banking and other key financial sectors, are sufficient to meet the needs of the TCSP sector. Nevertheless, it was suggested that it would be beneficial were the FATF to pursue additional work on TCSPs to enhance the sector specific guidance available for TCSPs; and also if some thematic approach were adopted by international organisations – *e.g.*, to consider the abuse of trusts in concealing the proceeds of corruption.[65] In this regard, it was suggested that this type of analysis could be carried out by existing organisations in the anti-corruption framework.

89. On the other hand, ten jurisdictions have expressed the view that an international body would be beneficial to this sector.[66] The reasoning articulated for this view is that an international body would serve to develop a uniform set of internationally accepted minimum standards and best practices, as well as to provide typologies on an ongoing basis for TCSPs; also to serve as a forum for regulatory agencies to discuss trends that are unique to this industry. The prospect of such a body being well poised to provide guidance for the establishment of regulatory agencies in jurisdictions that have not yet established a regulatory framework for the sector, is of particular value. Some jurisdictions are of the view that the standards set by such a body should of necessity include minimum requirements in relation to licensing and supervision. However, one jurisdiction went further in suggesting that membership to this body should be circumscribed by these minimum requirements as there is no advantage, and possibly even some disadvantage to well-regulated jurisdictions, to have a body which would be open to jurisdictions that do not have a high standard of supervision for TCSPs. In that regard it was being suggested that admission to membership to this body should be predicated on the jurisdiction having a high standard for regulation and supervision of this sector. The view was also expressed that having only a handful of jurisdictions, all of which are non-OECD countries, applying licensing and prudential regulation to this sector, opens this sector up to greater vulnerability to money laundering and other crimes. It should be noted that of the ten jurisdictions that favour the establishment of such a body, the majority of that group would be classified as major offshore financial centres and they subject their significant TCSP sectors to vigorous prudential and AML/CFT oversight. However, it should be highlighted that two of the jurisdictions that support this position are onshore jurisdictions, one of which is an OECD member country.

90. In relation to the development of international standards specifically for TCSPs, a large majority of the responding jurisdictions, including all of those with rigorous prudential/licensing regimes for TCSPs, strongly supported this idea. It was suggested that international standards would help to harmonise performance and assessment criteria for TCSPs; and in time would close the loopholes and eliminate the opportunities for regulatory arbitrage. Respondents were strongly in favour of the requirement for the application to this sector of fit and proper assessment, as well as other more general supervisory requirements akin to those recommended by the Basel Committee, International Association of Insurance Supervisors (IAIS) and International Organisation for Securities Commissions (IOSCO).

---

65 This was a suggestion from the GB

66 BE, VG, BG, KY, GG, JE, AN, LC, VC and TC. Though BM responded in the negative, in its response it pointed to the views of TSPs in BM that are in favour of the institution of an international body.

CHAPTER 3: ANALYSIS OF MONEY LAUNDERING TYPOLOGIES

91. In the responses to the questionnaire, several jurisdictions provided case studies to demonstrate the misuse of TCSPs in their jurisdictions and in others, as well as to show how the implementation of AML/CFT requirements in this sector, together with the conduct of supervisory arrangements for TCSPs, contribute to the fight against money laundering. No case studies were provided on terrorism financing and so the ensuing chapter will focus only on the money laundering vulnerabilities of TCSPs. The typologies presented and discussed in this chapter are based on these case studies.

92. However, it should be noted that, in addition to the cases provided in the responses to the questionnaire, case studies were also extracted from a number of other sources, including the 2006 FATF Typologies Study on the *Misuse of Corporate Vehicles*, the Egmont Group website,[67] publications of the United States Senate's Permanent Sub-Committee on Investigations and the website of the Jersey Financial Services Commission[68]. The case studies used within this chapter are only a representation of all the cases gathered from the sources mentioned above. Other relevant cases are included in Annex II to this report.

93. This chapter has been divided into two main sections; the first section dealing with money laundering threats and the second section dealing with combating the money laundering threats. The typologies addressed in the first section relate to the threats that have been identified in the case studies received. The threats have been sub-divided in the following three main categories:

A. Threats posed by the jurisdiction as a whole;

B. Threats posed by TCSPs; and

C. Threats posed by professional intermediaries.

94. Category (A) highlights the importance of a robust AML/CFT regime at a national level and underscores the money laundering vulnerabilities that emanate from less vigorous AML/CFT regimes. Categories (B) and (C) focus on the threats and vulnerabilities posed by TCSPs and professional intermediaries as facilitators or perpetrators of money laundering. Throughout this report, professionals such as lawyers and accountants have been considered as part of the TCSP landscape whenever they perform the designated services. However, for the purpose of analysis of the typologies, they have been separately considered to take account of the fact that, in many jurisdictions, professionals are treated separately from the rest of the TCSP sector whether or not their services account for a significant portion of the TCSP services provided in the jurisdiction. The case studies may help to demonstrate their relative role within that sector.

95. Finally, in the second section of this chapter, the case studies dealt with in Category D are used to highlight ameliorative measures that can be taken to address the threats identified in the cases.

---

67 The Egmont Group (2006)

68 www.jerseyfsc.org

3.1 Money Laundering Threats

3.1.1 Threats posed by the jurisdiction as a whole

96. Deficiencies within the national laws and systems of a jurisdiction can pose a threat to the international financial system where there is weakness in AML/CFT laws and procedures. This has been highlighted in the FATF NCCT[69] process and more recently in the FATF's work to name and shame jurisdictions through the International Co-operation Review Group's (ICRG) review process and the public statement mechanism. There are obvious ways in which jurisdictions can constitute a threat, primarily among which is no or inadequate AML/CFT laws as well as no or ineffective regulation of the financial sector. However, even where the laws in place conform to the FATF 40+9 standards, there are other less obvious ways in which the legal or regulatory environment can motivate and attract criminals to bring business within that country's borders. Lack of financial or technical resources to enforce and give effect to laws and regulations are issues that affect many jurisdictions, especially those that have poorer economies or overwhelming social problems that utilise the bulk of limited resources.

97. The case studies considered in this section focus on how weaknesses within the AML/CFT regime of the jurisdiction as a whole, encourages the misuse of TCSPs for ML/FT purposes, or facilitates rogue TCSPs in their bid to establish schemes that assist criminals to have easier access to their criminal proceeds and/or to legitimise them. The typologies below focus in on factors such as bank secrecy laws and poor bank regulation; inadequate corporate registration requirements and weak regulation of TCSPs; and the use and proliferation of shell companies.

i. The presence of bank secrecy laws, poor bank regulation and other areas of deficiency in certain jurisdictions facilitate money laundering schemes created by or participated in by TCSPs; and can prevent or prolong detection by or cooperation with the home State of the money launderer.

98. Bank secrecy has a history spanning many decades and emanates from jurisdictions with extensive banking sectors that emphasised confidentiality for their clients through devices such as the use of numbered bank accounts to facilitate anonymity. Historically, bank secrecy laws have become notorious for providing cover for war operatives to funnel and secure money procured by them through looting the property of war prisoners; for enabling rogue leaders and dictators from impoverished countries to find a secure resting place for the millions of dollars of corruptly obtained lucre which further impoverished their nations; and more recently for becoming a harbour for criminal/money laundering schemes.

99. Secrecy in the banking sector restricts competent authorities from obtaining or sharing information on banking relationships and account activities; thereby preventing local or foreign authorities from ferreting out inappropriate or criminal behaviour within the banking sector. Unrestrained bank secrecy is therefore an area of AML/CFT vulnerability for jurisdictions; because criminals will seek out such jurisdictions in order to gain the protection afforded them from free exchange of information with other jurisdictions and law enforcement authorities. The case study below exemplifies how bank secrecy, exacerbated by extremely weak bank regulation and supervision can be misused by money launderers, predicate criminals and collusive banking officials. See also Case A in Annex II.

---

69 This process was undertaken by the FATF between 2000 and 2006 to identify non compliant countries and territories (NCCT). During this time 23 countries were listed due to lack of an effective AML/CFT system and they were subjected to annual review during this period to determine whether they could be removed from the list. The last country was removed from the list in 2006. Visit the FATF website at www.fatf-gafi.org for more information on this.

Example Case Study

Case No. 1: TCSPs role in laundering fraud proceeds and the benefits of bank secrecy laws

Bank X was an offshore bank licensed in 1997 to operate in a small jurisdiction which was known at the relevant time for its bank secrecy laws. One of Bank X's wholly owned affiliates was a corporate service company which was used primarily to form the trusts and corporations that made up Bank X's accountholders. These trusts and corporations, known as International Business Corporations (IBC), routinely received nominee director and shareholder services from the corporate service company. In 1998 Bank X became the fulcrum for a money laundering scheme established by Mr. K, a US citizen who operated a fraudulent high yield investment programme that targeted victims in the US. Mr. K relied on the bank and the corporate service company to establish IBCs for himself, his victims and co-conspirators; to open accounts for these IBCs with Bank X; to receive the 'investment' funds from victims and to transfer them into various accounts belonging to himself and his conspirators for onward transmission to other accounts and locations. Investigation by US law enforcement resulted in money laundering and fraud charges being laid against Mr. K. During the course of the investigation, numerous efforts through legal channels to procure information from Bank X about Mr. K's activities were refused by Bank X on the basis of the secrecy laws. US law enforcement was unable to obtain the detailed information about the transactions and the movement of the funds in Mr. K's bank accounts until Mr. K cooperated and instructed the Bank to provide the requested information. At the material time, although one of only seven (7) offshore banks licensed in that jurisdiction, BANK X was subjected to very minimal regulatory oversight.

Source: Extrapolated from Minority Staff of the Permanent Subcommittee on Investigations (US Senate)

100. In this case it is evident that the TCSP, which was closely affiliated with the poorly regulated offshore bank, was utilised to establish the corporate network to facilitate the activities of both the banks and the criminal players using the banks. The TCSP played an integral role in establishing and managing the accounts used by the criminal network to defraud its victims and then carry out the laundering process which followed. The TCSPs involved carried out the bidding of senior banking officials who were their principals, and in so doing appeared to have little separate corporate identity or independence.

ii. Jurisdictions with limited corporate registration requirements; unrestricted bearer share usage; limited beneficial ownership information requirements; and/or lax regulation of TCSPs.

101. The case studies reviewed in this regard highlight that regulatory and supervisory deficiencies in relevant sectors represent AML/CFT risk. The deficiencies in the cases relate to: the use of intermediaries in circumstances where there is an insufficiency in the corporate registration requirements; the unrestricted use of bearer shares; and inadequate requirements relating to beneficial ownership; and what can only be overall weaknesses in the regulation or supervision of TCSPs. Because TCSPs provide services in relation to the establishment and management of corporate structures, trusts/foundations, and structuring of investments, criminals will often target TCSPs or other intermediaries in jurisdictions that have weak laws and/or inadequate enforcement of laws in these areas. They will seek to capitalise on these weaknesses and use the intermediaries to distance themselves from the money laundering and other criminal schemes established on their behalf. The cases also show that while some offshore jurisdictions have been vulnerable to misuse in this way, TCSPs in onshore jurisdictions were at liberty to take advantage of these circumstances due to inadequate restrictions on their operations.

Example Case Study – Jurisdictions that have insufficient beneficial ownership requirements to facilitate international cooperation

Case No. 2: Inadequate beneficial ownership information requirements

Acting on information from the foreign Central Bank and STR from an Austrian Bank, the Austrian FIU conducted enquiries into suspected cases of tax evasion and money laundering being carried out by foreign banks with correspondent relationships with banks in Austria. The STR related to transactions by the foreign banks involving different offshore companies amounting to about USD 45 000 000.

The A-FIU analysed the transactions relating to the correspondent banking accounts and tried to link these transactions with a predicate offence. The A-FIU also made requests to several FIUs in other jurisdictions.

The responses received from these foreign FIUs, and also the A-FIU's own investigations, confirmed that the transactions involved approximately 72 offshore companies (as sender and receiver) but no information regarding the beneficial owner or the registration country of the different offshore companies involved was able to be obtained. The A-FIU were able to establish and trace the existence of only six offshore companies (receiver of the money) and made requests for further information. However unfortunately the only information available was that the companies were registered but the work regarding the due diligence and the real beneficial owners was done in another jurisdiction by lawyer companies.

Source: submitted by AT

102. Bearer shares are shares that can be readily moved from share holder to share holder without any requirements for the recording of the ownership details with the company or any competent authority. Ownership of these shares vests in the person or entity that has physical possession of the shares at any given time. This type of share ownership affords anonymity to the shareholder who can freely obtain and pass on these shares. The unrestricted use of bearer shares not only prevents competent authorities from being able to identify the legal or beneficial ownership of corporate structures, but in tandem with inadequate AML/CFT requirements for and oversight of TCSPs, it also provides a veritable blank cheque for rogue TCSPs to design and operate money laundering schemes using corporate vehicles for the benefit of their criminal clients.

Example Case Study – Jurisdictions that allow unrestricted use of bearer shares

Case 3: Concealment of beneficial ownership information through use of bearer shares

As a result of a drug importation investigation, approximately USD 1.73 million was restrained in combined assets from residential property and bank accounts. These assets were located in four countries in various regions. Significant assets restrained involved two offshore companies incorporated in Country A. Investigators also seized original bearer shares of three offshore companies and original articles of incorporation. The investigation revealed that one of the suspects used the services of a lawyer from Country B to design a money laundering scheme that included the incorporation of offshore companies with bearer shares. The lawyer hired the services of a management company in Country C, who in turn used the services of a company in Country A to incorporate bearer share companies in Country A.

There was no requirement to register the names of the shareholders at the corporate registry office, company head office or anywhere else. The only names that appeared were the original incorporators of the company in Country A, who then forwarded the bearer shares and articles of incorporation to the Country B management company. The management company then forwarded the original bearer shares and articles of incorporation to the lawyer, who in turn handed them over to his client. The files held by the management company only contained the names of the nominee directors, nominee administrators and the directions given by the Country B lawyer who acted on behalf of the suspect shareholder.

The use of bearer shares companies and professional intermediaries in this investigation almost offered absolute anonymity to the person in possession of the bearer shares and is clearly a powerful tool to conceal proceeds of crime. If investigators had not seized the bearer shares in the possession of the suspect, it would have been impossible to determine the owner of these companies and ultimately to identify and restrain their assets as proceeds of crime. In this case, the offshore companies held significant assets alleged to be the proceeds of crime - bank accounts in Country C, and residential property in Country B and Country D.

a. Found on the JE FSC website in **"Anti-Money Laundering/Countering the Financing of Terrorism Typologies from a Jersey perspective"** published on October 28, 2008 and produced by BakerPlatt on behalf of the Law Officers, Joint Financial Crimes Unit and the JE Financial Services Commission. The purpose of the publication was to raise awareness of typologies that are relevant to JE including the risks arising from the nature of the customer base and products associated with Jersey as an international finance centre. Both local and international cases were used. The cases included within this report with the annotation "Extracted from website of JE Financial Services Commission" are the international cases referenced in the October 2008 publication. The origins of the international cases used in the publication are not noted therein.

103. Many jurisdictions operate central registries of companies, requiring a record of all corporate structures established in the jurisdiction to be stored there. Company registries may have various minimum requirements for the information that needs to be submitted to them. Beneficial ownership information is often one type of information required to be submitted to a company registry at the time of a company's formation. However, as can be seen from the responses to the questionnaire, many jurisdictions choose to either share between TCSPs and the company registry the responsibility for capturing and maintaining beneficial ownership information; or they place the entire

responsibility on TCSPs alone. However, there are jurisdictions where no one is charged with this duty and this becomes an area of vulnerability as it provides anonymity for beneficial owners of companies formed in the jurisdiction. This can become an allurement for money launderers and other criminals who wish to use corporate structures to launder their criminal proceeds, as they are no doubt aware that secrecy surrounding company ownership is a significant obstacle in combating money laundering and other financial crimes.

Example Case Study– Jurisdictions whose corporate registration processes do not require the submission of beneficial ownership information to competent authorities or the capture by TCSPs of such information

Case No. 4: Registration process that does not require identification of beneficial ownership

In 2002, U.S. Immigration and Customs Enforcement (ICE) (through its legacy agency U.S. Customs) received a request for assistance from a foreign customs service concerning alleged customs fraud with respect to the importation of various kinds of used trailers, semi-trailers, container-transporters, and transport-vehicles equipped with supplemental cranes. The foreign customs service alleged that the invoices and customs entry documents undervalued the actual cost of the vehicles, and misrepresented the country of origin of the merchandise. The customs entry documents and accompanying invoices identified a US-based company in Washington DC as the exporter of the vehicles.

As a result of the foreign request, ICE was asked to interview company officers located in Washington, DC, in an attempt to determine the origin of the suspected fraudulent invoices. The investigation revealed that the suspect company was incorporated in the District of Columbia and the Registered Agent was a Washington, DC "corporate registration agency." The President of this corporate registration agency was interviewed and told agents that his company "provides assistance to mostly foreign companies with U.S. export documentation, and serves as a U.S. incorporation agent." He went on to advise that his company had been requested by a corporate registration agency from Delaware to assist in filing the District of Columbia incorporation papers on behalf of the suspect company. He advised that approximately 60% of his business was referrals from the Delaware corporate registration agency. The agents were told that no documents relating to the suspect company were maintained by his registration agency and they should contact the Delaware registration agency for those documents.

Agents contacted the Delaware registration agency and were told the suspect company was "ordered and paid for" by a foreign corporation registration agent. The agents were told that if they wanted additional information, they would have to contact the foreign corporate registration agency located in an offshore jurisdiction. According to its website, the foreign corporate registration agency provides advisory, management, and administrative services relating to offshore companies.

Because there is no requirement in the U.S. for the identification of beneficial ownership at the time of incorporation, the ICE investigation was unable to obtain the information that the foreign customs authorities had requested.

iii Use of Shell companies

104. Shell companies are corporate entities that are used for legitimate purposes such as to hold stock or intangible assets of another business entity. However, they can also be misused by illicit actors and have no legitimate commercial purpose. While it is arguable whether shell corporations can have appropriate application in the operations of legitimate corporate groups, they can be used by white-collar criminals in money-laundering operations, mutual-fund schemes, tax fraud and internal business fraud. To facilitate these types of schemes, shell companies may be used to generate false invoices, fictitious consultancy fees or bogus loans.[70] Where shell companies are permitted under the corporate registration laws of a jurisdiction or where its usage is unrestricted, this may present a money laundering and financial crime vulnerability which criminals will take advantage of. It has

[70] This issue was discussed in the APG/FATF "*Anti-Corruption/AML/CFT Research Paper*", 2007 prepared for the FATF/APG Project Group on Corruption and Money Laundering by Dr. David Chaikin and Dr. Jason Sharman (7 September 2007). This paper was presented to the FATF Plenary in 2007 and the APG Plenary in 2008.

been acknowledged that tackling the problem of anonymous shell companies is a crucial factor in combating a range of high priority international problems such as organised crime, tax evasion, corruption and money laundering.[71]

105. Shell companies together with other tools used in financial crimes, can be used in both the placement and layering phases of the money laundering process to disguise the trail of evidence. The cases below show various ways in which shell companies have been used to establish layers between the criminal and the laundering, fraudulent or corrupt transaction; and between the predicate crime and the criminal proceeds. Where jurisdictions allow their incorporation processes to be indiscriminately used in this way, TCSPs will have no reason to self regulate to prevent criminals from taking advantage of this facility.

Example Case Studies

Case No. 5: Use of shell companies to facilitate corrupt payments

An operational business goes through a TCSP with the objective of getting control (via a fiduciary/trust contract) of a shell company domiciled under European law, giving it the appearance of being operational. The objective is to pay the shell company a compensation for fictitious consulting services. This fee is then paid by the TCSP, on behalf of the shell company, to a third person who in turn is responsible for bribing a public official who grants access to a public exchange to the above-mentioned operational business. This corruption can be done with or without the knowledge of the TCSP.

Source: submitted by CH

Case No. 6: Use of domestic and foreign shell companies in the placement and layering stages of money laundering

ICE initiated an investigation against a criminal organisation involved with defrauding investors out of millions of dollars and laundering the fraudulently obtained proceeds. The investigation revealed an enterprise of individuals offering fictitious instruments for investment programs described as "currency leasing trading programs," leading to more than USD 14 million in fraudulent transactions. These funds were laundered through a network of domestic and foreign bank accounts utilizing shell corporations, many of which had been established in the United States.

The perpetrators of the scheme operated an Internet web site out of Las Vegas, Nevada, which offered investors the opportunity to "lease" $1 million for a fee of USD 35 000. Once "leased," victims were told these funds would be placed into a high yield international trading program. The contracts provided to the investors indicated an expected return on their investment of as much as 25 percent every two weeks.

An additional co-conspirator in the scheme was responsible for establishing a complex web of bank and brokerage accounts, and shell companies. This individual established corporations in Delaware, Nevada, California, and Massachusetts in the United States along with companies in several foreign jurisdictions. Another co-conspirator opened cash management accounts at brokerages utilizing the shell corporations. Investors were told to send their USD 35 000 fee to the accounts established utilizing the shell corporation names. Once in this account, the funds were transferred to secondary accounts. From these accounts, the funds were then disbursed to various foreign and domestic accounts and liquidated through the use of checks, debit cards, and ATM cards.

In the end, six individuals pled or were found guilty in the United States of violating money laundering, wire fraud, and international transportation of stolen funds statutes. The defendant's use of domestic and foreign shell companies to layer the funds prevented full recovery of the fraudulently obtained funds.

Source: submitted by US

[71] Sharman, Dr. Jason C. *"Behind the Corporate Veil: Financial Anonymity and Crime"*, 2008. Dr. Sharman is a Professor at Griffith University in Brisbane, Australia and works jointly with the Centre for Governance and Public Policy and the Griffith Asia Institute. This paper is based on research done to assess the effectiveness of international standards that prohibit anonymity within the global financial system.

106. These cases show that money launderers and other criminals will use TCSPs to take advantage of systems that allow for the establishment of corporate structures with no apparent legitimate commercial purpose.

3.1.2 Threats posed by TCSPs

107. The typologies addressed in this section relate to the threats posed by TCSPs, which have been identified from the case studies and responses. These typologies address the vulnerability of TCSPs for being used by both internal and external persons/entities for money laundering purposes.

i. Criminal culpability of TCSPs involved in money laundering schemes or the predicate crimes which give rise to it

108. The responses received from the jurisdictions that participated in this typologies exercise, reveal that TCSPs are increasingly involved in money laundering schemes. TCSPs and/or their principals have in many jurisdictions been under investigation, and at times convicted, for money laundering and proceeds of crime related offences. While some countries have reported more cases of misuse of TCSPs by criminals for money laundering purposes than others, it remains undoubtedly the case that the potential risk for misuse is evident across jurisdictions. Given the diverse nature of activities of TCSPs within and across jurisdictions and the diverse oversight regime governing these activities, it is difficult to determine whether the lack of money laundering cases in some jurisdictions is due to the absence of abuses within those jurisdictions or the inability thus far of regulatory and law enforcement authorities to detect such abuses. Nonetheless, the threat resulting from the potential role of TCSPs in facilitating money laundering and terrorist financing constitutes a major concern among jurisdictions where TCSP businesses are prevalent.

109. It is in this context that this typologies exercise sought to understand the types of misuse of TCSPs for money laundering and terrorist financing purposes and the specific "red flags" that may be indicative of it. More specifically, the potential vulnerabilities that appear to be inherent to the very nature of the activities of TCSPs have been examined.

110. Although TCSPs are less conducive to the initial placement of criminally derived funds than for example, banking institutions, they are prone to be used particularly in the layering stage of money laundering. TCSPs possess many characteristics that make them vulnerable to misuse for money laundering and terrorist financing purposes. Their fiduciary responsibility allow them often times to have discretionary control over the accounts and funds of their clients. Due to the broad scope of their fiduciary responsibility, the risk exists that TCSPs may abuse this responsibility entrusted to them. Furthermore, the ease with which the sources and uses of funds as well as legal beneficial ownership information can be concealed through the establishment of multiple accounts and the conduct of complex transactions on behalf of clients, constitutes another area of potential threat.

111. The case examples presented in this section highlight the areas of vulnerability to money laundering of TCSPs, as well as the risk of being misused in a variety of ways and for different purposes within the framework of money laundering. More specifically, the cases highlight the following money laundering related misconducts: misappropriation of clients' assets, and facilitation of money laundering for organised crime groups by abusing discretionary control over clients' funds. Case F and others in Annex II also demonstrate money laundering misconduct by TCSPs through misrepresentation of clients' beneficial ownership information, among other things.

Example Case Studies

Case No. 7: Criminal culpability of TCSPs based on co-mingling of clients' funds

A company service provider on the island State of Country A embezzled USD 35 million from its clients over an 11-month period. The money was sent to some international criminal network organisations in Country B. The CSP was co-mingling its clients' funds with its own assets. The owner of the CSP was convicted and sent

to prison.

Source: submitted by AN

Case No. 8: Criminal culpability of TCSPs as facilitator of ML

A Company Formation Agent involved in the financial services sector was prosecuted for money laundering offences, for laundering funds on behalf of organised crime groups. He carried out a complex process of funnelling criminal proceeds through a system of trusts and front and shell companies, linked to a complex matrix of inter-account bank transfers. As administrator of all the trusts used in the scheme he exercised full control of the funds flowing through them. Trusts, as well as front and shell companies were used deliberately to disguise the source of the money, and to provide a veil of legitimacy to the financial transactions.

Source: submitted by the GB

112. From the cases it is evident that TCSPs can play a significant role in facilitating money laundering and that the perpetration of money laundering crimes can take place in various forms. Cases such as the White Whale case[72] also highlight the fact that not only can TCSPs be used by criminals for the entering or mediation of transactions from or intended for criminal activities, but also their principals and/or employees can play an important facilitating role in the money laundering process. This internal risk factor is one that should be monitored closely.

ii. Misuse of TCSPs by money launderers and terrorists to establish sophisticated/complex legal structures to facilitate money laundering.

113. Although the nature of the services provided by TCSPs vary from one institution to another and at times from one jurisdiction to another, it is generally noted that TCSPs are prone to be used for the set up and management of complicated structures through which money may be laundered or terrorist funds channelled. Structures created by TCSPs to facilitate legitimate business activities might also be attractive to money launderers and terrorists, particularly at the layering stage. A money launderer may seek the service of a TCSP to set up legal structures or arrangements in multiple jurisdictions. Jurisdictions that do not require identification of beneficial owners; or that refuse to disclose such information when requested by competent authorities; or that do not have a robust regime of combating money laundering and terrorist financing, are jurisdictions often times of particular interest to the money launderers and terrorists. Once the legal entities or legal arrangements are established, the money launderer or terrorist typically uses the companies or legal arrangements, by moving funds through the various company accounts, for money laundering or terrorist financing purposes.

114. It should also be noted that money launderers are well aware of the fact that investigation of a money laundering scheme is more complicated when there are more jurisdictions involved, since some jurisdictions may be unable or unwilling to provide information on the legal entities or arrangements. As a result, the authorities investigating a particular money laundering scheme will be unable to establish the link between the funds and the criminal.

115. The ease of formation of companies and legal arrangements in various jurisdictions, some of which have a less robust oversight regime than others, make it also easier for money launderers to layer the proceeds of their criminal activities and integrate them into the financial system. Furthermore, advances in technology, financial engineering and innovation, have contributed significantly to the use of sophisticated legal structures and multiple accounts to facilitate money laundering and terrorist financing. This has made it more difficult to identify who is actually controlling the structures and accounts thereby contributing to a lack of transparency.

---

[72] See Case No. 11: *TCSPs obscuring beneficial ownership through the use of pre-constituted companies*

116. Although it is likely that a majority of the sophisticated/complex structures established by TCSPs for their clients are set up for legitimate purposes, the obvious potential for abuse nevertheless remains a concern. The following case, along with others in this report, highlights the money laundering risk inherent in these complex structures that are created and/or administered by TCSPs.

Example Case Studies

Case No. 9: Complex multijurisdictional structures to facilitate money laundering

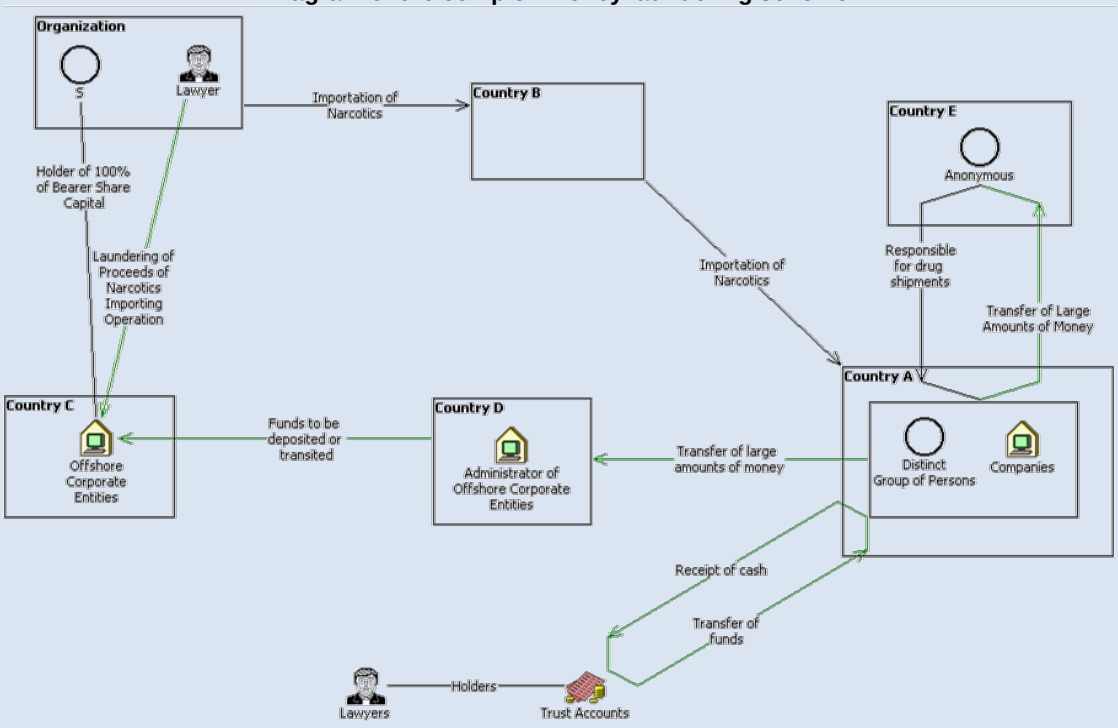
S headed an organisation importing narcotics into Country A, from Country B. A lawyer was employed by S to launder the proceeds of this operation.

To launder the proceeds of the narcotics importing operation, the lawyer established a web of offshore corporate entities. These entities were incorporated in Country C, where scrutiny of ownership, records, and finances was not strong. A local management company in Country D administered these companies. These entities were used to camouflage movement of illicit funds, acquisition of assets, and financing criminal activities. S was the holder of 100% of the bearer share capital of these offshore entities.

In Country A, a distinct group of persons and companies without any apparent association to S transferred large amounts of money to Country D where it was deposited in, or transited through S's offshore companies. This same web network was found to have been used to transfer large amounts of money to a person in Country E who was later found to be responsible for drug shipments destined for Country A.

Several other lawyers and their trust accounts were used to receive cash and transfer funds, ostensibly for the benefit of commercial clients in Country A. When they were approached by law enforcement during the investigation, many of these lawyers cited "privilege" in their refusal to cooperate. Concurrently, the lawyer established a separate similar network (which included other lawyers' trust accounts) to purchase assets and place funds in vehicles and instruments designed to mask the beneficial owner's identity. The lawyer has not been convicted of any crime in Country A. Investigators allege however that his connection to and actions on behalf of S are irrefutable.

Diagram of the complex money laundering scheme



Source: extracted from website of JE Financial Services Commission [a]

a. Found on the JE FSC website in **"Anti-Money Laundering/Countering the Financing of Terrorism Typologies from a Jersey perspective"** published on October 28, 2008 and produced by BakerPlatt on behalf of the Law Officers, Joint Financial Crimes Unit and the JE Financial Services Commission. The purpose of the publication was to raise awareness of typologies that are relevant to JE including the risks arising from the nature of the customer base and products associated with Jersey as an international finance centre. Both local and international cases were used. The cases included within this report with the annotation "Extracted from website of JE Financial Services Commission" are the international cases referenced in the October 2008 publication. The origins of the international cases used in the publication are not noted therein.

Case No. 10: Complex structures to facilitate money laundering

This case is concerned with the use of seven (7) International Business Companies which were incorporated in AI by a foreign national, Mr. D, using a local TCSP. The seven companies were then used to open bank accounts in AI at two local private banks; these accounts were then utilized as the flow through points for money obtained from elaborate investment wire fraud scheme targeting persons from across the Americas, Asia and Europe. The monies would flow through bank accounts in AI and another jurisdiction then onwards to accounts in Europe. Over USD 4 million was defrauded from investors who were investing into the schemes of Mr. D. Mr. D was arrested by the authorities in the other jurisdiction and extradited to the USA for prosecution for fraud and money laundering. The remaining USD 80 000 which Mr. D had in AI was subject to a civil recovery process for forfeiture to the State.

Source: submitted by AI

iii. Complex methodology used by TCSPs on behalf of money launderers to obscure beneficial ownership of legal structures used in money laundering schemes

117. A subject closely related to the lack of transparency in complex structures which was addressed above, is the risk involved with the concealment of beneficial ownership of legal structures. This is a subject that has been significantly debated over the past years, considering the perceived confidentiality inherent in the services provided by TCSPs. The reduction or elimination of face-to-face contact between the service provider and its customer has made it even more difficult to know who is actually controlling the structures and/or accounts.

118. The responses received highlight the fact that the identification of a customer at the beginning of a business relationship may not be sufficient for the detection of serious or organised money laundering crimes developed after the client acceptance phase. Both the relationship and the beneficial ownership must continue to be monitored after the initial client acceptance stage. If not adequately monitored, the TCSP may lose sight of the true person(s) controlling the legal structure.

119. Although the concealment of beneficial ownership may take place in various forms, as reflected in the cases below, the concern was also raised during this typology exercise of the difficulty in identifying beneficial owners, particularly in the case of legal entities, such as foundations; and legal arrangements, such as trusts. In those cases, there is no generally agreed upon definition of beneficial ownership. The issuance of bearer shares also seems to be an area of risk that may obscure beneficial ownership.

Example Case Studies

Case No. 11: TCSPs obscuring beneficial ownership through the use of pre-constituted companies

THE WHITE WHALE CASE

The investigations started in September 2003 by cross referencing data from an investigation on drug trafficking, with information coming from another investigation on assets owned by Eastern European citizens living in the Costa del Sol (Malaga). In such cross referencing of information, it arose that [H] appeared as administrator of more than 300 companies established through [R], a lawyer's office in Marbella (Malaga). All of the companies had similarities: companies established off-shore, except one held by [H] who was the single administrator of the companies and, at the same time, an employee of [R]. Giving support to clients of [H] by establishing companies was one of the activities of [R], which also offered the management of client's bank accounts and real estate buying and selling. The investigators knew that several clients of [R] were allegedly connected with international organized crime groups and/or with people involved in serious crimes in Spain and abroad.

The board of [R] was aware of the likely criminal activities of some of H's clients, because they had been the subject of media and press reports as possible criminals, and because the board knew that some clients were in prison in Spain or in other countries since documents had been sent to them there. In other cases, members of the board were called to testify as witnesses in judicial proceedings against those clients. Additionally, the board deliberately ignored the activities of their clients. In their advertisements they even advertised that the office conducted company´ "engineering", that they guaranteed anonymity and that they did not ask any questions or respond to requests for information.

The Spanish companies were established for use as an instrument for money laundering schemes based on the real estate market. They were companies created exclusively for the management and administration of real estate properties. Re.Es. was one of these companies. The off-shore companies which participated in the Spanish companies were "shell companies" established in an American State whose laws allow a special tax regime for these companies and for their transactions. The companies were pre-constituted in the name of an agent (usually a lawyer) before the incorporation of the company. In other words, the document of incorporation of the company would remain inactive in the hands of the agent until the company was bought by a client, and at that moment the company would be effective.

Therefore, the board of the companies when first registered was made up of the agent and his associate, without any link with the real owners of the company who subsequently purchased the shell. Consequently, the ultimate beneficiaries of the off-shore companies and, consequently, of the Spanish companies, remained hidden. The launderer (LAU) transferred funds from a foreign country to a non-resident account owned by Spanish company Re.Es. The use of non-resident accounts provided other advantages, including the advantage of being subject to less control by the tax authorities. The funds described above were gathered in the account of Re.Es under the guise of foreign loans received. The destination of the funds received was the purchase of real estate properties in the name of Re.Es. in the last stage of the money laundering process, taking advantage of the hidden situation of the launderer and of the beneficial owners.

Three public notaries documented all the transactions, from the incorporation of the companies to the purchase of real estate. The suspicion of money laundering was clear: incorporation of several companies by the same persons in a short period of time, concurrence of the same partners in several companies, several real estate purchases in a short period of time, etc. Despite this, and even though the public notaries were obliged to report under the Spanish anti-money laundering law, such transactions were not disclosed to the Spanish FIU

Case No. 12: TCSPs instrumental in obscuring beneficial ownership by PEP

Mr. X, a foreign lawyer, utilized the services of several Trust and Company Service Providers to set up several offshore entities in various offshore Financial Services Centres including Countries A, B and C.
The offshore entities included a private growth Fund which was registered in Country B. The subscriptions which were paid into the Fund were routed through the various offshore entities in order to obscure the true source of the funds. At least two of the offshore entities were known to have bank accounts at a financial institution in Country B, where significant funds were located.

A joint investigation was subsequently initiated by authorities in Countries A and B, following allegations that the structures were set up to disguise the true source of the funds which allegedly came from a PEP in an Eastern European country and that these funds were the proceeds of corruption. Information regarding the true ownership and purpose of the offshore entities was requested from TCSPs in the respective jurisdictions. The resultant information was incomplete. Though the foreign Lawyer claimed ultimate beneficial ownership of the entities, the authorities believed he was acting on behalf of the PEP. Investigation indicated that the private growth fund was established on behalf of a prominent Minister of Government in the Eastern European

country, who used the fund and the several other offshore entities to create a number of fictitious consultancy agreement entities, for the purpose of concealing millions of dollars he made as a result of investments in the sector which fell under his ministerial portfolio during his time as Minister.

The investigation ultimately resulted in criminal charges being brought against several of Country A registered offshore entities. These charges led to the successful prosecution and confiscation of USD 47 000 000.00 which was shared equally between the Countries A and B.

3.1.3 Threats posed by Professional Intermediaries

i. Use of professional intermediaries to facilitate money laundering.

120. Lawyers, accountants, notaries and other such professionals provide services to clients to help them navigate the often complex and sometimes treacherous world of finance, law and corporate governance. They have essential knowledge and expertise in relation to the technical rules and regulations that pertain to the operation of business, as well as experience in crafting legal strategies in relation to investment, mergers and acquisitions, tax liability, corporate structuring, among others. These professionals can be important service providers for businesses, high net worth investors and anyone who has wealth or assets which need to be managed or channelled appropriately. However, these same skills and expertise are attributes that are desired by criminals, who require assistance in organizing their affairs, to enable them to distance proceeds from their criminal origins; and to liberate these proceeds for eventual use in 'legitimate' endeavours. For this purpose criminals seek out the services of professional intermediaries to help them establish corporate structures, set up trusts, transfer funds and negotiate deals. The important advantages to the criminal are: the concealment of the proceeds of crime; the granting of access to various financial centres through the diverse mechanisms which can be used by these intermediaries; and the creation of confusing audit trails to stymie law enforcement's efforts with regard to these transactions.

121. The nature of the relationship established with the professional, the integrity of the individuals involved and the level of regulation and regulatory oversight can all affect the degree of knowledge or involvement of the professional in the criminal scheme being pursued. However, it is safe to say that the more complex the scheme being established and the more economically senseless the approach adopted, then the more likely it is that the professional intermediary involved knows, strongly suspects or is wilfully blind to the true nature of the activities which underpin the professional services being provided.

122. The following cases provide some examples of the role played by professional intermediaries in money laundering schemes.

Example Case Study

Case No. 13: Use of professional intermediaries to facilitate money laundering

A law enforcement operation identified an accountant, J, who was believed to be part of the criminal organisation involved in money laundering and re-investment of illicit proceeds derived from drugs trafficking led by X. J's role was mainly that of a "legal and financial consultant". His task was to analyse the technical and legal aspects of the investments planned by the organisation and identify the most appropriate financial techniques to make these investments appear legitimate from a fiscal stance. He was also to try, as much as possible, to make these investments profitable. J was an expert in banking procedures and most sophisticated international financial instruments. He was the actual financial "mind" of the network involved in the re-investment of proceeds available to X. J operated by sub-dividing the financial transactions among different geographical areas through triangle transactions among companies and foreign credit institutions, by electronic transfers and stand-by credit letters as a warrant for commercial contracts which were later invested in other commercial activities.

Case No. 14: Use of professional intermediaries to facilitate money laundering

A criminal involved in smuggling into GB set up a Trust in order to launder the proceeds of his crime, with the assistance of a collusive Independent Financial Adviser (IFA) and a Solicitor, who also appeared to be acting in the knowledge that the individual was a criminal. The Trust was discretionary and therefore power over the management of the fund was vested in the Trustees, namely the criminal, his wife and the IFA. This example illustrates the complexity of Trusts used to hide the origins of funds from any law enforcement scrutiny. One way in which this was done was through the purchase of a garage. The criminal's daughter, who was a beneficiary, was given the property by her father and she in turn leased it to a company. The property was eventually sold to this company, the purchase funded by a loan provided by the Trust. The company subsequently made repayments of several thousand pounds a month, ostensibly to the Trust, but in practice to the criminal. Thus the criminal who had originally owned the garage probably maintained control despite his daughter's ownership. Through controlling the Trust he was able to funnel funds back to himself through loaning funds from the Trust and receive payments on that loan.

3.2 Countering the Money Laundering Threats

3.2.1 Measures that can reduce money laundering threats

i. Application of suspicious transaction reporting, CDD and other such measures enhance TCSPs role in the detection, investigation and/or prosecution of players in the money laundering scheme

123. The cases below are good examples of how the operation of an appropriate AML system within TCSPs can facilitate law enforcement's efforts to address money laundering transactions and activities which might otherwise go undetected. The cases below range from instances of mere suspicion triggered by unusual or questionable transactions resulting in the filing of STRs, to active instances of sleuthing by the TCSP as a result of suspicion aroused through implementation of regular CDD procedures or because of suspicious activity.

Example Case Studies

Case No. 15: Detection of illegal activities by TCSP, reporting to the FIU, and international cooperation between FIUs

Mr. A established a KY revocable trust in 2004, with himself as settlor and a local Trust Company B as service provider acting as trustee. Mr. A also arranged for the incorporation of a KY company known as company C, with the Trust Company B also acting as registered office.

In 2008, Trust Company B, in conducting its risk assessment of its clients, became aware of allegations relating to Mr. A and his involvement in an oil and gas contract scam which also involved members of a foreign jurisdiction's government. Mr. A was the representative of the oil and gas company and was allegedly involved in a kickback scandal in which his company was awarded a contract by the foreign jurisdiction's government.

According to allegations in media reports, Mr. A was the money source who provided several officials from the foreign jurisdiction's government with the means to buy the support of other government officials, in order for them to participate in the scam.

Trust company B reported in its suspicious activity report, that between 2004 and late 2005, Mr. A's trust and underlying company had received numerous transfers of funds and property from what was now deemed to be questionable sources, which in turn heightened its suspicions, thereby prompting its reporting to the FRA.

An analysis of the trust accounts, undertaken by the FRA, reflected outgoing funds to individuals named in numerous media reports who allegedly took part in the kickback scandal. The FRA in turn requested information from the FIU of the foreign jurisdiction to enquire if there were any investigations or criminal proceedings underway involving Mr. A. The foreign FIU responded that Mr. A was being investigated for money laundering and corruption of government officials. The FRA was also able to construct a timeline of events which revealed that funds and other assets were being added to the trust around the same time the alleged criminal activity of Mr. A and others was reported.

As a result of the FRA's analysis and information from the FIU of the foreign jurisdiction, a disclosure was made to that FIU based on the premise that a KY trust and company was being used to house the proceeds of Mr. A's criminal activity. The information disclosed by the FRA was useful to the overseas FIU and the

investigations of the foreign jurisdiction, and the matters before the courts are still pending.

Case No. 16: Detection of fraudulent malpractice insurance and international cooperation

Mr. L, a citizen of country A with prior criminal convictions, set up two medical liability insurance companies in third countries and offered fraudulent malpractice insurance coverage to medical practitioners and practices in Country A. Mr. L also opened two bank accounts in BM in the name of two of the insurance companies controlled by him, along with a mailing drop box account with a local mailbox service in BM, thereby establishing a nominal office in Bermuda for each of these insurance companies. Both the drop box and the bank accounts were managed by a BM corporate service provider. Mr. L also had other similar drop box and bank account schemes in Country A and in several countries. Premiums collected under these fraudulent insurance contracts were paid through the network of mailing/drop box accounts into related bank accounts. Through ongoing due diligence, the BM service provider became unhappy with responses from Mr. L arising from questions/complaints from customers of the insurance companies. The service provider therefore made a suspicious activity report triggering an investigation locally. This tied in with suspicions originating from a potential customer in Country A, who was also approached and offered insurance coverage, thereby resulting in investigations by local authorities in Country A. The net result was that, in cooperation with law enforcement authorities in Country A, BM secured in excess of $5,000,000.00 by restraining the accounts of Mr. L's insurance companies in BM, and this amount was eventually repatriated to Country A to assist in making restitution to the victims. BM authorities provided significant evidence to Authorities in Country A via mutual legal assistance to facilitate Mr. L's prosecution for fraud and money laundering.

ii Benefits of sound regulation of TCSPs

124. The FATF Recommendation 24 requires that TCSPs be subject to effective systems for monitoring and ensuring compliance with AML/CFT requirements. There should be a designated competent authority or SRO responsible for monitoring and ensuring compliance of TCSPs. The authority or SRO should have adequate powers to perform its functions, including powers to monitor and sanction. The "Risk-Based Approach Guidance for Trust and Companies Service Providers issued by the FATF on June 17, 2008"[73] has also highlighted the fact that the regulation and oversight of TCSPs should have a risk-based character. The regulation and oversight regime should have a targeted function and focus on areas of high risk.

125. From the responses received from the jurisdictions participating in this typology exercise, it is evident that the nature, level and scope of the regulatory and oversight regime applicable to TCSPs, vary from jurisdiction to jurisdiction. Some jurisdictions have a more robust regulatory framework, while others do not. In the responding jurisdictions that have a regulatory framework for TCSPs, this framework more often than not encompasses both off-site and on-site supervision. Some countries have a long-standing history of active regulatory oversight of trust and/or company service providers, while other countries concentrate more on criminal investigation and detailed record-keeping requirements. Other countries have implemented regulatory systems that comprise of aspects such as licensing of both trust service providers and company service providers, detailed customer due diligence requirements, record keeping and reporting requirements, auditing requirements, sanctions and enforcement.

126. Although there are differences in the regulatory approaches of the various countries, the overriding consensus is that additional regulatory guidance will likely be needed to reduce vulnerabilities of TCSPs to misuse for money laundering and terrorist financing purposes. An effective regulatory regime commands a premium. The questionnaire responses from those jurisdictions that have implemented an effective regulatory regime, suggest that they have significantly strengthened their ability to deter and address money laundering and terrorist financing abuse in their jurisdictions. Countries must implement regulatory and supervisory policies and

[73] Available on the FATF website at http://www.fatf-gafi.org/dataoecd/19/44/41092947.pdf

practices that conform to the scope and complexity of their specific sector. Public confidence in TCSPs, and hence their stability, can even be undermined by adverse publicity as a result of their unwitting use by criminals for money laundering and terrorist financing purposes.

127. The cases below shed further light on this important subject of effective regulatory oversight. They underline the fact that if TCSPs are not subject to an effective and adequate regulatory regime, they may be exposed to a greater level of money laundering and terrorist financing risk.

Example Case Studies

Case No. 17: Effectiveness of on-site inspections to prevent and detect money laundering

Corporate Service Providers (CSP) and Trust Service Providers (TSP) are under regulatory control in the IM. One entity licensed as a CSP was found, at its first full supervisory visit by the Regulator, to have serious Customer Due Diligence (CDD) problems, especially entailing lack of beneficial ownership details. A remedial programme was agreed and put in place with the CSP.

Subsequent supervisory inspections showed that the CSP was not making satisfactory improvements and formal Directions and reporting requirements were issued to them to fully comply and record progress with the remediation programme. A Direction was also issued that no new business was allowed to be taken on.

In the meantime the CSP applied for a licence to carry out TSP work. The Regulatory authority refused to process this application until the CSP side of the business was put in order.

The CSP submitted its required reports on the progress made in improving its CDD standards. A further supervisory visit showed some positive improvements but not as much as had been indicated in the company's reports. The visit also found evidence of further examples of poor CDD standards and lack of beneficial ownership details being obtained.

A formal warning notice was issued to the directors of the company informing them that the regulator found their conduct to be unsatisfactory and future action could be taken against them if the situation did not improve. A Direction was also issued for the appointment of an external compliance resource (pre-approved by the regulator) and paid for by the CSP.

At the present time the IM regulator will not issue a TSP licence to the entity and has informed those involved that consideration was being given to starting action on any one, or combination, of the following; -

a. to take from them their CSP licence;

b. to formally refuse their application for a TSP licence;

c. to start legal proceedings against the company for breach of the IM's AML/CFT legislation, especially with regard to their lack of identification of beneficial ownership when taking on previous business;

d. to take disqualification action against the company officials for failing to undertake their statutory duties, such as complying with the AML/CFT requirements.

As a direct result of regulatory intervention, the people running the business are now actively working to sell the CSP and the situation is being closely monitored by the Regulator.

Source: submitted by the IM

Case No. 18: Vulnerability arising from lack of AML/CFT oversight

This case occurred in 2002, when one of the directors of a trust company business operating in Country X was approached to set up a discretionary trust by a solicitor in Country Y. The solicitor advised that one of his clients, Mr. A, was acting on behalf of another individual, Mr. B. Mr. A had received monies from the sale of sauna business, which was owned by Mr. B. The solicitor wished to hold the sale proceeds through an offshore trust. The solicitor sent through documents to identify Mr. A, but none in relation to the ultimate client Mr. B. A few days later, over $850,000 was sent from the solicitor's account to the trust company's client account. Two days later, the solicitor requested the trust company to pay the bulk of those monies to four named entities, none of which had any connection to the trust and which were unknown to the trust company. The trust was established with Mr. A as the sole beneficiary. On the next working day, the trust company made the four payments as requested.

The High Court of Country X found both the trust company and the director of the trust company guilty of failing to comply with client identification requirements of the anti-money laundering law, a decision which was

upheld by the Court of Appeal. The Court of Appeal found that an isolated failure to comply with client identification procedures in the context of financial services business can amount to a criminal offence and that a systemic failure is not required. It was held that Client identification procedures prescribed by the anti-money laundering law must be kept up and that a single breach, provided that it was more than a mere oversight, is sufficient to constitute an offence.

Submitted by JE

CHAPTER 4: KEY FINDINGS

128. The types of entities that operate as Trust and Corporate Service Providers and the depth and nature of supervision to which they are subject, vary from jurisdiction to jurisdiction. Notwithstanding the fact that some jurisdictions do not recognise TCSPs as a formal sector or indeed that the laws of some jurisdictions do not recognise certain types of legal structures, such as trusts, these factors do not preclude the existence of TCSPs or the provision of these services in some way in these jurisdictions. The variance in supervision and the breadth of technical/complex services available from this sector are matters that feed into the money laundering vulnerabilities to which TCSPs are subject.

129. In addition, a review of money laundering cases illustrated how the services offered by TCSPs had been used in obscuring illegal activities in both the regulated and unregulated environments. Other cases highlighted that persons holding positions of trust and/or authority had themselves knowingly assisted in perpetrating money laundering crimes. The following are the key findings from a review of the questionnaire responses and an analysis of the various cases studies.

4.1 Description of Money Laundering Vulnerabilities/Observations

130. Though some jurisdictions do not recognise trusts in their laws, nevertheless case studies show that persons providing the services of a TCSP are able to provide trust vehicles to clients using the laws of other countries to do so. This can make it difficult for the authorities in the TCSP's home country to provide oversight for a legal structure established under foreign law. Additionally, the foreign country under whose laws the trust is established may have lacunae in their laws which allows the foreign TCSP to avoid oversight or supervision for the trusts established in that country. This type of lacuna is a vulnerability that criminals/money launderers capitalise on.

131. Pre-constituted companies are companies that TCSPs incorporate and hold as assets for sale or transfer to clients. After the company is sold there may be no requirement for the information on the new owners to be collected and submitted to the authorities to update the information on the corporation. Jurisdictions that allow TCSPs or professional intermediaries to establish pre-constituted companies, without the need for the ownership structure of those companies to be updated after the company has been sold to clients, might provide a cover to criminals and other persons who wish to use corporate structures to obscure beneficial ownership and thereby hide assets.

132. As the creation of complex structures can often generate higher fees for TCSPs, this can make such structures more attractive to TCSPs thereby potentially reducing their ability to associate an increased use of complex structures with a higher money laundering risk. TCSPs may not have a sufficiently robust risk framework in place that mitigates against the increased risk that may be posed by more sophisticated schemes. The provision of value-added services to a client base by TCSPs may also expose them to regulatory and reputational risks where a client has been found to be carrying out ML/FT.

133. TCSPs operating in highly competitive environments, both regulated and unregulated, may also experience additional challenges in obtaining adequate CDD, where there may be no minimum standard that has been clearly communicated or otherwise established that is in keeping with the FATF Recommendations, particularly Recommendation 5. Further, given the potential in some cases

for "flight to quality" of service providers, in order to attract business, certain TCSPs may operate on CDD requirements that would not be adequate under the FATF Recommendation 5.

134. Vulnerabilities of Regulated Regime – The regulated environment does not guarantee the absence of ML/FT activities. In the face of regulation and more consistent application of AML/CFT measures, the ML/FT activities tend to become more sophisticated and complex. As such, the emerging trends of movement from known ML/FT typologies may not be readily detected and discernable by TCSP. This is so because:

- More sophisticated vehicles are being established through TCSPs and ultimately used to perpetrate ML/FT activities;
- TCSP employees may knowingly assist the concealment of ML/FT activities, which may ultimately be more difficult to detect in light of the knowledge of employees; and/or
- Sanctioning powers on rogue individuals within TCSPs may be limited or difficult to apply.

135. **Vulnerabilities of an Unregulated Regime** – Within an unregulated environment, the risk of TCSPs not adequately applying the relevant FATF Recommendations to their operations and client base is greater than that of the regulated environment. Additionally, TCSP practitioners, who have not been subjected to fit and proper testing, may be uneducated about the ML/FT risks and the known typologies for the misuse of corporate vehicles. As such, their operating policies and procedures may be deficient in this regard. Therefore, some of the vulnerabilities include:

- Unknown and/or inconsistent application of the FATF 40 + 9 Recommendations to client base, and in particular Recommendations 5, 6, 8 & 11;
- Little market restriction on practitioners – lack of fit and proper assessment to ensure practitioners have adequate skills, competence and integrity;
- Inconsistent record keeping across practitioners may hamper investigations that do arise;
- TCSPs operating in an unlicensed environment appear to be more susceptible to being misused by money launderers, which may be indicative of the need for appropriate training, as well as the review and/or implementation of robust procedures;
- TCSPs may also rely on other financial institutions to carry out CDD on clients, which have been sourced through related or unrelated financial institutions; and
- Limited dialogue between competent authorities and TCSPs as well as amongst TCSPs from varied backgrounds.

136. Within unregulated environments, nuances in legislation from jurisdiction to jurisdiction can serve to assist in the obscuring of beneficial ownership information. This will be further compounded by the use of unrestricted/mobile bearer shares[74] within the ownership structures of corporate vehicles thereby opening them up to misuse for ML/FT.

---

[74] It is acknowledged that aside from the use of bearer shares, concealing beneficial ownership is also possible with other forms of shares *e.g.*, where nominal shares are used and documents are falsified by a nominee.

137. **Vulnerabilities of Direct Incorporation / Central Registry** - the following vulnerabilities were identified:

- Registry may be under-resourced to perform supervisory functions in the absence of a regulated environment;
- Registry does not conduct CDD and EDD where applicable, or verify the accuracy and completeness of data; and.
- CDD information may become outdated and incorrect, which may also impede investigations where the need arises.

4.2 Other Findings

138. Some of the respondents to the questionnaire believe that proper regulation and/or supervision of TCSPs by jurisdictions according to the FATF standards related to regulation and supervision in Recommendation 23 would provide a better safeguard against money laundering risks.

139. There was insufficient information available from responses to the questionnaire, in relation to jurisdictions that operate a central registry system, on their capacity to verify beneficial ownership and other information, provided to the registry by TCSPs or other persons, on corporate structures established within the jurisdiction. Therefore it is difficult to determine the effectiveness of central registry systems.

140. The questionnaire also highlighted the varied positions amongst jurisdictions on who/what is a TCSP. Some jurisdictions went wider in scope than the FATF definition required, while others applied a more restrictive definition. Therefore, for broad analytical purposes, this could make it difficult to evaluate the application of the FATF Recommendations, whether by competent authorities, examiners or self regulating organisations, and the assessment of whether or otherwise there are appropriate measures in place.

4.3 Money Laundering Indicators

141. The following are money laundering indicators that can be gleaned from the responses to the questionnaire and the case studies provided:-

- Transactions that require the use of complex and opaque legal entities and arrangements;
- The payment of “consultancy fees” to shell companies established in foreign jurisdictions or jurisdictions known to have a market in the formation of numerous shell companies;
- The transfer of funds in the form of “loans” to individuals from trusts and non-bank shell companies. These non-traditional “loans” then facilitate a system of regular transfers to these corporate vehicles from the “borrowing” individuals in the form of “loan repayments”;
- Cases of corruption where the company paying the bribe to secure a contract or the person brokering a contract will seek to secure a successful outcome by utilising a TCSP to operate a trust with the funds held on deposit for the benefit of the person approving the contract;

- The use of TCSPs in jurisdictions that do not require TCSPs to capture, retain or submit to competent authorities information on the beneficial ownership of corporate structures formed by them;

- The use of legal persons and legal arrangements established in jurisdictions with weak or absent AML/CFT laws and/or poor record of supervision and monitoring of TCSPs;

- The use of legal persons or legal arrangements that operate in jurisdictions with secrecy laws;

- The use by prospective clients of nominee agreements to hide from the TCSP the beneficial ownership of client companies;

- The carrying out of multiple intercompany loan transactions and/or multijurisdictional wire transfers that have no apparent legal or commercial purpose;

- Clients who require the use of pre-constituted shell companies in jurisdictions that allow their use but do not require updating of ownership information; and

- TCSPs that market themselves and/or their jurisdictions as facilitating anonymity and disguised asset ownership.

CHAPTER 5: CONCLUSIONS

142. This section details significant conclusions arising from the responses to the questionnaire and the analysis of the cases presented.

143. TCSPs vary from jurisdiction to jurisdiction in the types of persons and entities that make up the sector; the definition and scope of services provided; as well as in the nature and effectiveness of regulation and supervision by the competent authorities. This variation in the industry on an international level poses difficulties for appropriately managing the AML/CFT risk that this sector faces, particularly since in many jurisdictions the services offered by TCSPs have an international component.

144. Although TCSPs may play marginally important roles in some larger jurisdictions, they do play a significant role in the economies of many smaller jurisdictions where the financial services industry is a key source of income. In these jurisdictions TCSPs are significant in that they introduce international business to the jurisdiction and facilitate a smoother journey into and through these business relationships.

145. The Questionnaire responses indicate that in jurisdictions that operate unregulated regimes for their TCSP sectors, there is inconsistent application of the FATF 40+9 requirements. Also, in the jurisdictions that do regulate, there are sometimes variations in the approach to regulation, as some jurisdictions fully regulate the entire sector while others do it on a partial basis.

146. For the most part, the information that TCSPs should be required to capture in accordance with the FATF Recommendations, appears to be adequate to assist in AML/CFT efforts. However, more guidance is necessary to clarify the meaning and scope of 'beneficial ownership'; and to specify the categories of persons on whom information is needed in relation to legal persons such as foundations or legal arrangements.

147. Although considerable work has already been done by the FATF to include TCSPs in the AML/CFT framework requirements, the current recommendations and guidance by the FATF need to more effectively address the risks associated with this sector and to comprehend the role of TCSPs in AML/CFT efforts. In this regard, the TCSP sector may benefit from the application of certain specific recommendations that already apply to the financial sector. For instance, the fit and proper requirements and the rules relating to branches and subsidiaries would be greatly beneficial to ensuring that jurisdictions are able to effectively combat money laundering and terrorist financing through this sector.

148. Given the disparity in the nature of the TCSP sectors and their supervision in various jurisdictions, many stakeholders in this industry support the development of sector-specific international standards for TCSPs, whether formulated through the FATF or through an international body established primarily to focus on this sector. Creating or implementing international standards for TCSPs will provide clarity to countries/jurisdictions and ultimately strengthen the application of the FATF Recommendations. The work of the OGBS in developing a Statement of Best Practices for this sector, although not having achieved the status of recognised international standard, is an important step in this direction. To promote consistency in the regulation of TCSPs internationally, most jurisdictions that operate fully licensed and regulated TCSP regimes recommend that such an international body should establish minimum standards for the regulation of TCSPs and should act as

a forum to encourage dialogue between regulators and to facilitate the establishment of new regulatory agencies in jurisdictions that currently do not regulate.

149. Supervision of TCSPs, whether on a prudential level or only for AML/CFT purposes, will be greatly enhanced with the implementation of supervisory requirements that oblige TCSPs, to establish separate legal identity from other companies within their corporate group; and require them to ensure that the mind and management of the TCSP is also separate and/or has appropriate degrees of autonomy and independence.

150. Additionally, supervision of TCSPs should of necessity include the implementation of 'fit and proper' requirements in relation to the mind and management of TCSPs. This will increase the likelihood of sound business management; adherence to regulatory requirements; and appropriate implementation of AML/CFT measures including more rigorous and discerning measures to vet clients. It should also decrease the likelihood of mindless conformity to improper policies/instructions laid down by parent companies or clients.

151. Although the responses to the questionnaire, the case studies and the literature review do not readily suggest that the TCSP sector lends itself to terrorist financing, it remains a serious risk given the fact that the methods used for money laundering and terrorist financing can be similar. In particular, there is a potential vulnerability in the use of opaque corporate structures and/or charities, combined with the transfer of value via TCSPs. In addition, the FATF Special Recommendations relating to terrorist financing are newer than those for money laundering, and thus further trends may become apparent as suspicious transaction reporting regimes mature.

CHAPTER 6: ISSUES FOR CONSIDERATION

152. This report has highlighted the vulnerabilities inherent in the TCSP sector and the policy considerations outlined below suggest that additional work may need to be done by the FATF and other stakeholders to address the issues raised there.

6.1 Policy Considerations

153. The findings show that TCSPs internationally play a central role in the formation and administration of trusts and corporations. When trust and corporate vehicles are misused for money laundering, there will almost always be a connection to a TCSP that was either knowingly or otherwise involved in the establishment or administration of the misused trust or corporate vehicle. Steps taken to require that those engaged in the provision of trust and corporate services meet appropriate fit and proper standards could reduce the money laundering risk. It may be useful therefore, to consider establishing minimum standards to restrict persons from operating as TCSPs unless they are properly qualified professionals; and having provisions that might permit monitoring of their activities and ensure their compliance with international standards. In the light of this, the project team has identified the following policy implications that flow from the analysis of the questionnaire responses and the case studies presented,

i. The FATF may wish to consider whether any gaps exist in Recommendations 12, 16 and 24 as they apply to TCSPs,

ii. The FATF may wish to consider whether the Recommendations relating to TCSPs should be applied according to the nature of the activities in which a TCSP is engaged.

iii. Trust service providers hold and manage assets, and are engaged in financial transactions in respect of the trusts they form and/or administer. The FATF may wish to consider whether such providers should still be classified as DNFBPs.

iv. While in some jurisdictions trust service providers are also corporate service providers, the research shows that several jurisdictions do distinguish between trust service providers and corporate service providers. Within the broad scope of the services that can be provided by corporate service providers, it may be beneficial to consider whether there should be a differentiation between:

   a. Corporate Service Providers that provide management and administration services, particularly when they fulfil a fiduciary responsibility. It might be appropriate to consider making these CSPs subject to additional requirements above those specified in Recommendations 12 and 16; such as Recommendations 22 and 23. Recommendation 23 dealing with fitness and propriety may be especially important to safeguard this class of CSPs from being involved in, or misused for money laundering and other criminal purposes; and

b. Corporate Service Providers that provide only basic incorporation services.[75] It might be appropriate to consider making this category of CSPs subject only to the minimum requirements currently in place for DNFBPs. However, it follows that jurisdictions might then need to have some means of determining whether this class of CSP goes outside this narrow scope of business; and of ensuring that, if they do begin to provide a wider range of services, the more rigorous controls are applied to them.

v. Consideration could be given to imposing a requirement, specific to TCSPs, in respect of the establishment of policies and procedures relative to the segregation of clients' assets and liabilities from the assets and liabilities of the TCSP; as well as the safe custody of clients' assets. These policies and procedures may address at least a description of the control of and the full physical separation between the assets of every client, every third party and the TCSP.

vi. Jurisdictions that elect to implement central registry systems should consider the inclusion of effective mechanisms to ensure that beneficial ownership information is kept up to date, and at the point of incorporation/registration, that appropriate CDD is carried out. It could also be important that the onus of these key and ongoing responsibilities be made clear to the responsible person(s); and that adequate and dissuasive sanctions be available and applied to persons who fail to carry out these requirements. However, if this enforcement function is carried out by the Registry itself rather than by another appropriate body, this would move the Registry's mandate more towards that of a supervisory authority, rather than the repository function of most central registries.

vii. As part of the on-going FATF work to look at the AML/CFT standards , the FATF may wish to consider whether Intermediaries/TCSPs should be required to maintain within the jurisdiction current information on beneficial ownership/control pertaining to all legal persons and legal arrangements established or administered by them, except as allowed for under Recommendation 9. It follows that any requirement of this nature would need to be supported by compulsory or punitive measures available to competent authorities to ensure compliance.

6.2 Areas for Further Work

154. In addition to the policy considerations outlined above, the following describe other important areas for possible further research or deliberation.

i. Assessing the national and international cooperation issues ensuring and/or enhancing access to and exchange of information on beneficial owners, was included as a key issue to be addressed within the scope of this report. However, there was insufficient information gathered to form the basis of any substantive analysis of this issue. Nevertheless, this is a matter on which the FATF is now focussing its attention.

ii. A further definition of beneficial owner as it relates to legal entities, such as foundations, and legal arrangements such as trusts, may need to be contemplated. It is recognised that this is one of the issues that the FATF is currently examining through its work in reviewing Recommendations 5, 33 and 34.

---

[75] This is where no value-added services are provided over and above the incorporation service.

iii. Consideration and appropriate research in determining the value of assets administered by and flowing through TCSPs (similar to the statistical data that is maintained for banks, mutual funds, and insurance brokers of the assets managed, premiums underwritten, etc.) may provide a basis upon which to review the level of risk and incentive for fraud, ML and TF being conducted through corporate vehicles.

iv. It may be useful to evaluate the efficacy of extending FATF Recommendation 22, on branches and subsidiaries, to the TCSP sector.

v. Consideration may be given to the development of further guidance in the FATF Methodology on legal professional privilege vis-à-vis the filing of SARs. A study by the FATF on the conflict between legal professional privilege in both common law and civil law jurisdictions may lend clarity to this area and facilitate the development of guidance in this area.

vi. There is a need for a more detailed consideration on whether or not it may be useful to have an international body to provide oversight for the TCSP sector. If this is considered appropriate, then a determination of the scope of the remit of such a body would be necessary to bring uniformity to both the operation of the sector and the supervision of the sector for prudential and AML/CFT purposes.

vii. Consideration could be given, under the anti-corruption framework, to the issue of the abuse of corporate vehicles and legal arrangements in concealing the proceeds of corruption. This is another area included within the current work agenda of the FATF.

viii. The FATF has developed specific requirements regarding the administration of trust services and cooperation between competent authorities that are applicable to all jurisdictions including those countries that do not have any trust laws. It is therefore important that all jurisdictions, including those that do not have any trust laws, effectively implement these requirements. Consideration might be given to whether there is a need for the development of a mechanism to enable or require jurisdictions to determine whether trust services are in fact being provided by persons or entities within their jurisdiction.

ix. Consideration should be given to what more needs to be done to enhance the effectiveness of company registers and other publicly available information sources such as the Stock Exchange. Consideration should be given to determining whether such bodies should be given additional responsibilities in relation to verification of the information provided to them. This is another area included in the current work of the FATF.

x. Consideration should be given to determining whether there is any practical action that needs to be or can be taken to enhance the information that is publicly available in respect of legal arrangements. Again, this is an area included in the current work of the FATF.

xi. Consideration should be given to determining whether guidance in other forms should be produced, for example, risk assessment checklists, to help the competent authorities focus their risk-based approaches in relation to the different types of misuse of legal persons and legal arrangements. In the interim, countries are encouraged to consider the guidance documents issued by the FATF in 2008

and 2009 on the risk-based approach for legal professionals;[76] accountants;[77] and TCSPs.[78] Additionally, it should be noted that the FATF is in the process of developing further guidance to assist jurisdictions in conducting national ML/TF assessments, which is expected to include additional guidance on national risk assessment of certain types of financial institutions or activities. It is also looking at this issue from the point of view of the risk-based approach.

** As of October 10, 2010 the Netherlands Antilles (comprising of Curaçao, Bonaire, St. Martin, St. Eustatius and Saba) has been dismantled and has therefore ceased to exist. This entails that besides the Netherlands and Aruba, Curaçao and the Dutch part of St. Martin have now become autonomous countries within the Dutch Kingdom, while Bonaire, St Eustatius and Saba have been integrated into the Netherlands as special municipalities. All five islands remain non-sovereign by mutual consent.

AN NEX I - TABLES

Table 1 – Services Provided by TCSPs in Respondent Jurisdictions

Type	Yes	Estimated total based in jurisdiction				No Estimates Provided
Acting as a formation agent of legal persons;	15 Jurisdictions	64 Anguilla 221 Bahamas 56 Bermuda 127 British Virgin Islands 278 Cayman Islands	100 Guernsey 19 St. Lucia 41 Turks and Caicos 209 United Kingdom[a] 995 United Kingdom 5000 United States			Canada Jersey St. Vincent and Grenadines Switzerland
Acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;	16 Jurisdictions	64 Anguilla 221 Bahamas 56 Bermuda 127 British Virgin Islands 160 Cayman Islands 140 Guernsey 170 Netherlands	146 Netherland Antilles 19 St. Lucia 41 Turks and Caicos 207 United Kingdom[b] 964 United Kingdom			Canada Jersey St. Vincent and Grenadines Switzerland United States
Providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangements;	16 Jurisdictions	64 Anguilla 221 Bahamas 56 Bermuda 127 British Virgin Islands 278 Cayman Islands 140 Guernsey 170 Netherlands	146 Netherland Antilles 19 St. Lucia 41 Turks and Caicos 483 United Kingdom[c] 1420 United Kingdom			Canada Jersey St. Vincent and Grenadines Switzerland United States

Table notes:

a. UK: 209 solely undertaking this (of acting as a formation agent of legal persons) activity as TCSP activity; 995 undertake this in addition to other activity

b. UK: 207 solely undertaking this (of acting as (or arranging for another person to act as) a director or secretary of a *company*, a partner of a partnership, or a similar position in relation to other legal persons) as TCSP activity; 964 undertake this in addition to other activity

c. UK: 483 solely undertaking this (of providing a registered office; business address or accommodation, correspondence or *administrative* address for a company, a partnership or any other legal person or arrangements) as TCSP activity; 1420 undertake this in addition to other activity

d. UK: 140 solely undertaking this (of acting as(or arranging for another person t act as) a trustee of an express trust) as TCSP *activity*; 336 undertake this in addition to other activity

e. UK: 207 solely undertaking this (of acting as (or arranging for another person to act as) a nominee shareholder for another person) as TCSP activity; 964 undertake this in addition to other activity

Table 2 – Jurisdictions requiring licensing for TCSPs

Questions 9 and 15 Table of Responses

Jurisdiction	TCSP required to be licensed	TCSP required to be registered	No. of TCSPs currently licensed	No. of TCSPs currently registered	Ongoing monitoring and supervision of TCSPs	Competent authority responsible for ongoing monitoring and supervision	Nature of ongoing monitoring and supervision
Anguilla	Yes	-	16	-	Yes	Anguilla Financial Services Commission	Prudential and AML/CFT • Onsite • Offsite • Review of annual submissions
Bahamas							
TSPs	Yes	-	283	-	Yes	Central Bank of the Bahamas	Prudential and AML/CFT
CSPs	Yes	-	211	-	Yes	Compliance Commission on behalf of the Inspector of Financial and Corporate Service Providers (FCSPs) (the Securities Commission)	AML/CFT • Onsite • Offsite • Training • Consultations
Bermuda							
TSPs	Yes	No	31	-	Yes	Bermuda Monetary Authority	Prudential and AML/CFT • Onsite • Offsite • Review of annual submissions
CSPs	No	No	N/a	N/a	No	N/a	N/a

Jurisdiction	TCSP required to be licensed	TCSP required to be registered	No. of TCSPs currently licensed	No. of TCSPs currently registered	Ongoing monitoring and supervision of TCSPs	Competent authority responsible for ongoing monitoring and supervision	Nature of ongoing monitoring and supervision
British Virgin Islands	Yes	-	239	-	Yes	Financial Services Committee	Prudential and AML/CFT • Onsite • Offsite Review of half year prudential return and biennial risk based questionnaire
Canada							
TSPs	Yes (Trust Co's)	-	81	-	Yes	Financial Transactions and Reports Analysis Centre of Canada (FINTRAC)[a]	Prudential and AML/CFT • Onsite • Offsite Review of compliance questionnaires
CSPs	No	N/a	N/a	N/a	Yes	Financial Transactions and Reports Analysis Centre of Canada (FINTRAC)[b]	AML/CFT • Onsite • Offsite Review of compliance questionnaires
Cayman Islands	Yes	-	278	-	Yes	Cayman Islands Monetary Authority	Prudential and AML/CFT • Onsite • Offsite Review of audited financial statements

Jurisdiction	TCSP required to be licensed	TCSP required to be registered	No. of TCSPs currently licensed	No. of TCSPs currently registered	Ongoing monitoring and supervision of TCSPs	Competent authority responsible for ongoing monitoring and supervision	Nature of ongoing monitoring and supervision
Guatemala*	Yes (financial institution – banks and financial companies - that serve as trustees)	-	33 (18 banks and 15 financial entities)	-	Yes	Superintendency of Banks (prudential supervision) Intendancy of Special Verification (AML/CFT supervision) Superintendency of Tax Administration (matters of tax control)	Prudential and AML/CFT
Guernsey	Yes	-	197	-	Yes	Guernsey Financial Services Commission	Prudential and AML/CFT • Onsite • Offsite Review of annual submissions
Honduras*	Yes (banks are the only entities able to act as 'trustees'. Banks require a license to operate)	-	17	-	Yes	National Banking and Insurance Commission	Prudential and AML/CFT • Onsite • Offsite
Jersey	Yes	-	182	-	Yes	Jersey Financial Services Commission	Prudential and AML/CFT • Onsite • Offsite Review of annual submissions

Jurisdiction	TCSP required to be licensed	TCSP required to be registered	No. of TCSPs currently licensed	No. of TCSPs currently registered	Ongoing monitoring and supervision of TCSPs	Competent authority responsible for ongoing monitoring and supervision	Nature of ongoing monitoring and supervision
Netherlands	Yes (only TCSPs who carry on Corporate Service Business are recognised)	-	170	-	Yes	Dutch Central Bank (De Nederlandsche Bank)	AML/CFT • Onsite • Offsite
Netherlands Antilles	Yes	-	146	-	Yes	Central Bank of the Netherlands Antilles (Bank Van de Nederlandse Antillen)	Prudential and AML/CFT • Onsite • Offsite • Review of submissions
Panama*	Yes	-	-	-	Yes	Superintendency of Banks of Panama	Prudential and AML/CFT
St. Lucia	Yes	-	20	-	Yes	Financial Sector Supervision Unit	Prudential and AML/CFT • Onsite • Offsite Review of financial statements
St. Vincent and Grenadines	Yes	-	24	-	Yes	International Financial Services Authority	Prudential and AML/CFT • Onsite • Offsite Review of annual submissions

Jurisdiction	TCSP required to be licensed	TCSP required to be registered	No. of TCSPs currently licensed	No. of TCSPs currently registered	Ongoing monitoring and supervision of TCSPs	Competent authority responsible for ongoing monitoring and supervision	Nature of ongoing monitoring and supervision
Switzerland	Yes	-	Not known	Not known	Yes	FINMA or a SRO (authorized and monitored by FINMA)	Prudential and AML/CFT • Onsite • Offsite • Audits
Turks and Caicos	Yes	-	58	-	Yes	Turks and Caicos Islands Financial Services Commission	Prudential and AML/CFT • Onsite • Offsite Review of statutorily required documents
United Kingdom	No	Yes	-	2197	Yes	HM Revenue and Customs (HMRC), Financial Services Authority or professional bodies (the relevant legal and accountancy bodies) named in Schedule 3 of Money Laundering Regulations 2007	AML/CFT only • Onsite • Offsite
United States							
TSPs[c]	Yes	-	-	-	-	National or Relevant competent authority for each State	Prudential and AML/CFT
CSPs	No	Yes-in two States[d]	-	1176 approx	Yes – in two States	Secretary of State for each State	Conduct of Business only • Onsite • Offsite Audits

Jurisdiction	TCSP required to be licensed	TCSP required to be registered	No. of TCSPs currently licensed	No. of TCSPs currently registered	Ongoing monitoring and supervision of TCSPs	Competent authority responsible for ongoing monitoring and supervision	Nature of ongoing monitoring and supervision
Venezuela*	Yes	-	-	-	Yes	Inspection Management of Superintendency of Banks and Other Financial Institutions	Prudential and AML/CFT Submission of required documents

Table notes:

* These jurisdictions indicate that only banks or financial institutions are permitted to provide trust services within the jurisdiction. Therefore these financial institutions are licensed under general banking laws and not specifically under separate trust legislation.

a. Trust Companies are regulated at both the federal and provincial level. Market conduct is regulated by the provinces, and federally incorporated trust and loan companies are regulated by the Office of the Superintendent of Financial Institutions (OFSI). FINTRAC conducts onsite compliance inspections for TCSPs. OFSI also conducts onsite inspections, as the primary regulator for trust companies, and shares with FINTRAC information related to AML/CFT compliance.

b. FINTRAC conducts AML/CFT ongoing monitoring and supervision for all reporting entities in Canada, including persons or business carrying out CSP functions.

c. Due to the definition of TCSP used in this report and the fact that in the US, trust companies are defined as 'financial institutions' the responses provided by the US do not generally address trust companies. Trust companies, which are licensed to provide a range of fiduciary services, are chartered at either the national of State level, and are included in the definition of "bank" for AML/CFT purposes and are generally subject to the same regulations.

d. Two States, Delaware and Wyoming, require company service providers having a minimum number of customers to register with the Secretary of State in their capacity as commercial registered agents. In addition, nine other states have adopted the Model Registered Agents Act, (MORAA) which provides incentives that encourage commercial agents to register with the State Filing Office / Secretary of State.

Table 3 – SARs filed by TCSPs

- Number of SARs filed for each year between 2006-2009
- Percentage of SARs filed by TCSPs for each year between 2006-2009 in relation to the total number o f SARs filed for the said period.

	Year

Venezuela	1	0.2%	1	0.08%	1	0.08%	2	0.07%	5	0.1%

Table notes:

a. No aggregate figures were provided by Hong Kong for SARs filed by all sectors for the relevant period.

b. Unusual Suspicious Transactions Reports: STR's in the Netherlands are different from STR's in other countries. Unusual financial transactions are first investigated by the FIU and then upgraded to Suspicious Transactions Reports (STRs).

c. No aggregated statistics exist for SAR covering all categories of financial intermediaries which provide TCS (legal professionals, fiduciaries and banks). In addition, it is not known what proportion of SAR attributed to lawyers/fiduciaries result exclusively from TCS activities as defined by the FATF. Having considered these limitations, the figures are the aggregated figures for the number of SARs attributed to the fiduciaries and legal professionals.

ANNEX II – ADDITIONAL CASES

Case A: Weak regulatory AML/CFT regime and bank secrecy laws

Banks A and B were offshore banks licensed and operating in a small island State. Bank A was part of a group of companies which also consisted of a trust company providing corporate management services. Bank B was owned by two International Business Corporations which in turn were owned by two individuals in the United States. Bank B was created on their behalf by the trust company for the sole purpose of facilitating the receipt of the proceeds from an 'advance fee-for-loan' fraud operated by the ultimate beneficial owners of Bank B. Bank B had a correspondent banking relationship with Bank A and relied on Bank A's correspondent banking relationships in the United States and elsewhere to facilitate the receipt of the fraud proceeds. Bank B was managed by a corporate service provider which was owned and operated by one of the senior officers in Bank A, and this service provider also managed Bank A's correspondent banking accounts, established IBCs and opened accounts for Bank A's clients as well as for the potential victims of the 'advance fee-for-loan' fraud. These victims were required to establish IBCs in that jurisdiction and to open bank accounts at Bank A to which the fraud proceeds would be sent. Bank A on the instructions of the victims' IBCs would then transfer those funds into Bank B's account. From there the funds were transferred into the IBC accounts of Bank B's owners. This entire scheme therefore took place within the Banking system of this Caribbean jurisdiction, which being subject to bank secrecy laws meant that the fraudster's activities were protected from disclosure to US or local authorities. In the approximately three years over which Bank B was in existence, the Bank was never subjected to any form of regulatory oversight by the competent authorities of the island State. Even though Bank A had a longer history of operation and was implicated in a vaster array of questionable activities and schemes, it too escaped scrutiny by banking regulators because during the entire period of its existence the jurisdiction in question had no policy of examinations for licensed offshore banks. During the relevant period only a nominal requirement was in place for the submission of audited financial statements, but the authorities were lax in policing even this minimal obligation. The fraudsters therefore targeted this jurisdiction as a likely receptacle for the funnelling of illicit proceeds and the pivotal point for commencing the laundering of those proceeds.

Source: Extrapolated from: Minority Staff of the Permanent Subcommittee on Investigations (US Senate)

Case B: Weak regulatory AML regime and unrestricted use of bearer shares

To launder the proceeds of a narcotics importing operation, a lawyer who worked on behalf of the organisation, established a web of offshore corporate entities. These entities were incorporated in Country C, where scrutiny of ownership, records, and finances was not strong and where bearer shares were permitted to be used indiscriminately. A local management company in Country D administered these companies, which were used to camouflage the movement of illicit funds, acquisition of assets, and financing criminal activities on behalf of the criminal organisation. The person at the helm of the narcotics importing organisation was the holder of 100% of the bearer share capital of these offshore entities.

* Found on the Jersey FSC website in **"Anti-Money Laundering/Countering the Financing of Terrorism Typologies from a Jersey perspective"** published on October 28, 2008 and produced by BakerPlatt on behalf of the Law Officers, Joint Financial Crimes Unit and the Jersey Financial Services Commission. The purpose of the publication was to raise awareness of typologies that are relevant to Jersey including the risks arising from the nature of the customer base and products associated with Jersey as an international finance centre. Both local and international cases were used. The cases included within this report with the annotation "Extracted from website of Jersey Financial Services Commission" are the international cases referenced in the October 2008 publication. The origins of the international cases within the publication are not noted therein.

Case C: Concealment of beneficial ownership through the use of shell companies

THE WHITE WHALE CASE – H, an employee of a lawyer's office, was the administrator for 300 companies established through the law office on behalf of its clients, many of whom were known to be involved in international criminal organisations. The majority of the companies were shell corporations established in an

American State, though some companies were incorporated in Spain for the purpose of being used in money laundering schemes based on the real estate market. The Spanish companies were usually owned by the shell corporations registered in the American State and these pre-constituted companies, would have been incorporated using the name of an agent, usually a lawyer. The documents of incorporation for such companies would remain inactive in the hands of the agent until the company was bought by a client, and at the moment of purchase the company would become effective. The board of these pre-constituted companies when first registered would comprise the agent and his associates, who would usually have no link with the real owners who subsequently purchased the shell company.

Source: extracted from 2006 FATF Typology Study – Submitted by Spain

Case D: CSP's role in trade based ML and the concealment of beneficial ownership through use of shell companies

In 2003, ICE received a foreign law enforcement request for information about two U.S. companies which were registered in Wyoming. The foreign law enforcement agency suspected that several shipments of canned seafood, allegedly shipped from the U.S. companies, had been imported into their country, and undervalued in order to evade their taxes and duties.

In response to this request, the ICE was asked to determine if the companies existed, and to obtain as much information as possible regarding their corporate officers, business locations, business activities, and corporate registrations documents.

Subsequent investigation by ICE revealed that both companies were "shell" companies, legally incorporated in the State of Wyoming. The addresses provided by both of the suspect companies on their import documents into the requesting foreign country provided only the address of the Wyoming incorporating agent. The Articles of Incorporation for the suspect U.S. companies were obtained and listed that it was managed by a foreign firm with an address on an island in the Far East. The Articles of Incorporation for the foreign firm had been signed by the Wyoming incorporation agent. The investigation located no records for any additional business addresses, phone listings, or officers located in the United States.

Because there is no requirement for the identification of beneficial ownership at the time of incorporation, the ICE investigation was unable to obtain the information that the foreign government had requested.

Source: submitted by the USA

Case E: Concealment of beneficial ownership through use of shell companies

ICE investigated a criminal organisation where the violators utilized shell corporations to defraud a foreign government out of more than $100,000,000. The foreign and domestic shell companies enabled them to engage in a "bid-rigging" scheme and then launder the fraudulently obtained proceeds. In this bid-rigging fraud scheme, the co-conspirators bribed members of the foreign government's new airport bid committee, in order to win a competitive construction bid. The U.S. targets of the investigation operated a construction company and architectural firm, which submitted a competitive bid for work in the construction of the airport. A Government Assessor in the victim foreign country believed the bid was too high and requested that the bid committee obtain a second bid. As a result, the targets of the investigation utilized a shell company to submit a second, much higher valued bid for the work. As a result of this much higher second bid, the contract was awarded to the targets of the investigation.

Once they had been paid by the foreign government, the organisation laundered the proceeds of the fraud by layering them through a series of shell companies in several countries, including the United States. It was only through handwritten notes kept by foreign bankers that ICE investigators were able to identify the true beneficiaries of the funds. Six of eight indicted individuals were found guilty of violating money laundering, and wire fraud statutes. As part of the sentence, the court ordered the payment of approximately $22 million in restitution.

Case F: Criminal culpability of TCSPs as facilitator of ML

X was a chartered accountant and the sole principal of a financial services business trading as X & Co. He acquired companies, provided directors, formed trusts and acted as trustee. He was signatory to hundreds of bank accounts. X used these facilities as a tool kit to help foreign clients to cheat their fiscal authorities and

launder the proceeds of crime. The common theme was that he was willing deal with the assets of clients according to their instruction.

X laundered money in a variety of ways. He extracted money from foreign trading companies using false invoices drafted at the behest of clients, holding the sums received anonymously for his clients. He layered millions of pounds through his pooled accounts. He obtained and delivered cash from and to his clients. He lied about the beneficial ownership and purpose of his companies and the origin of property to the Jersey authorities and others.

A key aspect of his business was his trade in bank notes. He obtained cash from clients who wanted to get rid of it, crediting bank accounts held for them with equivalent sums sourced from different money in return. The actual cash was then delivered to other clients who wanted their income secretly returned to them in this fashion – bank notes which he personally delivered to them in the Country A. These dealings were hidden by the operation of a spider's web of bank accounts.

The result of these activities was that it was impossible to ascertain the origin and ownership of property without access to the records of X & Co. Even then the tracing exercise was extremely difficult, requiring years of analysis by investigative lawyers, police, and forensic accountants to unravel.

* See note * of Case B, above.

Case G: Concealment of beneficial ownership through use of shell companies

The White Whale Case

In the money laundering scheme involved in this case, ultimate beneficial ownership was obscured through the use of pre-constituted shell companies, which had been incorporated using the name of an agent, usually a lawyer. The documents of incorporation for such companies would remain inactive in the hands of the agent until the company was bought by a client, and at the moment of purchase the company would become effective. The board of these pre-constituted companies when first registered would comprise the agent and his associates, who would usually have no link with the real owners who subsequently purchased the shell company. The immediate benefit of this to the new owners of such companies was that their involvement in the companies remained hidden. *(See Case No. 11 in the report for fuller details)*

Case H: Use of professional intermediaries to facilitate money laundering

There are various examples in the UK of gatekeepers (for example Solicitors, Accountants and Notaries, among others) being involved in setting up Trusts for criminals to launder funds. In one example, a drug dealer deposited the proceeds of his crime into an offshore Trust for laundering purposes and then used funds from the Trust to buy property and also take a loan (one of the powers of a Trust is the facility for it to provide a loan). The use of a Trust in this manner demonstrates a way in which funds can be disassociated from criminality. Investigation of this case suggested that a Solicitor was involved in the laundering process and his expertise used to administer the Trust.

Source: submitted by the United Kingdom

Case I: Use of professional intermediary to facilitate money laundering

Mr. A was in control of a corporation's financial affairs and abused this position of trust by defrauding the company. He authorised and instructed staff to make electronic funds transfers from the company to his bookmakers' accounts. He then instructed the bookmakers to direct excess funds and winnings from the account to his personal account or that of third parties. He also instructed bank officers to transfer funds from his accounts internationally. In order to layer and disguise the fraud, Mr. A instructed his lawyer to contact the beneficiary of these international transfers to return the payments via wire transfers into the lawyer's trust account. Approximately $340,000.00 was returned in one international transfer to the lawyer's trust account. The lawyer then transferred $270,000.00 to a church fund in an attempt to further hide the assets and was preparing to transfer the funds to an overseas account. To access these funds, Mr. A undertook structured withdrawals of $7,400.00 each within a nine day period.

Source: extracted from Egmont Case Studies

Case J: Professional intermediary marketing and providing services as ML facilitator

Mr. C was an accountant who started his own accounting and financial services business, company N, in Panama. He advertised his services primarily on the internet and through mass mailings. Company N provided a variety of services including the following:

- Formation of offshore entities to disguise ownership of assets;
- Passports and dual citizenship, mostly using new nominee names;
- Movement of cash and other assets offshore and back onshore using various methods;
- Issuance of debit cards for the purpose of anonymously repatriating and spending offshore funds;
- Use of correspondent bank accounts to skim profits off legitimate businesses and repatriate funds through the purchase of assets and use of debit cards;
- Anonymous trading of securities through accounts with two major brokerage houses;
- False invoicing/re-invoicing schemes to support fraudulent deductions on tax returns; and
- False investments losses, to disguise transfer of funds overseas.

Mr. C was identified pursuant to an Internal Revenue Service investigation of one of his clients for illegal importation and sale of goods. The targets of this investigation were using a re-invoicing scheme devised by Mr. C to illegally import these chemicals into the US for sale. Mr. C assisted the targets in the re-invoicing scheme by preparing the invoices, receiving the proceeds of the scheme and hiding the proceeds in a myriad of Panamanian corporations for later use by the targets.

Source: extracted from 2006 FATF Typology Study – Submitted by the USA

Case K: Use of professional intermediaries to facilitate money laundering

Bank Y-Trust reported that Mr. John Doe, Attorney-at-Law, contacted them requesting information to open a trust account for his client and was subsequently provided with the necessary information. Bank Y-Trust further reported that John Doe and his client, Mr. Z, visited the office of Bank Y-Trust and presented documents which aroused suspicion because the amount stated to commence the relationship was USD $20 billion. Bank Y-Trust was told that this amount was to be placed into two company accounts, namely 'Night' and 'Day'. Also, the funds were purported to be lodged in cheques at a Bank in a foreign country. Mr. Z indicated that his business partner was Mr. AA. Mr. Z promised to complete and return the due diligence documentation to Bank Y-Trust, which never materialised. Research conducted by Bank Y-Trust, via the internet, revealed that the Central Bank in a foreign country had advised of the counterfeiting of government bonds for and in the name of Mr. AA. The matter was reported to the FIU for analysis, which subsequently forwarded the matter to law enforcement authorities for further investigation.

Source: submitted by the Bahamas

Case L: Detection by TCSP of international boiler room scam

This case is concerned with Subjects A and B who tried to incorporate several International Business Companies in Anguilla at a local TCSP, Company Z via a St. Maarten based TCSP, Company Y. During the KYC process for Company Z, they realized that subjects A and B may have submitted a fraudulent document, namely a reference letter. This was reported to the authorities and further analysis and investigation revealed that subject A and B were owners of several companies which were being used to facilitate an international Boiler Room scam. Most of the victims of this scam were foreign based nationals. Intelligence was supplied to various jurisdictions and investigations have commenced in several. Thus far one Mutual Legal Assistance Letter has been received and the process has already been completed. Thus there will be some form of prosecution as it relates to Company Y which is based in another island jurisdiction as it relates to the matter. A Memorandum of Understanding has also been signed between the cooperating FIUs and any forfeiture made will be shared on a fifty-fifty (50/50) basis.

Source: submitted by Anguilla

Case M: Detection of illegal activities through FIU reporting

Company A was managed by Mr. OXO while company B was managed by Mr. RYA. Company A sold a property to Company B for a significant amount of money, the deposit for which and a large portion of the remaining price was paid in cash and the rest by cheque. The Notary who executed the transaction noticed these unusual large cash payments and made a disclosure to the FIU based on Article 10bis of Belgium's anti-money laundering law. Analysis revealed that:

- The notary deed showed that money for the cheque that was paid to the Notary was put on the account of company A by a cash deposit two days prior to the issue of the cheque.
- Information from the bank showed that company A's account as well as Mr. OXO's personal account were credited by substantial cash deposits, which, among other things, were used for reimbursing a mortgage loan and for cash withdrawals.
- Police sources revealed that both Messrs. OXO and RYA were subjects of a judicial inquiry into money laundering with regard to trafficking in narcotics. They were suspected of having invested their money for purchasing several properties in Belgium through their companies.

These factors together showed that the cash used for purchasing the property probably originated from trafficking in narcotics for which they were on record.

Source: submitted by Belgium

Case N: Investigation of suspicious activities and reporting to FIU

'ABC' was a company established for the provision of accounting, fiduciary and bank signatory services to others. In a regular review of its customers, 'ABC' found the bank accounts of two of its customers, who were the beneficial owners of a number of connected companies, having frequent large-amount deposits and transfers. Open source research was conducted by the TCSP that unveiled that the clients might be related to money laundering activities in three overseas jurisdictions. A report was subsequently filed with the Joint Financial Intelligence Unit and the matter was pursued both in Hong Kong and the concerned overseas jurisdictions.

Source: submitted by Hong Kong

Case O: Reporting of suspicious activities to the FIU and international cooperation between FIUs

Two individuals, A and B, visited a country in Europe where they used a company formation agent to establish a registered company to receive profits from their ownership of 300 fairgrounds sites around the world. The Agent, who also provided a company and account management service, was suspicious of the underlying story and made a disclosure to the national FIU. Huge sums of money were received into the account in a brief period and A and B gave instructions to the Agent for a large sum to be invested in a Unit trust. The account continued to receive large US transfers over 2 years and a large amount was transferred into the account of a Mrs. X., who had earlier that year visited the formation agent with an introduction from A and B.

Mrs. X's story was that she would be receiving this money for a large amount of soya beans which she would be supplying to A and B's fairgrounds and as such needed the agent's help to set up an account to receive these funds. The agent assisted her and then made a further disclosure to the FIU detailing the full transaction. When the large transfer to Mrs. X's account was made, a further disclosure to the FIU was again submitted by the agent.

As a result, the FIU's enquiries to their home country revealed that A and B were convicted drug traffickers and that Mrs. X was the wife of another convicted drug trafficker. Mrs. X later requested the Agent to transfer a huge sum to her personal account in her home country. When notified of this development by the Agent, law enforcement agents in both countries agreed that the transaction should be done to gain further intelligence. However when the money arrived in her account, the Customs agency in Mrs. X's country restrained the funds. These funds were ultimately confiscated after a judicial determination was made that they were drug proceeds. Efforts by Mrs. X to liquidate her remaining funds held by the Agent was also notified to law enforcement and prevented from taking place.

Case P: Detection of fraud scheme and international cooperation

Bermuda Police received two suspicious activity reports, one from a bank and the other from a Corporate Service Provider, both in relation to a Country A individual, who was attempting to urgently establish a local business and open bank accounts. Unhappy with the results of due diligence, both the bank and the service provider simultaneously made the reports, indicating that the individual was trying to wire in excess of $1,000,000 into accounts in Bermuda the following day. Upon investigating, Bermuda Police discovered that fraudulent documents had been used to open the accounts and to start the business and therefore quickly arrested the individual. Search warrants conducted the following day in the individual's hotel room revealed evidence of serious fraud, which had been perpetrated in Country A and Country B; as well as documents that showed the route through Countries A, B and C of the laundered proceeds of that fraud. The end result was that the individual was charged and convicted in Bermuda for minor fraud offences and was repatriated to Country A to face criminal charges. The Bermuda Police provided significant evidence for the ensuing market manipulation trials in Country A that saw two persons convicted on numerous counts for a multi-million stock market dollar fraud scheme. They also provided significant evidence relating to the assets of the main perpetrators for later recovery.

ANNEX III – QUESTIONNAIRE

LONG FORM QUESTIONNAIRE

FATF / CFATF TYPLOGIES PROJECT ON MONEY LAUNDERING AND FINANCING OF TERRORISM USING TRUST AND COMPANY SERVICE PROVIDERS (TCSP)

Dear Colleague

We are writing to seek your assistance in obtaining information for a typologies project on money laundering and financing of terrorism using trust and company service providers (TCSP; see note 1). As you are aware, this and related matters have been the subject of many discussions and debates at the highest levels in our countries and many jurisdictions are currently grappling with how best to address the challenges being faced in this regard.

This questionnaire has been compiled by a Working Group of FATF and CFATF members and the information will be used to create greater awareness and understanding of this important area and potentially assist in policy formulation regarding money laundering and terrorist financing issues that relate to TCSPs[79]. It is intended that a report on Money Laundering and Financing of Terrorism using Trust and Company Service Providers will be completed by the end of 2010.

Please complete all of the following questions as comprehensively as possible. However with regard to information on legislation, a summary of the relevant provisions and/or copies of appropriate sections is acceptable. In order to assist us in meeting key external deadlines we would urgently request that the information be provided to us on or before January 15, 2010.

Industry Feedback on the questions posed in Part G may also be solicited but we would request that such feedback be specifically identified.

Confidentiality: Please be assured that your submissions will remain confidential as the following conditions will be strictly adhered to:

a) The completed questionnaires will not be published; and

b) Jurisdiction specific information will only be included in the report if the permission of the relevant person in the jurisdiction is first obtained.

We certainly appreciate your contribution to this important work.

79 Please note that this is a typologies research project and not a standard setting project.

Part A: BACKGROUND INFORMATION

1. Jurisdiction

2. Contact Name and title (please give two names, if the first contact is regularly away from the office for long periods of time)

3. Contact details

E-mail address	
Telephone Number	
Fax Number	

Part B: DESCRIPTION OF TCSPs

4. Please provide the definition, if any, of TCSPs provided for under the legislation of your jurisdiction.

5. What is the estimated total number of TCSPs in your jurisdiction?

6. i) Of the total number of TCSPs in your jurisdiction, please indicate which of the following types of TCSPs are present. Please also rank each type of TCSP in terms of which is the most and least common type of TCSP present in your jurisdiction (with 1 being the most common and 6 being the least common).

	Type of TCSP	**Present (Yes/No)**	**Rank (1 = most common 6 = least common)**
1	TCSP which carries on Trust business only		
2	TCSP which carries on Corporate Services Business[80] only		

[80] Company Management Business

3	TCSP which carries on both Trust and Corporate Services Business		
4	TCSP businesses which are licensed as a financial institution (other than as a TCSP) or are subsidiaries or branches of financial institutions licensed either locally or in another jurisdiction (E.g. TCSP owned or controlled by banks, attorneys, investment, fund manager or insurance companies)		
5	TCSP businesses which are banks, subsidiaries or branches of TCSP businesses based in another jurisdiction (E.g. Country X TCSP which is a subsidiary of Country Y fiduciary)		
6	Other (please specify)		

ii) Which of the following TCSP services are conducted in your jurisdiction? Where applicable, please state the corresponding legislation (if any) and the estimated number of such TCSP services in the jurisdiction.

Type	**Yes/ No**	**Name of Applicable Legislation**	**Estimated total based in jurisdiction**
Acting as a formation agent of legal persons;			
Acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;			
Providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangements;			
Acting as (or arranging for another person to act as) a trustee of an express trust;			
Acting as (or arranging for another person to act as) a nominee shareholder for another person.			

iii) What restrictions, if any, apply in your jurisdiction on persons carrying on TCSP business? Please provide further information.

Who can act in capacity of: **(Yes/No)**	**Corporations**	**Accountants**	**Lawyers**	**Others (please specify)**
TCSP: incorporating a company				
TCSP: providing company administration/corporate services business				
TCSP: acting as a Trustee				
TCSP: providing trust administration services/trust business				

7. i) Is it a requirement in your jurisdiction that a TCSP be used to incorporate a company or can a company be incorporated through direct central registration? Please provide information on the incorporation process.

ii) Please estimate the approximate proportion of legal persons (see note 2) formed in your jurisdiction by non-residents in relation to residents (the terms 'resident' and 'non-resident' as defined in your jurisdiction).

Is the answer to 7(i) above different for residents and non-residents?

PART C: OVERSIGHT OF TCSPs

Legislation

8. i) Are TCSPs subject to any AML/CFT legislation, or any other related legislation, in your jurisdiction?

If TCSPs are subject to any such legislation, including AML/CFT legislation, please provide information on this legislation. For example, the title of the legislation, the year it came into force and the relevant provisions of the legislation.

ii) Please provide information on the procedure and requirements that TCSPs must comply with pursuant to the relevant provisions of the legislation, including the AML/CFT legislation, in your jurisdiction.

iii) In your view are the activities of TCSPs effectively controlled by the application of AML legislation alone or should they be subject to ongoing regulatory /supervisory measures?

iv) Is there a Self Regulatory Organization involved in the oversight of TCSPs for the purposes of a) AML/CFT compliance or b) Prudential Supervision. If Yes have there been any difficulties with respect to the SRO exercising adequate oversight, monitoring and enforcement?

9. i) Are TCSPs required to be licensed/authorized (as part of a prudential or regulatory regime) in your jurisdiction? If so, how many are currently registered and how many of those registered are active? Please note that this question does not refer to the license that individual lawyers obtain from their respective Bar or Regulatory agency in order to practice.

TCSP License/Registration required?	Total currently registered	Total registrants active

ii) If TCSPs are required to be licensed/authorized please provide information on the relevant legislation.

iii) If TCSPs are required to be licensed/authorized please provide information on the licensing/authorization procedure and requirements.

10. What other risk mitigation measures are in place in your jurisdiction to limit the misuse of TCSPs?

11. i) Are trusts required to be registered in your jurisdiction? If so, how many are currently registered and how many of those registered are active?

Trusts License/Registration required?	Total currently registered	Total registrants active

ii) If trusts are required to be registered please provide the year in which this registration requirement commenced.

iii) If trusts are required to be registered in your jurisdiction, please provide details on the registration requirements.

12. If TCSPs in your jurisdiction are subject to AML/CFT legislation and/or are required to be licensed/authorized what has been the impact, if any, on the operation of TCSPs since these requirements were brought into force.

For example:

- Did the number of TCSPs operating increase or decrease or was there a change in the types of TCSPs operating?
- Have there been any cost and/or efficiency implications for TCSPs?
- Has there been any impact on the efficiency of TCSPs in combating money laundering and terrorist financing? For example:
  a. The number or significance of ML/FT investigations initiated as a result of unsolicited reports from TCSP.
  b. Opinion of law enforcement/prosecution authorities on the information and cooperation received from TCSP during an investigation.
  c. Evidence of criminals being discouraged from using TCSP
- Has there been any increase or decrease in the number of clients using TCSPs?

13. Are TCSPs subject to "fit and proper" requirements (see note 3) in your jurisdiction? If yes, please describe these requirements.

14. Are there any proposed amendments to the legislation affecting TCSPs in your jurisdiction? If yes, please provide further information on these proposed amendments and any ML/FT vulnerabilities that the amendments seek to reduce.

Ongoing Monitoring and Supervision

15. i) Are TCSPs subject to ongoing monitoring and supervision in your jurisdiction? If yes, please provide the name of the monitoring authority responsible for this monitoring and supervision.

ii) Please provide further details on the nature and requirements of the ongoing monitoring and supervision.

16. i) Are onsite inspections carried out in relation to TCSPs in your jurisdiction? If yes, please provide the name of the authority responsible for conducting the inspections.

ii) Please provide further details on the nature and requirements of the onsite inspections.

17. If the answer to question 16 (i) above is yes, how many onsite inspections have been carried out between 2006 - 2009?

Year	**Number of onsite inspections**	**Percentage of providers inspected**	**Percentage of market-share inspected** (in terms of number of companies/trusts covered or otherwise)
2009			
2008			
2007			
2006			

Penalties

18. i) Can any penalties and regulatory or other enforcement action be taken against TCPSs in your jurisdiction? If yes, please provide information on the circumstance that would result in any such penalties and regulatory or other enforcement action.

ii) If the answer to question 18 (i) above is yes, please indicate whether the following type of penalties are available:

Penalties	**Yes or No**	**Any additional comments (including enforcement authority)**
Criminal		
Civil		
Administrative (penalties and fines)		
Others (please specify)		

PART D: INFORMATION REQUIREMENTS FOR TCSPs

Beneficial Ownership

Company and Trust Formation

19. i) Is disclosure of beneficial ownership (see note 4) information required at the time of all company formations in your jurisdiction?

ii) Is disclosure of information on the settlors and beneficiaries (see note 5) of trusts required at the time of all trust formations in your jurisdiction?

iii) If yes, is 'beneficial ownership', 'settlors' and 'beneficiaries' defined in the relevant legislation? Please list the relevant legislation that a) defines beneficial ownership, settlors and beneficiaries, and b) requires the identification and collection of beneficial ownership information and information on settlors and beneficiaries.

iv) If disclosure of beneficial information and information on the settlors and beneficiaries is required at the time of company and trust formation, what (if any) are the requirements for providing the competent authorities with any changes to this information after formation?

General Requirements under AML Legislation

v) Are TCSPs required by AML legislation in your jurisdiction to request beneficial ownership information and information on the settlors and beneficiaries of trusts?

vi) If there is legislation requiring beneficial ownership information and information on the settlors and beneficiaries, has there been any impact on the investigations or prosecutions of the misuse of corporate entities in your jurisdiction since this legislation came into force?

vii) Are TCSPs required to obtain information on any of the following :

Information	Yes/No
Source of funds	
Nature of the business to be undertaken	
If yes to either of the above, are TCSPs required to keep the information up to date?	

viii) If disclosure of beneficial ownership information is required, please provide information on who has access to this information and the conditions of access. Where information is held by a TCSP and requested by a competent authority please indicate in your response:

(a) whether there are established procedures for obtaining this information and whether these procedures are established in legislation or rules or guidance;
(b) whether there are specific timeframes for the release of the information;
(c) whether legal proceedings are required to obtain the information;
(d) any limitations to access by the authority (confidentiality, consent of affected party etc); and
(e) the extent to which TCSPs have been unable to or uncooperative in providing the information.

ix) Are there any challenges or difficulties with access to this beneficial ownership? If yes please provide further details.

x) If disclosure of beneficial ownership information is required, do you think there are any changes that need to be made to the way that beneficial ownership information is kept in your jurisdiction, and why?

Bearer Shares

20. i) Are bearer shares (see note 6) explicitly prohibited or permitted in your jurisdiction, or is the law silent on the issue? If yes, please provide further information on whether bearer shares are known to exist and how bearer shares are dealt with in your jurisdiction.

ii) If bearer shares are permitted, what requirements are in place to address potential AML/CFT risks?

iii) Are there any proposed amendments to the legislation affecting bearer shares in your jurisdiction? If yes, please provide further information on these proposed amendments.

Co-operation/Sharing of Information

21. i) Are there any measures in place in your jurisdiction that provides for domestic and international co-operation regarding the exchange of information on beneficial ownership and control? If yes, please provide details on the relevant legislation and measures in place, for example the procedure for obtaining this information and any restrictions on access to this information.

ii) If the answer to question 21 (i) above is yes, have there been any challenges or difficulties experienced with the exchange of information on beneficial ownership?

PART E: MONEY LAUNDERING/TERRORIST FINANCING AND TCSPs

Suspicious Activity Reports (SARs)

22. i) Are TCSPs required to file SARs in your jurisdiction?

ii) If the answer to question 22 (i) above is yes, please indicate i) the number of SARs filed for each year between 2006-2009 and ii) the percentage of SARs filed by TCSPs for each year between 2006-2009 in relation to the total number of SARs filed for the said period.

Year	**Number of SARs filed**	**As a percentage of the total number of SARs filed**
2009		
2008		
2007		
2006		
Total SARS 2006 – 2009		

23. If SARs are required to be filed, what has been the typical subject area of the SARs filed?

24. (i) If a competent authority carries out investigations in relation to a SAR and/or requests information from a TCSP, what in your experience has been the average response time? If time requirements are specified in the legislation please provide these also.

(ii) If problems have been encountered with obtaining information from TCSPs relating to SARS or investigations please provide a general description of these problems.

Cases

25. Is there evidence in your jurisdiction, and beyond, of the misuse of TCSPs for money laundering and terrorist financing? If yes, please provide recent case studies.

    If there are any other cases involving more generic abuses of TCSPs to carry out other types of offences please also include.

Threats

26. What, in your view are the greatest vulnerabilities, to money laundering and financing of terrorism faced by TCSPs?

PART F: GENERAL ASSESSMENT OF OTHER AML/CFT REQUIREMENTS AND TCSPs

27. i) Please provide an assessment of the adequacy and role that TCSPs play in the detection, prevention and prosecution of money laundering and terrorist financing. Please provide any evidence, including any recent case studies from your jurisdiction, to support your assessment.

    ii) Please provide an assessment of the impact, if any, of AML/CFT legislation on the adequacy and role that TCSPs play in the detection, prevention and prosecution of money laundering and terrorist financing. Please provide any evidence, including any recent case studies from the jurisdiction, to support your assessment.

28. Please provide an assessment of the adequacy and role that the information (See note 7) required from TCSPs, in accordance with the FATF 40 Recommendations, plays in combating money laundering and terrorist financing?

29. i) Are there any difficulties experienced by TCSPs in obtaining the FATF required information from clients? If yes, please provide recent examples of such difficulties.

    ii) If there are difficulties experienced by TCSPs, what action in your view needs to be taken to overcome these difficulties?

30. In your view, do the FATF recommendations and guidance need to more effectively address the role of TCSPs in the efforts to combat money laundering and terrorist financing? If yes, please explain.

International Standards

31. In your view, is there a need for the establishment of an international organization (such as IAIS, IOSCO, Basel etc.) dedicated solely to TCSPs? If yes, please explain.

32. In your view, is there a need for an international standard for TCSPs to address issues such as the "fit and proper" prerequisite and other minimum requirements (E.g. Systems and Controls, Corporate Governance, Authorization criteria, Maintaining and Sharing Information)? If yes, please explain.

33. In your view, what steps would need to be taken to ensure effective implementation of any international requirements (please see question 32 above for details of these requirements)?

TCSP Project

December 2009

NOTES

1. **Trust and company service provider (TCSP):** This has the same meaning as in the glossary attached to the FATF Methodology[81] and refers to any person or business that provides any of the following services to third parties:

- acting as a formation agent of legal persons;
- acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangements;
- acting as (or arranging for another person to act as) a trustee of an express trust;
- acting as (or arranging for another person to act as) a nominee shareholder for another person.

2. **Legal persons**: This has the same meaning as in the glossary of the FATF 40 Recommendations: "Bodies corporate, foundations, anstalt, partnerships, or associations, or any similar bodies that can establish a permanent customer relationship with a financial institution or otherwise own property".

[81] FATF Methodology: www.fatf-gafi.org/dataoecd/16/54/40339628.pdf

3. As referred to in the interpretative note of Recommendation 23 of the FATF 40: http://www.fatf-gafi.org/document/28/0,3343,en_32250379_32236920_33988956_1_1_1_1,00.html#Interpretative_Note_to_r_23

4. **Beneficial Ownership:** This has the same meaning as in the glossary of the FATF 40 Recommendations: "the natural person(s) who ultimately owns or controls a customer and/or the person on whose behalf a transaction is being conducted. It also incorporates those persons who exercise ultimate effective control over a legal person or arrangement."

5. **Beneficiary**: This has the same meaning as in the glossary of the FATF 40 Recommendations: "All trusts (other than charitable or statutory permitted non-charitable trusts) must have beneficiaries, who may include the settlor, and a maximum time, known as the perpetuity period, normally of 100 years. While trusts must always have some ultimately ascertainable beneficiary, trusts may have no defined existing beneficiaries but only objects of a power until some person becomes entitled as beneficiary to income or capital on the expiry of a defined period, known as the accumulation period. This period is normally co-extensive with the trust perpetuity period which is usually referred to in the trust deed as the trust period."

Settlors: This has the same meaning as in the glossary of the FATF 40 Recommendations: "Settlors are persons or companies who transfer ownership of their assets to trustees by means of a trust deed. Where the trustees have some discretion as to the investment and distribution of the trusts assets, the deed may be accompanied by a non-legally binding letter setting out what the settlor wishes to be done with the assets."

6. **Bearer Shares**: This has the same meaning as in the glossary of the FATF 40 Recommendations: "Bearer shares refer to negotiable instruments that accord ownership in a corporation to the person who possesses the bearer share certificate."

7. **The relevant provisions of the FATF 40 Recommendations:**

The relevant provisions of the FATF 40 Recommendations applicable to TCSPs are set out below.

Measures to be taken by Financial Institutions and Non-Financial Businesses and Professions (DNFBPs) (See note 8) to prevent Money Laundering and Terrorist Financing

Customer due diligence and record-keeping requirements
Recommendation 12
The customer due diligence and record-keeping requirements set out in Recommendations:

- 5 (CDD measures)
- 6 (Politically Exposed Persons)
- 8 (threats from new technologies and non face to face business)
- 9 (third party reliance)
- 10 (record-keeping)
- 11 (complex, unusual transactions)

apply to designated non-financial businesses and professions in the following situations:

…d) Lawyers, notaries, other independent legal professionals and accountants when they prepare for or carry out transactions for their client concerning the following activities:

- buying and selling of real estate;
- managing of client money, securities or other assets;
- management of bank, savings or securities accounts;
- organization of contributions for the creation, operation or management of companies;
- creation, operation or management of legal persons or arrangements, and buying and selling of business entities.

e) Trust and company service providers when they prepare for or carry out transactions for a client concerning the activities listed in the definition in the Glossary.

Reporting of suspicious transactions and compliance
Recommendation 16
The requirements set out in Recommendations:

- 13 (report suspicious transactions)
- 14 (protection from any liability for reporting suspicious transactions)
- 15 (develop programmes against money laundering)
- 21 (special measures to be taken with respect to countries that do not or insufficiently comply with the FATF Recommendations)

apply to all designated non-financial businesses and professions, subject to the following qualifications:

a) Lawyers, notaries, other independent legal professionals and accountants should be required to report suspicious transactions when, on behalf of or for a client, they engage in a financial transaction in relation to the activities described in Recommendation 12(d). Countries are strongly encouraged to extend the reporting requirement to the rest of the professional activities of accountants, including auditing.
…c) Trust and company service providers should be required to report suspicious transactions for a client when, on behalf of or for a client, they engage in a transaction in relation to the activities referred to Recommendation 12(e).
Lawyers, notaries, other independent legal professionals, and accountants acting as independent legal professionals, are not required to report their suspicions if the relevant information was obtained in circumstances where they are subject to professional secrecy or legal professional privilege.

Regulation and supervision
Recommendation 24
Designated non-financial businesses and professions should be subject to regulatory and supervisory measures as set out below.

…b) Countries should ensure that the other categories of designated non-financial businesses and professions are subject to effective systems for monitoring and ensuring their compliance with requirements to combat money laundering and terrorist financing. This should be performed on a risk-sensitive basis. This may be performed by a government authority or by an appropriate self-regulatory organization, provided that such an organization can ensure that its members comply with their obligations to combat money laundering and terrorist financing.

8. <u>Designated Non-Financial Businesses and Professions:</u>
a. Casinos (which also includes internet casinos).
b. Real estate agents.

c. Dealers in precious metals.
d. Dealers in precious stones.
e. Lawyers, notaries, other independent legal professionals and accountants – this refers to sole practitioners, partners or employed professionals within professional firms. It is not meant to refer to 'internal' professionals that are employees of other types of businesses, nor to professionals working for government agencies, who may already be subject to measures that would combat money laundering.
f. Trust and Company Service Providers refers to all persons or businesses that are not covered elsewhere under these Recommendations, and which as a business, provide any of the following services to third parties:

- acting as a formation agent of legal persons;
- acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangement;
- acting as (or arranging for another person to act as) a trustee of an express trust;
- acting as (or arranging for another person to act as) a nominee shareholder for another person

SHORT FORM QUESTIONNAIRE

FATF / CFATF TYPLOGIES PROJECT ON MONEY LAUNDERING AND FINANCING OF TERRORISM USING TRUST AND COMPANY SERVICE PROVIDERS (TCSPS)

Dear Colleague

We are writing to seek your assistance in obtaining information for a typologies project on money laundering and financing of terrorism using trust and company service providers (TCSP; see note 1). As you are aware, this and related matters have been the subject of many discussions and debates at the highest levels in our countries and many jurisdictions are currently grappling with how best to address the challenges being faced in this regard.

This questionnaire has been compiled by a Working Group of FATF and CFATF members and the information will be used to create greater awareness and understanding of this important area and potentially assist in policy formulation regarding money laundering and terrorist financing issues that relate to TCSPs[82]. It is intended that a report on Money Laundering and Financing of Terrorism using Trust and Company Service Providers will be completed before the end of 2010.

Please complete all of the following questions as comprehensively as possible. In order to assist us in meeting key external deadlines we would urgently request that the information be provided to us on or before January 15, 2010.

Confidentiality: Please be assured that your submissions will remain confidential as the following conditions will be strictly adhered to:

c) The completed questionnaires will not be published; and

d) Specific information will only be included in the report if the permission of the relevant person from the participating organization is first obtained.

Part A: BACKGROUND INFORMATION

34. Jurisdiction/Organization

35. Contact Name and title (please give two names, if the first contact is regularly away from the office for long periods of time)

36. Contact details

E-mail address	
Telephone Number	
Fax Number	

82 Please note that this is a typologies research project and not a standard setting project.

Part B: DESCRIPTION OF TCSPs

37. Please provide the definition, if any, of TCSPs provided for by your jurisdiction/organization.

PART C: GENERAL ASSESSMENT OF OTHER AML/CFT REQUIREMENTS AND TCSPs

38. i) Please provide an assessment of the adequacy and role that TCSPs play in the detection, prevention and prosecution of money laundering and terrorist financing. Please provide any evidence, including any recent case studies from any jurisdiction, to support your assessment.

ii) Please provide an assessment of the impact, if any, of AML/CFT legislation on the adequacy and role that TCSPs play in the detection, prevention and prosecution of money laundering and terrorist financing. Please provide any evidence, including any recent case studies from any jurisdiction, to support your assessment.

39. Please provide an assessment of the adequacy and role that the information (See note 2) required from TCSPs, in accordance with the FATF 40 Recommendations, plays in combating money laundering and terrorist financing?

40. i) In your view, are there any difficulties experienced by TCSPs in obtaining the FATF required information from clients? If yes, please provide recent examples of such difficulties.

ii) If there are difficulties experienced by TCSPs, what action in your view needs to be taken to overcome these difficulties?

41. In your view, do the FATF recommendations and guidance need to more effectively address the role of TCSPs in the efforts to combat money laundering and terrorist financing? If yes, please explain.

International Standards

42. In your view, is there a need for the establishment of an international organization (such as IAIS, IOSCO, Basel etc.) dedicated solely to TCSPs? If yes, please explain.

43. In your view, is there a need for an international standard for TCSPs to address issues such as the "fit and proper" prerequisite and other minimum requirements (E.g. Systems and Controls, Corporate Governance, Authorization criteria, Maintaining and Sharing Information)? If yes, please explain.

44. In your view, what steps would need to be taken to ensure effective implementation of any international requirements (please see question 10 above for details of these requirements)?

TCSP Project

84 FATF 40 Recommendations www.fatf-gafi.org/document/28/0,3343,en_32250379_32236930_33658140_1_1_1_1,00.html

- 10 (record-keeping)
- 11 (complex, unusual transactions)

apply to designated non-financial businesses and professions in the following situations:

d) Lawyers, notaries, other independent legal professionals and accountants when they prepare for or carry out transactions for their client concerning the following activities:

- buying and selling of real estate;
- managing of client money, securities or other assets;
- management of bank, savings or securities accounts;
- organization of contributions for the creation, operation or management of companies;
- creation, operation or management of legal persons or arrangements, and buying and selling of business entities.

e) Trust and company service providers when they prepare for or carry out transactions for a client concerning the activities listed in the definition in the Glossary.

Reporting of suspicious transactions and compliance

Recommendation 16
The requirements set out in Recommendations:

- 13 (report suspicious transactions)
- 14 (protection from any liability for reporting suspicious transactions)
- 15 (develop programmes against money laundering)
- 21 (special measures to be taken with respect to countries that do not or insufficiently comply with the FATF Recommendations)

apply to all designated non-financial businesses and professions, subject to the following qualifications:

a) Lawyers, notaries, other independent legal professionals and accountants should be required to report suspicious transactions when, on behalf of or for a client, they engage in a financial transaction in relation to the activities described in Recommendation 12(d). Countries are strongly encouraged to extend the reporting requirement to the rest of the professional activities of accountants, including auditing.
…c) Trust and company service providers should be required to report suspicious transactions for a client when, on behalf of or for a client, they engage in a transaction in relation to the activities referred to Recommendation 12(e).
Lawyers, notaries, other independent legal professionals, and accountants acting as independent legal professionals, are not required to report their suspicions if the relevant information was obtained in circumstances where they are subject to professional secrecy or legal professional privilege.

Regulation and supervision

Recommendation 24
Designated non-financial businesses and professions should be subject to regulatory and supervisory measures as set out below.

…b) Countries should ensure that the other categories of designated non-financial businesses and professions are subject to effective systems for monitoring and ensuring their compliance with requirements to combat money laundering and terrorist financing. This should be performed on a risk-sensitive basis. This may be performed by a government authority or by an appropriate self-regulatory organization, provided that such an organization can ensure that its members comply with their obligations to combat money laundering and terrorist financing.

3. Designated Non-Financial Businesses and Professions[85]:

a. Casinos (which also includes internet casinos).
b. Real estate agents.
c. Dealers in precious metals.
d. Dealers in precious stones.
e. Lawyers, notaries, other independent legal professionals and accountants – this refers to sole practitioners, partners or employed professionals within professional firms. It is not meant to refer to 'internal' professionals that are employees of other types of businesses, nor to professionals working for government agencies, who may already be subject to measures that would combat money laundering.
f. Trust and Company Service Providers refers to all persons or businesses that are not covered elsewhere under these Recommendations, and which as a business, provide any of the following services to third parties:

- acting as a formation agent of legal persons;
- acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangement;
- acting as (or arranging for another person to act as) a trustee of an express trust;
- acting as (or arranging for another person to act as) a nominee shareholder for another person

ANNEX IV – OGBS STATEMENT OF BEST PRACTICE

TRUST AND COMPANY SERVICE PROVIDERS STATEMENT OF BEST PRACTICE

Introduction

This statement of best practice has been prepared by a Trust and Company Service Providers Working Group set up by the Offshore Group of Banking Supervisors on which four G7 countries (France, Italy, Netherlands and United Kingdom) and three international organisations (FATF, IMF and OECD) were also represented. The terms of reference of the Working Group were –

"To produce a recommended statement of minimum standards/guidance for Trust and Company Service Providers; and to consider and make recommendations to the Offshore Group of Banking Supervisors for transmission to all relevant international organisations/authorities on how best to ensure that the recommended minimum standards/guidance are adopted as an international standard and implemented on a global basis".

The Working Group decided that a statement of best practice should be prepared rather than a statement of minimum standards. At the present time many jurisdictions do not regulate trust and company service providers, and in some cases such providers are not presently embraced by anti-money laundering legislation. Accordingly it is considered that a statement of best practice is more appropriate.

This statement of best practice is intended for use by jurisdictions generally in reviewing the position of their trust and company service providers. It is also intended for use by international organisations such as the IMF when they are engaged in an assessment of individual jurisdictions in respect of their policy/procedures/practices from a financial regulatory/anti-money laundering standpoint.

Trust and company service providers are important for financial regulation, anti-money laundering and combating the financing of terrorism as intermediaries both as introducers of business to other institutions and as entities responsible for handling and/or managing funds/assets. Their importance is recognised in the Financial Stability Forum's report on Offshore Financial Centres and the Financial Action Task Force consultation paper on the review of the forty recommendations.

This statement of best practice is intended to fill the gap that exists at the present time where trust and company service providers generally are not subject to standards set by bodies such as the Basel Committee on Banking Supervision and IOSCO. However, in those cases where such standards do apply nothing in this statement of best practice alters the existing obligations to comply with those standards.

There is a wide range of different types of business or professionals that act as professional service providers for the creation and administration of companies, trusts, foundations and other legal entities or arrangements, and offer related management and advisory services. What are known generically as trust and company service providers ("Service Providers" for the purpose of this statement) refer to those who carry on a business that involves the provision of company administration services or trustee or fiduciary services and in the course of doing so provide one or more of the following services:-

- acting as a company or partnership formation agent;
- acting as (or arranging for another person to act as) a director or secretary of a company or a partner of a partnership;
- providing a registered office; business address or accommodation, correspondence or administrative address for a company, partnership or for any other person;
- acting as (or arranging for another person to act as) a trustee of an express trust;
- acting as (or arranging for another person to act as) a nominee shareholder for another person.
- arranging the establishment of, or providing services in relation to, any legal entities not covered by the foregoing (e.g. a foundation or anstalt).

In the following statement, Section A addresses the requirements for Service Providers responsible for handling and managing client funds; Section B considers some broader structural issues; and Section C gives recognition to the possible need for a lighter touch where a Service Provider does not handle client funds.

A. <u>All countries/jurisdictions should require that where a Service Provider is responsible for handling/managing funds/assets</u> –

1. Those individuals holding key positions providing the service should be persons of integrity and should exhibit evidence of meeting the following requirements –

i) having no relevant adverse business/professional/personal history:

relevant considerations would include –

- professional or administrative reprimands;
- regulatory directions/public statements;
- disciplinary findings;
- civil fines;
- criminal convictions;
- declaration of bankruptcy;
- adverse personal credit rating

and would extend to a person's involvement as a director or senior manager/officer within a company that has been the subject of such considerations.

ii) having relevant and appropriate level of competence/capability:

relevant considerations would include –

- professional or other relevant qualifications;
- knowledge and/or experience relevant to the business concerned and appropriate to the employment status/role of the individuals concerned.

2. Those providing the service should exhibit evidence that their business will be or is being conducted in accordance with the following requirements under the headings of corporate governance, customer due diligence, conduct of client business, financial soundness, and systems and controls –

Corporate Governance

The Service Provider should be able to demonstrate that they are in –

i) compliance with recognised general standards of corporate governance in respect of both the business itself and each company, partnership, trust and other legal entity ("the client(s)");

ii) compliance with national regulations with respect to money laundering and the financing of terrorism;

iii) compliance with all relevant and applicable financial regulatory standards;

iv) compliance with all relevant and applicable domestic statutory requirements/obligations (e.g. companies law);

v) compliance with recognised standards in respect of directors/trustees responsibilities;

Customer Due Diligence

The Service Provider should be able to demonstrate that they are engaged in –

vi) effective customer due diligence - to satisfy the standards set out in the Basel Committee's Customer Due Diligence Paper, published in October, 2001, to the extent that the recommendations in that paper are relevant to non-banks.

This should include proper procedures for –

- customer identification;
- verification of identity of customer;
- risk profiling of customers (e.g. politically exposed persons);
- establishing the source of wealth;
- establishing the source of funds;
- ongoing monitoring of a customer's activities.
- adequate documentation to meet KYC requirements.

Specific issues on which attention should focus relate to information on the ultimate beneficial owner and/or controller of companies, partnerships and other legal entities, and the settlor/protector/beneficiaries of trusts, which should be known to the Service Provider and be adequately documented.

Conduct of Client Business

The Service Provider should be able to demonstrate that client business is being properly conducted through the –

vii) Identification and segregation of clients' assets and liabilities from the assets and liabilities of the Service Provider;

viii) effective handling of clients' assets covering –

- safe custody of assets;
- proper management of assets;

ix) maintaining adequate and orderly accounting records of clients affairs;

x) maintaining adequate client documentation (e.g. trust deeds);

xi) ensuring that all transactions/decisions entered into, taken by or on behalf of clients are appropriately authorised/handled by persons with an appropriate level of knowledge, experience and status properly to effect such transactions or make the proper decisions according to the nature and status of the transactions/decisions involved; for example –

- where discretion is exercised for or in relation to clients, all reasonable steps should be taken to obtain sufficient information in order to exercise that discretion or other powers in a proper manner and such discretion should only be exercised for a proper purpose;
- any actual or perceived conflict of interest should be avoided or appropriately disclosed; and where conflicts arise and cannot be resolved by disclosure and, internal rules of confidentiality, or rules on when or when not to act, the Service Provider should withdraw its services in an orderly manner;
- all business (including the establishing, transferring or closing of business relationships with its customers) should be transacted in an expeditious manner.

xii) ensuring that, where appropriate, there is a full understanding of the duties arising under the laws relevant to the administration and affairs of clients for which they are acting in the jurisdictions in which they are carrying on business and in which the assets being handled/managed are held.

Financial Soundness

The Service Provider should be able to demonstrate that it is financially sound by –

xiii) maintaining adequate and orderly accounting records of –

- the business of the Service Provider itself;
- the affairs of the clients.

xiv) maintaining adequate financial resources including –

- paid up capital; and/or
- liquid capital;

to enable the business to continue as a going concern and for the affairs of each client to be managed properly for an appropriate period in the event of a trading difficulty being experienced

xv) providing evidence of compliance with any relevant financial regulatory standards;

xvi) providing evidence of compliance with international accounting standards;

xvii) maintaining adequate professional indemnity insurance cover.

Systems and Procedures

The Service Provider should be able to demonstrate that the following systems, procedures and controls are adequately addressed –

xviii) effective compliance functions – where appropriate a skilled and experienced person should be designated as a compliance officer;

xix) effective reporting procedures and effective systems to submit timely and accurate information to the appropriate authorities – where appropriate a skilled and experienced person should be designated as a money laundering reporting officer;

xx) an effective complaints handling system including maintaining a record of complaints and the actions taken to resolve them;

xxi) maintaining at an appropriate location in the jurisdiction adequate, orderly and up to date records of all business transactions of the Service Provider and instructions received from clients,, including–

- the accounting records of the business;
- the accounting records of each client;
- records of the internal organisation and risk management systems;
- client documentation (e.g. client requirements, customer due diligence requirements);
- document retention policies appropriate to the business of the provider and in compliance with relevant legal obligations;

xxii) maintaining a manual of appropriate policies and procedures for the operation of the Service Provider's business and the provision of services to each client; including business acceptance procedures, and documented systems and procedures intended to safeguard the business and

the clients' and their assets and ensure that all authorised and proper transactions are undertaken;

xxiii) maintaining an adequate span of control with a sufficient number of appropriately skilled and experienced persons able to exercise independent judgement in relation to the running of the Service Provider's business;

xxiv) ensuring that those engaged in the business have appropriate relevant experience and qualifications;

[Note: exceptions to xxiii, xxiv may apply in respect of sole practitioners where, for example, an individual trustee function is controlled by the Court];

xxv) ensuring that continuous professional development requirements are satisfactorily met;

xxvi) maintaining effective procedures to ensure that no false or misleading information is provided (including advertisements).

3. There should be proper provision for holding, having access to and sharing of information, including ensuring that –

i) information on the ultimate beneficial owner and/or controllers of companies, partnerships and other legal entities, and the trustees, settlor, protector/beneficiaries of trusts is known to the service provider and is properly recorded;

ii) any change of client control/ownership is promptly monitored (e.g. in particular where a service provider is administering a corporate vehicle in the form of a "shelf" company or where bearer shares or nominee share holdings are involved);

iii) there is an adequate, effective and appropriate mechanism in place for information to be made available to all the relevant authorities (i.e. law enforcement authorities, regulatory bodies, FIU's);

iv) there should be no barrier to the appropriate flow of information to the authorities referred to in 3 (iii) above;

v) KYC and transactions information regarding the clients of the Service Provider is maintained in the jurisdiction in which the Service Provider is located;

vi) there should be no legal or administrative barrier to the flow of information/documentation necessary for the recipient of business from a Service Provider who is an acceptable introducer to satisfy itself that adequate customer due diligence has been undertaken in accordance with the arrangements set out in the Basel Customer Due Diligence paper;

B. All countries/jurisdictions should make proper provision to ensure that –

– the interests of customer/clients can be adequately safeguarded when the Service Provider is no longer able to carry on the business for any reason;

– external auditors with relevant experience and appropriate qualifications and track record are appointed to carry out a full audit of the Service Provider's business in accordance with international standards;

– external auditors have the statutory authority/protection to report to the competent authorities any breaches of relevant legislation or other material concerns;

– adequate provisions are in place to ensure that regular independent reviews are conducted of all Service Providers who carry on business in or from the country/jurisdiction to assess compliance with the statement of best practice; and that action can be taken where there is evidence of non-compliance;

– for the purposes of compliance with A.2.(ii) above, Service Providers are embraced by national anti-money laundering legislation;

C. Conclusions–

Service Providers in all countries/jurisdictions should be expected to comply with the statement of best practice. However it is recognised that where the Service Provider is not responsible for handling/managing funds/assets and carries on business which might be perceived as lower risk, a lighter touch may be applied, according to the nature and scope of the business activity.

Examples of "lower risk" business might include business which consists solely of one of the following –

- formation of companies, partnerships, and other legal entities;
- providing a registered office or business address for a company or partnership;
- providing for the formation/administration of local trading companies only and where the provider does not act as –
  - · a director or secretary;
  - · a trustee;
  - · a nominee shareholder

In the case of such business the lighter touch could be in respect of –

- the span of control covering the number of persons engaged in the business;
- the level of qualifications/experience of the persons engaged in the business;
- the capital/professional indemnity insurance requirements;

- the audit requirements.

With the exception of the foregoing such service providers, and any other service provider not covered by the above provisions, would be expected to comply with all the requirements set out in Section A.

Financial Action Task Force

Groupe d'action financière

THE MISUSE OF CORPORATE VEHICLES, INCLUDING TRUST AND COMPANY SERVICE PROVIDERS

13 OCTOBER 2006

Executive Summary

Despite the important and legitimate roles corporate entities, including corporations, trusts, foundations and partnerships with limited liability, play in the global economy, they may, under certain conditions, be used for illicit purposes.

The present study's prime aim has been to seek to identify in respect of corporate vehicles areas of vulnerability for money laundering and terrorist financing, along with evidence of their misuse. Faced with the vast scope of a general project on corporate vehicle misuse the study focuses on what is considered to be the most significant feature of their misuse – the hiding of the true beneficial owner.

The study examined a series of cases as examples of the misuse of corporate vehicles from which certain key elements and patterns for this misuse are identified. The study also analyses the results of a survey conducted to obtain a better picture of the international diversity in the formation and administration of corporate vehicles.

Drawing on the typologies, as well as prior studies, a number of frequently occurring risk factors associated with corporate vehicle misuse are identified, which could be useful to countries in helping identify such misuse.

The information and typologies examined suggest a number of areas that may call for further and separate consideration in preventing corporate vehicles and their activities from misuse by criminals.

Table of Contents

Page

1. Introduction

Corporate entities, including corporations, trusts, foundations and partnerships with limited liability characteristics, conduct a wide variety of commercial activities and are the basis for a broad range of entrepreneurial activities in market-based economies. However, despite the important and legitimate roles these entities play in the global economy, they may, under certain conditions, be used for illicit purposes, including money laundering, bribery and corruption, improper insider dealings, tax fraud, financing of terrorist activities and other forms of illegal activities[1]. Criminals have responded to the money laundering defences put in place by banks and other financial institutions by misusing corporate vehicles, and those who provide trust and company services, to disguise and convert their proceeds of crime before it enters the traditional financial system.

Organised crime groups or individual criminals tend to seek out the services of professionals to benefit from their expertise in setting up schemes that the criminals then use for illicit purposes. Criminals may seek advice from trust and company service providers (TCSPs) as to the best corporate vehicles or jurisdictions to use to support their schemes, with the TCSPs having varying degrees of awareness of or involvement in the illicit purposes underlying their client's activities.

General concerns about the misuse of corporate vehicles by criminals to disguise and convert the proceeds of their illegal activities, as well as concerns about the use of trust and company services to help facilitate this misuse, are reflected in the extension of the scope of the FATF Forty Recommendations to lawyers, accountants and TCSPs, and, in particular, in the wording of Recommendations 5, 33 and 34. They are concerns that have also been specifically referred to by the G7 Financial Stability Forum, the European Commission, the International Organisation of Securities Commissions (IOSCO) and the Organisation for Economic Co-operation and Development (OECD).

Of particular concern is the ease with which corporate vehicles can be created and dissolved in some jurisdictions, which allows these vehicles to be used not only for legitimate purposes (such as business finance, mergers and acquisitions, or estate and tax planning) but also to be misused by those involved in financial crime to conceal the sources of funds and their ownership of the corporate vehicles. Shell companies can be set up in onshore as well as offshore locations and their ownership structures can take several forms. Shares can be issued to a natural or legal person or in registered or bearer form. Some companies can be created for a single purpose or to hold a single asset. Others can be established as multipurpose entities. Trusts are pervasive throughout common law jurisdictions.

When in February 2000 the FATF reviewed the rules and practices that impair the effectiveness of money laundering prevention and detection systems as part of its non-cooperative countries and territories initiative, it found in particular that:

> *Shell corporations and nominees are widely used mechanisms to launder the proceeds from crime, particularly bribery (e.g. to build up slush funds). The ability for competent authorities to obtain and share information regarding the identification of companies and their beneficial owner(s) is therefore essential for all the relevant authorities responsible for preventing and punishing money laundering.*

The aims/objectives of the project:[2] This typologies project's prime aim has been to seek to identify in respect of corporate vehicles areas of vulnerability for money laundering and terrorist financing, along with evidence of their misuse. It has also sought to identify differences among jurisdictions for establishing and using corporate

[1] Organisation for Economic Corporation and Development (OECD), Options for Obtaining Beneficial Ownership and Control Information: A Template (OECD Template) p.7

[2] This report is the product of research carried out by a project team operating under the umbrella of the FATF typologies initiative.

vehicles, how these may be exploited and what steps have been or are being taken by jurisdictions to address this threat[3].

While this typologies project is concerned with the misuse of corporate vehicles for money laundering and terrorist financing, the findings and the issues for further consideration can be expected to have similar application to other types of criminal activity. In addition to their use in facilitating money laundering, corporate vehicles are frequently mis-used to help commit tax fraud, facilitate bribery/corruption, shield assets from creditors, facilitate fraud generally or circumvent disclosure requirements.

The concerns arising from the misuse of corporate vehicles by criminals have been well documented by a number of other authorities.[4] However, it is hoped that from this typologies project will come a clearer picture of the misuse involved. This in turn should help focus and prioritise efforts made in the anti-money laundering (AML) and combating the financing of terrorism (CFT) areas to meet those concerns.

Corporate vehicles play a complex, varied and essential role in modern economies. The scope and scale of a typologies project that looks at the misuse of corporate vehicles is therefore potentially enormous. Extensive literature already exists on the subject, and the considerable jurisdictional variation in the nature, scale and oversight of corporate vehicles means that there are also many differing viewpoints on the subject to be taken into account. Similarly, many specific issues arise regarding the creation, administration and operation of corporate vehicles.

In examining the potential misuse that corporate vehicles may be subject to, it is important to bear in mind that, of the millions of companies that exist, the vast majority engage in legitimate business, and only a small minority are misused. Likewise among the trusts that are set up, the majority serve legitimate purposes, and only a small minority are misused.[5] In considering the misuse of corporate vehicles, it will be essential therefore to distinguish between those vehicles that pose a high risk and those that pose a low risk in relation to money laundering and terrorist financing.

The initial step for this project was to establish a team of experts which included persons drawn from FATF jurisdictions, observer organisations and FATF-style regional bodies (FSRBs) with skills/experience in the process of corporate vehicle formation and administration, and in particular the formation and administration of shell companies, and in regulatory action and law enforcement in this field. The experts came from a range of countries including common law and civil law jurisdictions, countries from outside the FATF and also countries with a substantial TCSP and/or non-resident business activity sectors.

The first step taken by the team of experts was to conduct a survey (by means of a questionnaire)[6] as a way of obtaining a fuller picture of the international diversity in the formation and administration of corporate vehicles, and of providing both FATF and FSRB members with an opportunity to contribute to the exercise.

Faced with the vast scope of a general project on corporate vehicle misuse mentioned above, it was clear to the team of experts that the most effective way to deal with the subject was to focus first on what they and prior studies considered to be the most significant feature of the misuse of corporate vehicles – the hiding of the true beneficial ownership. It is therefore with this aspect in mind that this report is primarily concerned. This is not to deny that there are other aspects that are worthy of attention, and that more detailed work on other areas could be done later.

---

[3] Some jurisdictions, such as the US, do not have a national or nationally uniform system of incorporation or registration of corporations, trusts and other business entities but instead have a dual Federal State or multi-regional systems. References in this report to the laws and principles in such jurisdictions are necessarily generalisations regarding the majority of states or regions, or the most common elements of the specific law or principle referenced.

[4] See the bibliography and Annex 5.

[5] Annex 2 refers to the many legitimate uses for trusts as well as the potential for their misuse.

[6] A copy of the questionnaire used is attached at Annex 7.

The terminology used in the context of corporate vehicles is also quite varied and complex, and it often differs from one study to another. Therefore, a glossary of terms used in this report is included in Annex 1. At the start of this report, it is useful however to highlight two key terms as they will be used for this study:

- *Corporate vehicle*: This term has the same meaning as that used by the OECD[7] and thus includes corporations, trusts, partnerships with limited liability characteristics, foundations, etc.

- *Trust and company service provider (TCSP)*: This term has the same meaning as used by the FATF[8] and thus includes those persons and entities that, on a professional basis, participate in the creation, administration and management of corporate vehicles.

2. Typologies

As a starting point for this study, the team of experts first examined a series of case examples of misuse of corporate vehicles[9]. By examining such material, certain key elements and patterns for this misuse were identified. The following typologies then derive from case examples that were submitted as part of the response to the survey as well as from several databases.

This section uses a selection of the submitted cases[10] to focus on examples in which one of the main objectives of the misuse was to hide the ultimate beneficial owner. The case studies indicate how difficult it can be to determine who actually benefits from the structure. The different ways to maintain anonymity and to hide identity are described in the following case examples. Often these structures are used to perform two functions simultaneously: the execution of a criminal scheme and the diversion of money flows as part of a money laundering scheme.

All submitted case studies show several common features. For illustrative purposes, four typologies were selected, each of which focuses on a specific method or element of a corporate vehicle structure that is commonly used to hide identity. As indicated above, the selection of cases was made so as to highlight the key characteristic involved. The remaining case examples are included in Annex 4, which classifies the examples according to individual typologies and main characteristics that can be useful for money laundering activities.

Typology 1 – Multi-jurisdictional structures of corporate entities and trusts[11]

In many instances, a structure consisting of a series of corporate entities and trusts — created in different jurisdictions — is used to hide identity and carry out a fraud scheme[12]. The complex structure can give the appearance of a legitimate purpose, which can then be used to easily attract investment from third parties. For the third parties that are victims of such schemes, it is almost impossible to see behind the structure of the various corporate entities to find out who is liable for their loss. By setting up such a complex multi-jurisdictional structure, the seemingly logical money flow between these entities is used to move and launder criminal money. These structures can also be convenient for diverting the money flow or hiding payments. The cases belonging to this typology are described briefly in the next few paragraphs, with more detailed descriptions set out in the boxes below.

---

[7] See the OECD report *Behind the Corporate Veil: Using Corporate Entities for Illicit Purposes (Behind the Corporate Veil), 2001*.

[8] See the glossary to the FATF Forty Recommendations.

[9] A detailed description of all characteristics of these case studies is included in Annex 4 which was compiled with the considerable assistance of the Netherlands authorities.

[10] A detailed description of all characteristics of these case studies is included in Annex 4.

[11] This relates to cases 1, 2, 3, 12, 16, 17, 24, 25, 26, 27, 28, 29, 31, 32, 33 and 34.

[12] The scheme mostly involves types of financial fraud and Ponzi schemes.

In Case 1, third parties were persuaded to invest savings and retirements accounts in a series of trusts. The investors were led to believe that the trusts would ultimately provide investment income. In fact, however, the trusts, which were tied to offshore bank accounts, served as conduits for channelling funds to the perpetrators of the fraud scheme.

In Case 2 a multi jurisdictional structure was set up to purchase insurance companies and again divert the assets to the creators of the structure.

Case 3 concerns an investment fraud scheme. To realise the scheme, offshore corporations from Antigua, Isle of Man and Belize were used. The structure was also used to divert the money and hide the profits from fiscal authorities.

Case 1
Mr. [A] was a trust service provider operating a trust company [L]. Using a series of domestic trusts that he established, he wired large sums of money to 51 different US and offshore bank accounts. In total it is estimated the scheme defrauded over 500 investors of approximately $56 million.
The thrust of the scheme was that A and associates convinced their clients to form ["Pure Trust Organizations" (PTO)] and to place their life savings, including their retirement accounts, into these trusts created by [L]. Clients were advised that the [PTO] provided asset protection providing concealment of their assets from the government and other creditors. The [L] package promised the formation of a [PTO] and off- shore bank accounts. The clients were told that when the funds were placed in these off-shore bank accounts the funds was beyond the reach of the US government and any creditor.
Once the clients had placed their assets into the trusts, [A] used another corporation to provide investments for the assets in the trusts. In reality there were no real investments, and [A] and his associates defrauded the trust owners.

Case 2
Mr. [B] set up an international structure with on- and offshore companies as well as trusts to purchase insurance companies. The insurance companies were actually bought through a trust to hide the personal involvement of [B]. The assets of these companies were subsequently drained and used for personal benefits. The draining of these assets was concealed by transferring the money into accounts in and out of the US via wire transfers. Immediately after the acquisition, [B] would transfer million of dollars of reserve assets to a corporation he set up in the US. The funds were transferred to an offshore bank account in the name of another corporation that he controlled. Once these funds were deposited into the offshore bank account, [B] used them to pay for his personal expenses. In this way [B] laundered about USD 225 million over a period of 9 years.

Case 3
This case example shows a pyramid investment scheme. It caused more than USD 8.4 million in losses to almost 8,000 investors in the US. The investigation focused on an association [M]. [M] was a pyramid business enterprise that sold various products to its members including investment plans. It was alleged that [M] leaders were promoting the sale of an investment, identified as [Private Placement Offers (PPO)]. The investment promised a 30 to 1 return within a year. To be able to benefit f the investment members were encouraged to establish offshore corporations and bank accounts in Antigua, Isle of Man and Belize. They were advised that financial transactions relating to these investments should be transferred through their offshore accounts. The funds of all the investments were deposited into bank accounts in the US. Instead of using these monies as purported, [M's] leaders diverted the funds to their personal use and used the funds to promote the carrying on of the illegal enterprise. Potential investors were fraudulently lulled into believing that the investment was guaranteed by a bank and the principal insured by a major insurance company. The new investor funds collected and not yet turned over to the US Corporation were used to issue checks to investors within the group who were expecting their first returns from investment. The appearance that the program was working caused a windfall of new investor money to begin pouring in for the [PPO].

Case 4
The identity of the beneficial owner remained unknown in the management of several investment funds.
Fund E was established in the British Virgin Islands. This fund had over EUR 93 million in assets in Bank A. The fund was managed by Company F in Dublin.
One of the shareholders of Fund E was Bank G in Switzerland. Another shareholder was Fund H (Bahamas), managed by Company I (Bahamas). Fund H was 100% controlled by Bank J, another Swiss bank.
However, for Fund E, Bank A was not able to compare the subscriptions with the total amount of capital issued by the fund. Moreover it appeared from business correspondence found during the on-site mission led by the French Banking Commission that Mr K was directly involved in the management of Fund E. It was likely that Mr K's family was the beneficial owner of the fund, but the bank had no evidence thereof.

Typology 2: – Specialised financial intermediaries / professionals

The cases related to this typology highlight the fact that, when there is evidence of the misuse of corporate vehicles, a specialised financial intermediary or professional has often been involved, to a greater or lesser extent, in facilitating the formation of an entity and exploiting the opportunities presented by foreign jurisdictions to employ various arrangements that can be used for legitimate purposes but also can be used to help conceal true beneficial ownership, such as corporate shareholders, corporate directors and bearer shares. The degree of complicity of these financial intermediaries and professionals varies widely, with some unknowingly facilitating illicit activities and others having greater knowledge of their clients' illicit purposes.

Case 5
A company initially established in an offshore centre had moved its registered office to become a limited company under Belgian law. It had consulted a lawyer for this transition. Shortly afterwards the company was dissolved and several other companies were established taking over the first company's activities. The whole operation was executed with the assistance of accounting and tax advisors. The first investment company had opened an account in Belgium that received an important flow of funds from foreign companies. The funds were later transferred to accounts opened with the same bank for new companies. These accounts also directly received funds from the same foreign companies. Part of it was invested on a long term basis and the remainder was transferred to various individuals abroad, including the former shareholders of the investment company. These funds were also transferred to the new companies. The whole structure was set up by tax accountants.

Case 6
Mr. [C] was an accountant who started his own accounting and financial services business [N] in Panama. He advertised his services primarily on the internet and through mass mailings. [N] provided a variety of services including the following:

- *Formation of offshore entities to disguise ownership of assets;*
- *Passports and dual citizenship, mostly using new nominee names;*
- *Movement of cash and other assets offshore and back onshore using various methods;*
- *Issuance of debit cards for the purpose of anonymously repatriating and spending offshore funds;*
- *Use of correspondent bank accounts to skim profits of legitimate businesses and repatriate funds through the purchase of assets and use of debit cards;*
- *Anonymous trading of securities through accounts with two major brokerage houses;*
- *False invoicing/re-invoicing schemes to support fraudulent deductions on tax returns;*
- *False investment losses, to disguise transfer of funds overseas.*

[C] was identified pursuant to an Internal Revenue Service investigation of one of his clients for illegal importation and sale of goods. The targets of this investigation were using a re-invoicing scheme devised by [C] to illegally import these chemicals into the US for sale. [C] assisted the targets in the re-invoicing scheme by preparing the invoices, receiving the proceeds of the scheme and hiding the proceeds in a myriad of Panamanian corporations for later use by the targets.

As a result of this investigation, [C] became a subject of investigation for the formation of illegal trusts to facilitate money laundering and other crimes. The investigation disclosed that [N] had about 300-400 active clients/investors. The investigation also disclosed that it created between 5,000-10,000 entities for these clients, including the layering of foreign trusts, foundations and underlying business corporations, which were formed in offshore countries. The primary package purchased by the client was referred to as the Basic Offshore Structure that includes a foreign corporation, a foreign trust and a foundation. In 2003, [C] was found guilty of money laundering and other criminal violations. He was sentenced to 204 months' imprisonment and fined USD 20,324,560 and ordered to pay restitution to the Internal Revenue Service in the amount of USD 6,588,949.

Typology 3: – Nominees

The next series of cases provides examples of the extent to which the use of nominees may be used to hide the identity of the beneficial owners. Within this typology, the use of nominees may be grouped into the following categories: nominee bank account, nominee shareholders and nominee directors.

Case 7
Mr [B] and his associate bought insurance companies. The assets of these companies were drained and used for personal benefits. The draining of the assets was concealed by transferring them into accounts in and out the US via wire transfers. The first step in the scheme was establishing a trust in the US. [B] concealed his involvement and the control of the trust through the use of nominees as grantors and trustee. [B] then used the trust to purchase the insurance companies. Immediately after the acquisition, [B] would transfer millions of dollars of reserve assets to a corporation he set up in the US. The funds were then wire-transferred to an offshore bank account in the name of another corporation that he controlled. Once these funds were deposited into the offshore bank account, [B] used them to pay for his personal expenses.

Case 8
Beginning in 1997, Mr. [D] assisted his clients with various schemes to hide income and assets from the IRS, including a method by which an individual used ' common used trusts' to conceal ownership and control of assets and income and the use of offshore trusts with related bank accounts in which the assets would be repatriated through the use of a debit card. [D] also set up international business corporations (IBC) that had no economic reality and did not represent actual ongoing business concerns, on behalf of his clients, to conceal the clients' assets and income from the IRS. Concerning his own liabilities, [D] opened and maintained nominee bank accounts both in the US and abroad to conceal his income from the IRS.

Case 9
Mr. E, a CEO of a local telecommunication company received corrupt money of RM 300.000 as an inducement to award supply and work worth RM 5 million to a company P which belonged to Mr. F. Mr. F paid the corrupt money as a payment by company P to company Q for services rendered. Company Q also belonged to Mr. F but was merely a dormant and shell company with RM 2.000 paid up capital. The money was later withdrawn from company P and placed in a stock broking firm under the name of Mr. G., a nominee of Mr. E, who opened an account with the same stock broking company using his son's name. The money in G's account was used to purchase shares in the open market and later sold to Mr. E's son using numerous married deal transactions whereby the shares were later sold by Mr. E's son in the open market at a higher price. Capital gains subsequently were used to open fixed deposits, sign up for a insurance policy (under the name of Mr. E) as well as purchase assets in the name of Mr. E's relatives.

Typology 4: Shell companies.

The use of shell companies to facilitate money laundering is a well-documented typology. The complex case included here provides a "textbook" typology as an example of misuse of corporate vehicles. The scheme established here was intended to launder criminal proceeds through real estate investment. A complex structure was set up by legal professionals to hide the origin of the beneficial owners as well as the origin of the money.

THE WHITE WHALE CASE

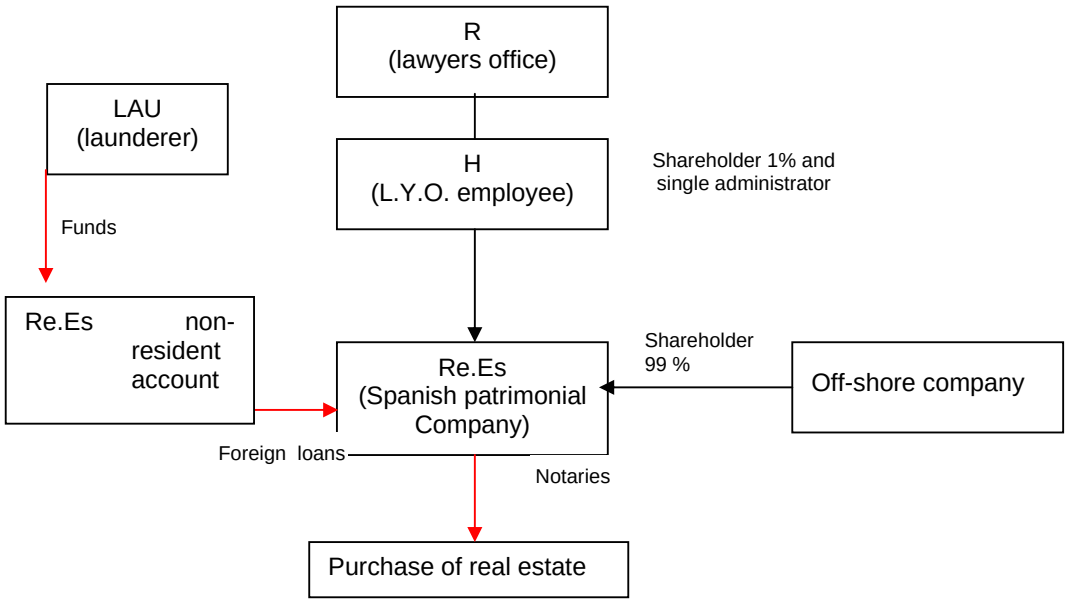
The investigations started in September 2003 by cross referencing data from an investigation on drug trafficking, with information coming from another investigation on assets owned by Eastern European citizens living in the Costa del Sol (Malaga).

In such cross referencing of information it arose that [H] appeared as administrator of more than 300 companies established through [R], a lawyer's office in Marbella (Malaga).

All of the companies had similarities: companies established off-shore, except one held by [H] who was the single administrator of the companies and, at the same time, an employee of [R]. Giving support to clients of H by establishing companies was one of the activities of [R], which also offered the management of client's bank accounts and real estate buying and selling. The investigators knew that several clients of [R] were allegedly connected with international organized crime groups and/or with people involved in serious crimes in Spain and abroad.

The board of [R] was aware of the likely criminal activities of some of H's clients, because they had been the subject of media and press reports as possible criminals, and because the board knew that some clients were in prison in Spain or in other countries since documents had been sent to them there. In other cases, members of the board were called to testify as witnesses in judicial proceedings against those clients.
Additionally, the board deliberately ignored the activities of their clients. In their advertisements they even advertised that the office conducted company´ "engineering", that they guaranteed anonymity and that they did not ask any questions or respond to requests for information.

Diagram of the money laundering scheme



The Spanish companies were established for use as an instrument for money laundering schemes based on the real estate market. They were companies created exclusively for the management and administration of real estate properties. Re.Es. was one of these companies.

The off-shore companies which participated in the Spanish companies were "shell companies" established in an American State whose laws allow a special tax regime for these companies and for their transactions. The companies were pre-constituted in the name of an agent (usually a lawyer) before the incorporation of the company. In other words, the document of incorporation of the company would remain inactive in the hands of the agent until the company was bought by a client, and at that moment the company would be effective.

Therefore, the board of the companies when first registered was made up of the agent and his associate, without any link with the real owners of the company who subsequently purchased the shell. Consequently, the ultimate beneficiaries of the off-shore companies and, consequently, of the Spanish companies, remained hidden.

The launderer (LAU) transferred funds from a foreign country to a non-resident account owned by Spanish company Re.Es. The use of non-resident accounts provided other advantages, including the advantage of being subject to less control by the tax authorities. The funds described above were gathered in the account of Re.Es under the guise of foreign loans received. The destination of the funds received was the purchase of real estate properties in the name of Re.Es., in the last stage of the money laundering process, taking advantage of the hidden situation of the launderer and of the beneficial owners.

Three public notaries documented all the transactions, from the incorporation of the companies to the purchase of real estate. The suspicion of money laundering was clear: incorporation of several companies by the same persons in a short period of time, concurrence of the same partners in several companies, several real estate purchases in a short period of time, etc. Despite this, and even though the public notaries were obliged to report under the Spanish anti-money laundering law, such transactions were not disclosed to the Spanish FIU

Analysis of the Typologies

From the typologies presented here, the methods for concealing the identity of the beneficial owner and/or his customer may be broken down into the following groupings based on the types of corporate vehicles used in the structure of the money laundering scheme.

Figure 1

Use of (various types of) companies	7 cases
Use of banks or investment funds	2 cases
Use of one of more trusts	5 cases
Use of companies and trusts	4 cases
Use of nominees	6 cases
Use of TCSPs	5 cases

More details on the findings for the individual case studies used are described in Annex 4.

Traditionally the money laundering process is broken down into three phases — placement, layering and integration. Since corporate vehicles may be used for multiple purposes in the different phases of the money laundering process, a slightly modified version of this template might be considered to better describe the role

that such entities can play in money laundering[13]. For the analysis of the case studies four phases of money laundering were distinguished.

In the "placement" phase, dirty money is inserted into the financial system. In the second or "layering" phase, the money is moved through various bank accounts, mostly belonging to several different corporate vehicles in multiple jurisdictions. The third phase, known traditionally as the "integration" phase consists of two sub phases: "justification" and "investment". In the "justification" phase, the proceeds are re-integrated into regular business activities, for instance by way of a loan structure. In the "investment" phase, the now laundered money is invested for personal gain, such as purchasing real estate.

Looking at the cases sampled for this study, the following breakdown may be made of the particular phases in which the corporate vehicles appeared to play a preponderant role in the money laundering process.

Figure 2

Money laundering phase	Number of case studies
Placement	22
Layering	5
Justification	2
Investment	4
Unknown (more specific details are needed for classification)	2
No money laundering process identified	4
Combination of money laundering phases	6

As can be seen from this overview, it was found that the majority of the cases presented involved misuse of corporate vehicles in the first phase of money laundering. In a number of cases, corporate vehicles are used to lure third parties in fraudulent investment schemes or committing other types of fraud. It is clear that this finding is based on the information available and that the case studies from which information has been obtained involve crimes other than money laundering. However, the techniques observed – the use of corporate vehicles, the use of specialised intermediaries, and the use of foreign jurisdictions – are all common to the techniques used for money laundering and therefore can be considered to be of equal relevance.

In analysing the submitted case studies, certain common elements were found. These elements are sometimes combined with the typologies (e.g. the involvement of financial or legal experts) and sometimes with an additional element to help achieve the goal (e.g. concealing identity, diverting money flow). The most common elements are the following:

- Multi-jurisdictional and/or complex structure of corporate entities and/or trusts (cases 1, 2, 3, 4 and White Whale);
- (Foreign) payments without a clear connection to the actual activities of the corporate entity (cases 5, 11,and White Whale);
- Use of offshore bank accounts without clear economic necessity (cases 1, 4, 3, 6, 17, 21, 27, 28 , , 30, 31, 32, 34, and White Whale);

[13] It should be noted that the case studies showed that, unlike most other methods used to launder money, legal entities are used not only to launder money, but also to generate it, e.g. from earnings of a criminal offence (money with illegal origin) or as windfalls (earnings) of tax evasion (money with legal origin).

- Use of nominees[14] (cases 2 7, 8, , 27, 28, 35, and White Whale);
- Use of shell companies (White Whale);
- Tax, financial and legal advisors were generally involved in developing and establishing the structure. In some case studies a TCSP or lawyer was involved and specialised in illicit services for their clients (cases 1, 5,6,7 and White Whale).

When hiding or disguising the identity, often a combination of the above mentioned elements and various layers with a foreign element is established to maintain as much anonymity as possible. These elements can be considered as indicators or "red flags" for such activity. The more of these elements observed, the greater the likelihood (and the risk) that the identity may be able to remain unknown. It is therefore essential for authorities to be able to determine the ultimate beneficial owners of a company and the trustees, settlors, beneficiaries involved with a trust.

3. Analysis of the Questionnaires

The following is an analysis of the responses of 32 jurisdictions to the survey conducted by the FATF as part of this study[15]. The assumption underlying the survey is that one of the main purposes of the misuse of corporate vehicles is to hide the identity of the natural person(s) benefiting from and/or controlling the money laundering, that is, the beneficial owner (BO). Thus the primary aim of the survey was to ascertain how criminals might use corporate vehicles to hide their identities and how, in practice, this may have occurred. The survey sought to achieve this aim by eliciting information on (1) the types of corporate vehicles in a particular country, (2) the types of BO relationships, (3) the sources of BO information and methods of obtaining such information, and (4) examples of the misuse of corporate vehicles in that jurisdiction. Beneficial ownership, the sources of information and the regulation thereof are addressed below. The case examples provided earlier demonstrate how the weaknesses identified are exploited in practice. The analysis is based solely on the information obtained through the survey; no verification of the information provided by respondent jurisdictions was undertaken.

The types of corporate vehicles are described in Annex 6[16]. Although many different types of corporate vehicle can be abused, the submitted case studies show that the legal entity most commonly misused is a private limited company with shared capital combined with activities in a jurisdiction other than the jurisdiction where the entity was created.

Section 1: Beneficial Owners

The FATF Methodology Glossary defines a beneficial owner (BO) as the natural person "who ultimately owns or controls a customer and/or the person on whose behalf a transaction is being conducted. It also incorporates those persons who exercise ultimate effective control over a legal person or arrangement."[17] Accordingly, the issues of ownership, control, and, for trusts, beneficiary identification must be addressed.[18]

---

[14] Other legal structures that could lead to same result are the use of bearer shares and corporate directors.

[15] The participating jurisdictions are listed in Annex 3, along with the abbreviations used hereafter. The analysis was undertaken with the considerable assistance of the World Bank.

[16] In the case studies, varying types of corporate vehicles are referenced, such as *offshore corporate vehicles* (case 3), , *limited companies* (case 17), *UK limited companies* (case 19), *limited liability companies* (case 18,19), *corporate vehicles* (case 20), , *shell companies* (case 21), *Nevada corporations* (case 22), *trusts* (case 33 and 34). Both formal terms (e.g. *limited liability company*) and informal or "popular" terms (e.g. *shell companies*) were used interchangeably.]

[17] FATF Methodology, www.fatf-gafi.org/glossary.

[18] In view of the lack of universally accepted definitions or principles regarding control, beneficial ownership and related concepts, this report does not attempt to provide a detailed analysis of these concepts.

A. Ownership

The potential for anonymity is a critical factor in facilitating the misuse of corporate vehicles.[19] In particular, the fact that ownership of a corporate vehicle may be through corporate shareholders, nominee shareholders and bearer shares presents a special challenge to determining beneficial ownership of a corporate vehicle.[20] Each of these types of ownership is considered in Figure 2.1. It should be noted however that the ownership and control structures described below have many legitimate purposes.

Figure 3

PRACTICE: Ownership through…	Defining Characteristics	Associated Problems/ Risks	Where permitted among reporting jurisdictions
Corporate shareholders[21]	Shares are owned by a legal entity.	Creates an extra layer between BO and entity.	Not addressed in questionnaire
Nominee shareholders][22]	Shares are registered in the name of another (such as a stockbroker)	Reduces usefulness of shareholder register	Not addressed in questionnaire
Bearer shares[23]	Negotiable instruments according ownership of a corporation to the person who possesses the bearer share certificate.	Can be easily transferred without leaving a paper trail	NL,[24] UK,[25] TR, LB, LV, NZ, QA, HK, MH, DE, SK, CH, US, DK Permitted but dematerialised[26] in: VI, BE, LT, MO, FR

B. Control[27]

Corporations serving as directors and nominee directors can be used to conceal the identity of the natural persons who manage and control a corporate vehicle.[28] Corporate directors and nominee directors are described in Figure 4.

---

[19] OECD *Behind the Corporate Veil*, 2001, pp. 21.

[20] Id pp. 29-32.

[21] This type of ownership was not addressed in the survey, but the layering of different corporate entities on top of each other is a common characteristic in many cases of misuse of corporate vehicles, and hence it is included here. Of course this is not so much a "practice", but rather a logical characteristic of corporate law; anyone can hold shares, be it a natural person or a legal entity.

[22] This type of ownership was also not addressed in the survey. It is included here because two jurisdictions mentioned this issue (GI and IM). Of course ownership through nominee shareholders being simply a contractual relationship, it is possible in any jurisdiction that does not explicitly prohibit it, and this type of ownership is necessary for any broker trading on a stock exchange where shares are held on behalf of a client.

[23] A majority of bearer shares are book entries and are "dematerialised". Shares are dematerialised when they are registered. Dematerialisation is achieved by requiring registration upon transfer or requiring registration in order to vote the shares or collect their dividends. While physical transfer of bearer shares is possible it is believed to be rare.

[24] A majority of the bearer shares are *book entries* and are dematerialised. While physical transfer of bearer shares is possible it is believed to be rare.

[25] Some of the bearer debt in the United Kingdom is dematerialised, while another part of it is immobilised in International Central Securities Depositories (ICSD). The records of the ICSDs cannot be inspected.

[26] Shares are dematerialised when they are registered. Dematerialisation is achieved by requiring registration upon transfer or requiring registration in order to vote the shares or collect their dividends.

[27] Of course ownership will in many cases entail (a degree of) control. This paragraph deals only with those relationships of control that do not derive from ownership.

Figure 4

PRACTICE: Control through...	Defining Characteristics	Associated Risks	Where permitted among reporting jurisdictions
Corporate directors	Corporation is selected to serve as a director. Management functions performed by representative of the selected corporation.[29]	Creates an extra layer in establishing identity of natural person who controls. May facilitate abuse of CVs if legal system cannot timely assign responsibility to physical persons.	NL, MY, US, GI, LV, MA, GG, QA, UK,[30] HK, MH, DE, PW, TR, LB, VI[31], BE, BA
Nominee directors [[32]]	Director nominates another entity or person to act as the director in its place.	Increased difficulty in identifying those who exercises de facto control.	Not addressed in questionnaire

Nineteen of the 32 jurisdictions responding to the survey indicated that corporations are permitted to serve as directors, whereas corporate directors are prohibited in eight. Five jurisdictions failed to provide an answer to this item on the questionnaire.[33] None of the responding jurisdictions that permit corporate directors indicated that foreign corporate directors were prohibited. One jurisdiction stated that "a fit and proper test applies to corporate directors, however executing these tests on foreign directors tend to be difficult due to lack of information."[34]

Although the survey did not specifically address the use of nominee directors, at least one respondent indicated that this practice is one of the greatest contributors to a corporate vehicle's vulnerability to misuse.[35] Typically, a nominee director appears as a director on all company documents and in any official registries, but passes the requisite duties of the directorship on to the beneficial owner.[36]

One jurisdiction allows TCSPs to act as nominee directors if certified to do so.[37] In this jurisdiction, TCSPs can face significant liability for failure to practice customer due diligence (CDD) and generally cannot be released from liability as nominees.[38] This jurisdiction further indicated that TCSPs are required to obtain indemnity insurance before acting as nominee directors.

[29] In some jurisdictions this representative can be liable for civil and criminal penalties. It is unclear from the questionnaires which jurisdictions in fact enforce these penalties.

[30] Legislation requiring that at least one natural person serve on the board is pending in the UK.

[31] VI has passed legislation requiring that at least one natural person serve on the board.

[32] Jurisdictions may have nominee directors, but this was not addressed in the survey.

[33] The item on the questionnaire reads "Are corporate directors possible?"

[34] NL, noting risk mitigation factors that effectiveness is limited to domestic corporate directors.

[35] GI, noting that the concept of nominee directors "does not exist in law". IM and TR also indicated permission of nominee directors.

[38] IM.

C. Beneficiaries

A beneficiary is someone for whose benefit property is held in trust, especially one designated to benefit from a disposition or assignment or to receive something as a result of a legal arrangement or other instrument. Traditionally, trusts have been treated like contractual agreements between private persons and subjected to less regulation and oversight and to fewer disclosure requirements, thus making them susceptible to abuse.[39] Trusts can legally be established in seventeen of the jurisdictions surveyed.[40]

Section 3: Information Sources

Information about corporate vehicles may be obtained from a variety of sources such as the corporate vehicles themselves, from a company registry, from public sources such as government or regulatory authorities, exchange operators, via intermediaries such as TCSPs or lawyers, notaries or accountants, or from other sources through the use of compulsory or investigatory measures.[41]

A. Corporate Vehicles

Corporate vehicles often keep shareholder registers. Fifteen jurisdictions indicated that corporate vehicles are obliged to keep shareholders lists that are then available to competent authorities.[42] One jurisdiction indicated that international business companies (IBCs) are required to maintain a register of shareholders at its registered office.[43] To be clear, the shareholder registers may contain accurate information on legal ownership, but not necessarily on beneficial ownership.[44]

B. Company Registries

All jurisdictions responding to the survey indicated that company registries with information on legal ownership are required. Twenty jurisdictions include foundations in these registries[45], twenty-five jurisdictions include limited liability partnerships[46], and three jurisdictions include trusts.[47] Eighteen jurisdictions indicated that it is mandatory for the registry to be regularly updated.[48] One jurisdiction requires that any change in the beneficial ownership of shares be reported to the public registry.[49] These registries are accessible to the public in all but three jurisdictions.[50] One jurisdiction indicated that it is optional for companies to be recorded in the company registries.[51] Five jurisdictions require that a corporate vehicle be approved before it can be included in the company registry.[52]

[49] JE, noting how it obtains information on the beneficial owner.

[50] BH,TR and JP did not report that the registries were open for public inspection, although they indicated that the registries could be accessed through investigatory means.

[51] VI

[52] NL, MY,LV,BH,GG

C. Intermediaries

Intermediaries, such as TCSPs, lawyers, notaries and accountants, commonly play a role in the formation and management of corporate vehicles.[53] In the cases submitted as part of the survey, intermediaries played a role in many instances. Twelve jurisdictions require TCSPs to carry out customer due diligence procedures that are predicated upon a verified identification of the beneficial owner[54], and nine jurisdictions mandate that TCSPs apply for a license before engaging in the business of the formation or management of corporate vehicles[55]. About half of the jurisdictions use TCSPs for the formation and management of corporate vehicles.[56] Within these jurisdictions, TCSPs face sanctions for deficiencies in exercising due diligence. These sanctions can include making public statements, the imposition of conditions on continued licensure, requiring specific actions, and license revocation.[57]

Twenty-nine jurisdictions allow lawyers, notaries, and accountants to participate in the formation and management of corporate vehicles.[58] However, only seven jurisdictions specifically reported that their governments enforce AML regulations with respect to intermediaries.[59] Of those six, three jurisdictions defined penalties for failure to follow AML regulations.[60] Those penalties included letters of disapproval, automatic governmental access to books and accounts, and loss of license. Ten jurisdictions rely on private regulation of intermediaries for the civil enforcement of AML.[61]

One jurisdiction stated that it places significant reliance on financial institutions to obtain information on the beneficial owner. It noted the importance of CDD and KYC practices for the success of their reliance on financial institutions.[62]

D. Other Sources

Other sources of information can be utilised through a jurisdiction's investigatory powers, including both the ability to gather information from public records as well as the authority to compel corporate vehicles to release information. Thirteen jurisdictions rely exclusively on investigatory powers to obtain information on beneficial ownership.[63]

Typical means employed by jurisdictions relying on investigatory powers include examining the tax returns of corporations through the local internal revenue office,[64] retrieval of information from online databases,[65] and acquiring information from a jurisdiction's securities exchange commission. According to one jurisdiction, the inability to use evidence gathered by investigation at trial presents a problem with this method.[66] Another

[57] JE, noting penalties regulatory bodies may impose on TCSPs

[58] GI, NO, MY, CH, US, LT, MO, LV, MA, BH, GG, IM, QA, UK, HK, MH, FR, DE, DK, PW, TR, LB, AU, NL, JP, VI, BE, BA, JE. Out of these, LT, GG, VI, NL and JP do not allow accountants to participate in these functions.

[59] MY, LT, HK, FR, AU, BE. BA noted that AML applies to all its citizens in compulsion for information but did not state any specific facts regarding lawyers, accountants, and notaries.

[60] MY, HK, BE

[61] MY, MO, LV, UK, HK, TR, LB, FR, JP, BE

[62] BA, noting the importance of financial institutions gaining BO information

[63] NO, US, SK, LV, QA, MH, DE, DK, PW, TR, LB, JP, AU, BE

[64] US,NL,UK,PW,SK,NL all noted the information on beneficial ownership could be obtained through tax returns.

[65] US noted availability of information from Dunn & Bradstreet, Lexis/Nexis, and Choicepoint.

[66] NO, noting its difficulties in using acquired intelligence information.

jurisdiction indicated that it uses its governmental powers to "undertake monthly updates of records of selected companies."[67]

The obstacles to obtaining information are compounded by the fact that in almost all cases of the misuse of corporate vehicles, there is one or more cross border relationship, as was evidenced by the cases submitted for the survey. In these examples, the cross-border structures had different corporate vehicles "stacked" on top of each other, with each vehicle holding (all or some) shares in the vehicle below it, they had non-resident management (directors)[68], or else the corporate vehicle had been incorporated in jurisdiction other than the one in which the related activity took place:

Figure 5

Jurisdiction or state of incorporation is *not* the same as jurisdiction or state where the actual activities take place	23 cases
Jurisdiction or state of incorporation is the same as jurisdiction or state where the actual activities take place	2 cases
Unknown (lacking information)	8 cases
Total number of analysed cases	33 cases

Indeed, the lack of economic and/or logistic benefits when using a multi-jurisdictional structure for corporate entities or the related money flow would appear to be an important indicator of possible abuse.

Furthermore, foreign (offshore) bank accounts were used in 13 of the 33 analysed cases. In 11 out of the 13 cases, a combination of multi-jurisdictional structure and foreign bank accounts was identified.

Section 4: Overview of survey responses

The responses to the survey highlighted the main areas of risk with respect to corporate vehicles, indicated frequent problems in obtaining information on beneficial ownership, and suggested areas for further investigation.

A. Areas of Risk

Several jurisdictions continue to have practices that make use of corporate vehicles which are relatively more vulnerable to exploitation for illicit purposes, such as ownership through nominee shareholding and bearer shares, and control through nominee and corporate directors.

Where information on a corporate vehicle must be disclosed upfront, there is a potential problem with ensuring that this information remains current and accurate over time. Dealing with this issue will require learning more about how jurisdictions with upfront disclosure systems for corporate vehicles enforce and update their company registers.

TCSPs, lawyers and accountants are required in most jurisdictions to practice CDD. Based on responses to the questionnaire this normally results in the information on beneficial owners being obtained by persons subject to AML requirements, but it does not necessarily mean this information is then directly accessible by the authorities.[69] Also, in jurisdictions with strong confidentiality rights, information held by the TCSPs may be treated in the same way as information held by legal professionals, thus making it harder for competent authorities to gain access to the records.[70]

[67] MO.

[68] See cases 4, 10, 11, 17, 19 .

[69] For example, MY, noting that TCSPs are not required to give information to investigators unless a warrant is obtained.

[70] Id.

Although bearer shares can serve legitimate purposes, they can also be used to mask the true ownership and control of a company and thus may be used for money laundering, self-dealing and/or insider trading. Sixteen of the thirty-two jurisdictions permit the use of bearer shares, and in two jurisdictions bearer shares can also be used by private companies.[71] Five jurisdictions indicated that they have dematerialized or immobilized bearer shares in an effort to verify the identities of their owners.[72]

B. Prevalent Problems in Obtaining Information[73]

Twenty-nine of the jurisdictions surveyed stated that they are willing to exchange information on beneficial ownership with foreign jurisdictions[74], although nine expressed concern about bureaucratic delays associated with obtaining information from foreign authorities[75]. Also, seven noted that the inability to gather necessary information from analogous regulatory bodies in other jurisdictions was due to insufficient disclosure from corporate vehicles and TCSPs, not from lack of co-operation.[76]

In summary: the survey appears to show that in the reporting jurisdictions–

- There is a wide variety of types of "corporate vehicles";
- "Beneficial owners" are involved with corporate vehicles in a number of different ways –through direct shareholding and through indirect shareholding (corporate shareholders, nominee shareholders, bearer shares, trusts);
- There are a large number of different competent authorities with oversight of corporate vehicles;
- Information on "corporate vehicles" can be found in a number of different places, such as company registries, financial institutions, and TCSPs;
- The degree of regulation applied to the creation and administration of corporate vehicles varies significantly from jurisdiction to jurisdiction – for example, a few jurisdictions regulate trust and company service providers, but the majority still do not;
- Many countries permit bearer shares to be issued and also permit the appointment of corporate and nominee directors;
- In some countries, the corporate vehicle itself is obliged to furnish/maintain certain information, and it is sometimes subject to criminal liability;
- In all countries covered by the survey, a company registry exists, but the extent of the information available from the registry varied significantly from jurisdiction to jurisdiction. Some require full shareholder information, others only partial information. Some provide information from the time of creation and have no update obligation; others include an obligation to register changes in shareholding. In nearly all cases, the information in the company registry relates to legal ownership – and not necessarily the beneficial ownership – of the corporate vehicle;

[71] TR,LB.

[72] LV,MO,FR,VI,BE.

[73] Note: there are a number of current international initiatives to improve the ability of regulatory authorities to share information (e.g. IOSCO).

[74] NL,GU,NO,MY,CH,LT,SK,MO,LV,MA,BH,GG,IM,QA,UK,HK,MH,DE,PW,TR,LB,FR,JE,JP,AU,BE, VI,BA, US

[75] GI,NO,MY,MA,IM,HK,PW,LB,JP

[76] NL,GI,LV,MA,GG,HK,LB

- Lawyers and accountants that are involved in establishing corporate vehicles are subject to AML regulation in the majority of countries surveyed.

4. Overall findings and conclusions

From the foregoing analysis of the typologies and the survey, it seems clear that prevention of corporate vehicle misuse for ML purposes could be improved by knowing or being in a position to determine in a timely fashion who are the ultimate beneficial owners of a company and who are the trustees, settlors, beneficiaries involved with a trust. It would also be important to find out for what purpose the corporate vehicle was formed, why foreign jurisdictions are being used for creation/administration of the entity, and why complex structures are being built.

The level of misuse of corporate vehicles could be significantly reduced if the information regarding the ultimate beneficial owner, knowledge of the source of assets and the business objective of the company or a trust within a structure were readily available to the authorities that might need it, especially in situations containing many or all of the "risk indicators" cited on pages 13/14. Since many of the structures are set up and / or managed by trust and company service providers it might be advisable that TCSPs be obliged to gather and maintain the above mentioned information. Some of this is already part of the present FATF-recommendations (at least the identification of the beneficial owner, as well as suspicious transaction reporting).

Another conclusion that may be drawn is that, in theory, it matters less who maintains the required information on corporate vehicles, namely:

- the corporate vehicle itself;
- the trust and company service provider;
- the registrar of companies; or
- another authority;

provided that the information on beneficial ownership exists, that it is complete and up-to-date and that it is available to competent authorities. It is thus an essential corollary that competent authorities – especially across jurisdictional lines – need to know where relevant corporate vehicle information is held and how it can be obtained. Both the OECD and IOSCO have emphasised that it is important for competent authorities to be able to co-operate with other competent authorities within and without their own jurisdiction to share relevant information on beneficial ownership.[77]

Company registers are an important source of information on legal ownership, although they may not always contain the most current information on the corporate vehicle. Nevertheless, as is indicated by the results of the survey, checking company registries is an important first step in obtaining information about the structure of corporate vehicles that are of concern. It is thus important that such registries be as comprehensive and as up-to-date as possible. Similarly, legal ownership information held by other public entities such as filings with financial regulatory authorities or stock exchanges should also be accurate and current.

Individuals and corporate vehicles have legitimate expectations of privacy and business confidentiality in their affairs and, from the information obtained through the survey, it is evident that jurisdictions adopt different approaches to protect legitimate privacy interests.[78] Certain of the arrangements and practices however, including the absence of appropriate regulation/supervision, would appear to contribute to the potential for

[77] OECD, Options for Obtaining Beneficial Ownership and Control Information: A Template (OECD Template) Annex 1, p33; IOSCO, Multilateral Memorandum of Understanding Concerning Consultation and Co-operation and the Exchange of Information (IOSCO Multilateral MOU); and IOSCO, Methodology for Assessing Implementation of the IOSCO Objectives and Principles of Securities Regulation, Principles 11-13.

[78] OECD Template 2002, Annex 2, p34.

corporate vehicle misuse by making it very difficult, and perhaps even impossible, for the authorities to identify beneficial owners and controllers.

As with all regulation – and as confirmed by the survey – it appears that there is a need to strike a balance between the need for robust regulation and/or supervision to prevent corporate vehicle misuse and the need to avoid unnecessary restrictions on legitimate business. In developing further guidance for this area, it will be important to consider the potential impact on overall economic performance, market integrity, market efficiency, market transparency and incentives.

The analysis of the typologies submitted as part of the survey, as well as prior studies relating to this topic,[79] points toward a number of frequently occurring risk factors associated with the corporate vehicle misuse (see Section 2 above). From this can be concluded that the further development of these common risk factors could be useful for countries in determining their own factors that help to identify such misuse and could be used in conjunction with other, existing, diagnostic tools, such as the OECD Template and the IOSCO Multilateral MOU. Examples of these factors are included in Figure 6.

Figure 6

Examples of Risk Assessment Factors

1. *What are the corporate vehicle formation requirements in the source jurisdiction?*
   - *Is information concerning the beneficial ownership and control of a company required to be recorded, maintained and kept up-to-date?*
   - *Do similar requirements apply concerning information on the settlor or founder, trustee and beneficiaries of a trust or foundation, and the partners of a partnership?*
   - *Are regularly updated list of the shareholders, directors and principal officers of all companies required to be maintained?*
2. *Are there adequate regulatory and/or AML standards or investigative capacities in the jurisdictions where the corporate vehicle has been incorporated /formed/administered (e.g. particularly in the application to lawyers, accountants and trust and company service providers engaged in the formation and administration of corporate vehicles)?*
3. *How might information on the beneficial owners be made available, or be obtained, in the jurisdiction of incorporation and/or the country in which the company and trust administration services are provided?*
   - *Is all or some of the information required to be maintained:*
     (a) *On a public register (and how easy it is to obtain the information)? *[80]*
     (b) *On a private register available to financial institutions;**
     (c) *On a private register available to regulators/law enforcement agencies (and under what circumstances can they share information available to them with other domestic/foreign regulatory authorities or law enforcement agencies)?*
     (d) *By licensed/regulated trust and company service providers (and under what circumstances and to whom are they permitted or required to make information available)?*
     (e) *By unregulated trust and company service providers (and under what circumstances and to whom are they permitted or required to make information available)?*
     (f) *By the entities themselves (and under what circumstances and to whom are they permitted or required to make information available)?*

[79] Id.

[80] Items marked by an asterisk should also be of particular interest to financial institutions when undertaking CDD in respect of corporate vehicles seeking to use their services.

- *Is there a register (public or otherwise) of the corporations, trusts, foundations and partnerships that are created, incorporated, registered or administered in the jurisdiction?**
- *Is the information referred to in the preceding bullet point required to be maintained in –*
  - *(a) The country of creation/incorporation?*
  - *(b) The country(ies) of administration or operation (if different to (a))?*
  - *(c) Both (a) and (b)?*

4. *What is known about the beneficial owner?**
5. *Is the corporate vehicle a regulated or unregulated entity?**
6. *What is the purpose of the corporate vehicle? Does it have 'real' activities (e.g. manufacturing, trading) or is it solely involved with holding/administrating the assets of the beneficial owner?**
7. *If applicable, why has the corporate vehicle been established in a foreign jurisdiction?**
8. *If applicable, why has an individual given up control over his assets to trustees, through the formation of a trust?**
9. *What is the purpose behind naming corporate shareholders, nominee shareholders, corporate directors or bearer shares* –*

   - *Are bearer or nominee shares permitted, and if so, is there an effective mechanism that will allow the ultimate beneficial owner of the shares to be ascertained? Who can use this mechanism and with whom can the information be shared?*
   - *Are corporate or nominee directors permitted, and if so, is there an effective mechanism that will allow the person with ultimate control of the company to be ascertained? Again, who can use this mechanism and with whom can the information be shared?*
   - *Is there a requirement that at least one director of the company/trustee of a trust/administrator of a foundation/partner in a partnership must be a natural person resident in the jurisdiction of creation/ incorporation/administration?*

10. *Can shell or shelf companies be formed in the jurisdiction of incorporation?*
11. *What is known about the source of funds?**
12. *What is known about the scale of the business/funds?**
13. *Are the business activities unusual, particularly with regard to the nature of the beneficial owners?**
14. *Are there any other unusual features about the structure/business activities of the corporate vehicles?**
15. *Are corporate vehicles administered by lawyers, accountants, trust company service providers or other individuals, and are intermediaries identified as the legal owner?*
16. *Is there a lack of oversight of those engaged in the formation and administration of corporate vehicles (e.g. is there a fit and proper test for those able to form and administer corporate vehicles; is there adequate control over the opening of bank accounts in the name of the corporate vehicles in the jurisdiction where the vehicle is formed)?*
17. *Do secrecy laws prevent or unduly restrict access to beneficial ownership information?*
18. *Are financial institutions and intermediaries obliged to obtain beneficial ownership information, and perform customer due diligence at the commencement, and during the course of, a business relationship, in particular when opening an account for a customer?*
19. *Have competent authorities been designated to oversee and monitor compliance with the requirements referred to in the preceding bullet point, including imposing sanctions for non-compliance where appropriate?*
20. *Can law enforcement agencies, and financial regulatory authorities, obtain or access beneficial ownership*

information, and is there evidence of information being obtained on a timely basis:

(a) For their own investigative or regulatory purposes?

(b) Based upon a legitimate request from another domestic or similar foreign authority, and share that information on a timely basis, and without unduly restrictive conditions?

21. Is there evidence of a lack of effective international cooperation exhibited by the authorities in the jurisdictions where the corporate vehicle is formed and/or administered?

22. What are the penalties or other consequences for non-compliance with international standards in the jurisdiction where the vehicle is formed and/or administered?

As suggested by the typologies examined as part of this research, there appear to be two essential factors that further protect against the misuse of corporate vehicles: (1) the quality of available information and (2) the quality of the "gateway" through which that information can be obtained. There is little value in having good gateways if no information on beneficial owners can be obtained. Likewise there is little value in knowing that there is good quality information available when investigators are unable to get access to it.

The conclusions drawn from the typologies are further reinforced by findings made in other sources that were consulted as part of this research project (extracts from these sources are included in Annex 5).

4. Issues for consideration

As stated at the beginning of this paper, the focus of research for this FATF typologies project has been on the beneficial ownership issues that are directly tied to the misuse of corporate vehicles for money laundering purposes. Despite this limited focus, however, the information and typologies examined through the project survey suggest a number of areas that may call for further and separate consideration – by the FATF and/or other relevant international organisations[81] – in preventing corporate vehicles and their activities from misuse by criminals. Some of the most important questions are as follows:

- Are the existing AML/CFT standards as a whole adequate to discourage the misuse of corporate vehicles?
- Are the specific FATF Recommendations 12, 16 and 24 sufficient as a basis for dealing with the issue of corporate vehicle misuse?
- What more can be done to ensure that adequate, accurate and timely information on the beneficial ownership and control of legal persons/legal arrangements may be obtained or accessed in a timely fashion by competent authorities?
- What can be done to ensure that those engaged in the formation and administration of corporate vehicles are "fit and proper"? Is there a need for an international standard for TCSPs or professionals engaged in providing trust and company services?
- What steps can and should be taken to ensure that the actions of those engaged in the formation and administration of corporate vehicles are properly monitored or subject to investigation as necessary?
- Should TCSPs be regulated or should there be enhanced regulation of such service providers, including lawyers and accountants where they offer similar services?

[81] For example, the OECD, who have already conducted extensive work in this area

- Should existing corporate governance standards (such as the OECD Principles) be extended to include factors relating to the role of TCSPs, lawyers and accountants in relation to the potential misuse of corporate vehicles?

- Should guidance in other forms be produced – for example risk assessment check lists – to help the competent authorities focus their risk-based approaches in relation to the different types of misuse of legal persons and legal arrangements?

- Where should beneficial ownership information be held?

- What more needs to be done to enhance the effectiveness of company registers, and other publicly available information?

- Is there any practical action that needs to be or can be taken to enhance the information publicly available in respect of legal arrangements?[82]

This typologies report should be seen as an initial report. It has addressed what is seen as the key issue in limiting the misuse of corporate vehicles – namely who is the beneficial owner and what is the purpose behind the corporate vehicles being used. There are however many matters deserving of further consideration which are further evidence of the scale and complexity of the issues involved in preventing the misuse of corporate vehicles.

[82] See Annex 2 for information on the South African system for registering the information on trusts.

BIBLIOGRAPHY

The following is a list of the source material/documentation accessed by the team of experts

- Behind the Corporate Veil – Using Corporate Entities for Illicit Purposes; a report by the OECD (2001);
- Options for Obtaining Beneficial Ownership and Control Information – a template prepared by the OECD (September 2002);
- Trust and Company Service Providers: Statement of Best Practices – a report by the Offshore Group of Banking Supervisors (OGBS) (September 2002);
- Securing Effective Exchange of Information and Supervision in Respect of Trust and Company Service Providers – a report by OGBS (December 2004);
- A review commissioned by the International Trade and Investment Organisation and the Society for Trust and Estate Practitioners on "Regulating Corporate Vehicles and Cross-Border Transactions" (2002);
- FATF Report on Money Laundering Typologies 2000-2001 – February 2002;
- "Euroshore". Final report prepared for the European Commission, Falcone Progamme 1998, (January 2000) on Protecting the EU Financial System from the Exploitation of Financial Centres and Offshore Facilities by Organised Crime;
- Transparency and Money Laundering. A report produced for the European Commission by the Research Centre on Transnational Crime – University of Trento ("the Savona Report") (October 2001) on Study of the Regulation and its Implementation in the EU Member States that Obstruct Anti-money Laundering International Co-operation;
- Report of the United States Government Accountability Office (October 2000) on Possible Money Laundering by US Corporations Formed for Russian Entities;
- US Money Laundering Threat Assessment (December 2005) – report of an inter-agency working group composed of experts from the spectrum of the US government agencies, bureaux and offices that study and combat money laundering;
- Options papers prepared for the FATF working groups engaged on the review of the Forty Recommendations on beneficial ownership and control of corporate vehicles; enhancing the transparency of trusts; and trust and company service providers (March 2002);
- US Government Accountability Office (April 2006) – Report to the Permanent Sub-Committee on Investigations, Committee on Homeland Security and Governmental Affairs, US Senate on Company Formations – minimal ownership information is collected and available.

Annex 1 GLOSSARY

The following are terms used in this report, and elsewhere in the study of the misuse of corporate vehicles:-

Corporate vehicles: The term "corporate vehicle" when used has the same meaning as in the OECD report "Behind the Corporate Veil – Using Corporate Entities for Illicit Purposes", and embraces corporations, trusts, partnerships with limited liability characteristics, foundations etc.

Legal persons/arrangements: The FATF Recommendations use two separate terms which together have the same scope as the OECD term "corporate vehicle" –

- legal persons - this refers to bodies corporate, foundations, anstalt, partnerships, or associations, or any similar bodies that can establish a permanent customer relationship with a financial institution or otherwise own property;

- legal arrangements - this refers to express trusts or other similar legal arrangements. Examples of other similar arrangements (for AML/CFT purposes) include *fiducie*, *Treuhand* and *fideicomiso*.

  Particular difficulties are often experienced in understanding what is meant by a "trust". The Hague Convention on the Law Applicable to Trusts and their Recognition (1985) provides as follows in Article II –

  "For the purposes of this Convention, the term "trust" refers to legal relationships created ... by a person, the settlor, when assets have been placed under the control of a trustee for the benefit of a beneficiary or for a specified purpose".

  There are many different types of trusts, many of which are most unlikely to be used by criminals (e.g. a will trust, an employee share/options trust, a pension fund trust). For an explanatory note on trusts, see Annex 2, which for the most part is taken from an OECD report produced by the Global Forum Joint Ad Hoc Group on Accounts entitled "Enabling Effective Exchange of Information: Availability and Reliability Standard".

Bearer shares: These are negotiable instruments that accord ownership of a corporation to the person who possesses the bearer share certificate.

Beneficial owner: This refers to the natural person(s) who ultimately owns or controls a customer and/or the person on whose behalf a transaction is being conducted. It also encompasses those persons who exercise ultimate effective control over a legal person or arrangement.

Beneficiary: A person who is designated to receive something as a result of a trust arrangement. While trusts must always have some ultimately ascertainable beneficiary, trusts may have no defined existing beneficiaries but only objects of a power until some person becomes entitled as beneficiary to income or capital on the expiry of a defined period, known as the accumulation period. This period is normally co-extensive with the trust's perpetuity period, which is usually referred to in the trust deed as the trust period.

Corporate Director: A corporation appointed as a director with "management" functions being performed by a representative of the selected corporation.

Corporate Shareholder: a legal person who holds shares.

Corporate Trustee: A trust company appointed as a trustee and who has all the responsibilities/obligations of an individual trustee.

Nominee: The person, corporation, or beneficiary who has been appointed or designated to act for another (e.g. a Nominee Director is a director nominated by another director to act in his or her place).

Settlors: Persons or companies who transfer ownership of their assets to trustees by means of a trust deed. Where the trustees have some discretion as to the investment and distribution of the trust's assets, the deed may be accompanied by a non-legally binding letter setting out what the settlor wishes to be done with the assets.

Shelf company: A corporation that has had no activity. It has been created and put on the "shelf". This corporation is then later usually sold to someone who would prefer to have an existing corporation than a new one.

Shell company/corporation: A company that is incorporated that at the time has no significant assets or operations.

Trustee: A trustee, who may be a paid professional or company or unpaid person, holds the assets in trust fund separate from their own assets. The trustee invests and disposes of the trust assets in accordance with the settlor's trust deed, taking account any letter of wishes. There may also be a protector, who may have power to veto the trustee's proposals or remove them, and/or a custodian trustee, who holds the assets to the order of the managing trustees.

Trust and company service provider (TCSP): This has the same meaning as in the Glossary attached to the FATF Forty Recommendations and refers to any person or business that provides any of the following services to third parties:

- acting as a formation agent of legal persons;
- acting as (or arranging for another person to act as) a director or secretary of a company, a partner of a partnership, or a similar position in relation to other legal persons;
- providing a registered office; business address or accommodation, correspondence or administrative address for a company, a partnership or any other legal person or arrangements;
- acting as (or arranging for another person to act as) a trustee of an express trust;
- acting as (or arranging for another person to act as) a nominee shareholder for another person.

In many jurisdictions the existence of TCSPs is not recognised. However, trust and company services may well be provided by lawyers and other professionals. For example, in most, if not all, jurisdictions lawyers will be engaged in the formation of foreign companies for clients to hold assets outside of that client's jurisdiction (e.g. a yacht, a residential or commercial property etc). Some TCSPs are required to afford confidentiality privileges to a client which can conflict with AML reporting requirements.

Even where jurisdictions do not recognise trusts, they may well have lawyers or other professionals within the jurisdiction engaged in the administration of trusts. For example, there may be no barrier in such jurisdictions to a resident professional acting as a trustee for a trust established under the law of a jurisdiction that does recognise trusts.

Annex 2 Explanatory Note: Trust

1. Definitions of a trust are to be found in the domestic trust law of those jurisdictions where such laws exist. Alternatively, the definition can be taken from the Hague Convention on the Recognition of Trusts.

2. As an example of a definition incorporated in a trust law, the following is taken from the Trusts (Guernsey) Law, 1989, which mirrors the definition in the Jersey (Trusts) Law, 1984:

   "A trust exists if a person (a "trustee") holds or has vested in him, or is deemed to hold or have vested in him, property which does not form, or which has ceased to form, part of his own estate –

   (a) for the benefit of another person (a "beneficiary"), whether or not yet ascertained or in existence;

   (b) for any purpose which is not for the benefit only of the trustee.

3. The Hague Convention on the Law Applicable to Trusts and their Recognition (1985) provides as follows in Article II –

   "For the purposes of this Convention, the term "trust" refers to legal relationships created .... by a person, the settlor, when assets have been placed under the control of a trustee for the benefit of a beneficiary or for a specified purpose".

4. The definition of a trust, whether included in domestic law or in the Hague Convention, normally embraces a wide range of types of trust.

5. It is important to remember that a trust is not a legal entity, it is a relationship between juridical persons – settlor, trustee, beneficiary.

Express Trusts

6. These are trusts created voluntarily and intentionally, either orally or in writing –

   - inter-vivos by the settlor executing an act or instrument of settlement made between the settlor and the trustees under which the settlor transfers assets to the trustee to hold subject to the terms of the trusts set out therein;

   - inter-vivos by the settlor transferring assets to the trustees and the trustees executing a declaration of trust (to which the settlor is not a party) whereby the trustees acknowledge that they hold the assets subject to the terms of the trusts set out in the instrument; or

   - on death by the Will of testator taking effect, whereby the testator's executors are directed to transfer all or part of the testator's estate to trustees (who may be the executors) to hold subject to the trusts set out in the Will.

7. The following are forms of express trusts. Within any trust, different elements of the following may be found.

   (a) <u>Bare/Simple Trust</u>

   A bare trust is one in which each beneficiary has an immediate and absolute right to both capital and income.

   (b) <u>Discretionary Trust</u>

This is a form of trust where the interests of the beneficiaries are not fixed but depend upon the exercise by the trustee of some discretionary powers in their favour. As such, it is the most flexible of all trusts.

(c) Interest in Possession Trust

This is a trust where a particular beneficiary (the "life tenant") has a right to receive all the income arising from the trust fund during his life time. The trustee will usually also have the power to apply capital to the life tenant. Often there are successive life interests in favour of an individual and his spouse. On the death of the life tenant, the remainder of the trust fund is often held on discretionary trusts for the other beneficiaries.

(d) Fixed Trust

A trust where the interests of beneficiaries are fixed. The trustee will have control over the management of the assets, but the interests of the beneficiaries are defined in and by the trust instrument. Typically such a trust may provide an income which is paid, say, to the wife of the settlor and capital to the children on her death.

(e) Accumulation and Maintenance Trust

This form of trust is usually created for the children or grand-children of the settlor, where the trustees have powers during the minority of each beneficiary to pay income in a way beneficial for the upbringing or education of the beneficiary, and to accumulate income not so applied. On attaining a certain age each beneficiary will become entitled to a particular share of the trust fund.

(f) Protective Trust

A trust where the interest of a beneficiary may be reduced or terminated, for example on the happening of events (a common scenario may be if the beneficiary attempts to alienate or dispose of his interest in income or capital).

(g) Employee Share/Options Trust

Trusts established by institutions in favour of their employees.

(h) Pension Fund Trusts

Trusts established to provide pensions for employees and their dependants.

(i) Charitable Trust

A trust established purely for charitable purposes. In this case there needs to be an enforcer.

(j) Purpose Trust

A trust established for one or more specific purposes. There are no named or ascertainable beneficiaries and there is commonly an enforcer to enforce the terms of the purpose trust.

(k) Commercial Trusts

The major applications include –

- unit trusts;
- debenture trusts for bond holders;

- securitisation trusts for balance sheet reconstructions;

client account trusts for lawyers and other providers of professional services, separate from the provider's own assets;

- retention fund trusts, pending completion of contracted work.

Implied Trusts

8. A trust can also arise from an oral declaration or by conduct and may be deemed by the Court to have been created in certain circumstances. On account of their very nature there are no formal requirements for those trusts. Usually the existence of such trusts is only recognised as a result of legal action.

Resulting Trusts

9. Both express and implied trusts require an intention for their creation. A resulting trust arises where the intention is absent and yet the legal title to property is transferred from one person to another. By way of example, where X transfers £100 to Y at the same time as executing an Express trust in respect of £80, only the balance of £20 is held on a Resulting Trust to be retransferred back to X. In this situation, in the absence of intention, the beneficial ownership remains with the transferor.

Constructive Trusts

10. Constructive trusts are those trusts that arise in circumstances in which it would be unconscionable or inequitable for a person holding the property to keep it for his own use and benefit absolutely. A constructive trust can arise in a number of differing scenarios covering a broad spectrum of activity. The proceeds of criminal activity can be traced into the hands of the recipient's bankers who, once alerted, would hold them as constructive trustee on behalf of those to whom they actually belong.

11. Trusts may also be classified according to why they are created and may include –

- private trusts – made for the benefit of specific private individuals, or a class thereof;
- public trusts – made for the benefit of the public at large, or a section of the public – for example a charitable trust established to relieve poverty, to advance education or to promote religion;
- purpose trusts (see above).

12. This brief, and limited, description of trusts shows that the concept encompasses a wide variety of arrangements. Essential to them all is that legal ownership and control is passed from the settlor to the trustee.

Potential for misuse

13. Aspects of some trusts that can give rise to a lack of transparency and enable their misuse, which are also to be found in the misuse of companies, limited partnerships and other legal entities, can be itemised as follows –

(a) Trusts can exist without any written record.

These conditions where they exist can create difficulties for law enforcement or regulatory authorities (either administrative or judiciary) to gather rapidly information or evidence regarding the very existence of the trust and collect the names of their settlor or beneficiary(ies). In such circumstances, it can also be very difficult, if not impossible, for a financial institution to know and verify the name of a beneficiary of a financial transaction conducted through such a trust.

(b) A trust deed can exist which does not identify the settlor and/or the beneficiary.

Together with the situation in (a) above, this can create an important obstacle for the law enforcement authorities to identify rapidly the beneficiary(ies) of the trust, and can hamper a financial institution in fulfilling properly its know your customer requirements.

(c) Some form of trusts, such as the discretionary trust, can make it possible to give the trustee discretionary power to name the beneficiary within a class of beneficiaries and distribute accordingly the assets held in trust.

The beneficiary can be named or changed at any time, which can make it possible to keep the beneficiary's identity secret up until the time the ownership of the assets held in trust is transferred to them. As in (a) this can also make it difficult, if not impossible, for a financial institution to know and verify the name of a beneficiary of a financial transaction conducted through such trusts.

(d) The laws of certain jurisdictions have encouraged the development of so called asset protection trusts which can protect the settlor from the freezing, seizure, or confiscation of the assets, even though the settlor is able to keep control over their management, either by giving the trustee instructions or by naming a protector. In some jurisdictions, the settlor can be made a beneficiary of the trust without anyone being able to find out.

(e) Decisions about the management of trusts may not be recorded and they may not be disclosed in writing to anyone. If such decisions are not recorded at least by the trustee the law enforcement authorities cannot have access to them.

(f) Trusts can be set up for the purpose of managing shares in a company, which can make it even more difficult to determine who the true beneficiaries of assets managed by trusts are (cascade arrangements). These kinds of arrangements often have the purpose of hiding the identity of the ultimate beneficiary(ies) or real owner of an asset.

(g) Flee clauses can constitute an obstacle to an effective anti-money laundering framework, in particular in terms of international legal assistance. These clauses permit the automatic change of the law of the trust in case of certain events. With such clauses it is possible to protect trust assets against legal action.

(h) In some countries the use of trusts can be a way to escape from judicial decisions that freeze, seize or confiscate the assets located in trusts. Some legislation can explicitly prohibit freezing, seizure or confiscation of the assets located in trusts.

Register of Trusts

14. Most countries in which trusts are set up do not consider it practical to require trusts to be registered in the same way that a company is registered. However, in South Africa the Trust Property Control Act, 57 of 1988, Section 4, provides that the trustee must, before he or she assumes control of the trust property, lodge with the Master of the High Court the trust instrument in terms of which the trust property is to be administered. In other words, in respect of a trust inter vivos, the deed in terms of which the trust agreement is recorded must be lodged with the Master of the High Court before a trustee is allowed to take charge of the trust property.

The contents of the trust deed and the appointment of the trustees are therefore matters of public record. The master must on written request and payment of the prescribed fee furnish a certified copy of any document under the Master's control relating to trust property to a trustee, his or her surety or representative or any other person who in the opinion of the Master has sufficient interest in the document.

The value of the register depends on what information is contained in the trust deed. Insofar as a trust is a discretionary trust reference may be made in the trust deed simply to a class of beneficiary.

No	Short description	Time	Experts involved	Jurisdiction of incorporation	Jurisdiction where the actual activities take place	Similar fashion (typology)	Case ID via	Offence(s)	ML phase	Amount (fine/damage)
1	Mr. A was a Trust Service Provider operating a Trust Company [L]. Using a series of domestic trusts that he established, he wired large sums of money to 51 different U.S. and offshore bank accounts that originated from a investment/securities fraud. The thrust of the scheme was that A and associates convinced their clients to form 'Pure Trust Organisations' (PTO) and to place their life savings, including their retirements accounts, into these Trusts created by L. Clients were taught the PTO provided asset protection providing concealment of their assets from the government and other creditors. The L-package promised the formation of a PTO and offshore bank accounts. The clients were told when the funds were placed in these offshore bank accounts it was beyond the reach of the U.S. government and any creditor. Once the clients placed their assets into the Trusts, A used another corporation to provide investments for the assets in the Trusts. In reality there were no investments, and A and his associates defrauded the Trust Owners.	Unknown	TSP	1) trusts in the U.S. (unknown is the type of Trust and the state in the U.S. in which the Trusts were established) 2) Pure Trust Organisation (PTO) (unknown is the type of corporation and the jurisdiction in which the corporation was established) 3) another corporation (unknown is the type of corporation and the jurisdiction in which the corporation was established)	The activities of this Trust Service Provider took place in the U.S. (unknown is the state in which this Trust Service Provider is seated and active)	1) use of trusts and corporations to realize scheme 2) use of trusts to divert the money flow 3) use of trusts and corporations to conceal identity of clients	IRS	1) Investment fraud 2) securities fraud 3) mail fraud 4) wire fraud 6) conspiracy Mr. A pleaded guilty and was sentenced to 220 months in federal prison.	1 Placement	In total it is estimated the scheme defrauded over 500 investors of approximately USD 56 million.

2	Mr. B and his associate bought insurance companies. The assets of these companies were drained and used for personal benefits. The draining of the assets was concealed by transferring them into accounts in and out of the U.S. via wire transfers. The first step in the scheme was establishing a Trust in the U.S. B concealed his involvement and control of the Trust through the use of nominees as the grantors and trustee. B used the Trust to purchase the insurance companies. Immediately after the acquisition, B would transfer million of dollars of reserve assets to a corporation he set up in the U.S. The funds were then wire transferred to an offshore bank account in the name of another corporation that he controlled. Once these funds were deposited into the offshore bank account, B used them to pay for his personal expenses.	Unknown during 9 years	Feasible but not specifically described	1) trust in the U.S. (unknown is the type of Trust and the jurisdiction or state in which the Trust was established) 2) corporation in the U.S. (unknown is the type of corporation and the jurisdiction in which the corporation was established) 3) another corporation with an offshore bank account (which type of corporation and in which jurisdiction the corporation was established)	Mr. B used a U.S. trust to purchase insurance companies (unknown in which jurisdiction) and subsequently transferred millions of dollars of reserve assets to a corporation in the U.S.	1) use of structure, trust and shell companies to realize scheme 2) use of structure to conceal identity 3) use of nominees to conceal identity	IRS	1) wire fraud 2) money laundering 3) racketeering influenced corrupt organisation (RICO) 4) RICO conspiracy 5) securities fraud	1 Placement	Total restitution ordered by the court was approximately USD 400 million.

3	Mr C and his associates perpetrated of a pyramid investment scheme caused more than USD 8,4 million in losses to almost 8,000 investors in the U.S. The investigation focused on an association [M]. M was a pyramid business enterprise that sold various products to its members including investment plans. The chairman of M was Mr. C. It was alleged that M's leaders were promoting the sale of an investment, identified as Private Placement Offers (PPO). The investment promised a 30 to 1 return within a year C promoted the PPO investments to M members and encouraged them to establish offshore corporations and bank accounts in Antigua, Isle of Man and Belize. He advised them to conduct their financial transactions relating to the PPO investments through their offshore accounts. It was proven that all the participants conspired to defraud and obtain money and property from individuals by means of false and fraudulent representations. From 4 years, C and his associates caused members of the M to invest in the PPO offered by a U.S. corporation. The result was the receipt of more than USD 8 million from investors for participation in the PPO. These funds were deposited into bank accounts in the U.S. Instead of using these monies as purported, they were diverted to the personal use and benefit of C and his associates and used to promote the carrying on of the illegal enterprise.	Unknown	Feasible but not specifically described	1) offshore corporations in Antigua, Isle of Man and Belize (unknown is the type of companies that were established)	An association known as Sovereign Business System (SBS) , a pyramid business enterprise was established in the U.S. and used to promote PPO´s. The investors subsequently transferred money into offshore organisations and trusts that were established in Antigua, Isle of Man and Belize.	1) use of multi jurisdictional structure realize scheme 2) use of offshore corporations divert money flow 3) use of offshore bank accounts	IRS	1) money laundering 2) mail fraud 3) wire fraud 4) other criminal charges	1 Placement	More than USD 8,4 million in losses to almost 8,000 investors in the U.S. Due to the seizure of assets, restitution of approximately USD 5,8 million was paid to the victims of this fraud.

6	Mr C was an accountant that started his own accounting and financial services, N in Panama. He advertised his services primarily on the internet and through mass mailings. N provided a variety of services including the following: formation of offshore entities shelf corporations (trust, foundations and corporations to disguise ownership of assets; passports and dual citizenship, mostly using new nominee names; movement of cash and other assets offshore and back onshore using various methods; issuance of debit cards for the purpose of anonymously repatriating and spending offshore funds; use of correspondent bank accounts to skim profits of legitimate businesses and repatriate funds through the purchase of assets and use of debit cards; anonymous trading of securities through accounts with two major brokerage houses; false invoicing-re-invoicing schemes to support fraudulent deductions on tax returns; false investment losses, to disguise transfer of funds overseas. C was identified pursuant to an IRS-CI investigation of one of his clients for illegal importation and sale of goods. The targets of this investigation were using a re-invoicing scheme devised by C to illegally import these chemicals into the U.S. for sale. C assisted the targets in the re-invoicing scheme by preparing the invoices, receiving the proceeds of the scheme and hiding the proceeds in a myriad of Panamanian Corporations for later use by the targets. As a result of this investigation, C became a subject investigation for the formation of illegal trusts to facilitate money laundering and other crimes. The investigation disclosed that L had about 300-400 active clients/investors. The investigation also disclosed that it created between	2000-2003?	C was an accountant	1) foreign trusts (unknown is the type of Trust and the jurisdiction in which the Trusts were established 2) Panamanian corporations (unknown is the type of corporation) 3) foundations (unknown is the jurisdiction in which the foundations were established)	N was seated in Panama and advertised its services primarily via the internet and through mass mailings.

17	The case relates to three fraudulent wire transfers from Miami to Mauritius and the funds were thereafter transferred to Sri Lanka, Hong Kong, India, USA and Panama A limited company A operating in the textile sector exports mainly to the USA. Its Board of Directors consists of an Indian national based in Sri Lanka, a Mauritius national, and a sister company B seated in Sri Lanka. A Miami bank received three requests by fax to debit the accounts of Mr. N., a client based in Venezuela and operating in cosmetics through his company C. and credited accounts of A a bank in Mauritius for an amount of USD 1,8 million. The Mauritius bank received three requests from their correspondent bank HSBC in New York for cancellation of the payment orders to A s they were sent in error. Delphis bank requested A to authorise for reversal of the payment order. However the funds were transferred to other bank accounts in Sri Lanka, India, Panama and Hong Kong. It seems that Mr. N. agreed A not to produce the goods. The goods were manufactured by B in Sri Lanka, but since there is exchange control regulation in Sri Lanka and Mauritius has offshore facilities the remittances were made to A in Mauritius. The documents that witnessed the export of textile to Venezuela were forged and improper.	2001-2004	Unknown	1) Mauritius (limited company) 2) Sri Lanka (unknown is type of company) 3) Company C(unknown is type of company and jurisdiction in which this company was established)	The goods were manufactured in Sri Lanka. In order to avoid exchange control regulation, the goods were pretended to be manufactured in Mauritius. The goods were sold to Mr. N in Venezuela, who paid by means of a wire transfer to a company incorporated in Mauritius (not Sri Lanka). The funds were thereafter transferred to Sri Lanka, Hong Kong, India, USA and Panama. Mauritius has offshore facilities.	1) multi jurisdictional structure to evade exchange control and taxes in Sri Lanka 2) false documents also to evade exchange control and taxes in Sri Lanka. 3) management of a company in Mauritius consists of at least one non-resident person.	Investigation by the police	1) forgery	no ML	Each director of A was fined to pay Rs. 1 million plus Rs 500 costs in 2004

26	On April, 19, 2005, in New York, Mr. M was sentenced to 96 months in prison, was amongst others ordered to pay USD 106 million in restitution to the creditors he defrauded. M was convicted of conspiring to defraud, and defrauding, his creditors and income tax evasion based on his receipt of over USD 25 million he never reported to the IRS. M and his partner N built a series of companies by borrowing hundreds of millions of dollars from and through various financial institutions and personally guaranteed many of the loans. After failing to repay the loans, M and N put into place a restructuring plan pursuant to which they signed deficiency notes making themselves personal liable to their creditors for approximately USD 100 million. Around the same time they were signing deficiency notes, M and N sold Company A to Company B in a deal that allowed M and N to earn shares of B. Pursuant to the agreement M and N with the assistance of others pulled off a massive fraud involving falsely representing to their creditors that they were broke and could not repay the notes and duping the creditors that held the notes, at a steep discount, to purportedly unrelated third parties who were in fact sham entities controlled and funded by M and N. During the scheme the identity of M and N remained unknown.	2002-2004	unknown	1) A series of companies (unknown is the type of companies and the state in which they were established)	unknown	1) use of structure to realize scheme 2) use of structure to conceal identity	IRS	1) bank fraud 2) tax evasion	1 Placement	On April 19, 2005 Hundley was sentenced to 96 months/ 8years in prison, ordered to pay USD 106 million in restitution to the creditors he defrauded and USD 5,4 million in restitution to the IRS The judge also entered a forfeiture order USD 44 million allowing the U.S. to seize assets of M.

30	A was a TCSP that operated from California in the late 1990. In order to help clients commit money laundering and tax evasion, he assisted them in purchasing banks offshore. Two of his clients, D and K, were committing investment (securities) fraud stealing millions of dollars from their clients. A helped them to set up a bank X that maintained a corresponding account at another bank in Liechtenstein for USD 25.000. Shortly after opening this account A set up an account at another bank Y in Liechtenstein. Monies from Bank X were wired to this account. During the period December 1, 1998 - February 5, 1999 approximately 2 months, D and K defrauded clients of approximately USD 8 million, that were deposited in to the account in Bank Y. However, Sexton convinced D and K to give a Power of Attorney to withdraw over USD 2 million and divert to another bank account that he controlled in Liechtenstein. Funds were then removed from this account and transferred to a trust A set up in the U.S. A then used these funds to pay for his personal expenses including purchase of a condominium in Austria, renovating a hotel he owned in California, purchase of a boat, among other items.	1998-1999	TCSP	1) Bank X (unknown in which jurisdiction the bank was incorporated)	The activities took place in the U.S. (unknown in which state)	1) use of trusts to conceal the identity 2) use of trusts to divert the money flow 3) use of offshore bank account (jurisdiction with bank secrecy law)	Liechtenstein bank contacted law enforcement agency	1) mail fraud 2) wire fraud 3) money laundering 4) conspiracy	1.2 Placement and layering	D and K defrauded clients of USD 8 million.

31	Mr X was a TCSP that co-founded an organisation Z that sold audiotapes, CD´s and tickets to offshore seminars on "wealth building" strategies. This firm and its vendors conducted seminars which promoted bogus trust packages and other schemes advocating fraudulent methods of eliminating a person´s income tax liability. Z allegedly received more than USD 40 million from selling the so-called "wealth building" products and tickets to the offshore seminars. The defendants were charged with concealing income they earned from the sale of Z products, in part by using bogus trusts, nominee entities and offshore bank accounts, into which they deposited portions of their profits. They also allegedly transferred funds from the offshore bank accounts back into the U.S. through wire transfers and the use of debit cards. All of Mr. X´s co-defendants have pleaded guilty to tax crimes in the Western District of Washington. All four defendants face sentencing on April 10, 2006 in Seattle.	1996-2002	TSCP	1) Corporation Z (unknown in which jurisdiction the corporation was established)	The tax crimes took place in the state Washington in the U.S.	1) use of corporation to realize scheme 2) use of trusts, corporations and offshore bank accounts to divert money flow 3) use of trusts, corporations to conceal identity 4) use of offshore bank accounts	IRS	1) charged in a superseding indictment with additional counts of tax evasion; conspiring to defraud the IRS.	2 Layering	If convicted, Mr. X faces a maximum potential sentence of 20 years in jail and USD 1 million in fines.
32	In August 1995, Mr. and Mrs. A sold 20 acres of property for USD 3,1 million. They tried to evade paying federal taxes with the use of sham trusts which were lacking economic substance. One day prior to the sale, Mr and Mrs. A transferred ownership of the property to a trust for "USD 10 and some shares", where they along with one of their sons, were the trustees with complete control of the assets. Mr. and Mrs. A also created another trust, just five days prior to the closing of the sale, along with a bank account, which was used to deposit the sales proceeds of the property. The majority of the money was later transferred into a Barclays bank account located offshore in the Cayman Islands, still under complete control of Mr	1995-2005	Unknown	1) trusts (unknown which type of trust and the jurisdiction in which the trust is established)	The activities took place in the U.S. (unknown in which state or jurisdiction) The majority of the sale proceeds was transferred to a bank account on the Cayman Islands	1) use of trusts to realize scheme 2) use of trusts to conceal identity 3) use of trusts to divert the money flow 4) use of offshore bank accounts	IRS	1) tax fraud	1.2 Placement and layering	Unknown

35	Mr. X, a CEO of a local telecommunication company received corrupt money of RM 300.000 as an inducement to award supply and work worth RM 5.0 million to company A, which belongs to Mr. Y. Mr. Y paid the corrupt money as a payment by company A to company B for services rendered. Company B also belongs to Mr. Y, but was merely a dormant and shell company with RM 2.00 paid up capital. The money was later withdrawn from company B and placed in a stock-broking firm under the name of Mr. W., a nominee of Mr. X, who opened an account with the same stock broking company using his son's name. The money in W.´s account was used to purchase shares in the open market and later sold to Mr. X´s son using numerous married deal. The married deal transactions whereby the shares were later sold by Mr. X´s son in the open market at a higher price. Capital gains subsequently were used to open fixed deposits. Sign up for a insurance policy (under the name of Mr. X) as well as purchase assets in the name of Mr. X´s relatives.	unknown	Feasible but not specifically described.	1) Company A and B. (unknown which type of company and in which jurisdiction these companies were established)	The activities of the companies took place in Malaysia. The purchase of shares in the open market took place via a stock broking firm seated in Malaysia	1) use of corporate structure for hiding of payments 2) conceal of identity by nominees (Mr. X´s son and Mr. W.)	Unknown	1) corruption	4 Investment	Unknown

Annex 5 Findings Drawn from other Source Material

There is extensive source material that reinforces the findings drawn from the typologies. The following extracts are taken from some of the key sources referred to in the Bibliography -

1. Behind the Corporate Veil – OECD Report (2001)

Page 8 - "In essence, any jurisdiction that provides mechanisms enabling individuals to successfully hide their identity behind a corporate vehicle while excessively constraining the capacity of authorities to obtain and share information on beneficial ownership and control for regulatory/supervisory and law enforcement purposes is increasing the vulnerability of its corporate vehicles to misuse. Certain jurisdictions allow corporate vehicles established in their jurisdictions to use instruments that obscure beneficial ownership and control, such as bearer shares, nominee shareholders, nominee directors, "corporate" directors, flee clauses, and letters of wishes, without devising effective mechanisms that enable the authorities to identify the true owners and controllers when illicit activity is suspected or to fulfil their regulatory/supervisory responsibilities. Some of these jurisdictions further protect anonymity by enacting strict bank and corporate secrecy laws that prohibit company registrars, financial institutions, lawyers, accountants, and others, under the threat of civil and criminal sanctions, from disclosing any information regarding beneficial ownership and control to regulatory/supervisory and law enforcement authorities."

Page 8 - "In order to successfully combat and prevent the misuse of corporate vehicles for illicit purposes, it is essential that all jurisdictions establish effective mechanisms that enable their authorities to obtain, on a timely basis, information on the beneficial ownership and control of corporate vehicles established in their own jurisdictions for the purpose of investigating illicit activities, fulfilling their regulatory/supervisory functions, and sharing such information with other authorities domestically and internationally."

Page 41/42 – "A number of factors influence the choice of mechanism for obtaining information on beneficial ownership and control, including the nature of business activity in a jurisdiction, the extent and character of non-resident ownership, corporate regulatory regime, existing anti-money laundering laws, powers and capacity of supervisors and law enforcement authorities to obtain beneficial ownership and control information, functioning of the judicial system, and availability of anonymity instruments. In addition, policy makers must find an appropriate balance between ensuring proper monitoring/regulation of corporate vehicles and protecting legitimate privacy interests. In jurisdictions with a substantial domestic commercial sector and where existing investigative mechanisms function well, policy makers must also take into account the risk that an extensive up-front disclosure system may impose unnecessary costs or burdens on corporate vehicles, particularly smaller enterprises."

2. Transparency and Money Laundering – Savona Report (2001).

Page 76 – the thematic area "incorporation" –

"The incorporation is the initial phase in the "life" of a legal and non-legal structure, in which the structure itself is established through a series of acts aimed at making it operational. The relevance of this thematic area for anti-money laundering international cooperation lies in the fact that lack of checks during the incorporation phase results in greater opacity in company law, which might obstruct the acquisition of information regarding the physical persons participating in its establishment. The less opaque (or the more transparent) the process of incorporation is, the more available should be the information concerning the incorporation of the structures. This facilitates investigation of their activities and of the persons controlling them, both at the national and at the international levels".

Page 79 - The thematic area "company activity" –

"The area of "company activity" refers to the activities of an operative legal and non-legal structure aimed at achieving its economic or patrimonial goal.

This area is relevant for anti-money laundering international cooperation because lack of checks on the activities of the company increases the opacity in company law and makes it difficult to monitor its behaviour and exchange this information with other foreign authorities. The greater the possibility is of gaining information on the management and on the activities of a structure, the more the names of shareholders are accessible to other parties.

The more closely accounts are audited, and the greater the obligation to disclose relevant information, the more information concerning the activities of structures is available to the law enforcement, judiciary and financial authorities to be exchanged, when necessary, with their counterparts for anti-money laundering purposes".

Page 82 – the thematic area "identification of the real beneficial owner" –

"The area "identification of the real beneficial owner" refers to those rules aimed at identifying the person/s who are actually in control of a structure and its activities.

In this thematic area, the opacity created by the impossibility of ascertaining the identity of the shareholders and establishing a connection between a structure and a physical person/s running it, obstructs effective investigation at the national and transnational levels.

Page 125 –

"The results illustrate that the greatest obstacles to anti-money laundering international cooperation are to be found in the thematic area "identification of the real beneficial owner"…. The main obstacle is lack of regulation requiring full information on the real beneficial owner of a public or private limited company, especially when a legal entity is a shareholder or director, or the issuance of bearer shares is permitted".

"The thematic area "incorporation" also presents obstacles to anti-money laundering international cooperation, even though at a lower degree than the former. Lack of regulation in this area makes it more difficult to acquire information of physical persons party to the creation of legal structures and increases the possibility that these might be used for criminal purposes".

"The analysis of regulation covering trusts has shown it has been characterised by great opacity and absent of all those provisions relevant for anti-money laundering international cooperation. Their regulation and the confidentiality of their constitution hinder the gathering of information on the people setting them up and of that management structure. This opacity creates obstacles to anti-money laundering international cooperation because of the lengthy process in getting information."

3. OECD, Template; Options for Obtaining Beneficial Ownership and Control Information (September 2002)

This OECD template, developed by an expert group under the authority of the OECD Steering Group on Corporate Governance, outlines three options for obtaining beneficial ownership and control information and provides a diagnostic tool to assist jurisdictions in assessing these options –

(a) Upfront disclosure system – an upfront disclosure system requires the disclosure of the beneficial ownership and control of corporate entities to the authorities charged with the responsibility at the establishment or incorporation stage and imposes an obligation to update such information on a timely basis when changes occur. The obligation to report beneficial ownership and control information to the authorities may be placed on the corporate entity, the ultimate beneficial owner or the corporate service provider involved in the establishment or management of the corporate entity;

(b) Imposing an obligation on service providers to maintain beneficial ownership and control information. This option requires intermediaries involved in the establishment and management of corporate entities, such as company formation agents, trust companies, registered agents, lawyers, notaries, trustees companies, registered agents, lawyers, notaries, trustees and companies supplying nominee shareholders, directors and officers

("corporate service providers") to obtain, verify and retain records on the beneficial ownership and control of the corporate entities that they establish, administer, or for which they provide fiduciary services;

(c) Primary reliance on an investigative mechanism. Under an investigative system, the authorities seek to obtain (through compulsory powers, Court issued subpoenas, and other measures) beneficial ownership and control information when illicit activity is suspected, when such information is required by authorities to fulfil their regulatory/supervisory functions, or when such information is requested by other authorities domestically and internationally for regulatory/supervisory or law enforcement purposes. The effectiveness of an investigative system depends, to a significant extent, on the likelihood that beneficial ownership and control information relating to the establishment stage is available within the jurisdiction in which the corporate entities were established.

4. US Money Laundering Threat Assessment (2005)

Page 47 - "The use of bearer shares, nominee shareholders and nominee directors function to mask ownership in a corporate entity. While these mechanisms were devised to serve legitimate purposes, they can also be used by money launderers to evade scrutiny.

Trusts separate legal ownership from beneficial ownership and are useful when assets are given to minors or individuals who are incapacitated. The trust creator, or settlor, transfers legal ownership of the assets to a trustee, which can be an individual or a corporation. The trustee fiduciary manages the assets on behalf of the beneficiary based on the terms of the trust deed.

Although trusts have many legitimate applications they can also be misused for illicit purposes. Trusts enjoy a greater degree of privacy and autonomy than other corporate vehicles, as virtually all jurisdictions recognising trusts do not require registration or central registries and there are few authorities charged with overseeing trusts. In most jurisdictions no disclosure of the identity of the beneficiary or the settlor is made to authorities. Accordingly, trusts can conceal the identity of the beneficial owner of assets and ….. can be abused for money laundering purposes, particularly in the layering and integration stages.

Legal entities such as shell companies and trusts are used globally for legitimate business purposes, but because of their ability to hide ownership and mask financial details they have become popular tools for money launderers."

5. US Government Accountability Office Report on Company Formations (2006)

Page 1 – "Companies – business entities that conduct a variety of commercial activities and hold a variety of assets – form the basis of most commercial and entrepreneurial activities in market based economies. Companies in the United States play an essential and legitimate role in the country's economic system. They provide a wide variety of services that range from the provision of necessary utilities and investment services to retail sales of items such as clothing and furniture. Companies can also be set up that act as "shell" companies and conduct either no business or minimal business. Shell companies are used for legitimate purposes; for example, they may be formed to obtain financing prior to starting operations. However, government and international reports indicate that shell companies have become popular tools for facilitating criminal activity in the United States and internationally and can be involved in fraud and corruption or used for illicit purposes such as laundering money, financing terrorism, hiding and shielding assets from creditors, and engaging unquestionable tax practices. Such schemes can conceal money movements that range from a few thousand to many millions of dollars".

Page 6 – "Although law enforcement officials noted that information on owners was useful in some cases, State officials, agents and others we interviewed said that collecting company ownership information could be problematic. For instance, if States or agents collected such information, the cost of filings and the time needed to approve them could increase, potentially slowing down business dealings or even derailing them. A few States and some agents also said they might lose business to other States, countries, or agents that had less stringent requirements, a consequence two foreign jurisdictions experienced after regulating agents and requiring collection of ownership information. Further, State officials and agents pointed out the difficulties of collecting

information when companies are being formed or on periodic reports since ownership can change frequently. In addition, State officials and agents expressed concerns about maintaining privacy when making public information about legitimate businesses that historically has been protected. State officials, agents and other experts in the field suggested internal company records, financial institutions, and the IRS as alternative sources of ownership information for law enforcement investigations. However, collecting information from these sources could present many of the same difficulties."

Annex 6 Corporate Vehicles

I. Corporations

A corporation is a legal entity whose owners consist of shareholders. Control of a corporation is vested in the board of directors elected by the shareholders. Since a corporation is a legal entity, the shareholders are only liable up to the amount of their investment. A corporation can have unlimited duration.

a. Private Companies[83] – A private company is restricted in its number of shareholders and the transferability of its shares. Private companies may not issues shares to the general public. Private companies have less stringent reporting requirements than public companies.

b. Public Companies – A public company can freely trade its shares and there is no limit on the number of shareholders. It may offer its shares to the general public. A public company is generally required to adhere to strict reporting guidelines and is subject to rigorous governmental oversight.

II. Partnerships[84]

A partnership is an association of two or more legal or natural persons created to conduct business. For the most part partnerships do not enjoy limited liability and partners may be jointly and severally liable for the actions of the partnership. Partnerships generally benefit from "flow through" taxation which prevents profits being taxed twice.

a. General Partnership – In a general partnership, partners are jointly and severally liable. Partners in such an arrangement are usually easy to identify and general partnerships are rarely required to register.

b. Limited Partnership – A limited partnership consists of general partners and limited partners. The general partners are liable as under general partnerships. The limited partners will typically have limited control and are only liable up to the amount of their investment. Limited partnerships are required to register in most jurisdictions.

c. Limited Liability Partnerships – Under this arrangement, all partners possess limited liability even if they exercise management control. Limited liability partnerships are required to register in most jurisdictions.

III. Limited Liability Companies (LLC)

The LLC is a hybrid business structure that is designed to provide the limited liability features of a corporation and the tax and operational flexibilities and efficiencies of a partnership. The advantages are:

1. Limited liability of the members;
2. Profits and losses are passed-through for taxation purposes; and
3. In the U.S., for the most part, you do not need to be a U.S. person to own, operate or control an LLC.

LLCs generally have fewer disclosure requirements, both in the formation stages and subsequently. Unlike corporations, LLCs are run by members and do not have a formal structure (i.e. with directors and corporate officers). Generally, there are no annual reporting requirements for LLCs, and there are less

[83] Responses to the questionnaires support the conclusion that Trusts and Private companies are the vehicles that are most susceptible to abuse.

[84] All jurisdictions indicated recognizing Partnerships.

administrative burdens than on corporations. Generally, they are less expensive and easier to form and maintain.

IV. Foundations[85]

A foundation (based on the Roman law *universitas rerum)* is the civil law equivalent to a common law trust in that it may be used for the similar purposes. A foundation traditionally requires property dedicated to a particular purpose. Typically the income derived from the principal assets (as opposed to the assets themselves) is used to fulfill the statutory purpose. A foundation is a legal entity and as such may engage in and conduct business. A foundation is controlled by a board of directors and has no owners. In most jurisdictions a foundation's purpose must be public. However, there are jurisdictions in which foundations may be created for private purposes. Normally, foundations are highly regulated and transparent.

V. Trusts[86]

A trust[87] is a corporate vehicle that separates legal ownership (control) from beneficial ownership. Trusts are important for transferring and managing assets. Trusts usually are restricted in duration. Trusts are not required to register in many jurisdictions and because of this it can be difficult to identify the beneficial owner of a trust. Trusts are common law vehicles, but there are civil law constructions that also separate legal ownership from beneficial ownership.

VI. Associations[88]

Associations (based on the Roman law *universitas personarum*) are membership-based organizations whose members, legal or natural persons, or their elected representatives, constitute the highest governing body of the organization. They can be formed to serve the public benefit or the mutual interest of members. Whether an association is a legal entity or not often depends upon registration. Registered associations may enjoy the same benefits as other legal entities.

Annex 7 QUESTIONNAIRE

FATF-XVII WGTYP/50

FATF TYPOLOGIES PROJECT ON MISUSE OF CORPORATE VEHICLES (see note 1) QUESTIONNAIRE

This questionnaire has been compiled by the FATF for use in typologies research – the examination of money laundering and terrorist financing methods and trends. The information from this questionnaire will be used by the FATF as part of its assessment on the misuse of corporate vehicles; the completed questionnaires will not be published. A completed report on the misuse of corporate vehicles will be published on the FATF website in June 2006; no country specific information will be placed in the report without first seeking the permission of the country concerned.

Further information on FATF typologies can be found at: http://www.fatf-gafi.org/document/23/0,2340,en_32250379_32237277_34037591_1_1_1_1,00.html

Please try and complete all of the following questions as comprehensively as possible.

1. Country or Jurisdiction (see note 2)

2. Contact Name (please give two names, if the first contact is regularly away from the office for long periods)

3. Contact details -

E-mail address:	
Telephone number:	
Fax. Number:	

4. What type of corporate vehicles (see note 1) can be formed or (b) can be recognised legally (see note 3) in the jurisdiction? Please give the national name of each type, the closest English translation (or equivalent) and a brief description.

	Can be formed	Can be recognised legally (see note 3)	Are bearer shares possible	Are corporate directors possible
1. Legal persons				
Companies				
Foundations				
Partnerships				

Other (specify)				
2. Legal arrangements			[redacted]	
Trusts				
Other				

If there is a form of corporate vehicle that neither can be formed nor can be recognised legally, how are such vehicles that are formed in other jurisdictions dealt with if they are the subject of investigation/prosecution (e.g. if a trust can neither be formed nor recognised legally how would assets held in the trust be dealt with in the event of an investigation/prosecution).

5. What is the estimated number of corporate vehicles formed, for the most recent year for which data is available? If possible this information should be split between corporate vehicles formed for residents and for non-residents.

	Number formed in ……for residents of the jurisdiction	Number formed in ... ... for non-residents of the jurisdiction	Total number of 'live' companies as at end 2004
Companies			
Trusts			[redacted]
Foundations			
Foundations			
Partnerships			
Others (specify)			

If a register is kept of all 'live' companies incorporated please also provide a total figure as at end 2004 (or the most recent end year available).

6. Which of the following entities in the jurisdiction are engaged in the formation and/or administration of corporate vehicles -

	Yes/No	Estimated Number of Entities	Comments
Lawyers, notaries etc.			
Accountants			
Financial institutions (see note 4)			
Trust and company service providers (see note 5)			
Other entities (please specify)			

7. For those who are engaged in the formation and/or administration of corporate vehicles which of the following are they subject to. In each case, please specify the agency or other body that is responsible for performing the relevant functions. To the extent possible also indicate the main characteristics of each of the categories in your jurisdiction.

	The Agency(ies) Responsible	Brief Description of What is Involved
AML legislation		
Prudential regulation		
Self-regulation		
Registration		
A fit and proper test		
Regulatory oversight (see note 6)		
Regulatory monitoring (see note 6)		
Investigatory powers		

8. How do investigative agencies (or other competent authorities) obtain routine information (see note 7) on legal persons and legal arrangements?

	Comments
1. Legal persons	
Companies	
Foundations	
Partnerships	
2. Legal arrangements	
Trusts	
Other	

9.How do investigative agencies (or other competent authorities) obtain information on the beneficial ownership of companies and other legal persons?

	Comments
Upfront disclosure (see note 8)	
From trust and company service providers when required (please indicate what kind of information they are required to keep) (see note 8)	
Through the use of investigatory powers	

Where relevant please distinguish between domestic and foreign beneficial owners

10. How do investigative agencies (or other competent authorities) obtain information on the beneficiaries and settlors of trusts and other legal arrangements?

	Comments
Upfront disclosure (see note 8)	
From trust and company service providers when required (please indicate what kind of information they are required to keep) (see note 9).	
Through the use of investigatory powers	

Where relevant please distinguish between domestic and foreign beneficiaries

11. Can information obtained on corporate vehicles be exchanged with other jurisdictions?

Yes/No

If not what restrictions are in place?

What is the experience of obtaining information from other jurisdictions? What particular difficulties have been experienced?

12. What information is available on the purposes for which corporate vehicles are established, and have you noted any recent trends in this respect?

13. Where those engaged in the formation and administration of corporate vehicles are covered by AML legislation what number of STRs are being filed by this sector, what proportion of the total number of STRs does this account for, and how many have led to investigations/prosecutions.

(i) Number of STRs filed by those engaged in the formation and administration of corporate vehicles in 2004	
(ii) Total number of STRs filed in 2004	
(iii) The number of STRs filed under (i) that have led to investigations/prosecutions to date	

14. What evidence do you have available, in the form of recent case studies, of the misuse of corporate vehicles to launder the proceeds of crime? Please provide evidence, for example, of situations in which the differences between corporate vehicle establishment/management systems in two jurisdictions have been exploited for ML purposes or to carry out other types of offences.

If you have any cases involving more generic abuse of corporate vehicles to carry out other types of offences – circumventing disclosure requirements, bribery/corruption, committing fraud, hiding assets from creditors - please also submit these as case examples.

15. From experience of the misuse of corporate vehicles what in your view are the greatest money laundering vulnerabilities (e.g. which corporate vehicles are most misused and why in your view are these vehicles most usually selected for misuse).

16. What risk mitigation measures are in place to limit the misuse of corporate vehicles (e.g. where bearer shares and/or corporate directors are permitted).

NOTES

1. The term corporate vehicles is as used in the OECD publication "Beyond the Corporate Veil":

   http://www.oecd.org/document/11/0,2340,en_2649_201185_2672715_1_1_1_1,00.html. It includes both legal persons (companies, foundations, partnerships etc.) and legal arrangements (trusts, some forms of anstalts, etc.) as defined for the purposes of the FATF Recommendations.

2. Where the matters with which the questionnaire is concerned are the responsibility of a regional or State authority within a federal structure please complete a separate questionnaire for the jurisdiction as a whole and the regional/State authorities.

3. The term "recognised legally" means recognised by the Courts of the jurisdiction.

4. The term "financial institutions" is as for the FATF Forty Recommendations: http://www.fatf-gafi.org/glossary/0,2586,en_32250379_32236930_34276935_1_1_1_1,00.html#34289432

5. The term trust and company service providers is as for FATF Recommendation 12: http://www.fatf-gafi.org/document/45/0,2340,en_32250379_32236930_33966509_1_1_1_1,00.html

6. Regulatory oversight is intended to cover those situations where there is an opportunity to exercise regulatory control on an ad hoc basis whereas regulatory monitoring envisages a situation where there is formal, continuous, monitoring of those concerned.

7. Routine information would include name, date of incorporation/registration, place of business, registered office/place of administration, sources of funds, shareholders/ and purpose.

8. Upfront disclosure means disclosure to a public body. In the comment please specify what type of information is required to be filed/registered with a local registry or other authority and whether or not the information is available to the public. Please also indicate if information on beneficial owners/beneficiaries is required to be kept by the legal entity itself.

9. The term trust and company service providers is not necessarily restricted to the formal professional category of TCSP's. If – in your jurisdiction – these services are mainly provided by other regulated entities, such as lawyers (see question 6) , please also indicate to what extent investigators can rely on records that are legally required to be kept by such other professionals when providing TCSP-services.

If you have any questions on the FATF typologies, or how to compete the questionnaire please contact Mark Hammond at the FATF Secretariat at: mark.hammond@fatf-gafi.org or tel: +33 (0)1 45 24 99 50

(Paris: FATF, 2019)

FATF

BEST PRACTICES ON **BENEFICIAL OWNERSHIP FOR LEGAL PERSONS**

OCTOBER 2019

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

This document and/or any map included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

Table of Contents

ACRONYMS

AML/CFT	Anti-money laundering/Countering the financing of terrorism
CDD	Customer due diligence
DNFBP	Designated non-financial businesses and professions
FATF	Financial Action Task Force
FIU	Financial intelligence unit
FI	Financial Institution
INR.	Interpretive Note to Recommendation
LEA	Law Enforcement Authorities
ML	Money laundering
NRA	National Risk Assessment
R.	Recommendation
RBA	Risk-based approach
SRB	Self-regulatory body
STR	Suspicious transaction report
TCSP	Trust and company service providers
TF	Terrorist financing

Executive Summary

1. The results of FATF Mutual Evaluations indicate that jurisdictions find it challenging to achieve a satisfactory level of transparency regarding the beneficial ownership of legal persons. This best practice paper aims to provide suggested solutions, supported by cases and examples of best practices from delegations, in response to challenges faced by delegations in implementing FATF Recommendation 24.

2. As stated in Interpretative Note to R.24, countries should use one or more of mechanisms (the Registry Approach, the Company Approach and the Existing Information Approach) to ensure that information on the beneficial ownership of a company is obtained by that company and available at a specified location in their country; or can be otherwise determined in a timely manner by a competent authority[1].

3. Countries' experience shown in the FATF mutual evaluations echoes that jurisdictions using a single approach is less effective in making sure that competent authority can obtain accurate and up-to-date BO information to in a timely manner. Instead, a ***multi-pronged approach*** using several sources of information is often more effective in preventing the misuse of legal persons for criminal purposes and implementing measures that make the beneficial ownership of legal persons sufficiently transparent. The variety and availability of sources increases transparency and access to information, and helps mitigate accuracy problems with particular sources.

4. Under a multi-pronged approach, competent authorities can gain access to information on beneficial ownership through different sources. They can also ensure the accuracy of information by cross-checking. It is also easier for key stakeholders (including companies, directors, shareholders, obliged parties such as FIs and DNFBPs) to identify incorrect beneficial ownership information in their database by looking up different registers or requesting information from different sources. This will then trigger the obliged party to seek clarifications from the companies, and if necessary, report suspicious activities to competent authorities. Therefore, such approach encourages key stakeholders to fulfil their obligations through peer interaction and supervision.

5. This paper then identifies the following suggested key features of an effective system (Section 5): a) Risk assessment; b) Adequacy, accuracy and timeliness of information in beneficial ownership; b(i) Obliged parties to verify or/and monitor the accuracy of the information; b(ii) Supplementary information platform in addition to company registry; b(iii) Ongoing reporting at company level / to the reporting entities or company registry; b(iv)Verification through different means; b(v) Enhanced measures for companies with foreign ownership/directorship; b(vi) Highly effective law enforcement authorities with adequate resources; b(vii) Using technology to facilitate checking and validation; c) Access by competent authorities; d) Forbidding or immobilising bearer shares and nominee arrangements; e) Effective, proportionate and dissuasive sanctions.

[1] Interpretative Note to R.24, para. 7 and 8, FATF (2013a).

6. The case examples covered in the best practice paper should be considered in the context of their national system. For jurisdictions that have undergone mutual evaluations, their case examples have been checked against their respective mutual evaluation reports and take into account the latest development in the jurisdiction as far as practicable. It should also be noted that some cases are provided by countries which have not yet undergone mutual evaluation to date, but they are included based on their relevance. Readers are advised to bear this in mind when drawing reference to these examples.

7. This best practice paper also puts forward suggestions on ensuring authorities can access getting information on beneficial ownership of overseas entities (Section 6).

Section I - Introduction and key concepts

This paper should be read in conjunction with the following, which are available on the FATF website: www.fatf-gafi.org.

a) The FATF Recommendations, especially Recommendations 1, 2, 10, 11, 20, 22, 23, 24, 26, 27, 28, 30, 31, 34, 35, 37, 40 and their Interpretive Notes (INR), and the FATF Glossary

b) FATF Guidance on Transparency and Beneficial Ownership (October 2014)

c) The Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership (July 2018)

d) The FATF Horizontal Study: Enforcement and Supervision of Beneficial Ownership Obligations

Background and context

8. In 2003, the FATF became the first international body to set international standards on beneficial ownership. In 2012, the FATF strengthened its standards on beneficial ownership, to give more clarity about how countries should ensure information is available, and to deal with vulnerabilities such as bearer shares and nominees. The revised standards also clearly distinguish between basic ownership information (about the immediate legal owners of a company or trust), and beneficial ownership information (about the natural person(s) who ultimately own or control it). They also clarify that having accurate and up-to-date basic information about a legal person or legal arrangement is a fundamental prerequisite for identifying the ultimate beneficial owners, and require countries to provide international co-operation in relation to ownership information.

9. The FATF further published the Guidance on Transparency and Beneficial Ownership in 2014 to explain what the FATF Standards require. This guidance paper gives a step-by-step guide on how to access publicly available information on legal persons and legal arrangements, and establish procedures to facilitate information requests from foreign counterparts.

10. However, effective implementation of these measures is still challenging. At the time of publication, 25 FATF members have been assessed since the FATF Standards were strengthened in 2012.[2] For R.24, only 11 out of 25 were rated as largely compliant, 12 were rated as partially compliant and 2 were rated as non-compliant. For IO.5, only 4 out of 25 countries attained a substantial level of effectiveness in preventing the misuse of legal persons and arrangements, 17 attained a moderate level of effectiveness and 4 attained a low level of effectiveness.

[2] Consolidated assessment ratings, FATF www.fatf-gafi.org/media/fatf/documents/4th-Round-Ratings.pdf

11. In 2016-17, the FATF undertook a horizontal study on the enforcement and supervision of beneficial ownership obligations. The FATF and Egmont Group also jointly published the Report on Concealment of Beneficial Ownership in July 2018. The results of the analysis pointed to that the root of the problem lies in the weak implementation of the existing standard, rather than in the gaps of the standard itself.

12. There is a need for more practical advice and examples for jurisdictions on the effective measures to ensure that legal persons are prevented from being used for criminal purposes, and information on their beneficial ownership is available to competent authorities without impediments.

13. Based on the reviews conducted in the fourth round of FATF mutual evaluation so far, the FATF has identified some specific obstacles in the following areas to effective implementation (detailed in Section II), including:

a) risk assessment;

b) adequacy, accuracy and timeliness of information on beneficial ownership;

c) access by competent authorities;

d) bearer shares and nominee shareholder arrangements;

e) fines and sanctions; and

f) international co-operation.

14. From countries' experience, there is no single solution to tackle these obstacles that are intertwined with each other. The fourth round of FATF mutual evaluations reveals that systems combining one or more approaches under R.24[3] are often more effective than systems that rely on a single approach.

15. To ensure that the system is effective, it requires concerted efforts from different stakeholders to implement measures that prevent legal persons from being misused, and make available accurate information on the beneficial ownership of legal persons so that competent authorities can access the information in a timely manner.

16. This best practice paper aims to provide suggested solutions, supported by cases and examples of best practices that are correspondent to each challenge. This paper draws on countries' experience concluded from adopted MERs, information provided by the delegations, as well as work carried out by other stakeholders in the field. The paper will also provide cases and examples to other inter-governmental organisation in developing their areas of expertise.

17. Taking into account the flexibility allowed by the FATF Recommendations, this best practice paper suggests different ways jurisdictions can use to ensure

[3] The approaches include:
(a) Registry Approach – requiring company registries to obtain and hold up-to-date information on the companies' beneficial ownership
(b) Company Approach – requiring companies to obtain and hold up-to-date information on the companies' beneficial ownership or requiring companies to take reasonable measures to obtain and hold up-to-date information on the companies' beneficial ownership
(c) Existing Information Approach – using existing information

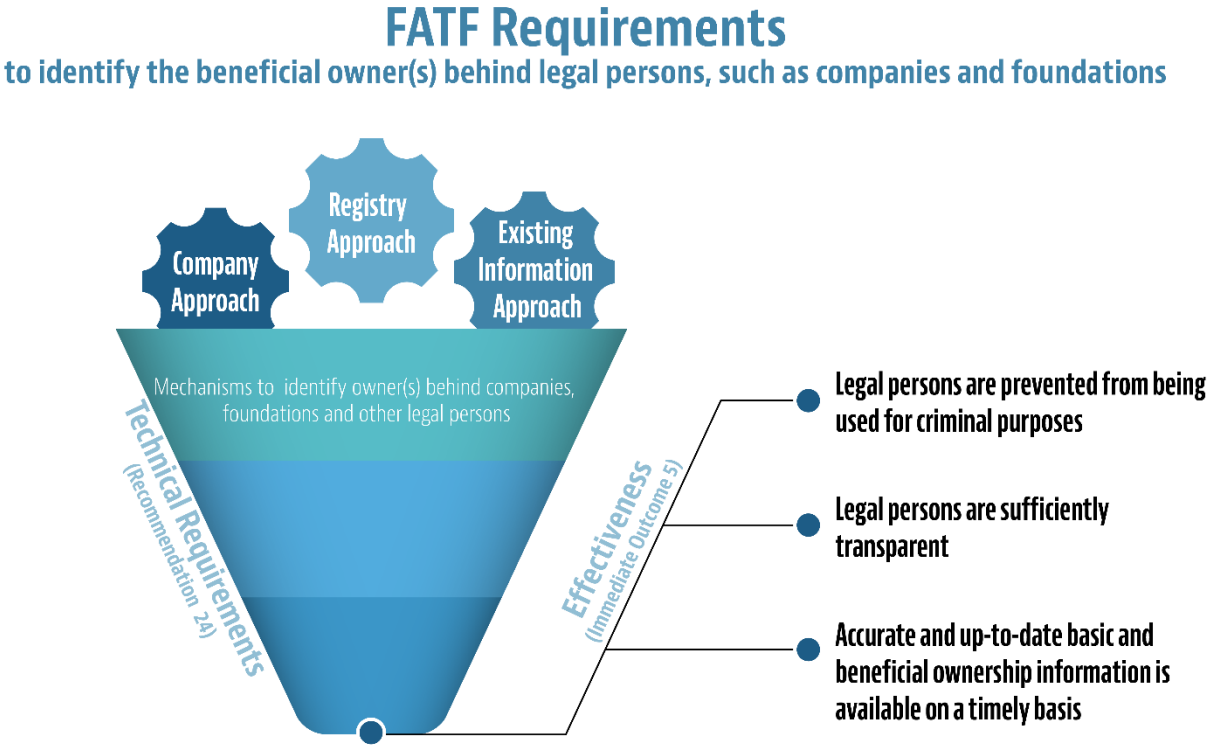
compliance and provides advice on how to implement chosen approaches in the most effective way.

Scope of the paper

18. In order to keep the scope of this project achievable, this paper will focus on beneficial ownership of legal persons (not of legal arrangements such as trusts).

19. The implementation of R.24 and IO.5 also hinges on the effectiveness of other FATF Recommendations (paragraph 44 refers). Although the discussion of the paper will touch on other FATF Recommendations, this paper will only cover examples of best practices that are directly related to approaches associated with transparency of beneficial ownership under R.24 and measures on preventing misuse of legal persons by criminals under IO.5.

Section II - Objectives



FATF requirements

20. Under R.24, countries should take measures to prevent the misuse of legal persons for ML/TF. Countries should ensure that there is adequate, accurate and timely information on the beneficial ownership and control of legal persons that can be obtained or accessed in a timely fashion by competent authorities. In particular, countries that have legal persons that are able to issue bearer shares or bearer share warrants, or which allow nominee shareholders or nominee directors, should take effective measures to ensure that they are not misused for ML/TF. Countries should consider measures to facilitate access to beneficial ownership and control information by financial institutions (FIs) and designated non-financial businesses and professions (DNFBPs) undertaking the requirements as set out in R.10 and 22.

21. In relation to beneficial ownership information, countries should ensure that either information on the beneficial ownership of a company is obtained by that company and available at a specified location in their country; or can be otherwise

determined in a timely manner by a competent authority[4]. In order to meet such requirement, countries should use one or more of the following mechanisms[5] –

a) requiring company registries to obtain and hold up-to-date information on the companies' beneficial ownership (the Registry Approach);

b) requiring companies to obtain and hold up-to-date information on the companies' beneficial ownership or companies to take reasonable measures to obtain and hold up-to-date information on the companies' beneficial ownership (the Company Approach);

c) using existing information (the Existing Information Approach), including:

   i. information obtained by FIs and/or DNFBPs, in accordance with R.10 and 22;

   ii. information held by other competent authorities on the legal and BO of companies;

   iii. information held by the company as required; and

   iv. available information on companies listed on a stock exchange, where disclosure requirements ensure adequate transparency of beneficial ownership.

22. Regardless of which of the above mechanisms is used, R.24 specifically requires countries to establish mechanisms to ensure that companies co-operate with competent authorities to the fullest extent possible in determining the beneficial owner. Under the existing R.24, countries have three options for facilitating such co-operation which may be used alone or in combination[6]:

a) Require companies to authorise at least one natural person resident in the country of incorporation to be accountable to the competent authorities for providing all basic information and available beneficial ownership information, and giving further assistance to the authorities as needed.

b) Require companies to authorise a DNFBP in the country to be accountable to the competent authorities for providing such information and assistance.

c) Take other comparable measures which can effectively ensure a company's co-operation.

23. The FATF Guidance on Transparency and Beneficial Ownership[7] states that the FATF Recommendations recognise these different mechanisms and the need to provide flexibility for countries to implement the requirements in a manner that corresponds with their legal, regulatory, economic and cultural characteristics.

4 R.24 applies broadly to "legal persons" meaning any entities, other than natural persons, that can establish a permanent customer relationship with a FI or otherwise own property. This can include companies, bodies corporate, foundations, anstalt, partnerships, or associations and other relevantly similar entities that have legal personality. This can include non-profit organisations (NPOs) that can take a variety of forms which vary between jurisdictions, such as foundations, associations or cooperative societies.

5 Interpretative Note to R.24, para. 7 and 8, FATF (2013a).

6 Interpretive Note to R.24, para. 9, FATF (2013a).

7 Guidance on Transparency and Beneficial Ownership, para. 38, FATF (2014).

Whichever mechanism(s) is used, the fundamental requirement relating to beneficial ownership information remains the same. Countries should ensure that either:

a) information on the beneficial ownership of a company is obtained by that company and available at a specified location in their country; or

b) there are mechanisms in place so that the beneficial ownership of a company can be determined in a timely manner by a competent authority[8].

24. Countries may choose the mechanisms they rely on to achieve the objective of preventing the misuse of legal persons for ML/TF [9]. Countries should consider the feasibility of the possible mechanisms based on their particular circumstances and risk assessment. In determining the appropriate mechanism, countries should seek to strike an appropriate balance between allowing the legitimate operation of corporate vehicles and the need to combat ML/TF[10].

25. R. 24 states that countries should use one or more of the mechanisms (the Registry Approach, the Company Approach and the Existing Information Approach). As stated in the Interpretive Note to R.24, it is also very likely that countries will need to utilise a combination of mechanisms to achieve the objective[11].

Relationship between R.24 and IO.5

26. Compliance with R.24 is intrinsically linked with the effectiveness of the measures assessed in IO.5 to prevent the misuse of legal persons for ML/TF[12]. R.24 requires countries to ensure that competent authorities have timely access to adequate, accurate and up-to-date beneficial ownership information. As a result, measures to implement R.24 is fundamental to implement an effective system.

27. IO.5 states clearly that an effective system should put in place measures to:

a) prevent legal persons and legal arrangements from being used for criminal purposes;

b) make legal persons and legal arrangements sufficiently transparent; and

c) ensure that accurate and up-to-date basic and beneficial ownership information is available on a timely basis.

28. Persons who breach these measures are subject to effective, proportionate and dissuasive sanctions. This results in legal persons being unattractive for criminals to misuse for ML and TF. Prohibitive measures should be imposed to deter criminals from using legal persons to obscure beneficial ownership of illicit assets.

29. Other measures to ensure transparency of beneficial ownership is also essential to AML/CFT regimes so that competent authorities can trace and identify the right target to conduct investigation and prosecution effectively, as well as to provide the high quality of financial intelligence.

Section III – Common challenges

Common challenges faced by countries

30. Based on the reviews conducted in the fourth round of FATF mutual evaluation, the FATF has identified the following common challenges faced by countries in implementing measures on beneficial ownership, including:

a) **Risk assessment –** Inadequate risk assessment concerning the possible misuse of legal persons for ML/TF, e.g.

i. Not all types of legal persons were covered in the risk assessment.

ii. Relevant risk assessment was not consistent with the results of national risk assessments.

iii. Only domestic threats and vulnerabilities associated with legal persons incorporated were considered.

iv. Registries, companies, FIs, DNFBPs and competent authorities might not possess a good understanding and knowledge of risks involved in legal persons.

b) **Adequacy, accuracy and timeliness of information on beneficial ownership –** Inadequate measures to ensure that information on beneficial ownership was accurate and up-to-date e.g.

i. Information was not accurate – they are not adequately and actively verified, tested or monitored. There was no obliged party[13] to verify, test or monitor the information or the obliged party might not have rigorous implementation of customer due diligence (CDD) measures.

ii. Relevant parties were not required to keep records for a period of time (for at least five years).

iii. Legal persons did not update their beneficial ownership information or inform the company registry when there was a change of beneficial ownership.

iv. There was a lack of co-ordination among different sources of information and there was no cross-checking to ensure the accuracy of the information.

v. Information on beneficial ownership was difficult to identify when complex structure was involved.

vi. Information on beneficial ownership was not always available when foreign ownership was involved.

c) **Access by competent authorities –** Inadequate mechanism to ensure that competent authorities had timely access to beneficial ownership information on legal persons e.g.

i. There were obstacles to information sharing such as data protection and privacy laws which impeded competent authorities from getting timely access to adequate, accurate and up-to-date basic and beneficial ownership information.

ii. There was no information sharing among competent authorities.

iii. The competent authorities did not have established procedures to seek information from obliged parties.

iv. There was no registration/licensing mechanism of obliged parties so that the competent authorities had difficulties in identifying the source of information.

v. Competent authorities did not have sufficient resources to carry out investigations or law enforcement actions.

13 Obliged party refers to a gatekeeper that is subject to AML/CFT obligations to conduct customer due diligence, including verifying information on the beneficial ownership of the legal person

d) **Bearer share and nominee shareholder arrangements –** Insufficient risk mitigating measures in place to address the ML/TF risk posed by bearer share and nominee shareholder arrangements e.g.

   i. When bearer shares and share warrants were allowed in the countries, the ownership of bearer shares and share warrants was not sufficiently transparent and readily accessible by competent authorities.

   ii. The use of nominee shareholder obscured the ultimate control and ownership of the companies.

e) **Fines and sanctions** – Lack of effective, proportionate and dissuasive sanctions on companies which failed to provide accurate and up to date information on beneficial ownership (e.g. companies providing false information to company registries, or not keeping information about their shareholders or members up-to-date), and reporting entities which failed to apply specific CDD measures required for legal persons.

f) **International co-operation –** Inadequate mechanism for monitoring the quality of assistance received from other countries e.g.

   i. It took long time to obtain information on beneficial ownership as it might involve legal complexities and multiple agents to release the information.

   ii. Other countries concerned did not keep the information on beneficial ownership.

   iii. Language barrier posed a challenge in understanding the information.

Challenges for specific approach

31. Under R.24, countries are allowed to choose to implement one or more of the mechanisms to ensure the transparency of beneficial ownership[14]. This section provides analysis on the implementation of each mechanism and covers issues that could impact the reliability of the information. The detailed arrangement of each mechanism under R.24 is at Appendix 1.

32. The issues mentioned in this section may intersect with the common challenges faced by countries mentioned in Section II. Nevertheless, this section aims to provide an overall review (including challenges) from the perspective of each mechanism.

Registry Approach

33. Countries may implement R.24 by requiring company registries to obtain and hold up to date information on beneficial ownership.

34. Pursuant to R.24, all companies created in a country should be registered in a company registry which should record and maintain (at a minimum) basic information on a company, including company name, proof of incorporation, legal form and status, address of the registered office, basic regulating powers and list of

[14] Interpretive Note to R.24, para. 8, FATF (2013a).

directors[15]. The basic information held by registries should be made publicly available[16] to facilitate timely access by FIs, DNFBPs and other competent authorities.

35. A well-resourced and proactive company registry holding beneficial ownership information can be an effective mechanism because it provides a useful basis for competent authorities to access to such information. Other information agents and the public can also gain access to the information on beneficial ownership for cross-checking and verification.

36. The role of company registries varies greatly from country to country, as does the level and quality of information obtained on companies. The following are the implementation challenges identified from countries' experience:

a) The objectives of company registry may not be broad enough to cover the role of collecting, verifying/monitoring and maintaining information on beneficial ownership, leading to that:

   i. the company registry plays a passive role, acting as repositories of information or documents, rather than undertaking verifying and monitoring or other measures to ensure that the information they receive is accurate.

   ii. the company registry may not be obliged to conduct AML/CFT activities and its relevant performance may not be supervised.

   iii. there may also be lack of sanction powers/insufficient sanctions for missing/incorrect/false information.

   iv. the provision of information on beneficial ownership to the company registry may not necessarily be made a condition for incorporation.

   v. the company registry does not keep information of ultimate beneficial ownership, but only the immediate legal ownership of the company.

b) There may be a lack of mechanisms for ensuring that the information provided to the company registry is accurate and up to date.

c) There may be a lack of interface with other sources of information agents and/or other authorities and this may hamper the effectiveness of cross-checking.

d) Company registry may not have sufficient human and capital resources to enable it to undertake the additional functions of collecting, verifying/monitoring and maintaining information on beneficial ownership.

37. Most of the challenges in implementing the Registry Approach originate from the institutional level – whether the registry is established to collect accurate and updated information on beneficial information, whether it is empowered to do so and to perform its roles with sufficient resources.

38. Countries that make use of registers of beneficial ownership information should consider the resources and expertise that will be required in order to maintain these, and to ensure that the information recorded in the register is adequate,

15 Interpretive Note to R.24, para. 5, FATF (2013a).

16 Interpretive Note to R.24, para. 12, FATF (2013a).

accurate, and up-to-date, and can be accessed in a timely manner[17]. This is also true for the maintenance and supervision of company registries.

39. If the objective of the company registry is not well defined and the power and responsibilities of the company registry are not clear enough, the company registry will not be able to collect the right information in order to meet the objective. Without sufficient resources, the effectiveness of the company registry will also be compromised.

Company Approach

40. Another element that can help implement R.24 is the Company Approach. Countries should require companies themselves to obtain and hold up-to-date information[18] on beneficial ownership by maintaining a list of shareholders or members, and keeping it up-to-date. Companies should also keep updated the list of their representatives, including their roles, functions and authority[19].

41. Below are some problems which have been encountered in countries seeking to follow/rely on this approach for countries taking this approach:

a) Shareholder registers contain information on legal ownership, but not necessarily on beneficial ownership.

b) There is a lack of regulatory framework or mechanism to require and ensure that the beneficial ownership information collected by companies is accurate and up-to-date. For example,

   i. companies may not have sufficient powers to require updated information from their shareholders, including the power to request information on beneficial ownership at any time. Shareholders may not be required to notify the company within a set time period when there are changes in ownership or control.

   ii. shareholders may not be required to disclose the names of person(s) on whose behalf shares are held.

   iii. companies may not have sufficient powers to impose sanctions for shareholders failing to respond or provide false information.

   iv. law enforcement entities may find it difficult to enforce the requirements if these have to be implemented by non-resident subjects (e.g. directors), in particular when they cease to carry out their functions.

c) It is difficult for companies to verify or/and monitor the information received from their shareholders, as well as to up-to-date the information.

d) It is difficult for competent authorities to obtain information on beneficial ownership without alerting the company of a potential investigation.

42. As an alternative, countries may also require companies to take reasonable measures to obtain and hold up-to-date information on their beneficial ownership. From countries' experiences, it is not easy to establish a clear and practical framework

17 The Joint FATF and Egmont Group Report on Concealment of Beneficial Ownership (July 2018)

18 Interpretive Note to R.24, para. 4, FATF (2013a).

19 Interpretive Note to R.24, para. 3, FATF (2013a).

to set out the scope of reasonable measures. The difficulties lie in that the extent to which companies take measures to obtain and hold up-to-date beneficial ownership information should be proportionate to the level of ML/TF risk or complexity induced by the ownership structure of the company or the nature of the controlling shareholders. It is difficult for companies to perform their obligations if 'reasonable measures' are not well-defined and well-articulated to companies according to the risk levels involved for each type of legal persons.

43. If countries choose to implement this mechanism, countries should identify and assess the ML/TF risks associated with legal persons to enable it to implement a risk-based approach as required by R.1 and 24. Based on the countries' understanding of ML/TF risks through a comprehensive risk assessment, countries should then establish a legal or enforceable framework setting forth a mechanism governing how companies should take 'reasonable measures' to obtain and hold up-to-date beneficial ownership information.

44. In addition to the fundamental challenge on understanding ML/TF risks of different legal persons, another challenge is that the companies are usually not obliged/empowered/motivated to seek to apply restrictions against shareholders for failure to provide BO information.

45. In this case, countries should put in place a legal framework which requires and enables company to obtain updated and accurate beneficial ownership information through enforceable means e.g. seek information through appropriate courts or authorities, imposing restriction in relation to shareholder voting rights, or the sale of shares. The provision of false information by shareholders should also be subject to dissuasive administrative or criminal sanctions. Countries should also make sure that companies and shareholders are aware of their obligations. The authorities can provide guidance to companies or shareholders explaining their obligations, and make this guidance publicly available.

46. Last but not least, the legal framework should also govern that companies should provide lists of shareholders and beneficial owners to competent authorities upon request in a timely manner. Failure by a company to provide the information to authorities is subject to sanctions, which may include administrative penalties or restrictions on incorporation. Where lists of shareholders and beneficial owners are held with a third party provider on the company's behalf, the company should remain liable for the obligations.

Existing Information Approach

47. Countries may also implement R.24 by using existing information collected on the beneficial ownership of corporate entities to identify beneficial owner. Possible sources of information include company registries and other types of registries (such as, land, motor vehicle and moveable property registries); FIs and DNFBPs; other authorities (such as supervisors or tax authorities; information held by stock exchanges, and commercial databases) [20].

48. Below are the specific challenges for countries taking this approach via different channels:

[20] Interpretive Note to R.24, para. 8, FATF (2013a).

FIs/DNFBPs

a) Information may be only available where the relevant entity or structure has established or maintained business relationship with a FI or DNFBP.

b) FIs and DNFBPs may not adequately implement CDD obligations as required under R.10, including measures to identify and verify/monitor the identity of the beneficial owner, and also apply specific measures required for legal persons.

c) FIs and DNFBPs may not be adequately supervised or be provided with sufficient guidance on how to properly conduct CDD.

d) FIs and DNFBPs may not have good understanding and knowledge to assist competent authorities in determining the BO of a complicated legal structure.

Competent authorities

a) Competent authorities may not be aware of the relationship between the legal person and FIs/DNFBPs.

b) Competent authorities may not be able to identify and contact easily the FI/DNFBP if the FI/DNFBP is not subject to registration or licencing requirements.

c) Competent authorities may not have sufficient procedures in getting information from FIs and DNFBPs which may lead to undue delays in receiving information.

d) In relation to tax information, other competent authorities (particularly law enforcement authorities (LEAs)) may not be aware of the information collected and maintained by tax authorities. In addition, the extent to which tax authorities collect information on the ownership and control of legal persons varies greatly from country to country, depending on the tax regime.

Companies listed on a stock exchange

a) The information is only available if the company is listed on a stock exchange.

b) There may not be specific obligation for stock exchange to collect, verify/monitor and keep the information up-to-date for the purpose of AML/CFT.

49. The root causes of the challenges mentioned in paragraph 40 are the lack of established mechanism in obtaining existing information by competent authorities and the lack of mechanism on information sharing among competent authorities.

50. Competent authorities (particularly law LEAs) may not know where beneficial ownership information is held if there is no registration/licensing system for FIs and DNFBPs, which may affect their timely access to such information.

51. The lack of mechanism for information sharing among competent authorities is another obstacle to obtain and verify/monitor beneficial ownership information. In fact, the Existing Information Approach can be effectively used in investigations if there are mechanisms in place to facilitate authorities' access to information held by other authorities (such as tax authorities, supervisory authorities, or land titles offices).

52. The effectiveness of the Existing Information Approach also hinges on the implementation of other FATF Recommendations including:

a) R.2, 37 and 40: Country should rapidly provide international cooperation in relation to basic and beneficial ownership information.

b) R.10 and 22: FIs and DNFBPs to adequately implement CDD obligations, including measures to identify and verify the identity of the beneficial owner. Failure to adequately implement CDD under R.10 can lead to poor collection of BO information.

c) R.11: FIs and DNFBPs to record the CDD procedures performed and maintain these records for at least five years.

d) R.20 and 23: FIs and DNFBPs to report suspicious transactions;

e) R.26, 27 and 28: FIs and DNFBPs to be adequately supervised and supervisors should have adequate powers to supervise or monitor.

f) R.30: competent authorities to be able to access the CDD information held by FIs and DNFBPs in a timely manner

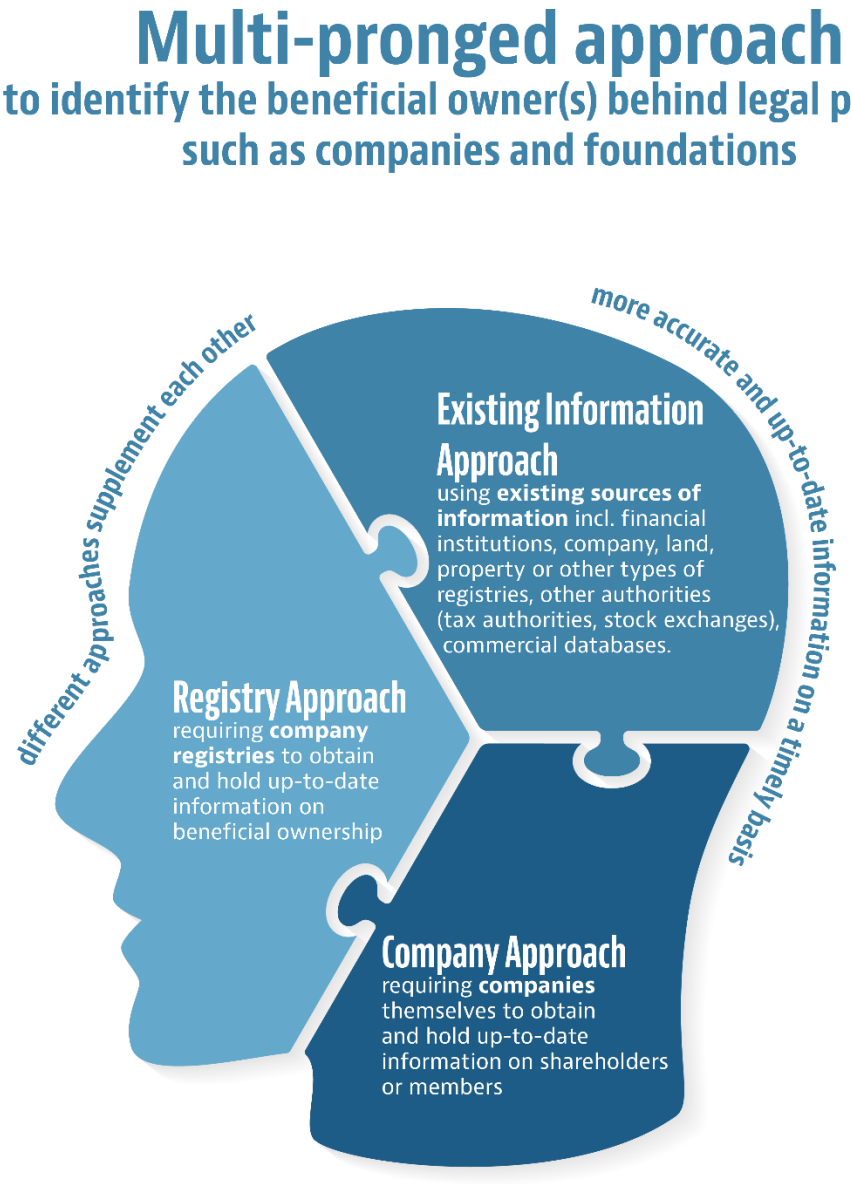
g) R.31: competent authorities to be aware of the existence of the legal person's accounts held by a FI.

h) R.34: FIs and DNFBPs to be provided with sufficient guidance on how to properly conduct CDD.

i) R.35: Countries should ensure that there is a range of proportionate and dissuasive sanctions, whether criminal, civil or administrative, available to deal with natural or legal persons that fail to comply with the AML/CFT requirements.

53. Therefore, it is important to take a holistic view in implementing the Existing Information Approach. It is important to define the roles and responsibilities of each stakeholder, empower them and equip them with the necessary resources and support to carry out their functions.

Section IV – The Suggested Effective System



Multi-pronged approach

54. As stated in Section II (paragraph 14 above refers), countries should use one or more of mechanisms (the Registry Approach, the Company Approach and the Existing Information Approach) to ensure that information on the beneficial ownership of a company is obtained by that company and available at a specified

location in their country; or can be otherwise determined in a timely manner by a competent authority[21].

55. Countries' experience shown in the FATF mutual evaluations echoes that jurisdictions using a single approach is less effective in making sure that competent authority can obtain accurate and up-to-date BO information to in a timely manner. Instead, a multi-pronged approach using several sources of information is often more effective in preventing the misuse of legal persons for criminal purposes and implementing measures that make the beneficial ownership of legal persons sufficiently transparent. The variety and availability of sources increases transparency and access to information, and helps mitigate accuracy problems with particular sources.

56. As illustrated in Section III, information on beneficial ownership of legal persons can be found in a number of different places, including company registries, the company itself, FIs, DNFBPs, and other national authorities, such as tax authorities[22] or stock exchange commissions. Implementing different approaches under R.24 can therefore complement each other to verify or/and monitor the information on beneficial ownership and make sure that the information is accurate.

57. For example, an openly and publicly accessible central registry does not necessarily mean that the information is accurate and up-to-date. It is important for an obliged party (e.g. notary, company registrar) to verify or/and monitor the information on beneficial ownership held under different approaches. The availability of other information agents (e.g. companies, FIs, DNFBPs) facilitates obliged party to cross-check, verify and/or monitor the information.

58. Under a multi-pronged approach, competent authorities can gain access to information on beneficial ownership through different sources. They can also ensure the accuracy of information by cross-checking.

59. It is also easier for key stakeholders (including companies, directors, shareholders, obliged parties such as FIs and DNFBPs) to identify incorrect beneficial ownership information in their database by looking up different registers or requesting information from different sources. This will then trigger the obliged party to seek clarifications from the companies, and if necessary, report suspicious activities to competent authorities. Therefore, such approach encourages key stakeholders to fulfil their obligations through peer interaction and supervision.

Roles and responsibilities of each key stakeholders

60. To effectively implement the multi-pronged approach, it is important to ensure that the responsibilities of various parties are clear and they have played their roles in defending the system of preventing misuse. The system is more effective if every key stakeholder can carry out "defence" in their roles duly. The roles of defence

21 Interpretative Note to R.24, para. 7 and 8, FATF (2013a).

22 For example, the Global Forum on Transparency and EOI (the GF)'s project on beneficial ownership, developed based on the FATF standard, encourages jurisdictions to develop complementary frameworks and enforcement programmes for tax transparency purposes. In March 2019, the GF's Beneficial Ownership Toolkit was launched, which contains policy considerations that jurisdictions can use to implement legal and supervisory frameworks to identify and collect beneficial ownership information.

may include, as appropriate, verification and monitoring of information, carrying out CDD, identifying suspicious patterns and trends on beneficial ownership, reporting suspicious cases and taking enforcement action.

61. Each key stakeholder should know their obligations, understand the risks involved in the form of legal persons, carry out their duties actively and continuously on a timely manner with sufficient resources. The effectiveness of supervision and law enforcement, as applicable, are also important to make sure that the relevant parties have performed their duties.

62. Section 4.3 specifies the basic roles and responsibilities of each key stakeholders and Section 5 supplements on the additional steps or defence that the stakeholders can take to help competent authorities to obtain accurate and up-to-date BO information to in a timely manner.

Suggested roles and responsibilities of each key stakeholder

63. The key stakeholders involved in the system include the company itself, company registry, obliged parties involved in company registration and verification of information (such as lawyers, notary, and accountants), FIs, DNFBPs, supervisors and self-regulated bodies (SRBs). The respective roles and obligations of each key stakeholder are suggested as follows:

a) Company and legal persons

i. Provide basic and BO information, via obliged parties (e.g. lawyers, notaries, accountant, FIs) as required, for the company registry upon registration.

ii. Provide basic and BO information, via obliged parties (e.g. lawyers, notaries, accountant, FIs) as required, both annually and when changes occur without delay to ensure that the information is up-to-date.

iii. Provide copies of documentation for verification of identity as requested.

iv. Keep shareholder registers, such as shareholder lists and information on beneficial ownership (including the disclosure of the names of person(s) on whose behalf shares are held), and make it available to competent authorities or obliged entities upon request in a timely manner.

v. Keep updated the list of their representatives, including their roles, functions and authority.

vi. Obtain updated information from their shareholders.

vii. Seek to apply restrictions against shareholders for failure to provide BO information through appropriate courts or authorities, such as in relation to shareholder voting rights, or the sale of shares.

viii. Understand and/or hold information on their ownership structure, including chain of ownership.

b) Shareholders

i. Provide accurate information on beneficial ownership and updates on changes to beneficial ownership without delay.

c) Company registry

i. Keep basic information and make it publicly available.

ii. Keep information on beneficial ownership and provide access to competent authorities, including full search capability. The company registry may make the information publicly available, or available to FIs and DNFBPs. The company registry authority may also collect information on the board of directors, senior management and the natural person authorised to act on behalf of the company. In addition, directors are required to be natural persons.

iii. Verify or/and monitor the identity of the beneficial owners.

iv. Apply sanctions when obligations are breached. Companies that fail to provide BO information are subject to dissuasive administrative sanctions, such as restrictions on incorporation. The company's representative could also be held personally liable.

v. Report trend/pattern of activities to competent authorities as necessary.

d) Obliged parties (e.g. company registry authority, lawyers, notaries or accountant, other FIs and DNFBPs, as required by the country[23])

i. Understand the ownership and control structure of the customer, and understand the ML/TF risks in relation to legal persons.

ii. Adequately carry out CDD measures at the incorporation stage and conduct ongoing CDD to make sure that the information on beneficial ownership is accurate and up-to-date.

iii. Identify indicators of misuse or unusual activity in the database and keep in view the trend/pattern of suspicious structure of beneficial ownership and report to relevant authorities as necessary e.g. using red flags, sample testing, cross-checking with other data, and public data.

e) FIs and DNFBPs

i. Adequately carry out CDD measures at the incorporation stage and conduct ongoing CDD on the business relationship, and scrutinise transactions throughout the course of that relationship to ensure that the transactions being conducted are consistent with the institution's knowledge of the customer and its business and risk profiles, including, where necessary, the customer's source of funds.

ii. Record the CDD procedures performed and maintain these records for at least five years.

iii. Report suspicious transaction activities.

f) Supervisors and SRBs

i. Conduct supervision and monitoring of all AML obliged persons including FIs and DNFBPs and to ensure that they are complying with CDD requirements.

23 An obliged party could be a company registry, FI or DNFBPs. In this case, the obliged party needs to fulfil their duties in their own role and the role of being an obliged party.

ii. Conduct outreach to obliged parties or as applicable, companies, to foster a greater understanding of the ML/TF risks, in particular of companies being created for the sole or main purpose of laundering funds.

iii. Produce guidance on additional steps which could or should be applied as part of (enhanced) due diligence on legal persons.

iv. Apply concrete and dissuasive sanctions (e.g. including monetary penalties) in the case of non-compliance.

g) Competent authorities

i. Know what basic and beneficial ownership information is available in the country, and which relevant parties are holding it.

ii. Establish process and procedures in obtaining information on beneficial information.

iii. Assess the risks of legal persons being misused for ML/TF purposes in order to improve the understanding of risks.

iv. Ensure that there is adequate sharing of information on ML/TF risks, trends and typologies between competent authorities and foster communication with the reporting entities. This would ensure that reporting entities, in particular, are more sensitive to and more familiar with typologies.

v. Provide guidance to companies or shareholders, FIs and DNFBPs explaining their obligations, and provide awareness raising activities as necessary (e.g. through the provision of information to companies upon registration).

vi. Carry out enforcement to ensure that effective, proportionate and dissuasive sanctions are applied in the case of breaches.

h) National authorities

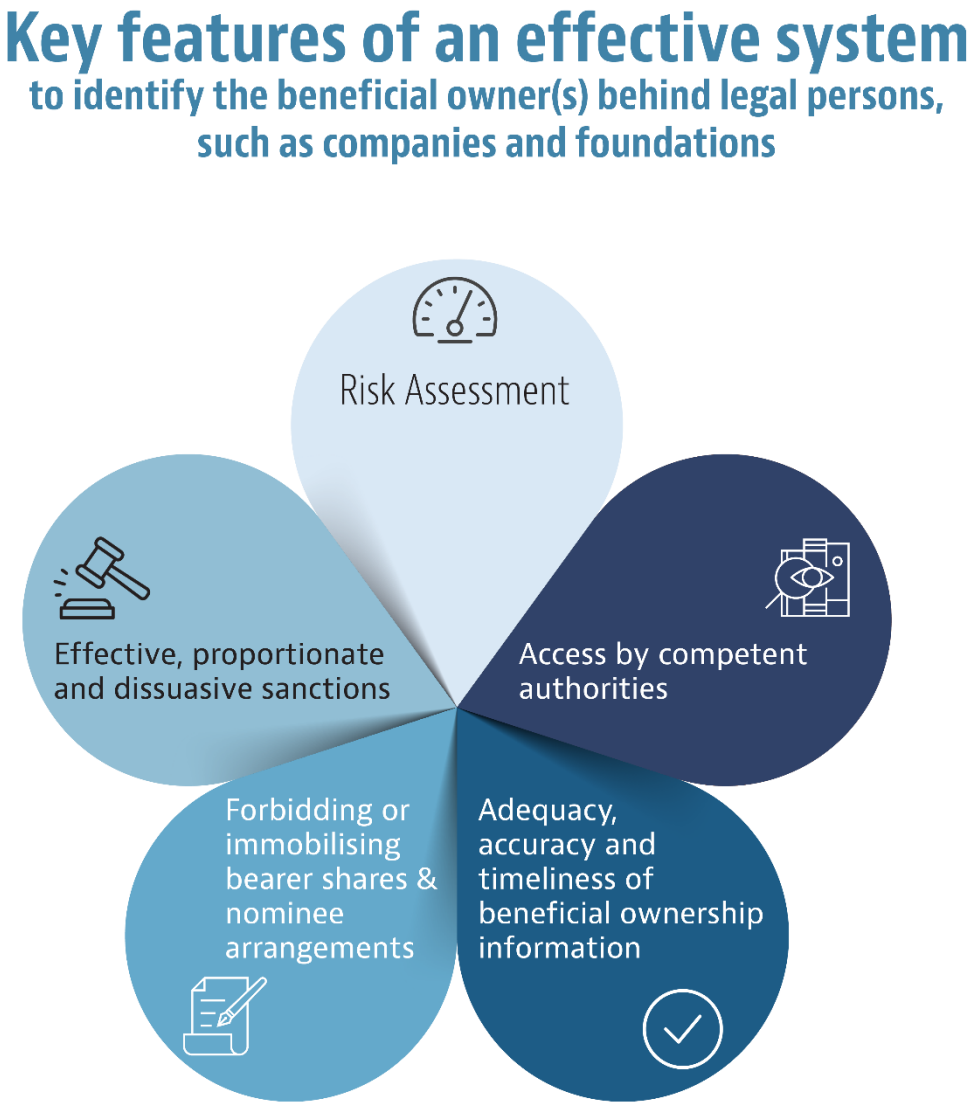
i. Ensure co-operation between government entities holding information on beneficial ownership and set out the mechanism(s) in legislation or regulations to make sure that competent authority can access to information on beneficial ownership in a timely manner.

ii. Identify and assess the ML/TF risks associated with legal persons, to enable it to implement a risk-based approach.

iii. Establish a legal or enforceable framework setting forth the appropriate approach (Registry Approach, Company Approach and Existing Information Approach) to ensure transparency of beneficial ownership.

iv. Introduce measures to prevent legal persons from being misused by criminals e.g. prohibiting bearer shares and bearer share warrants, converting them into registered shares or share warrants, or immobilising them by requiring them to be held with a regulated FI or professional intermediary, or requiring shareholders with a controlling interest to notify the company, and the company to record their identity.

Section V – Suggested key features of an effective system



64. Along with the multi-pronged principle, the FATF has identified the following suggested solutions to facilitate countries to tackle the challenges that they are facing. These suggested solutions are identified from the practical experience of countries as shown in the fourth round of FATF mutual evaluations and information provided by countries in the earlier Horizontal Study.

Risk assessment (relevant to core issue 5.2)

65. Countries should conduct a comprehensive risk assessment of legal persons so as to develop a more thorough understanding of vulnerabilities and potential of abuse of legal persons for ML/TF. This may also help countries to develop specific measures for legal persons that are easily being misused for ML/TF.

66. In some countries, there is a designated agent commissioned to analyse the ML/TF risks posed by all types of legal persons. Such agent considers relevant legal and regulatory contextual issues particular to the country and multi-agency information sources to identify trends and patterns, including:

a) review of relevant court cases;

b) suspicious transaction reports filed by obliged parties e.g. notaries, lawyers, company registry, other FIs and DNFBPs;

c) practical experience of competent authorities;

d) identified patterns/trends in ML/TF and relevant changes e.g. "preferences" amongst the various types of organised crime groups for certain forms of company.

67. The agent then conducts assessment regarding the risks of legal persons, and share information on ML/TF risks, trends and typologies with competent authorities and obliged parties. The sharing of current trends and typologies enables obliged parties to consider the risks at the incorporation stage, and they can pay attention to potential red flags at the incorporation stage.

68. For countries which are an important regional and international financial centre, more efforts should be put to identify, assess and understand the vulnerabilities of corporate structures for ML/TF particularly in relation to international threats.

Belgium

In 2018, an agent was hired at the Treasury (FPS Finance) to conduct a horizontal risk analysis on legal persons which could be established under the Belgian law. The analysis involved a study of the legal framework as well as meetings with competent authorities to identify trends and patterns. The purpose of the analysis was to enhance the understanding and knowledge of competent authorities on the vulnerabilities and potential abuses associated with each legal person, and also to identify the loopholes and necessary legal reforms or additional measures.

The analysis concluded that the most vulnerable structure is the private limited liability company (SPRL/BVBA). This is the most common form of legal persons. While most of them are properly registered, some of them pose ML/TF risks. Fraudsters are aware of certain loopholes which allow them to circumvent controls and misuse the structure to conduct unlawful activities. This may lead to inaccuracy of the Registry. Another risk is that legal persons that are registered are not necessarily active.

This affects the accuracy of statistics and also allows the trading of dormant companies to avoid the administrative process of creating or dissolving a company.

Belgian authorities are aware of the threats and vulnerabilities and have taken measures to address them. The Belgian Company Code has been recasted to reduce the number of types of legal persons and harmonise the rules applicable to profit and non-profit legal persons. Targeted actions have also been launched. For instance, a task force has been established by competent authorities to efficiently dissolve inactive entities.

Indonesia*

Sectoral Risk Assessment of Legal Person

The Indonesia National Risk Assessment (NRA) 2015 indicated that financial criminals perceived it safer to disguise illicit funds through legal person(s). Corrupt government officials and drug dealers can easily hide their illicit gain behind the complex structure and network of corporate transactions. In many cases, this was made possible by the lack of governance in beneficial ownership. Criminals can appoint nominees to appear as the owners of their assets while leaving no trails anywhere in the corporate legal documents.

In 2017, the Commission Eradiation Commission (KPK) together with PPATK (Indonesia's Financial Intelligence Unit (FIU)) and Financial Service Authority (FSA/OJK) conduct the Sectoral Risk Assessment (SRA) of Legal Persons. This money laundering SRA of Legal Persons is separate with the terrorist financing SRA of Legal Persons. The SRA of Legal Persons identified all types of legal person in Indonesia, which are limited liability companies, foundation, cooperative, firm, partnership, and association.

The money laundering SRA of Legal Persons identified six dimensions of risks, including(1) type of legal person; (2) type of business; (3) delivery channel; (4) reporting party; (5) international transaction (inflow); and (6) international transaction (outflow). The terrorist financing SRA of Legal Person identified four dimensions of risks, including (1) type of legal person; (2) type of business; (3) delivery channel; and (4) reporting party.

The result of SRA of legal persons shed light on the risks faced by different legal persons as follows:

- Indonesia's "Perseroan Terbatas ("PT" i.e. limited liability companies) are exposed to a higher ML risk, while "Yayasan" (i.e. foundations) are exposed to higher risk for TF.

- Companies that operate trading business are prone to ML more than other types of business, while social foundations and religious institutions remain the most vulnerable to TF.
- From delivery channels perspective, fund transfers are the most frequently used for in both ML and TF scheme.
- Despite of the stringent regulations, banking remains the reporting party with the highest ML risk.
- Indonesia specifically covered international transactions in the assessment and noted that some jurisdictions with perceived low ML risk appear to have been used by Indonesian-based corporations to keep their money.

**yet to undergo mutual evaluation as of September 2019*

The United Kingdom

A thematic review of relevant legal entities (RLEs) on the PSC Register

Following engagement with NGO community and Companies House facilitating data analysis by NGOs, the risk of accidental or deliberate misuse of the Relevant Legal Entity (RLE) exemption for the PSC register was raised. Companies House has undertaken to check each RLE registered, prioritising on a risk-based approach by focussing on those registered in financial centres or countries with weaker transparency laws.

Circular ownership of companies is prohibited by Companies Act 2006. The UK's experience is that circular registrations are a result of a misunderstanding of the person with significant control (PSC) requirements, not deliberate. For a company to deliberately register a circular loop would essentially disclose that they had breached s.136 of the Companies Act and committing a false filing offence.

UK National Crime Agency (NCA) Intelligence Report - "The use of corporate entities to enable international money laundering networks"

The NCA report examined the case of an overseas international money launderer utilising UK corporate entities to launder the proceeds of crime. In this example, the controller routed illicit funds to an overseas based company from 11 UK corporate entities (Ltd company, Limited Liability Partnerships (LLPs), Scottish Limited Partnerships (SLPs)), all of which banked exclusively outside of the UK. The ownership of these companies highlighted that they were often nominee partners or directors who had been linked to suspicious offshore structures.

The key insights from this report included: the use of several different "vanilla" structures for illicit purposes; the use of "nominee partners" can present a vulnerability; entities were often banked overseas where CDD requirements or enforcement of regulations might be lower; and criminals

take advantage of the perceived respectability of the UK business community in order to provide a façade of legitimacy. This intelligence report contributed to more fundamental reviews of the vulnerabilities posed by LLPs and SLPs in respect of high-end money laundering. After the report, the UK introduced several measures to improve transparency of these entities and is expected to have mitigated some of the vulnerabilities identified. For example, criminals can no longer hide beneficial ownership through one of the partners being a corporate body registered in an overseas jurisdiction.

Strategic intelligence assessment: 'The use of corporate vehicles to hide beneficial ownership'

This report identified the use of multiple corporate vehicles, and complex structures using multiple jurisdictions consisting of a series of corporate entities to obfuscate beneficial ownership. There are delays in identifying the relevant jurisdiction(s), requesting, and accessing the required information, assuming it exists. Organised crime groups and individuals will be aware of this and will seek to complicate the structures as much as possible. Furthermore, law enforcement have to rely on legal requirements of that country e.g., details required when incorporating a company, which vary considerably depending on the country. This is most apparent in a country where secrecy is one of the main attractions for using that jurisdiction. Furthermore, the report found that the use of SLPs created further complications as they do not need to register for tax or provide financial reports if the business is conducted abroad. SLPs can register companies abroad in foreign offshore centres, which limits Her Majesty's Revenue and Customs (HMRC)'s ability to perform background checks as the beneficial ownership is disguised in these companies. This analysis has been used to inform the UK's risk-based approach and to understand the vulnerabilities in the UK.

Switzerland

A dedicated inter-agency group for the assessment of AML/CFT risks

Switzerland has established a national AML/CFT co-operation and co-ordination framework led by the Interdepartmental Co-ordinating Group on Combating Money Laundering and the Financing of Terrorism (GCBF). All competent authorities regularly take part in this group. The Group is responsible for the ongoing identification of risks to which the country is exposed. Under the leadership of MROS (FIU), there is a specific working group dedicated to risk analysis. The GCBF, represented by high-level officials, proposes measures to address the identified risks. The results of the works of the GCBF are submitted each year to the Swiss Federal Council for information or for adoption of further measures.

In June 2018, GCBF published an in-depth analysis on the AML/CFT risk of legal persons and arrangements. This report, adopted in November

2017, compiles extensive quantitative and qualitative data from multiple sources of information from competent authorities, academia and the private sector. It identifies the main threats and vulnerabilities affecting Switzerland with regard to legal per-sons and arrangements and addresses the residual risks by proposing measures, including at the legislative level. The report is publicly available which ensures a wide dissemination and awareness raising.

Adequacy, accuracy and timeliness of information in beneficial ownership

Obliged parties to verify or/and monitor the accuracy of the information (relevant to core issue 5.3 and 5.4)

69. The country may appoint a fully regulated and effectively supervised gatekeeper i.e. an obliged party which is subject to AML/CFT obligations, to ensure the accuracy of the information. Such an obliged party should be fully aware of their obligations, understand thoroughly the risks associated with all types of legal persons, and verify or/and monitor the accuracy of information on beneficial ownership. The role of this obliged party in authenticating and verifying/monitoring the acts relating to the information on beneficial ownership throughout the whole lifecycle of legal persons reinforces the reliability of information in particular when its activities are constantly supervised and in sanctioned in case of identified non-compliance.

70. In some countries, the company registrar is the obliged party who shall perform CDD functions. The registrar checks information submitted by companies against other sources (such as national identity registers or tax administrative registers) to verify or/and monitor the information on beneficial owner. The registrar also identifies anomalies or inconsistencies and make reports to the competent authorities.

71. In some countries, the involvement of a notary, a lawyer or an accountant, who is an obliged party subject to AML/CFT obligations, is required at the company incorporation stage, as well as subsequent stages to validate and ensure accuracy of information reflected in the business register and authenticate changes in ownership. Such obliged party is under the supervision of a designated supervisor that is responsible for verifying compliance with these CDD obligations. Some countries implemented additional mitigation measures by verifying or/and monitoring the identity of the obliged party. The company registry will check against the relevant register to confirm that the obliged party is a qualified professional and that his/her licence has not been suspended or revoked.

72. In some countries, it is mandatory to open a bank account with an obliged FI (e.g. banks) before completing company registration. This entails a separate CDD process by FIs where beneficial owners of the company are identified. Such a requirement can help with verification of BO at the time the legal person is created. If there were a requirement to maintain this (or another) bank account throughout the life of the legal entity, then it could also contribute to maintaining up-to-date information, by leveraging the FI's ability to periodically refresh customer files or identify when changes occur.

Denmark

When establishing a company in Denmark, obliged parties subject to AML/CFT obligations (lawyers or auditors) are often involved at the incorporation stage as the business register requires confirmation from a lawyer, auditor or bank that the required capital has been paid in full. Hence, obliged entities that must perform CDD are very often involved at the incorporation stage.

Danish natural and legal persons that are creating or managing legal persons by making registrations in the Central Business Register (CVR) are required to use a special form of ID (NemID), issued by a government agency. NemID is a common secure login to the Internet that is used for a variety of purposes, such as online banking, finding out information from the public authorities, or engaging with businesses. This electronic login leaves an electronic footprint and gives the DBA digital information about the person making a registration which can be used in various control situations.

Further, when making a registration in the Central Business Register, everyone must sign an electronic declaration stating that the information put in the business register is correct.

Guernsey*

Validating beneficial ownership information and providing information to TCSPs on their "gatekeeper role" in the formation and administration of legal persons

Only licensed trust and company service providers (TCSPs) who are subject to full AML/CFT and prudential supervision in Guernsey by the Guernsey Financial Services Commission (GFSC) can incorporate legal persons in Guernsey. TCSPs have been subject to requirements to identify and verify the beneficial owners of all structures for whom they act under Guernsey's Proceeds of Crime legislation. In 2017, Guernsey introduced additional legislation requiring all Guernsey legal persons to disclose the identity of their beneficial owners to a central register of beneficial ownership. Transitional provisions in this law required accurate and up to date beneficial ownership information to be provided to the Register on existing legal persons before the end of February 2018.

In the second half of 2018, the GFSC undertook a thematic review to assess the effectiveness of the 2017 legislation for ensuring the accuracy of information on the Register about the beneficial ownership of Guernsey legal persons, which are administered by TCSPs. The review consisted of an extensive survey of all licensed TCSPs who were required

to provide detailed information on the proportion of beneficial owners wh**o** fell within each of the FATF's "3 tier ownership test" for the legal persons for whom they act. The results were examined and together with input from the Registrar and Guernsey's Financial Intelligence Unit. Twenty TCSPs were selected for focused on-site inspections to review the beneficial ownership records of up to twenty legal persons per firm. The GFSC also compared information on the beneficial ownership register with that on TCSPs' files to check the accuracy of beneficial ownership information submitted to the Register.

The GFSC issued a public report on its findings from the review in 2019 to help inform TCSPs of their obligations under both the Proceeds of Crime law and the 2017 law. The report included case studies on different types of beneficial ownership structures observed by the GFSC during the inspections to highlight examples of good practice and areas for improvement.

**yet to undergo mutual evaluation as of September 2019*

Hong Kong, China

Information provided to the Companies Registry (CR) are subject to checking and verification by the CR. Financial institutions are also subject to statutory CDD and record-keeping requirements when any company opens a bank account. The CR also conducts regular site inspections to check if significant controllers registers (SCRs) are properly kept or not by companies. The CR will check the accuracy of information contained in the SCR against other available sources on a risk based approach.

Italy

Notaries in Italy perform a public function. The information that they provide is deemed self-sufficient, and its content is verified through the automated checks. At the time of incorporation, the information is entered on the basis of a public deed prepared by a notary and processed online through the use of a digital signature. The public deed itself is available to external parties "as is." Basic checks are conducted by the IT system upon registration. They include an automated calculation of shares (to ensure that they don't exceed 100%) and of the capital (to ensure it does not exceed the proposed total) as well as an automated validation of information such as the tax ID number entered, digital signature –and therefore the identify– of the applicant, and of the payment of the mandatory fees and taxes. Additional automated checks are also performed with respect to new information entered into the system (for example to ensure that shares are only transferred by persons who are already in the system). Any anomaly highlighted by these automated checks is analysed by the Business Register staff before the publication is authorised.

Israel

In addition to the mandatory involvement of an Israeli lawyer for both the online and paper registration process to verify the signatures of shareholders and directors, the vast majority of applications made in paper form are submitted to the registry by lawyers who are subject to CDD obligations, including an obligation to obtain and retain beneficial ownership information. The Israel Companies Authority (ICA) confirmed that the vast majority of all registered company applications are submitted by Israeli lawyers. These lawyers are subject to CDD obligations on beneficial ownership. The MoJ is in charge of verifying compliance with these CDD obligations.

The ICA has implemented additional mitigation measures in relation to potential abuse by use of online applications. Such applications must be submitted by a lawyer subject to AML/CFT obligations, who is identified by an electronic certificate. The identity details of that lawyer are checked against the Bar Association's register to confirm he/she is a qualified lawyer and that his/her licence has not been suspended or revoked. There is one exception, which is rarely used, when the application is submitted by a shareholder who is the sole shareholder and a director of a company. Such applications require the identification of that shareholder on the on-line system by an electronic certificate (which is issued only after a face-to-face meeting with the shareholder/director concerned). In addition, the ICA requires the applicant (i.e. the lawyer or shareholder) to upload a copy of the by-laws, signed in the presence of a lawyer required to verify the signature of the shareholder on the articles of association – hence, sole shareholders making online applications are also subject to identification measures.

Japan*

On 30 November 2018, the amendment of the Ordinance for the Enforcement of the Notary Act came into force. Under the amended ordinance, to incorporate stock companies (the most commonly used form of legal entity), general incorporated associations and general incorporated foundations (hereinafter called 'stock companies etc.'), the founders (clients) are required to report to notaries the information regarding the identity of the person who ultimately owns or controls the legal person they establish when notaries certify articles of association. In Japan, the articles of association must be certified by notaries to incorporate these legal entities. The clients also need to report to notaries whether the person who ultimately owns or controls the legal person is a member of organised crime groups or international terrorists. The notary database is kept in a centralised and systemic way. Competent authority can access the information in the database through notaries.

Notaries are required to check the accuracy of the reported information regarding the identity of the person who ultimately owns or controls the legal person by examining the submitted articles of association and other documents. Notaries also make use of their database on organised crime groups and international terrorists and when the person who ultimately owns or controls the legal person falls into these categories, the notaries refuse to certify the articles of association. The information regarding the identity of the person who ultimately owns or controls the legal person acquired by notaries is stored in their database to which competent authorities can refer upon their request.

**yet to undergo mutual evaluation as of September 2019*

Jersey*

Fully regulated and supervised obliged persons are required to form and maintain legal persons, along with vetting by registry

The incorporation of most legal persons in Jersey is conducted by regulated trust and company service providers (TCSPs).[24] TCSPs are subject to full supervision in Jersey, including fit and proper requirements and regulation of both AML/CFT and prudential/conduct. TCSPs are required under the Money Laundering (Jersey) Order 2008 to find out, and to verify, the identity of the beneficial owners of structures that they administer, and to keep information and records up to date. TCSPs are also required to update the central register of beneficial ownership and control within 21 days of knowledge of a change of beneficial ownership.

24 Local trading companies may incorporate without the use of a TCSP, but are subject to additional identity verification and due diligence by the Jersey Financial Services Commission.

In 2018, with a focus on the accuracy of the Register, the Jersey Financial Services Commission (JFSC) carried out a series of themed examinations to a cross section of TCSPs who provide administration services to Jersey registered entities. The accuracy of client information held by TCSPs continues to be a focus of the JFSC. Customer data is reviewed against data held on the register of beneficial ownership during on-site examinations.

The Companies Registry itself conducts a three stage, sequential vetting process, which involves 3 separate individuals when vetting a) on incorporation; and b) on change of beneficial ownership or control. The vetting process on incorporation must be signed off by either a Head of Unit or a Director of the JFSC within which the Companies Registry sits.

Each beneficial owner and controller and the activities of each entity is vetted against sanctions lists and court regulatory decisions made anywhere in the world, using various sources including a consolidated sanctions and Office of Foreign Assets Control (OFAC) lists, World-Check, internal Customer Relationship Management systems check, internal intelligence/enforcement database check, open source internet searches and regulatory databases maintained by the JFSC.

Any negative information found during the vetting process will be escalated to Head of Unit or Director level and will either result in shared internal intelligence and/or filing of a Suspicious Activity Report. An active feedback loop is exercised to ensure that deficiencies are taken into account by the Supervision division of the JFSC, and, where relevant, the Enforcement division.

**yet to undergo mutual evaluation as of September 2019*

Spain

Notaries are required in all cases, to identify and record the beneficial owner of a newly incorporated entity on the basis of a declaration made by the company's representative Customer due diligence undertaken by obliged entities makes a significant contribution to Spain's systems for providing authorities access to beneficial ownership information and to ensuring the quality of that information. The notary profession is particularly relevant in virtue of the legal requirements for their involvement to validate most acts involving legal persons. Notaries are very aware of their significant gatekeeper role, as well as of the importance of the information they hold, and have actively worked with the authorities to develop systems to open up their wealth of information for the authorities.

Supplementary information platform in addition to company registry (relevant to core issue 5.3 and 5.4)

73. In addition to company registries, some countries have another database holding information on beneficial ownership. Competent authorities or obliged parties can access these repositories, and cross-check the information against that held by obliged parties and authorities such as company registry, notary profession, tax or stock market authorities.

74. In some countries, their notary profession, being the obliged party, keeps a centralised database on beneficial ownership of legal persons. This includes information obtained and recorded by notaries when incorporating entities or conducting certain other acts or transactions by persons and entities, and information on the transfer. This creates another repository of corporate information which is used to validate the information on the company registry.

75. Some countries may also have their tax authorities maintain beneficial ownership information for certain legal persons. The tax authorities may hold basic and beneficial ownership information on legal persons who have an income, have ownership and/or make transaction of real estate or hire employees. Some even require that all legal persons making disclosures to the tax authorities are required to have a bank account and are subject to banks' CDD requirements.

76. In some countries, professional associations have made free access to certain private databases available to their members. This facilitates the professionals to cross-check information with existing customers or exchange with other obliged parties while complying with data protection measures.

China

In March 2014, China launched the National Enterprise Credit Information Publicity System (NECIPS), which includes information of all enterprises registered with the State Administration of Market Regulation (SAMR). The NECIPS is an authoritative, nationally unified information system established by the competent authority to disclose statutory information. Written inspection, on-site inspection and network monitoring are conducted to randomly check the publicity information. Enterprises that violate the information disclosure requirements are listed on the "grey list" and "black list" for creditworthy sanctions, and may also be subject to fine or even licence revocation. The system strengthens the transparency of business operations, promotes the company's integrity and self-discipline, and strongly supports the supervision. Since 2017, the average number of visits has reached 19.4 million times per day, and the average number of inquiries has reached 3.2 million times per day.

The available information of the NECIPS includes the company's basic information, shareholders and funding information, mortgage registration, administrative licensing and sanctions, as well as some business information. This does not include beneficial ownership information, but may nevertheless contribute to efforts to identify the beneficial owner.

Indonesia*

Since 2018, all legal persons are required to disclose their beneficial owner and to provide beneficial ownership electronically through AHU Online. AHU Online is an application that consist of basic information and beneficial information of legal person that maintain by Ministry of Law and Human Right (companies registry). To ensure that the reporting parties can access the beneficial ownership information in timely manner, Presidential Regulation Number 13 year 2018 regulates specific requirement that oblige the companies registry to provide direct access for reporting parties.

Moreover, competent authorities, especially government agencies (e.g. Ministry of Energy and Mineral Resources, Ministry of Agriculture, Ministry Agrarian Affairs and Spatial Planning), are empowered to consider whether to provide business license to legal person which has not yet disclosed or designated its beneficial owner. Competent authorities will decide based on the assessment of the authorised institution, (a) audits of the legal person by the competent authorities; (b) information from a government institution or private entity that manages data and/or information of the beneficial owner, and/or report from certain professions that keep information of the beneficial owner; and/or (c) other relevant information.

**yet to undergo mutual evaluation as of September 2019*

Israel

Information held by Tax Authorities

The Israel Tax Authority (ITA) holds basic and beneficial ownership information on all legal persons which have an income, which own real estate, which buy/sell real estate, which have any employees in Israel, which have any assets in Israel or which undertake any financial transactions. All legal persons making disclosures to the ITA are required to have a bank account and are subject to banks' CDD requirements, including those on beneficial ownership.

Italy

The Guardia di Finanza (GdF) has been successful in a number of instances in identifying the beneficial owners of companies misused by criminals, especially mafia-type organised crime groups, through a combination of measures, including consultation of the information collected by reporting entities (mainly notaries and banks) and of various databases.

- on the basis of the data contained in Suspicious Transaction Reports (STRs) – Instructions issued by the FIU establish that the transmission of STRs shall always be complemented with indication of the beneficial owner. The incapability to identify the beneficial owner represents, in itself, a reason for filing a STR;
- from notaries – whereby the legal person under investigation has been part of public acts (e.g. purchase of properties). Information acquired from the Business Register, Anagrafe Tributaria, records held at notaries, and Notarial Archives;
- from accountants. Consultation of the Anagrafe Tributaria allows to identify the custodian of the accounting records or the intermediary who transmitted the compulsory returns for income tax and VAT purposes; and consultation of records (registers) held by professionals;
- from banks, other financial intermediaries and trust companies, identified through queries of the Archivio dei Rapporti Finanziari. After identifying the intermediary, the AUI (Archivio Unico Informatico) shall be consulted.

The same sources may also be utilised in criminal investigations on the basis of an ad-hoc decree (Article 248 Code of Criminal Procedure) issued by the relevant Judicial Authority.

Spain

In Spain, there are currently three databases that hold information on beneficial ownership of companies, each one of them set up with information collected by different obliged entities (Notaries, Registrars and credit institutions). All of them are accessible on-line to LEAs by means of web portals or web services. Such network of overlapping mechanisms together secure the availability of beneficial ownership information of all commercial entities operating in Spain. The mechanisms are as follows:

1. The Single Notarial Computerised Index: beneficial ownership information obtained by notaries through their CDD is held in the notary profession's Single Computerised Index. This database records separately the information obtained through customer declarations at the time of notarised transactions and the verified, aggregated information compiled by notaries.
2. The Business Registry also collects information on beneficial ownership as reported by the authorised representative of the company. On 21 March 2018 a Ministerial Order was issued, requiring all companies (except for publicly listed companies) to annually submit a form, identifying their beneficial owners, to the Business Registry when fulfilling the obligation to file annual accounts. Failure to file the annual accounts (including this form, as accounts deposited

without it shall be rejected for being incomplete) causes the Registry sheet of the company to be locked and has other legal consequences, such as a possible monetary fine, the exclusion of the company from any public tender and, in cases where the company reaches an insolvency state, there is the legal presumption that such state has been reached by negligence or fraud. Even though the period for depositing accounts is not closed yet, on 1st April 2019 more than 1 154 000 companies have already filed their 2018 annual accounts and more than 1.5 million beneficial owners have already been reported.

3. The third database is the Financial Ownership File held by Sepblac (the Spanish FIU and AML/CFT supervisor). Credit institutions will submit a monthly report about the bank and securities accounts opened/held by them to Sepblac. One of the fields required for credit institutions to fill in (except for publicly listed companies) is the identification of the beneficial owners of the account holders. Therefore, information that comes from the CDD carried out by banks to legal persons whenever opening or holding a bank or securities account is also accessible to LEAs for the purposes of preventing, detecting or investigating ML/TF cases.

Ongoing reporting at company level / to the reporting entities or company registry (relevant to core issue 5.3 and 5.4)

77. To ensure that the information on beneficial ownership is updated in a timely manner, a country may require legal persons to undergo ongoing reporting. If there is change to the beneficial ownership, legal persons are obliged to file changes that are verified by the obliged party.

78. In some countries, the company registry imposes an annual updating requirement on companies to make sure that the information of the company's beneficial ownership is up-to-date. Some registries may implement automated systems to monitor deadlines for filing annual returns or certifications. In addition, legal persons are required to file updates within a designed period if there is any change in beneficial ownership. Otherwise, the change may not have legal effects. Some registries require companies to provide an annual report confirming the basic information previously provided to the registry by the end of the calendar year and making such annual reports publicly available so that the public can see the contents of a report and when it was last submitted.

79. A point to note is that such updates on beneficial ownership to the company register are to be verified by an obliged party. In some countries, involvement of a notary is further required to validate changes in basic information. Information submitted to the company registry must be accompanied by a notarial document. Notaries also maintain the same information, as well as information related to changes in shareholders in a separate database that is updated within a specified timeframe.

80. For registers of shareholders, if these are held by the company itself or a depository institution, the company director is responsible for ensuring their accuracy, and for updating them immediately when changes take place. A Registry system that is held at the company level allows keeping a complete and full record of beneficial ownership information. The register can show the changes of beneficial owner. This allows competent authorities to obtain or retrieve beneficial ownership information from the company.

a) Ongoing reporting at company level

Switzerland

Companies in Switzerland must keep a record of their shareholders (SAs) or members (SARLs and SCs) and their beneficial owners (Art. 686, 697j, 697l, 747, 790, 837 CO), including for bearer shares. Shareholders must inform the company within a month of any acquisition of the shares (697i CO). All shareholders, of both registered and bearer shares, or of units where the holding reaches or exceeds the threshold of 25% of the capital or of the votes, must inform the company of the name of the natural person who is the beneficial owner of the shares or units. The information must be kept up to date. They must also notify the company of any changes (Art. 697i, Art. 697j and 790a CO). In addition, the company must be notified of any changes to the information identifying the shareholders or beneficial owner (first name, surname, address) (Art. 697i, 697j para. 2 and 790a para. 2 CO).

b) Ongoing reporting to the reporting entities or company registry

Austria

Based on Art. 3 of the Beneficial Owners Register Act (BORA), legal entities are required to conduct and review their due diligence requirements pursuant to Art. 3 para. 1 BORA at least once a year, and verify whether the beneficial owners listed in the Register are still up-to-date. Moreover, changes related to beneficial ownership have to be reported within four weeks of obtaining knowledge of these changes.

Legal entities will be required to not only perform their due diligence obligation at least once a year, but also to confirm the reported beneficial ownership data within four weeks after the due date of the annual review. All reporting requirements will be enforced by automated coercive penalties.

Belgium

In Belgium, there is a duty for legal entities and arrangements (LE/LA) to update the ultimate beneficial ownership information within a month of the change Such update should be registered directly in the online UBO Register platform. LE/LA also have the duty to confirm on an annual basis that the information registered is up-to-date, accurate and adequate.

Accountants or notaries can also file the UBO information directly in the UBO Register and do the annual confirmation for their clients. They can also choose to send an extract of the register to the legal representative and ask them to confirm the information by directly clicking on a link embedded in the email.

Denmark

In Denmark, corporate and legal entities covered by the BO rules are obliged to register its beneficial owners in the Central Business Register (CVR). If the entity is informed that there might have been a change of the beneficial ownership, the entity is obliged to investigate it and update the registration in the BO registry as soon as possible and no later than within two weeks.

Corporate and legal entities must keep information on the company's beneficial owners, including attempts to identify the beneficial owners, for five years after the ownership ended or identification was attempted. This information shall be provided if for example the Danish Business Authority (DBA), the State Prosecutor for Serious Economic and International Crime (SØIK) or the Danish Tax Agency (SKTST) considers the information necessary to fulfil its supervisory and control tasks. If the company ceases to exist, the last registered management must ensure that information and documentation regarding the investigation into the beneficial owner(s) can be produced five years after the ownership ended or identification was obtained.

In 2020, corporate and legal entities will be required to screen the BO information registered in the CVR at least once a year and, if necessary, update the BO information. The relevant information shall be presented on the meeting where the annual report is approved by the board of directors.

France*

In France, pursuant to Article R. 561-55 of the Monetary and Financial Code, any corporate or legal entity that has change(s) in its beneficial ownership chain needs to file an up-to-date BO document with the "greffier de

commerce" (commercial court's clerk) within 30 days following the change. Corporate and legal entities must keep updated and accurate BO information.

Failure to submit information within appropriate time or to provide accurate information is subject to 6 months of imprisonment and a fine of € 7 500, according to Article L. 561- 49 of the Monetary and Financial Code. Natural persons may also face a disqualification from practice of business activities or a partial privation from national and civil rights. The legal persons convicted may face a sanction payment equal to five times the sanction applicable for natural persons (37 500 euros) and supplementary penalties as described by Article 131.39 of Penal Code.

**yet to undergo mutual evaluation as of September 2019*

Jersey*

Legal Persons required to update the central register within 21 days of any change in beneficial ownership

Under the Control of Borrowing (Jersey) Order 1958 (COBO) every Jersey entity is required to obtain the consent of the Jersey Financial Services Commission (JFSC) on incorporation. The JFSC uses this regime to impose conditions on all Jersey companies which facilitate the collection of beneficial ownership and control information.

All TCSPs must provide information where an individual acquires beneficial ownership of 25% or more (the threshold being flexed on a Risk Based Approach) or becomes a controller (the Jersey Registry adopts the FATF "3 tier test"). TCSPs must notify the Companies Jersey Registry within 21 days of knowledge of a change.

In respect of legal persons formed not by TCSPs but by local residents, under COBO, there has always been a requirement to obtain the permission of the Commission before a change of beneficial ownership and to therefore update the central register upon change of beneficial ownership.

**yet to undergo mutual evaluation as of September 2019*

Italy

Changes to the ownership and control structure of the legal person must be recorded in the Register within different timeframes, namely within 30 days of the notarial act that validates them, in the case of limited liability companies (società a responsabilità limitata; SRL), and once a year for the joint stock companies (società per azioni) (i.e. at the time of filing the annual accounts). Transfers of shares must be filed with the Business

Register by a notary or be performed by a bank or stockbroker in the case of SRL, the information may be filed by notaries or chartered accountants. The checks are performed with respect to the information filed by notaries.

Verification through different means (relevant to core issue 5.3 and 5.4)

81. The effective mechanism also involves active and adequate verification of information to ensure that the information on beneficial ownership is accurate. Verification of information can be conducted through the following means.

Cross-checking

82. Countries may adopt cross-checking measures to verify or/and monitor the information on beneficial ownership, taking advantage of the availability of different information agents. For example, FIs and DNFBPs, as well as tax authorities, can cross-check the basic and beneficial ownership information provided to them by companies with the information available at the at the registry held by the company or by the registry. Obliged parties such as FIs and DNFBPs can also continuously monitor changes in the registries, including designations of violating companies (through automated computerised interfaces) and inquire with their customers with regard to any potential discrepancies.

83. Given the interrelatedness of the information available and the procedures implemented by government authorities, some countries implement automated cross-checking controls among databases held by different government authorities. For example, a common portal is developed so that the system of company registry can cross-check the beneficial ownership database against other government databases (e.g. law enforcement databases, tax administration database, land register, and other open sources) to verify or/and monitor the accuracy of information on beneficial ownership.

84. Some countries have developed a blacklist, where all individuals and organisations listed in the United Nations are included, in addition to any local individual or organisation which is subject to domestic listing. Those who are listed will not be able to register or own or transfer ownership of any kind. Obliged party can cross-check the identity of shareholder/director against the blacklist at the company incorporation and subsequent stages.

Red flags

85. Some countries identify indicators that suggest suspicious activities e.g. a single credit card or email address being used to incorporate many companies, which on the surface are unconnected. The company registry will then report to law enforcement/competent authorities regarding suspicious activities.

86. In some countries, the obliged party determines a set of indicators and then reviews and assesses the legal persons' financial statements to properly identify the nature and size of the business. For example, the obliged party may establish indicators on sector's income specifically cash income, and the level of assets. This is then compared to the industry average. Subsequent abnormal and/or significant results are deemed suspicious and are therefore subject to further assessment.

87. In some countries, the company registry system is capable of detecting any variations in the information submitted by companies (i.e. increase in shares, transfers of ownership) and to also compare the relevant indicators against the industry average. In case of abnormal variations, an alert is triggered and is subsequently sent to the concerned department for further investigation. Where the primary finding does not justify the business purpose of the behaviour that generated the alert, an in-depth investigation is conducted to determine whether such behaviour is associated with ML/TF risks.

Sample testing with public and non-public data

88. Some registries conduct ongoing sample testing or targeted audits to verify or/and monitor the accuracy of information on selected legal persons. In some countries, company registries conduct sample testing for specific industries/ companies of specific business nature/ risk features by using the annual reports provided by companies to conduct periodic verification. They may check the annual report submitted against the information in its database.

Co-ordination among authorities

89. In some countries, relevant obliged parties and authorities (e.g. company registry and tax authorities) have worked closely together on cases of fraud and market manipulation. The authorities may jointly conduct detailed analysis of transactions and trading patterns, leveraging of certain parameters e.g. IP addresses and use of telephone system information. This helps identify connections between beneficial owners and facilitate further investigations.

External parties engaged in verification of register information

90. Some countries introduce a reporting feature on the public register to encourage external parties to voluntarily notify it of suspected errors. Some organisations e.g. NGOs may then undertake data analysis and report on potential inaccuracies and issues of concern. Some countries also require FIs and DNFBPs to report inaccuracies when they conduct CDD process.

Austria

The BO Registry Authority is responsible for ensuring the correctness and completeness of the data as well as for the prevention of money laundering and terrorist financing. To fulfil these obligations, the BO Registry Authority is authorised to carry out analyses, or may at all times request information and documents from legal entities and their beneficial owners and perform off-site analyses of the correctness of beneficial ownership on the bases of the documentation received and other available sources.

Where an obliged entity determines during the application of its due diligence obligations towards customers that a different beneficial owner has been entered as beneficial owner than was determined, and is convinced that the entry is incorrect or incomplete, then the obliged entity may electronically report this case to the BO Registry Authority by setting

a remark – a "red flag" – for the respective legal entity. The same applies to all competent authorities.

By setting a remark the legal entity will automatically be notified about the remark (without identifying the obliged entity that set the remark) and informed that the reported beneficial owners could not be verified and that the legal entity therefore has to examine its report. The remark is only removed if the legal entity then files a new report. However, the remark will still be visible in the historical data.

Consequently, a remark will be visible in all excerpts from the BO Register. In addition the BO Registry Authority is monitoring the list of all remarks set in the register and may request documentation on beneficial ownership if a remark is not resolved by a correct report.

Belgium

In Belgium, a centralised beneficial ownership register (UBO Register) has been implemented for both legal entities and arrangements (LE/LA). It is developed, managed and controlled by the Treasury administration of the Federal Public Service Finance and is separate from the Commerce registry managed by the Federal Public Service Economy.

The UBO register is an online and fully digitalised platform through which all LE/LA can submit and update their UBO information and that can directly be accessed by competent authorities, obliged entities and members of the general public. An additional condition of demonstrating a legitimate interest is applicable to access the UBO information of certain LA.

For data-privacy protection reasons, the access to the platform is only authorised to persons (both nationals and non-nationals) that have a Belgian electronic identity card. The access is also extended to eIDAS (i.e. Regulation (EU) N°910/2014 on electronic identification and trust services for electronic transactions in the internal market) compliant jurisdictions.

Considering the limited resources available and extent of the task, the Treasury cannot conduct systematic *ex ante* controls of the information registered by LE/LA. However, in order to ensure a high level of data quality, several control mechanisms have been embedded in the platform. They are intended to avoid mistakes during the registration process and facilitate the implementation of (targeted) controls of the data. These include:

- To avoid spelling mistakes or typos during the registration phase, a direct link has been made between the UBO register and both the commerce registry (for LE/LA) and the national identification registry (for natural persons);

- The connection with the commerce and national register enables the prefilling of all the information pertaining to the LE/LA and the natural person available in those registries. This prefilling must however be confirmed by the legal representative of the LE/LA, the purpose being to avoid extracting inaccurate, inadequate or outdated information. If the information is not correct, the LE/LA will have to modify it directly at the commerce or national registry. It has been observed that during the registration of their UBO, LE/LA realise that the information is not up to date in the Commerce registry and make the necessary changes in said registry; this mechanism thus also enhances the quality of the information available in the commerce registry;
- This mechanism also enables the Treasury to implement the "only-once" regulatory framework by allowing public authorities to request the communication of an information/document if it has already been provided to another public authority; the resulting process is therefore less costly and more efficient for LE/LA and public authorities;
- Several business rules have also been set to avoid the registration of certain situations (e.g. ownership of more than 100% of the shares/voting rights, registration of a deceased person or a Belgian national that is not registered in the national register of natural persons, start of control before the incorporation of the company).

China

Under the current AML laws and regulations of China, all regulated institutions are required to establish and formulate proper CDD processes. The CDD process is embedded into various operational workflows of the organisation in order to improve the process effectiveness. The verification of corporate customers can be conducted through the National Enterprise Credit Information Publicity System established by the State Administration of Industry and Commerce, to verify the licenses, certification documents and the operation status of licenses in accordance with the law. The regulated institutions will not establish relationships or engage in business before CDD is completed. FIs should obtain information and materials related to legal person while conducting CDD to identify BO, which is very helpful for verifying the materials required in the CDD process.

The regulated institutions would commonly make use of either the official public channels to enquire and verify customer information, as well as maintain on-going understanding of the customers' background. The official public channels including Administration of Industrial and Commercial Registration Information System, National Enterprise Credit Information Publicity System, Unified Social Credit Code Inquiry of National

Organization System, Commercial Entity Registration Information Platform, Commercial Entity Credit Information Publicity Platform, Tax Registration Inquiry System and so on. The "grey lists" and "black lists" on the National Enterprises Credit Information Publicity System (NECIPS) are not only the sanction lists, but also the red flags. Once FIs find legal persons listed in these lists, they will conduct enhanced CDD measures and require more materials in identifying BO, which will in turn ensure the accuracy of BO information in FIs.

Denmark

Cross-checking

Denmark operates with an official online company registry called the Central Business Register (CVR). The CVR contains and publishes free of charge information on legal entities registered according to both company law and tax law. To secure data quality, several automatic control mechanisms have been incorporated in the Business Register. They are intended to avoid mistakes during the registration process and facilitate the implementation of targeted control. The CVR automatically checks information that is filed (which must be done electronically), and will cross-check this information with various governmental registers, the CPR number - Civil registration number / CVR number - Unique identification number for legal entities and other details such as address (Danish Address Register - DAR) and dates. Furthermore, business rules are set up in the system to avoid impossible situations ex. registration of a deceased person, and as the Business Register entails information about legal entities, certain information about the entity is prefilled in order to ease the registration and to avoid mistakes. These automated checks are then followed by more detailed manual checks in suspicious cases. The system is also designed to use large datasets and with machine learning to better identify potential risks.

Sample testing/checking

To ensure that BO information in the CVR is accurate and current, the Danish Business Authority (DBA) starts to select and manually control 500 companies and their registration of BOs in 2019.

The control is divided into two approaches: In the registration phase, and after the information is registered. In the registration phase, the BO information is in specific suspicious cases checked and verified by the DBA before the incorporation of the company is completed. If the BO information is not adequate when checked, the company will not be incorporated. If the BO information is checked in the following phase, the DBA has the legal basis to dissolve the company compulsorily. The possibility to enforce the winding up relates to both missing and inadequate

BO information and can also be used if the corporate or other legal entity does not hold BO information or the information held is inadequate.

External parties engaged in verification of register information

In 2020, entities within the CDD framework will be obliged to report to the DBA any discrepant BO information available in the CVR and the BO information available to them. In case of reported discrepancies, the relevant authority must take actions to resolve the discrepancies. It is possible for the DBA to make a note in the CVR about the reported discrepancy.

France*

In France, the verification of information is two-fold: firstly, the clerk verifies that the company has submitted all the necessary information. Secondly, the clerk verifies the declared information by mainly cross-checking against information held by the Trade Register.

As of April 2019, (Art. 561 46-3), the information contained in this register can be disclosed to : the legal entity itself, one of the 18 competent authorities, one of the entities subject to AML/CFT obligations or any person justifying a legitimate interest and authorised by the judge responsible for the surveillance of the BO register.

**yet to undergo mutual evaluation as of September 2019*

Hong Kong, China

The Companies Registry (CR) has introduced a complaint form for reporting breaches of the Companies Ordinance (CO). Companies or members of public can use the form to report any breaches of the CO (including failure to keep a Significant Controllers Register) to the CR for investigation.

The introduction of the complaint form greatly facilitates the public members to report any breaches of the Companies Ordinance to the CR in a timely manner. Among the 2 310 complaints received by CR between 2017 and 2019 (up to July), 40% of them were reported via the complaint forms.

Ireland

Data interfaces have been established between the Companies Registration Office (CRO) and Revenue, as the two key data repositories of corporate information in Ireland. Such interfaces allow the authorities to conduct ongoing red-flag monitoring and some verification of the information held. For example, Ireland has assessed that higher ML/TF and tax evasion risks attach to entities which, although incorporated through CRO, fail to engage with Revenue. The interface between CRO and the Revenue combats risks associated with 'non-engaged' entities and enquiry letters are generated.

The Netherlands*

The automated information system TRACK of the Scrutiny, Integrity and Screening Agency (part of the Ministry of Justice and Security) continuously monitors the integrity of legal persons, including its directors and affiliated persons or legal persons. The system was introduced in January 2011.

The Scrutiny, Integrity and Screening Agency performs risks analysis by automatically scanning several closed and public sources on a daily basis, to look for any relevant financial or criminal records of directors, and the (legal) persons in their immediate surroundings. Data includes the Company Registry, Citizens Registry of the municipalities and the Central Insolvency Registry, as well as other public sources. In addition, data is obtained from the tax authorities, the Judicial Information Service, and the National Police Services Agency. If the computer system reveals a heightened risk, either immediately upon registration or later on, during the life span of the legal person, this dedicated Agency will carry out a more in-depth analysis. If the analysis confirms that there is indeed a heightened risk, a risk alert will be sent to a group of recipients, including law enforcement and supervisory authorities such as the Public Prosecution Service, the Police, the Tax Intelligence and Investigation Service, the Dutch Central Bank, the Netherlands Authority for the Financial Markets and the Tax and Customs Administration. In 2018, 264 of such risk alerts were made, and another 50 in the first quarter of 2019. A risk analysis can also be performed upon request from these authorities. In 2018, 17 risk alerts were made following a request.

The Scrutiny, Integrity and Screening Agency also provides 'network maps' for inter alia law enforcement and supervisory agencies. A network map plots the relevant relationships between a (legal) person of interest, and other persons or legal persons, including bankrupted or disincorporated legal persons. In 2018, the agency provided 947 network maps, and 217 in the first quarter of 2019.

**yet to undergo mutual evaluation as of September 2019*

The United Kingdom

Civil society using PSC information

In November 2016, Global Witness worked in collaboration with DataKind UK, OpenCorporates, Spend Network and OCCRP to bring together a team of 30 volunteer data scientists to analyse the information provided in the first batch of data from the person with significant control (PSC) register. The team worked on the first three months' worth of data available (around 1.3 million companies out of 3.5 million). In a weekend, the team were able to provide a number of insights which illustrate the value and potential use of public PSC information:

- The team were able to build a map of complex corporate structures. As an example, they partially mapped the ownership structures of Reckitt Benckiser, the healthcare company. The PSC data enabled them to develop an understanding of complex ownership structures and while they did not identify any wrongdoing, it shows how the information can be used to increase transparency.
- The team were able to identify 9 800 companies that listed their beneficial owner as a foreign company. This is allowed if the foreign company was listed on one of the stock exchanges deemed equivalent to the UK system (e.g. the US, EU and Japanese exchanges).

Global Witness informed Companies House that there were over 4 000 companies who appeared to have filed details of a relevant legal entity (RLE) who may not be registrable; as they were based in jurisdictions such as Costa Rica, Panama and the Isle of Man. Companies House have taken action by writing to these companies. Upon receipt of the information, approximately 70% of the companies had already corrected their PSC information on the Companies House register. While Companies House would have identified many of these errors, by having publicly accessible information, it has accelerated the identification of these issues.

Sweden

Flagging suspected incorrect information in the beneficial ownership register

The Swedish system for information on beneficial ownership is based on a combination of the Company Approach and the Registry Approach. A report to the registry is made by a representative of the legal person and signed electronically.

The register of beneficial ownership is publicly accessible. In case the quality of an entry in the register is insufficient, relevant FIs, DNFBPs or state authorities are obliged to report this to the registry authority. The registry authority will then evaluate if the registered information is incorrect based on the report. If so, an official notice will be given to the

legal person either to submit a correction or to submit additional information that supports the registered information as correct. If that is not done, another official notice will be sent with an administrative fee. This has proven to be an effective measure during the relatively short period of time the Swedish register has been in effect. Most legal persons who receive the first official notice file a correction within the required timeframe.

Apart from keeping the registered information in the register correct through official notices, the registry authority may flag up registered information connected a the legal person with a warning triangle and an explicatory text that the registry authority has reason to presume that the information is incorrect. This flag is shown to anyone looking at the legal person in the registry and remains until a report with correct information has been registered. The flag functions as a warning for FIs, DNFBPs or any other party dealing with the legal person. This is an indication in a CDD situation that caution is needed and that clarifications should be requested before initiating or continuing a business relationship.

Enhanced measures for companies with foreign ownership/directorship (relevant to core issue 5.3 and 5.4)

91. It is understood that foreign ownership/directorship is a main concern on tracing beneficial ownership of legal persons.

92. In some countries, foreign individuals/legal persons who wish to carry out business or acquire ownership of local companies must obtain another licence from a designated competent authority. As part of the application process, the individual/legal person is required to provide a comprehensive set of information, including on the financial standing of the foreign individual/legal person, the ownership and control structure of the foreign legal person, and copies of founding documents and agreements regulating the powers to bind the legal person. Certified documents by obliged party have to be provided. The obliged party is required to undertake enhanced CDD and undertake a comprehensive screening and verification of each applicant's financial background, ownership and control structure, previous commercial activity, etc.

In some countries, where a shareholder/director is not a local citizen, the registry authority requires the applicant to provide a certified copy of the passport for individuals and a certified certificate of incorporation for legal persons. Some countries rely on the certification by an obliged party, or by an official local representative in the foreign country where the passport or certificate was issued to conduct verification to this group of foreign shareholders/ directors.

Austria

As part of the risk based approach of the BO Registry Authority, legal entities, which report beneficial owners with foreign citizenship or place of residence, or ultimate legal entities with a registered address in a foreign

country will receive a certain number of risk points based on the ISO Code of the foreign country. Thus those legal entities will be more likely be in the risk category high or very high, resulting in a greater chance that the BO Registry Authority will request documentation on beneficial ownership and will carry out an off-site analyses of beneficial ownership.

Belgium

The electronic identification system ("eID") in Belgium implemented since 2002 greatly facilitates the identification process of foreign citizens that had a prior contact with an administrative authority in Belgium.

If a foreign citizen has been in contact with an authority in Belgium for any reason, e.g. for VAT or other fiscal purpose, traffic offence, employment, they will be assigned a unique eID number that will be registered in the national register for natural persons. This eID will be used to identify them in the UBO register and verified by an authority.

In the medium term, the EU eIDAS (electronic IDentification, Authentication and trust Services) Regulation aims to ensure that people and businesses can use their own national eID schemes to access public services in other EU countries where eID is available. For non-EU citizens that do not have any (compatible) EU eID, several solutions are being investigated besides the request for substantiating documents upon registration (e.g. simplified remote authentication method).

Denmark

Under the beneficial ownership legislation, corporate and other legal entities are obliged to register BO information in the Central Business Register. This applies whether it is a foreign or national beneficial owner. If a beneficial owner is a foreign citizen, further registration information is necessary e.g. copy of passport, national identification number etc.

Hong Kong, China

Under Part 16 of the Companies Ordinance (CO), a non-Hong Kong company that has established a place of business in HKC is required to register under the CO. Corporate documents of the non-Hong Kong company such as constitution, certificate of incorporation and latest accounts have to be delivered together with the application of registration. Such corporate documents have to be certified in accordance with s.775 of the CO. For example, they should be certified by a notary public, lawyer, professional accountant, professional company secretary, etc.

Jersey

Foreign owned are subject to enhanced requirements reflecting their higher risk

All Jersey companies that are foreign owned are subject to enhanced requirements reflecting their higher risk.

The beneficial owners and controllers of companies, which will be owned by local residents, are subject to identity checks by the Companies Registry on incorporation and when new beneficial owners and controllers become connected with the company.

In addition to those checks, all companies incorporated at the behest of a foreign owner must engage the administration services of a locally regulated TCSP which is subject to AML/CFT regulation. The TCSP will hold the certified copy and conduct risk-based due diligence.

The Taxation (Companies – Economic Substance) (Jersey) Law 2019 strengthens the requirement for Jersey companies to demonstrate real economic substance in the Island and the overall level of responsibility that Jersey-resident directors shall take in relation to foreign-owned companies that they direct and administer.

The Netherlands*

There is a general obligation for all foreign incorporated companies with an office in the Netherlands, or who provide employment in the Netherlands, to register basic company information in the company register of the Dutch Chamber of Commerce.

FIs and DNFBPs are obliged to perform enhanced CDD if the country of residence of the customer is declared a high-risk country by the European Commission.

**yet to undergo mutual evaluation as of September 2019*

Switzerland

Enhanced measures for the identification of beneficial owners of non-operational legal entities (domiciliary companies)

The risk of the abuse of legal persons is taken into account in preventive due diligence measures applicable by the financial intermediaries. The complexity of the structures involved in the business relationship, particularly the use of domiciliary companies, whether Swiss or foreign, is one of the criteria of higher risk according to Art. 13(2)(h)of the FINMA

Anti-Money Laundering Ordinance (OBA-FINMA). Art. 2a OBA-FINMA defines domiciliary companies as entities such as legal entities, trusts or foundations, that do not have any operational activity. They do not carry out any commercial or manufacturing activity or any other activity as a commercial enterprise. Financial intermediaries adopt a very prudent approach with such types of entities and do not enter into business relations when a natural person cannot be identified as the actual beneficial owner of the company. A written declaration will be required from the domiciliary concerning its beneficial owners. (Art. 4 para. 2 of the Federal Act on Combating Money Laundering Act and Terrorist Financing). The threshold of 25% of the capital or voting rights in the legal entity does not apply to such type of entities. This means that all beneficial owners must be identified, regardless of the amount of their participation in the company.

Highly effective law enforcement authorities with adequate resources (relevant to core issue 5.4)

93. In some countries, the AML supervisors/law enforcement authorities (LEAs) prioritise ML/TF and financial investigations, and routinely and proactively pursues ML/TF investigations. Investigative tools and information-sharing gateways are robust, and resources are applied flexibly both within and across enforcement agencies to respond to investigative needs.

94. Where prosecution is not possible, LEAs actively use a wide array of other alternative measures to disrupt offenders, including pursuing the predicate offence, seeking civil recovery, taking action for tax offences, or obtaining serious crime prevention orders to restrict behaviour. The efforts are supported by adequate human and capital resources.

The Netherlands*

Dutch law enforcement agencies work closely and share information with each other, as well as with other agencies such as the Tax and Customs Administration. The national police and the Tax Intelligence and Investigation Service (in Dutch: Fiscale Inlichtingen en Opsporingsdienst or FIOD), which both work under the authority of the Public Prosecution Service investigate suspected ML/TF criminal activity and carry out extensive law enforcement measures. These authorities also work together in the Dutch Financial Expertise Centre (FEC), which is a partnership among authorities that carry out supervisory, prosecution or investigation activities in the financial sector. Partners of the FEC are: Dutch Central Bank DNB, AFM Netherlands Authority for the Financial Markets, FIU-Netherlands, Tax and Customs Administration, Tax Intelligence and Investigation Service (FIOD), National Police and the Public Prosecution Service. The Ministry of Finance and the Ministry of Justice and Security act as observers. The FEC also plays an important role in providing and

disseminating information. The various criminal law enforcement agencies, FIU-Netherlands and the Public Prosecution Service also work together in the Anti Money Laundering Centre.

**yet to undergo mutual evaluation as of September 2019*

The United Kingdom

The UK competent authorities manage to use Companies House records to identify those individuals acting as company officers, and undertake further enquiries to test the credibility of their appointments and of the company, through the examination of company records, tax returns, and both corporate and individual financial activity. Sometimes, these enquiries showed that the company officers were simply acting as the agent of the defendant, and knew nothing about the operation of each company. These companies were used as a device to hide the beneficial ownership of the assets.

Using technology to facilitate checking and validation (relevant to core issue 5.3 and 5.4)

95. In some countries, basic checks are conducted by the IT system in the company registry upon registration. They include an automated calculation of shares and of the capital as well as an automated validation of information such as the tax identification number entered, digital signature–and therefore the identify–of the applicant, and of the payment of the mandatory fees and taxes.

96. Some systems will perform automated checks when there is new information entered into the system (for example to ensure that shares are only transferred by persons who are already in the system). Any anomaly highlighted by these automated checks is analysed by the register staff before the publication is authorised.

97. In some countries, data mining technology is used to cross-check the information available and report suspicious activities to the various authorities. False information can be easily detected and the system can help highlight any inconsistency. Some countries even appoint a dedicated data miner to monitor cross-checking systems among different databases in order to ensure compliance of requirements on beneficial ownership.

98. For countries that adopted a national standardised electronic identification system, such electronic ID (for all directors and authorised signatories) is one of the required information to register companies in the company registry. Competent authorities can also make use of trustworthy electronic identification system to gather information.

Austria

The BO Register integrates existing information from other registers, such as the Central Register of Residents related to information on the beneficial owner or the other national registers containing information about legal entities concerning the reporting of ultimate beneficial ownership of legal entities.

Through an automated alignment with other registers, it is ensured that beneficial owners and legal entities can only be reported if their data is also contained in other public registers. If, for example, a person with a main residence address in Austria is entered as a beneficial owner, there is a real time check with the Central Residence Register in the background if the entered person has a valid main residence in Austria.

Another key factor is the reporting form for reporting beneficial ownership itself. The reporting form provides a digital guidance throughout the reporting process and makes reporting for both legal entities and their legal professionals as easy as possible. The reporting form itself is dynamic and tailor made to the specific legal form for which the report is made. Incorrect reports can be prevented largely by built-in conditions and error indications.

Denmark

Information on any natural person registered in the Central Business Register (CVR) is updated automatically for all Danish persons from the Danish CPR-register. The DBA's IT-system (CVR) also automatically checks the business address in the Danish Address Register (DAR) to make sure that the address exists. When a new business is registered or changes are made to a governing body, the DBA's IT-system (CVR) will automatically notify the affected person(s) to make sure that the changes are correct.

The digital self-registration systems have been designed with several built-in minimum requirements that must be met for completion of the registration. These include that certain types of document must be enclosed with the individual type of registration case, as well as requirements for the information that must be disclosed to the DBA. The IT-system (CVR) is under an ongoing development and most recent developments is using machine learning to check enclosed documents signatures and read if certain documents entail demanded text and conclusions. The DBA can perform checks to verify the registrations. In these cases, DBA can ask for documentation for the registrations. If the company cannot provide this, or the incorrect registrations are not rectified, DBA can enforce a forced winding up.

With the modernisation of IT systems for company registrations, the DBA has enhanced its enforcement activities to prevent misuse and to check

registrations, including 1) activities that take place automatically in connection with a registration in the DBA's systems, and 2) the manual follow-up activities that the DBA conducts up to three years after the registration.

Italy

The MOLECOLA platform* used by the Guardia di Finanza (GdF, the financial police), facilitates the identification of the real beneficial owner of legal persons incorporated in Italy by processing the information maintained in various sources (Business Register, law enforcement databases, tax administration database, land register, lists of designated persons under the United Nationals Security Council Resolutions (UNSCRs), and other open sources). As established in the cases provided, this has enabled the GdF to successfully identify the ultimate beneficial owner in a number of instances, including in cases involving complex, transnational corporate structures. The MOLECOLA platform has proven useful notably by considerably reducing the length of time needed to conduct cross-checks.

**MOLECOLA: This tool is used in financial investigations with software integrated within GdF and National Anti-mafia Directorate (Direzione Nazionale Antimafia). MOLECOLA imports electronically bulk information from different databases (e.g., the various law enforcement databases, tax administration database, land register, company register and information from other open sources). The information is analysed according to the operational activities investigated, allowing to elaborate standardised reports suitable for investigations and also operational analysis reports detecting links between people and financial operations, and the disproportion between incomes and expenses of the persons that are under investigation.*

The Netherlands*

The company register of the Dutch Chamber of Commerce performs automatic checks of specific information upon registration. For example, information on the identity of natural persons is checked against the citizens register (in Dutch: BRP or Basis register personen) automatically, amongst which the name, date of birth and the Dutch Citizen Service Number (Burgerservicenummer or BSN).

**yet to undergo mutual evaluation as of September 2019*

Access by competent authorities *(relevant to core issue 5.4)*

99. Competent authorities (including LEAs) may have direct access to the beneficial ownership information held by company registry, database held by other competent authorities and information held in FIs and DNFBPs (e.g. notaries' database). According to the 2018 FATF-Egmont report, FIUs should have access to the widest possible range of financial information. Consideration of possible measures to increase the breadth and depth of information available to FIUs is merited.

100. In some countries, competent authorities have direct access to the beneficial ownership information through the company registries and the centralised database kept by notary profession, which ensures the timeliness of the access to information on beneficial ownership. The private sector discloses information to the competent authorities in due time and within the time limits set by the requesting authority. Whenever necessary, the information is collected directly from and/or verified directly with the companies. Competent authorities (especially LEAs) can also compel the provision of beneficial ownership information through available investigative measures such as production or disclosure orders. Production orders can be obtained relatively quickly through an electronic filing and granting system. Moreover, access has been authorised by the data protection agency so that there is no impediment to competent authorities in obtaining information on beneficial ownership.

Belgium

In Belgium, the Ultimate Beneficial Owner register (UBO register) is accessible by competent authorities. The Security officer or Data Privacy Officer of each competent authority will be granted the right to manage the access to the platform for the employees of said competent authorities. This Security or Data Protection Officer is tasked to authorise any agent of the competent authority to consult the UBO register in accordance with the law. Such a system enables the Treasury to:

- Enable competent authorities to have access to the past and present UBO information instantly;
- Offer flexibility to competent authorities in the internal organisation of the accesses. They will be able to tailor the access to their needs and specificities. Subsequently, certain entities limit the access to the UBO register to certain categories of agents or employees (e.g. head of departments, specially designated investigators…);
- Assign clear responsibilities. The responsibility to consult the UBO register in accordance with the AML/CFT and UBO regulation lays on the competent authority and its agents;

This system also enables the Treasury to keep track of the logs of each user, for data privacy concerns and in order to enable an audit to be conducted on the use of the information.

Germany*

In Germany, access to the Transparency Register is possible through a central platform. The access is available depending on the type of the applicant. There are three possible types of applicants.

- Competent authorities are granted access for fulfilling their legal requirements. They have, as far as it is necessary in fulfilling their statutory tasks, full access to the database of the Transparency Register.
- Obliged entities are granted access to the register if they inspect the entries in the Transparency Register while acting in the exercise of their professional activities to fulfil due diligences. Obliged entities are for example credit institutions, financial companies, auditors, chartered accountants or tax advisors.
- Any natural or legal person, domestic or foreign, that can demonstrate a legitimate interest can access the information available. The decision is made on a case-by-case basis.

**yet to undergo mutual evaluation as of September 2019*

France*

According to article L. 561-46 of the CMF, 18 of competent authorities shall have access to the beneficial ownership register among which :

- Judicial authorities;
- The national Financial Intelligence Unit (FIU);
- The custom administration officials;
- The public finances officials in charge of control and recovery in fiscal matters.

The French FIU has a direct access to the electronic beneficial ownership register. When orientating the information or when further investigating, FIU officials are able to check instantly all the information transmitted by the company to the "greffier de commerce" (commercial court's clerk) when registering as mentioned above.

The aforementioned provisions differ from those of Section 3 of the Monetary and Financial Code on customer due diligences which provide that obliged entities shall identify the beneficial owner before entering in a business relationship or before performing a transaction. After applying those due diligences on beneficial ownership, if they suspect or know that the operation which is about to be performed is linked with ML or FT, they must transmit the information to the FIU.

Therefore, the French FIU has two different sources of information on beneficial ownership at its disposal and is able to cross-check it.

**yet to undergo mutual evaluation as of September 2019*

Hong Kong, China

On demand by a law enforcement officer for the purpose of performance of functions relating to the prevention, detection or investigation of money laundering or terrorist financing, a company must at any reasonable time make its Significant Controllers Register (SCR) available for inspection by the officer at the place at which the SCR is kept and permit the officer to make copies (s.653X of the Companies Ordinance (CO)). If the company fails to comply with the requirements of s.653X, the law enforcement officer can apply to the Court for a court order to direct the company to permit the inspection or making copies of the SCR (ss.653Y and 653Z of the CO).

Jersey

Jersey's FIU, the Joint Financial Crimes Unit of the States of Jersey Police (JFCU), has direct access to the register of beneficial ownership and control through a dedicated portal in the JFCU's headquarters. Searches can be made for entities based on entity registration number, name and/or country of incorporation. Searches can also be made for natural persons based on first name, surname, alias, date of birth and/or nationality.

The JFCU also acts as the designated contact point for exchanging beneficial owner and controller information with foreign law enforcement agencies. Since 1 July 2017, an agreement between Jersey and the United Kingdom has been in place to enhance the speed of information exchange between the jurisdictions (the 'Exchange of Notes'). The Exchange of Notes agreement provides for the exchange of adequate, accurate and current beneficial ownership information between Jersey and the UK within 24 hours on a normal request, or within 1 hour, where the request is urgent (due to TF concerns, for example).

Switzerland

In Switzerland, legal entities (public companies, private limited liability companies and cooperative companies) must be represented by individuals (directors or managers) domiciled in Switzerland. The presence of a representative of the company in Switzerland facilitates the cooperation with the competent authorities and timely access by authorities to beneficial ownership information, especially in case the information spans several jurisdictions.

The United Kingdom

UK authorities are able to access basic and BO information on legal persons and arrangements via one of three sources: from financial institutions and DNFBPs, from registers, or from the legal entity itself. The variety of sources increases transparency and access to information, and helps mitigate accuracy problems with particular sources.

There are several channels available for LEAs to obtain information on legal entities from FIs and DNFBPs. At the intelligence-gathering stage, LEAs can request information through Joint Money Laundering Intelligence Task Force (JMLIT) provided the request is justified, proportionate and necessary.

LEAs can also compel the provision of BO information through available investigative measures such as production or disclosure orders. These orders require judicial authorisation, which can be obtained in a matter of hours for urgent cases. Production orders can be obtained relatively quickly through an electronic filing and granting system. Once issued, the orders typically receive a response within seven days, although immediate disclosure can also be sought. Both production and disclosure orders require suspicion of an indictable offence so are used at the investigative stage once sufficient evidence has been collected to meet this threshold. The Serious Fraud Office (SFO) has access to additional investigative powers to compel the provision of information believed to be relevant to an investigation or inquiry within a timeframe set by the SFO (typically no longer than 14 days).

Forbidding or immobilising bearer shares and nominee arrangements (*relevant to core issue 5.3)*

101. The Interpretive Note to R.24 requires countries to take measures to prevent the misuse of bearer shares and bearer share warrants, as well as the misuse of nominee shares and nominee directors. Measures include prohibiting, dematerialising, immobilising and disclosing them. According to the 2018 FATF-Egmont report, given the vulnerabilities associated with use of nominees, individual countries and the FATF, working with the broader global community may wish to consider measures to limit their misuse.

102. In some countries, shares may be issued in bearer form in limited circumstances, and must be dematerialised. They must be deposited with a central depository and the exercise of the rights that they confer may only be performed through a reporting entity. The central deposit opens an account for each intermediary to record the movements of the financial instruments deposited into that account. In some countries, the holder of bearer shares is obliged to declare purchase or transfer of shares within a specified timeframe, and done through an obliged entity.

103. In some countries, shareholders may be represented by third parties, but the latter may only intervene on their behalf on the basis of a duly signed power of

attorney, which ensures the transparency of the operation. Companies must maintain a copy of the power of lawyer when the non-shareholder third party exercises the rights carried by the shares in the company's general assembly. The same applies to notaries (and, where relevant, accountants), in the case of a transfer of the shares performed by the third party on behalf of the shareholder, and the normal CDD requirements apply.

104. In most of the cases, although bearer shares and bearer shares warrants are not explicitly prohibited, there is no real incentive because of the lack of legal protection offered. The same applies to the nominee arrangement.

Demark

Corporate and legal entities are required to identify those individuals exercising their rights through a nominee scheme and hold information about this. A person may not exercise the rights conferred to an owner of capital unless he/she is registered in the registry of owners or has notified and documented the acquisition.

In 2015, Denmark abolished the possibility to issue bearer shares and established an obligation for holders of bearer shares below 5% to register those shares with the Danish Business Authority.

France*

Since April 2016, bearer shares are necessarily nominatives: from subscription, the bearer designates a beneficiary by its name (this latter being himself most of the time) without any possibility of further modification. This beneficiary can ask for the reimbursement of the share if he is in its possession.

**yet to undergo mutual evaluation as of September 2019*

Hong Kong, China

Since March 2014, Hong Kong, China (HKC) has prohibited the issue of bearer share warrants.

Section 6, Division 2, Schedule 5A of the Companies Ordinance (CO) states that a share held by a nominee for another person is regarded as being held by "that other person". If the nominee holds more than 25% of the issued shares of the company, "that other person" should be identified by the company and be entered into the Significant Controllers Register. Moreover, anyone who by way of business acts or arranges for another person to act as a shareholder or a director of a company for another person would be considered to be providing trust or company service under Anti-Money Laundering and Counter-Terrorist Financing Ordinance (AMLO) and is required to obtain a license from the CR to do so. Since March 2018,

licensees are subject to statutory customer due diligence and record-keeping requirements under AMLO.

HKC applies director duties to "shadow directors". Under the interpretation of the Companies Ordinance (Cap. 622 of the Laws of Hong Kong), "director" includes any person occupying the position of director (by whatever name called). Under section 3 of the CO, the "responsible person" in the context of a contravention of the Ordinance, or of a requirement, direction, condition or order, includes an officer or shadow director who authorises or permits, or participates in, the contravention or failure.

The Netherlands*

The Netherlands prohibits companies from issuing bearer shares, and requires holders of bearer shares to change them to regular registered shares at the issuing company, or to deposit and register their shares at a central institution (Euroclear) or an intermediary such as a bank or investment firm. Companies are obliged to alter their articles of association, insofar necessary, to allow bearer shares to be changed to registered shares. Any bearer shares not deposited or registered before 1 January 2020 are deemed to be registered shares.

After this date, holders of (former) bearer shares that have not presented them to the company, nor deposited them at the central institution or an intermediary, cannot exercise their rights under those shares, such as voting rights and rights to dividend. All (former) bearer shares have to be presented at the issuing company or deposited at the central institution or intermediary before 31 December 2020. After the deadline, the issuing company will become the owner of these unregistered (former) bearer shares. Holders of (former) bearer shares then have a final chance to receive their registered shares by presenting their former bearer shares to the issuing company before 1 January 2026.

**yet to undergo mutual evaluation as of September 2019*

Switzerland

In Switzerland, there are mechanisms for identifying the holders of bearer shares, along with obligations on purchasers of such shares to declare their identity to the company either themselves or through a financial intermediary, and on the company to keep a list of the holders of these shares. Furthermore, the conversion of these shares into registered shares is facilitated: according to Art. 704a of the Code of Obligations, the shareholders' meeting may decide by a majority of the votes, to convert bearer shares in-to registered shares. The decision to convert must be taken by a simple majority, since it is prohibited to set a higher quorum in the Articles of Association.

Effective, proportionate and dissuasive sanctions *(relevant to core issue 5.6)*

105. Effective, proportionate and dissuasive sanctions may range from administrative sanctions and prosecution action against corporate entities that fail to comply with information filings. These include rejection of registration or business relationships, de-registration and abortion of business relationships, fines and penalties or criminal sanctions, measures taken by the courts to dissolve legal entities involved in ML schemes, or seize their assets.

106. In some countries, company registry, notaries and others obliged parties do not proceed with the requested activity in the absence of all the requested information. Entities that fail to provide information on beneficial ownership is not possible to register as a company or establish a business relationship with FIs or DNFBPs. Companies that fail to complete the required annual filings of information are ultimately liable to be struck off the company register. A change in legal status will not take effect if it is not recorded with and verified by the company registry/obliged entity. This significantly limits the ability of companies to obtain credit, change the company name or purpose, and register mergers. In some cases, the company registry can also deny the controlling shareholder and any director who has not paid a fine from registering new companies.

107. In some countries, disclosure of false information to notaries constitutes a criminal offence. In some cases, the courts are even empowered to dissolve legal entities involved in ML schemes, and or seize their assets. This forms a strong deterrent to the misuse of legal persons.

Austria

Under the Beneficial Owners Register Act (BORA), it will be penalised to violate the reporting obligation either by an incorrect or incomplete report or by a failure to submit a report with up to € 200 000 for intentional acts or up to € 100 000 for gross negligence (Art. 15 para. 1 BORA). This includes in particular the following cases: Inaccurate report of beneficial owners, unclear information leading to inability to identify beneficial owner, annual reporting obligation has not been fulfilled, report was not made within the statutory time periods; cases in which the legal entities are exempt from the reporting obligation, but have not reported another natural person as the beneficial owner through control (the additional beneficial owners are beneficial owners through a Treuhand or other control relationships) have not been reported to the BO Register; cases of not reporting changes of beneficial owners within four weeks of obtaining knowledge of the changes.

In case of a persistent failure to report, coercive penalties will be imposed twice according to Art. 16 BORA.

In addition, it will be sanctioned with up to € 75 000 for intentional acts or up to € 25 000 for gross negligence, if the legal entity has breached its obligation to retain copies of the documents and information required for their due diligence obligations based on the BORA.

Cases, where the correct information about beneficial owners has been reported, but in the course of the voluntary submission of a Compliance-Package false or falsified documents are transmitted to the BO Register, will be punished with up to € 75 000.

Cases, in which beneficial owners have been disclosed but individual details of beneficial owners are incorrect or missing or in which no copies of an official photo ID are submitted with the report, will be punished with up to € 25 000.

Cases, where the legal entity seemed to intend to provide a correct report but in which individual documents with the submission of the voluntary submission of a Compliance-Package were not transmitted or cases, where other obligations in relation to the submission of a Compliance-Package, that are not already covered by an individual sanction, will be punished with up to € 10 000.

Compliance with the obligation to report is ensured on an ongoing basis through the implementation of automated coercive penalties. If a report is not filed within the deadline – either within the initial reporting period or within 28 days of newly established legal entities – then the competent tax office will automatically send a reminder letter with the threat of a coercive penalty of € 1 000 to the legal entity. If the legal entity fails to report within the deadline given in the reminder, the penalty will be set and a higher penalty of € 4 à00 is threatened. If the legal entity still fails to report within the given deadline, the coercive penalty of € 4 000 will be set and the case will be forwarded to the responsible fiscal penal authority.

With this automated system, the BO Registry Authority was able to achieve an overall reporting rate of more than 93% as of July 2019.

Belgium

In Belgium, penalty (€ 4K-40K) and administrative fines (€ 250-50K) are available in case of non-compliance by legal entities and arrangements (LE/LA) with their obligation to hold information on their ultimate beneficial ownership (UBO) and register it.

The Treasury has identified additional mechanisms that could be implemented in the medium/long term. These include:

- Procedures for “automatic” administrative fines;
- Consider declarations as non-valid if no substantiating documents are provided;
- Loss/suspension of the rights associated with shares or suspension of the payment of dividends;
- Duty for UBOs to notify their status to LE/LA;
- Duty to notify when an intermediate LE/LA or a legal person refuses to provide UBO information
- Publication of a black list of non-compliant LE/LA;
- System of flags based on, among others, notifications received.

Denmark

The Danish Business Authority (DBA) can demand the documentation that prove the validity of the information registered within 3 years after a registration has taken place. If the documentation or the circumstances under which the registration has taken place is not sufficient, the DBA can file a report to the police or impose a daily/weekly fine to the company until the registration is complete.

Registering BO information is a pre-requisite to get a CVR-number for most types of legal persons. It is also possible to enforce a winding up of the existing entities if there is no or inadequate beneficial ownership information registered / inadequate recordkeeping. If a company does not register the BO information or provide it to the authorities, the company and their management have committed a criminal offence. If the company has an auditor (which most have), the auditor is legally obliged (according to the Danish audit regulation) to check if the management has fulfilled its obligations in the company law. If not, the auditor must make a note in the annual report about the offence of the company law. This way non-compliance of BO-registration will be visible in the annual report to the company stakeholders.

Compulsory dissolution is also possible if a corporate or other legal entity has not registered BO information or the registered information or recordkeeping is inadequate. It is possible to strike off Partnerships (I/S) and Limited Partnerships (K/S) (that are required to register accordingly to the Certain Commercial Undertakings Act) from the CVR register due to inadequate beneficial ownership information or recordkeeping or if no beneficial owners are registered.

By November 2018, the DBA had compulsorily dissolved around 7500 companies that had failed to register their BO information in due course. As of January 2019, approximately 96 % of all entities covered by the BO legislation had registered BO information. And 99.80 % of the entities covered by the company laws under the DBAs area of responsibility had registered BO information.

France*

France introduced dissuasive sanctions in the event of failure to declare a beneficial ownership document containing inaccurate or incomplete information (article L. 561-49 of the Code monétaire et financier (CMF)). In order to reinforce the effectiveness of the system, injunctions and penalties can also be imposed:

- - Art. L. 561-48 of the CMF allows the president of the court, spontaneously or at the request of the public prosecutor or any interested person, to order a company to proceed to the deposit of documents on beneficial owner, if necessary under penalty payments. The president may also appoint someone else to perform these formalities;
- -Art. L. 561-49 of the CMF punishes with imprisonment of 6 months and a fine of 7,500 euros the fact of not filing the document relating to the beneficial or filing a document containing inaccurate or incomplete information. Additional penalties prohibiting management and partial deprivation of civil and civic rights may also be imposed. The maximum amount of the financial penalty is multiplied by five in the case where the author of the breach is a legal person.

**yet to undergo mutual evaluation as of September 2019*

Hong Kong, China

Hong Kong, China (HKC) has various provisions in the Companies Ordinance (Cap. 622 of the Laws of Hong Kong) for sanctions against companies that fail to comply with information filings, below are some examples:

Section 662 of the Companies Ordinance provides that if a company fails to deliver to the Registrar of Companies for registration an annual return within the specified time, the company, and every responsible person of the company, commit an offence, and each is liable to a fine at level 5 (i.e. HK$ 50 000) and, in the case of a continuing offence, to a further fine of $ 1000 for each day during which the offence continues.

HKC will strike companies off the Companies Register if they fail to file annual returns for consecutive years, as this is a cause to believe that the companies are not in operation or carrying on business.

Section 653H of the Companies Ordinance provides that if a company fails to keep a register of its significant controllers, the company, and every responsible person of the company, commit an offence, and each is liable to a fine at level 4 (i.e. HK$ 25 000) and, in the case of a continuing offence, to a further fine of HK$ 700 for each day during which the offence continues.

Under section 895 of the Companies Ordinance, a person commits an offence if, in any return, report, financial statements, certificate or other document, required by or for the purposes of any provision of the Companies Ordinance, the person knowingly or recklessly makes a statement that is misleading, false or deceptive in any material particular. The person is liable on conviction to a fine and imprisonment.

Spain

Corporate criminal liability was introduced in Spain. With the ease of access to basic and beneficial ownership information, the strong preventive measures imposed on FIs and DNFBPs, (including notaries and company registrars, which are obliged entities under the AML/CFT law), and the measures taken by the courts to dissolve legal entities involved in ML schemes, and or seize their assets should, over time, act as strong deterrents to the misuse of Spanish legal persons.

Section VI – Getting information on beneficial ownership of overseas entities

108. For entities registered abroad, the information sources on beneficial ownership mainly used by competent authorities are the public companies/business register available in the country and information collected by FIs/DNFBPs of the country in question, information disclosed following requests made to foreign authorities, and information from foreign tax authorities. The exchange of information with a foreign counterpart is a critical component of measures pursuant to an international ML/TF investigation.

109. According to the 2018 FATF-Egmont report, increased sharing of relevant information and transaction records would benefit global efforts to improve the transparency of beneficial ownership. Further consideration of possible ways to enhance this information sharing is merited.

110. There is a good practice that basic information relating to legal persons is available online and in several languages, which can enable foreign authorities to continue their investigations without necessarily having to wait for a reply from the authorities. Nevertheless, it is also understood that countries have encountered difficulties in getting information on beneficial ownership that is not publicly available.

111. The effectiveness of getting beneficial ownership information of foreign legal persons is generally more reliant on foreign countries' active co-operation, with varying degrees of timeliness and success. Despite FATF general requirement on international co-operation and the specific requirements to provide co-operation on identifying the beneficial ownership of corporate vehicles under R.24, some countries do not effectively facilitate requests from their foreign counterparts by providing information held by domestic authorities and companies.

112. Imposing restriction on activities of foreign legal persons may affect a country's direct foreign investment. Balancing the need of obtaining information on beneficial ownership of foreign legal persons and ensuring legitimate business operation of foreign legal persons, countries can consider adopting the following approaches with an aim to achieving the objectives of R.24 and IO.5 based on the risk level of legal persons registered aboard identified from the risk assessment.

a) No specific prior requirements - Not applying specific ex-ante requirements on legal persons registered abroad, but only seeking mutual legal assistance when there is a problem.

b) Rating jurisdictions' level of co-operation - Rating jurisdictions based on the availability and extent of their co-operation. Impose defensive measures such as restriction of certain business activities accordingly.

c) Requiring re-registration with a local beneficial ownership.

d) Requiring re-approval by domestic national authorities based on detailed investigation of the relevant legal entities.

Information on beneficial ownership of overseas entities

No specific prior requirements

Not applying specific *ex-ante* requirements on legal persons registered abroad, but only seeking mutual legal assistance when there is a problem.

Re-registration

Requiring re-registration with a local beneficial ownership.

Re-approval

Requiring re-approval by domestic national authorities based on detailed investigation of the relevant legal entities

Rating jurisdictions' level of co-operation

Rating jurisdictions based on the availability and extent of their co-operation. Impose defensive measures, such as restriction of certain business activities, accordingly.

Section VII - Conclusion

113. Many countries have made progressive efforts in putting in place a more robust legal framework in preventing legal persons from being misused since 2012. With the flexibility provided by the FATF in implementing R.24 and achieving IO.5, it is also seen that countries are exploring different measures to ensure the transparency of beneficial ownership. With the sharing of best practices among countries, it is expected that countries will continue to improve their system particularly in relation to the requirements to ensure that adequate, accurate and up-to-date basic and beneficial ownership information is available to the authorities in a timely manner.

114. Under a multi-pronged approach, it is vital that there is effective monitoring of key gatekeepers (including company formation agents, lawyers, and trust-and-company-service providers) for compliance with their CDD obligations, and enforcing those requirements – including identifying and shutting down those who facilitate misuse of corporate structures.

115. More importantly, it is also expected that countries will take action to facilitate the timely sharing of basic and beneficial ownership information at the domestic and international level to address barriers to information-sharing (e.g. reviewing data protection and privacy laws). The FATF will continue to intensively monitor the steps taken by countries to meet the FATF Standards on legal and beneficial ownership and ensuring they are properly enforced.

ANNEX 1: Detailed Arrangement of Mechanisms under R.24

1. Under R.24, countries should use one or more of mechanisms (the Registry Approach, the Company Approach and the Existing Information Approach) to ensure that information on the beneficial ownership of a company is obtained by that company and available at a specified location in their country; or can be otherwise determined in a timely manner by a competent authority[25].

2. Countries' experience shown in the FATF mutual evaluations points out that more than one approach may be needed in order to ensure a complete and effective system. Based on countries' experience and good practices, this Annex aims to set out the arrangements of the mechanisms (Registry Approach, Company Approach and Existing Information Approach) which vary in different aspects, including collection and verification of information on beneficial ownership, modalities of storage and access to information on beneficial ownership, and supervision and enforcement of the relevant obligations.

Registry Approach

Collection and verification of information on beneficial ownership

3. All companies created in a country are registered in the company registry. The registry records and maintains basic information of a company, including company name, proof of incorporation, legal form and status, address of the registered office, basic regulating powers and list of directors. Registries are also required to hold information on beneficial ownership or a separate register of beneficial owners might be set up. This register may include beneficial owner data as well as company information. Excerpts from the register may be used for CDD considering the risk-based approach.

4. The basic information held by registries are made publicly available and the availability of information on beneficial ownership varies with the practice of each countries. Information in the company register is generally recorded digitally and is preferably searchable. The search function supports searches by multiple fields.

5. In some countries, the registry is entrusted with oversight function, including verification of completeness or accuracy of filings, conducting CDD in certain cases, or cross-checking their information with data held by other authorities (e.g. with tax authorities). Some registries conduct sample testing or targeted audits to verify or/and monitor the accuracy of information on selected legal persons. Some countries rely on notarial systems or other gatekeepers to verify or/and monitor the information for company registration. Registry in some countries do not verify or/and monitor the information by itself, but rely on surveillance by civil society on reporting.

Modalities of storage and access to that information

6. Company registries generally keep the information on beneficial ownership in public domain and impose annual updating requirement for registered companies. When the company initiates a change, it should notify and submit supplementary

[25] Interpretative Note to R.24, para. 7 and 8, FATF (2013a).

information and relevant proof to the company registry, via obliged party if required, within a specified period.

7. Some company registries will verify or/and monitor information changes. In some countries, the company registry only accepts notary-certified information/ updates. Some registries accept self-declared information. Nevertheless, the reliability of self-declared information is in doubt.

8. Competent authorities generally have access to the company registry online, including full search capability on both basic information and information on beneficial ownership. Basic information of the company is publicly available. The trend of openly accessible information on beneficial ownership is on the rise among countries.

Supervision and enforcement of the relevant obligations

9. If a company fails to provide information or has provided false information on beneficial ownership, it is subject to proportionate and dissuasive administrative sanctions e.g. rejection of registration, de-registration. Owners and senior management that effectively control the company are also held personally liable and are subject to administrative and criminal sanctions.

10. The company registry authority regularly applies such sanctions by reviewing annual return, conducting sample testing, conducting investigations arising from report of suspicious activities, validating the information by cross-checking information by other authorities. Company registry may de-register/struck-off the company if the information is not accurate and up to date. It may also apply fines when the company fails to provide the requested information. In some cases, the company registry can refuse registration application from the same person/legal entity which breached the obligations before.

Company Approach

Collection and verification of information on beneficial ownership

11. Companies are required to maintain basic information, including company name, proof of incorporation, legal form and status, the address of the registered office, basic regulating powers (for example, memorandum and articles of association), and a register of their shareholders or members, containing the number of shares held by each shareholder and categories of shares (including the nature of the associated voting rights).

12. Companies also hold information on beneficial ownership, and to achieve this they are generally provided with the authority to request information from shareholders on the beneficial ownership of shares.

13. In general, the company needs to rely on shareholders to provide them with information. It is rare for company to involve an independent third party to verify or/and monitor the information. Some companies may not have the legal knowledge and experience to identify and verify their beneficial owners. This could be in particular true, when knowledge of foreign jurisdictions and legal persons is necessary to determine their beneficial owners. Even if it is rare for company to involve an independent third party to verify or/and monitor the information, an

effective company approach could therefore allow the involvement of independent third parties (e.g. tax advisors, lawyers).

Modalities of storage and access to that information

14. Companies, or a third person under the company's responsibility, are required to keep shareholder registers, such as shareholder lists which are made available to competent authorities.

15. Under this approach, companies are generally provided powers to require updated information from their shareholders (including the power to request information on beneficial ownership at any time). Shareholders are required to disclose the names of person(s) on whose behalf shares are held. When there are any changes in ownership or control, shareholders are required to notify the company within a specified time period.

16. The information on beneficial ownership is maintained within the country at a location notified to the company registry. Lists of shareholders and beneficial owners may be held, and provided, in electronic form.

17. Companies are required to provide lists of shareholders and beneficial owners to competent authorities upon request in a timely manner. Companies are generally not required to disclose its information on beneficial ownership to public. Where information on beneficial ownership cannot be identified, companies may be required to publish this fact on their website.

Supervision and enforcement of the relevant obligations

18. Companies can seek to apply restrictions against shareholders for failure to provide information on beneficial ownership through appropriate courts or authorities, such as in relation to shareholder voting rights, or the sale of shares.

19. Failure by a company to provide the information to authorities is subject to sanctions, which may include administrative penalties or restrictions on incorporation. Where lists of shareholders and beneficial owners are held with a third party provider on the company's behalf, the company remains liable for the obligations.

Existing Information Approach – FIs/TCSPs and other DNFBPs

Collection and verification of information on beneficial ownership

20. Under R.10 and 22, FIs and DNFBPs are required to identify and take reasonable measures to verify the identity of the beneficial owner such that the FI/DNFBP is satisfied that it knows who the beneficial owner is. FIs and/or DNFBPs should obtain sufficient information from their clients so that they can identify and verify the identity of clients, and understand the nature of its business, and its ownership and control structure, including name, legal form, proof of existence, company arrangement and persons exercising control from the company. If there is a discrepancy between the records of FIs and DNFBPs with those on the central registry, the FIs and DNFBPs have an obligation to report such discrepancy to a responsible entity to carry out further investigation and make clarifications.

21. FIs and DNFBPs also collect information on beneficial ownership when they carry out CDD and ongoing monitoring, maintenance of records, training and reporting.

22. FIs and DNFBPs generally need to rely on information provided by the client (for example, certificate of incorporation, certificate of good standing, partnership agreement, deed of trust, memorandum and articles of association of a company, proof on address of the registered office) and existing information available in the public domain to verify the information. In some case, FIs and DNFBPs may hire risk management service providers that collect data on corporate entities when carrying out CDD.

23. The effectiveness of verification also hinges on the availability of a reliable independent source and whether they are authorised to authenticate the identity of the natural persons directly.

Modalities of storage and access to that information

24. FIs and DNFBPs generally store information on beneficial ownership, e.g. clients' files, in their private domains. In some countries, TCSPs (e.g. notary) maintain a central computerised platform that is accessible on public domain. How the information on beneficial ownership is stored and updated are subject to the requirement of financial supervisors and SRBs. FIs and DNFBPs are required to conduct ongoing CDD on the business relationship, and scrutinise transactions throughout the course of that relationship to ensure that the information on beneficial ownership is kept up-to-date.

25. Actions may include undertaking reviews of existing records, request information from their clients, cross-check information from reliable sources or hire services from a commercial database, particularly for higher-risk categories of customers.

26. FI and DNFBPs are required to provide information on BO to competent authorities upon request in a timely manner. In some countries, notary profession who is the obliged party has maintained and made publicly available a register on beneficial ownership of legal persons. In some countries, professional organisations maintain an internal register which is accessible by the profession themselves. In general, the public is not granted access to information held by FIs, TCSPs and other DNFBPs.

Supervision and enforcement of the relevant obligations

27. FIs and DNFBPs should adequately implement CDD obligations, including measures to identify and verify the identity of the beneficial owner, as is required by R.10 and 22. FIs and DNFBPs should be adequately supervised by supervisors, competent authorities or SRB in accordance with R. 26 and 28.

28. FIs and DNFBPs are provided with sufficient guidance on how to properly conduct CDD in accordance with R.34. Such guidance will facilitate implementation of the CDD requirements, thereby improving the quality and sufficiency of information on beneficial ownership being collected by these entities.

29. To ensure compliance, supervisors, competent authorities and SRBs will perform monitoring (e.g. inspections) and impose a range of disciplinary and financial sanctions e.g. penalties, disciplinary proceedings, suspension or ban of professional practice on FIs and DNFBPs.

Existing Information Approach – Competent authorities

Collection and verification of information on beneficial ownership

30. Competent authorities (particularly LEA) generally rely on information held by registries, companies, FIs and DNFBPs, and other asset registries such as for land, property, vehicles, shares or other assets. Therefore, the collection of information on beneficial ownership hinges on whether the concerned entities (registries, companies, FIs and DNFBPs, and other asset registries) hold accurate and up-to-date information and whether competent authority can have timely access to the basic and information on beneficial ownership of legal persons.

31. Competent authorities should be aware of the availability of information, and are able to identify the FIs, DNFBPs or entities concerned for access to information, for example, through a national register of bank accounts or a central register of transactions of shares, or a register of TCSPs.

32. The effectiveness of obtaining information on beneficial ownership hinges on whether competent authorities have adequate powers, mechanisms and expertise to access to information on beneficial ownership in a timely manner.

33. Competent authorities generally verify the information by conducting further desk-based reviews and on-site inspections. An authority responsible for the Beneficial Owner Register or the beneficial owner data held in the business register might also contribute to an effective system. Competent authorities should generally verify the information i.e. by conducting risk based reviews and having the power to request information on beneficial ownership from companies, legal and beneficial owners.

34. Desk-based reviews involve analysis of existing information available on different domains, e.g. annual independent audit reports and other mandatory reports, identifying risky intermediaries (i.e. on the basis of the size of the firms, involvement in cross-border activities, or specific business sectors), automated scrutiny of registers to detect missing beneficial ownership information and identify the gatekeeper responsible for the filing.

35. On-site inspections involve reviewing internal policies, controls and procedures, gatekeeper's own risk assessments, spot-checking CDD documents and supporting evidence, sample testing of reporting obligations.

36. Taxation database is also a useful means of identifying indicators of criminality and schemes designed to obscure beneficial ownership and verifying information on beneficial ownership. Further investigation often uncovers dubious control structures or corporate dealings designed to conceal beneficial ownership.

Modalities of storage and access to that information

37. Competent authorities, including regulators, tax authorities, intelligence authorities store and update information in accordance with their functions and obligations – e.g. some tax authorities will keep an account of names of company owners and directors, some stock registries will hold information on meaningful shareholders or persons directly or indirectly controlling meaningful voting rights in public companies.

38. Competent authorities (such as supervisory authorities, tax authorities, or land titles offices) generally share information on beneficial ownership upon requests by other competent authorities. In some countries, certain electronic databases are made readily accessible among competent authorities. There should be sufficient mechanisms in place for information sharing between competent authorities so that competent authorities can gain access to information held by other authorities for verification and investigation in a timely manner.

Supervision and enforcement of the relevant obligations

39. Competent authorities are subject to national governance, for example, audit checking, monitoring and surveillance on their compliance.

Existing Information Approach – Companies listed on a stock exchange

Collection and verification of information on beneficial ownership

40. The information on beneficial ownership is usually collected when the company goes on initial public offering. The availability of information on beneficial ownership hinges on the disclosure requirement (either by stock exchange rules or through law or enforceable means).

41. The information of stock exchange is generally verified by the responsible FIs and/or DNFBPs that provided services to the company. The FI and/or DNFBP is held accountable for the verification of accuracy in performing their functions.

Modalities of storage and access to that information

42. The information on beneficial ownership may be stored at the stock exchange at the time of initial public offering. The information is generally accessible on the website of the stock exchange. Whether and how frequent it will be updated depends on the policy and rules of the stock exchange.

43. Public, FIs, DNFBPs, competent authorities can gain access to the information as long as the website of the stock exchange is public and contain information on beneficial ownership.

Supervision and enforcement of the relevant obligations

44. In general, there is no particular obligation for stock exchange to collect, verify and keep the information up-to-date for the purpose of AML/CFT.

BEST PRACTICES ON BENEFICIAL OWNERSHIP FOR LEGAL PERSONS

Transparency of beneficial ownership is essential to prevent the misuse of companies, associations or other entities for money laundering or terrorist financing. The Financial Action Task Force (FATF) is the global standard-setter for measures to fight money laundering and terrorist financing. Since 2003, the FATF Recommendations require countries to ensure that authorities can obtain up-to-date and accurate information about the person(s) behind companies, foundations and other legal persons.

This best practices paper, with examples from across the global network of FATF and FATF-Style Regional Bodies' members, will help countries effectively implement the FATF's requirements. The report highlights that jurisdictions using a multi-pronged approach with several sources of information are often more effective in preventing the misuse of legal persons for criminal purposes. The report identifies the most common challenges that countries face in ensuring that the beneficial owner(s) of legal persons is identified, and suggests key features of an effective system.

(Paris: FATF, 2018)

FATF

GUIDANCE FOR A RISK-BASED APPROACH

SECURITIES SECTOR

OCTOBER 2018

The Financial Action Task Force (FATF) is an independent inter-governmental body that develops and promotes policies to protect the global financial system against money laundering, terrorist financing and the financing of proliferation of weapons of mass destruction. The FATF Recommendations are recognised as the global anti-money laundering (AML) and counter-terrorist financing (CFT) standard.

For more information about the FATF, please visit **www.fatf-gafi.org**

RISK-BASED APPROACH GUIDANCE FOR THE SECURITIES SECTOR

Executive summary

1. The risk-based approach (RBA) is central to the effective implementation of the FATF Recommendations. It means that supervisors, financial institutions, and intermediaries identify, assess, and understand the money laundering and terrorist financing (ML/TF) risks to which they are exposed, and implement the most appropriate mitigation measures. This approach enables them to focus their resources where the risks are higher.

2. The FATF RBA Guidance aims to support the implementation of the RBA, taking into account national ML/TF risk assessments and AML/CFT legal and regulatory frameworks. It includes a general presentation of the RBA and provides specific guidance for securities providers and for their supervisors. The Guidance was developed in partnership with the private sector, to make sure it reflects expertise and good practices from within the industry.

3. The Guidance describes various types of securities providers that may be involved in a securities transaction and their business models. It also sets out key characteristics of securities transactions that can create opportunities for criminals, and measures that can be put in place to address such vulnerabilities.

4. The development of the ML/TF risk assessment is a key starting point for the application of the RBA by securities service providers. It should be commensurate with the nature, size and complexity of the business. The most commonly used risk criteria are country or geographic risk, customer risk, product or service risk and intermediary risk. The Guidance provides examples of risk factors under these risk categories.

5. The Guidance highlights that it is the responsibility of the senior management of securities providers to foster and promote a culture of compliance as a core business value. They should ensure that securities providers are committed to manage ML/TF risks before establishing or maintaining business relationships.

6. The Guidance clarifies the role and responsibilities of intermediaries that may provide services on behalf of securities providers to customers of securities providers, customers of intermediaries or both. It highlights that the nature of the business relationship between the securities provider, the intermediary and any underlying customers will affect how ML/TF risks should be managed. This includes clarifying when the FATF's Recommendations on reliance apply.

7. The Guidance clarifies that when determining the type and extent of CDD to apply, securities providers should understand whether its customer is acting on its own behalf or as an intermediary on behalf of its underlying customers. Even when CDD is the responsibility of the intermediary, an understanding of the intermediary's customer base can often be a useful element in determining the risk associated with the intermediary itself. The level of understanding should be tailored to the perceived risk level of the intermediary.

8. Some business relationships in the securities sector might have characteristics similar to cross-border correspondent banking relationships; the Guidance also contains a description of how AML/CFT requirements apply to such relationships.

9. The Guidance highlights the importance of ongoing transaction monitoring to determine whether transactions are consistent with the securities provider's information about the customer and the nature and purpose of the business relationship. In case of any suspicions, security providers are required to report promptly their suspicions to the Financial Intelligence Unit. It provides up-to-date examples of indicators of suspicious activity in relation to securities sectors, which may trigger filing of STRs or additional CDD measures by securities providers, or further investigation or ongoing monitoring.

10. The Guidance stresses the importance of the group level approach to mitigate ML/TF risks, including the development of group-wide assessment of ML/TF risks and the sharing of relevant information between supervisors involved. It also highlights the importance of guidance and feedback from supervisors to securities providers on regulatory expectations and quality of reporting by securities providers. This will develop a shared understanding between the public and private sector. In this regard, the Guidance provides examples of supervisory practices of certain countries in the implementation of RBA in the securities sector.

This Guidance should be read in conjunction with:

- the FATF Recommendations, especially Recommendations 1, 10, 13, 17, 19, 20 and 26 and their Interpretive Notes (INR), and the Glossary

other relevant FATF Guidance documents, such as:

relevant FATF typology reports, such as:

- the FATF Report: Money Laundering and Terrorist Financing in the Securities Sector (October 2009)

INTRODUCTION AND KEY CONCEPTS

Background and context

11. The risk-based approach (RBA) is central to the effective implementation of the revised FATF *International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation*, which were adopted in 2012[2]. This Guidance focuses on RBA for the securities sector[3], and includes an annex on suspicious activity indicators in relation to the securities sector. It takes into account the experience gained by public authorities and the private sector over the years in applying a RBA. This Guidance should be read in conjunction with the *FATF Report: Money Laundering and Terrorist Financing in the Securities Sector* (October 2009), which outlines vulnerabilities in the sector.

12. The RBA Guidance for the securities sector was drafted by a project group of FATF members and representatives of the private sector, co-led by representatives of the Royal Bank of Canada and the United States[4].

[2] www.fatgafi.org/media/fatf/documents/recommendations/pdfs/FATF_Recommendations.pdf

[3] Securities activities are activities or operations described in the FATF Glossary under "Financial institutions", in particular points 7, 8, 9, 10 and 11.

[4] The FATF project group was composed of representatives from FATF members [International Organisation of Securities Commissions (IOSCO), Ireland, Luxembourg, Singapore and the USA] and from the private sector [Association for Financial Markets in Europe (AFME), Pershing, Philip Capital, Royal Bank of Canada, and the Securities Industry and Financial Markets Association (SIFMA)].

13. The FATF adopted this updated RBA Guidance for the securities sector at its October 2018 Plenary.

Purpose of this Guidance

14. The purpose of this Guidance is to:

a) Outline the key principles involved in applying a risk-based approach to Anti-Money Laundering /Countering the Financing of Terrorism ("AML/CFT") in the securities sector;

b) Assist countries, competent authorities, providers of securities products and services ("securities providers") and intermediaries in the risk-based design and implementation of applicable AML/CFT measures by providing general guidelines and examples of current practice;

c) Support the effective implementation and supervision of national AML/CFT measures, by focusing on risks and on mitigation measures; and

d) Support the development of a common understanding of what the risk-based approach to AML/CFT entails in the context of the securities sector.

Target audience, status and content of the Guidance

15. This Guidance is aimed at the following audience:

a) Countries and their competent authorities, including AML/CFT supervisors of the securities sector, and Financial Intelligence Units ("FIUs"); and

b) Practitioners in the securities sector (including securities providers and intermediaries, and external examiners for AML/CFT purposes).

16. The Guidance consists of three sections. Section I sets out the key elements of the risk-based approach and needs to be read in conjunction with Sections II and III, which provide specific guidance to securities providers and intermediaries (Section II), and on the effective implementation of a RBA to supervisors of the securities sector (Section III). The annexes provide examples of countries' supervisory practices and suspicious activity indicators in the securities sector.

17. This Guidance recognises that an effective RBA will build on, and reflect, a country's legal and regulatory approach, the nature, diversity and maturity of its securities sector and its risk profile. It sets out what countries should consider when designing and implementing a RBA; but it does not override the purview of national competent authorities. When considering the general principles outlined in the Guidance, national authorities should take into consideration their national context, including the supervisory approach and legal framework. Similarly, as with any application of the risk-based approach, securities providers should tailor their own policies and procedures to the risks they face and the jurisdictional requirements in which they conduct their business. In light of the complexity and scope of the sector, this Guidance may address issues not relevant to all securities providers, as it will by necessity, not address in detail, the entire spectrum of activities or entities operating in the sector.

18. This Guidance is non-binding. It draws on the experiences of competent authorities as well as AML/CFT professionals in the private sector and may assist both competent authorities and the private sector to effectively implement some of the Recommendations.

Scope of the Guidance: terminology, key characteristics and business models

Terminology

19. This Guidance applies to the provision of securities products and services. However, given the commonality of issues between the securities and banking sectors, such as issues raised by pooled account structures, banks offering securities products and services should consider this Guidance in conjunction with the *FATF Guidance for a Risk-Based Approach: The Banking Sector*.

20. The term "securities" is broadly defined for the purpose of this guidance as including, for instance:

a) Transferable securities, including equities and bonds or similar debt instruments;

b) Money-market instruments;

c) Investment funds, including units in collective investment undertakings;

d) Options, futures, swaps, forward rate agreements and any other derivative contracts relating to securities, currencies, interest rates or yields or other derivatives instruments, financial indices or financial measures, which may be settled physically or in cash;

e) Options, futures, swaps, forwards and any other derivative contracts relating to commodities that must be settled in cash or may be settled in cash;

f) Derivative instruments for the transfer of credit risk;

g) Financial contracts for differences; and

h) Options, futures, swaps, forward rate agreements and any other derivative contracts relating to climatic variables, freight rates, emission allowances or inflation rates or other official economic statistics that are settled in cash, as well as any other derivative contracts relating to assets, rights, obligations, indices and measures not otherwise mentioned in this section, which have the characteristics of other derivative financial instruments.

21. The above definition is neither rigid nor exhaustive. Differences exist in legal and regulatory definitions across different jurisdictions and the securities sector continues to evolve constantly with the introduction of new securities products and services. Further, national authorities should have the flexibility to identify providers of securities products and services, which should be subject to AML/CFT obligations, taking into account risk and context and their role in the securities sector.

22. In some countries virtual assets and the associated Initial Coin Offerings ("ICOs") are recognised as securities (and subject to AML/CFT regimes), whereas other countries have banned them. Some countries are also evaluating the appropriate regulatory framework for these products and services.

Key characteristics of the securities sector

23. Securities markets are often characterised by complexity, internationality, a high level of interaction, high volumes, speed and anonymity. Many of the core economic functions of securities markets are critical to efficient price-formation and capital allocation, which contribute to economic growth, job creation and overall prosperity. However, some of the same characteristics associated with the sector can create opportunities for criminals. *The FATF Report: Money Laundering and Terrorist Financing in the Securities Sector* (October 2009) outlines the main ML/TF vulnerabilities in the securities sector. Some of the key characteristics of the securities sector for the purpose of this Guidance for a RBA are as follows:

a) The varying roles that securities providers and other intermediaries play in transactions; for example, a securities provider may be both an investment fund manager and a depository bank (see paragraphs 27-42 below);

b) Differences among jurisdictions in defining securities, securities products and services and their providers and the AML/CFT regulated status of these providers;

c) ML/TF risks stem mainly from the types of securities products and services, customers, investors and payment methods used in the securities sector; noting that cash is generally not accepted by securities providers in many jurisdictions;

d) Global reach of the securities sector and speed of transactions across a multitude of onshore/offshore jurisdictions and financial markets;

e) Ability to transact in securities products via an intermediary which may provide a relative degree of anonymity;

f) High liquidity of some securities products, which often enables their easy conversion to cash;

g) Complex products that may be offered before they are regulated (or not regulated at all) or rated for ML/TF risks (e.g. the crypto-assets mentioned above);

h) Common involvement of a multitude of securities providers and intermediaries on behalf of both buying and selling principals or agents, potentially limiting the ability of any one participant to have complete oversight of the transaction;

i) An often highly competitive and incentive-driven environment, which may lead to a higher appetite for risk, or failure to adhere to internal controls;

j) Pricing volatility of some products, particularly low-priced securities;

k) Transactions executed both on registered securities exchanges and elsewhere, such as over-the-counter (where parties trade bilaterally), and reliance on alternative trading platforms, electronic communication networks and internet-based trading;

l) Opportunity to use transactions in securities for generating illicit income within the sector, for example, market abuse or fraud; and

m) Challenges in pricing some securities products due to their bespoke nature or complexity.

24. Market abuse is a general term used to describe a wide range of types of unlawful behaviour in the financial markets including market manipulation, wash trading, insider trading, misappropriation, layering, unauthorized pooling, spoofing, front running and the like. Chapter 4 of the *FATF Report: Money Laundering and Terrorist Financing in the Securities Sector* (October 2009) provides additional information in relation to predicate offences for money laundering linked to securities.

25. Market abuse risk is relevant in the AML/CFT context for two principal reasons. Firstly, some forms of market abuse may constitute predicate offences for money laundering under applicable national laws. Secondly, certain controls which financial institutions may be required to implement to comply with market abuse laws, in particular, the surveillance of trading activity, may also be of use in monitoring for suspicious activity for AML/CFT purposes. Such commonalities and efficiencies are to be encouraged so long as both market abuse and AML/CFT obligations are each fully met.

26. This Guidance does not, however, purport to describe controls that financial institutions may be required to implement to prevent or detect market abuse. While applicable laws may require financial institutions to report suspicions of market abuse to certain authorities, references in this Guidance to reporting suspicious transactions relate to reporting suspicions of ML/TF (including market abuse, where appropriate) pursuant to R.20.

Securities providers (services and activities)

27. For the purpose of this Guidance, **securities provider** means any natural or legal person who is, or is required to be licensed or registered by a competent authority, to provide securities products and services as a business. Securities providers range from those that largely interact with retail investors, such as retail stockbrokers, wealth managers and financial advisors, to those serving a largely institutional market like clearing members, prime brokers, global custodians, sub-custodians and depository banks including securities depository participants. This is not an exhaustive list of all securities providers, and in some instances a securities provider may assume more than one of the above roles. One characteristic, particularly of larger securities providers, is that they may perform a diverse set of activities through different legal divisions or entities within the same group. These

different group entities may be subject to different regulatory and statutory requirements and the group's risk-based approach will need to consider this carefully.

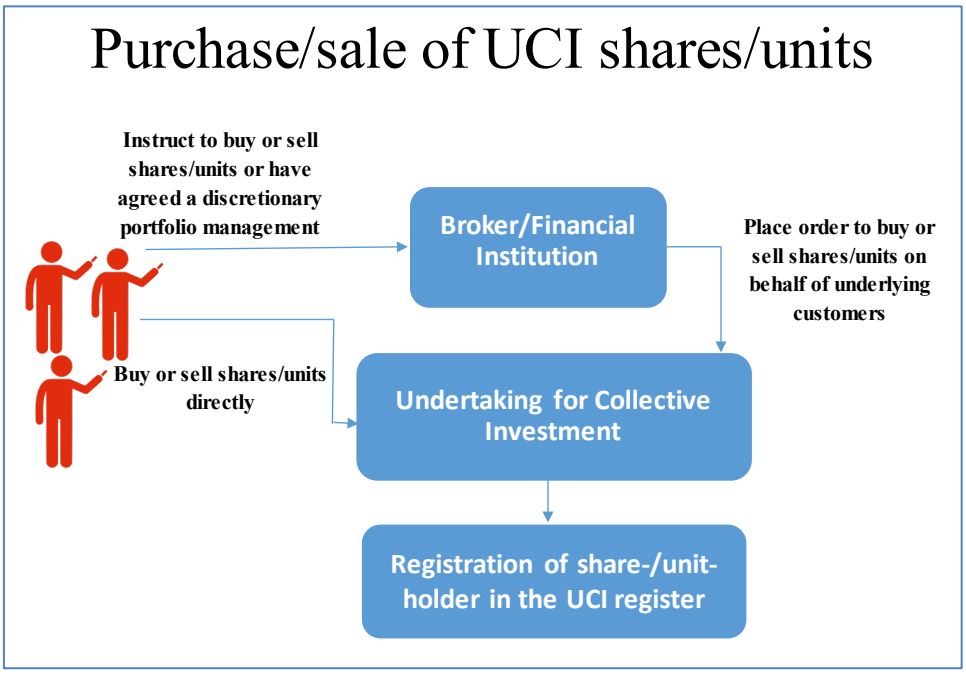
28. Securities providers offer various types of services, including capital market research and advisory, individual and collective portfolio management, investment funds distribution, order execution (trading in transferable securities), underwriting for issuers, private placements and other prospectus-exempt products, custody of client assets, lending money (providing margin) to clients and transfers of client cash (e.g. wire transfers). Mergers and acquisitions services and syndicate and secondary market financing are other types of securities services. Each of these activities and services may present different ML/TF risks depending on factors like the customer type, source and use of funds, customer business sector and geography. Securities providers typically specialise along retail, institutional and wholesale lines. Different risks may arise when a securities provider offers customers, securities accounts with a wide range of transactional and cash-management services associated with securities. Regardless of the role, the securities provider must continually tailor its own RBA to assessing and managing ML/TF risk.

29. The RBA to due diligence by securities providers can vary depending on a number of factors, such as the securities product involved in a transaction, custodial relationships, contractual obligations, the customer, and applicable AML/CFT regulatory requirements, including customer identification requirements.

30. **Investment funds**, including undertakings for collective investment ("UCIs") and pooled investment vehicles, are undertakings established as limited companies, limited partnerships or by contract that generally pool money from a number of third party investors and invest it in assets such as securities (e.g. stocks, bonds, and other mutual funds) or other assets (e.g. real estate, private equity and commodities). The combined investment holdings of the investment fund are known as its investment portfolio. Investors may buy and sell shares or units in the investment fund. Each share/unit represents an investor's part ownership in the fund and the income it generates. Investors may buy and sell investment fund units directly from the fund itself or indirectly through an intermediary, such as a broker or another financial institution. When an intermediary's name is recorded in the investment fund's share/unit register but it is holding units for its underlying customers, the arrangement is often referred to as an "omnibus account".

31. See illustration below, which demonstrates in simple terms one of the many distribution arrangements for investment funds (also refer to section 7.1.3 of this Guidance).

Diagram 1.Illustration of ways which UCI shares/units are distributed



32. Another type of securities provider is an **investment advisor**, which can be either an individual or a firm that gives advice about securities and financial planning to its customers, which may include individuals, institutions, trusts, or pooled investment vehicles.

33. A **broker** is a person or an entity that is in the business of buying and selling securities - stocks, bonds, mutual funds, and other investment products either on behalf of its customers or for its own account. A broker may have customers that are individuals or other legal entities (including financial institutions, corporate entities, partnerships and trusts).

34. Brokers serve retail customers and other institutions, such as pension plans, hedge funds, banks and other brokers. It is not uncommon that a number of different brokers are involved in a particular transaction, for example, an "**introducing broker**" may pass orders on to an "executing broker", who may execute the trade and give it up for clearing to a "clearing broker".

35. Securities providers known as **clearing members** or clearing brokers may provide record-keeping, confirmation, settlement, delivery of transactions and related functions associated with securities transactions, usually on behalf of other brokers, such as introducing or executing brokers.

36. **Institutional brokers** interact largely with large institutional clients and are often used to provide execution and custody services unaccompanied by investment advice. Customers of institutional brokers may and do use multiple institutional brokers to execute transactions.

37. **Prime brokers** provide execution, custody and other services to other financial institutions, such as hedge funds. This can include providing centralised clearing facilities for investment funds and allowing customers to borrow shares or money. Prime brokers may also act as record-keepers for other securities providers (e.g. investment advisors or investment managers) that may in turn be acting on behalf of customers' transactions.

38. Another type of securities provider, a **custodial broker-dealer**, can maintain custody of assets for its own customers (e.g. other broker-dealers, investment advisers, banks or other types of institutional clients) or their underlying customers. The underlying customers may be fully or partially disclosed to the custodial broker-dealer, while others may be non-transparent ("omnibus").

39. The **global custodian** provides safekeeping and settlement "custody services" for fund-managers, their underlying funds, asset managers and other institutional clients across multiple markets globally through a network of relationships with sub-custodians, banks, national and international central securities depositories (CSDs).

40. A **sub-custodian** provides safekeeping, clearing and settlement custody services in a domestic or international market on behalf of its customers. Although often employed by a global custodian, the sub-custodian, also referred to as an agent bank, might also service brokers and banks.

41. A **central securities depository** (CSD) provides securities accounts and, in many countries, operates a Securities Settlement System. A CSD also provides central safekeeping and asset servicing and plays an important role in helping to ensure the integrity of securities issues. The CSD will service many customers including sub-custodians, banks, brokers, global custodians, prime brokers, and issuers.

42. The size and complexity of securities providers vary significantly and as discussed above, they use various business models and may play different roles in different transactions. The complexity of the securities sector and the variety of securities provider roles highlight that where multiple securities providers are involved in a transaction, some securities providers may be in a better position than others, to have more complete transparency relating to a transaction. Thus, a securities provider should appreciate that it may not have a full picture of the entirety of business occurring through it and should therefore conduct an initial and ongoing risk assessment of its customers and activities to best understand and then mitigate any ML/TF risks identified.

Intermediaries

43. In the provision of their products and services, securities providers often interact with intermediaries, which may provide services on behalf of the securities provider to a person or entity who is the customer of the securities provider, a customer of the intermediary, or a customer of both.

44. Services provided by these intermediaries could include performing certain aspects of CDD, which are relied upon by a securities provider (reliance model - see paragraphs 114-116 for further description). Services may also include distribution services for selling securities products on behalf of a securities provider.

45. The distribution of securities products and services can also involve multiple parties, such as distributors appointed by a securities provider, transfer agents, registrars and administrators, tied agents or proprietary distributors, and platform service providers.

46. In other cases, securities providers may conduct transactions for certain other securities providers or intermediaries, which may be acting on behalf of their own customers. Indeed, an intermediary can be and very often is a securities provider itself, providing securities services within a chain of multi-step transaction.

47. All these different models and business practices may pose different ML/TF risks and require different approaches to risk mitigation.

48. The complexity of the securities sector and the variety of intermediary roles involved highlight that no one-size-fits-all AML/CFT approach should be applied. However, this variety and complexity highlights the importance of securities providers' understanding of how their business arrangements raise ML/TF risks both directly (e.g. through transactions executed by customers) and indirectly (e.g. risks associated with the underlying customers of the securities provider's customers, or risks associated with the possibility that an intermediary or other entity on which the securities provider relies to perform a task fails to do so). Securities providers should implement risk-sensitive measures to mitigate the ML/TF risk faced by them.

International provision of securities products and services

49. Some securities providers provide products and services across national borders through an intermediary or a network of intermediaries operating in another country. In instances where a securities provider operates in more than one country, the securities provider and competent authorities should verify that any ML/TF concerns are adequately addressed, in accordance with the FATF standards and regulations in the jurisdictions in which they operate. This is without prejudice to supranational rules that would enable securities providers to supply services throughout the supranational jurisdictions subject to the applicable legal framework.

50. Cross-border provision of products and services (including through intermediaries or over the internet or otherwise) highlights the importance of international cooperation among the competent authorities of the relevant jurisdictions. Such international cooperation can be spontaneous or upon request depending upon the nature of the specific situation.

51. This Guidance provides more detail on the recommended actions for securities providers and competent authorities in Sections II and III.

SECTION I – THE FATF'S RISK-BASED APPROACH TO AML/CFT (RBA)

WHAT IS THE RBA?

52. The RBA to AML/CFT means that countries, competent authorities and financial institutions[5] should identify, assess and understand the ML/TF risks to which they are exposed and take AML/CFT measures commensurate to those risks in order to mitigate them effectively.

53. When assessing ML/TF risk, countries, competent authorities, and financial institutions should analyse and seek to understand how the ML/TF risks they identify affect them; the risk assessment therefore provides the basis for the risk-sensitive application of AML/CFT measures[6]. For securities providers, this will require an understanding of the ML/TF risk faced by the sector as well as specific products and services, customer base, the capacity in which their customers are operating (e.g. on their own behalf or on behalf of underlying customers), jurisdictions in which they operate and the effectiveness of risk controls put in place. For supervisors, this will require maintaining an understanding of the ML/TF risks specific to the securities providers they supervise, and the degree to which AML/CFT measures can mitigate such risks. While institutions should strive to detect and prevent ML/TF, the RBA is not a "zero failure" approach; there may be occasions where an institution has taken all reasonable measures to identify and mitigate ML/TF risks, but it is still used for ML/TF in isolated instances.

54. A RBA does not exempt countries, competent authorities and financial institutions from mitigating ML/TF risks where these risks are assessed as low[7].

THE RATIONALE FOR A NEW APPROACH

55. In 2012, the FATF updated its Recommendations to strengthen global safeguards and to further protect the integrity of the financial system by providing governments with stronger tools to take action against financial crime.

56. One of the most important changes was the increased emphasis on the RBA for AML/CFT for all relevant public and private sector entities, especially in relation to preventive measures and supervision. Whereas the 2003 Recommendations provided for the application of a RBA in some areas, the 2012 Recommendations consider the RBA to be an 'essential foundation' of a country's AML/CFT framework[8].

---

[5] Including both physical and natural persons, see definition of "Financial institutions" in the FATF Glossary.

[6] FATF Guidance National Money Laundering and Terrorist Financing Risk Assessment, paragraph 10. See also Section I D for further detail on identifying and assessing ML/TF risk.

[7] Where the ML/TF risks have been assessed as low, INR.1 allows countries not to apply some of the FATF Recommendations, while INR.10 allows the application of Simplified Due Diligence measures to take into account the nature of the lower risk – see INR.1 (paragraph 6, 11 and 12) and INR.10 paragraph 16 and 21.

[8] R.1.

The RBA is an over-arching requirement applicable to all relevant FATF Recommendations.

57. According to the introduction to the FATF 40 Recommendations, the RBA allows countries, within the framework of the FATF requirements, to adopt a more flexible set of measures in order to target their resources more effectively and apply preventive measures that are commensurate to the nature of risks, so they can focus their efforts in the most effective way.

58. The application of a RBA is therefore not optional, but a prerequisite for the effective implementation of the FATF Standards[9].

APPLICATION OF THE RISK-BASED APPROACH

59. R.1 sets out the scope of the application of the RBA. It applies in relation to:

a) Who and what should be subject to a country's AML/CFT regime: in addition to the sectors and activities already included in the scope of the FATF Recommendations[10], countries should extend their regime to additional institutions, sectors or activities if they pose a higher risk of ML/TF.

b) How those subject to the AML/CFT regime should be supervised for compliance with this regime: AML/CFT supervisors should consider the securities provider's own risk assessment and mitigation, and acknowledge the degree of discretion allowed under the national RBA, while INR.26 further requires supervisors to themselves adopt a RBA to AML/CFT supervision; and

c) How those subject to the AML/CFT regime should comply: where the ML/TF risk associated with a situation is higher, competent authorities and securities providers have to take enhanced measures to mitigate the higher risk. This means that the controls implemented will be stronger, more numerous, wider in scope, more frequent, or a combination of these. Conversely, where the ML/TF risk is lower, standard AML/CFT measures may be reduced, which means that each of the required measures has to be applied, but they may be applied more narrowly, less frequently, or in a reduced way [11].

[9] The effectiveness of risk-based prevention and mitigation measures will be assessed as part of the mutual evaluation of the national AML/CFT regime. The effectiveness assessment will measure the extent to which a country achieves a defined set of outcomes that are central to a robust AML/CFT system and will analyse the extent to which a country's legal and institutional framework is producing the expected results. Assessors will need to take the risks, and the flexibility allowed by the RBA, into account when determining whether there are deficiencies in a country's AML/CFT measures, and their importance - *FATF Methodology for assessing technical compliance with the FATF Recommendations and the Effectiveness of AML/CFT systems (2013).*

[10] See Glossary, definitions of "Financial institutions" and "Designated non-financial businesses and professions".

[11] R.10; INR.10, footnote 33.

CHALLENGES

60. Implementing a RBA can present a number of challenges:

Allocating responsibility under a RBA

61. An effective risk-based regime builds on, and reflects, a country's legal and regulatory approach, the nature, diversity and maturity of its financial sector, and its risk profile. Securities providers' identification and assessment of their own ML/TF risk should consider all relevant national risk assessments in line with R.1 and take account of the national legal and regulatory framework, including any areas of prescribed significant risk and any mitigation measures defined at legal or regulatory level. Where ML/TF risks are higher, securities providers should consider applying enhanced due diligence and monitoring (e.g. varying the degree or frequency of ongoing monitoring), although national law or regulation might not prescribe exactly how these higher risks are to be mitigated[12].

62. Securities providers should have the flexibility in deciding the most effective way to address other risks, including those identified in the national risk assessment or by the securities providers. The securities providers' strategy to mitigate these risks must take into account the applicable national legal, regulatory and supervisory frameworks. When deciding the extent to which securities providers may be permitted to independently mitigate risk, countries should consider their securities sector's ability to effectively identify and manage ML/TF risks as well as their supervisors' expertise and resources, which should be sufficient to effectively supervise securities providers and take measures to address any failure by securities providers to do so.

63. Countries may also take into account evidence from competent authorities regarding the level of compliance in the securities sector, and the sector's approach to dealing with ML/TF risks. Countries whose financial services sectors are emerging or whose legal, regulatory and supervisory frameworks are still developing, may determine that securities providers face challenges in effectively identifying and managing ML/TF risks and any flexibility allowed under the risk-based approach for simplified due diligence should therefore be limited[13].

64. Securities providers should not be exempted from AML/CFT supervision even where their capacity and compliance is good. However, the RBA should allow competent authorities to focus more supervisory resources on higher risk institutions and institutions providing higher risk products and services[14]. Nonetheless, countries and competent authorities should take steps to effectively supervise all entities covered by AML/CFT requirements.

[12] R.1.

[13] This could be based on a combination of elements described in Section II, as well as objective criteria such as mutual evaluation reports, follow-up reports or FSAP (financial sector assessment program) reports.

[14] See FATF Guidance for a Risk-Based Approach: Effective Supervision and Enforcement by AML/CFT Supervisors of the Financial Sector and Law Enforcement.

Identifying ML/TF risk

65. Access to accurate, timely and objective information about ML/TF risks is a prerequisite for an effective RBA. INR.1.3 requires countries to have mechanisms to provide appropriate information on the results of the risk assessments to all relevant competent authorities, financial institutions and other interested parties. Information sharing plays a vital role in allowing financial institutions and supervisory and law enforcement authorities to better deploy resources on a risk basis, and to develop innovative techniques to combat ML/TF[15]. Enabling greater information sharing is a key element of collaboration, whether it involves sharing across borders, between entities of the same financial group, between different financial groups or between private and public sector[16]. Jurisdictions should promote information sharing where possible, always seeking to ensure compatibility and coherence between local laws (including data protection laws) and AML/CFT laws. Where information is not readily available and adequate, it will be difficult for securities providers to correctly identify ML/TF risk and they may therefore fail to assess and mitigate it appropriately.

Assessing ML/TF risk

66. Assessing ML/TF risk means that countries, competent authorities and securities providers have to determine how the ML/TF threats identified will affect them. They should analyse the information obtained to understand the likelihood of these risks occurring, and the effect they could have on individual securities providers, the securities sector, large- scale financial institutions, and the national economy, if they did occur[17]. Risks identified through this process are often known as inherent risks, and risks, which remain after the risk mitigation process, are known as residual risks.

67. During the course of a risk assessment, ML/TF risks may be classified as low, medium and high, with possible combinations between the different categories (e.g. medium-high, low-medium). These classifications are meant to assist in communicating ML/TF risks and to help prioritise them. Assessing ML/TF risk, therefore, goes beyond the mere collection of quantitative and qualitative information: it forms the basis for effective ML/TF risk mitigation and should be kept up-to-date to remain relevant.

68. Assessing and understanding risks means that competent authorities and securities providers should have skilled and trusted personnel, proportionate to the size and ML/TF risk and recruited through fit and proper tests, where appropriate. This also requires such personnel to be technically equipped to carry out their responsibilities.

[15] See R.18, R.20, R.21 and FATF Guidance on Private Sector Information Sharing.

[16] In the context of R.13, R.16, R.17, R.18 and R.26.

[17] Financial institutions are not necessarily required to perform probability calculations, which may not be meaningful given the unknown volumes of illicit transactions.

Mitigating ML/TF risk

69. The FATF Recommendations require securities providers, countries and competent authorities when applying the RBA, to decide on the most appropriate and effective way to mitigate the ML/TF risk they have identified. This implies that enhanced measures should be taken to manage and mitigate situations in which the ML/TF risk is higher; and that, correspondingly, in lower risk situations, less stringent measures may be applied[18]:

a) Countries looking to exempt certain institutions, sectors or activities from some of their AML/CFT obligations should assess the ML/TF risk associated with these financial institutions, sectors or activities and be able to demonstrate that the risk is low, and that the specific conditions required for one of the exemptions of INR.1.6 are met. The comprehensiveness of the risk assessment will depend on the type of institution; sector or activity; products or services offered; and the geographic scope of the activities that stand to benefit from the exemption. The nature and complexity of the securities sector mean that this exemption often will not apply

b) Securities providers looking to apply less stringent measures should conduct an assessment of the risks connected to the category of customers or products targeted, establish the lower level of the risks involved, and define the extent and intensity of the required AML/CFT measures. Specific Recommendations set out in more detail how this general principle applies to particular requirements[19].

Developing a common understanding of the RBA

70. The effectiveness of a RBA depends on a common understanding by competent authorities and securities providers of what the RBA entails, how it should be applied and how ML/TF risks should be addressed. The legal and regulatory framework should spell out the degree of discretion appropriate for financial institutions in the sector to assume. Competent authorities and supervisors in particular should issue guidance to securities providers on how they expect them to meet their legal and regulatory AML/CFT obligations in a risk-sensitive way. Supporting ongoing and effective communication between competent authorities and securities providers is essential for the successful implementation of a RBA.

71. Competent authorities should acknowledge that in a risk-based regime, not all securities providers will adopt the same AML/CFT controls and that relatively isolated incidents of insignificant risk should not necessarily invalidate the integrity of a securities provider's AML/CFT controls. On the other hand, securities providers should understand that a flexible RBA does not exempt them from applying effective AML/CFT controls. They should be able to explain to their supervisors the effectiveness of their AML/CFT controls and how those controls are commensurate with the risks identified.

---

18 Subject to the national legal framework providing for Simplified Due Diligence.

19 For example, R.10 on Customer Due Diligence and INR.10.

SECTION II – GUIDANCE FOR SECURITIES PROVIDERS AND INTERMEDIARIES

72. This section should be read in conjunction with the *FATF Report on Money Laundering and Terrorist Financing in the Securities Sector* (October 2009), especially the summary of Chapter 3 highlighting the main ML/TF vulnerabilities in the securities sector. The RBA consists of the identification of ML/TF risks and the definition and adoption of risk-sensitive measures that are commensurate with the ML/TF risks identified. In the case of securities providers, this applies to the types of products and services securities providers offer, the way they allocate their compliance resources, organise their internal controls and internal structures, and implement policies and procedures to manage and mitigate risk and detect and deter ML/TF. The RBA should also take into account intermediation networks.

RISK ASSESSMENT

73. Combating ML/TF is a global priority. The risk assessment should enable the securities provider to understand how, and to what extent, it is vulnerable to ML/TF. The risk assessment will also be developed because of regulatory requirements, guidance or expectations and will form the basis of a securities provider's RBA. It will often result in the categorisation of risks, including inherent and residual risks based on established controls and other mitigants, which will help securities providers determine the nature and extent of AML/CFT resources necessary to mitigate and manage that risk.

74. The risk assessment should be properly documented, regularly updated and communicated to the relevant securities provider's senior management. In conducting their risk assessments, securities providers should consider quantitative and qualitative information obtained from relevant internal and external sources to identify, manage and mitigate these risks[20]. This may include consideration of the risk and threat assessments, crime statistics, typologies, risk indicators, red flags, guidance and advisories issued by inter-governmental organisations, national competent authorities and the FATF, and AML/CFT mutual evaluation and follow-up reports by the FATF or associated assessment bodies. Many governments and authorities carry out ML/TF risk assessments for their jurisdictions, and securities providers should take these into account where relevant, when they are published or otherwise communicated. Furthermore, in identifying and assessing indicators of ML/TF risk to which it is exposed, a securities provider should consider a range of factors including:

a) The nature, diversity and complexity of its business, products and target markets;

b) The proportion of customers identified as high risk;

c) The jurisdictions in which the securities provider is operating or otherwise exposed to, either through its own activities or the activities of customers, especially jurisdictions with greater vulnerability due to contextual and other

[20] For example, in relation to terrorist financing, see the FATF Guidance on Emerging Terrorist Financing Risk (2015), and the countries that are in the FATF's International Cooperation Review Group (ICRG) process.

risk factors such as the prevalence of crime, corruption, or financing of terrorism, the general level and quality of the jurisdiction's prosecutorial and law enforcement efforts related to AML/CFT, the regulatory and supervisory regime and controls and transparency of beneficial ownership;

d) The distribution channels through which the securities provider distributes its products, including the extent to which the securities provider deals directly with the customer and the extent to which it relies (or is allowed to rely) on third parties to conduct CDD or other AML/CFT obligations, the complexity of the transaction chain (e.g. layers of distribution and sub-distribution, type of distributors such as independent financial advisors, investment advisors) and the settlement systems used between operators in the payment chain, the use of technology and the extent to which intermediation networks are used;

e) The internal and external (such as audits carried out by independent third parties, where applicable) control functions and regulatory findings; and

f) The expected volume and size of its transactions, considering the usual activity of the securities provider and the profile of its customers[21].

75. Securities providers should review their assessments periodically and when their circumstances change or relevant new threats emerge. Securities providers should consider internal feedback within their organization, including from those who interact with customers, compliance risk management, and internal audit departments (where relevant), in performing their periodic risk assessments.

76. ML/TF risks may be measured using various methods. The use of risk categories enables securities providers to manage potential risks by subjecting customers to proportionate controls and oversight. The most commonly used risk criteria are: country or geographic risk; customer/investor risk; product/service risk and intermediary risk.

77. The extent to which these risk categories are applicable and the weight they should carry (individually or in combination) in assessing the overall risk of potential ML/TF risk may vary from one institution to another, depending on their respective circumstances and risk management framework. Securities providers must comprehensively review all risk factors relevant to their business, including how certain factors may interplay and have an amplifying effect. For example, the risks inherent in an under-developed securities sector could be amplified by regional risks (if it is located, e.g. in an area where there is high incidence of drug trafficking). Consequently, securities providers should determine the risk weights and at the same time, parameters set by law or regulation may limit a business's discretion.

78. As noted above, while there is no complete set of risk categories, the examples provided herein are the most commonly identified. There is no one single methodology to apply to these risk categories, and the following risk categories could be considered alone or in conjunction with other risk categories:

[21] See R.1 (c1.10 and c.1.11), INR.1 and R.10.

Country/Geographic risk

79. There is no universally agreed upon definition or methodology for determining whether a jurisdiction, in which the securities provider or intermediary operates, such as a particular country, geographic area or border region within a country, represents a higher risk for ML/TF. Country/area risk, in conjunction with other risk factors, provides useful information as to potential ML/TF risks. Factors that may be considered as indicators of higher risk include:

a) Countries/areas identified by credible sources[22] as providing funding or support for terrorist activities or that have designated terrorist organisations operating within them.

b) Countries identified by credible sources as having significant levels of organized crime, corruption, or other criminal activity, including source or transit countries for illegal drugs, human trafficking and smuggling and illegal gambling.

c) Countries subject to sanctions, embargoes or similar measures issued by international organisations such as the United Nations Organisation.

d) Countries identified by credible sources as having weak governance, law enforcement, and regulatory regimes, including countries identified by the FATF statements as having weak AML/CFT regimes, and for which financial institutions should give special attention to business relationships and transactions.

Customer/Investor risk

80. Securities providers should determine whether a particular customer/investor[23] poses higher risk and analyse the potential effect of any mitigating factors on that assessment. Such categorisation may be due to a customer's occupation, behaviour or activity. These factors considered individually may not be an indication of higher risk in all cases. However, a combination of them may certainly warrant greater scrutiny. Categories of customers whose business or activities may indicate a higher risk include:

a) Customer is sanctioned by the relevant national competent authority for non-compliance with the applicable AML/CFT regime and is not engaging in remediation to improve its compliance.

b) Customer is a PEP or customer's family members or close associates are PEPs (including where a beneficial owner of a customer is a PEP) as covered under R.12.

---

22 "Credible sources" refers to information that is produced by reputable and universally recognised international organisations and other bodies that make such information publicly and widely available. In addition to the FATF and FATF-style regional bodies, such sources may include, but are not limited to, supra-national or international bodies such as the International Monetary Fund, the World Bank and the Egmont Group of Financial Intelligence Units.

23 The use of the term "customer" covers "customer/investor" throughout the guidance.

c) Customer resides in or whose primary source of income originates from high-risk jurisdictions (regardless of whether that income originates from a cash-intensive business).

d) Customer resides in countries considered to be uncooperative in providing beneficial ownership information.

e) Customer acts on behalf of a third party and is either unwilling or unable to provide consistent information and complete documentation thereon.

f) Customer has been mentioned in negative news reports from credible media, particularly those related to predicate offences for ML/TF or to financial crimes.

g) Customer's transactions indicate a potential connection with criminal involvement, typologies or red flags provided in reports produced by the FATF or national competent authorities (e.g. FIU, law enforcement etc.).

h) Customer is also a securities provider, acting as an intermediary or otherwise, but is either unregulated or regulated in a jurisdiction with weak AML/CFT oversight.

i) Customer is engaged in, or derives wealth or revenues from, a high-risk cash-intensive business

j) The number of STRs and their potential concentration on particular client groups.

k) Customer is a legal entity predominantly incorporated in the form of bearer shares.

l) Customer is a legal entity whose ownership structure is unduly complex as determined by the securities provider or in accordance with any regulations or guidelines.

m) Customers who have sanction exposure (e.g. have business/activities/transactions).

n) Customer has a non-transparent ownership structure.

Product/Service/Transactions risk

81. A securities provider may offer a range of products/services to customers. An overall risk assessment should therefore include determining the potential risks presented by specific products and services offered by the securities provider. These products and services commonly involve executing transactions for a customer by processing an order to transact or clear trades, handling the movement of funds or securities for the customer and settling a customer's transactions and liabilities. The securities provider may also offer brokerage accounts as a custodian of a customer's assets. Transactions may be conducted on a regulated exchange or other market or they may be conducted between parties directly. A securities provider should assess, using a RBA, the extent to which the offering of its products and services presents potential vulnerabilities to placement, layering or integration of criminal proceeds into the financial system.

82. Determining the risks of products and services offered to a customer may include a consideration of their attributes, as well as any associated risk mitigation measures. Products and services that may indicate a higher risk include:

a) Products or services that may inherently favour anonymity or obscure information about underlying customer transactions (e.g. bearer share instruments or the provision of omnibus account services).

b) The geographical reach of the product or service offered, such as those emanating from higher risk jurisdictions.

c) Products with unusual complexity or structure and with no obvious economic purpose.

d) Products or services that permit the unrestricted or anonymous transfer of value (by payment or change of asset ownership) to an unrelated third party, particularly those residing in a higher risk jurisdiction.

e) Use of new technologies or payment methods not used in the normal course of business by the securities provider.

f) Products that have been particularly subject to fraud and market abuse, such as low-priced securities.

g) The purchase of securities using physical cash.

h) Offering bank-like products, such as check cashing and automated cash withdrawal cards.

i) Securities-related products or services funded by payments from or instructions given by unexpected third parties, particularly from higher risk jurisdictions.

j) Transactions involve penny/microcap stocks.

83. A customer may request transactions that pose an inherently higher risk to the securities provider. This may be detected during transaction monitoring, although in many cases the customer's transactional activity may be apparent during both the point-of-sale interaction and back-end transaction monitoring. Factors that may be considered as indicators of higher risk include:

a) A request is made to transfer funds to a higher risk jurisdiction/country/corridor without a reasonable business purpose provided.

b) A transaction is requested to be executed, where the securities provider is made aware that the transaction will be cleared/settled through an unregulated entity.

Distribution channel risk

84. An overall risk assessment should include the risks associated with the different types of delivery channels to facilitate the delivery of securities products and services. Securities products and services are typically distributed directly to customers (including online) or through intermediaries.

85. A securities provider that distributes products or services directly through online delivery channels should identify and assess the ML/TF risks that may arise in relation to distributing its products using this business model. In addition to the analysis of risks performed in advance of engaging in such an online business, the risk assessment process for online delivery risk should be performed when the securities provider develops new products and new business practices.

86. A securities provider should analyse the specific risk factors, which arise from the use of intermediaries and their services. Intermediaries' involvement may vary with respect to the activity they undertake and their relationship with the securities providers. Some intermediaries may only introduce customers to the securities provider, whereas in other cases intermediaries may also use the products and services for their underlying customers (e.g. where the business relationship is established between intermediary and customer).

87. Regardless of the model, a securities provider should understand who the intermediary is and perform a risk assessment on the intermediary prior to establishing a business relationship. Securities providers and intermediaries should establish clearly their respective responsibilities for compliance with applicable regulation. Assessing intermediary risk is more complex for securities providers with an international presence due to varying jurisdictional requirements, the potential risk of non-compliance by intermediaries with the applicable local AML/CFT regulations and the logistics of intermediary oversight. An intermediary risk analysis should include the following factors, to the extent that these are relevant to the securities providers' business model:

a) Intermediaries suspected of criminal activities, particularly financial crimes or association with criminal associates.

b) Intermediaries located in a higher risk country or in a country with a weak AML/CFT regime.

c) Intermediaries serving high-risk customers without appropriate risk mitigating measures.

d) Intermediaries with a history of non-compliance with laws or regulation or that have been the subject of relevant negative attention from credible media or law enforcement.

e) Intermediaries that have failed to attend or complete AML/CFT training programmes requested by the securities providers.

f) Intermediaries that have weak AML/CFT controls or operate sub-standard compliance programmes, i.e. programs that do not effectively manage compliance with internal policies and/or external regulation or the quality of whose compliance programmes cannot be confirmed.

RISK MITIGATION

88. Having assessed ML/TF risks in their business, securities providers should then develop mitigating controls proportionate to the ML/TF risks identified and to the complexity, nature and size of the entity and activity. Consistent with the RBA,

securities providers should allocate more resources to mitigating their most significant risks.

Customer/Investor due diligence

CDD general considerations

89. CDD processes should be designed to meet the FATF standards and national legal requirements. The CDD process should help securities providers assess the ML/TF risk associated with a business relationship. Securities providers should have policies, procedures, systems and controls which are up to date and effectively implemented to carry out CDD: (a) when establishing business relations with a customer; (b) when carrying out occasional transactions above the applicable monetary threshold; (c) where they have suspicions of ML/TF regardless of any exemption or thresholds; and (d) where they have doubts about the veracity or adequacy of previously obtained identification data. Where a securities provider cannot obtain the information necessary to carry out CDD, R.10 provides that the securities provider not enter into a business relationship or carry out an occasional transaction, or terminate an already existing business relationship, and consider making a suspicious transaction report in relation to the customer.

Initial and ongoing CDD

90. Securities providers should develop and implement policies and procedures to mitigate the ML/TF risks identified through their individual risk assessment. In light of that assessment, CDD processes should help securities providers understand who their customers are by gathering information on what they do and why they require their services. The initial stages of the CDD process should help securities providers assess the ML/TF risk associated with a proposed business relationship, determine the level of CDD to be applied and deter persons from establishing a business relationship to conduct illicit activity.

91. Based on information obtained in the CDD process, securities providers should prepare a customer risk profile. Customer risk profiles should be informed by the FATF Standards, including those covered in INR.10, R./INR.12-16 and by the risk and complexity of the securities products and services offered. This will determine the level and type of ongoing monitoring and support the securities providers' decision whether to enter into, continue or terminate the business relationship. Risk profiles can apply at the individual customer level or, where groups of customers display similar characteristics (e.g. customers with similar income range, or conducting similar types of securities transactions). On the basis of their risk assessment, securities providers should periodically update customer risk profiles, which should help them apply the appropriate level of CDD.

92. When carrying out the initial CDD, securities providers should identify and take reasonable steps to verify the identity of the customer's beneficial owner, where appropriate. This should be undertaken on the basis of reliable and independent information, data or documentation, to at least the extent required by the applicable legal and regulatory framework. The CDD process also includes understanding the purpose and intended nature of the business relationship to form a basis for ongoing

monitoring of the business relationship and with a view to facilitating the detection of potentially suspicious activity.

93. When designing CDD procedures and conducting CDD on customers, securities providers should, where appropriate, consider the following issues:

- **Purpose and intended nature of business:** A securities provider should ensure it has a clear understanding of expected activity to support ongoing transaction monitoring. Typically, the key consideration is being able to identify whether the customer's activity (e.g. transaction type, size or frequency) is in line with the securities provider's knowledge of the customer. Understanding the nature of the business relationship includes understanding any other parties involved within the relationship. This includes verifying the authorisation of persons purporting to act on behalf of the customer, their identification and verification on a risk-sensitive basis and understanding the role the securities provider plays. In higher risk situations, obtaining further information for ongoing monitoring of the business relationship and detection of potentially suspicious activity may be needed.
- **Beneficial ownership structures:** Where a customer appears to have a less transparent beneficial ownership or control structure, including the presence of corporate vehicles, nominees or private legal arrangements, a securities provider should ensure to undertake reasonable steps to verify the identity of beneficial owner(s). Securities provider should also consider whether the opacity of the ownership structure or the identity of one or more beneficial owners is an indicator of elevated risk and whether it is a cause or not for not performing the transaction or terminating the business relationship and considering making a suspicious transaction report.
- **Source of wealth and funds:** Under the RBA, a securities provider should take reasonable measures to establish the source of wealth and source of funds of relevant parties.

94. In addition, securities providers should take measures to comply with national and international sanctions legislation; sanction screening is mandatory and is not discretionary.

95. As a general rule, securities providers must apply CDD measures to all customers. The extent of these measures may be adjusted, to the extent permitted or required by regulatory requirements, in line with the ML/TF risk associated with the individual business relationship. This means that the amount and type of information obtained, and the extent to which this information is verified, must be increased where the risk associated with the business relationship is higher or decreased where the associated risk is lower.

96. A securities provider should conduct CDD on an initial and ongoing basis. A securities provider should endeavour to be aware of material changes to the customer's legal form, beneficial ownership and nature of business. A securities provider should implement procedures to periodically review the customer relationship and CDD information. The risk-based periodic review process should be based on a formal cycle, and additional reviews should be performed based on "trigger-event" causes.

The securities provider's customer

97. In addition to carrying out transactions and/or maintaining accounts for customers directly, securities providers may also deal with other securities providers and intermediaries who in turn have their own underlying customers. For illustration purposes, refer to paragraph 31, which provides an example of investment funds where the customer may be direct or indirect. Also, for a discussion of issues particular to similar correspondent relationships in the cross-border context, refer to section 7.1.5 of this Guidance.

98. The business relationship between the securities provider, the intermediary and any underlying customers, including the degree of transparency the securities provider has into any underlying customers and their transactions will affect a number of AML/CFT obligations and outcomes, such as who is responsible for conducting CDD, the securities provider's risk assessment of the intermediary and the securities provider's ability to monitor transactions associated with the intermediary and its underlying customers.

99. When determining the type and extent of CDD to apply, a securities provider should be clear as to whether its customer is acting on its own behalf or as an intermediary on behalf of its underlying customers. Even when CDD is the responsibility of the intermediary, an understanding of the intermediary's customer base can often be a useful element in determining the risk associated with the intermediary itself; the level of understanding obtained should be tailored to the perceived risk level of the intermediary.

100. While a detailed analysis of the wide variety of intermediary and customer relationships that occurs in the securities sector is beyond the scope of this Guidance, a brief discussion of the distribution of investment funds may illustrate some common themes and concerns. In this context, the CDD measures an investment fund should take will depend on how the ultimate customer invests in the fund. Depending on how the investment fund is sold, with whom the business relationship is established or who is registered in the fund's share/units register, the investment fund may be required to treat an underlying investor as its customer or the intermediary as its customer. Where an intermediary is treated as the investment fund's customer, the investment fund may not have visibility on the intermediary's underlying customers. This includes not having comprehensive identification nor transaction-related information on the customers of the intermediary in cases such as, for example, where the intermediary nets all of its customers' orders and submits a single net order to the investment fund each day.

101. Securities providers should also obtain (and intermediary should provide) information about the intermediary's AML/CFT controls, including information regarding the intermediary's risk assessment of its underlying customer base and its implementation of risk mitigation measures.

102. The above requirements may be adapted to particular conditions (e.g. additional onsite control or other more thorough controls when an intermediary is a non-regulated or non-supervised entity or is located in a country presenting high ML/TF risks).

Enhanced CDD ("EDD") and simplified CDD ("SDD")

103. The extent of CDD measures may be adjusted, to the extent permitted by applicable regulatory requirements, in line with the ML/TF risk. This means that the amount or type of information obtained, or the extent to which this information is verified, must be enhanced where the risk associated with the business relationship is higher. The type of enhanced due diligence measures applied should be effective and proportionate to the risks. It may also be reduced where the risk associated with the business relationship is lower. Ongoing monitoring can also lead to a reassessment of the customer's risk profile, and should inform whether additional CDD or EDD is required.

104. The derogation described in INR.1.6(b), which permits countries to decide not to apply some FATF Recommendations to financial institutions conducting financial activity on an occasional or very limited basis is not generally appropriate, unless there is proven low risk of ML/TF. SDD measures are also not acceptable whenever there is a suspicion of ML or TF, or where specific higher-risk scenarios apply.

105. One example of when SDD measures may generally be appropriate is a pension product funded directly from a reputable company's payroll as such a product may present a lower ML/TF risk compared to other products. Conversely, EDD measures must be required for a PEP customer since such a customer presents heightened risks. Illustrative examples of both SDD and EDD measures are detailed below. However, these examples are intended to form a non-exhaustive list, and financial institutions are encouraged to apply a risk-based analysis that takes account of the particular circumstances of each case.

Box 1. Non Exhaustive List of Examples of Enhanced Due Diligence/Simplified Due Diligence measures (see also INR.10)

Enhanced Due Diligence

- Obtaining additional customer information, such as the customer's reputation and background from a wider variety of sources before the establishment of the business relationship and using the information to inform the customer risk profile
- Carrying out additional searches (e.g. internet searches using independent and open sources) to better inform the customer risk profile
- Carrying out additional searches focused on financial crime risk indicator (i.e. negative news screening) to better assess the customer risk profile
- Obtaining additional or more particular information about the intermediary's underlying customer base and its AML/CFT controls
- Undertaking further verification procedures on the customer or beneficial owner to better understand the risk that the customer or beneficial owner may be involved in criminal activity
- Obtaining additional information about the customer's source of wealth or the source of funds involved in the transaction
- Verifying the source of funds or wealth involved in the transaction or business relationship to seek to ensure they do not constitute the proceeds of crime
- Evaluating the information provided with regard to the destination of funds and the reasons for the transaction
- Seeking and verifying additional information from the customer about the purpose and intended nature of the transaction or the business relationship
- Requiring that the redemption payment is made through the initial account used for investment or an account in the sole or joint name of the customer
- Increasing the frequency and intensity of transaction monitoring

Simplified Due Diligence

- Limiting the extent, type or timing of CDD measures
- Obtaining fewer pieces of customer identification data
- Altering the type of verification carried out on customer's identity
- Inferring the purpose and nature of the transactions or business relationship established based on the type of transaction carried out or the relationship established, without collecting additional information or carrying out additional measures related to understanding the nature and purpose
- Verifying the identity of the customer and the beneficial owner after the establishment of the business relationship (e.g. if transaction or account values rise above a defined monetary threshold)
- Reducing the frequency of customer identification updates if the securities provider implements or is required to implement a periodic review process based on a formal cycle
- Reducing the degree and extent of on-going monitoring and scrutiny of transactions, for example based on a reasonable monetary threshold

Correspondent Relationships [24]

106. INR.13 stipulates that for correspondent banking and other similar cross-border relationships, financial institutions should apply criteria (a) to (e) of R.13, in addition to performing normal customer due diligence measures. Because certain relationships in the securities sector have characteristics similar to cross-border correspondent banking relationships, they are addressed in this Guidance.

107. A typical cross-border correspondent relationship in the securities sector is a relationship between the securities provider (correspondent), with an intermediary (respondent), which is regulated and supervised by a supervisory authority, for securities transactions. In such cases, the customer of the respondent would not be considered as a customer of the correspondent, and the FATF Recommendations do not require the correspondent securities providers to conduct CDD on the customers of their respondent institutions. One example of these types of relationships could be between a global securities firm (correspondent) executing securities transactions on a stock exchange for a cross-border intermediary, acting as a respondent for its underlying local customers, subject to complying with R.13 requirements.

108. Not all cross-border correspondent relationships pose the same level of ML/TF risk and the securities providers should adjust the type and extent of CDD measures to account for the risk posed by the respondent. The correspondent institution should monitor the respondent institution's transactions with a view to detecting any changes in the respondent institution's risk profile (i.e. compliance with AML/CFT measures and applicable targeted financial sanctions), any unusual activity or transaction on the part of the respondent, or any potential deviations from the agreed terms of the arrangements governing the correspondent relationship. Where such concerns are detected, the securities provider should follow-up with the intermediary by making a request for information on any particular transaction(s), possibly leading to more information being requested on the underlying customers of the intermediary on a risk-sensitive basis.[25]

109. Due diligence with regard to a correspondent relationship with a respondent generally takes place at two levels:

- Risk-based due diligence on the respondent by using reliable, independent source documents, data or information (Rec. 10 (a)) and its beneficial owners, such that the securities provider is satisfied that it knows who the beneficial owner(s) of the respondent are.
- Additional due diligence on the correspondent relationship with the respondent, as described below.

110. In accordance with R.13, correspondent securities providers in addition to performing customer due diligence on the respondent intermediaries should also:

- Gather sufficient information about the respondent to understand the nature of the respondent's business and to determine from publicly available information the reputation of the respondent and the quality of its

24 FATF Guidance on correspondent banking services (October 2016).

25 See Paragraph 3 of the FATF Guidance on correspondent banking services (October 2016).

supervision, including whether and when it has been subject to targeted financial sanctions, a ML/TF investigation or regulatory action;

- Assess the respondent's AML/CFT controls. The assessment should include confirming that the respondent institution's AML/CFT controls are subject to independent audit (which could be external or internal). A more detailed/in-depth review should be conducted for higher risk relationships, possibly including reviewing the independent audit, interview of compliance officers, a third party review and potentially an onsite visit;
- Obtain approval from its senior management before setting up a correspondent relationship;
- Clearly understand the respective AML/CFT responsibilities of each institution.

111. In the case of such relationships, the correspondent generally does not have direct relationships with the customers of the respondent. There is no expectation or requirement for the correspondent to apply CDD on a respondent's customer, which is, instead the responsibility of the respondent. Nonetheless, it is consistent with the risk-based approach for the correspondent to have some general sense of the respondent's customer base as part of ascertaining the risks associated with the respondent itself.

112. In case the respondent allows its underlying customers to have direct access to its correspondent accounts (for example through a power of attorney or permitting the underlying customer to place orders directly with the securities provider while settling them through the correspondent account), the securities provider must be satisfied that the respondent has conducted CDD on the customers having direct access to these accounts, and that it is able to provide relevant CDD information upon request.

113. Securities providers should also be prohibited from entering into, or continuing, a correspondent relationship with shell banks or shell securities providers. They should be required to satisfy themselves that respondent institutions do not permit their accounts to be used by shell banks or securities providers.

Reliance on third parties

114. In accordance with R.17 and where permitted by local legislation, a securities provider may reasonably rely on third parties for performing some elements of initial CDD (identification of customer, identifying and taking reasonable measures to verify identification of beneficial owner and understanding the purpose and intended nature of business relationship). However, it may not rely on such parties to perform ongoing monitoring, ongoing due diligence and scrutiny of transactions. The term 'third parties' means financial institutions or DNFBPs that are supervised or monitored and that meet the requirements under R.17. Specifically the securities provider should complete appropriate due diligence on the third party to determine whether reliance can be placed on the AML/CFT risk and control framework of financial institution or DNFBP and whether they are based in a country whose risk has been assessed by the securities provider (in accordance with R.17(1) (c and d).

115. When reliance is appropriate, after consideration of the above, the ultimate responsibility for CDD remains with the securities provider- in other words, the provider can delegate the task but not the responsibility. In such situations, the securities provider should verify that the third party is conducting checks similar to or at a higher level than the securities provider's own internal standards. The securities provider should immediately obtain the necessary information concerning elements (a)-(c) of the CDD measures set out in R.10, and also take adequate steps to satisfy themselves that copies of identification data and other relevant documentation relating to CDD requirements will be made available by the relied upon institution upon request and without delay.

116. Where appropriate, securities providers should ensure that formal agreements, which clearly set out the terms and conditions, including the roles and responsibilities of both the securities provider and the institution relied upon, are in place.

Outsourcing

117. The reliance model above can be contrasted with an outsourcing or agency scenario, where the outsourced entity conducts CDD on behalf of the securities provider, in accordance with the procedures of securities provider and under its instructions. In such case, the securities provider is the principal while the outsourced entity acts as its agent.

118. Under an outsourcing arrangement, a securities provider may also outsource ongoing monitoring and transaction monitoring. Securities providers should ensure that formal agreements which clearly set out the relevant terms and conditions, including the roles and responsibilities of both the outsourced entity and the securities provider, are in place.

119. The ultimate responsibility for CDD and/or ongoing monitoring remains with the securities provider; again, it cannot delegate responsibility. In this regard, the securities provider should implement appropriate processes to monitor that the outsourced entity is performing effectively in accordance with the instructions set by the securities provider.

Electronic wire transfers requirements

120. R.16 establishes the requirements for countries with respect to wire transfers. R.16 apply to both cross-border wire transfers and domestic wire transfers[26]. Securities providers who make wire transfers must include relevant originator and beneficiary information, where appropriate, on those wire transfers and ensure that the information remains with the wire transfer throughout the payment chain, as set out in the INR.16. Countries may adopt a *de minimis* threshold for cross-border wire transfers, below which verification of the customer and beneficiary information is not required unless there is an ML/TF suspicion[27]. That is, for occasional cross-border wire transfers below USD/EUR 1 000, or the equivalent amount in local currency, the requirements of the INR.16 apply and the name of the originator and of the

26 INR.16 paragraph 3.

27 INR.16 paragraph 5.

beneficiary will be requested, as well as an account number for each or a unique transaction reference number. However, such information will not have to be verified unless there are suspicious circumstances related to ML/TF, in which case information pertaining to the customer should be verified.

121. Securities providers that make wire transfers should adopt effective risk-based policies and procedures for determining when to execute, reject or suspend a wire transfer lacking required originator or beneficiary information, as well as for defining and taking the appropriate follow-up actions[28]. In case of doubt, securities providers should clarify the responsibility for monitoring wire transfers between themselves and any other person involved in the wire transfer.

122. Where securities providers rely on payment service providers for fund transfers, depending on the arrangement, the responsibility for AML/CFT compliance with relevant electronic wire transfer requirements may likely be with the payment service provider.

Suspicious transaction monitoring and reporting

Risk-based monitoring

123. Ongoing risk-based transaction monitoring is the scrutiny of transactions to determine whether they are consistent with the securities provider's information about the customer and the nature and purpose of the business relationship. This should include surveillance of securities transactions and fund movements. Monitoring also involves identifying changes to the customer risk profile - for example, the customer's behaviour, use of products and the value involved, and keeping this information up-to-date, which may trigger the application of enhanced CDD measures. When suspicious activity or high-risk behaviour is identified, appropriate steps should be taken in a timeline commensurate with the risk.

124. Transaction monitoring is essential for identifying suspicious transactions. Transactions that are not in line with the customer's risk profile, that exhibit red flags of established money laundering typologies, or that deviate from the usual pattern, may be potentially suspicious. Securities providers may also draw upon surveillance frameworks and tools used to detect predicate offences to money laundering, such as market abuse and insider dealing in securities, to identify suspicious transactions. Integration of existing data sets more efficiently into AML/CFT framework can produce more effective results.

125. In many wholesale business relationships, such as principal to principal execution-only, the securities provider will generally have limited visibility of the end-to-end transaction; it is also typical for the underlying instructing party to have multiple brokers and deal in various products and asset classes, meaning that securities providers will only have visibility of a part of the overall trading activity. In such circumstances, effective transaction monitoring measures are likely to consist of leveraging existing market surveillance controls, rather than implementing electronic transaction monitoring systems similar to those in retail relationships. For example, in wholesale markets, securities providers may reasonably determine that, given the

[28] INR.16 paragraph 18 and 22.

difficulties in developing meaningful rules for electronic monitoring, it may be appropriate to implement alternative methods of monitoring. Whatever the approach taken, the securities provider should be able to demonstrate the rationale for their monitoring strategy.

126. A customer may transact in multiple jurisdictions and with multiple financial firms, which perform a variety of activities in relation to securities transactions. A securities provider may consider the following to determine the nature and extent of monitoring activity:

a) The nature of the securities provider's customer base, including the country risk and whether customers are regulated or unregulated entities, and publicly or privately owned;

b) The risk and complexity of products offered to customers;

c) The volume and frequency of transactions processed by the securities provider; and

d) The execution, clearing or settlement processes facilitated by the securities provider, including consideration as to whether payments to third parties are permitted.

127. Transaction monitoring should be carried out on an ongoing basis and may be triggered by specific and unusual transactions. For example, a sudden spike in trading volumes for a particular issuer can be a red flag of potentially suspicious activity, such as a fraud associated with low priced securities. However, market events, like corporate announcements, news or rumours on likely mergers or acquisitions may also contribute to unusual trading patterns; this means that such a sudden spike in trading volume may not be suspicious upon further consideration, but instead was simply a red flag worthy of further inquiry. Therefore, in conducting effective transaction monitoring, the securities provider should take into account such market events.

128. Securities providers should consider adjusting the extent and depth of monitoring based on their institutional risk assessments, customer risk profiles and the complexity of products offered. For example, having less visibility into the underlying customer of an intermediary might increase the risk profile of the intermediary itself. Enhanced monitoring should be required for higher risk situations. The adequacy of monitoring systems and the factors leading securities providers to adjust the level of monitoring should be reviewed regularly to verify that it is in line with the securities provider's overall AML/CFT risk programme.

129. Monitoring under a RBA allows securities providers to create internal thresholds based on a range of factors, such as transaction number or value to determine which activities should be reviewed. Defined situations or thresholds used for this purpose should be reviewed on a regular basis to determine their adequacy for the risk levels established. Monitoring system should flag unusual movements of funds or transactions for further analysis and scrutiny in a timely manner for determining as to whether the funds movements or transactions are suspicious.

130. Criteria applied to decide the frequency and intensity of the monitoring of different customer segments should also be readily explicable. If a securities provider establishes different customer segments for monitoring, it should document and state

clearly the criteria and parameters used for customer segmentation and for the allocation of a risk level for each of the clusters of customers.

131. Where automated systems are appropriate, securities providers should understand their operating rules, verify their integrity on a regular basis and check that they consider the identified ML/TF risk typologies applicable for the securities sector.

132. Securities providers should properly document, retain and communicate to the relevant staff the results of their monitoring and any queries raised and resolved.

Reporting suspicious activity

133. R.20 requires all financial institutions - including securities providers - that suspect, or have reasonable grounds to suspect, that funds are the proceeds of crime or related to terrorist financing to report their suspicions promptly to the relevant FIU.

134. Transactions or movements of funds that are considered suspicious should be promptly reported to the FIU, in the manner specified by the competent authorities. Securities providers' processes to escalate suspicions and ultimately report to the FIU should reflect this. While the policies and processes leading securities providers to form a suspicion can be applied on a risk-sensitive basis, a securities provider should report the activity once ML/TF suspicion has been formed.

135. Some jurisdictions require that suspicious market abuse (see paragraphs 24-26 above in relation to market abuse) be reported to a different authority (other than or in addition to FIU), generally the markets regulator. A securities provider should be aware of the specific reporting obligations required by the jurisdiction in which it is operating.

INTERNAL CONTROLS AND COMPLIANCE

Internal controls and governance

136. Adequate internal controls are critical for an effective AML/CFT framework. Internal controls include appropriate governance arrangements that clearly allocate AML/CFT responsibilities, and controls to monitor the integrity of staff and intermediaries, implemented in accordance with the applicable local legislation. Securities providers should consider national or sectoral risk assessments and controls to validate that their policies and processes are effective for identifying, assessing, and monitoring ML/TF risks where they operate. Securities providers should modify their internal controls according to relevant changes in their size, operational complexity or risk exposure. Accordingly, securities providers should maintain systems that are adequate and effective to manage and mitigate their risks. Where the risks are low, less sophisticated systems will suffice.

137. Securities providers, which distribute their products or services through intermediaries, such as stockbrokers or funds platforms, should include these networks in their AML/CFT internal risk assessment processes.

138. The successful implementation and effective operation of a RBA to AML/CFT also depends on strong leadership by a securities provider's senior management, which includes oversight of the development and implementation of the RBA across business.

139. Senior management should consider various ways to support AML/CFT initiatives, including:

a) The fostering of a culture of compliance and promoting compliance as a core value of the securities provider by sending a clear message that the securities provider is committed to ensuring that:
   - ML/TF risks will be managed before entering into, or maintaining, business relationships or offering services that are associated with significant ML/TF risks; and
   - Business relationships will not be established when the ML/TF risks cannot be mitigated and managed.

b) Together with the company board of directors (where applicable), taking responsibility for setting up robust risk management governance and controls mechanisms that:
   - Reflect the company's established risk policy;
   - Implement adequate internal communication processes appropriate for the ML/TF risks faced by the securities provider. Where applicable, these processes should link the board of directors, the top AML/CFT compliance officer, any relevant committee (e.g. the risks or ethics/compliance committee), the information technology unit and each of the business areas;
   - Help to determine the measures needed to mitigate the identified ML/TF risks and the extent of residual risk the securities provider is ready to accept; and
   - Allocate adequate resources for the securities provider's AML/CFT function.

140. Senior management should not only be aware of the ML/TF risks to which the securities provider is exposed but also understand how its AML/CFT control framework operates to mitigate those risks. This would require that senior management:

a) Understands the regulatory and supervisory requirements where the securities provider operates;

b) Receives sufficient, regular and objective information to get an accurate picture of the ML/TF risk to which the securities provider is exposed through its activities and individual business relationships;

c) Receives sufficient and objective information to understand whether the securities provider's AML/CFT controls are effective;

d) Receives updates on government enforcement actions and other communications related to the AML/CFT obligations of securities providers and ML/TF risks; and

e) Ensures that processes are in place to timely escalate important decisions that directly affect the ability of the securities provider to address and control risks.

141. A sufficiently senior person within a securities provider should have the responsibility to ensure the effectiveness of AML/CFT controls. This is to highlight the importance of ML/TF risk management and compliance and for bringing ML/TF issues to senior management's attention. This includes the appointment of a skilled compliance officer at the senior management level[29]. The group top AML/CFT officer should have the necessary independence, authority, seniority, resources and expertise to carry out these functions effectively, including the ability to access all relevant internal information (including across lines of business, and across foreign branches and subsidiaries).

142. R.18 requires financial institutions to have an independent audit function to test the effectiveness of its AML/CFT programme, policies and processes and the quality of its risk management across its operations, departments, branches and subsidiaries, both domestic and cross-border. Such independent testing should allow senior management to validate the development and operation of the risk assessment and management processes and internal controls, in order to ensure that the adopted measures reflect the risk profile of the securities provider. This independent testing and reporting should be conducted by, for example, the internal audit department, external auditors, specialist consultants or other qualified parties who are not involved in the design, implementation or operation of the securities provider's AML/CFT compliance programme. The testing should be risk-based; evaluate the adequacy of the securities provider's AML/CFT policies and programme and the quality of risk management for its operations, departments and subsidiaries; and cover all activities.

143. Both the compliance and audit functions should base their assessment on all information relevant to their task including, where relevant and appropriate, information obtained confidentially through relevant internal mechanisms or whistleblowing hotlines. Other sources of information can include training pass rates, compliance process or control failures or analysis of questions received from staff.

Compliance controls

144. A securities provider's internal control environment should be designed to achieve high standards of the integrity, competence and compliance of staff with relevant policies and procedures.

145. The nature and extent of AML/CFT controls will depend upon a number of factors, including the nature, scale and complexity of a securities provider's business. This includes the diversity of its operations, geographical location, customer base, product and activity profile and the degree of risk associated with each area of its operations (e.g. the extent to which the securities provider is dealing directly with the customer or through intermediaries, third parties, or in a non-face-to-face setting without appropriate mitigating measures).

29 INR.18.

146. The framework of AML/CFT compliance function and internal controls should:

a) Place priority on the securities provider's operations (products, services, customers and geographic locations) that are more vulnerable to abuse.
b) Provide for regular review of the risk assessment and management processes, taking into account the environment within which the securities provider operates and the activity in those locations in which it operates.
c) Provide for an AML/CFT compliance function and review programme that includes the testing of key components.
d) Verify that adequate risk assessment and controls are in place before offering new products or services.
e) Regularly inform senior management of compliance initiatives, identified compliance deficiencies, corrective action taken, and suspicious activity reports.
f) Provide for programme continuity despite changes in management or employee composition or structure.
g) Focus on complying with applicable regulatory requirements on record keeping and reporting for AML/CFT compliance and timely response to changes in regulations.
h) Provide for adequate controls for higher risk customers, transactions and products, as necessary, such as transaction limits or management approvals.
i) Provide for adequate management and oversight of its intermediaries, including initial intermediary due diligence, oversight of AML/CFT training, and ongoing risk-based monitoring.
j) Provide for adequate supervision of employees who handle transactions, complete reports, grant exemptions, monitor for suspicious activity, or engage in any other activity that forms part of the business's AML/CFT programme.
k) Incorporate AML/CFT compliance into job descriptions and performance evaluations of appropriate personnel.
l) Ensure that staff or firm performance is not the driver for taking disproportionate ML/TF risks.
m) Provide for appropriate initial and refresher training to for all relevant staff.
n) Provide for initial and refresher training for intermediaries, as applicable, at appropriate intervals.

Vetting and recruitment

147. Securities providers should conduct background checks on staff as part of the recruiting process to satisfy themselves that the staff they employ have integrity, are adequately skilled and possess the knowledge and expertise necessary to carry out their function, in particular where staff are responsible for implementing AML/CFT controls, whether in the compliance or front-line functions.

148. The level of vetting procedures of staff should reflect the ML/TF risks to which individual staff are exposed and not focus merely on senior management's roles. Steps should be taken to manage potential conflicts of interest for staff with AML/CFT responsibilities.

Training and awareness

149. The effective application of AML/CFT policies and procedures depends on the understanding of securities providers' staff of the relevant requirements and accompanying processes they are required to follow and the risks these processes are designed to mitigate. This training is designed to mitigate potential ML/TF risks occurring by, at or through a securities provider. Staff should receive AML/CFT training, which should be:

a) Relevant to the securities provider's ML/TF risks and business activities and up to date with the latest legal and regulatory obligations and internal controls;

b) Obligatory for all appropriate staff, including senior management;

c) Tailored, where applicable, to particular lines of business within the securities provider, equipping staff with a sound understanding of specialised ML/TF risks they are likely to face and their obligations in relation to those risks. This may be particularly important with regard to staff responsible for identifying fraud and market abuse, which may be reportable as a suspicious transaction;

d) Effective, as measured, for example, by requiring staff to pass tests as part of the training or by monitoring levels of compliance with the securities provider's AML/CFT controls and applying appropriate measures where staff are unable to demonstrate the level of knowledge expected;

e) Regular, relevant, and not a one-off exercise when staff are hired, in line with INR.18; and

f) Complemented by AML/CFT information and updates that are disseminated to relevant staff, as appropriate.

150. Overall, the AML/CFT training should also seek to build a culture in which compliance is embedded in the activities and decisions by its staff. Training may also be provided by a third party, though the securities provider remains responsible for the quality of the training.

SECTION III – GUIDANCE FOR SUPERVISORS

151. The RBA to AML/CFT aims to develop prevention or mitigation measures that are commensurate to the ML/TF risks identified. For supervision, this applies to the way supervisory authorities allocate their resources and conduct supervisory tasks to facilitate the application of a risk-based approach by securities providers.

THE RISK-BASED APPROACH TO SUPERVISION

152. R.26 requires countries to subject securities providers to adequate AML/CFT regulation and supervision. INR.26 requires supervisors to allocate supervisory resources to areas of higher ML/TF risk, based on supervisors' understanding of the ML/TF risks in their country, and to have on-site and off-site access to all information relevant to determining a securities provider's risk profile. There is a higher supervisory standard for the supervision of institutions subject to core principles.

Box 2. Recommendation 26: Regulation and Supervision of Financial Institutions

[…..] For financial institutions subject to the Core Principles, the regulatory and supervisory measures that apply for prudential purposes, and which are also relevant to money laundering and terrorist financing, should apply in a similar manner for AML/CFT purposes. This should include applying consolidated group supervision for AML/CFT purposes.

Other financial institutions (for intermediaries) should be licensed or registered and adequately regulated, and subject to supervision or monitoring for AML/CFT purposes, having regard to the risk of money laundering or terrorist financing in that sector. […..]

Additional sources of information

- Joint Guidelines on the characteristics of a risk-based approach to anti-money laundering and terrorist financing supervision, and the steps to be taken when conducting supervision on a risk-sensitive basis - The Risk-Based Supervision Guidelines published by the European Supervisory Authorities (April 2017).
- Principles on customer identification and beneficial ownership for the securities industry published by the IOSCO (May 2004).
- AML Guidance for collective investment schemes published by the IOSCO (October 2005).

Understanding ML/TF risk

153. Supervisors should understand the ML/TF risks to which the securities sector is exposed[30], and the ML/TF risks associated with securities providers, both at an individual firm level and a financial group level, and the different securities sub-

[30] Consistent with IOSCO Core Principle (ICP) 6.

sectors in which they operate. Supervisors should draw on a variety of sources to identify and assess ML/TF risks, including information from stock exchanges and self-regulatory bodies.

154. For sectoral risks, these are likely to include, but will not be limited to, the jurisdiction's national and sectoral risk assessments, domestic or international typologies and supervisory expertise, as well as FIU feedback.

155. For individual securities providers, supervisors should take into account the level of inherent risk for that provider including the nature and complexity of its products and services, size and business model, corporate governance arrangements, financial and accounting information, delivery channels, customer profiles, geographic location and countries of operation. Supervisors should also look at the controls in place, including the quality of the risk management policy, the effectiveness of the internal oversight functions, the history of the securities provider's compliance with regulations, STR reporting history (including quality, timing and volume of STRs submitted) and other open source information.

156. Some of this information should be obtained from the supervised entities (e.g. on the size, business model, location and nature of business). Some of this information can also be obtained through prudential supervision or routine supervisory oversight of the sector. Other information, which may be relevant in the AML/CFT context, includes the fitness and propriety of the senior management and the adequacy of the compliance function[31]. In some jurisdictions, this may involve information sharing and collaboration between prudential and AML/CFT supervisors or between different AML/CFT supervisors, especially when the responsibilities belong to two or more separate agencies.

157. Information from the securities providers' other stakeholders such as other supervisors, industry bodies, FIUs and law enforcement agencies may also be helpful in determining the extent to which a securities provider is able to effectively manage the ML/TF risk to which it is exposed.

158. Supervisors and other competent authorities should review their assessment of both the sector's and a specific securities provider's ML/TF risk profile periodically, and when a provider's circumstances change or new threats or vulnerabilities emerge. These could include, for example, new products and delivery channels that pose ML/TF risks, or the absence of local regulations to govern them sufficiently.

Mitigating ML/TF risk

159. The FATF Recommendations require supervisors to allocate more supervisory resources to areas of higher ML/TF risk. This means that supervisors should determine the frequency and intensity of periodic assessments based on the level of ML/TF risk to which the sector and individual securities providers are exposed. It also means that where detailed supervision of all securities providers for AML/CFT purposes is not feasible, supervisors should give priority to the areas posing higher risk, either in the individual securities provider or to securities providers operating in a particular sector.

31 As specified in ICP 3.

160. Examples of ways in which supervisors can adjust their approach include:

a) **Performing additional enhanced checks, as appropriate, as part of their authorisation function:** supervisors can adjust the level of information they require to prevent criminals or their associates from holding a significant or controlling interest in a securities provider. Where the ML/TF risk associated with the applicant is considered low (e.g. due to ownership structure, nature of business and role in a securities transaction), the associated opportunities for ML/TF may also be limited and thus supervisors may decide to approve applications on a review of relevant documentation. Where the associated ML/TF risk is considered high, supervisors may ask for additional information and set out more elaborate processes, including for example face-to-face interviews, criminal record and background checks, liaisons with other authorities, etc.

b) **Adjusting the type of AML/CFT supervision:** supervisors should have both on-site and off-site access to all relevant risk and compliance information. To the extent permitted by their regime, supervisors can also determine the correct mix of on-site and off-site supervision. Off-site supervision alone may not be appropriate in higher risk situations.

c) **Adjusting the frequency and nature of ongoing AML/CFT supervision:** supervisors should adjust the frequency of AML/CFT supervision in line with the risks identified. They should combine periodic reviews and ad hoc AML/CFT supervision as issues emerge (e.g. due to information received from law enforcement or whistle-blowers). General supervisory findings on thematic areas (e.g. focused reviews of particular products or services or types of providers or customers, or particular areas of interest such as beneficial ownership, distribution channels used etc. by securities providers) may also inform these supervision decisions.

d) **Adjusting the intensity of AML/CFT supervision**: supervisors should determine the scope or level of supervision in line with the risks identified in order to assess the adequacy of a securities provider's policies and procedures. Examples of more intensive supervision could include detailed review of the implementation and adequacy of the provider's risk assessment, files on CDD and reporting, record-keeping policies and processes and internal auditing. This may also include interviews with operational staff, senior management and the board of directors and AML/CFT assessment in particular lines of business.

161. Supervisors should use their findings to review and update their ML/TF risk assessments and, where necessary, consider whether their approach to AML/CFT supervision and framework remains adequate. Whenever appropriate, these findings should also be communicated to the provider to enable them to enhance their RBA.

162. In line with R.26 and the application of the International Organisation of Securities Commissions (IOSCO) Core Principles relevant for AML/CFT[32], securities supervisors should consider the results of other prudential or financial supervision in their AML/CFT supervisory activities. Similarly, they should check that the broader

[32] IOSCO Principles 24, 28, 29 and 31; and Responsibilities A, B, C and D.

prudential findings that drive the overall supervisory strategies of securities providers are informed by, and adequately address, the findings of the AML/CFT supervisory programme.

163. FATF R.27 and R.35 requires supervisors to have the power to impose adequate sanctions on securities providers and intermediaries when they fail to comply with AML/CFT requirements. Supervisors should use proportionate actions, including a range of supervisory interventions; remedial/corrective actions to ensure proper and timely correction of identified deficiencies and punitive sanctions for more egregious non-compliance, taking into account that identified weaknesses can have wider consequences. Generally, systemic breakdowns or significant failure in controls will result in a more severe supervisory response.

AML/CFT supervision of securities providers in a cross-border context

164. For cross-border supervision, supervisors of the home jurisdiction should have access to the customer, account and transaction information maintained by the financial institution in the host jurisdiction, to the extent permissible under the legal frameworks of both jurisdictions. This should include STR or STR-related information, where this is necessary to assess compliance with AML/CFT obligations and the robustness of risk management procedures. While host supervisors will be assessing compliance with local laws and obligations, home supervisors should have the ability to assess compliance with group-wide AML/CFT policies and procedures.

165. Lack of such access may inhibit the ability of the home supervisor to effectively assess group compliance, thereby affecting the effective implementation of FATF Recommendations. If the reasons for the denial of access prove to be insurmountable and there are no satisfactory alternative arrangements, the home supervisors should inform the host supervisor that the financial institution may be subject to additional supervisory actions. This could result in enhanced supervisory measures on the group, including, as appropriate, requesting the parent group to close down its operations in the host country.

166. In adopting a RBA to supervision, countries and competent authorities may consider allocating supervised entities sharing similar characteristics and risk profiles into groupings for supervision purposes. Examples of characteristics and risk profiles could include the size of business, type of customers serviced, geographic areas of activities and delivery channels. The setting up of such groupings could allow competent authorities to take a comprehensive view of the securities sector, as opposed to an approach where the supervisors concentrate on the individual risks posed by the individual securities provider or intermediary. If the risk profile of a securities provider or intermediary within a grouping changes, the supervisor may reassess the supervisory approach, which may include removing the securities provider or intermediary from the grouping.

SUPERVISION OF THE RISK-BASED APPROACH

General approach

167. Supervisors should encourage and monitor securities providers' adoption of a RBA that is in line with the FATF recommendations, and that is risk-appropriate given the provider's respective business models, size of operations, and operating environments.

168. Supervisors should note that under the RBA, particularly in the securities sector, given the diversity in size, scale of operations, business models and domestic regulatory requirements, there may be valid reasons for differences in securities providers' controls. There is therefore no one-size-fits-all approach; proportionality is an important element to be considered. In evaluating the adequacy of their RBA, supervisors should take into consideration the merits of these differences.

169. The securities sector is inter-connected with the rest of the financial system, in particular the banking system. Supervisors should get a good understanding of the effect of such interconnections on the ML/TF risk of the securities providers, and make appropriate adjustments where necessary to the supervisory RBA.

170. The task of supervising the implementation of the risk-based approach is a challenging one. To be effective, the following are some of the necessary preconditions:

- **Adequate understanding of ML/TF risk in the sector, sub-sector and individual firms.** Supervisors should adopt measures to acquire and maintain adequate and up to date knowledge of the ML/TF risks faced by the industry. They should have a thorough understanding of the higher and lower risk lines of business. This understanding should help supervisors form a sound judgment about the proportionality and adequacy of AML/CFT controls.
- **Adequate resources and skillsets.** Supervisors should have adequate financial, human and technical resources to properly conduct the risk-based supervision. In assessing the adequacy of resources, considerations include the size and complexity of the sector and the level of ML/TF risks faced by the sector.
- **Strong supervisory focus on effective implementation of controls by securities providers.** Basic compliance with the relevant laws and regulations is necessary but not sufficient. For an effective RBA, supervisors should also focus on assessing the quality of the securities providers' controls and effectiveness of their implementation to mitigate the ML/TF risks. Supervisors should clearly articulate and communicate their expectations, including the necessary rectification measures where there are deficiencies in providers' controls.

171. Examples of supervisory practices adopted in a number of countries for implementation of the RBA in the securities sector are set out in Annex A.

Training

172. Training is important for the supervision staff to understand the securities sector and the various business models that exist. In particular, supervisors should ensure that the staff are trained to assess the quality of a securities provider's ML/TF risk assessments and the adequacy, proportionality, effectiveness, and efficiency of the securities provider's AML/CFT policies, procedures and internal controls in light of its risk assessment.

173. Training should allow the supervisory staff to assess and form sound judgments about the quality of the securities provider's risk assessment and effectiveness of the securities provider's AML/CFT control. It should also aim at achieving consistency in the supervisory approach at the national level in case of multiple competent supervisory authorities or when the national supervisory model is devolved or fragmented.

174. Given the diversity and complexity within the securities sector (e.g. due to emergence of new business models and technologies), supervisory authorities should conduct continuous training programmes for supervisors, so that they can develop and maintain their proficiency. A training programme could include the following topics:

a) General AML/CFT issues;

b) Business models of various sub-segments of the securities sector (e.g. broker-dealers, fund managers) and the associated ML/TF risk issues;

c) Interaction among the various sub-segments of the securities sector, and with other parts of the financial system (e.g. the banking system), as well as the impact on the scale and nature of ML/TF risks;

d) International regulatory actions, such as economic sanctions;

e) National and international supervisory cooperation mechanisms; and

f) Other pertinent issues (e.g. implementation of common reporting standards, enhancing transparency of beneficial ownership, and the effect of financial technology developments on ML/TF risks).

Guidance and Feedback

175. Supervisors should communicate their expectations of financial institutions' compliance with their legal and regulatory obligations. This could be done through a consultative process after engaging with relevant stakeholders. This guidance may be in the form of high-level requirements based on desired outcomes, risk-based rules, and information about how supervisors interpret relevant legislation or regulation, or more detailed guidance about how particular AML/CFT controls are best applied. Guidance issued to securities providers should also discuss ML/TF risk within their sector and also outline ML/TF indicators (transactional and behavioural) in order to help them identify suspicious transactions.

176. Where supervisors' guidance remains high-level and principles-based, this may be supplemented by further guidance written by the industry, which may cover operational issues, and be more detailed and explanatory in nature. Securities

providers should note, however, that the private sector guidance they take into consideration should be consistent with national legislation and with any guidelines issued by competent authorities and international standards.

177. Supervisors should communicate with other relevant domestic regulatory and supervisory authorities to secure a coherent interpretation of the legal obligations and to minimise disparities. This is particularly important where more than one supervisor is responsible for supervision (e.g. where the prudential supervisor and the AML/CFT supervisors are in different agencies or in separate divisions of the same agency). Multiple guidance should not create opportunities for regulatory arbitrage, loopholes or unnecessary confusion among securities providers. When possible, relevant regulatory and supervisory authorities should consider preparing joint guidance.

178. To the extent possible, supervisors and FIUs should provide timely feedback to securities providers on effectiveness of their monitoring/reporting systems, quality of STRs filed and AML/CFT controls in general. A well-defined and institutionalised feedback mechanism can enhance the effectiveness of the monitoring and surveillance system to capture as many suspicious transactions as possible while efficiently avoiding too many false-positives. Guidance on potential risk indicators in the securities sector, in consultation with the industry, where feasible, can also be considered.

ANNEX A. EXAMPLES OF COUNTRIES' SUPERVISORY PRACTICES FOR THE IMPLEMENTATION OF THE RBA IN THE SECURITIES SECTOR

Canada

179. As the AML/CFT supervisor in Canada, FINTRAC issues sector specific workbooks that help reporting sectors design a risk-based approach that is tailored to their business, including for securities: http://www.fintrac-canafe.gc.ca/guidance-directives/compliance-conformite/rba/rba-sec-eng.asp.

Guernsey

180. Guernsey is an international finance centre with a significant collective investment funds sector. There are more than 800 Guernsey domiciled funds authorised or registered by the Commission, which is the regulatory authority responsible for AML/CFT, conduct and prudential supervision of Guernsey's financial services sector.

181. Prudential and conduct supervision is undertaken by sector specific supervisory divisions with a dedicated AML/CFT supervisory division responsible for risk-based AML/CFT supervision across the industry as a whole. The AML/CFT supervisory division works closely with the relevant supervisory divisions. This collaboration includes sharing prudential, conduct and AML/CFT issues because of the crossover implications an issue may have for both supervisory teams, and in undertaking joint onsite inspections to optimise its resources.

182. The AML/CFT supervisory division also undertakes its own onsite inspections depending upon the firm's ML/TF risk profile, which is assessed annually utilising business and compliance data received from the firm, together with open source and confidential information available to the Commission, such as information from Guernsey's FIU. Each Guernsey fund must appoint a designated fund administration company which is responsible for discharging the fund's AML/CFT obligations, and in particular for the initial and ongoing customer due diligence on investors into the fund. Five of these administration firms administer approximately half of the assets under management in the funds sector. These administrators are subject to structured supervisory engagements, including onsite inspections at least every three to four years, under the Commission's risk-based supervisory model.

183. Smaller administration firms are subject to less frequent structured supervisory engagements, the Commission uses thematic reviews to assess key issues on a firm and sector basis. As an example, the prudential and AML/CFT supervisory divisions undertook a joint thematic supervisory review of this sub-sector to analyse and assess the effectiveness of the governance, risk and compliance frameworks within these administration firms for managing both ML/TF and prudential risks. Whilst individual findings were raised with the relevant firm, anonymised findings together with examples of good and poor practice were published in a report on the thematic review to assist the whole industry in its development of effective AML/CFT controls. The Commission monitors the external use of its website and it recorded 801 online views of the report in the first two weeks after its publication. The thematic exercise also provided information for the Commission to use in its presentations to industry.

184. The AML/CFT supervisory division has also undertaken AML/CFT themed reviews on the provision of AML/CFT training within the industry.

Ireland

Central Bank of Ireland's AML/CFT Supervision of the Funds Sector

185. There are approximately 7,000 funds authorised by the Central Bank of Ireland (the Central Bank). Each fund is required to appoint an Irish authorised Fund Service Providers (FSPs) to administer the fund. The FSP is often the point of contact in the customer relationship between the investor and the fund. When appointing an FSP, the fund will typically contract the FSP to provide certain AML/CFT services to the fund; however this does not absolve the fund from its own obligations.

186. In order to utilise its supervisory resources in the most effective manner and maximise supervisory coverage, the Central Bank's AML/CFT supervisory strategy is to supervise funds through supervisory engagement of FSPs. Five FSPs account for almost 85% of the total amount of assets of Irish authorised funds. While the Central Bank's minimum AML/CFT supervisory engagement model provides for on-site inspections of FSPs at least once every five years, these five FSPs are subject to an on-site inspection at least once every three years. In addition, these five FSPs are also subject to an AML/CFT review meeting at least once every two years and are required to complete an online AML/CFT return at least once every two years. This supervision strategy enables the Central Bank to regularly assess the AML/CFT control framework of both the funds and the FSPs, through sample testing, interviews and reviews of policies and procedures. The Central Bank has also has a dedicated relationship manager for the funds industry to deal promptly and effectively with any issues that may arise on occasion.

187. The Central Bank's supervisory engagements are complemented by an AML/CFT communications and outreach programme to the funds sector. This includes presentations by the Central Bank at a number of industry events each year, as well as the publication of bulletins and reports that set out in aggregate and anonymised form the findings from the Central Bank's supervisory engagements. The publications also state the Central Bank's expectations around AML/CFT compliance.

Hong Kong, China

Securities and Futures Commission's AML/CFT Supervision Securities Sector

188. The Securities and Futures Commission (the "SFC") of Hong Kong conducts on-site inspections and employs various off-site monitoring tools to supervise licensed firms' compliance with AML/CTF requirements and monitor their ML/TF risks. The frequency, intensity and scope of the inspection and off-site monitoring carried out on an individual firm vary with, and are proportionate to, the risk level of the firm assessed based on a number of risk and impact factors. The SFC also conducts enforcement actions in relation to suspected breaches of AML/CFT legal and regulatory requirements and related internal control failures, for which a range of remedial measures and dissuasive sanctions may be imposed.

189. The SFC places emphasis on senior management responsibility (Manager-In-Charge or MIC), with detailed expectations regarding compliance and control functions that are relevant to MICs for AML/CFT as set out in the SFC's AML/CFT guidelines. If an MIC fails to ensure that the licensed firm complies with AML/CFT

requirements, the failure may render the MIC liable to disciplinary sanctions (e.g. pecuniary fine and reprimand) imposed by the SFC. SFC's investigations will, whenever appropriate, focus on the culpability of individuals with oversight of the AML/CFT function and other core functions.

190. The SFC places emphasis on sharing its supervisory observations, and signalling to all licensed firms its regulatory priorities and the focuses of compliance inspections. The goal is to promote and assist the efforts of licensed firms and their senior management in discharging their responsibilities. To this end, the SFC has initiatives in place to alert the industry of different areas of compliance concern from time to time. This includes communicating supervisory findings to the industry via circulars and seminars.

191. The SFC also provides transparency of its enforcement actions by issuing press releases on its enforcement actions. In disciplinary cases, a copy of the Statement of Disciplinary Action summarising the material facts and conclusion of a disciplinary action is available on the SFC's website.

Luxembourg

192. Luxembourg Investment funds and their Luxembourg Investment Fund Managers as well as service providers established in Luxembourg are obliged entities under the applicable AML/CFT framework. The CSSF is the competent supervisory authority for all the entities falling under its remit. The Luxembourg investment fund industry is notably characterised by its cross-border distribution nature. Thus, subscription into Luxembourg-based funds is often performed through intermediaries acting on behalf of their own customers in other countries.

193. Consequently, the supervisory approach of the CSSF has been tailored to take into account this operational reality and it requires the investment funds, their Investment Fund Managers, or where applicable, any proxy, to perform AML/CFT enhanced due diligence on those intermediaries.

194. The AML/CFT supervisory approach of the CSSF takes into account the roles and responsibilities of the several parties involved in the investment fund industry. The supervisory life cycle starts with AML/CFT controls performed at licensing, continuing on an ongoing basis through off-site and on-site supervisory actions. For instance, dedicated on-site inspections are performed at the level of the Investment Fund Managers as they often decide on the channels and countries of distribution of the funds. These on-site inspections are complemented by supervisory actions on-site and off-site at the level of Luxembourg service providers such as at registrar and transfer agents and at the custodian/depositary bank of the funds.

195. The CSSF's AML/CFT Risk Based Supervisory ("RBS") approach to the sector is subject to a continuous improvement. Lastly, through the addition of two new components. First, an Automatic Score, calculated from a dedicated AML/CFT online questionnaire filled in by investment fund managers, registrar and transfer agents and depositary banks. Second, through an internal Expert Judgement Score. The combination of both sources aims at providing a final score, taking into account several risk criteria and respective mitigation measures implemented by the obliged entities. The RBS is a dynamic process in that the score of an entity may be changed at any point of time, if affected by new information or trigger events. This enables the CSSF to adapt its supervisory actions to emerging threats.

196. Furthermore, the CSSF maintains a database of main findings identified during its AML/CFT onsite inspections and shares them with the private sector on an anonymous basis through its annual reports. Other interactions with the private sector take place notably via regular meetings with obliged entities, events with professional associations, and the publication of AML/CFT guidance through CSSF circulars. In addition, the CSSF makes contact with other competent authorities within Luxembourg and abroad in order to discuss AML/CFT matters and to exchange information through Memoranda of Understanding.

Mexico

National Banking and Securities Commission's AML/CFT Supervision of Securities Sector and guidance provided for the implementation of the RBA

197. The National Banking and Securities Commission's (the "CNBV") of Mexico is responsible for the licencing and registration, prudential and AML/CFT supervision for the brokerage firms, investment funds and investment advisors. CNBV supervises other financial institutions as well, such as banks, savings and loan companies, money transmitters, among others.

198. The AML/CFT supervision consists of on-site inspections and off-site monitoring in order to verify the securities providers and intermediaries' compliance with AML/CFT requirements and monitor their ML/TF risks. The RBA on supervision is applied at different levels and stages of the supervision process. Off-site monitoring activities are carried out for all supervised entities. However, depending on their ML/TF level of risk, additional supervision measures are taken.

199. CNBV has a methodology that measures the ML/TF risks for all supervised entities considering the inherent risk for both ML/TF (two separate measures are performed, and the results are combined to obtain the entities ML/TF inherent risk), taking into account information provided by the entities themselves, the prudential supervisors and other authorities, such as the FIU, other supervisors and the federal law enforcement agency (PGR). The results of previous supervision actions are considered as the evaluation of their mitigating measures, which may reduce the inherent risk. Other factors are considered as risk intensifiers that may increase the inherent risk, such as the non-compliance with periodic obligations, findings indicated in the annual audit report, low quality of the STRs, obtaining at the end the residual risk for each entity.

200. The annual on-site visiting program takes into account the results from the aforementioned methodology and other additional factors, such as the systemic relevance and those related to special concerns from the AML/CFT and prudential supervision. With the resulting ratings, it is decided which entities will have stronger supervisory actions, starting with the on-site visits from the AML/CFT supervisors, on-site visits from the prudential supervisors including some specific AML/CFT topics, and continuing with other off-site additional monitoring programs.

201. Once the annual on-site visiting program is defined under a RBA, for each on-site visit it is necessary to identify the mitigating measures that are going to be revised considering as well a RBA. A document called "entity's diagnostic" is executed at least one month in advance from the on-site visit including all the CNBV's available information as well as information from the FIU, and considering all the gathered elements, the visit strategy (intensity and scope) is defined. Additionally, during the

on-site visit the selection of the entity's clients for a deeper revision is made based on the risk they represent for the entity itself, meaning another way to implement the RBA in the supervision process.

202. In 2017, the AML/CFT legal provisions in Mexico were modified in order to include as an obligation the design, implementation and assessment of an internal RBA for all entities supervised by the CNBV. In order to give guidance on the implementation of this new obligation, the CNBV has put into practice several actions:

- Issue a guideline in order to explain in a more detailed manner what is expressed in the legal provisions in terms of how to accomplish the design, implementation and assessment stages for their internal RBA.
- Organize forums by supervised sector in order to give some examples of how to apply the RBA given each sector's specific characteristics, including, products, type of clients, distribution channels and geographic areas of operation.
- Publish a video-tutorial with the most important information from the forums in the previous bullet, in order to have a wider range of reach among all the supervised entities, especially for those who were unable to assist to those forums.
- Carry out workshops where the supervisor's expectations regarding this new obligation are clarified and to perform some exercises for the design of the RBA methodology and supervisor's feedback regarding these exercises.
- Release the supervisor's on-site visit guidelines for all the supervised entities to make more transparent the supervision process and the entities could be aware of the supervisor's expectations in terms of compliance of all their AML/CFT obligations, especially regarding this new one.

USA

203. The SEC conducts examinations of SEC registrants using a risk‐based approach. A firm may be selected for examination for any number of reasons including, but not limited to, a tip, referral, or complaint; the firm's risk profile; or in connection with a review of a particular compliance risk area. The reason why firms have been selected for examination is non-public information, and typically will not be shared with the firm under examination. ML risks, among others, may be considered in developing a firm's risk profile and the scope of each examination.

204. During examinations, SEC examiners seek to determine whether the entity being examined is, among other things, conducting its activities in accordance with the federal securities laws and the rules thereunder, the bank secrecy act as applicable and the rules of self-regulatory organizations (SRO).

205. Over the past several years, the SEC exam group has recruited industry experts to enhance the national examination program's technology and data analytics and thus advance its risk-based examination approach. The examination staff is increasingly incorporating into its AML reviews such enhanced technology and tools to review vast amounts of data so that the staff can identify suspicious activity from the source trade data rather than relying on the broker-dealer's surveillance reports. The staff can compare the activity it identifies to activity identified by the firm, to test

for weaknesses in a firm's monitoring and reporting of suspicious activity, including assessing the reasonableness of the parameters set by firm. Thus, rather than a simple verification of an AML program's existence, examiners can perform nuanced assessments of the quality of the program.

206. FINRA, the SRO for US broker-dealers, has supervisory duties over approximately 3 700 brokerage firms and 6 29 000 registered securities representatives and conducts the majority of broker-dealer AML examinations. FINRA also examines its member firms on a routine basis for compliance with its rules (including its own AML rule) and the federal securities laws, related to both sales practices and financial operations in its Firm Examination Program. The Firm Examination Program is risk-based, and the frequency of an examination of a member firm is determined through a risk assessment. Thus, a member firm may be examined pursuant to a one or four-year cycle, with higher risk and higher impact firms being examined each year, with a frequency no less than every four years for all firms. AML may be considered for inclusion based on an assessment of risk at that particular firm. When AML is selected for review on a Firm Examination, reviews for particular areas of AML compliance can be narrowly or broadly focused, depending on the specific risks posed by the firm.

207. Firms also may be examined for compliance with certain AML rules and regulations through a Cause Examination or as part of a Sweep Examination, which may encompass multiple firms. Cause Examinations are initiated through terminations for cause, tips, referrals from other regulatory agencies, complaints or by identifying high-risk activity through data analysis. Ongoing risk monitoring is conducted on all FINRA member firms, which includes reviews for compliance with AML-related rules and regulations.

208. In addition, in 2013, FINRA established an AML Investigative Unit to conduct examinations where highly complex or novel money-laundering and AML compliance program concerns exist. In addition to conducting examinations, these AML regulatory specialists provide technical assistance to other examiners and constantly pursue an expansion of knowledge and professional development in the AML arena. The AML Investigative Unit also provides training and education to FINRA staff members and members of the brokerage industry. FINRA has found that this approach leads to better-informed examiners and higher-quality exams.

ANNEX B. SUSPICIOUS ACTIVITY INDICATORS IN RELATION TO SECURITIES

This Annex provides examples of suspicious indicators in relation to securities, which may trigger filing of STRs and/or require additional CDD measures, including further investigation and ongoing monitoring, before a decision on filing is made by the securities provider. This is not an exhaustive list; each element may not be relevant in all countries, for all securities providers, for different customer relationships (retail vs. institutional), or for all business activities described in this document.

I. Product/Customer transactions suspicious activity indicators

1. Transactions do not have apparent economic rationale.
2. Transactions appear to be undertaken in a structured, sequential manner in order to avoid transaction monitoring/reporting thresholds.
3. A concentration ratio of transactions relating to a particular and/or higher risk jurisdiction that is notably higher than what is to be expected considering its normal patterns of trading of a customer.
4. Frequent trades resulting in losses for which the customer appears to have no concern.
5. Sudden spike in transaction volumes, which deviates from previous transactional activity absent any commercial rationale or related corporate action event.
6. Mirror trades or transactions involving securities used for currency conversion for illegitimate or no apparent business purposes.
7. A pattern of securities transactions indicating the customer is using securities trades to engage in currency conversion. Examples of securities that can be used in this manner include dual-currency bonds, American Depositary Receipts (ADRs) and foreign ordinary shares traded in the Over-the-Counter Market.
8. Securities transactions are unwound before maturity, absent volatile market conditions or other logical or apparent reason.
9. Trading or journaling in the same security or securities between numerous accounts controlled by the same people (e.g. potential wash sales and/or directed trading).
10. Two or more unrelated accounts at the securities firm trade an illiquid or low-priced security suddenly and simultaneously.
11. Purchase of a security does not correspond to the customer's investment profile or history of transactions (e.g. the customer may never have invested in equity securities or may have never invested in a given industry) and there is no reasonable business explanation for the change.
12. Transactions that suggest the customer is acting on behalf of third parties with no apparent business or lawful purpose.

13. Funds deposited for purchase of a long-term investment followed shortly by a customer request to liquidate the position and transfer the proceeds out of the account.

II. Distribution channel suspicious activity indicators

1. Intermediaries whose transaction volume is inconsistent with past transaction volume absent any commercial rationale or related corporate action event.
2. A transaction pattern indicating a value of transactions just beneath any applicable reporting threshold.
3. Unclear or complex distribution channels that might limit the ability of the investment fund or asset management company to monitor the transactions (e.g. use of a large number of sub-distributors for distributions in third countries)

III. Selected indicators of suspicious trading or market manipulation

1. Making a large purchase or sale of a security, or option on a security, shortly before news or a significant announcement is issued that affects the price of the security, which may be suggestive of potential insider trading or market manipulation.
2. A request is made to execute and/or clear a buy order and sell order for the same security or similar or correlated securities (and/or on behalf of the same beneficial owner), in close chronology.
3. Accumulation of stock in small increments throughout the trading day to increase price.
4. Engaging in prearranged or other non-competitive securities trading, including wash or cross trades of illiquid or low-priced securities.
5. Marking the closing price of a security.
6. Front-running suspected with regard to other pending customer orders.

IV. Suspicious indicators associated with CDD and interactions with customers

1. Customer has no discernible reason for using the securities provider's services or the firm's location (e.g., customer lacks ties to the local community or has gone out of the way to use the firm).
2. Customer's legal or mailing address is associated with other, apparently unrelated, accounts.

3. Locations of address of the customer, bank or financial institution seem unconnected to the customer and little or no explanation can be given by the customer for the disparate addresses.
4. Customer is a trust, shell company, or private investment company that is reluctant to provide information on controlling parties and underlying beneficiaries.
5. Customer is a legal person having issued bearer securities for a large part of its capital.
6. Customer is publicly known to have criminal, civil or regulatory proceedings against it for corruption, misuse of public funds, other financial crimes or regulatory non-compliance, or is known to associate with such persons. Sources for this information include news items or Internet searches.
7. Customer's background is questionable or differs from expectations based on business activities.
8. Customer has been rejected or has had its relationship terminated as a customer by other financial services firms.
9. Customer's account information reflects liquid and total net worth that does not support substantial account activity.
10. Customer maintains multiple accounts, or maintains accounts in the names of family members or corporate entities with no apparent business or other purpose.
11. Non-profit or charitable organizations engage in financial transactions for which there appears to be no logical economic purpose or in which there appears to be no link between the stated activity of the organization and the other parties in the transaction.
12. Customer is reluctant to provide information in relation to its identity and/or transactions.
13. Customer is reluctant to provide information needed to file reports to proceed with the transaction or requests an inordinate amount of secrecy around a transaction.
14. Customer exhibits unusual concern with the firm's compliance with government reporting requirements, the firm's systems or the firm's AML/CFT policies and controls.
15. Customer tries to persuade an employee not to file required reports or not to maintain the firm's required records.
16. Law enforcement or regulators have issued subpoenas and/or freeze letters regarding a customer and/or account at the securities firm.
17. Customer wishes to engage in transactions that lack business sense or apparent investment strategy, or are inconsistent with the customer's stated business strategy.
18. Customer does not exhibit a concern with the cost of transactions or fees (e.g. surrender fees, higher than necessary commissions) or of investment losses.

V. Suspicious indicators in deposits of securities, particularly low-priced securities; these can often be indicators of low-priced securities fraud, distribution of an unregistered offering, or market manipulation schemes

1. Customer opens a new account and deposits physical certificates or delivers in shares electronically representing a large block of thinly traded or low-priced securities.
2. Customer has a pattern of depositing physical shares certificates or a pattern of delivering in shares electronically, immediately selling the shares and then wiring or otherwise transferring out the proceeds of the resale(s).
3. A sudden spike in investor demand for, coupled with a rising price in, a thinly traded or low-priced security.
4. The lack of a restrictive legend on shares physically or electronically deposited seems inconsistent with the date the customer acquired the securities, the nature of the transaction in which the securities were acquired, the history of the stock, and/or the volume of shares trading.
5. Customer with limited or no other assets at the firm receives an electronic transfer or journal transfer of large amounts of low-priced, non-exchange-listed securities.
6. Customer's explanation of how the customer acquired the securities does not make sense or changes.
7. Customer deposits physical securities or delivers in shares electronically and requests to journal the shares into multiple accounts that do not appear to be related, or to sell or otherwise transfer ownership of the shares.

VI. Movement of funds or securities

1. The securities account is used for payments or outgoing wire transfers with little or no securities activities (i.e. account appears to be used as a depository account or a conduit for transfers with no reasonable business explanation for such).
2. Funds are transferred to financial or depository institutions other than those from where the funds were initially received, specifically when different countries are involved.
3. Customer "structures" deposits, withdrawals or purchase of monetary instruments below a certain amount to avoid reporting or recordkeeping requirements.
4. Customer engages in excessive journal entries of funds or securities between related or unrelated accounts without any apparent business purpose.

5. Payment by third party check or money transfer from a source that has no apparent connection to the customer.
6. Customer uses a personal/individual account for business purposes.
7. Payment to a third party to which the customer has no apparent connection.
8. Frequent transactions involving round or whole dollar amounts.
9. The customer requests that certain payments be routed through nostro[33] or correspondent accounts held by the financial intermediary instead of its own accounts.
10. Funds transferred into an account that are subsequently transferred out of the account in the same or nearly the same amounts, especially when origin and destination locations are high-risk jurisdictions.
11. A dormant account suddenly becomes active without a plausible explanation (e.g. large amounts are suddenly wired out).
12. Frequent domestic and international automated teller or cash machine activity out of character with the customer's expected activity.
13. Many small, incoming wire transfers or deposits made using checks and money orders that are almost immediately withdrawn or wired out in a manner inconsistent with the customer's business or history. This may be an indicator of, for example, a Ponzi scheme.
14. Wire transfer activity, when viewed over a period of time, reveal suspicious or unusual patterns.
15. Transfers of funds or securities are made to the same person from different individuals or to different persons from the same individual with no reasonable explanation.
16. Unusually large aggregate wire transfers or high volume or frequency of transactions are made with no logical or apparent reason.
17. Customer transfers/receives funds to/from persons involved in criminal or suspicious activities (as per the information available).
18. In/out transactions for substantial amounts on a short-term basis.
19. Receipt of unexplained amounts, followed, shortly thereafter, by a request to return amounts.
20. Frequent transfers of securities' ownership.
21. Use of bearer securities with physical delivery.
22. Frequent change of bank account details or information for redemption proceeds, in particular when followed by redemption requests.
23. The usage of brokerage accounts as long term depository accounts for funds.

[33] Nostro accounts are accounts that a financial institution holds in a foreign currency in another bank, typically in order to facilitate foreign exchange transactions.

FATF

GUIDANCE FOR A RISK-BASED APPROACH
SECURTIES SECTOR

The risk-based approach (RBA) is central to the effective implementation of the revised FATF International Standards on Combating Money Laundering and the Financing of Terrorism and Proliferation.

This Guidance focuses on RBA for the securities sector and includes an annex on suspicious activity indicators in relation to the securities sector. It takes into account the experience gained by public authorities and the private sector over the years in applying a RBA.

This Guidance should be read in conjunction with the FATF Report: Money Laundering and Terrorist Financing in the Securities Sector (October 2009), which outlines vulnerabilities in the sector.

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

1. Trade Based Money Laundering (TBML) was recognized by the Financial Action Task Force (FATF) in its landmark 2006 study as one of the three main methods by which criminal organizations and terrorist financiers move money for the purpose of disguising its origins and integrating it back into the formal economy. This method of money laundering (ML) is based upon abuse of trade transactions and their financing. The 2006 FATF Study highlighted the increasing attractiveness of TBML as a method for laundering funds, as controls on laundering of funds through misuse of the financial system (both formal and alternate) and through physical movement of cash (cash smuggling) become tighter.

2. In recent years APG members have continued to highlight vulnerabilities for TBML, but very few cases investigations or prosecutions appear to have been undertaken in the Asia/Pacific region and very few case studies had been shared.

3. The APG's TBML study aims to build on the existing studies, in particular those of the FATF, in order to study the extent of the prevalence of TBML and highlight current methods, techniques and modus operandi for TBML as well as to identify 'red flags' to detect and respond to TBML.

4. In determining the magnitude of TBML, the study considered why so few cases of TBML have been detected since the FATF's 2006 study. The Paper has sought to clarify and furnish explanations for terms and processes of 'trade finance' which are comprehensible to Money Laundering (ML) investigators.

5. This Paper has focused on TBML occurring in the course of international trade in goods. The study does not include in its scope capital flight, tax evasion, trade in services and domestic trade. The features of the dynamic environment that distinguish TBML from other forms of ML are its occurrence through intermingling of the trade sector with the trade finance sector in cross- border transactions. The foreign exchange market and the long supply chain make international trade particularly vulnerable to TBML.

6. The study included circulation of a questionnaire to APG and FATF members seeking statistically significant indicators. The Paper sets out a number of Case Studies to illustrate trends of TBML. Simplified explanations of the terms and processes of trade finance have been attempted through interaction with the private sector. A brief review of the literature on the subject generated by the FATF, FSRBs and other authors has been made.

7. There is a growing concern on how the rapid growth in the global economy has made international trade an increasingly attractive avenue to move illicit funds through financial transactions associated with the trade in goods and services. TBML is a complex phenomenon since its constituent elements cut across not only sectoral boundaries but also national borders. The dynamic environment of international trade allows TBML to take multiple forms.

KEY FINDINGS

8. Statistical analysis has been conducted on the basis of responses received on 64 questions from 19 jurisdictions and 1 organisation.

9. Few TBML cases have been reported. The extent of TBML in the region was not able to be accurately estimated in this study. However, during the course of the study it has become evident that TBML is a problem for many of the participating jurisdictions and has serious significance as an avenue to launder proceeds of crime.

10. There is lack of awareness and training on TBML among the jurisdictions. Training for those responsible for detection and investigation of TBML as well as to those who collect trade data and handle trade finance is critical to raise their awareness about TBML and build capacity to identify TBML.

11. Most jurisdictions do not distinguish TBML from other forms of ML. A major obstacle in devising strategies to tackle TBML has been the lack of reliable statistics relating to it. There is presently no standardization with regard to the practice of collection and maintenance of data on TBML. Trade related data is collected to serve purposes other than those of detecting TBML.

12. The lack of TBML investigators and absence of systems capable of cross-referencing trade and trade finance data are significant limitations. In most of the reporting jurisdictions customs authorities or equivalent collect and manage trade data but do not have the authority to conduct ML investigation.

13. Over 50% of the reporting jurisdictions indicate referrals from other agencies which trigger TBML investigations. Again, over 50% of the reporting jurisdictions seek information from international counterparts. However there are impediments in domestic coordination and international cooperation among the competent authorities. The main impediments which have been identified are requirement of maintaining confidentiality, delays in response and conveying of information with restrictions.

14. Reporting jurisdictions have listed a large number of patterns and red flags which this Paper has categorised in five broad groups viz. Trade Finance, Jurisdictions, Goods, Corporate Structure and Predicate Offences. The last four categories have been dealt with in the past papers under the broad category of trade. With regard to trade finance the important red flags relate to methods of payment and letters of credit. Existence of duty free zones and prevalence of high duty structure can make jurisdictions sensitive to TBML. The discrepancy about description, quality, quantity and value of the goods which are traded can be important red flags. Front or shell companies are often used as corporate structures to facilitate TBML. Tax evasion and customs offences are important predicate offences for TBML.

15. The trade finance products identified in this study reveal a menu of choices that are available to genuine traders to facilitate trade. Exporters and importers enter into an agreement to trade more often than not by way of cash payment or through some more

complex form of trade financing. Such trade finance products include bills of exchange, counter trade, letters of credit and open account facilities. A range of open account facilities may encompass factoring, forfaiting and other forms of credit. While the trade finance products were innovated to reduce trade transaction costs, their accessibility have also made them vulnerable to TBML abuse. Thus the trade in commodity has become as good as means of movement of cash and of transfer of funds to indulge in laundering.

16. Financial sector representatives indicate a trend toward the use of open account financing in trade. This has implications for detecting the abuse of trade finance for ML.

17. The case studies included in the Paper, besides identifying the elements of trade that facilitate TBML, also bring out the mechanisms of trade finance used in TBML. One case study highlights the financing of different segments of trade through diverse mechanisms of trade finance that can introduce risks in the trade transactions which are difficult to assess by financial institutions. The mechanisms of financing trade through factoring and through disbursement of trade credit to overseas suppliers are fraught with risks for financial institutions unless due diligence is exercised over the overseas trading partner, are brought out in another case study. Another case study shows how the operations of 'exchange houses' owned and controlled by criminals coupled with 'compromised' working of a bank make trade finance mechanisms means for indulging in TBML. There are other case studies which demonstrate the use of alternative remittance systems and of corporate structures to facilitate TBML. A final case study shows multiple forms of international trade and various mechanisms of trade finance which give inherent flexibility to criminals to adopt those forms and types which suit the demands of a situation.

18. The 2006 FATF Paper on TBML focused on trade based techniques used in TBML, which have been mentioned as over/under invoicing of goods, multiple invoicing of goods, over/under shipments of goods and false description of goods. These techniques need to combine with techniques which abuse trade finance mechanism, for TBML to occur. Four of these techniques have been identified in this paper as cash inflow based payment, third party payment, segmental modes of payment and alternative remittance payment.

POLICY OBSERVATIONS

19. Any strategy to prevent and combat TBML needs to be based on dismantling TBML structures while allowing genuine trade to occur unfettered. An emphasis on inter-agency coordination and international cooperation, needs to be adopted by policy-makers. A comprehensive strategy which takes into account sectoral peculiarities, agency specialization and jurisdictional frameworks can only address the challenges in tackling TBML.

20. There is a need to have common formatting for recording and maintaining trade-relevant statistics so that data sets can be analysed to identify trends related to TBML. Cross-referencing of data relating to trade and trade finance can be the starting point for adopting a risk based approach to identifying TBML. There is an acute need to correlate trade data

with the foreign exchange data to detect TBML and identify cases where value is in the form of goods without corresponding outgo of foreign exchange as payment.

21. Multiple agencies are involved either directly or indirectly in combating TBML. Levels of specialization in mandated roles to combat TBML varies. However, the strategy to prevent and combat TBML requires expertise created through the combination of all such authorities. One way-forward to combine the respective competencies of relevant authorities for combating TBML is to form domestic task-forces. Task-forces focused on TBML investigations will need to have the ability to utilize the expertise of each agency without compromising its functional skills.

22. There is an urgent need to strengthen the existing bilateral arrangements like Trade Transparency Units (TTUs) and to build multilateral mechanisms for international cooperation. The bilateral arrangements must ensure prompt exchange of information with regular follow-ups which should result in more efficient delivery. The multilateral mechanisms may entail equal commitment of all trading jurisdictions for coordination in matters relating to TBML.

23. TBML focused training is an absolute necessity for the anti-TBML strategy to succeed. Customs, ML investigating LEA, FIU, Tax Authorities and Regulators have all identified a pressing need for more focused training so that their personnel can have an adequate knowledge base to detect, prevent and combat TBML. The sharper focus on TBML in existing training programs can be brought about by incorporating specific topics which relate to TBML. The case studies, the red flags and typology papers on TBML may be disseminated during such programs. As trade essentially involves multiple jurisdictions, there is a need for Law Enforcement Officers to understand the legal and procedural aspects of other jurisdictions. Training should be aimed at making use of trade data analysis as well as cross referencing trade data with trade finance data and understanding any useful tools developed to identify trade anomalies which may lead to investigation and prosecution of TBML cases. Inter-linkages of tax frauds and customs violations with TBML also need to be explained.

CHAPTER I - SCOPE & COVERAGE

INTRODUCTION

24. The Asia/Pacific Group on Money Laundering (APG) produces regional typologies studies of money laundering (ML) and terrorist financing (TF) in the Asia/Pacific region. This is done to share information and support a better understanding of ML and TF methods, techniques and trends in the region.

25. Typologies of ML and TF allow Governments and the private sector to understand the nature of the ML and TF environment and design effective AML/CFT strategies to address threats. Typologies help APG members to implement effective strategies to investigate and prosecute ML and TF, as well as design and implement effective preventative measures.

26. Trade Based Money Laundering (TBML) has been recognized by the Financial Action Task Force (FATF) in its landmark study published in 2006, as one of the three main methods by which criminal organizations and terrorist financiers move money for the purpose of disguising its origins and integrating it back into the formal economy. This method of ML is based upon abuse of trade transactions and their financing. The FATF Study 2006 highlighted the increasing attractiveness of TBML as a method for laundering funds, compared with misuse of the financial system (both formal and alternate) and through physical movement of cash (cash smuggling).

27. The revision of FATF standards undertaken in 2003 entailed stricter controls on the financial system and on cash couriers, which may have had an unintended consequence of leaving the trade finance sector more vulnerable to ML and TF. The increasing volume, speed and value of global trade and the complexities inherent in trade transactions and in its financing arrangements coupled with limited awareness and understanding of how such trade can be abused, have made TBML an important avenue for moving illicit funds.

AIMS OF THE STUDY

28. The APG Annual Meeting in Kochi, India in July 2011 resolved to take-up further study on TBML as an APG Typology Study. The Study commenced with the following aims:

i) to build on the existing studies and in particular that of FATF published in 2006;
ii) to study the extent of the prevalence of TBML;
iii) to highlight current methods, techniques and modus operandi for TBML so as to short list 'red flags' to detect and respond to TBML; and
iv) to clarify and furnish explanations for terms and processes of 'trade finance' which are comprehensible to ML investigators.

SCOPE OF THE STUDY

29. It is useful to consider the fundamental elements of trade in goods that this study will consider when discussing TBML. Conceptually, trade can be broken into various elements which may be overlapping:

- arrangements to trade goods
- financial steps to facilitate the trade (financing, insurance, etc.)
- movement of goods
- reconciliation or settlement of financial accounts

30. TBML was defined by the FATF in 2006 as 'the process of disguising the proceeds of crime and moving value through the use of trade transactions in an attempt to legitimize their illicit origins.' The FATF Paper on Best Practices (2008) broadened the definition by stating, "TBML and terrorist financing (TBML/FT) refer to the process of disguising the proceeds of crime and moving value through the use of trade transactions in an attempt to legitimise their illegal origin or finance their activities." Such broadening of the definition, allows for illegal activities such as terrorist financing to be covered within the scope of TBML.

31. The FATF Study of 2006 excludes the coverage of the movement of money for tax avoidance, evasion and capital flight, on the grounds that such movement of funds usually involves transfer of legitimately earned funds across borders while TBML involves the 'proceeds of' or 'instruments of' crime. However, the FATF 2008, Paper on Best Practices does cover within the definition of TBML, the movement of licit funds for the purpose of illegal activities such as terrorist financing. This broadening of the definition, coupled with the intermingling of licit and illicit funds imply that the abuse of capital flight and the movement of funds for tax avoidance / evasion are within the scope of TBML.

32. This paper excludes consideration of domestic trade in its study of TBML. While the FATF definitions of TBML do not exclude domestic trade from their ambit, the framework chosen by this and other papers leaves domestic trade out of scope. This is not to deny that TBML can occur through domestic trade, however given that domestic trade is less regulated and large in terms of number of transactions, the time resource available to compile this Paper and the amount of 'noise' that exists in the domestic market does not allow for its coverage.

33. Whilst the definition of TBML being considered includes international trade in 'services' which has also been addressed in previous FATF Papers, trade in services and other intangibles is also out of scope of this Paper. The lack of standardization of the definition of 'services' and difficulties in estimating the 'fair value' of their provision, will not allow for its meaningful treatment in the present study. The project team believes that separate studies devoted to trade in services and other intangibles, keeping their peculiarities in view, are called for. The implications of the capital flight and the movement of funds for tax evasion for TBML need to be examined separately. Mechanisms like transfer pricing are still largely in the domain of taxation. Therefore the present Paper while adopting the

definition of TBML given by the Best Practices Paper 2008 of FATF does not include in its scope capital flight, tax evasion, trade in services and domestic trade.

34. The rapid expansion of global trade has increased the possibilities for TBML. Trade is the 'engine of growth' and ensures optimal use of resources. Thus the need to have a 'free and fair' trade regime has been emphasized. The dilemma which is faced by policy makers is the requirement to balance the needs of a free, fair and predictable trade regime with the needs for regulation of trade so as to prevent its abuse. Total Global Merchandise Trade stood in 2010 at US $ 30.729 Trillion {US $ 15.237 Trillion exports + US $ 15.492 Trillion imports}1 which indicates the potential for absorption and movement of funds of criminal origin through international trade and the need to study TBML.

35. One common thread running through studies of the FATF, of FATF-style regional bodies (FSRBs) such as the APG, and other literature is acknowledgement of the lack of awareness of TBML. Such studies have consistently highlighted difficulties in detecting TBML cases. A lack of understanding of those features of TBML that are distinct from other forms of ML is viewed as one reason for a lack of TBML cases. While acknowledging the commonalities between TBML and other forms of ML, attempts have been made in this Paper to identify a few distinguishing features of TBML. Recognition of such features may help develop better 'red flags', support increased awareness and lead to more detections.

36. Distinguishing features of the dynamic environment for TBML include:

a) TBML using international trade occurs over more than one jurisdiction, while other forms of ML may be only of a singular jurisdiction. **Cross border transactions** provide opportunities to take advantage of differences in legal systems of various jurisdictions. A jurisdiction may have less restrictive Customs checks (Free Trade Zones) and less stringent AML set-up than trading partner. The high volume, regularity and speed of international trade increase vulnerabilities.

b) TBML necessarily requires **intermingling of the trade sector with the finance sector.** Criminals take advantage of vulnerabilities of both the sectors. Merely having an AML regime for the finance sector becomes inadequate unless such a regime effectively covers the corresponding trade sector. Moreover, cross-referencing of trade-data, with that of trade finance becomes essential when investigating TBML.

c) International trade is denominated in terms of internationally acceptable currencies. Trade becomes exposed to the **vulnerabilities of the foreign exchange market.** The conversion of currency at market determined exchange rates enhance the scope for criminals to launder the proceeds of or instruments of crime.

d) The **long supply chain** necessary for international trade make the trade more vulnerable to TBML. This chain of manufacturer, trader, consigner, consignee, notifying party, financier,

[1] Source:(http://stat.wto.org/StatisticalProgram/WSDBViewData.aspx?Language=E

shipper, insurer and freight forwarder broaden the scope for abuse of the system by the criminals because of all the vulnerabilities that exist.

METHODOLOGY

37. The Methodology which has been adopted in this Paper has the following important elements:-

a) A Questionnaire was prepared and circulated among the jurisdictions for completion by relevant agencies (see Annex B). A statistical profile was drawn from responses to the questionnaire. However responses were received from only limited number of jurisdictions which has resulted in making the size of the sample small. Results based on a sample of small size may not be regarded as statistically significant. Nevertheless, the statistical responses have brought the project team to the conclusion that there are commonalities amongst various jurisdictions with regard to the challenges in understanding and tackling TBML.

b) Case studies were sought as part of the questionnaire. APG members' Typology Status Reports from previous year were examined for cases and other reference materials. A limited number of case studies were reported. Those case studies have been used to appreciate the recent trends of the modus-operandi and techniques adopted for TBML as well as to develop 'red flags'.

c) Terms and 'processes of trade finance' have been examined and simplified explanations have been attempted so as to make these comprehensible for investigators. This is considered an important feature of this study as TBML is a complex subject and lawmakers and investigators alike find it difficult to understand the terms and processes of international trade and its financing arrangements. In this regard the Project Team interacted with the private sector.

d) A brief review of some of the literature on the subject has been made. Existing studies on the subject made by the FATF, FSRBs and other organizations have been examined in an attempt to take this body of research forward.

FRAMEWORK

38. Chapter II of this paper considers issues categorized into four areas of concern.

(i) What is the extent of TBML in specific jurisdictions, regions and across the globe?
(ii) What should be the roles, responsibilities of investigating agencies and other allied agencies to tackle TBML?
(iii) What are the best practices (preventative measures) to effectively deal with TBML? and
(iv) What are those features of TBML which can make it possible to discern it from other forms of ML?

39. The inferences drawn from the statistical analysis of the responses received to the Questionnaire attempt to provide answers to these concerns. The statistical analysis made in Chapter-II has also looked at the extent of the prevalence of TBML.

40. Chapter III of this Paper aims to develop a simplified explanation of terms and processes of trade finance so as to make these comprehensible for investigators. Improved understanding of concepts, terms and processes of trade finance should assist AML investigators to detect TBML cases by cross-referencing the leads from trade transactions with those of trade finance.

41. Chapter IV of this Paper illustrates the techniques of TBML through case studies. The Chapter elucidates how the abuse of trade system combines with that of trade finance for TBML to occur. Techniques of Trade Finance abuse have been identified. Chapter-V of this Paper is devoted to drawing of conclusions and suggesting way forward.

REVIEW OF EXISTING STUDIES

42. In order to better understand the complex subject of TBML, this Paper seeks to review the existing literature on TBML. This includes studies by published by the FATF, FATF-style regional bodies (FSRBs) and a range of studies from intergovernmental organisations, jurisdictions, the academic sector and other bodies.

Financial Action Task Force (FATF) Studies

Trade Based Money Laundering (2006)[2]

43. The FATF TBML study of 2006 set out a number of key findings and recommendations:-

a) TBML is a complex and increasingly important channel of ML.

b) Techniques of TBML adopted by criminals vary from simple to complex. Simple techniques include ‘over/under invoicing’ of goods, multiple invoicing of goods, ‘over/under shipments’ of goods and falsely described goods. Combinations of several simple techniques have been regarded as complex.

c) Analysis of trade data and its international sharing are useful tools for identifying trade anomalies and detection of TBML. Since international trade leaves behind documentation, the anomalies noticed during data analysis may lead the investigator to documentary evidence. Lack of structured and regular exchange of information related to trade and trade finance among relevant agencies.

d) The lack of resources and training further constrain Customs, LEA, FIU and Tax Authorities to develop effective AML methodologies against TBML.

[2] http://www.fatf-gafi.org/dataoecd/60/25/37038272.pdf

44. The FATF 2006 study identified and recommended three main areas to be focused by Authorities to increase effectiveness in combating TBML:

i) Building better awareness among the agencies responsible for detection, investigation and prosecution of offenders involved in TBML. These agencies have expressed strong need for training.

ii) Strengthening current measures so that there is extensive use of the available material in the form of case studies and red flag indicators of TBML. The aspects of effective domestic cooperation and sharing of information among Law Enforcement Agencies and Regulators have also been impressed upon.

iii) Improving international cooperation so that it can act as a trigger for detection of TBML cases. In this regard the setting up of physical and legal infrastructure has been emphasized.

Best Practices Paper on Trade Based Money Laundering (2008)[3]

45. The FATF Best Practices Paper on TBML (2008) has provided important guidelines for detection and investigation of cases of TBML. The objective of the Best Practices Paper was to improve the ability of competent authorities to collect and effectively utilise trade data, both domestically and internationally, for the purpose of detecting and investigating ML and TF through the trade system. It was also aimed at FATF continuing to explore vulnerabilities in the trade system, including those related to trade finance, with a view to identifying other measures that could be considered in combating illicit use of the trade system.

46. The best practices described include:

a) Capacity building and increased awareness of TBML to be achieved by enhancing the focus on TBML in training programs. Developing capacity to identify anomalies in data collected for trade transactions and in trade finance.

b) Familiarize staff of competent authorities with typologies & 'red flags' and include these in their training materials & internal guidance manuals. A Risk based approach with target orientation has been strongly recommended.

c) Cooperation among domestic competent authorities to be developed so as to facilitate coordination between authorities responsible for collecting and analysing trade data and the authorities responsible for investigating ML and TF. For this purpose, jurisdictions should identify where trade data and trade finance data are being stored and managed. Often such data is dispersed over more than one agency.

[3] http://www.fatf-gafi.org/media/fatf/documents/recommendations/BPP%20Trade%20Based %20Money%20 Laundering %202012%20COVER.pdf

d) Investigation Agencies should have timely and clear access to trade data and trade finance databases, through secure networks and Memoranda of Understanding.

e) Practical obstacles in the area of domestic cooperation and information sharing to combat TBML/FT need to be identified and addressed. Specific best practices involving information sharing between domestic agencies and FIU were also suggested. It has been recommended that FIU should be able to obtain information from agencies collecting trade data viz. Customs and Trade Authorities.

f) Encourage international cooperation to provide the widest possible range of mutual legal assistance in TBML/FT investigations and prosecutions. Clear and effective mechanisms and gateways need to be established to facilitate trade data.

47. The Best Practices Paper has recommended safeguards relating to maintenance of data protection and privacy as well as to ensure competitive neutrality for legitimate trading activities which is also supported by the project team.

Money Laundering Vulnerabilities of Free Trade Zones (2010)[4]

48. The 2010 FATF study on Free Trade Zones (FTZs) has significant cross-over with earlier studies on TBML and includes three case studies of TBML. One of these cases relates to TBML for terrorist financing (Hezbollah).

49. Businesses located in FTZs utilise international trade for a majority of transactions. FTZs are designated areas within jurisdictions in which incentives are offered to support the development of exports, foreign direct investment (FDI), and local employment. These incentives include exemptions from duty and taxes, simplified administrative procedures, and the duty free importation of raw materials, machinery, parts and equipment. In addition to boosting economic opportunity, these incentives can result in a reduction in finance and trade controls and enforcement, creating opportunities for ML and TF.

50. The lack of AML/CFT safeguards poses a particular vulnerability in FTZs. Cases in the FATF report highlight systematic weaknesses that make FTZs vulnerable to abuse including relaxed oversight, lack of transparency, absence of trade data and systems integration.

51. The study finds that FTZs may facilitate the TBML and related illicit activity. The misuse of FTZs impacts every jurisdiction in the world, regardless of whether or not a jurisdiction has FTZs.

FATF Typologies on Proliferation Financing (2008)

52. The June 2008 FATF Typologies Paper on Financing the Proliferation of Weapons of Mass Destruction[5] did not address TBML directly, but did include an annex on trade

[4] http://www.fatf-afi.org/media/fatf/documents/reports/ML%20vulnerabilities %20of%20Free%20 Trade% 20Zones .pdf

documentation, including those relevant to trade finance. These descriptions have been included as part of the Chapter on Trade Finance.

EAG

53. The Eurasian Group (EAG) on Combating ML and TF has published two reports relating to TBML. These are as follows:

(i) EAG Working Group on Typologies Study Report on "International Trade Based Money Laundering" (December, 2009)[6]

54. The EAG Study Report on International TBML was based on the generalized findings of national studies conducted by select EAG members. The study considered the use of foreign trade transactions to launder proceeds and instruments of crime. The EAG study focused on identifying the legal aspects of business regulation that affect the development of various mechanisms using both international economic and especially, trade-based, activities for ML. An attempt was made to analyse the legal standards of national legislations governing the conduct and control of foreign trade-based transactions.

55. This Study highlighted instruments, mechanisms and corporate structures, used for TBML. Instruments such as fictitious export/import transactions and false contracts were identified. Common mechanisms used for the purpose have been found as non-declaration / mis-declaration of goods and false certificate of origin. Corporate structures involved in the process comprise three groups of entities viz. transient firms, off-shore companies and illegal financial services providers.

(ii) EAG Typology Report on Risks of Money Laundering in Foreign Trade Transactions (December, 2010)[7]

56. The EAG Report on the Risks of Money Laundering in Foreign Trade Transactions aimed to develop a risk assessment methodology to prevent and combat use of foreign trade transactions in ML schemes.

57. The main features of the study were: the identification of legal aspects in Foreign Trade Regulation; efficient assessment of the risk based approach in national AML strategies; and, the analysis of monitoring mechanisms adopted by financial institutions. The study attempted to classify ML risks in foreign trade transactions by determining the share therein of risk companies, risk countries and risk commodities. All competent authorities, including, policy makers, customs, taxation authorities, central bank and financial institutions were called to adopt risk assessment approach.

APG

58. The 2008 APG Typologies Report[8] collected case studies from across the Asia/Pacific region and included case studies on TBML and related cases. Case studies on alternative remittance services, shell companies, off-shore banks and promissory notes are of significance to the current research.

59. The 2012 APG Typologies Report includes a number of TBML case studies from across the Asia/Pacific region.

The Wolfsberg Group

60. The Wolfsberg Group is an association of eleven global banks formed in 2000 to develop financial services industry standards. In 2009 the Wolfsberg Group published a paper entitled The Wolfsberg Trade Finance Principles[9], which aimed to contribute to industry efforts to define standards for the control of the AML/CFT risks associated with trade finance activities. The Wolfsberg Group published these Principles on the role of Financial Institutions (FIs) in relation to the management of processes: 1) To address the risks of ML and terrorist financing through certain trade finance products, and 2) To aid compliance with international and national sanctions, including the Non Proliferation of Weapons of Mass Destruction requirements of the United Nations.

61. The paper addresses the mechanisms used for the finance of the movement of goods or services across international boundaries. In particular, the paper provides detailed, practical guidance on the types of controls that may be applied to letters of credit (LCs); documentary bills for collection (BCs); and sanctions, including non proliferation, weapons of mass destruction and dual use goods (NP WMD)

62. In 2011 an expanded version of the paper was published[10]. This version provides additional AML guidance in relation to guarantees (Gtees); standby letters of credit (SBLCs); and open account trade transactions. it is noted:

> "Despite the fact that historically trade finance has not been viewed as high risk it has always been recognised that international trade and the processes and systems that support it are vulnerable to abuse for the purposes of ML and terrorist financing. In recent years, however, the focus on these risks has increased for a variety of reasons, including the dramatic growth in world trade. In addition, the fact that controls introduced by FIs in response to the more traditional ML techniques have become more robust means that other methods to transmit funds, including the use of trade finance products, may become more attractive to criminals." (2011: 3)

63. The Wolfsberg Group noted that it is committed to the application of appropriate systems and controls in respect of trade finance products to mitigate these risks. It does not however

[8] http://www.apgml.org/documents/docs/6/APG_2008_Typologies_Rpt_July08.pdf
[9] http://www.wolfsberg-principles.com/pdf/Wolfsberg_Trade_Principles_Paper_I_(2009).pdf
[10] http://www.wolfsberg-principles.com/pdf/Wolfsberg_Trade_Principles_Paper_II_(2011).pdf

believe that currently there is sufficient evidence to support an assessment of this area as high risk for AML/Sanctions purposes. Despite this, the Wolfsberg Group calls for on-going cooperation between stakeholders to counter the threat of ML in the trade finance area.

United Nations Office of Drugs and Crime (UNODC)

***Risk of Money Laundering through Financial Instruments, Users and Employees of Financial Institutions* (2010)**[11]

64. The UNODC Risk of Money Laundering through Financial Instruments, Users and Employees of Financial Institutions (2010 English version) was produced to address the need of the justice sector to improve their economic, financial and accounting preparation in order to investigate, prosecute and adjudicate ML cases. The report does not specifically address TBML, but contains a brief description of various financial instruments, including a number of trade instruments, as well as their underlying documentation and red flags (451 in total).

65. Chapter 8 deals with Foreign Trade Business. It is noted that "Payments resulting from foreign trade business, understood to be the export or import of goods or services, can be one of the financial instruments at the highest risk for ML operations." (2010: 113). Documents of interest (e.g. the import or export declaration or form, the interbank transfer of funds, and the declaration or form for registering the exchange operation) are identified. Warning signs regarding the transfer of funds resulting from foreign trade are also listed.

United States

66. The Financial Crimes Enforcement Network (FinCEN) issued an advisory in 201012 to inform and assist the financial industry in reporting suspected instances of TBML. This advisory contained examples of 'red flags' based on activity observed in Suspicious Activity Reports (SARs) that may indicate TBML. Financial institutions were advised to take appropriate measures to mitigate the risks of analogous activity occurring globally.

67. It was concluded in that advisory that no one activity by itself is a clear indication of TBML. Due to some similarities with legitimate financial activities, financial institutions should evaluate indicators of potential trade-based money laundering in combination with other 'red flags' and expected transaction activity for its customer before making determinations of suspicion. Additional investigation and analysis may be necessary to determine if the activity is suspicious, based on information available to the financial institution.

Journal Articles

Delston R S & Walls SC (2009) Reaching Beyond Banks: How to Target Trade-Based Money Laundering and Terrorist Financing Outside The Financial Sector.

68. Delston and Walls in their publication (Delston R S & Walls SC 2009) Reaching Beyond Banks: How to Target Trade-Based Money Laundering and Terrorist Financing Outside The Financial Sector. Case Western Reserve Journal of International Law 41 (8): 85–118) have stated that AML/CFT measures have succeeded in restricting the two traditional avenues of ML, namely, the abuse of financial intermediaries and the physical movement of money across borders. Consequently, international criminal and terrorist organizations have turned to TBML to conceal and legitimize their funds, as this is a channel that remains relatively untouched by AML/CFT efforts internationally.

69. The authors noted the FATF's focus on TBML due to ML and TF risks as well as financing of the proliferation of weapons of mass destruction (WMDs). The paper proposed a far-reaching solution—that those in the international supply chain be required by law to adopt AML/CFT safeguards to protect their businesses, including filing suspicious activity reports, identifying their customers, and designating an AML/CFT compliance officer.

70. Delston and Walls (2009), argued that there needs to be greater harmonisation between the FATF Best Practices Paper for combating TBML and the 2003 FATF Recommendations calling for traders to adopt CDD, KYC and STR reporting protocols in line with obligations on financial institutions and DNFBPs. Their proposals appear to be at odds with the recommendations put forward in the FATF *Best Practices Paper*, which cautioned against undue regulatory burdens upon legitimate trading activities. However, Delston & Walls warn that 'companies may ignore their TBML risk only at their peril' (Delston & Walls 2009: 118) and suggest that businesses may voluntarily go beyond FATF's Best Practices to safeguard themselves against TBML threats.

Zdanowicz JS 2009, Trade-Based Money Laundering and Terrorist Financing

71. Zdanowicz (Zdanowicz JS 2009, Trade-Based Money Laundering and Terrorist Financing. Review of Law and Economics 5(2): 858–878) contributes to the literature on TBML and terrorist financing by providing an analysis of previously unused statistical techniques and methodologies as a means of monitoring, detecting and prosecuting ML activities. Zdanowicz describes how new statistical profiling methodologies that evaluate transactions contained in a jurisdiction's international trade database can mitigate the risks associated with TBML.

72. Zdanowicz discusses the application of four new TBML profiling techniques which focus on jurisdiction, customs district, product, and transaction price risk characteristics. The paper highlights recent developments which reveal a new focus on TBML and TF.

Brown HA 2009, Free Trade Zones: Haven for Money Laundering and Terrorist Financing?

73. Brown has raised several possible vulnerabilities associated with the area of FTZs (Brown HA 2009, Free Trade Zones: Haven for Money Laundering and Terrorist Financing? ACAMS Today January: 10–12) that include:

i) Possible lack of regulations or lack of enforcement of regulations within free trade zones;
ii) use of cash or nonfinancial instruments, which are usually high risk, as the primary forms of payment that occur within these zones;
iii) lack of means to implement, enforce or create regulations needed within free trade zones;
iv) difficulties in determining the primary owner of the goods or the point of origin of the shipments due to the transference of many shipments into and out of multiple free trade zones around the world;
v) due to the beneficial tax incentives offered within these areas, and the decrease or lack of tax revenue gathered by customs officials, there is little incentive to enforce or implement regulations and oversee trade;
vi) the lack of automation and an accurate method of recording shipments and items manufactured or received within many free trade zones, causing the loss of a paper trail that can accurately verify the true owner of the goods;
vii) possible zone manipulation to aid in trade-based money laundering, including over-and-under invoicing, *hawalas* and Black Market Peso Exchange, among other trade based schemes.

74. Various best practices and recommendations, as mentioned in this paper could increase the security, regulations and enforcement within these areas that currently do not have the measures in place to monitor or detect illegal activities.

McSkimming S 2010, Trade Based Money Laundering: Responding to an Emerging Threat.

75. McSkimming (McSkimming S 2010, Trade Based Money Laundering: Responding to an Emerging Threat. Deakin Law Review 15(1): 37–63) observes that while little has been done to prevent trade-based financial crime, there is also little empirical evidence of its ill effect. Further, there has been little consideration as to whether systematic monitoring of the trade system would be cost-effective, relative to the number of offenders detected and the harm prevented. Without such analysis, it is almost impossible to reach a measured and balanced view on appropriate policy settings.

76. When considering typologies of over and under invoicing, McSkimming briefly considers issues of transfer pricing manipulation. A transfer price is the price paid for an exchange of goods and services between related affiliates of the same transnational corporation. This may be a parent firm trading with subsidiaries or between subsidiaries of the same firm. Transfer pricing refers to the method transnational corporations adopt for the setting and adjusting prices of goods or services from one associate of the entity to another associate within that same entity. Corporate subsidiaries in different countries must adjust prices

when one subsidiary transfers goods or services to a subsidiary operating in a different country. It is estimated that trade between related transnational corporations affiliates account for 60% cent of global trade, which represents significant risks for transfer mispricing.[13] Tax authorities require that an 'arm's length principle' should be followed in determining the open-market price. Many markets are thin and often dominated by the same multinationals and market prices are hard to determine. Transfer pricing frauds ignore the arm's length principle and misprice transactions to allow companies to move profits to low tax jurisdictions to minimise or avoid tax.

77. McSkimming proposes that even if monitoring were to be implemented, the analytical methodologies that are currently used have major flaws. They not only rely on data that is often of poor quality, but may also be worryingly easy to circumvent. This too, raises serious questions about the effectiveness of the proposed policy responses to TBML. The difficulties associated with data monitoring also raise the spectre of a significant increase in the number of physical, and therefore costly, inspections of trade goods. Preventing TBML/TF will take more than importing AML/CFT strategies from the financial sector to the trade sector. Instead, a robust new approach to AML/CFT in the trade sector will be required.

78. The author highlights that the absence of data on TBML/TF is particularly concerning in light of the fact that TBML/TF is a credible substitute for traditional, financial system ML typologies. If offenders are able to avoid AML/CFT controls by abusing the trade system in substantial numbers, then costly regulation of the financial sector may be pointless. McSkimming notes that the larger, organised crime syndicates most able to take advantage of TBML/TF, which makes the lack of effective AML/CFT responses even more concerning.

Liao J & Acharya A 2011. Trans-shipment and Trade-Based Money Laundering

79. Liao and Acharya (Liao J & Acharya A 2011. Trans-shipment and Trade-Based Money Laundering. Journal of Money Laundering Control 14(1): 79–92) analyse reports made by international organizations and government bodies, particularly, the US, dealing with various aspects of financial crime, import/export activity, and world trade statistics, in order to identify major challenges and possible solutions to the problem.

80. The paper finds that efforts to monitor and staunch the flow of illicit money through trade would be enhanced through more widespread coverage of customs cooperation and standardization of information sharing procedures between national customs agencies. Also, measures should be taken to make free trade areas (FTZs) more transparent to regulatory scrutiny.

[13] Prem Sikka, 'Enterprise, culture and accountancy firms; new masters of the universe', *Accounting, Auditing and Accountability Journal*, vol 21, no 2, 2008, p 268-295, www.emeraldinsight.com/Insight/viewContentItem.do;jsessionid=CD97B03F94E6B0C92BDA1B4D3D

Australian Institute of Criminology

81. Sullivan and Smith (Paper: 2011 by Claire Sullivan and Evan Smith, Trade-Based Money laundering: Risks and Regulating Responses Published as Australian Institute of Criminology Reports -Research and Public Policy Series 115) contend that the formation of a regulatory framework to deal with TBML would be premature and unnecessary at this stage, as more research needs to be conducted to ascertain with greater precision the nature, risks and prevalence of TBML in Australia.

82. The Report identifies additional TBML methods besides those identified in the FATF Study 2006. The two other techniques involve:
    (i) related party transactions; and
    (ii) acquisition and sale of intangibles.

83. The Report further holds that the specific areas of risks increase the vulnerability of international trade to TBML. These risks are:
    - Barter trade
    - use of shell and front companies
    - trade with and through high risk jurisdictions; and
    - trade with and through free trade zones.

84. The Report recommends that future education and awareness-raising programs should usefully incorporate training materials on TBML.

CHAPTER II - STATISTICAL ANALYSIS

85. An important objective of this Paper is to build on the existing studies, particularly those of the FATF. The past studies have raised issues in four key areas:

(i) What is the extent of TBML in specific jurisdictions, regions and across the globe?
(ii) What should be the roles, responsibilities of investigating agencies and other allied agencies to tackle TBML;
(iii) What are the best practices (preventative measures) to effectively deal with TBML ; and,
(iv) What are those features of TBML which can make it possible to discern it from other forms of ML?

86. To look at these four primary areas of concern, this Chapter presents a Statistical Analysis. The statistical analysis is based upon the responses received from 19 Jurisdictions and 1 Organization, to a Questionnaire circulated by the APG Secretariat. Due to the limited number of responses received from jurisdictions & organizations the sample size is not large enough to lead to any statistically significant inferences. However, these responses do add to the understanding of the issues involved in each of the four primary areas of concern and can help crystallize work done in the future on TBML.

87. The Questionnaire, comprising six parts, was designed in such a way that each part could be answered by the Agency in the best position to furnish answers in any given jurisdiction. In all, 64 questions were circulated in the Questionnaire. The Six classes of agencies which have combined to answer the Questionnaire can be classified as follows:-

(A) Coordinating Agency; (8 questions)
(B) Customs; (19 questions)
(C) ML Investigating Law Enforcement Agency (LEA); (17 questions)
(D) Financial Intelligence Unit; (7 questions)
(E) Tax Authority; (7 questions)
(F) Anti Money Laundering Regulator; (6 questions)

EXTENT AND PREVALENCE OF TBML PROBLEM

88. The concern about the extent and prevalence of TBML across the globe has confronted investigators and policy-makers, as there are inherent difficulties in gauging the extent and magnitude of the problem. This Paper has highlighted a few of the difficulties which became obvious during the analysis of questionnaire responses. These difficulties may also go some way to explain why only a few cases of TBML have been reported.

89. In fact getting a sense of the magnitude of the problem has been the most challenging for this Paper. Walker J and Unger B in their Paper "*Measuring Global Money Laundering: The Walker Gravity Model*" (published in 2009 in Review of Law and Economics 5(2):821-853) have acknowledged that measuring global ML is still in its infancy. In most jurisdictions,

when data about ML is captured, there is no distinction made in the data with respect to cases of TBML.

90. Further, since in most jurisdictions the same investigating agencies investigate TBML cases and other ML cases, there is no distinction between the methods of detection, investigation and prosecution of the cases of TBML and of other forms of ML. Therefore, no separate statistics of TBML are available among most of the jurisdictions. Suspicious Transaction Report (STR) database of FIUs also generally do not distinguish between TBML STR and other STRs.

91. A general lack of awareness about the red flags of TBML and the multiplicity of authorities which deal with elements of international trade transaction increases the challenges with the detection and investigation of TBML cases. Resultantly fewer cases are being reported, thereby making estimation of the correct size of TBML almost impossible.

92. Responses which have been received from 20 jurisdictions/organizations indicate the following:

a) 45% of the respondents have attributed the reason for so few cases of TBML being reported is the lack of training / awareness and limited resources being allocated for the purpose. Most of the jurisdictions have responded that they have not undertaken sufficient studies and/or risk assessments on TBML; abuse of trade finance; transfer pricing, and alternative remittance systems.

b) 40% of the respondents have attributed the reason for low reporting of TBML cases as their law and current policy. It is interesting to note that such law and policy relate to trade policy and to Customs law. For instance, in a few jurisdictions, violations of Customs law have not been included as a predicate offence under their national AML Law. Consequently, a lower number of cases of TBML have been detected, reported or investigated. A few jurisdictions stated in the questionnaire that low rates of Customs duties / taxes effectively lower the incentive of 'over and-under invoicing' of shipped goods. Since the aim of criminals using TBML is to earn ineligible export incentives and evade customs duty there have been few TBML cases recognized. Others have responded that Customs officers are primarily required to detect and investigate cases of undervaluation / overvaluation of export / import of goods / services, and are not primarily responsible for enforcing the national AML/CFT laws therefore, a limited number of TBML cases are detected. Among other policy/law issues highlighted in the questionnaire were, the absence of proper categorization of TBML cases and hence the nonexistence of separate data for TBML cases. This was explained by the observation that the priority of the authorities, till recent times, has been to prevent ML by the other two significant methods of ML, namely, cash remittance and bulk cash smuggling, rather than through TBML.

c) Only 20% of respondents indicated that TBML was not an issue despite the low recording rates. Reports received from respondents reveal that for a few jurisdictions, international trade is an insignificant percentage of their GDP, hence possibility for TBML is also limited.

93. It appears from the analysis that the low level of cases that have been reported on TBML are largely due to a lack of awareness and training about TBML among the jurisdictions. It follows then that any available statistics will be an underestimate of the true extent of the TBML problem.

94. To ascertain the extent of TBML an attempt has been made in this Paper to see whether all known forms of TBML have been covered by the past studies or whether there is scope for further expansion.

95. Analysis indicates that 55% of the respondents have stated that the FATF studies of the past have covered all known types of TBML. Whilst this leaves scope to explore other types of TBML a few jurisdictions have also reported that the following aspects of TBML call for sharper focus than what has been achieved in the past:

i. 'Under /over pricing' of **services** need to be targeted separately due to its peculiar nature
ii. **Terrorist financing** and its linkage to TBML
iii. Misuse of **Trade Finance**.

96. The most challenging aspect relating to the extent of TBML given the current sample size, has been to arrive at any conclusion about the magnitude of the TBML problem. Perhaps one way of such estimation may be by looking at the number of TBML investigations which have been carried-out; the average size of TBML offence; and, the number of STRs generated in this regard, over the last five years. Even this methodology is flawed by the fact that most of the jurisdictions do not maintain separate statistics for TBML as a distinct from other ML offences and therefore no meaningful inferences can be drawn. However, for the sake of completeness and record, this report will present the few statistics provided, though the results are unlikely to be representative of regional or global patterns.

97. Five jurisdictions reported on the numbers of TBML investigations in the TBML questionnaires. Between 2007 and 2011 investigating authorities in the jurisdictions reported 289 investigations. The number of identifiable TBML STRs generated between 2007 & 2011 has been 1994. The average size of a TBML offence is USD 1.93 million (USD 557.32 million involved in 289 cases), based upon the responses received. The total value of assets forfeited by two of these jurisdictions between 2007 and 2011 on account of TBML was USD 144.35 million.

CONCLUSION ON THE EXTENT AND PREVALENCE OF TBML

98. This study has not been able to draw definitive conclusions on the extent and prevalence of TBML. The few cases reported by the limited number of jurisdictions undermine estimation of the size of TBML. To what extent TBML is in use remains a concern as a straight answer is not available due to the lack of awareness and paucity of training on TBML among the jurisdictions. All the aspects of TBML are not even covered by those jurisdictions which have reported TBML statistics. There is no standardization with regard to the practice of collection and maintenance of data on TBML. Even then, it is obvious that TBML is a

problem for many of the jurisdictions and has tremendous potential as an avenue to launder money.

99. Despite the findings in this Paper in relation to lack of awareness; in tandem with the limited number of TBML studies that have been done by jurisdictions; and, the lack of separate statistics for TBML, it is still asserted by the project team, with some measure of confidence, that these statistics, although underestimating the problem, do go some way to corroborate the significance of TBML as an increasingly important avenue for laundering of proceeds of crime.

ROLE OF AGENCIES RESPONSIBLE FOR TACKLING TBML

100. The 2006 FATF Paper on TBML pointed out that trade data analysis is a useful tool to discover trade anomalies,, which in turn can lead to detection, investigation and prosecution of cases of TBML. The questionnaire sought to consider which agencies are responsible for collecting and managing trade data; what risk management analysis is undertaken for such data; and, whether it is the same agency or some other agency which undertake TBML investigation. The study has sought to determine the role of other allied agencies including the regulators in this regard.

101. Almost all the jurisdictions reported that at least one department within Government records and manages information on goods imported and exported into the jurisdiction. In most of the jurisdictions, it is the Customs Department that does this. In a few jurisdictions, other agencies like the Economic Services Bureau, Free Zone Authorities, Census and Statistics Department, Port Terminal Operators also record and manage information on goods imported / exported. In most of the jurisdictions, information databases are maintained by Customs and these databases record all relevant information both on imported and exported goods. In response to questions on whether information is collected on: the type of goods; value of goods; importer details; exporter details; owner details; receiver details; and, shipping company details etc, almost all the jurisdictions have reported that all this information is collected. Generally, a Customs Declaration Form is used to obtain this information, which besides being used for tax / duty purposes, can also be used for the purpose of detecting or investigating TBML cases. The Questionnaire circulated among jurisdictions also sought to ascertain whether the jurisdictions collected information to identify the true value of goods, i.e. whether there is under/overpricing. 60 %of the jurisdictions have advised that they are using data within the various databases to help identify the true value of goods, i.e whether goods have been under/overpriced, by attempting to ‘normalise, Trade Pricing.

102. 75% of the jurisdictions have indicated that the relevant Customs agencies are also maintaining an intelligence database on import and export of goods; however, 30% reported that Customs also cross reference this information with other government databases, i.e. companies registry, tax records, criminal records etc. Only 20% of the respondents indicated that Customs conduct ML investigations. In most of the jurisdictions, ML investigations were done by a separate ML investigating agency. In these jurisdictions Customs generally referred the potential TBML cases to an investigating agency mandated to investigate ML cases.

103. Only 25% of respondents have reported that Customs have dedicated financial investigators with experience in trade related offences and/or ML investigations. Thus in most of the jurisdictions, although Customs capture and manage the information on goods imported and exported into the jurisdiction, they have either no authority to investigate ML cases or even where they have such authority, they don't have dedicated financial investigators with experience in trade related offences and/or ML investigations.

104. About 50% of the respondents have indicated that Customs personnel are part of joint financial investigation/ML task forces in those jurisdictions. In a few jurisdictions, Customs officers are members of Anti-Money Laundering Working Groups. The working groups do not conduct investigations; however their members do share information, typologies, and emerging trends on ML.

105. 45% of the respondents have reported that the law enforcement agency mandated to investigate ML cases is part of a joint financial investigation/ML task force that conducts investigations into TBML offences. The same percentage of respondents have reported that ML investigating agency have specialist financial investigators to conduct the TBML investigations.

106. Only 15% of the jurisdictions have reported that their FIU form part of any joint financial investigation/ML task forces that conduct investigations into these offences. In the majority of jurisdictions, the relevant FIU is not part of any joint financial investigation/ML task forces that conduct investigations into TBML offences and is designated as the agency responsible for carrying out day to day functions of the ML Reporting Authority only i.e. functioning as an administrative FIU.

107. Only 15% of the jurisdictions have reported that their relevant Tax Authority conduct investigations/audits into TBML. Most responses indicated that the main aim of tax authorities in their jurisdiction was to ensure tax compliance and not to focus on detecting suspected criminal activity of ML. In most of these jurisdictions, there was no detection of any link between TBML and transfer pricing and no case of TBML was detected out of tax compliance audits.

108. Only 25% of the jurisdictions reported that members of the relevant Tax Authority were part of any joint financial investigations/ML Task Force that investigates TBML.

109. More than 50% of the jurisdictions have indicated that the relevant regulator or supervisor are providing guidance to reporting entities regarding TBML vulnerabilities and red flags. Such guidance includes dissemination of examples of suspicious transactions (red flags in relation to trade finance, typologies report and papers issued by either FATF or APG) so as to enhance awareness. Some responses indicate that although no specific guidance was provided in relation to TBML, more general guidelines about AML/CFT were issued to the banking and financial institutions. One jurisdiction indicated that they had established specific examination procedures relating to a range of banking activities, products, and services, including trade finance activities, in the form of an AML Examination Manual. Feedback also indicated that supervisors regularly participated in industry forums, regulator

panels, and other outreach activities so as to provide financial institutions with guidance relating to TBML risks.

110. 50% of the jurisdictions indicated that their AML supervision regime include trade finance aspects of compliance. Response received from one jurisdiction also indicated that in its jurisdiction, AML supervision applied a risk-based approach to scoping and planning its AML supervisory functions.

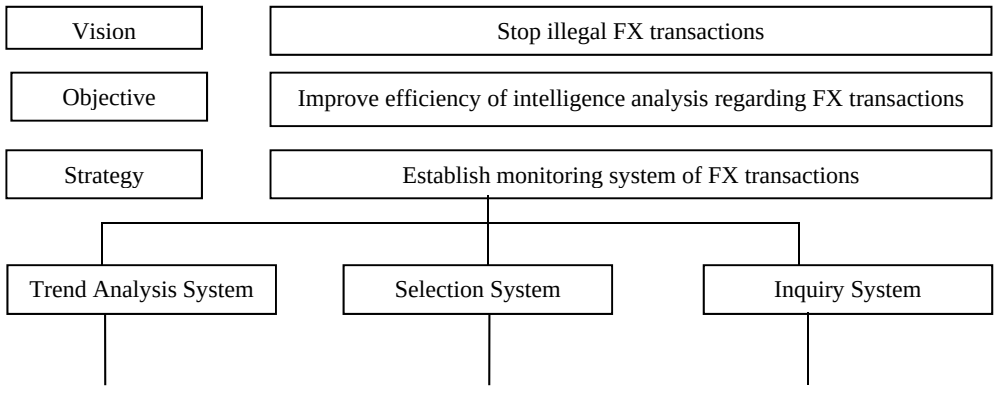
111. Only 40% of jurisdictions indicated that the regulator or supervisor was providing training to reporting entities and to its own staff. Further, only 25% of jurisdictions have reported that regulators have experts in the area of Trade Finance. However, jurisdictions were unanimous that there is a need for training to be provided to regulators about AML risks and vulnerabilities associated with trade finance activities as they, the regulators, would benefit from better training and awareness.

112. 55% of the jurisdictions indicated that their jurisdictions had in place foreign currency controls. However, 25% of jurisdictions reported that in their opinion, such "foreign currency control" had a role in identifying abuse of trade finance or TBML. Thus, it may be extrapolated that in these 25% of jurisdictions the aim and objective of foreign currency controls, are not specifically to target abuse of trade finance or TBML. However, the significance of foreign exchange manipulation in adding to the vulnerability from TBML in international trade and the necessity to monitor foreign exchange data to reduce such vulnerabilities are demonstrated by the contribution from South Korea in the box item placed below.

FX MONITORING SYSTEM

The volume of Foreign Exchange (FX) data received in the course of cross border economic transactions has skyrocketed largely due to increase in international trade. There was no satisfactory system in South Korea which would allow effective monitoring of overall FX data, which limited the capacity for quick response to changes in the foreign exchange market. It became imperative that an Effective Risk Management System is developed to deal with the voluminous data. FX Transaction Monitoring System has been developed in South Korea which aims at (1) effective monitoring of FX data, (2) selection of suspicious companies based on logical criteria, and (3) swift intelligence analysis.

System Structure



(1) Time series information on trend of changes in FX data (2) Information on abnormal FX transactions.	(1) Selection model utilizing statistical method. (2) User-oriented selection model.	(1) Detailed analysis on FX Balance Sheet (B/S). (2) One-click inquiry about detailed transaction records.

The Trend Analysis System monitors all FX data (including inward /outward remittances and purchase of bill of exchange) collected by Korean Customs for working out trends of changes. The System categorizes FX data by industry or jurisdiction month-wise so as to provide inquiry service about time series information. Users can take a look at trend of changes in industry-/jurisdiction-specific FX data. The System brings out changes considered abnormal with regard to overall FX data; or FX data by major industry or jurisdiction. Transactions are regarded as abnormal which show abrupt changes compared to average value of the recent three years. Once abnormal transaction is spotted, the system provides relevant information to experts in charge of intelligence analysis. The experts would compare such abnormal inflow or outflow of FX for that industry or jurisdiction with data of exports or imports made from/to that industry/jurisdiction.

The Selection System calculates scores of all exports/imports by taking advantage of statistical method (data mining). Based on the scores, the System helps users to select suspicious companies. Crimes related to FX transactions are categorized into four categories based on applicable legislations and violation types viz. (1) Violations in terms of payment method, (2) Violations in terms of the report of capital transaction, (3) illegally moving property abroad, and (4) ML (which include trade abuse through mispricing etc.) For example ML may occur through inward remittances to multiple bank accounts disguising wire transfers as being related to trade activities. On analysing past crimes of four types of violations, risk profiles of companies are drawn. The System also provides a user-oriented selection model whereby experts in charge of intelligence analysis choose risk factors; and adjust value or ratio depending on their analysis purpose to select suspicious companies. One-click inquiries about suspicious companies regarding their records of export/import clearance and foreign exchange transactions are made possible.

The Inquiry System provides refined FX Balance Sheet (B/S), which reflects position of individual companies and jurisdiction-specific FX B/S of trading partners. Foreign exchange B/S is basic data for intelligence analysis on FX transactions. The B/S allows comparison between export/import amount and receipt/payment of FX money during certain period. The System builds jurisdiction-specific B/S by linking export/import data and FX data of each trading partner jurisdiction; and provides visualized results such as tables and graphs. The System enables one-click inquiry about general information of export /import and FX data of individual companies. The System is equipped with user interface which not only allows selection of suspicious companies but also enables search for raw data of transaction records of each company. Such a System can shorten inquiry time.

113. Only 15% of the jurisdictions have reported that during investigations of Alternative Remitters, they have identified instances of TBML. Further only 10% of the respondents reported that during such investigations of Alternative Remitters, they have identified instances of abuse of trade finance. 40% of the respondents did not submit any response in respect to questions concerning alternative remittance systems.

CONCLUSIONS ON ROLES OF AGENCIES

114. The statistical analysis reveals that 'trade data' is collected and managed by at least one of the Government Department in each jurisdiction. In most of the jurisdictions that Department is the Customs Department which not only collects and manages 'trade data' but also uses the data to detect and investigate violations of Customs Law relating to evasion of Customs duty. However, in most of the jurisdictions, the Customs Department does not have the authority to conduct any ML investigation including TBML investigation. It appears that the agency responsible for ML investigations in those jurisdictions conduct all ML investigations including TBML investigations.

115. The Tax authorities in a large number of jurisdictions also have a limited role to play in investigation of TBML cases. While regulators in most jurisdictions do sensitize their reporting units about the abuse of finance products emphasis on the significance and relevance of these products in detecting TBML does not appear to be high. The lack of trade finance investigators and absence of 'systems' capable of cross-referencing trade data with that of trade finance are important limitations.

DOMESTIC & INTERNATIONAL COOPERATION AND TRAINING

116. Professional specialization of any agency makes it more proficient to carry-out its mandated work. However, a complex problem like TBML which cuts across more than one sector of an economy and goes beyond the national borders require considerable cooperation among agencies both domestically and internationally in order to provide solutions. To address this, a set of questions were incorporated in the Questionnaire so as to determine the extent and manner of cooperation among agencies both at the domestic and international levels. The FATF Paper on Best Practices published in 2008, has recommended having joint task forces among domestic agencies to ensure domestic inter-agency cooperation.

117. This Paper suggests strengthening the arrangements concerning exchange of information by fortifying mutual legal assistance agreements to support more meaningful international cooperation. One significant method of building such best practices has been the suggestion to include TBML orientation in ML training programs. Another set of questions in the Questionnaire relate to the exposure to TBML training for the agencies concerned.

118. The project team has categorized that there are three broad phases of domestic cooperation among the competent authorities namely: sharing of intelligence; coordination in investigation; and, support in prosecution.

119. The statistical analysis reveals that only 55% of the jurisdictions have submitted a response to the question of how the TBML investigations were initiated. 30% of the jurisdictions reported that the inputs for TBML investigations came from intelligence and STRs. 45% of jurisdictions reported that inputs for TBML investigation came from law enforcement agencies whereas only 25% of jurisdictions reported that the source for initiating TBML investigations was "Trade Data". For almost 35% of the respondents, suspicious transactions related to TBML were first reported to FIU, which conducted analysis before reporting it to the relevant investigating authority.

120. 35% of jurisdictions reported that TBML investigations by ML investigating agency are initiated from 'internal intelligence' whereas 55% of respondents reported the source of intelligence for ML investigating agency as 'referrals from other agencies'. Jurisdictions reporting 'internal intelligence' as the source for initiation have also reported that 'referrals from other agencies' are another source for initiating TBML investigations. A few jurisdictions have also reported referrals from the 'private sector'. 60% of responses received indicate that they receive information from the relevant Customs agency. However, 35% of the jurisdictions stated that though their ML investigating agency receives information from Customs there are restrictions on the use of that information.

121. In response to the question on the types of impediments faced in use of information received from other agencies, 25% of the jurisdictions have reported that there are impediments which have been identified as: resource constraints; lack of training; delay in release of further information; and, the inability to justify an inquiry. It is interesting to note that limited capacity to match trade data with financial transaction information also hinders the capability of the FIU to proactively assess possible TBML-related transactions.

122. 30% of the jurisdictions have reported that there are impediments encountered in the extending of cooperation while conducting investigations. According to the survey the main impediments encountered during the course of investigations were maintaining confidentiality; inhibited from using such information in prosecution / legal proceedings; non-disclosure to third parties without consent; and, use of juridical information only with the authorization of a magistrate (or judicial authority).

123. 90% of the jurisdictions submitting response to the Questionnaire reported that Customs agencies receive financial information from the FIU. According to the responses the FIU generally provided such information spontaneously or upon request. However, responses received also revealed that in some countries, there is requirement to sign a Memorandum of Understanding before sharing of information can take place. In one jurisdiction, the FIU has a Memorandum of Understanding (MOU) with several partner agencies/departments. These Partner Agencies according to the response have on-line access which allows them to ask for financial information relevant to all investigations. According to the response, the MOU framework accounts for objectives of each agency and is aligned with national interests.

124. 30% of the respondents have indicated that the Tax Authority receives FIU data for the purpose of investigation of administrative issues. However, to what extent such data relate to TBML has not been indicated.

125. Since TBML occurs across national borders, the best practices for strengthening international cooperation recommended by the FATF in 2008 and supported by the project team needs to be emphasized. Mutual Legal Frameworks with effective gateways must be capable of facilitating prompt exchange of information and trade data.

126. 55% of the jurisdictions have indicated that they seek information from their international counterparts during ML investigations. Responses received indicate that jurisdictions

provide and share intelligence with the Regional Intelligence Liaison Office and World Customs Organization. Some share 'trade data' with their partner countries in terms of specific information sharing agreements to exchange trade data. 40% of the respondents have indicated that they seek information from FIUs and LEAs in other countries. 40% of the respondents have advised however that there are impediments to the receipt or dissemination of this information. The most common impediments identified in the survey are: "supply and use of information under the secrecy clauses"; signing of relevant MoUs: lack of a clear document of mutual administrative assistance in areas that are not under the control of Customs; delay in response; and, use of financial information obtained from the FIUs being limited to intelligence purposes only etc. Further, it was identified that restrictions occur without the existence of a multilateral trade agreement for the use and sharing of information with other foreign partners.

127. About 30% of the jurisdictions indicated that they have shared TBML related intelligence with foreign counterparts. However, 15% jurisdictions have reported that they were not made aware of the results of that dissemination.

128. 70% of the respondents advised that international requests have been made for sharing financial intelligence. Responses also indicate that in some jurisdictions, trade-related information can be shared with other FIUs within the framework of MOUs. Operationalising international cooperation by developing a common platform to share and analyse trade data of trading partners so as to combat TBML is demonstrated by forming Trade Transparency Units (TTU). The challenges met by formation of a TTU and its basic features have been explained in the contribution made by the USA in the box placed below:

TRADE TRANSPARENCY UNITs (TTU)

TBML schemes are often accomplished through customs fraud violations such as over & under-valuation, over & under-shipment, false invoicing, double invoicing, and the Black Market Peso Exchange. Due to the complex nature of international trade systems, law enforcement agencies are only able to see one side of the trade transactions. Criminal investigators might have expertise and experience investigating either financial or customs fraud crimes, but do not have the full financial and trade data that would give them a complete picture of the scheme. This lack of transparency often catalyzes the use of TBML by Transnational Criminal Organisations (TCOs).

Furthermore, as international trade has expanded, so also has the range of activities that TCOs are involved in. This has led to TCOs evolving into loose networks who work together in order to exploit new market opportunities. Such rapid evolution calls for international law enforcement agencies to take a more integrated approach to address this threat. However, many challenges on integration, such as communication and cooperation, still present themselves. Law enforcement agencies are often hamstrung when it comes to sharing information with international partners, relying on traditional diplomatic channels such as Mutual Legal Assistance Treaties (MLATS) or Customs Mutual Assistance Agreements (CMAAs), in order to gather or exchange information on criminal or terrorist threats. These agreements are often lacking in scope and can take considerable time to execute the exchange of information. Additionally, International trade transactions inherently occur behind multiple sides of international borders involving multiple parties and many layers of documentation and paperwork. This complexity and lack of transparency make these transactions highly susceptible to fraud and exploitation.

Another core issue is the disparity of the capacity and capabilities between different international law enforcement agencies. A uniform understanding of the threat and threat space is a key starting point

amongst partnered countries, followed up by in-depth co-sponsored training that will eventually close the knowledge gap on TBML. Law enforcement agencies must follow a uniform methodology in attacking TBML if they are to be successful. Agencies must have adequate strategic, operational, and tactical intelligence capabilities. Also, agencies must have a platform to share trade data across borders with partner countries. Finally, countries must have adequate prosecutorial authorities and arrest powers for their agencies to attack the threat.

In 2004, United States Homeland Security Investigations (HSI) initiated the Trade Transparency Unit (TTU) to prevent, combat, and dismantle TCOs that engage in TBML. TTU develops partnerships with customs and financial agencies around the world to detect trade discrepancies and to investigate criminal violations including TBML. TTU focuses on the sharing of trade information with international partners allowing each TTU to compare values reported on U.S. import/export declarations against the corresponding values reported on foreign counterpart import/export declarations. Investigators are thus able to see both sides of the trade transaction, thereby adding a level of transparency.

The process starts when HSI reaches out to jurisdiction representatives, to further discuss a potential partnership under the TTU umbrella. Thereafter trade data of the partner jurisdiction is formatted. Agreements are signed and guidelines are established for the sharing of trade information. The access to the shared TTU trade software system is the key component that allows the TTUs to operate. TTU has developed a proprietary computer-based system called "Data Analysis & Research for Trade Transparency System" (DARTTS) to host and analyse the combined international trade data, which allows the user to identify abnormal trade transactions that may indicate TBML, customs duty evasion, and other related customs and financial crimes.

Direct communication amongst international partners is highly encouraged. Personnel assigned to the TTUs meet regularly to exchange ideas, discuss emerging trends and to provide each other support, guidance, training, and tools to combat TBML.

129. The FATF Best Practices Paper 2008 urged for a stronger focus on training programmes for competent authorities to enhance their ability to identify TBML techniques which is also supported by the project team. Such programmes, particularly those directed towards investigating and other allied agencies, must highlight the relevance of both financial and trade data to assist programme participants in detection of TBML cases.

130. 40% of the jurisdictions indicated that Customs have received training on TBML. Further, only 10% indicated that they provided training to others. Most of the jurisdictions have agreed on the need for better training and understanding of the techniques of TBML. Even on the question of 'challenges and obstacles for the Customs agency', a common response was that besides the 'lack of authority for Customs to investigate TBML cases' (legal issue), 'lack of training and resource' was indicated as a major challenge for Customs to identify or investigate TBML.

131. 35% of the jurisdictions indicated that relevant ML enforcement agencies had received training on TBML. Further, only 15% of the jurisdictions reported that they provide training to other agencies on TBML issues. The main methods of training have been stated as, 'attending local and overseas training and seminars'. Most of the jurisdictions agreed on the need for better training and awareness of the techniques of TBML.

132. Only 35% of the jurisdictions have indicated that the FIU has received training on TBML. Equal numbers of jurisdictions have indicated that FIU is also providing training to other agencies on TBML issues. The mode / method of training are through the participation in international conferences, seminars and overseas training. Material relied upon in the training include annual reports of FIUs, typologies, sanitised cases and indicators linked to TBML latest studies & papers etc. 20% of the jurisdictions have informed that their Tax Authority received training on TBML. Further only 5% have indicated that their Tax Authority provides training to others on TBML issues. Responses received from jurisdictions indicate that officers of Tax Authority are trained to conduct tax audits and no training with specific reference to audit in TBML cases has been received by the said officers.

133. Training to those responsible for detection and investigation of TBML as well as to those who collect trade data and handle trade finance is critical to raise their awareness about TBML and build capacity to identify TBML. Since in majority of jurisdictions those who handle trade data, who deal with trade finance and who investigate TBML belong to separate agencies the significance of building mechanisms for domestic cooperation cannot but be emphasized. Sharing of trade data across trading countries supported by prompt exchange of information during investigation and for prosecution can be very important for preventing and curbing TBML. However, there are impediments in exchange of information both domestically and internationally.

PATTERNS OF FINANCIAL PRODUCTS USED

134. On the issue of financial or banking products used for TBML, responses received from the jurisdictions indicated that formal banking channels as well as alternative remittance system are being used. Normal banking channels that have been used to finance trade are open accounting system and letter of credit mechanisms. The gaps between declared trade transaction value and the true value of goods have often been filled-up through alternative remittance.

RED FLAGS AND PATTERNS

135. The last set of questions in the Questionnaire relate to eliciting responses from the jurisdictions about the indicators which can help discern the patterns of TBML. The FATF Best Practice Paper 2006 has regarded making case studies and red flags available to competent authorities and financial institutions as a basic principle of guidance to foster the capacity to combat TBML. The patterns and red flags help in identifying the occurrence of ML in trade and trade finance transactions. The jurisdictions which responded to the Questionnaire have listed a large number of patterns and red flags which this Paper has categorised in five broad groups: i) Trade Finance; ii) Jurisdictions; iii) Goods; iv) Corporate Structures; and v) Predicate Offences. The last four categories have been dealt with in the past papers under the broad category of trade.

136. TBML can take many forms and the distinction between it and other forms of ML which use the financial system is often blurred. Efforts have been made in the present section of this Chapter to identify and describe specific characteristics of TBML and hence this

Section has examined and analysed trade characteristics as patterns of jurisdictions, goods, corporate structures and predicate offences. Red flags identify only possible signs of illicit activity and have to be considered in conjunction with the normal transaction activity expected.

137. Based on the responses received from jurisdictions, red flags relating to financial & banking products may be categorized as follows:

a) Use of **letters of credit** to move money between those countries, where such trade would not normally occur and / or is **not consistent with the customer's usual business activity**. A Letter of credit is generally resorted to so as to accord more legitimacy to the transaction in order to conceal the real facts.

b) The **method of payment** requested by the client appears **inconsistent with the risk characteristics of the transaction**. For example receipt of an advance payment, for a shipment, from a new seller in a high-risk jurisdiction.

c) The transaction involves the receipt of cash (or by other payment methods) **from third party entities** that have no apparent connection with the transaction or which involve front or shell companies or wire instructions / payment from parties which were not identified in the original letter of credit or other documentation. The transactions that involve payments for goods through cheques, bank drafts, or money orders not drawn on the account of the entity that purchased the items also need further verification.

d) The transaction involves the use of repeatedly **amended or frequently extended letters of credit** without reasonable justification or that includes changes in regard to the beneficiary or location of payment without any apparent reason.

e) **Unusual deposits** i.e. use of cash or negotiable instruments (such as traveller's cheques, cashier's cheques and money orders) in **round denominations** (to keep below reporting threshold limit) to fund bank accounts and to pay for goods and services. The negotiable instruments may be sequentially numbered or purchased at multiple locations and may frequently lack payee information. Further, cash payments for high-value orders are also indication of TBML activity.

f) Inward remittances in **multiple accounts** and payments made from multiple accounts for trade transaction of same business entity are indicators for TBML. In this regard the study of foreign exchange remittances may help detect the offence.

g) In the case of **merchanting trade**, the trade finance mechanism should be in place for both export leg as well as import leg of transaction. If the Trade Finance mechanism, for example, Letters of Credit, have been provided for only the import leg of the transaction and not for export leg, it also indicates the possibility of TBML.

PATTERNs OF JURISDICTION (FROM WHERE OR TO WHOM, GOODS ARE USUALLY SHIPPED/TRANSHIPPED)

138. The Questionnaire also intended to ascertain patterns from jurisdictions as to or from where goods usually shipped. Responses received indicated that in 90% of jurisdictions, no such patterns had been identified to date, either because of the low numbers of TBML cases or due to other reasons such as a study of this type had not been carried out. Responses indicated that existence of duty free zones or jurisdictions having high import tax / export tax rebate are most likely to be used for TBML. Volume of trade, value of trade, type of commodity or service traded and/or the domestic regulatory environment are the factors which determine the sensitiveness of a jurisdiction for TBML. Generally, all the factors combine to make a jurisdiction prone to high risk of TBML.

RED FLAGS WITH REGARD TO JURISDICTIONS

a) The commodity is shipped to or from a jurisdiction designated as '**high risk'** for ML activities or sensitive / non co-operative jurisdictions.

b) The commodity is **transhipped** through one or more such high risk / sensitive jurisdictions for no apparent economic reason.

c) Presence of **Free Trade Zones / Special Economic Zones** also affects the sensitiveness of a jurisdiction as far as TBML is concerned. FTZs are also emerging as being especially vulnerable to TBML. FATF (2010: 4) defines FTZs as 'designated areas within countries that offer a free trade environment with a minimum level of regulation'. In the said report, FATF noted that most zone authorities operate separate company formation services from those that exist in the rest of the jurisdiction and market the ease of setting up a legal entity in an FTZ to attract business. Many zone authorities request little or no ownership information of the companies interested in setting up in the zone. As a result, it is simpler for legal entities to set up the firms/companies in FTZs and hide the name(s) of the true beneficial owners. This lack of transparency has allowed companies located in FTZs to create layers of transactions that are difficult (if not impossible) for law enforcement agencies to follow (FATF 2010). It also reported that 'goods introduced in a FTZ' are generally not subject to the usual customs controls, with goods undergoing 'various economic operations, such as transhipment, assembly, manufacturing, processing, warehousing'. FinCEN has identified TBML red flags that are specific to FTZs. In its 2010 report, FinCEN (2010: 4) signalled that a number of red flags seen in conjunction with shipments of high dollar merchandise (such as electronics, auto parts and precious metals and gems) to duty free trade zones could be an indication of a trade-based money laundering activity.

   These include:

   i. third-party payments for goods or services made by an intermediary (either an individual or an entity) apparently unrelated to the seller or purchaser of goods. This may be done to obscure the true origin of the funds;
   ii. amended letters of credit without reasonable justification;

iii. a customer's inability to produce appropriate documentation (ie invoices) to support a requested transaction; and
iv. significant discrepancies between the descriptions of the goods on the transport document (ie bill of lading), the invoice, or other documents (ie certificate of origin, packing list etc) (FinCEN 2010).

d) **Circuitous route of shipment** and/or **circuitous route of financial transaction** or **Order for the goods** is placed by firms or individuals from foreign countries other than the jurisdiction of the stated end-user.

e) Transaction involves **shipment of goods inconsistent with normal geographic trade patterns** of the jurisdiction i.e. trade in goods other than goods which are normally exported/ imported by a jurisdiction or which does not make any economic sense e.g. Semi-conductor manufacturing equipment being shipped to a jurisdiction that has no electronics industry.

PATTERNS OF GOODS INVOLVED IN TBML

139. Most of the jurisdictions have responded to state that no definite pattern of goods involved in TBML is identifiable. This is probably due to the vulnerability of almost all trade transactions for TBML, irrespective of the goods involved. A few studies including that of Clare Sullivan and Evan Smith cited earlier, have emphasized the vulnerability of trade in services for TBML. Global trade in services provide greater opportunities for ML than trade in merchandise because fraud particularly in regard to valuation of services is more difficult to detect and prove. The intangible nature of services makes even facts of supply / delivery / provisioning difficult to determine. Unlike merchandise, services are also less likely to be standard, so anomalies in value and price are less apparent and more difficult to substantiate. However responses do indicate that goods involved in TBML will be usually those goods, where it is rather difficult to identify true value, due to the nature of these goods. Further responses also indicate that vulnerable goods are those which are subjected to higher taxes/ duties or are high turnover goods or are high valued goods. Examples of such goods are consumer goods, textiles, garments, engineering goods, electronics goods, illicit tobacco products, leather goods, luxury cars, precious metals, counterfeit products, diamonds, metal scraps. Illicit trade in tobacco has been identified as prone to ML as such trade is cash intensive, profitable with low levels of risk, and the possibility of intermingling of illicitly generated funds with legitimate forms of business is high.

RED FLAGS WITH REGARD TO GOODS

a) Where significant discrepancies appear between the **description, quality and quantity** of the goods on the documents such as bills of lading, invoices etc and the actual goods shipped. The misrepresentation may also be in relation to or type / grade of goods. For example, a relatively inexpensive good is supplied but it is invoiced as being more expensive, of different quality or even as an entirely different item so the documentation does not accurately record what is actually supplied. This technique is particularly useful in TBML. Cheap cloth items / waste thereof are declared as premium quality garments to launder the criminal money.

b) Significant discrepancies appear between the **value** of the commodity reported on the invoice and the commodity's fair market value. This is done either in conjunction with mis-declaration of the description / quality / grade of goods or without it. This is also often associated with mis-declaration of the jurisdiction of origin.

c) **Consignment size or type of commodity** being shipped appears **inconsistent with the scale or capacity of the exporter or importer having regard to their regular business activities** or the shipment does not make economic sense i.e. there is no reasonable explanation for the client's financial investment into the shipment.

PATTERN OF CORPORATE STRUCTURES

140. To adduce information about the types of corporate structures i.e. Companies, Partnership Firms, Proprietorship, Offshore Companies etc. used by criminal syndicates in TBML, relevant questions were included in the Questionnaire. Responses indicate that both domestic companies as well as overseas companies are used by criminal syndicates. Bogus registered companies (behave like true consignor / consignees of goods) and offshore companies located in tax havens have been reported as corporate structure misused by criminal syndicates. The use of offshore companies is also associated with complex schemes and methodologies utilized by established criminal enterprises.

RED FLAGS WITH REGARD TO CORPORATE STRUCTURES

a) The transaction involves the use of **front or shell companies**. Both shell and front companies can be used to facilitate TBML but in different ways. A shell company has no real operating activity and is used to hide ML activity and the identities of individuals involved so as to obscure the money trail. If activity is traced to the company it is literally an empty shell. As FATF (2010: 20) explained TBML and other ML schemes rely on the ability of the perpetrator of the crime to distance themselves from the illicit proceeds. Shell companies enable illicit actors to create a network of legal entities around the world. By contrast, a front company has real business whose legitimate operations are used as a cover for ML and other criminal activity. In many ways, front companies present a much more significant TBML threat than shell companies. The characteristics of offshore companies, for example, convenient formation, free operation, tax exemption and financial secrecy, all provide rather good veneer to disguise ML

b) Numerous **sole proprietorship businesses/private limited companies** set up by seemingly unrelated people (proxies) are found to be controlled by the same group of people. For the setting up of such businesses false addresses are registered.

c) Trade transaction reveals links between representatives of companies exchanging goods i.e. same owners or management. TBML requires collusion between traders at both ends of the import/export chain. **Related party transactions** (ie transactions between entities that are part of the same corporate or business group) can possibly make TBML easier and more difficult to detect. Related party transactions, including transfer pricing, rely on mutual agreements between the parties, rather than free market forces. As the FATF (2006: 5) pointed out, over-

or under-invoicing of goods and services requires collusion between the exporter and importer. Although there is a higher risk of related party transactions being used for fraud and for TBML, dealings between related parties are not necessarily illegal.

d) **Transfer pricing** is a related party transaction that is commonly used by transnational corporation as part of their financial and tax planning strategy. Multinational organisations use transfer pricing to shift taxable income from jurisdictions with relatively high tax rates to jurisdictions with relatively low tax rates to minimise income tax. Similar strategies are also employed in relation to import duties and value added tax. FATF (2006: 3) made it clear though that in the case of transfer pricing, the reference to over- and under-invoicing relates to the legitimate allocation of income between related parties, rather than customs fraud. However possibility of TBML originating in transfer pricing cannot be ruled-out.

PREDICATE OFFENCES OF TBML

141. 15% of the jurisdictions have reported that **tax evasion** is the predominant predicate offence in TBML cases whereas 10% of the jurisdictions have reported **customs offences** as the main predicate offence. Other responses indicate that predicate offences are often related to commercial fraud, IPR, Narcotics, human trafficking, terrorist financing, embezzlement, corruption, organized crime (racketeering), dealing in banned goods, conducting illegal business, speculation etc. One Reporting jurisdiction indicated that ML is considered to be an autonomous offence and there is no need to prove the existence or nature of the predicate offence in order to prosecute hence as a consequence, there is no systemic link between ML cases and other crimes.

CONCLUSION ON RED FLAGS

142. The attempt here to segregate Red Flags for different segments of TBML is to simplify the process of understanding the complex problem of TBML. In real life situations the occurrence of more than one red flag is likely for trade transactions involving ML. The red flags enumerated in this Chapter are by no means exhaustive. Annexure A to this Paper has enlisted ‘red flags’ from a number of sources. The process of developing red flags is continuous and requires more and more jurisdictions to contribute towards a common pool of knowledge.

CHAPTER III - TRADE FINANCE

SIGNIFICANCE OF TBML

143. TBML provides an important avenue for disguising funds of illicit origin and for moving value to finance illegal activities. Chapter II on Statistical Analysis may have failed to show the extent and prevalence of TBML in terms of statistical results. However, the significance of TBML as a means of moving illicit value across the globe cannot be denied.

144. Baker (2005: 25) has argued that because 'anything that can be priced can be mispriced' and 'false pricing is done every day, in every jurisdiction, on a large percentage of import and export transactions' that TBML 'is the most commonly used technique for generating and transferring dirty money—money that breaks laws in its origin, movement and use'.

145. Preliminary examination of this statement would invoke acceptance by most AML practitioners as anecdotal evidence indicates that false pricing (under and over invoicing) is considerably widespread. It is considered by the project team to be particularly prevalent in trade within jurisdiction as a means of generating criminal wealth through deliberate avoidance of taxation commitments. This is one of the reasons why domestic trade is not within scope of this paper.

146. The project team believe that the geneses of TBML was to defeat the ability of jurisdictions to collect appropriate revenue as espoused by Baker but in more modern times, under and over invoicing has in fact become a 'by-product' of what has been identified as professional ML schemes involving very complex international TBML structures capable of moving billions of dollars of value with impunity. In these instances, the commodity is as good as cash without the governance currently imposed on cash transactions around the world. Why this can be achieved is also because of the fundamental lack of regulation of Trade internationally which provides the money launderer with ample vulnerabilities to exploit.

147. Using the cover of Trade is the most logical next step as it further frustrates the activities of regulators and investigators due to the sheer size of the trade mechanisms worldwide and the continuing introduction of new products to reduce supply line costs. The vast number of trade transactions produces a high level of 'noise' about the level of legitimate trade and increased flexibility of the processes masks the criminal ML activity. Without specific information to help focus investigations, automatic monitoring becomes relatively ineffective. Legitimate Trade structures have a significant number of benefits to professional ML syndicates namely:

- The large amount of value that is moved internationally in the guise of Trade;
- The appetite of jurisdictions especially those that are developing economies to promote trade which in turn reduces red tape to create corporate entities;
- The ability to mask true activity of corporate entities and ability to disburse concentrations of illegal currency through corporate entities disguised as 'business as usual';
- The ability to engage in corrupt practices on the pretense of trade and trade negotiation;

- The existing trade based mechanism including 'Trade financing', International trade payments in foreign exchange; trade liberalisation, electronic commerce and other financial markets are susceptible to abuse;
- Lack of international regulatory coordination;
- Lack of data matching across sovereign states;
- Inconsistent legal frameworks; and
- Enhanced electronic communication.

148. Unlike alternate remitters systems that are very mobile and operate on very small overheads, TBML structures, especially those that move large amounts of value, are expensive to create, expensive to maintain, leave a considerable evidentiary trail and are difficult to dismantle. It is for these reasons that those responsible for their creation leverage as much criminal profits as they can. These same structures can be used to:

- Launder criminal profits and instruments of crime from criminal activity other than tax evasion and fraud;
- Undertake large fraud;
- Facilitate confidence and other financial scams;
- Facilitate corruption payments; and,
- Siphon money from aid and other Government assistance programs.

149. Each can be undertaken as an individual activity or simultaneously if necessary. For this reason the project team see TBML as the most difficult activity to detect and in turn successfully disrupt and dismantle.

150. Further, professional money launderers do not need to utilise the traditional financing mechanisms used in International trade (for example credit documentation) as they are moving excess value (profit) or financing ongoing criminal activity (instrument of crime) and credit is not essential. They do so however, to further disguise their activity. The application of credit facilities also assist the criminals to defray their risk if it happens that their activities are detected as the credit partner has a legal right to at least some share of the funds that might be restrained for possible forfeiture.

THE TRADE FINANCE ENVIRONMENT

151. In order to better understand how TBML operates it is necessary to understand the environment in which it operates. By understanding this environment, the ML investigator can better recognise the 'red flags' that help peel away the veneer considered paramount by money launderers in achieving their goals. With this veneer in place, an investigator is unlikely to recognise TBML as a result of all the 'noise' of legitimate trade. As stated, this paper attempts to provide investigators and in turn regulators with the insight to enable them to 'crack' that veneer.

152. Occurrence of trade in a Cash Based Economy can also open up possibilities for TBML which may throw up challenges of its own kind. The contribution by Nepal in the box item placed below give succinct description of such challenges.

CASH BASED ECONOMIES

Less developed countries have economies which are largely cash based. These countries also usually have manual system of records. Such records lying with different entities are in a fragmented state and are usually un-reconciled. Discreet access to such records becomes impossible. These two features viz. Pre-dominance of cash transaction and manual record keeping pose many challenges in combating financial crimes as it is difficult to follow the paper trail. Cash based economies flourish in an economic environment which has a limited number of financial institutions in the formal financial sector. This situation makes the economy vulnerable to a number of financial crimes, including TBML.

Predominance of cash transactions builds uncertainty in the financial system. Transactions in cash allow for concealment of the true value of a transactions and/or the misrepresentation of true records. Cash transactions may even facilitate cash smuggling. Such transactions also fuel the underground economy and tax evasion.

The manual system of records engenders its own set of problems. There is difficulty in data collection. The data cannot be easily cross-checked, timely review of information is not possible and identification of any ultimate beneficiaries or ultimate suppliers and recipients becomes rather difficult. Without a proper database, the customs authorities in these countries also have a major handicap in detecting and investigating TBML cases.

The economic scenario is further compounded by the use of Alternate Remittance Systems (hawala / hundi) by workers of such countries who are located abroad and need to send their savings back home. Such an environment is quite conducive to TBML where proceeds of crime can be very easily structured as remittance for import/export and presented as legitimate funds.

153. It has been said that *trade finance* can be seen as the precise science of managing the capital required for Trade to flow. This chapter describes the most common of the Trade Financing Instruments used today in legitimate trade transactions and then attempt to identify the vulnerabilities of each of these.

154. In its simplest form, an exporter and importer enter into an agreement to Trade. This may be done in some developing regions by way of 'countertrade' but more often than not, it is achieved by way of a cash payment or some more complex form of financing.

155. Traders require working capital (i.e., short-term financing) to support their trading activities. Exporters will usually require financing to process or manufacture products for the export market before receiving payment. Such financing is known as *pre-shipping finance*. Conversely, importers will need a line of credit to buy goods overseas and sell them in the domestic market before paying for imports. In most cases, foreign buyers expect to pay only when goods arrive, or later still if possible, but certainly not in advance. They prefer an open account, or at least a delayed payment arrangement. Being able to offer attractive payments term to buyers is often crucial in getting a contract and requires access to financing for exporters.[14]

[14] Trade Facilitation Handbook for the Greater Mekong Subregion – Chapter 8: An introduction to Trade Finance

156. The absence of an adequate trade finance infrastructure is, in effect, equivalent to a barrier to trade. Limited access to financing, high costs, and lack of insurance or guarantees are likely to hinder the trade and export potential of an economy, and particularly that of small and medium sized enterprises. Trade facilitation aims at reducing transaction cost and time by streamlining trade procedures and processes. One of the most important challenges for traders involved in a transaction is to secure financing so that the transaction may actually take place. The faster and easier the process of financing an international transaction, the more trade will be facilitated.[15]

157. Financial institutions play the critical role in trade finance. The trade finance products elaborated in this chapter are all derived from financial institutions. Financial institutions have a role to play in efforts to prevent ML activity, holding a large amount of intelligence and information critical for TBML investigators. Often however, these institutions are not aware of how critical the information they hold may be to an investigator. Close interaction with financial institutions is seen by the project team as fundamental to success in dismantling TBML structures.

158. The role of Government in *trade financing* is crucial especially in emerging economies. In the presence of underdeveloped financial and money markets, traders have restricted access to financing. Governments can either play a direct role like direct provision of trade finance or credit guarantees; or indirectly by facilitating the formation of trade financing enterprises.

INSTRUMENTS OF TRADE FINANCE & THEIR VULNERABILITIES

Bills of Exchange

159. The drawing of a 'bill of exchange' (also referred to as a 'draft') is commonly used by exporters as a means of obtaining payment from buyers for goods shipped. Bills of exchange protects (reduces transactional risk) of both parties. Documentary credits (discussed later) issued for buyers by banks usually require bills of exchange to be drawn, and frequently bills of exchange are drawn by the seller in terms of the commercial contract of sale with the buyer.

160. The relevant financial institution has a vested interest in this transaction, as they are advancing credit to the buyer; and, given this advanced credit may be considerable in monetary terms, the due diligence by the institution is usually as comprehensive as is possible given the circumstances.

161. The Draft or Bill of Exchange (not always required) provides formal evidence of debt under a letter of credit and is presented with all other documents unless stipulated otherwise. A Draft may contain information on:

- Value of Draft, date of payment and payment terms e.g. "at sight", "30 days after sight", "60 days after Bill of Lading Date".

[15] (http://www.unescap.org/tid/publication/chap8_2224.pdf

- Date Exporter presents documents to the "available with" Bank (not normally required).
- Letter of credit reference number assigned by the Issuing Bank (if required by credit).
- Date the letter of credit was issued (not normally found on a draft).
- Name and address of the Issuing Bank (if the drafts are drawn on the issuing bank).
- Name and address of the bank on which the Drafts are to be drawn.
- Signature of an authorised signing officer of the Company and the Beneficiary's name as shown on the letter of credit.

162. The *Commercial Invoice* is the accounting document through which the exporter charges the importer for goods and services purchased. The Invoice gives details about:

- Merchandise weight, quantity and price and currency.
- The name and address of Exporter and the Importer.
- The number of copies presented and signed if required.
- The trade term listed, e.g. C.I.F., F.O.B etc.

163. The *Transport Document* (or Bill of Lading, Airway Bill, Railway Consignment Note) is a document issued by the carrier that describes the goods that have been accepted for carriage. In some forms, the Bill of Lading may also act as a document of title to the goods and should include information that is consistent with the letter of credit:

- Information on the merchandise (usually a general description).
- The points of loading and discharge.
- To whom the Bill of Lading is consigned.
- The date of shipment.

164. The *Insurance Document* is a guarantee in part or in whole (depending on the terms and conditions) by an insurance company, specifying the goods shipped on a named vessel, indicating the applicable coverage, and showing to whom loss is payable.

165. The *Certificate of Origin* notes the country where the goods were produced. The *Certificate of Inspection* offers an opinion that the specified quality and quantity related conditions have been met. These documents should be dated on or before the Bill of Lading date.

166. A *Packing List* is usually supplied by the exporting shipper in cases where a diversified shipment is packed in several packages or containers. The list will show the contents of each box or case identified by a specific number. A *Weight Certificate* is supplied by the Exporter, at the request of the Importer. It certifies the weight of each large unit in a shipment or the net and gross weights of packages containing smaller units. It is of

particular value when the price of the goods is based on weight and, also, is often used by the carrier in arriving at the weight to be recorded on the Bill of Lading as a basis for the freight charges.

167. The quantity of units/weights should match the Commercial Invoice (this may or may not agree based on how the weights are calculated by the various parties involved). The breakdown of merchandise/weight per carton, package or container should be shown if requested in the letter of credit.

Vulnerabilities:

- Undertaken and paid for without any form of due diligence by an intermediary in the supply chain because the parties are complicit.
- Phantom trades maybe the cause of unrealistic timeframes or unrealistically short supply chains.

Countertrade

168. Countertrade exists where economies face the problem of limited foreign exchange holdings. That is, they do not hold enough currency of the jurisdiction they are trading with to pay the outstanding debt and the cost of buying more foreign currency to service that debt makes the trade uneconomical.

169. One way to overcome this constraint is to promote and encourage countertrade. It generally encompasses the idea of subjecting the agreement to purchase goods or services to an undertaking by the supplier to take on a compensating obligation in lieu of a cash settlement. The seller is required to accept goods or other instruments of trade in partial or whole payment for its products. Some of the forms of counter trade include:

- Barter – This traditional type of countertrade involving the exchange of goods and services against other goods and services of equivalent value, with no monetary exchange between exporter and importer.
- Counter purchase – The exporter undertakes to buy goods from the importer or from a company nominated by the importer, or agrees to arrange for the purchase by a third party. The value of the counter-purchased goods is an agreed percentage of the prices of the goods originally exported.
- Buy-back – The exporter of heavy equipment agrees to accept products manufactured by the importer of the equipment as payment.

Vulnerabilities

- The TBML vulnerabilities arise in determination of exchange ratios for the goods to be countertraded. Such ratios may often be determined as a process of negotiation rather than market determined, giving scope to TBML.

Documentary Credit (Letters of Credit, etc)

170. Generally the exporter requires an importer to prepay in cash for goods shipped. The importer naturally wants to reduce risk by asking the exporter to acknowledge through documents that the goods have been shipped. The importer's bank assists by providing a letter of Credit (Documentary credits) to the exporter (or the exporter's bank) providing for payment upon presentation of certain documents, such as a bill of lading, either immediately or at a prescribed date.
